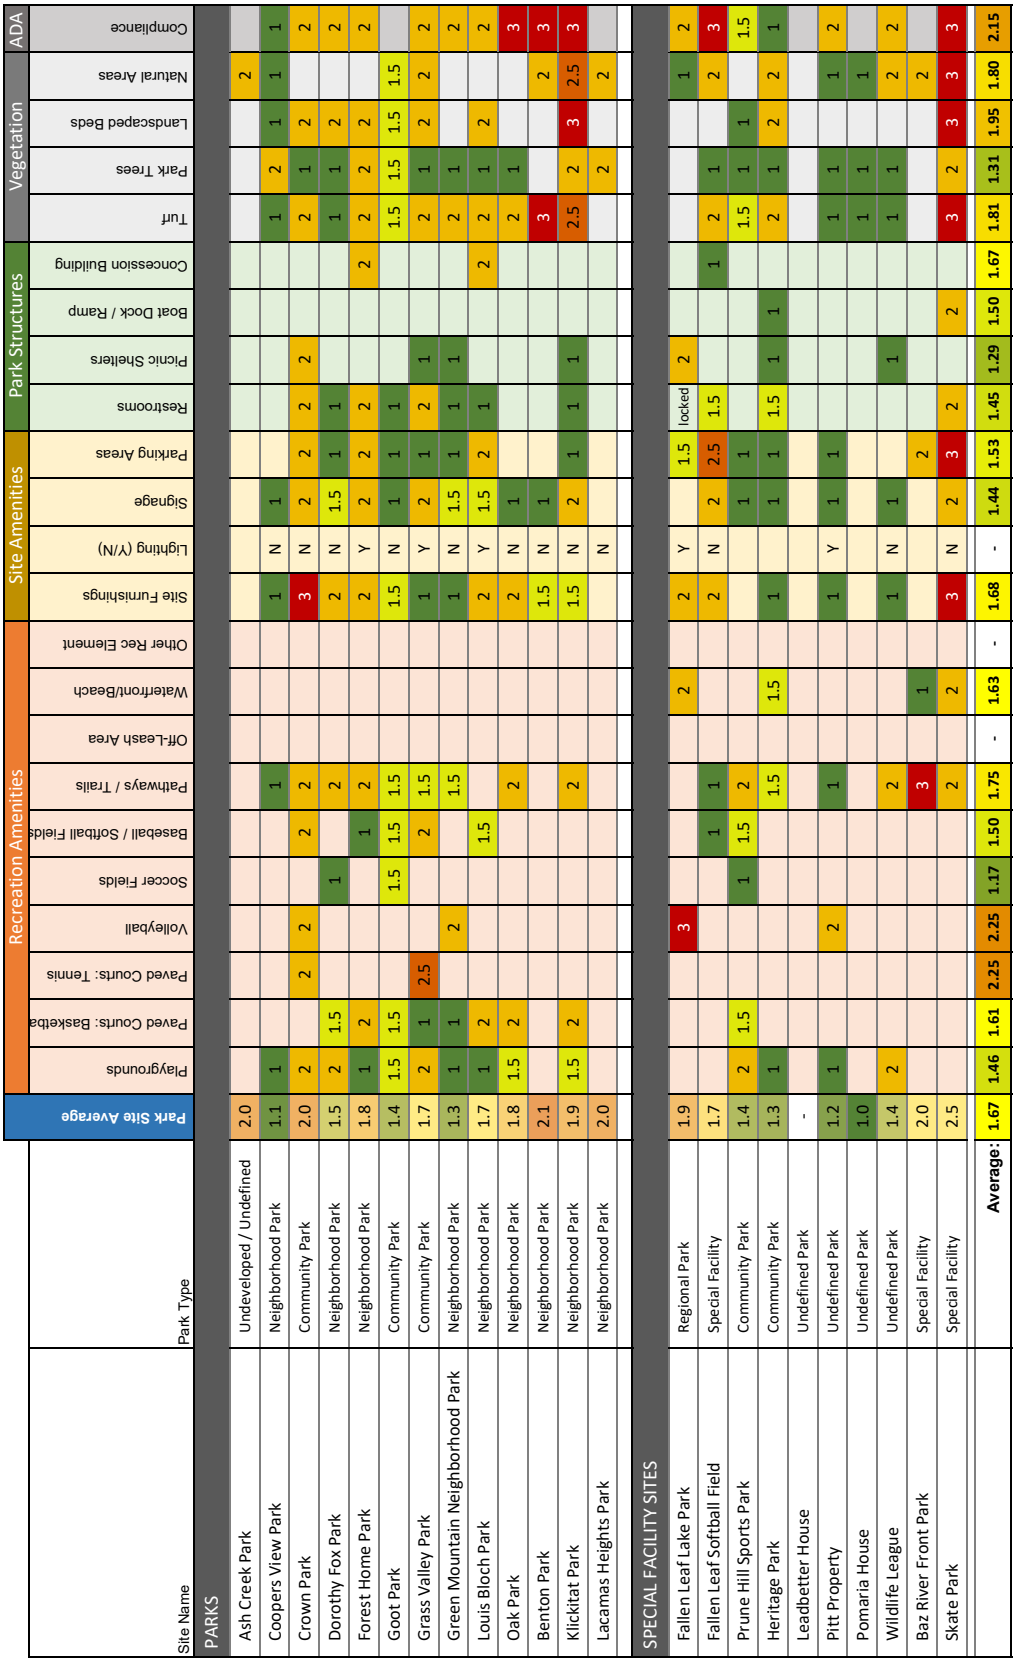
In general, good conditions should be the goal for the management and stewardship of park facilities. Where infrastructure or amenities are rated as “fair,” strategies should be developed for repair or restoration. Park features, structures, amenities, or landscapes rated as “poor” should receive immediate attention and be prioritized for near-term maintenance, capital repairs, or a new capital project. Facilities in “poor” condition should also be evaluated and taken out of operation if they are deemed unsafe. Based on this assessment, the City’s sport courts, trails, site furnishings, turf and ADA compliance are in the greatest need of attention.

Detailed site conditions and site enhancement recommendations are noted in Appendix D for the park sites visited.



Overview of Condition of Existing Parks

The following list summarizes some of the key observations and recommendations to enhance the City's park and trail system, its visual character, and longer-term sustainability.

1. Overall, the level of maintenance observed at the developed parks appears to be very good.
2. Consider upgrades to City Park Standards for signage and furnishings. For future park improvements and prior to implementing new master plans for undeveloped parks, it would be beneficial to use the same standard design, style and color for benches, picnic tables, other site furnishings and signs to provide a consistent identity to the park and trail system and reduce future maintenance costs.
3. As the trail system develops with additional connections, a wayfinding system would be beneficial. Coordinated with the graphic style for the park identification signs, this wayfinding signage would help trail users navigate the connections and know the destinations along the trails. Distances, destinations, trail etiquette, and other essential information should be planned and located at strategic sites to inform walkers, runners, and bikers.
4. Consider adding more destination amenities into the park system, such as splash pads, rock climbing, fitness equipment, nature play, inclusive play and/or themed designs to add a more diverse character to the system.
5. Many of the developed sites need ADA upgrades. Among the most common deficiencies observed are:
    - Current park standard trash and recycling receptacles are not ADA
    - The minimum ratio of ADA compliant tables and benches is below the required ADA standards
    - Lack of companion spaces adjacent to ADA compliant benches
    - Minimum clearances surrounding picnic tables are often not met
    - Several ADA compliant amenities are not along accessible routes
    - Many of the playgrounds lack ADA ramps leading into the play pit areas
    - All of the playground surfacing consists of engineered wood fiber. Although it is considered accessible when it is properly maintained; however, infrequent maintenance and refilling is fairly common. Consider transitioning to more stable playground safety surfacing options for the heaviest used playgrounds.
    - Several playgrounds do not have the minimum number of ADA accessible features
6. Several parks have vegetated open space within or adjacent to the property and may be good candidates for trail locations. Some open spaces connect residential neighborhoods with parks together and could provide alternative routes to City parks.
7. Camas has multiple storm facilities and or wetlands throughout the City, some of which are adjacent to existing developed parks. These facilities might offer opportunities to incorporate interpretive and educational experiences within the parks for a relatively low implementation cost. Proposed educational amenities might include wildlife viewing blinds and overlooks accompanied by interpretive signage.

Most of the undeveloped open space that was observed consisted of dense vegetation, including invasive species. The City should consider an invasive weed removal program, along with a more broadly framed open space management plan to identify resources and tactics to care for the City's nearly 700 acres of natural areas.

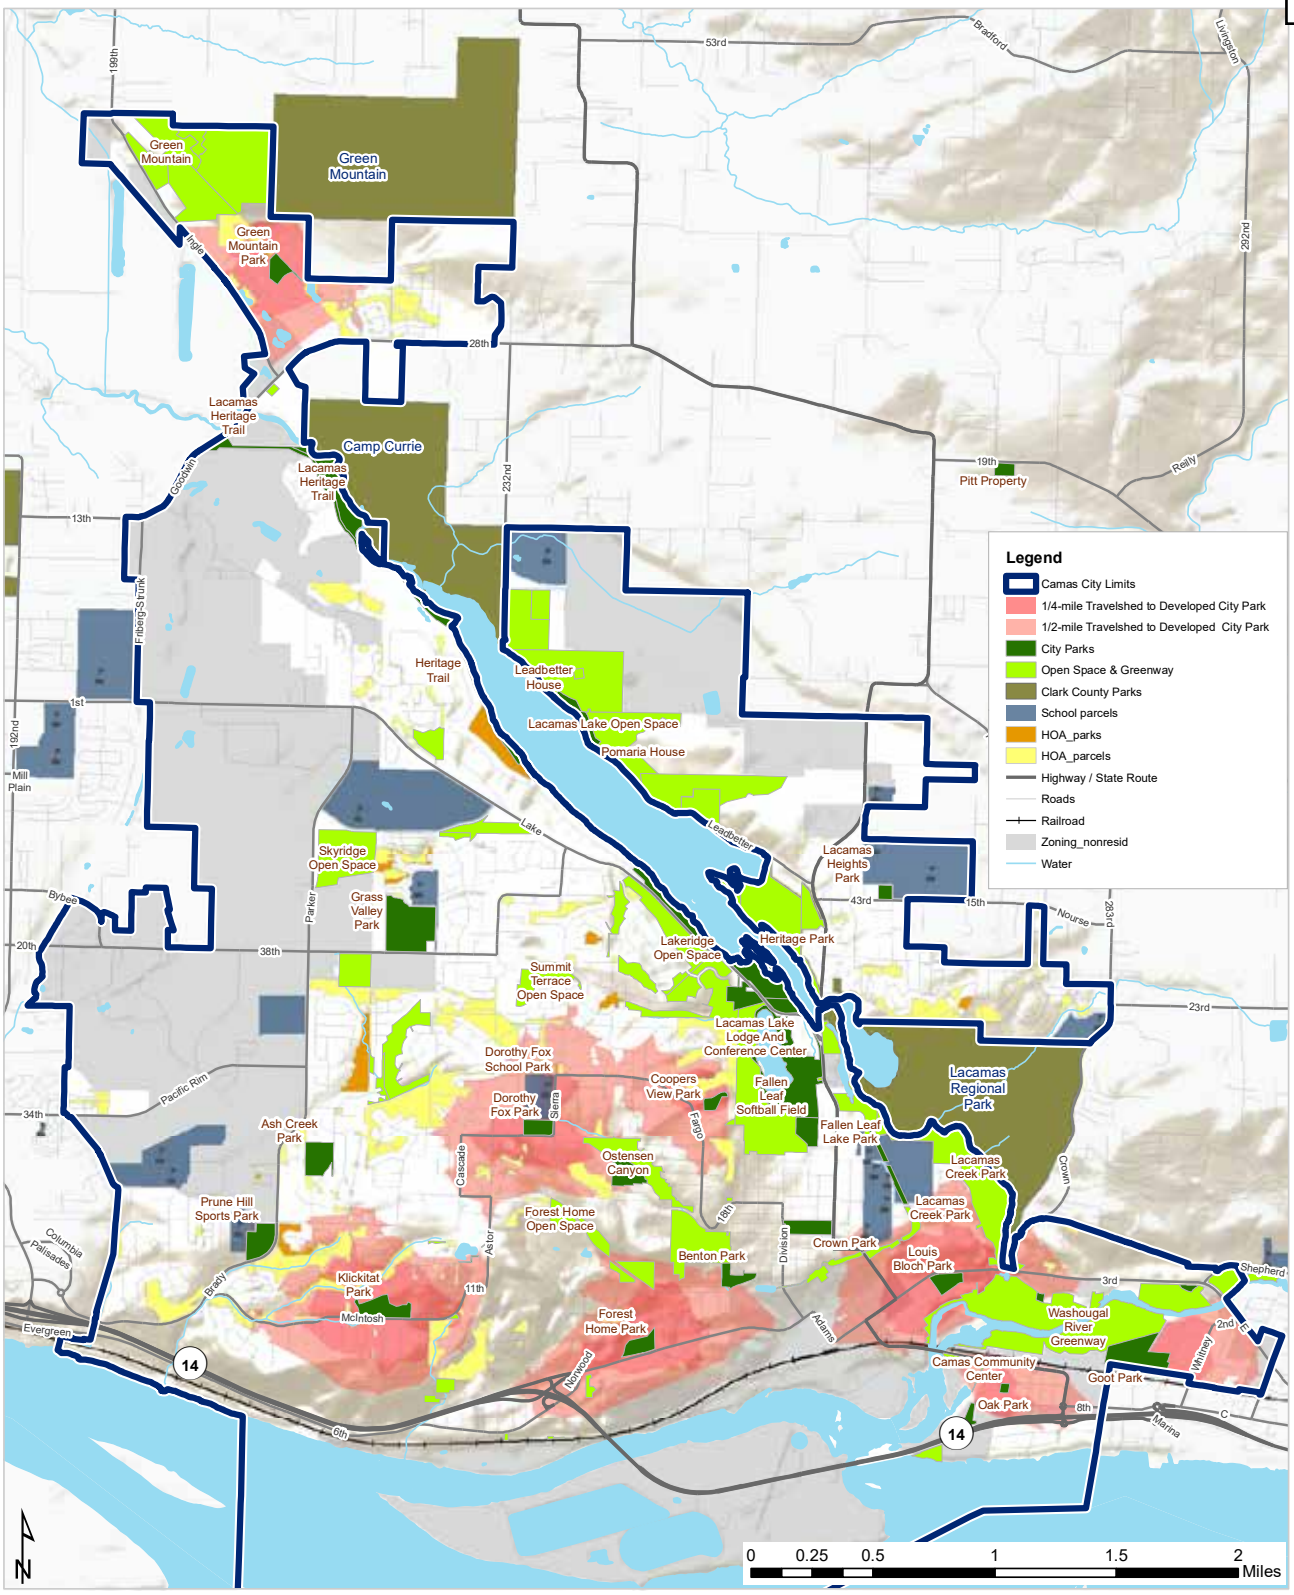
Page Left Intentionally Blank

Gap Analysis

Understanding the known gaps in the park system and evaluating the City's existing levels of service for parks (i.e., snapshot in time of how well the City is meeting its adopted standards) will provide a foundation for strategic planning as a basis for a balanced distribution of parks, trails and recreation amenities in the future.

To better understand where acquisition efforts should be considered, a gap analysis of the park system was conducted to examine and assess the current distribution of parks throughout the City. The analysis reviewed the locations and types of existing facilities, land use classifications, transportation/access barriers and other factors as a means to identify preliminary acquisition target areas. In reviewing parkland distribution and assessing opportunities to fill identified gaps, residentially zoned lands were isolated, since neighborhood and community parks primarily serve these areas. Additionally, travelsheds were defined for neighborhood parks using a ¼-mile primary and ½-mile secondary service area with travel distances calculated along the road network starting from known and accessible access points at each park. Travelsheds for community parks were derived using ¼-mile, ½-mile, 1-mile and 2-mile travel distances to acknowledge that these park types (including athletic fields) serve a wider array of users and driving to such sites is typical.

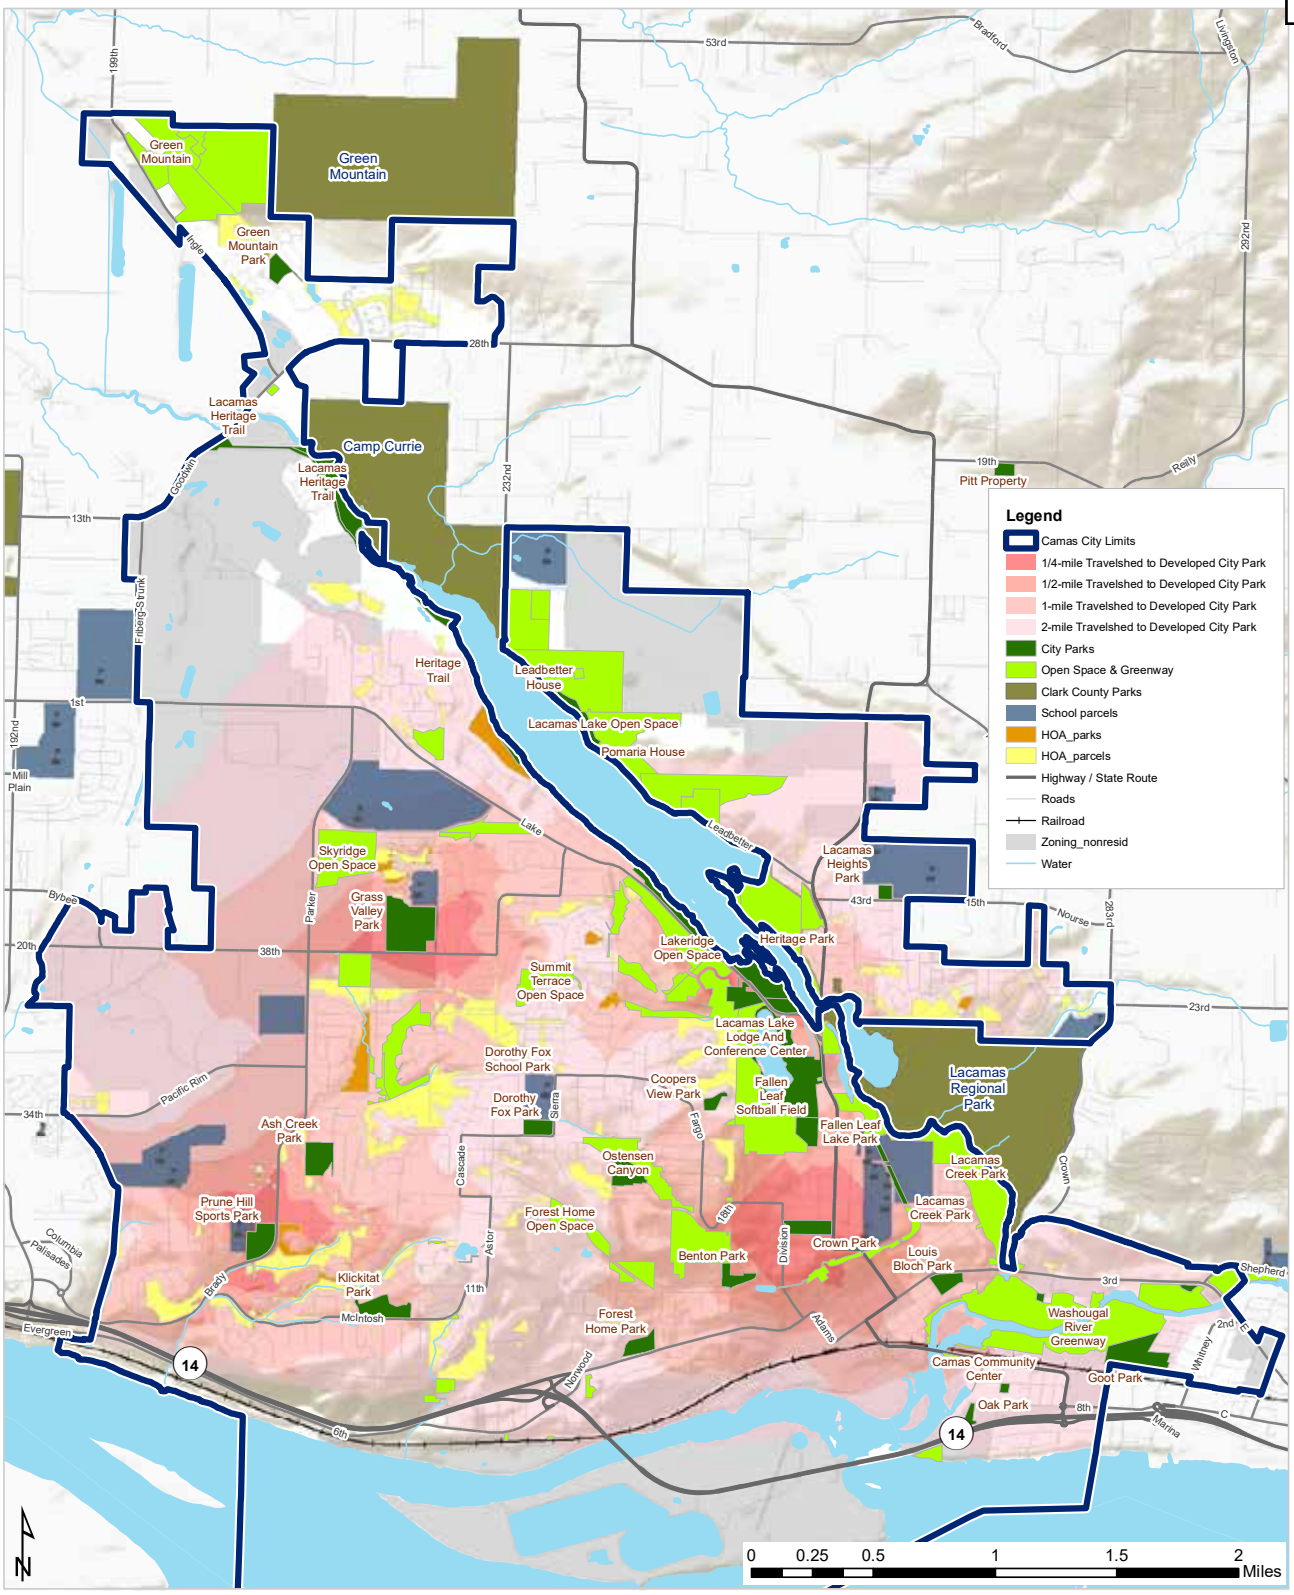
Maps 2 through 5 illustrate the application of the distribution criteria from existing parks. Areas in white do not have a public park within reasonable walking distance of their home. The illustrated 'travelshed' for each existing Camas park highlights that certain areas within the city do not have the desired proximity to a local park.



Striving to provide a neighborhood park within a reasonable walking distance (e.g., ½-mile) may require acquiring new park properties in currently under-served locations or improving multi-modal transportation connections to allow local residents to safely and conveniently reach their local park. As Camas develops and acquisition opportunities diminish, the City should consider taking advantage of acquisition opportunities in strategic locations and as funding allows to fill remaining gaps. In concert with the search for developable park land, the City should continue to coordinate with proposed residential land development projects to consider when and how a public park (or trail connection) could be incorporated into the planning of newly developed residential areas.

The mapping of park distribution and 'travelsheds' helps to illustrate the underserved neighborhoods in Camas. Areas of southwest Camas and north-central Camas have limited access to public parks or open space as indicated by white areas on Map 6. These areas of the City should be targeted for future acquisitions to help create more equitable access for all residents.

Camas has been very successful in securing park and open space as the community has grown, and the small number of potential acquisition sites is a testament to that effort. It should also be noted that the City owns several properties that are intended to serve as neighborhood parks, but are as of yet undeveloped. The future planning and development of these sites will further improve the overall distribution of parks for the Camas community, and these sites have been accounted for in the gap analysis. These future parks include:



- Ash Creek Park (future neighborhood park)
- Ostensen Canyon Park (future neighborhood park on approximately 8 acres of upper shelf)
- Lacamas Heights Park (future neighborhood park adjacent to Camas High School)
- Green Mountain property (pending community planning)
- North Shore Lacamas Lake (TBD, pending community planning)

Trails

The City of Camas consistently has been working to create a network of trails to connect important destinations and help create a more walkable community. Individual parks typically have internal (and usually paved) pathways that provide walking opportunities within the park. While these are popular amenities for park visitors and help provide access to recreational amenities, their isolation from other destinations limits their value. The lakefront, riparian areas and woodlands in Camas also have provided locations for aligning recreational, off-road trails as opportunity arises. Trail connections and walking or biking linkages have been noted as the highest priority for future improvements to Camas' park system.

The Heritage Trail offers the longest, singular trail at 3.7 miles within City ownership, and Lacamas Creek Park provides an additional 2.4 miles within a forested, park setting. Other significant trails within City open space include those at Fallen Leaf Lake (1.7 miles), Heritage Park (1.3 miles) and the Washougal River Greenway (1.5 miles). In total, Camas has almost 12 miles of walking or biking trails dispersed across its park system.

Figure 14.. Trail Inventory in Camas

Trail Owner Type	Mileage
Camas Recreational Trails	11.9
Camas ROW* Trails	6.8
Clark County Park Trails	10.9
Private / HOA Trails	8.4

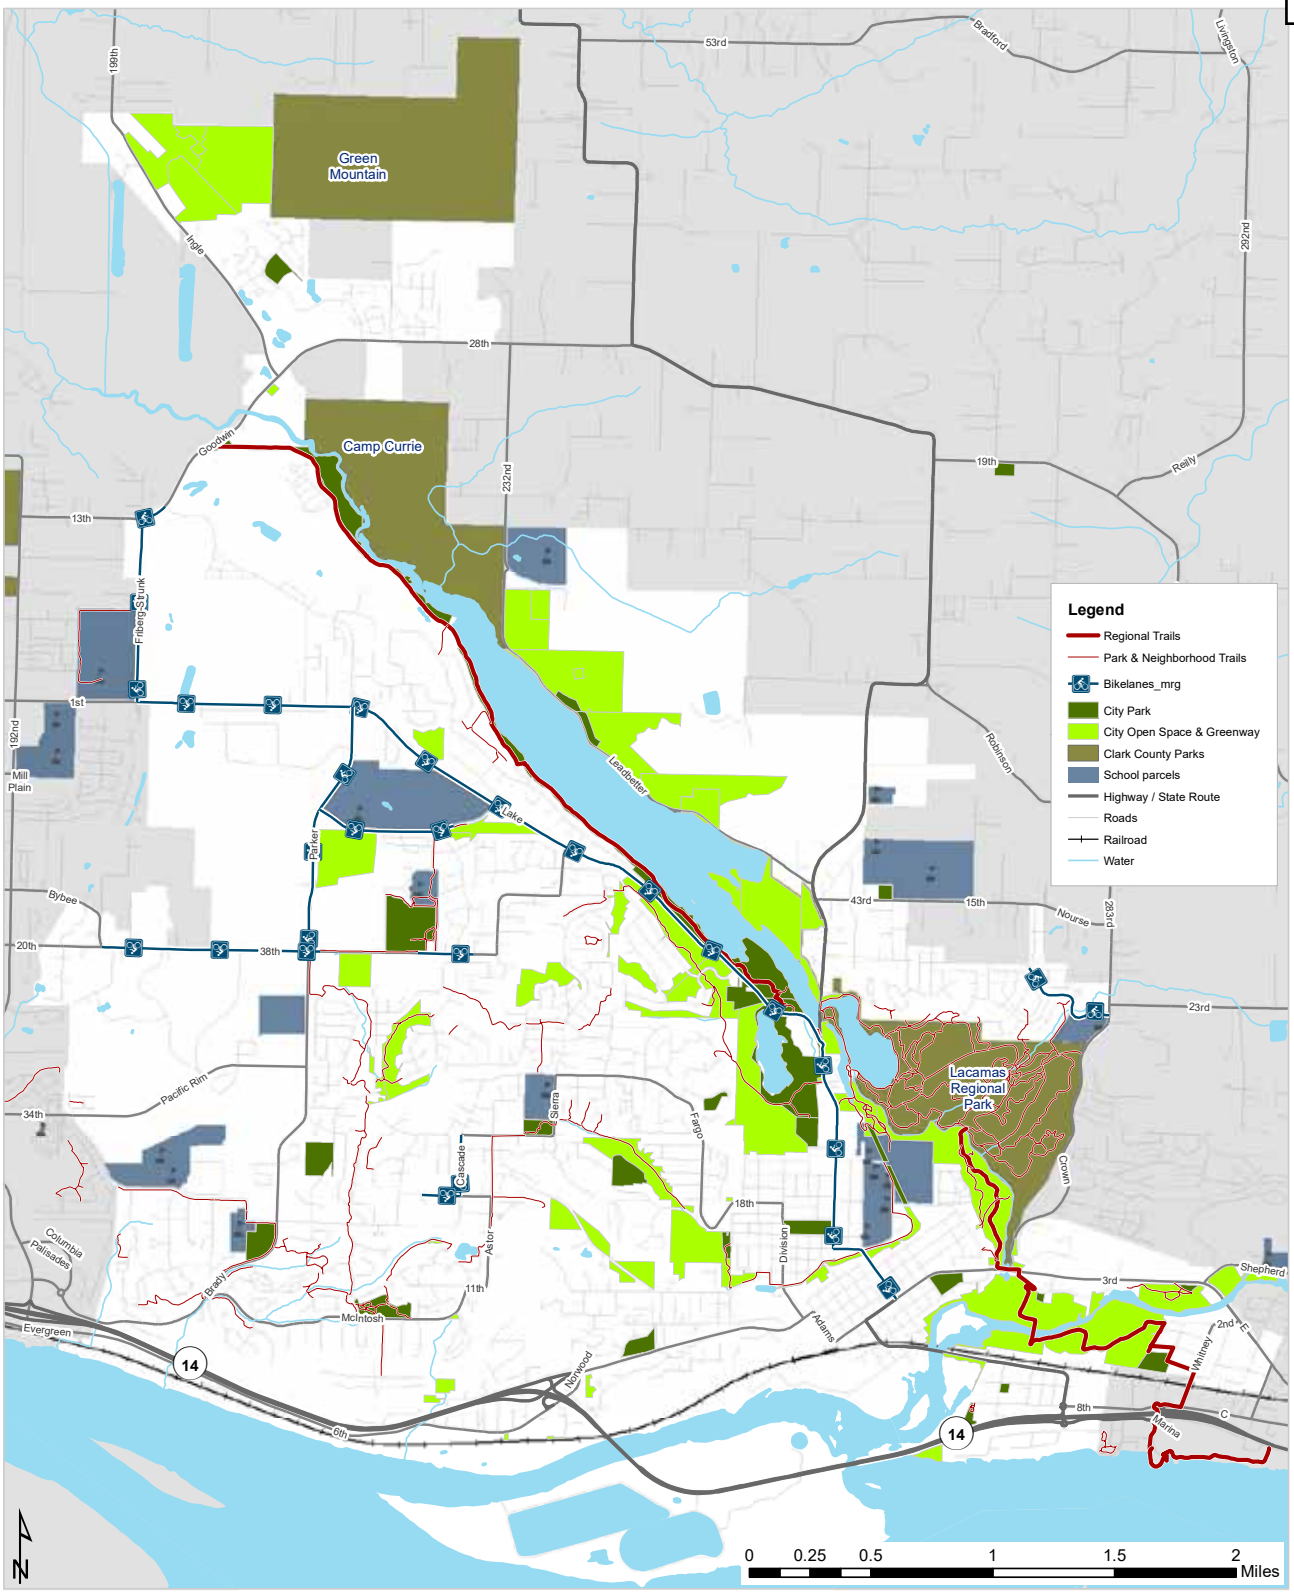
Trails for Walkable Communities

Parks are known to contribute to a healthier community by providing accessible outdoor recreation particularly through the walking trail within each park. Getting to the park by foot or bike can also offer a healthier choice integrated with the park destination and its amenities. In the NRPA publication *Safe Routes to Parks*, the elements of walkable, healthy community design are outlined as convenience, comfort, access & design, safety, and the park itself. Sidewalks, bikeways and trails should provide an integrated alternative transportation system for residents to access parks and other destinations within their community. As further emphasis for the importance of a walkable community to promote public health, the Surgeon General has issued a *Call to Action* to "step it up" and promote more walking and build a more walkable world. A more connected network of trails, sidewalks, and bike lanes with links to public transit also provides economic values.

Credit: Camas Post-Record

Trails for Aging Populations



Today's active seniors are looking at retirement age differently, as many are retooling for a new career, finding ways to engage with their community and focusing on their health and fitness. It will be critical for Camas' park and recreation system to take a comprehensive approach to the city's aging population needs. Accessibility and barrier-free parking and paths, walkability and connectivity will be paramount to future planning. Providing programming for today's older adults includes not only active and passive recreation, but also the type of equipment needed to engage in certain activities. Trails provide the infrastructure for the most popular and frequent outdoor recreation activity of older adults: walking.

Credit: Camas Post-Record

Trails for Economic Health

In the 2009 report, *Walking the Walk: How Walkability Raises Housing Values in US Cities* by Joe Cortright for CEOs for Cities, research cited the connection between home value and walkability. Higher WalkScore measurements, where more typical consumer destinations were within walking distance, were directly associated with higher home values. Homes located in more walkable neighborhoods command a price premium over otherwise similar homes in less walkable areas. The National Association of Realtors reports in their *On Common Ground* publication with numerous articles citing the preference of walkable, mixed-use neighborhoods and the role of walkability in creating healthier communities. These preferences translate into higher housing values. Even the National Association of Homebuilders (March 2014 publication: "Walkability, why we care and you should too") have recognized that walkability is desired by consumers, creates lower development costs and allows flexibility in design. As part of the system of walkability and bike-ability, recreational trails are real estate assets that enhance community connections and contribute to economic health, and these attributes should be considered as Camas enhances trail connections to downtown and plans the future of the North Shore.

Map 7: Existing Trails

Page Left Intentionally Blank

Trail Demand

Park & Neighborhood Trails

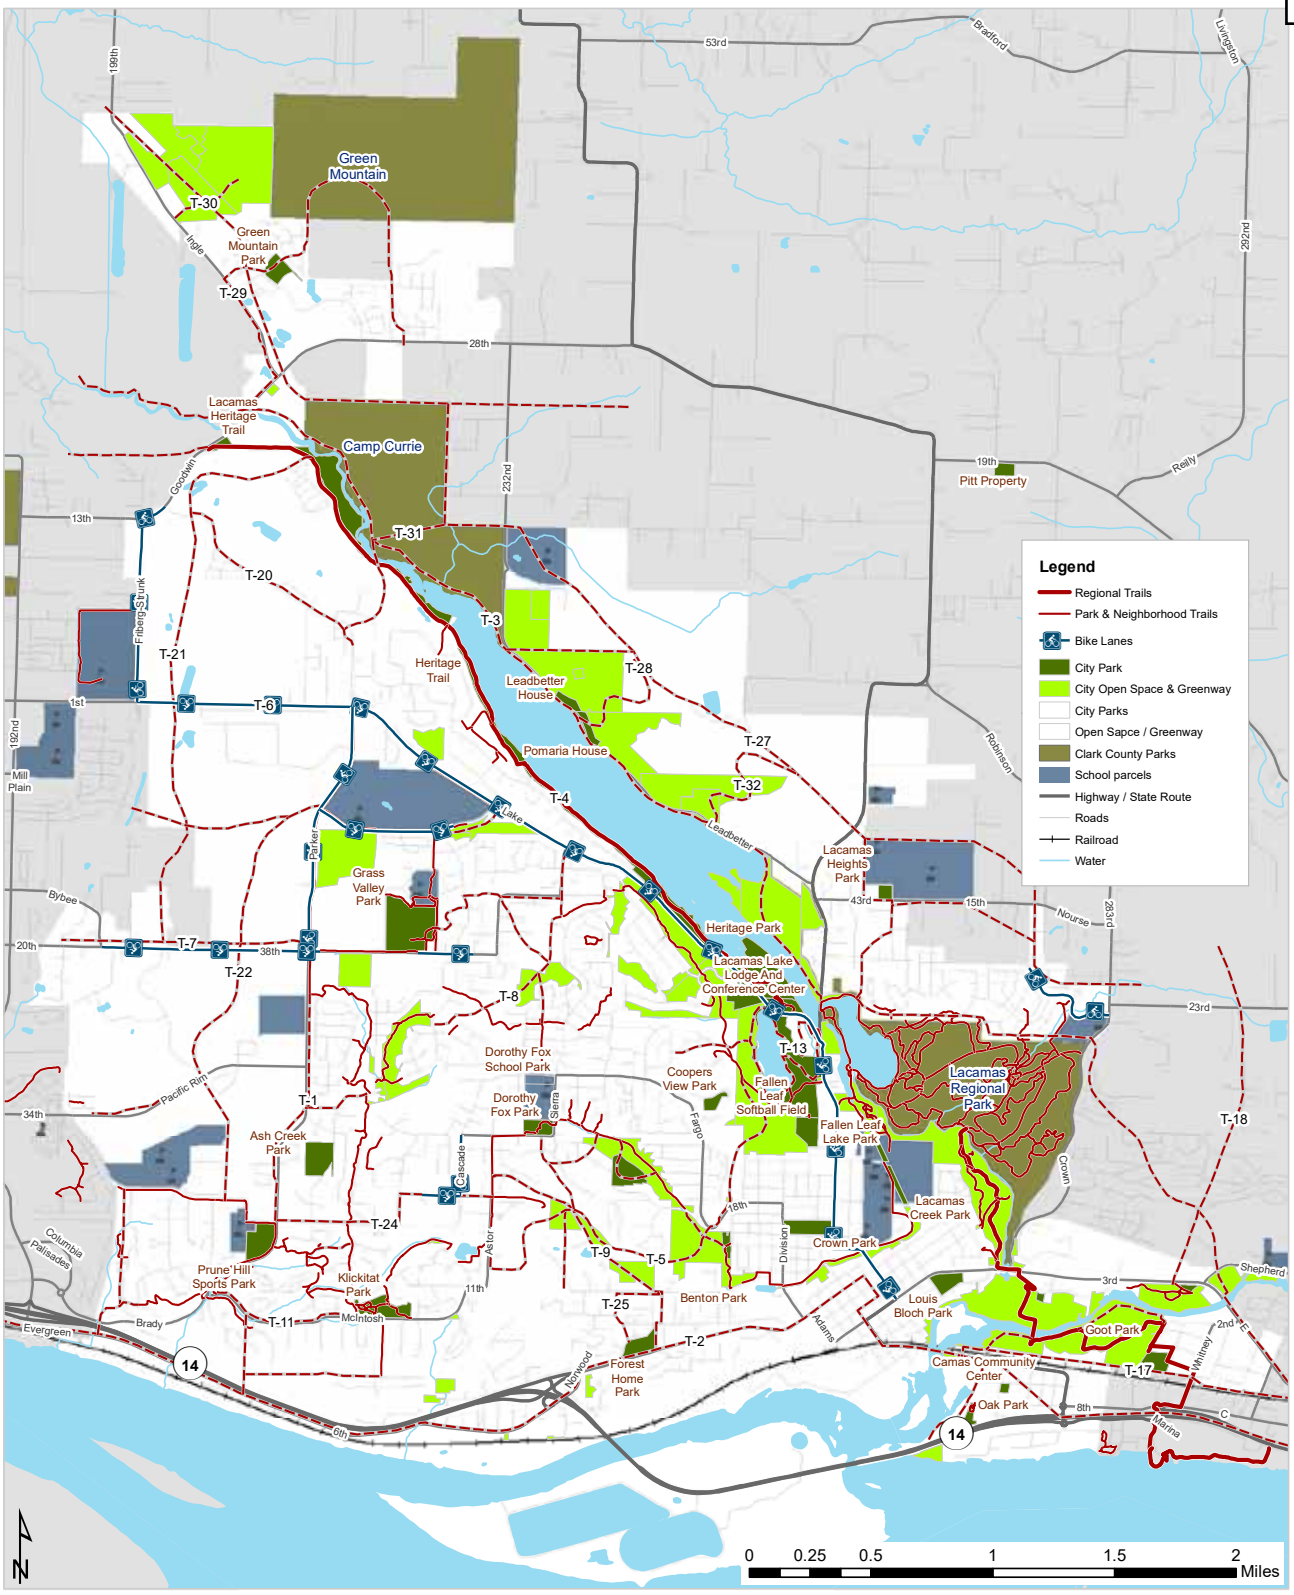
During the public outreach, 80% of the community clearly identified that walking or running was a top reason for visiting Camas' parks. Park pathways are popular recreational amenities and significant contributors for promoting physical activity. This recreational trend is notable in state and national recreation surveys. Running, jogging and trail running are the most popular outdoor activities across the nation, based on levels of participation. Also, the need for more walking and biking trail connections that link parks together has been reinforced in the community survey and other public feedback. The online open house polled opinions about potential trail links and which were the highest priority. The Mill Ditch connection and safe crossings along Lake Road were also noted as important.

With the array of existing park trails and pathways within homeowner association lands, the City should prioritize a couple other connections to close existing gaps and improve options for loop trail routes, to include:

- Ostensen Canyon gap to link Dorothy Fox Park to Benton Park
- Prune Hill Sports Complex to Forest Home Park via Forest Home Open Space (will require on-street connections in coordination with transportation system planning)

Regional Trails

A regional trail system helps knit communities within Clark County together. Public feedback deemed longer trails segments, such as the Lewis and Clark Regional Trail along the Columbia River and a North Shore Lacamas Lake connection important for Camas. The ongoing development of the North Shore Subarea Plan and conceptual trail planning outlined in the North Shores Lacamas lake - A Vision for Conservation and Recreation will guide more specific planning of trails through the North Shore Lacamas Lake area, including completing the loop to Heritage Trail. Future trail connections should link Round Lake to Camp Currie to Green Mountain, in addition to neighborhood and commercial area connections, trailheads, parking and signage.



Transportation Planning

The City is currently in the process of preparing an updated Transportation System Plan, and a review of existing pedestrian and bicycle infrastructure and discussion of future needs will be included in that plan. The existing conditions memo for the plan noted that paved, shared-use paths exist along portions of NW Parker Street, NW 18th Avenue, Lacamas Lake, Washougal River, and are also scattered throughout the residential neighborhoods. Regarding pedestrian routes and sidewalk coverage, a few areas do not have complete sidewalks, and gaps are most significant in southwest, southeast and northeast Camas.

Additionally, the City of Camas has a number of targeted improvement projects that will help further the alternative transportation options for residents. The City's Six-Year Transportation Improvement Program (TIP) from 2022 to 2027 lists planned road, intersection, sidewalk and bikeway projects. Funding and project partners are identified for each planned improvement project. The TIP includes 15 road projects that include bike lanes that will improve connectivity and rider safety along Camas streets.

> ***I just love the natural spaces, so if they're there and accessible (and safe), I'll be so grateful to walk for miles and miles. Thank you!***
> **- Online Open House participant**

Map 8: Potential Trails

Page Left Intentionally Blank

Trail Design Considerations

Alignment

The future growth of the trail network will need to balance between alignments that are optimal from trail user, trail experience and connectivity perspectives and those that are practical from cost, design and engineering, regulatory and availability perspectives. Future consideration should be given toward finding alignment options that can accommodate different trail use types (i.e., commuter vs. recreational/destination oriented, and ADA accessibility), as well as potentially interim solutions that rely on wider sidewalks to serve trail users or routing that utilizes existing or planned sewer lines or utility corridors. Accommodating alignments for local, neighborhood link trails as connections to regional, shared-used trails or major park trails is important for providing access and reducing the sole reliance on trailheads for providing access to the trail network.

Access & Trailheads

Safe, convenient entryways to the trail network expand access for users and are a necessary component of a strong, successful system. A trailhead typically includes parking, kiosks and signage and may include site furnishings such as trash receptacles, benches, restrooms, drinking fountains, and bicycle parking. Trailheads may be within public parks and open space or provided via interagency agreements with partner organizations (e.g., county, school district, etc.) to increase use and reduce unnecessary duplication of support facilities. Specific trailhead design and layout should be created as part of planning and design development for individual projects and take into account the intended user groups and unique site conditions. Trail connections and walking or biking linkages also are good access point to designated local and regional trails.

Trail Development Limitations

One underlying tenet of the recreational trail system is to enable the placement of trails within or close to natural features to provide access to the city's unique landscapes, as well as accommodate outdoor recreational access to creeks, hillsides and waterfront. The future planning and design of trail routes through natural areas should be based on sensitive and low-impact design solutions that offer controlled access that protects the resource, while providing for a positive experience for trail users. Trail routes should consider intended and unintended impacts to natural areas, such as soil erosion, especially near streams and shorelines. The determination of future trail alignments should place high priority on natural resource and natural hazards planning and protections, in part to meet local land use policies as well as Washington State requirements.

Ongoing Maintenance

Following trail construction, ongoing trail monitoring and maintenance will keep the trails functioning as designed, while working to protect capital investments in the network. Future trail renovation projects should be included in the Capital Improvement Plans as a means to identify and secure appropriate resources for needed enhancement, such as adding additional capacity to the trail. The City should maintain and expand their connection to and communications with the robust network of local volunteers to provide support as appropriate.

Trail Signs & Wayfinding

Coordinated signage plays a crucial role in facilitating a successful trail system. A comprehensive and consistent signage system is a critical component for the trail network and is necessary to inform, orient and educate users about the trail system itself, as well as appropriate trail etiquette. Such a system of signs should include trail identification information, orientation markers, safety and regulatory messages and a unifying design identity or element for branding. The following signage types should be considered and consistently implemented throughout the network:

- Directional and regulatory signage
- Trail user etiquette and hierarchy signage
- Continuous route signage for route identification and wayfinding
- Mileage markers or periodic information regarding distance to areas of interest
- Warning signs to caution users of upcoming trail transitions or potential conflicts with motor vehicles
- Interpretive information regarding ecological, historical and cultural features found along and in proximity to the trail
- Add QR codes to signs to provide links to additional information

Also, the installation of kiosks at trailheads is a best practice that should continue and provides important trail information, while reinforcing the visual brand of the Camas trail experience.

Level of Service Assessment

A level of service (LOS) review was conducted in addition to and in support of the gap analysis as a means to understand the distribution of parkland acreage by classification and for a broader measure of how well the City is serving its residents with access to parks, trails and open space. Service standards are the adopted guidelines or benchmarks the City is trying to attain with their park system; the level of service is a snapshot in time of how well the City is meeting its adopted standards.

Many jurisdictions are developing guidelines that are customized to their community and its unique and often changing park and recreation demands, rather than solely applying the historic National Recreation and Park Association's (NRPA) published park standards that primarily focused on parkland acreage per capita. The use and application of standards continues to evolve and develop diverse approaches. This Plan evaluates the City's current parkland level of service through a variety of characteristics, including acreage per capita, as a snapshot in time and means to describe the performance of the park system.

Figure 16. Existing & Projected Levels of Service by Park Classification

Type	Current Inventory	Existing Level of Service (2020)	Projected Level of Service (2035)
Regional & Community Park	219.1 acres	8.4 ac./1000	**6.4** ac./1000
Neighborhood Park	75.9 acres	2.9 ac./1000	**2.2** ac./1000
Special Facility	15.9 acres	0.6 ac./1000	**0.5** ac./1000
Trail / Linear Park	61.8 acres	2.4 ac./1000	**1.8** ac./1000
Open Space & Greenway	691.5 acres	26.5 ac./1000	**20.3** ac./1000
	1,064.1 acres	**40.8 ac./1000**	**31.2 ac./1000**

The National Recreation and Park Association (NRPA) conducts annual surveys to generate a Park Metrics database (formerly known as PRORAGIS) that reflects the current levels of service of park agencies across the country based on a variety of factors: population size, population density, number of full-time equivalent employees, number of park facilities, acres of parkland, and more. The Park Metrics survey data are used to compare different park and recreation providers in widely different communities across the country; however, the Park Metrics database relies on self-reporting by municipalities. Some agencies only include developed, active parks, while others include natural lands with limited or no improvements, amenities or access. The comparative standards in the table below should be viewed with this variability in mind.

A few highlights from the NRPA agency comparison provide perspectives on Camas' park system. Figure 17 compares jurisdictional populations served by park and recreation agencies against certain performance metrics. The number of residents per park and acres of parkland per 1,000 residents implicate the potential wear and tear on park facilities. Compared with similar population sizes, Camas provides considerably more parkland acreage (40.8 acres, including open space) per 1,000 residents. Comparing just developed park properties, the City has 6.4 acres per 1,000 residents. Looking at the numbers of residents per playground, Camas has more playgrounds (at 1,862 residents per playground) than similar-sized jurisdictions (at 3,157 residents per playground).

Figure 17. Service Levels Comparing Park Metric (NRPA) Data

Metric	Median Value		
	All Agencies	Pop. Range 20-50,000	Camas
Residents per Park	2,281	1,963	1,629
Acres of Parkland per 1,000 population	9.9	9.6	40.8
Miles of Trails *	11	8.5	39.2
Number of Residents per Playground	3,750	3,157	1,862
Number of Residents per Recreation Center**	31,141	25,716	6,516

* Note: Includes trails in County parks

** Note: Assumes 25% of Camas population for Camas Community Center and Lacamas Lake Lodge as neither facilities function as traditional recreation centers

The use of numeric standards is a blunt and limited tool to assess how well the City is delivering park and recreation services, since the numeric values alone neglect any recognition for the quality of the facilities or their distribution (i.e., the ease to which residents have reasonable, proximate access to park sites). While public ownership of a broad range of recreation lands is crucial to the well-being of the city, the simple use of an overall acreage standard does not match with the citizen input received during this planning process. Residents were particularly interested in the availability of trails, water access, and open space within a reasonable distance from their homes.

The City's park system also was assessed using Washington Recreation and Conservation Office's (RCO) level of service metrics provided in their planning manual. In reviewing the park system as a whole, Figure 18 illustrates the current levels of service across different performance measurements. From the community survey results, public satisfaction of the facilities and amenities that Camas provides ranked as the strongest indicator for the park system. Future development of Ash Creek Park, Lacamas Heights Park and Ostensen Canyon Neighborhood Park will further improve the distribution rating noted in the figure.

Figure 18. Levels of Service with RCO Metrics (System-wide)

Quality Criteria	
Public Satisfaction	
Condition of City Parks (rated as Excellent or Good)	**75.8%**
LOS Grade	**B**
Condition of Trails in Greenspaces (rated as Excellent or Good)	**81.7%**
LOS Grade	**A**
Agency-based Assessment	
Condition Assessment Rating of Existing Parks (3-point scale)	**1.67**
LOS Grade	**B**
Distribution Criteria*	
Parkland Access (within 1/2-mile travelshed)	
Percent Service Area with Access to Active-Use Parks	**71%**
LOS Grade	**C**
Usage / Visitation Criteria	
Frequency of Park or Trail Usage	
Percent Visiting Parks at Least Multiple Times per Month	**86.9%**
LOS Grade	**A**

* Note: The percentage of land area covered by service area walksheds is a proxy for the population within the residential portion of the City.

Scale: Condition Assessment

A	= <1.2
B	= 1.2 - 1.74
C	= 1.75 - 2.24
D	= 2.25 - 2.79
F	= >2.8

Scale: Satisfaction, Distribution & Usage

A	= >80%
B	= 70 – 79.9%
C	= 60 – 69.9%
D	= 40 – 59.9%
F	= <40%

No numeric standards are recommended or proposed for open spaces. While numerical planning standards are common for helping to determine a desirable number of neighborhood parks per thousand residents, they do not translate easily to open space because of the uniqueness of the land base itself. Rather than being guided by numerical standards for open space, the priority for future open space acquisitions, if any, should be focused toward those lands that expand ownership of adjacent City-owned properties or to ensure sufficient property is available to accommodate public access and future trail connections.

As with roadway system and transportation planning, planning for recreational trails should be geared toward connectivity, rather than mileage. Considering a mileage standard for paths within the Camas park system would provide only an isolated and inadequate assessment of need for the community and its plans for better connectivity, and as such no numeric standards are recommended or proposed for trails. This Plan recommends a connectivity goal that re-states and reinforces the desire to improve overall connections across the City and enhance off-street linkages between parks and major destinations, as feasible.

Other Considerations

While this Plan uses total parkland acreage and parkland access as primary indicators of parkland need, the City could also consider other factors as its population grows, including:

- Park pressure, or the potential user demand on a park: Residents are most likely to use the park closest to their home. This measure uses GIS analysis to assign all households to their nearest respective park and calculates level of service (in acres of parkland per 1,000 residents) based on the acreage of the park and the number of residents in the 'parkshed'. Areas with lower levels of service are more likely to be underserved by parkland and to see higher degrees of use and wear and tear on park amenities.
- Availability of park amenities: Park systems should include an equitable distribution and quantity of the most common amenities like playgrounds, picnic shelters, sports courts, sports fields and trails to meet local needs and help distribute the potential usage of individual parks. Working to provide well-distributed basic park amenities, while also offering unique outdoor experiences, will result in a varied park system with a range of different recreational opportunities for residents. See Appendix G for considerations.

Credit: Camas Post-Record

Park & Trail System Recommendations

Acquisitions and Development for Trail Connections

Additional trail connections are needed, as well as sidewalk and bike lanes improvements, to help link destinations across the community and park system to offer more walkability and promote healthier outdoor lifestyles. Acquisitions of easements, corridors and parcels will be needed to create the comprehensive linkages for Camas' future trail system. The Public Works and Parks and Recreation Departments will need to collaborate on the project planning to ensure the most appropriate links that improve the park and trail system. This should also include coordination with the Transportation System Plan (and subsequent updates), as well as coordination with local subdivision and site development projects.

Park Development & Improvement Projects

The preparation of an updated site master plan for Ash Creek Park and a new site plan for the flat, upper shelf of Ostensen Canyon Park will be beneficial to guide future decision-making and development of those two parks. Once master plans have been adopted, phased park development should be planned as part of the capital facilities program.

Field drainage problems are observed issues at various parks. The City should conduct a city-wide field assessment to create a capital improvement project list and on-going maintenance plan. Ongoing coordination with local leagues and the school district should inform other field improvements, including turfing existing fields, installing lights to expand play seasons and the development of additional fields to accommodate demand.

Expanding Recreation Options

Splash Pads / Spray Parks

Spray parks are water play features that are very popular and provide a means of integrating aquatics into parks at a relatively low cost. Camas currently does not have a splash pad in the park system, and strong public support exists for this feature. The City should consider at least one spray park to serve residents as an option for summertime water play that doesn't require lifeguarding. This special use amenity typically is supported by parking and restrooms, since it draws users from a wider area. Any spray park facility should be designed to recycle water, if practical.

Bike Skills

Engaging older youth, teens, and adults in more intense physical activity within parks requires amenities that support challenging active movement. The City should plan for a pump track and connecting flow track in a visible location that can accommodate parking and can enable a synergy with other park uses. These features would add new challenges for riders and add to the range of outdoor recreational opportunities across older youth and teens.

Alternative Sports

Providing facilities for alternative or emerging sports, such as skateboarding, BMX, mountain biking, climbing and parkour, can offer residents a more diverse range of recreational experiences, while creating destinations that attract local and regional visitors. Camas currently has an outdoor, concrete skatepark located next to the Washougal River Greenway, and opportunities and facilities for other alternative sports should be considered as new parks, such as Green Mountain, are designed and developed.

All-Inclusive Playgrounds

Upgrading play areas for ADA-accessibility will be necessary to ensure compliance and universal access; however, providing for ADA-accessibility should not be the City's only goal. As new parks or playground replacements are planned, Camas should consider opportunities for fully-accessible all-inclusive play areas to provide for users of all abilities.

Off-Leash Dog Area

Walking with a dog is a very popular recreational activity, and off-leash areas have become desired amenities for dog owners living in urban environments who may otherwise have limited opportunities to exercise their pets. Recreational trends and community input indicate an existing

need for an off-leash area. The City of Camas currently does not have an official off-leash dog area; however, the City of Washougal has prioritized implementation of a dog park within the next year with opportunities for Camas residents to use.

Appropriate sites should be safe, not isolated, and noise impacts on neighbors should be considered. Ideally, a dog park would be a component to a larger (future) community park, where infrastructure (e.g., parking, restrooms and garbage collection) exists and supports multiple activities. The development of a dog park may require code revisions, the development of rules and policies, and community support for self-policing for behavioral issues and waste pick-up. Communities throughout the Northwest have relied on grassroots or non-profit organizations, such as DOGPAW, for the ongoing operations and maintenance of such facilities.

Sport Courts

A limited variety of sport courts exists within Camas. Two tennis courts, three volleyball courts and nine basketball courts are provided at City parks. Tennis court surfacing will require attention in the coming years, and Camas has an opportunity to transition one or both courts to multi-sport use. Camas currently has no outdoor, dedicated pickleball courts available within public parks.

Pickleball continues to rank as one of the fastest -growing sports and has seen significant jumps in participation over the past decade, attracting a wide range of age groups. As an interim step, the City should plan to convert some tennis courts to multi-sport courts through striping and examine the need for additional multi-sport courts in the future.

Community Gardens

Community gardens provide common space for residents to grow fruits, vegetables and flowers. Gardens have been shown to increase healthy food consumption, while providing opportunities for active living, social interactions and lifelong learning. Community gardens are becoming more popular park amenities in urban environments, where residents may have limited outdoor space. Gardens are also popular with a diverse range of residents. Additional gardens could be sited in community or neighborhood parks or in stand-alone locations with parking and access to water. Due to limited staffing, the City should continue to seek partnerships for garden management with local community groups.

Water-oriented Recreation

Camas' location on the Columbia River and with three major lakes provide substantial opportunities for water-based recreation, including both motorized and non-motorized boating, fishing, paddle sports, wildlife watching, and beach activities. The City has made significant investments in waterfront acquisitions and water-oriented infrastructure over past decades, and this infrastructure, which includes docks, ramps and other water access amenities, should continue to be monitored.

Outdoor recreation businesses in the Camas-Washougal community benefit from the close proximity of the rivers, forests and mountains that provide venues for mountain biking, backpacking, rock climbing and similar outdoor activities. The cities of Camas and Washougal should coordinate and partner with local businesses to run classes that provide an introduction to these outdoor sports and broaden the outreach to new participants.

Acquisitions for a Complete Park System

Camas' park system has been expanding as the City grows and the need for more facilities triggers additions of both parkland and recreational amenities. The City is expected to continue its growth as a desirable place to live and, thus, must press forward to acquire more parkland and develop more amenities within existing parks. The mapping of existing parks within Camas' residential neighborhoods illustrated the need for three more strategically located park sites to ensure reasonable access to walkable parks for the bulk of the community. Acquiring parkland requires a proactive approach and may need to look beyond undeveloped or partially developed properties. In addition to fee-simple purchases, the City should continue to work and coordinate with local residential developers to include public parks in new subdivisions and utilize tools, such as park impact fee credits, to facilitate the process.

User Conveniences

Restrooms

Supporting park and trail use through the provision of restrooms is a critical element in any park system. Based on the park site assessments, several parks should have the restrooms replaced or upgraded; and where possible add new permanent bathrooms to parks and trailheads.

Parking

Camas has several park and trail assets that are heavily used during the summer, especially those that are adjacent to water or have access to water-oriented recreation such as Heritage Park and Heritage Trail. The City should evaluate such locations for parking and transportation constraints and needs and consider improvements to add capacity for heavy seasonal uses.

Picnic Areas & Shelters

Improving access to existing picnic areas and shelters for ADA compliance should be a core focus. Additionally, the City should assess and consider installation of new picnic shelters by city quadrants. Site master plans for Ash Creek Park and Ostensen Canyon Park should guide the future decisions about the need and location of picnic areas and shelter facilities.

Wayfinding

The City of Camas can benefit from enhanced wayfinding and signage supporting its overall park and trail system. Opportunities exist to help visitors navigate and inform them about the public spaces they are entering. A good wayfinding system can provide a consistent identity and display valuable and accessible information to orient the user. This guidance system ensures efficient use of the trail, park, or other public space and conveys safety to the user by translating the environment into a known geography. Signs, symbols, mapping, color, and standardized site amenities combined with good design of the physical environment (i.e., trail or park) help the user navigate the space and stay comfortably oriented.

ADA compliance

Minor improvements to access, such as providing ramped entrances, for site furnishings are necessary to conform to the Americans with Disabilities Act (ADA) and ensure universal accessibility. Also, the City should evaluate the play equipment and its signage for code compliance and replace outdated equipment, as appropriate. The Capital Planning section includes a line item for covering small upgrades and improvements to remove barriers and improve universal access. In general, the City should complete a system-wide ADA assessment and make improvements to existing parks as needed to ensure proper maintenance, usability and quality of park features and grounds.

CHAPTER 6

Open Space & **STEWARDSHIP**

Camas' open space, greenways and waterways are a critical component of the City's green infrastructure and play critical roles in supporting healthy, well-functioning ecosystems. These many benefits include maintaining and enhancing air and water quality, mitigating impacts of climate change, capturing stormwater runoff, and providing recreational and scenic opportunities to connect with nature that promote physical and mental well-being.

Open Space

The Camas community is fortunate to have retained several significant natural areas across the City. Over 700 acres of open space properties and natural lands are either owned or managed by the City, in coordination with the acreage of the developed park areas. These open space properties include forested lands, riparian corridors, wetlands, and steep slopes across 31 different sites. Together, the open space properties around Lacamas Lake comprise the most extensive and contiguous public open spaces, accounting for 49% of the open space in the City. Several other significant natural areas, ranging in size from 11 to 125 acres, also provide substantial forested areas. Smaller open space properties, under 10 acres in size, are distributed across Camas.

The open space classification distinguishes natural lands from parks developed for active recreation and other highly managed landscapes. Open space may refer to public properties that are exclusively natural areas or portions of larger parks that are managed as natural areas. These open space lands are managed to preserve, restore, and conserve ecosystem functions, water quality, native vegetation, and wildlife habitat. Open space properties are undeveloped, primarily left in their natural form, and are managed to retain or enhance natural or

- Online Open House participant

scenic resources. However, open space may include trails or interpretive signs, along with modest support amenities such as parking or restrooms. Additionally, some properties that are acquired and held as future, active-use parks are managed as open space until they are developed as parks, which may last five to ten years or even longer from the time of purchase.

Figure 19. City-owned Open Space Areas

Open Space Area	Acreage

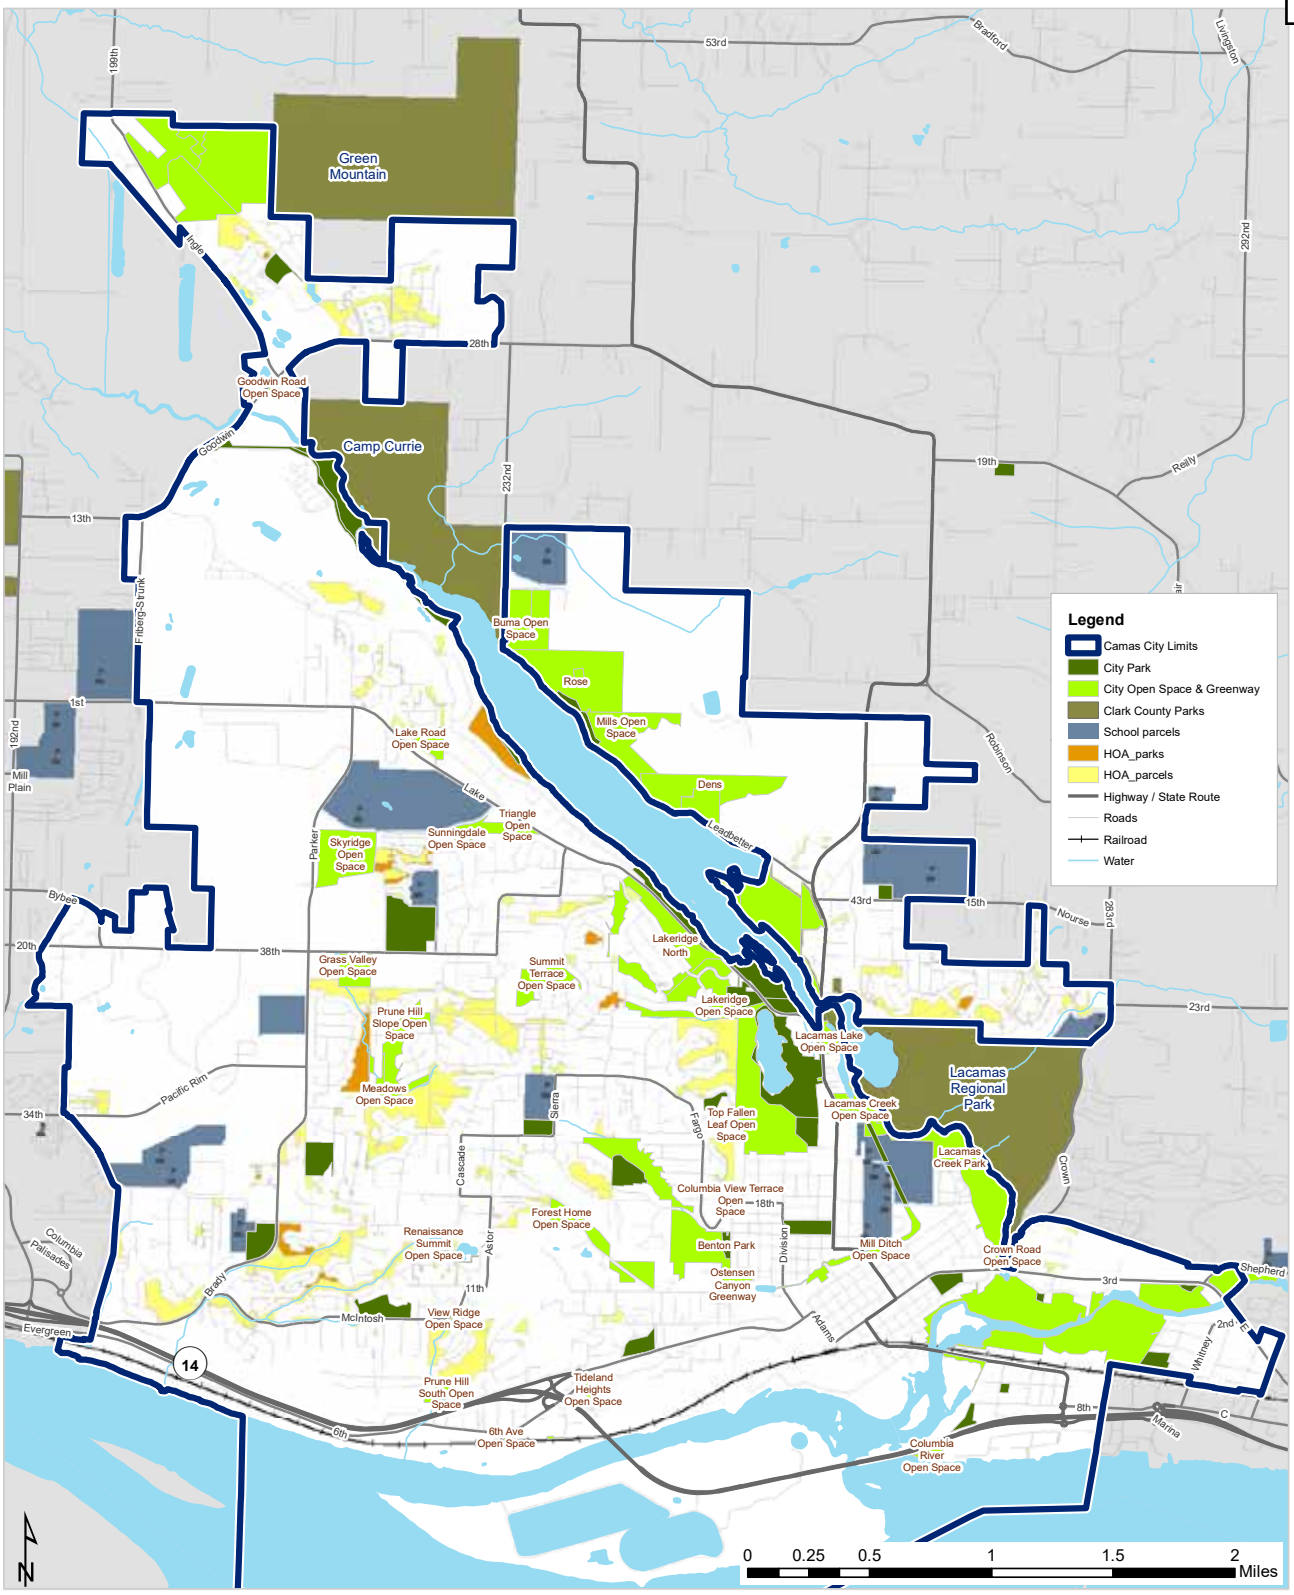
Ostensen Canyon Park	8.23
Subtotal	**139.05**
TOTAL OPEN SPACE	**835.78**

Large Open Space Properties

The City manages several other sizable open space properties. At more than 10 acres, significant habitat for wildlife and a quiet experience for park visitors is buffered by nature from the surrounding urban environment. These areas, in addition to the Lacamas Lake and Washougal River Greenway areas, include Ostensen Canyon, Prune Hill, Skyridge, Forest Home, and Grass Valley. These large open space areas contain a variety of distinct habitats, such as wetlands and creeks, adding to the diversity of plant species they host. Some of these open spaces also include developed trail systems, serving as recreation opportunities and valuable pedestrian connections for local streets and neighborhoods.

Smaller Open Space Properties



Smaller open space areas, ranging from less than one acre to ten acres, are distributed across the City. Though small, these pockets of natural area serve as refuges for wildlife traveling between larger forested areas, and in some cases, provide meaningful trail connections between adjoining neighborhoods. Several of these areas have no developed trails or site improvements and are managed exclusively as natural area set-asides and to preserve or enhance their ecosystem functions. These include Crown Road Open Space, Lake Road Open Space, Meadows Open Space, Mill Ditch Open Space and Triangle Open Space, among others. Development of these sites for public recreational use, including the construction of trails, may be limited, or restricted by natural characteristics of the land, including steep slopes, wetlands, and other features.

Other Open Space Properties

Other significant natural open space areas include sites owned by Clark County, such as Lacamas Regional Park and Camp Currie, and a significant collection of privately-held parcels owned by various homeowners' associations throughout the City.

Land Conservation

The City of Camas has demonstrated its commitment to conserving its natural resources within the context of a major metropolitan region. The preservation of the network of open space around Lacamas Lake and the Washougal River Greenway are shining examples of the importance of land conservation to the community. The City has also preserved a variety of public waterfront access and public park amenities along Lacamas Lake and the Washougal River.

Many of the public lands that the City owns and manages host unique, high-value landscapes, such as intact forests, waterfronts, and vistas. These areas are prioritized for conservation, acquisition, and restoration activities to ensure that they continue to thrive and provide their distinct ecosystem functions and benefits. High-quality waterfronts, watercourses, and wetlands are all vital to protecting water quality of these environments and preserving Camas' diversity of habitats. Providing safe public access to and within these areas needs to be carefully balanced with the crucial goal of environmental stewardship and natural habitat protection.

Waterfronts

Camas' diverse waterfronts present some of its most aesthetic and environmentally important characteristics. With only small exceptions, nearly the entire waterfronts of Lacamas Lake, Round Lake and Fallen Leaf Lake are in public ownership. Water access sites are provided at Heritage Park, Fallen Leaf Lake Park, Lacamas Regional Park and along Leadbetter Road. River access is provided within the Washougal River Greenway, and the Port of Camas-Washougal provides water access to the Columbia River. Through ongoing planning and coordination with Clark County, the City should continue to explore options to expand its waterfront ownership along the Columbia River. The conservation and continued restoration of these open spaces further highlight the conservation values of the Camas community.

Watercourses

The City's stormwater management area includes three major watersheds: the Columbia River, the Washougal River, and the Lacamas Lake watersheds. The Stormwater Management Program aims to inform and assist in the development of water quality management policies and strategies to protect local waterways, consistent with the state and federal requirements. Watercourses traversing the numerous sub-basins within the three main watersheds are naturally occurring or partially altered streams characterized by perennial or seasonal flows that contribute to water filtration, stormwater buffering, erosion control, and the provision of wildlife habitats. Within City-owned properties, preservation and restoration of the land surrounding watercourses are a priority, ensuring that these areas continue to provide their unique ecosystem services.

Wetlands & Steep Slopes

The City code also protects and regulates wetlands and steep slopes in Camas. The City's natural open space areas include several wetland areas, including riparian or lakeside wetlands and perched wetlands in upland forest areas. Steep slopes exist throughout the drainage basins and small canyons, such as Ostensen Canyon. These areas continue to be a high priority for protection and restoration efforts. Generally, they represent fragile ecosystems that host unique plant communities and serve as a valuable habitat for many animals, including bird and amphibian populations. These areas should be included in future open space management planning.

Forest Lands

Healthy and resilient forest lands are crucial for the preservation of Camas' high-value ecosystems. The City is fortunate to have acquired and protected many of the forested hillsides and canyons and open spaces around the three major lakes. Ongoing monitoring and management of these forest lands will be necessary to control impacts to water bodies and water quality, control invasive vegetation, maintain native plant communities and accommodate appropriate recreational access and usage.

Land Acquisition

Conservation may also take the form of acquiring important lands that contribute to the ecological health of Camas' forests, wetlands, and watercourses. For many years, the City has partnered and planned with Clark County on the Legacy Lands Program to secure such lands adjacent to the North Shore of Lacamas Lake.

The 2021 update to the Clark County Natural Areas Acquisition Plan provides a vision for preserving and enhancing a system of natural lands that includes greenways, habitat, farm, and forest resource lands. The plan provides a regional perspective, identifying specific acquisition opportunities, as well as accommodates future opportunities for park development, trail creation, and restoration. Within Camas, this county-wide plan continues to identify high-value conservation lands along the Columbia River shoreline (including Lady Island) for open space and to accommodate the Lewis and Clark Regional Trail, in addition to lands along Lacamas Creek.

Undeveloped lands or sections of existing properties are often restricted in their potential development by steep slopes, wetlands, or critical areas. These features are often highly valued for habitat conservation. These areas may extend existing natural areas or serve as essential habitat corridors between larger open space lands. Conservation easements and public access easements are tools that could be applied to increase habitat benefits and access across the parks and open space system.

Stewardship

With the growth of the open space network, the City has initiated several studies to guide the stewardship and management of these lands, informed by quantitative data and best practices.

Open Space Studies and Management Plans

Lacamas Lake Management Plan

The City has begun a process to develop a Lake Management Plan to outline actions to improve water quality in Lacamas, Fallen Leaf, and Round lakes. The project will address algae blooms, along with other water quality concerns that City Council has identified as a top priority. The planning effort will include water sampling and monitoring to better understand current water quality and to develop potential management strategies to improve the overall health of the lakes.

North Shore Subarea Plan

The area north of Lacamas Lake is anticipated to experience substantial growth and redevelopment within the next 20 years, and the City is actively planning the future of the North Shore through an ongoing community process. Current uses are primarily agriculture and single-

family residences, and most of the subarea is in private ownership. Planned transportation infrastructure will improve connectivity and support the employment and retail uses desired in the North Shore area. A large portion of the land in this area is zoned Business Park and Multi-Family, with some Commercial and lower density residential zoning. An eight-point vision statement, adopted by City Council in September 2020, includes as the first two points the intent to preserve the natural beauty of the North Shore and plan for connected greenspace.

1. Preserve the North Shore's natural beauty and environmental health. Policies, regulations and design rules must protect significant trees, tree groves, and surrounding lakes. Identify and preserve views to the treed hillside and the lake.
2. Plan a network of green spaces and recreational opportunities. Integrate a variety of parks, playgrounds, trails, and open spaces into residential and employment areas throughout the North Shore area. Create a "green corridor" along the lake that completes the Heritage Trail, provides lake access, and buffers the lake from adjacent development.

System-wide Open Space Management

In 2003, the City prepared Policy Guidelines for an Open Space Management Plan, which was intended to give staff the basis for effective resource management decisions. The plan identified nine management goals and eight policies to guide open space management. The plan identifies high-level issues related to land management and trail development in and through the open space network.

Since 2003, the City's open space network has grown by over 50% in terms of city-owned acreage, and an updated, more specific and science-oriented open space management and urban forest management plans are required to better guide City staff in the care, maintenance and stewardship of open space and forested lands. In particular, these new plans should reflect the realities of limited program funding and the challenges presented by climate change to include the following considerations:

1. Maintain the functional benefits of open space vegetation.
2. Foster resilient plant communities that can recover from disturbances and adapt to climate change and its impacts, such as forest fires.
3. Implement work based on the value of these functional benefits, the community's priorities for the open space properties and the condition of the vegetation found there.
4. Maximize the return on available funding through volunteers, matching grants, and donations.

Sustainable Stewardship Practices

The management of landscapes in City parklands, whether formal plantings in developed parks or diverse forest ecosystems in open space areas, requires continual attention and an investment of significant resources to properly steward and maintain the living landscape. Regardless of the use of these landscapes, the desired outcomes are the same – to sustain healthy, thriving plants.

Past practices and traditional horticultural methods to achieve this goal have become less reliable in recent years. Changes to the Pacific Northwest climate have increased summer heat and drought, causing more stress for mature and establishing plants. This change has been accompanied by a shift toward more sustainable landscape maintenance practices, reducing potential impacts on the surrounding environment and its inhabitants.

Water Conservation

Despite the rainy winters, water is not an unlimited resource in the mid Columbia River valley, and summers are expected to get even hotter and drier as climate change intensifies. It is increasingly likely that not just voluntary, but mandatory, water conservation measures will become necessary on occasion to preserve supplies for the most critical uses, such as domestic consumption.

In landscaped areas where shrubs and trees rely on some summer water, maintenance staff have adjusted the irrigation systems to water before sunrise to reduce water waste and maximize plant uptake. Depending on the landscape, watering also may need to be shifted to a deeper and less frequent watering schedule to reduce evaporation and encourage plants to root more deeply. In addition to reducing irrigation volumes and frequency, the City should consider shifting to planting more drought-tolerant species and schedule the majority of new plant installations in the early part of the rainy season to maximize root growth and establishment before the onset of the dry season.

Plant Selection

Selecting appropriate plants species for park landscapes is the source of a great deal of discussion, both on the local and regional scale. While drought-tolerant plants will be better able to establish in the short term, consideration is also given to how well newly established plants will survive in the long term. In recent years, cities across the Pacific Northwest have seen many mature native trees decline and die in recent years, unable to adapt quickly to the increased summer temperatures and lack of summer moisture. Plant selection for tree replacements or renovations that consider the anticipated climate in 10-50 years will be more likely to create resilient, mature landscapes that can better transition to warmer, drier conditions.

In natural areas, generally replanted with trees and shrubs native to the immediate area, staff should begin selecting new plants from seed zones that reflect the greater Portland-Vancouver area's projected climate. This focus on plant provenance (the original geographic source of seed, pollen, or propagule) will allow staff to plant the same native species better adapted to future conditions.

In addition to considering the climate in the selection of plants for developed parks, other factors must also be considered, including the mature size of the tree or shrub, any known pests or diseases that may affect the species, and how a fully developed root system will interact with nearby paved surfaces.

Invasive Species Management

The control of invasive species is a critical element of the restoration process and essential in maintaining a healthy natural landscape. Many invasive and non-native species exhibit strong adaptability to Pacific Northwest environments and displace native species, especially within the disturbed landscapes proximate to urban development. In relation to the need for an updated open space management plan, the City should expand resources to managing invasive species and enhanced partnerships to help with these efforts. While removal efforts may be ongoing, those sites cleared of invasives will require continuous monitoring and intervention to reduce or limit the re-establishment of the invasive plants. Through proper management of public open spaces and natural areas, the City and its partners can maintain and enhance its open space areas and the critical ecosystem and community benefits they provide.

Stormwater Management

The Pacific Northwest region is experiencing more severe rainstorms due to climate change, and more of that rain is falling on impervious surfaces: roads, parking lots, and rooftops. This untreated surface water runoff is a source of contamination along the Columbia River, Washougal River, Lacamas Lake, and in other riparian areas, impacting both people and wildlife, especially salmon populations.

State requirements for surface water management are becoming more stringent and costly for both developers and the City. Ongoing updates to and management of the City's NPDES Phase II Permit, Stormwater Design Standards, Stormwater Management Plan, and Stormwater Management Program should be acknowledged in relation to park and open space system management.

Runoff volumes, peak stream flows, and local flooding can be reduced by incorporating trees into stormwater management planning, lessening the need for expensive detention facilities (e.g., catch basins) and the cost of treatment to remove sediment and other pollutants such as lawn chemicals. Green infrastructure is far more cost-effective than grey infrastructure.

Using open space areas and greenspaces to capture stormwater runoff encourages infiltration into the soil, prevents excessive streambed erosion, and reduces sedimentation in major waterways. In addition, a healthy tree canopy increases carbon sequestration potential, encourages local biodiversity, and enhances overall environmental resilience by reducing heat island effects and offering cooler, shaded air.

CHAPTER 7

Recreation & EVENTS

...my top priority "Outdoor adventure summer camps, including archery..." I would be very interested in these types of activities/camps not only for children and youth, but adults as well. I would love to participate in all of the activities that were listed, not only to learn more but also to meet more people in the community.

- Online Open House participant

The recreation facilities and services available within Camas are a major community asset and support the physical, mental and social health of community members. Recreation services are available through a range of public and private recreation, health and fitness providers and facilities. The City currently provides nearly all of its programing through partnerships and program contractors and does not provide a full suite of 'traditional' recreation offerings, such as fitness and aquatics, due to limited facility space and staffing.

RECREATION MACROTRENDS

The following national and state data highlights some of the current trends in recreation and may frame future considerations in Camas' recreation programs. Additional trend data are provided in Appendix E.

- Nationwide, eighty-two percent of U.S. adults believe that parks and recreation are essential. (1)
- Seventy-seven percent of survey respondents indicate that having a high-quality park, playground, public open space or recreation center nearby is an important factor in deciding where they want to live. (1)
- Nearly all (93%) park and recreation agencies provide recreation programs and services. The top five most commonly offered programs include holiday or other special events (65%), educational programs (59%), group exercise (59%), fitness programs (58%), and day or summer camps (57%). (2)
- Youth aged 6 to 17 were active outside far less in 2019 than in previous years – the average

number of outings per child dropped 15% between 2012 and 2019. [4]

- Adults over the age of 65 showed significant change in inactivity rates in the six year period between 2014 and 2019, decreasing 6.8%. The rise in popularity of low impact exercise like aquatic exercise, swimming for fitness, yoga, and barre could be attributing to the decline of inactivity in this older age group. [5]
- Nearly all park and recreation providers in the U.S. experienced a decline in revenue in 2020 due to the COVID-19 pandemic. As early as May 2020, most providers had to close facilities temporarily in accordance with health and safety directives. Nearly half had also furloughed or laid off staff due to the funding and facility impacts of the pandemic. [3]

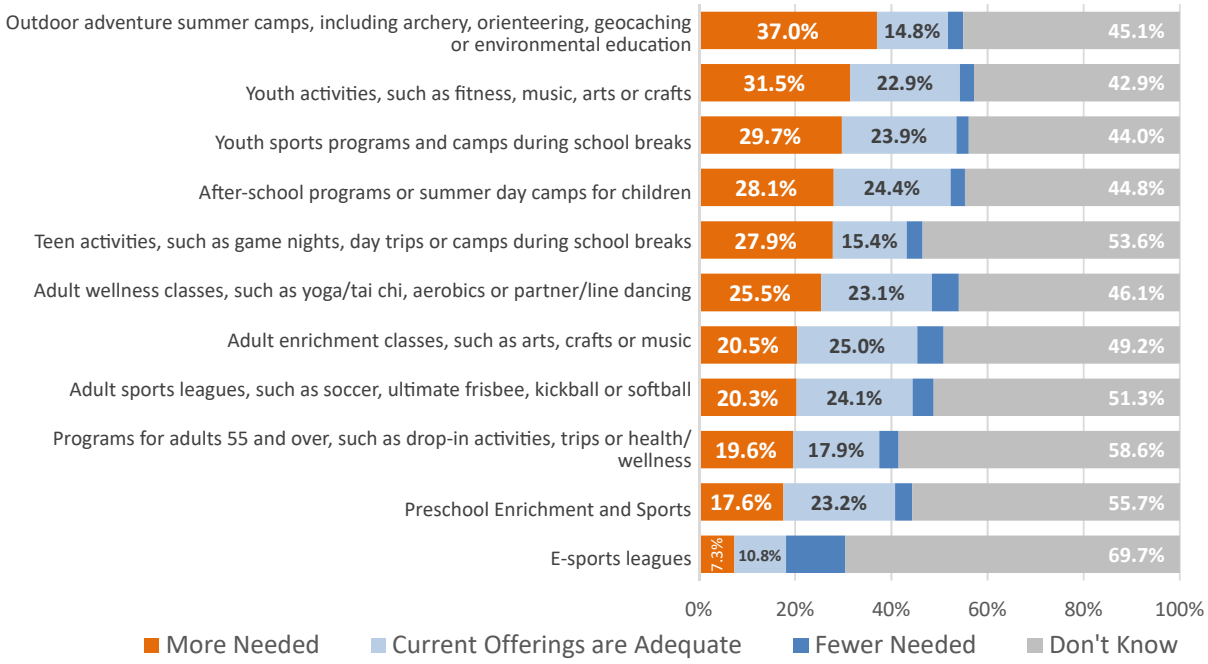
(1) American Engagement with Parks Survey

(2) 2020 NRPA Agency Performance Review

(3) 2020 State of the Industry Report



(4) 2020 Outdoor Participation Report

(5) 2020 Sport & Fitness Industry Association Sports, Fitness, And Leisure Activities Topline Participation Report

Local Perspectives

The community survey conducted as part of this PROS Plan update asked respondents which types of recreation programs, classes and activities they would like to see more of. Notably, approximately half of respondents indicated that they did not know whether current offerings were adequate or not. Of those who expressed an opinion, more than half felt the City needed more outdoor adventure summer camps, teen activities, adult wellness classes and programs for adults over 55. Respondents under 34 years of age were more likely to feel the City needs more adult sports leagues, youth camps and after-school programs, preschool activities, and E-sports leagues.

Figure 21. Adequacy of Current Recreation Options

Additional insight was gleaned from the online open house, which asked participants to prioritize the list of recreation programs and activities that ranked strongly from the above community survey. The top three recreation program priorities were noted as the following:

(1) After-school programs or summer day camps for children

(2) Outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education

(3) Youth sports programs and camps during school breaks

The online open house also included a question about community events. Participants were asked to rate the priority (high, medium or low) from a list of ten program options. The top three event priorities were noted as the following:

(1) Hometown Holidays

(2) Movies in the Park

(3) Concerts in the Park

- Outdoor Recreation – Environmental education, hiking, camping, kayaking, and other activities
- Sports – Team and individual sports including camps, clinics and tournaments, as well as adventure/non-traditional sports
- Seniors – Programs and services that are dedicated to serving the needs of seniors
- Special Events – City wide special events that are conducted throughout the year
- Teens - Programs and services that are focused on serving the needs of teens. This can include all of the activity areas noted above (except seniors)
- Youth – Before and after school programs, summer/school break camps, and preschool

Figure 22 highlights the major areas of focus for current Camas recreation programs, segmented by general program classification and age group. The programs noted are based on a review of program offerings for 2018-2021, that were provided by the Department.

Recreation Programs

Interest in the City providing recreation programs appears to be strong; however, the number and types of activities the City can offer is very limited due to the lack of staffing and indoor facility capacity. The City should consider incremental growth in recreation programs and initially focus on facilitating programs via contract vendors who provide their own staff and/or focusing on those programs that are not currently offered by local or regional providers.

Programming Classifications

Recreation program offerings can be classified and segmented into general program categories to assist in the planning and provision of programs and activities. The following general program categories have been applied to a review of programs offered by the City to illustrate the range and variety of program options:

- Education – Language programs, tutoring, science (STEM) classes, computer, financial planning, and CPR/AED/First Aid
- Fitness – Group fitness classes, personal training, education, and nutrition

Figure 22. Existing City Programs by Classification

Area	Focus	Programs
Sports	Youth Sports	Sports Camps, Soccer, Skyhawks Sports Camps, Co-ed Flag Football
	Adult Sports	Adult Co-ed Softball, Men's Softball
Fitness / Wellness	Youth	Fencing, Kung Fu, Fitness Classes, Tiny Tots Tumbling
	Adult	Fitness Classes, Yoga, Tai Chi, Women's Self Defense, Barre
Youth		Spring Kids Camp, Preschool, Preschool Summer Camp, Brickzone Summer Camp, School Break Camps
Teens		Camtown Art Show, plus Sports & Fitness (see above)
Education	Youth	CPR/AED/First Aid. Busy Bee Preschool
	Adult	CPR/AED/First Aid
Specialty / General Interest	Youth	Music Together, Craft Workshops, Family Paint Night
	Adult	Craft Workshops, Family Paint Night
Special Events		Easter Egg Hunt, Camtown Youth Festival, Movies in the Park, Summer Concerts, Family Fun Fridays, Hometown Holidays
Outdoor Recreation	Youth	Spring Adventure Camp
	Adult	N/A
Seniors		Fitness Classes, Tai Chi, Self-Defense, Cultural Bus Tours, Casino Tours

Programs Available by Age Groups

Below is listed the general program categories that are available for different age groups. Full dots represent categories where Camas has an established set of programs, and hollow dots represent categories where Camas currently provides some program options and is working to grow the programming.

Figure 23. Segmentation of City Programs by Age Group

Program Category	Preschool	Youth	Teen	Adults	Senior
Education	●		○	○	○
Fitness		●	○	●	●
Outdoor Recreation		●			
Seniors					●
Special Events	●	●	●	●	●
Sports	●	●	●	○	○
Teens			●		
Youth		●			

For the programs it provides, Camas serves all of the major age groups to a degree. Education and Outdoor Recreation have very limited programs in place and should be supplemented as staff and resources allow. Education programs could include language programs, tutoring, science (STEM) classes, computer classes and financial planning. Outdoor recreation programs could occur at many of the local parks and include environmental education, birding, hiking, camping, kayaking and other activities.

As shown in the community survey conducted as part of this Plan, the Camas community considers youth programs to be a high priority for City recreation services. More than three in ten survey respondents indicated that there were not enough youth activities, such as fitness, music, arts or crafts (31.5%) and outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education (37%). To address community needs and demand, the City should explore how to provide adequate resources to expand and diversify its youth programs to meet the growing need for engaging, affordable, safe options for children and teens. The City should continue to work with the school district, community partners, recreation providers, and sports organizations to explore facility options and availability. In utilizing existing parks and outdoor resources during the summer months, the City should explore specialized outdoor youth camps focusing on hiking, climbing or orienteering, as well as expand and strengthen its Adventure Camp program.

If opportunities are created for additional indoor or classroom space, the City should consider whether to expand the quantity and breadth of youth and adult programs offered. In particular, the City should consider health and fitness classes, additional team sports programs, classes in alternative sports, art and music classes, and educational programs, such as language, and personal and home improvement. Because recreational programming can be influenced by national and regional trends, staff must stay abreast of current trends and continue to evaluate and adjust program offerings within its contractor-reliant service model and if indoor program space becomes available.

The City also should continue to coordinate with the school district and explore options to partner with the district for the use of school facilities (e.g., gymnasiums and classrooms) as space for expanded program options, especially during non-school summer months. Such an option would require the loosening of COVID restrictions, as the school district has stopped allowing outside organizations to use their spaces for activities.

Regarding programs for adults over 55, the depth and breadth of programming for seniors may need to increase or be adjusted as the overall population ages, with a greater emphasis on the wide-ranging needs and expectations of the Baby Boomer generation. As noted in the Community Profile chapter, Camas has a slightly higher median age than the county and state, and nearly one-quarter of the city population is 55 years of age and over. Today's seniors are generally more active than previous generations and would benefit from a diverse array of recreational and educational programs that promote active, healthy lifestyles. The City will likely see an increased demand for programs offered on evenings and weekends, as older community members maintain employment or volunteer activities later in life.

Additionally, the following program categories are not provided due to the limited nature of the City's facilities and staffing capacity to support these programs:

- Aquatics – Learn to swim classes, aqua exercise classes, competitive swimming/diving, SCUBA, and other programs (synchro, water polo, etc.).
- Cultural Arts – Performing arts classes, visual arts classes, music/video production and arts events.
- Self-Directed – This includes the opportunities for individuals to recreate on their own. This can include activities such as open gym, use of weight/cardio space, and lap/recreational swimming.
- Special Needs – Programs for the physically and mentally impaired, as well as inclusion programs.
- Social Services – This can include nutrition and feeding programs, job training, life skills training, childcare and other activities, such as health screenings.

Recreation Facilities

Camas Community Center

The Camas Community Center is a historic school building located south of the Washougal River and downtown Camas, in the Oak Park neighborhood. The center is used for community meeting and private event space, recreation programs, senior activities, as well as storage for non-profit partners, special event and recreation program supplies. The facility has limited function due to its small size, limited amenities, location, and inability to expand. Built in 1915, the Center was not designed for recreation programming and does not have a full-size gym. In the future, if a new recreation center is approved, the City should reexamine the use of the existing community center to avoid duplication of services.

Lacamas Lake Lodge

The Lacamas Lake Lodge is located adjacent to Heritage Park on Lake Road, along Lacamas Lake. Located on the site formerly occupied by the Camas Moose Lodge, the new building provides community meeting and event space, adult and youth recreation programs, as well as improved access to Lacamas Lake and public parking. This facility is intentionally designed for multiple uses but is especially well suited to rent for events. The City should continue to program this facility to support recreation programs, but in a manner balanced with rental use of the facility, which provides the greatest revenue to support this facility and other City services.

Private Fitness

Several private fitness and aquatic clubs are located in or near Camas. These facilities vary in their offerings and clientele, and their strength in the marketplace is an indicator that the wider Camas-Washougal community seeks out and has a need for fitness-related activities and programs.

School District Facilities

In addition to school gymnasiums and sport fields, the Camas School District also operates the Jack, Will and Rob Center. The facility was opened in 2002 and run as a Boys & Girl Club until 2017. At that time, the Camas School District assumed operations. The center provides after-school programs, classes and rentals, and the facility offers a gym, classroom space, art room, computer lab and Family Community Resource Center.

Future Recreation & Aquatic Center

In 2019, Camas voters rejected a $78 million bond to build a community recreation and aquatics center with a recreation pool and competitive pool, in addition to sport field improvements. Although the outcome of that vote was clear, the outreach conducted through this planning effort indicates that many in the Camas community still have interest in an aquatics facility and indoor recreation space.

Traditional guidelines from the National Recreation and Parks Association for service demand for recreation centers are based on a population benchmark, with the idea that one recreation center could be supported by a population of 40,000. With the City's current population and projected growth, the City should continue to explore the potential to site and finance an indoor facility and continue the dialogue with the community about what could be included in a new facility, its projected costs, and the community willingness to support such an endeavor – at a scale that would be supported by voters. Partnerships will be necessary to offset development and operational costs of a community recreation center, so the City should continue discussions with local agency partners (e.g., City of Washougal, Camas School District) and with operators (e.g., YMCA) to explore options for the development and operations of a future center.

Special Events

The main recreation program area that is directly offered by Camas Parks and Recreation is special events, which include the following (pre-COVID):

- Easter Day Egg Hunt
- Camtown Youth Festival
- S'more Stories Under the Stars
- Concerts in the Park
- Camas Days Kids Parade
- Family Fun Fridays
- Movies in the Park
- Family Halloween Night
- Hometown Holidays

Community and special events should continue to be an area of emphasis. Special events draw communities together, attract visitors from outside the community, and are popular with residents. However, due to resource requirements of coordinating special events, the overall growth in the number of events should be carefully managed. This will ensure the City can adequately invest in its overall recreational offerings and maintain high-quality special events. Other community groups should be encouraged to be the primary funders and organizers of as many community-wide events as possible. If the City decides to offer more events, it should obtain sponsorships to offset costs and develop a series of seasonal activities.

Program Enhancement & Development

Staff should periodically review data from the following sources to determine community needs for programs and services:

- Historical registration trends/success of current programs and services
- Surveys and questionnaires
- Washington SCORP and national trend data
- Suggestions provided by current instructors and current employees
- Suggestions submitted by prospective instructors/ employees

Staff should continue to evaluate and assess the City's program offerings and prioritize future programs based on a mix of criteria that include:

- Current or potential importance for community-wide or broad individual benefit
- Community needs or deficiencies
- Potential for increased participation
- Revenue potential, affordability and accessibility

With the City of Washougal's interest in expanding recreation options, the City of Camas should directly coordinate and plan with Washougal staff to provide a balanced suite of programs in a complementary manner. This should be in parallel with the development of Camas' programming philosophy to detail how the City will deliver recreation programs and services in the future, which also is framed by the availability of flexible, indoor space for programs and classes. As part of the programming philosophy, the City must determine what programs and services will be offered directly by recreation staff and which will be contracted to other individuals or organizations. The City's current model of utilizing program contractors could be expanded or supplemented as indoor space is available via arrangements with the school district and/or the construction of a larger recreation center that can accommodate fitness, athletics and classes.

Before determining which programs and services to contract or have provided by others, an assessment of the specific pros and cons of such a move needs to be completed. A major aspect of this analysis should be to determine the financial impacts and

quality of the services that will be provided. Key questions to be asked include:

- Is this program offer consistent with community wants and needs?
- Do we have the facility capacity to provide the program? If not, can we partner with someone who has the space?
- Will this be the most cost-effective method to obtain the program, service or function?
- Does the Department have the knowledge, equipment, staffing resources and systems to provide the program, service or function?
- Are there other more qualified organizations that should provide the program, service or function? Will the quality of the program, service or function suffer if it is contracted to other organizations?
- Is the program, service or function only available from a contract provider?
- Are the safety and liability risks too high to provide the program or service in house/
- How will we effectively and efficiently market this program?

Communications & Marketing

As staffing and resources allow, the City should take a stronger role in coordinating and delivering recreation programs and services in the community to ensure that there is a broad base of inclusive programming options available. This will require strong communications with other providers to determine roles, tracking of programs offered and number of participants, plus actively promoting the availability of services. Strong marketing efforts will be needed to inform and promote the recreation programs that are available and should focus on the following areas:

- Website enhancement to better promote programs and services
- The development of an updated program catalog, circulated multiple times a year
- Promotion of program registration options
- Programs and services offered by other providers
- Using appropriate communication channels to effectively market to various demographic segments.
- Cross marketing and/or promotional opportunities with other organizations such as the Camas School District, Camas Library, Meals on Wheels, Camas-Washougal Rotary and others.

There must be a strong recognition of the different demographic markets that have to be served. The youth, senior and family populations in the area should be specifically addressed, as should the different ethnic groups. Cross marketing programs with the school district and using social media to highlight programs by target audience also should be employed.

CHAPTER 8

Operations & MAINTENANCE

> ***Near-term – increase field capacity by improving field quality.***
> **- Stakeholder Focus Group participant**

The City of Camas aims to provide a quality park, recreation, natural open space, and trail system that is efficient to administer and cost-effective to maintain. The previous 2014 PROS Plan outlined a set of objectives for operations and maintenance to help achieve this goal. These included staff training, updated equipment, the exploration of additional resources through alternative staffing, a volunteer coordinator position and the investment in preventative maintenance and upgrades to park facilities to maximize long-term benefits. Camas has since purchased larger mowing equipment, added two FTE positions in the fiscal 2019/20 period and added a playground inspection program with funding for playground equipment repair. This park management effort is ongoing as resources are available but further progress

is needed. Park Operations staff have demonstrated their dedication to keeping parks functioning while the parkland system, city population, and park use has been expanding rapidly.

This chapter will provide data and assessments to help identify existing resource gaps and explore opportunities that may improve the capacity of park operations and maintenance.

Background

The City of Camas has doubled its population since 2000 and has been very successful at implementing its plans for acquiring and preserving open space in the face of development pressures. The City has worked diligently to create its open space network with a connecting system of trails around Lacamas Lake and linked to regional trails. In the last decade alone the City has added over 316 acres of open space and over 146 acres for future parks. The ten years of successful acquisitions increased the 2010 park system size by over 75%.

Figure 24. Camas Parklands Acquisitions since 2010

	Acquisition Acreage		
Year	Park	Open Space	Total
2011	7.02	4.92	**11.93**
2012		48.92	**48.92**
2013		23.59	**23.59**
2014		5.82	**5.82**
2015	25.12		**25.12**
2016			**0**
2017			**0**
2018		75.57	**75.57**
2019		37.99	**37.99**
2020	58.55	119.66	**178.22**
2021	55.65		**55.65**
Subtotals	**146.34**	**316.47**	
	Total Acquisitions since 2010		**462.81**

While the park system in Camas increased by over 462 acres, the park maintenance staffing remained at the same equivalent employee level. There is some degree of maintenance outsourcing that accomplishes tree pruning or removal and invasive weed control.

Figure 25. Camas Park Maintenance Staffing Levels from 2010-2020

Metrics	2010 Actual	2020 Budget	2020 Actual
Parks Maintenance Expenditures	$842,449	$1,284,856	$1,246,099
Parks Maintenance Staffing (FTEs)*	7.3	7.3	*

* No seasonal workers were hired in 2020 due to COVID
2010 FTE's combined full-time and seasonal equivalents

In 2010, park maintenance was conducted by 5.3 full-time employees (FTE) and two FTE equivalents for summer seasonal work. Having added two FTEs in 2019, park maintenance was executed by 7.3 FTEs with two additional seasonal positions. In 2020, no seasonal workers were hired due to COVID restrictions. While the park maintenance budgetary expenditures increased by about 48%, the actual personnel level was similar to 2010. Those budget increases were mainly from normal inflation, additional playground repair/maintenance, and cost of living adjustments. Clearly, the operational resources have not kept up with the increase in the park system.

National Park and Recreation Agency Comparisons

The National Recreation and Park Association (NRPA) 2020 Agency Performance Review provides some park metrics that offer perspectives on the Camas park system. Selected findings from their benchmarking tool illustrate some disparities with park acreage, population size and Park Operations staffing levels.

Figure 26. NRPA Agency Performance Comparisons with Camas' City-owned Park Facilities

Metric	All Agencies	Pop. 20,000-49,999	Camas
Number of Parks	20	-	**18**
Park Acres	437.1	-	**240**
Parks & Open Space Facilities (# sites)	27	-	**70**
Parks, Open Space & Non-Parks Acres	530	-	**1,064**
Residents per Park	2,281	1,963	**1,448**
Park Acres per 1,000 Residents	9.9	9.6	**40.8**
Trail Miles	11	8.5	**18.7**

The City of Camas, with 1,064 acres of parks and natural areas, has more than double the acreage of parks and open space than the median park and recreation agency (at 530 acres). That acreage comparison uses only city-owned parklands excluding the parklands owned by Clark County. The City also manages much more than the median trail mileage as typical agencies across the country. For Camas residents, these additional park facilities help improve the quality of life. However, the existing park operations staffing level does not provide enough resources to oversee, monitor or steward this extent of open space and natural parkland. A review of additional NRPA metrics provides further comparison with other agencies and jurisdictions of similar size. The number of park FTE positions relative to the population size for most park and recreation providers is 8.9 FTEs per 1,000. The Camas park and recreation system has 0.4 FTEs per 1,000 population; the number of FTEs is considerably lower. The operating expenditures per capita is much lower than comparable cities.

Figure 27. NRPA Agency Performance Metrics Comparisons – Park & Recreation Staffing

Metric	All Agencies	Pop. 20,000-49,999	Camas 2020
Park & Rec FTEs*	41.9	27.3	**11.1**
P&R FTEs per 1,000 Residents	8.1	8.9	**0.4**
Annual Operating Expenditures	$4,342,495	$2,885,847	**$1,771,272**
Operating Expenditures per Capita	$81.19	$95.34	**$67.96**
Operating Expenditures per Park Acre	$7,160	$8,522	**$1,665**

**No seasonal FTEs for Camas in 2020 due to COVID*

The comparison with NRPA metrics predicts the need for additional staffing resources to effectively manage the extensive system of parklands owned by the City. As the City continues to work to fill in the gaps in its open space network and to further develop its comprehensive trail system, park operations will need to be expanded to meet the need for more active stewardship and care.

Additional agency performance review findings are located in the 2020 NRPA Agency Performance Review summary in Appendix E.

Washington Cities Park and Recreation Provider Comparisons

Park and recreation operations can be highly variable, particularly at different population sizes and residential densities. A more refined comparison of park metrics was prepared using several cities in western Washington with population sizes within range of the population size of Camas. This comparison used budgetary and staffing numbers from 2018 to avoid the highly variable impacts from the COVID-19 shutdown and ensuing restrictions.

Figure 28.. Comparable Washington Cities' Park & Recreation Performance Measures

		City Park Providers				Park District Providers	
Performance Measure	**City of Camas**	**Port Angeles**	**Maple Valley**	**Mercer Island**	**Mountlake Terrace**	**Si View**	**PenMet**
Population	**26,065**	19,960	28,013	25,748	21,286	25,410	37,485
P&R total spending (2018)	**$1,020,000**	$3,462,300	$2,525,940	$5,209,047	$3,623,851	$7,645,050	$14,567,517
Spending per resident (2018)	**$39.13**	$173.46	$90.17	$202.31	$170.25	$300.87	$388.62
Operating Budget (2018)	**$2,050,000**	$3,356,600	$2,525,940	$5,864,507	$3,623,851	$5,042,038	$6,297,517
Operating per Resident	**$78.65**	$168.17	$90.17	$227.77	$170.25	$198.43	$168.00
Annual Capital Spending (2018)	**-**	$1,024,000	$8,100,000	$3,154,753	-	$1,460,952	$8,270,000
Capital Spending per Resident	**N/A**	$51.30	$289.15	$122.52	-	$57.50	$220.62
Park & Rec FTE (2018)	**5.25**	25.6	11.75	29.75	44	14.5	22.3
Seasonal FTE positions	**3.75**	7.6	(combined)	(combined)	(combined)	-	(combined)
P&R FTEs per 10,000 Residents	**3.45**	16.6	4.2	2.6	2.1	5.8	4.6
Total Developed Parks (acres)	**240**	270	320	259.9	269	46	266.1
Park acres per 1,000 Residents	**9.2**	13.5	6.9	10.1	12.6	1.8	7.1
Total Parks & Natural Areas (ac.)	**1064**	270	370.8	479	269.0	890	570.9
Parkland acres per 1,000 Residents	**40.8**	13.5	13.2	18.6	12.6	35.0	15.2
Parkland acres per P&R FTE	**118.2**	8.1	31.6	16.1	6.1	61.4	25.6
Population Density (people/sq. mi.)	**1,853**	1,865	4,669	4,036	5,243	941	742
Park Facilities	**18**	23	9	52	15	65	19
Trails (miles)	**18.7**	8.5	3	24.9	-	-	1.6

Note: 2018 budget numbers were used for the provider comparison to avoid the highly variable budget impacts from COVID.

In reviewing the comparisons, a few observations about the Camas system stand out.

- Overall spending per resident for park and recreation services was considerably lower for Camas ($39.13 per resident). The average across the other comparable cities was $220.95 per resident.
- Also, Camas parks and recreation budget allocated the equivalent of $78.75 per resident compared with an average $170.46 per resident for the other cities.
- Overall, Camas had more total park and open space acres per 1,000 population (40.8 per 1,000) than the comparable agencies. However, when comparing staffing for that larger parkland system, Camas measured at 118.2 parkland acres per FTE significantly higher than the averaged 24.8 parkland acres per FTE of other comparable cities.

This comparison indicates some off-balance traits for Park Operations charged with stewardship of the entire Camas park system.

Open Space Management

The City provides conserved public lands and undeveloped parklands temporarily held as greenspace totaling over 830 acres. Recent additions of Green Mountain and properties in the north Lacamas Lake area have helped create a significant network of contiguous natural areas with high ecosystem value. Park Operations currently manage to accomplish field mowing in open space lands such as Goot power lines, Ostensen Canyon, etc. and have performed annual invasive species spraying in areas identified by the County Weed Management Board in the spring.

However, the capacity of the Park Operations staffing has not kept up with the more extensive need for open space management that may involve proactive hazard tree removal, vegetation monitoring, invasive plant control and addressing any ecological restoration needs. The open space network has grown by over 50% in terms of City-owned acreage since 2000.

With the growth of its open space network, the City has responsibilities for extensive conserved landscapes and has conducted several studies to guide the stewardship and management of these lands.

To highlight the intended need for open space management, past planning efforts have been summarized below.

The 2003 City of Camas Policy Guidelines for an Open Space Management Plan established the overall policies to guide the management of both public and private property within the Open Space Network. The Open Space Network was identified and mapped as part of the 2000 Parks & Open Space Comprehensive Plan. The Policy Guidelines document was intended to set the direction of open space planning and to provide staff with the foundation for effective resource management decisions. The Management Goals for open space policy included nine directives that coordinated best management practices in natural areas and funding for an open space management program by the City. The Parks and Recreation Department was designated with the responsibility for administration, management and maintenance of the open space network. Trails are considered to be an integral part of the open space network. The Parks and Recreation Department is designated with the responsibility for trail safety and security, inspection and monitoring, and maintenance.

The 2014 PROS Plan included Design and Development Guidelines for the City's Natural Open Space Areas that recognized natural areas should be protected for their environmental value with only limited improvements for passive recreation where appropriate. The guidelines encouraged public use of the natural open space through trails, viewpoints and other features while ensuring protection of ecologically sensitive areas. A minimum of park features were cited for improving natural open space including trails and site furnishing such as benches, picnic tables, bike racks, trash receptacles, and signs. The guidelines suggest additional park features for consideration such as parking, restrooms, picnic shelters, gathering spaces (for education), interpretive exhibits, trailhead or entry kiosks, and restoration areas.

The Legacy Lands Master Plan – 2020 Draft Design Report, was the culmination of a consensus-building process for guiding the future development of the north shore of Lacamas Lake. The City had secured significant lands intended for shoreline protection, conservation and recreation. The Legacy Lands Master Plan built on the concepts that were put forth in the 2016 North Shore Lacamas Lake Vision Plan whose guiding principles included recreational trails with connections to the regional trail network, active recreational facilities, native habitats, and preserving key visual landmarks along the shore. Acknowledging future population growth and development pressures, the City is undergoing the North Shore Subarea Plan that encompasses 800 acres north of Lacamas Lake, and will incorporate the concepts developed in the draft Legacy Lands Master Plan.

None of the above planning efforts addressed the predictable need for more maintenance staffing or the necessary increased funding for management and maintenance.

Trail Maintenance

Camas' trail network provides tremendous value to its residents and visitors with walking and biking infrastructure for healthy outdoor recreation and connections to destinations across the city. With limited Park Operations staffing, trail maintenance, upkeep and capital repairs will fall behind or be deferred on a recreational asset that receives continual, daily use. Park Operations are currently able to manage brush clearing on significant trail on the Washougal River Greenway and Heritage Trails. Trail resurfacing is scheduled when pathway tread conditions deteriorate. Other maintenance activities tend to be triggered by public comments or complaints.

The planned expansion of Camas' trail network along the north shore of Lacamas Lake, Mill Ditch and connecting to Green Mountain will add miles of public shared-use trails. To ensure safe and beautiful trails, park operations estimates one FTE to maintain trails, at .04 FTE per trail mile. The current level of service for trail maintenance is estimated at .02 FTEs/mile. As miles of trail are added, additional FTE resources should be increased concurrently.

To help convey the importance of trail upkeep, parks operations may want to consider adding one or two trail counters along the busier trail sections. Measuring the trail use can help communicate how many people are affected daily by the trail conditions. A record of trail use can also help when providing quantifiable data for grant support or submittals.

Sport Field Maintenance

Camas has sport fields in ten of its park facilities. Some of its sport fields receive extensive maintenance and care through partnering sports organizations (such as Little League) while other fields may only receive mowing, annual weed control and litter control. In parks where local sports organizations are not providing added level of care, Camas should address deficiencies to ensure that access and equity for sports facilities is maintained across the city. Additional maintenance on these sport fields calls for turf maintenance, including over seeding, fertilization, and top dressing; athletic field fence maintenance, including backstops and fence perimeters; and goal post maintenance.

Park Facilities Maintenance

Park maintenance staffing has been stretched to care for the City's aging park facilities, while the system continues to expand to meet the increased park use. Additional attention needs to be given to bolster existing general park maintenance tasks: playgrounds inspections, maintenance and repairs, and noxious and invasive weed control. Updating the older park amenities can help lighten the load on needed repairs and ongoing maintenance tasks, but as newly developed parks are added to the system, additional operational and maintenance resources will be necessary to ensure those park assets are managed for safe and enjoyable public use and longevity. Park Operations has not been able to proactively perform tree assessments within parks to ensure proper care of its tree canopy resource or to mitigate for potential tree hazards. Additionally, Park Operations is tasked with managing and maintaining the Camas Cemetery.

Asset Management

The NRPA has developed a quality risk assessment tool called "Park Check" to provide an analysis of an agency's risk profile. The online tool uses a series of questions to explore the likelihood of problems due to lack of resources available over time. The Park Check risk assessment tool rates your responses to these questions to determine if your agency's ability to deliver quality park and recreation amenities and services to all members of your community in the future is at "low," "moderate" or "high" risk. The online tool generates a customized report that could help department's further articulate their needs for dedicated and reliable funding and local support.

More specifically, the conditions assessment conducted in this PROS planning process reveals a number of areas where more attention in needed to physical amenities with park facilities. Whether the need to repair site furnishings, reduce ADA barriers, or correct deficiencies is identified, the conditions assessment should be used to help improve public safety in the parks and reduce public risk.

As an example, playgrounds across the city are in different stages of their life cycles. Some play equipment has aged beyond its life expectancy and may not meet current safety standards.

While the city has started regular scheduled safety inspections, additional funding needs to be evaluated to ensure timely repair or replacement of play equipment. In addition, the inspection report could include assessment of the likelihood and consequence, in terms of financial, community and environmental impact, of the future failure of its assets, such as shelters and other structures. Such an assessment can provide key information for the strategic prioritization of limited resources toward those assets whose failure would have the greatest negative impact on the Camas community.

As an element of Park Operations, the management of physical assets requires proactive planning for capture cost efficiencies. Tracking repairs, maintenance tasks, routine operations and seasonal work can help predict the needs for future labor resources as the system grows. The 2014 PROS Plan recommended developing a detailed list of the assets at each park facility site and evaluating asset conditions annually. Such a tracking schedule would create a framework for long-term management of the Camas park system. Detailed inventories with conditions tracking will inform replacement needs, monitor safe use, and assist in assigning maintenance frequency.

Most built park amenities have limited lifespans. Buildings, play equipment, pavement, etc. can be tracked from installation dates. As repairs are needed, those assets can have predictable replacement dates that are added to the capital facilities program. Life-cycle planning can help avoid extra time spent repairing outdated amenities and foster more cost effective labor resource use.

Following on a program of asset management tracking and life-cycle planning, a regular capital repair program should proactively address minor repairs and help extend the life of some amenities. The delay of small repairs can lead to more frequent maintenance that could be avoided. When existing staffing is stretched to its limit, park agencies must rely more heavily on outside contractors for implementing even the small capital repair projects. Without adequate staffing, a backlog of needed maintenance and repairs usually exists. With a sufficient skilled labor force, the City can capitalize on using existing staff resources to complete the smaller capital repair projects during off-season capacity.

Americans with Disabilities Act Compliance

The Americans with Disabilities Act of 1990 (ADA) prohibits discrimination on the basis of disability. Titles II and III of the ADA require, among other things, that newly constructed and altered state and local government facilities, places of public accommodation, and commercial facilities be readily accessible to, and usable by, individuals with disabilities. Recreation facilities, such as play areas, are among the types of facilities covered by Titles II and III of the ADA.

The U.S. Department of Justice 2010 ADA Standards for Accessible Design provide guidelines that are intended to address design conditions to ensure that barriers or obstacles blocking outdoor recreation facilities are prevented or removed, such that all park patrons have reasonable access to site amenities. As older facilities are in the process of renovations and replacements and new facilities are added to the system, Camas will need to ensure compliance with ADA accessibility requirements.

Invasive Species Management

The control of invasive species is a critical element in the stewardship of open space lands to ensure their continued conservation values and ecosystem services. An active invasive species control program is also necessary to ensure that the City is meeting the requirements of RCW 7.10 Noxious Weed regulations. This may involve direct control measures for known and identified noxious weed problems, pre-construction prevention of noxious weed spreading, and evaluating new parkland or conservation land noxious weed coverage. Clark County's Vegetation Management Division currently handles some of the invasive weed control for the Camas park system but more work needs to be accomplished to effectively meet the regulations. Camas should consider hiring and training its own staff to perform an invasive weed control program for all its park and open space lands.

In-House vs. Outside Contractors

Park and recreation agencies throughout the country should continually weigh the costs of service provision through internal staffing versus external contracts. Full-time staffing weighed against seasonal resources should explore the off-season workload, training time for new part-time seasonal employees, the availability of seasonal labor, and the specialized skill sets for some types of operations. One-time projects and specialized repairs and renovations may require outside contractors while some park agencies have enough trained in-house staff to accomplish smaller capital projects.

Staffing Needs

The assessments and comparisons of park operations staffing have indicated the need for a stronger labor force for maintaining Camas' parks and open space/natural lands. The 2014 PROS Plan recommended adding specialized trail position, an urban forester or arborist, and a natural resource specialist to the operations team to build the level of expertise needed to effectively manage the existing natural resources owned by the City. Since the 2014 PROS Plan, several additional open space properties have been acquired, increasing the natural lands owned by the City from 440 to 691 acres.

For the Clark County park system that includes extensive natural areas, regional parks, community and neighborhood parks, many years of tracking maintenance tasks and labor expenditures produced some five-year averages for the amount of labor required to adequately care for its park system.

Figure 29. Performance Metrics for Clark County Parks Maintenance

Predictive Labor Staffing Needs	Total Park Acres	Labor Hours/Acre	Total Labor Hours	FTE # (1,820/yr)
Neighborhood Parks	75.9	152	11,536.8	6.3
Community Parks	67.7	111	7,514.7	4.1
Regional Parks	151.4	98	14,837.2	8.2
Open Space/Natural Areas	691.5	21	14,521.5	8.0

Using those metrics can help predict the potential park maintenance staffing needs for the Camas park system as it ramps up its stewardship of natural areas and adds new developed parks.

Figure 30. Predictive Staffing Levels for Camas Park System

Annual Labor Expenditures per Acre	5-yr Average
Greenspace Labor Hours per Acre	21
Neighborhood Parks Labor Hours per Acre	152
Community Parks Labor Hours per Acre	111
Regional Parks Labor Hours per Acre	98

The table in Figure 30 (above) uses acreage that includes both developed and undeveloped parkland acreage. If only the currently developed park acreage was calculated in this staffing prediction and included special facilities sites, the 240 acres of developed facilities (not including trails or open space) would suggest the need for 15 full-time equivalent employees, double the size of the current staff level. Staffing resources are needed to implement the updating and renovations for older parks, to provide maintenance for expanded trail connections and to steward its hard-earned open space lands. Camas should be prepared to support its park system with adequate operations and maintenance staffing to ensure protecting and preserving the value of its outdoor assets now and in the future.

CHAPTER 9

Goals & OBJECTIVES

Add interpretive cultural and historical information to the parks or trails to honor local heritage. Highlight tribal history. This information can draw people into a park, and it helps teach kids. Provide signage in a blind/deaf-friendly way.

- Stakeholder Focus Group participant

The goals and objectives described in this chapter define the recreation and park services that Camas aims to provide. These goals and objectives were derived from input received throughout the planning process, from City staff, the Parks and Recreation Commission, City Council and community members.

The Growth Management Act (GMA) adopted by the Washington State Legislature in 1990 provided a foundation for land use planning in selected cities and counties throughout the state, including Clark County and the City of Camas. The GMA's purpose is to help communities manage efficiently with the challenges of growth to ensure their long-term sustainability and high quality of life. It identifies 14 planning goals to guide the development of comprehensive plans and development regulations (codified in Chapter 36.70A of the Revised Code of Washington). Four of these goals directly affect the development and implementation of this plan.

- "Encourage the retention of open space and development of recreational opportunities, conserve fish and wildlife habitat, increase access to natural resource lands and water, and develop parks." RCW 36.70A.020(9)
- "Protect the environment and enhance the state's high quality of life, including air and water quality, and the availability of water." RCW 36.70A.020(10)
- "Identify and encourage the preservation of lands, sites, and structures, that have historical or archaeological significance." RCW 36.70A.020(13)
- "Carry-out the goals of the Shoreline Management Act

with regards to shorelines and critical areas." RCW 36.70A.020(14)

Furthermore, the Camas Comprehensive Plan, the previous park system plan and county-wide planning policies provide a framework for this PROS Plan.

The following goals matrix is structured by functional areas and thematic goals, as follows:

Functional Areas

- Administrative
- Projects & Programs
- Policy

Goal Themes

- Welcoming For All
- Stewardship of Land, Parks & Programs
- Plan for & Fill Known System Gaps
- Organizational Excellence

Goals are stated within each thematic area and associated to the functional areas. Under each goal, action item(s) will be listed.

A goal is a general statement that describes the overarching direction for the park and recreation system. Action items are more specific and describe an outcome or a means to achieve the stated goals. Near-term recommendations are specific and measurable actions or projects intended to implement and achieve the goals, and will be contained within the Needs Assessment and Capital Planning chapters of the PROS Plan.

Page Left Intentionally Blank

WELCOMING FOR ALL

STEWARDSHIP OF LAND, PARKS & PROGRAMS

PLAN FOR & FILL KNOWN SYSTEM GAPS

ORGANIZATIONAL EXCELLENCE

PROJECTS & PROGRAMS

Actively communicate and improve outreach and marketing to increase participation.

- Promote and increase participation in youth and senior scholarships.
- Keep park and trail facilities map updated.
- Pursue opportunities for alternative outreach and education to diverse groups, such as piloting youth parks stewardship programs and active communication through faith groups and non-profit organizations that work with people of color and underserved communities.
- Pursue partnership opportunities with health care organizations to promote active recreation and wellness activities and events.

Opportunities for dogs to recreate with their human family.

- Partner with non-profits for more pet and animal and animal friendly events.
- Explore a partnership with DOGPAW to develop and manage off leash areas.

Increase capacity for sports field users.

- Explore opportunities through joint use agreements with school districts to use existing fields or interim use of other lands.
- Enable an effective scheduling system.
- Implement creative design options, such as multi-use fields, upgrade field turf surfacing, and/or install lights.

Improve Asset Management.

- Improve the asset management system; to include parks facilities and amenities assets along with tree and plant assets.
- Update levels of service standards and develop a per acre maintenance budget.
- Develop an urban forestry program that articulates long-term strategy for tree protection, urban forestry management and education.
- Develop and implement improved natural area management practices to enhance ecological health and remove invasive plant species.
- Continue to build on playground equipment inspection program, prioritizing removal and replacement of unsafe/hazardous equipment and plan for a cycle of replacement based on equipment age and anticipated useful life.

Enhance parks and trails amenities.

- Refresh existing legacy parks with new features to reflect current community desires, such as Crown Park.
- Prioritize permanent bathrooms at neighborhood parks and trailheads.
- Increase portable restrooms when permanent bathrooms are unavailable during the summer.
- Provide additional picnic shelters, tables and benches.
- Maximize the multiple-use aspects of critical areas, stormwater detention ponds, etc. with addition of public trails or viewing access and education of ecological value of the area.

Design new parks, trails and amenities with environment, safety and accessibility in mind.

- Design and maintain parks and facilities to offer universal accessibility for residents of all physical abilities, skill levels and age; at a minimal in compliance with the Americans with Disabilities Act (ADA) Standards for Accessible Design.
- Identify and grow trail segments and trailhead amenities that can accommodates residents of all physical abilities.
- Standardize and install a more complete wayfinding and signage system.
- Incorporate sustainable development and low impact design practices into the design, planning and rehabilitation of new and existing parks, trails and facilities.

Enhance outdoor recreation opportunities.

- Identify and prioritize the acquisition of parklands based on factors such as contribution to level of service, connectivity, preservation and scenic or recreational opportunities for residents.
- Develop park master plans that reflect local needs, community input, recreation and conservation goals; with consideration for financial resources and availability of similar amenities/facilities within the city and region.
- Prioritize implementation of existing master plans with consideration for service gap delivery and available financial resources.
- Add new unique park amenities to the system such as nature play area, a splash pad, a bike skills pump track, and all-inclusive playgrounds.

Partner with Developers to fill parks and trails gaps.

- Actively pursue trail connections via rights-of-way or easements.
- Continue and maintain Parks & Recreation review and comment on private development proposals that includes park and trail siting and design.
- Partner with developer to create robust public engagement process for park and trail design projects within the development project site intended to be transferred to the city.

Continued...

Continue building strong partnerships.

- Collaborate with local arts organizations, business, education institutions, other non-profits and jurisdictions to deliver on recreational programs and community events.
- Partner with user groups of specialized facilities, such as sport fields, off-leash areas, disc golf, skatepark, bike skills/pump track, etc. to continually improve programing and maintenance.

PLAN FOR & FILL KNOWN SYSTEM GAPS

Continued...

Partner with neighboring jurisdictions to fill regional trail network gaps.

- Work with Clark County, City of Washougal, City of Vancouver and Port of Camas-Washougal to align trail connectivity priorities.
- Coordinate and connect the City's pedestrian and bicycle system with the Clark County regional system of on-street and off-street trails.

Promote water access and safety.

- Collaborate with other agencies regionally in developing and operating parks and/or programs that access our bodies of water.
- Promote water safety through educational and marketing program in partnership with County and School Districts.
- Evaluate the north shores city-owned Legacy Lands properties to expand trails and water access points around Lacamas Lake.

Page Left Intentionally Blank

WELCOMING FOR ALL

STEWARDSHIP OF LAND, PARKS & PROGRAMS

PLAN FOR & FILL KNOWN SYSTEM GAPS

ORGANIZATIONAL EXCELLENCE

ADMINISTRATIVE

Regularly review and renew recreational classes for all ages, interest and abilities.

- Provide annual recreational program summary to Parks & Recreation Commission for review and input.
- Pilot new classes each year that reflects current market trends and community desires.
- Provide Summer free pop-up classes to promote recreational programs.

Continue to host events and provide community spaces that bring people together.

- Continue to partner to implement legacy events.
- Have intentional engagement with diverse community groups to create and partner on new diverse events.
- Expand locally sourced food options at parks and events.

Maintain Parks and Facilities.

- Standardize park furnishings and amenities (trash cans, tables, benches, fencing, etc.) to reduce inventory and replacement costs and improve appearance.
- Continue growing volunteer parks enhancement and beautification program.

Continue to preserve, protect and restore natural area corridors, include shorelines.

- Strengthen partnerships with public agencies, tribes, and private partners to facilitate greenway corridor connectivity.
- Continue to support and actively participate in shoreline and/or bodies of water conservation and restoration projects lead by other city departments, agencies and/or non-profits.
- Pilot environmental education program.
- Add educational interpretive signage to natural areas, shorelines and trails.

Evaluate user satisfaction and use.

- Implement periodic surveys to gauge user satisfaction, program initiatives and statistical use of parks, facilities and programs, including trail counts.

Promote and support Parks & Recreation Commission.

- Promote P&R Commission meetings as forum to discuss parks and recreation topics.
- Provide more training and resources to build parks and recreation knowledge base within Commission members.

Encourage staff innovation and creativity.

- Provide professional development opportunities through training and affiliation with NRPA and WRPA, among others.
- Provide opportunities to explore and implement pilot programs.

POLICY

Enhance our parks and recreation system to make it more welcoming and accessible.

- Develop Diversity/Equity/Inclusion policy that removes accessibility barriers (socio-economic, language, physical, geographic, transportation) to programs, parks and trails, and in alignment with City vision and policies.

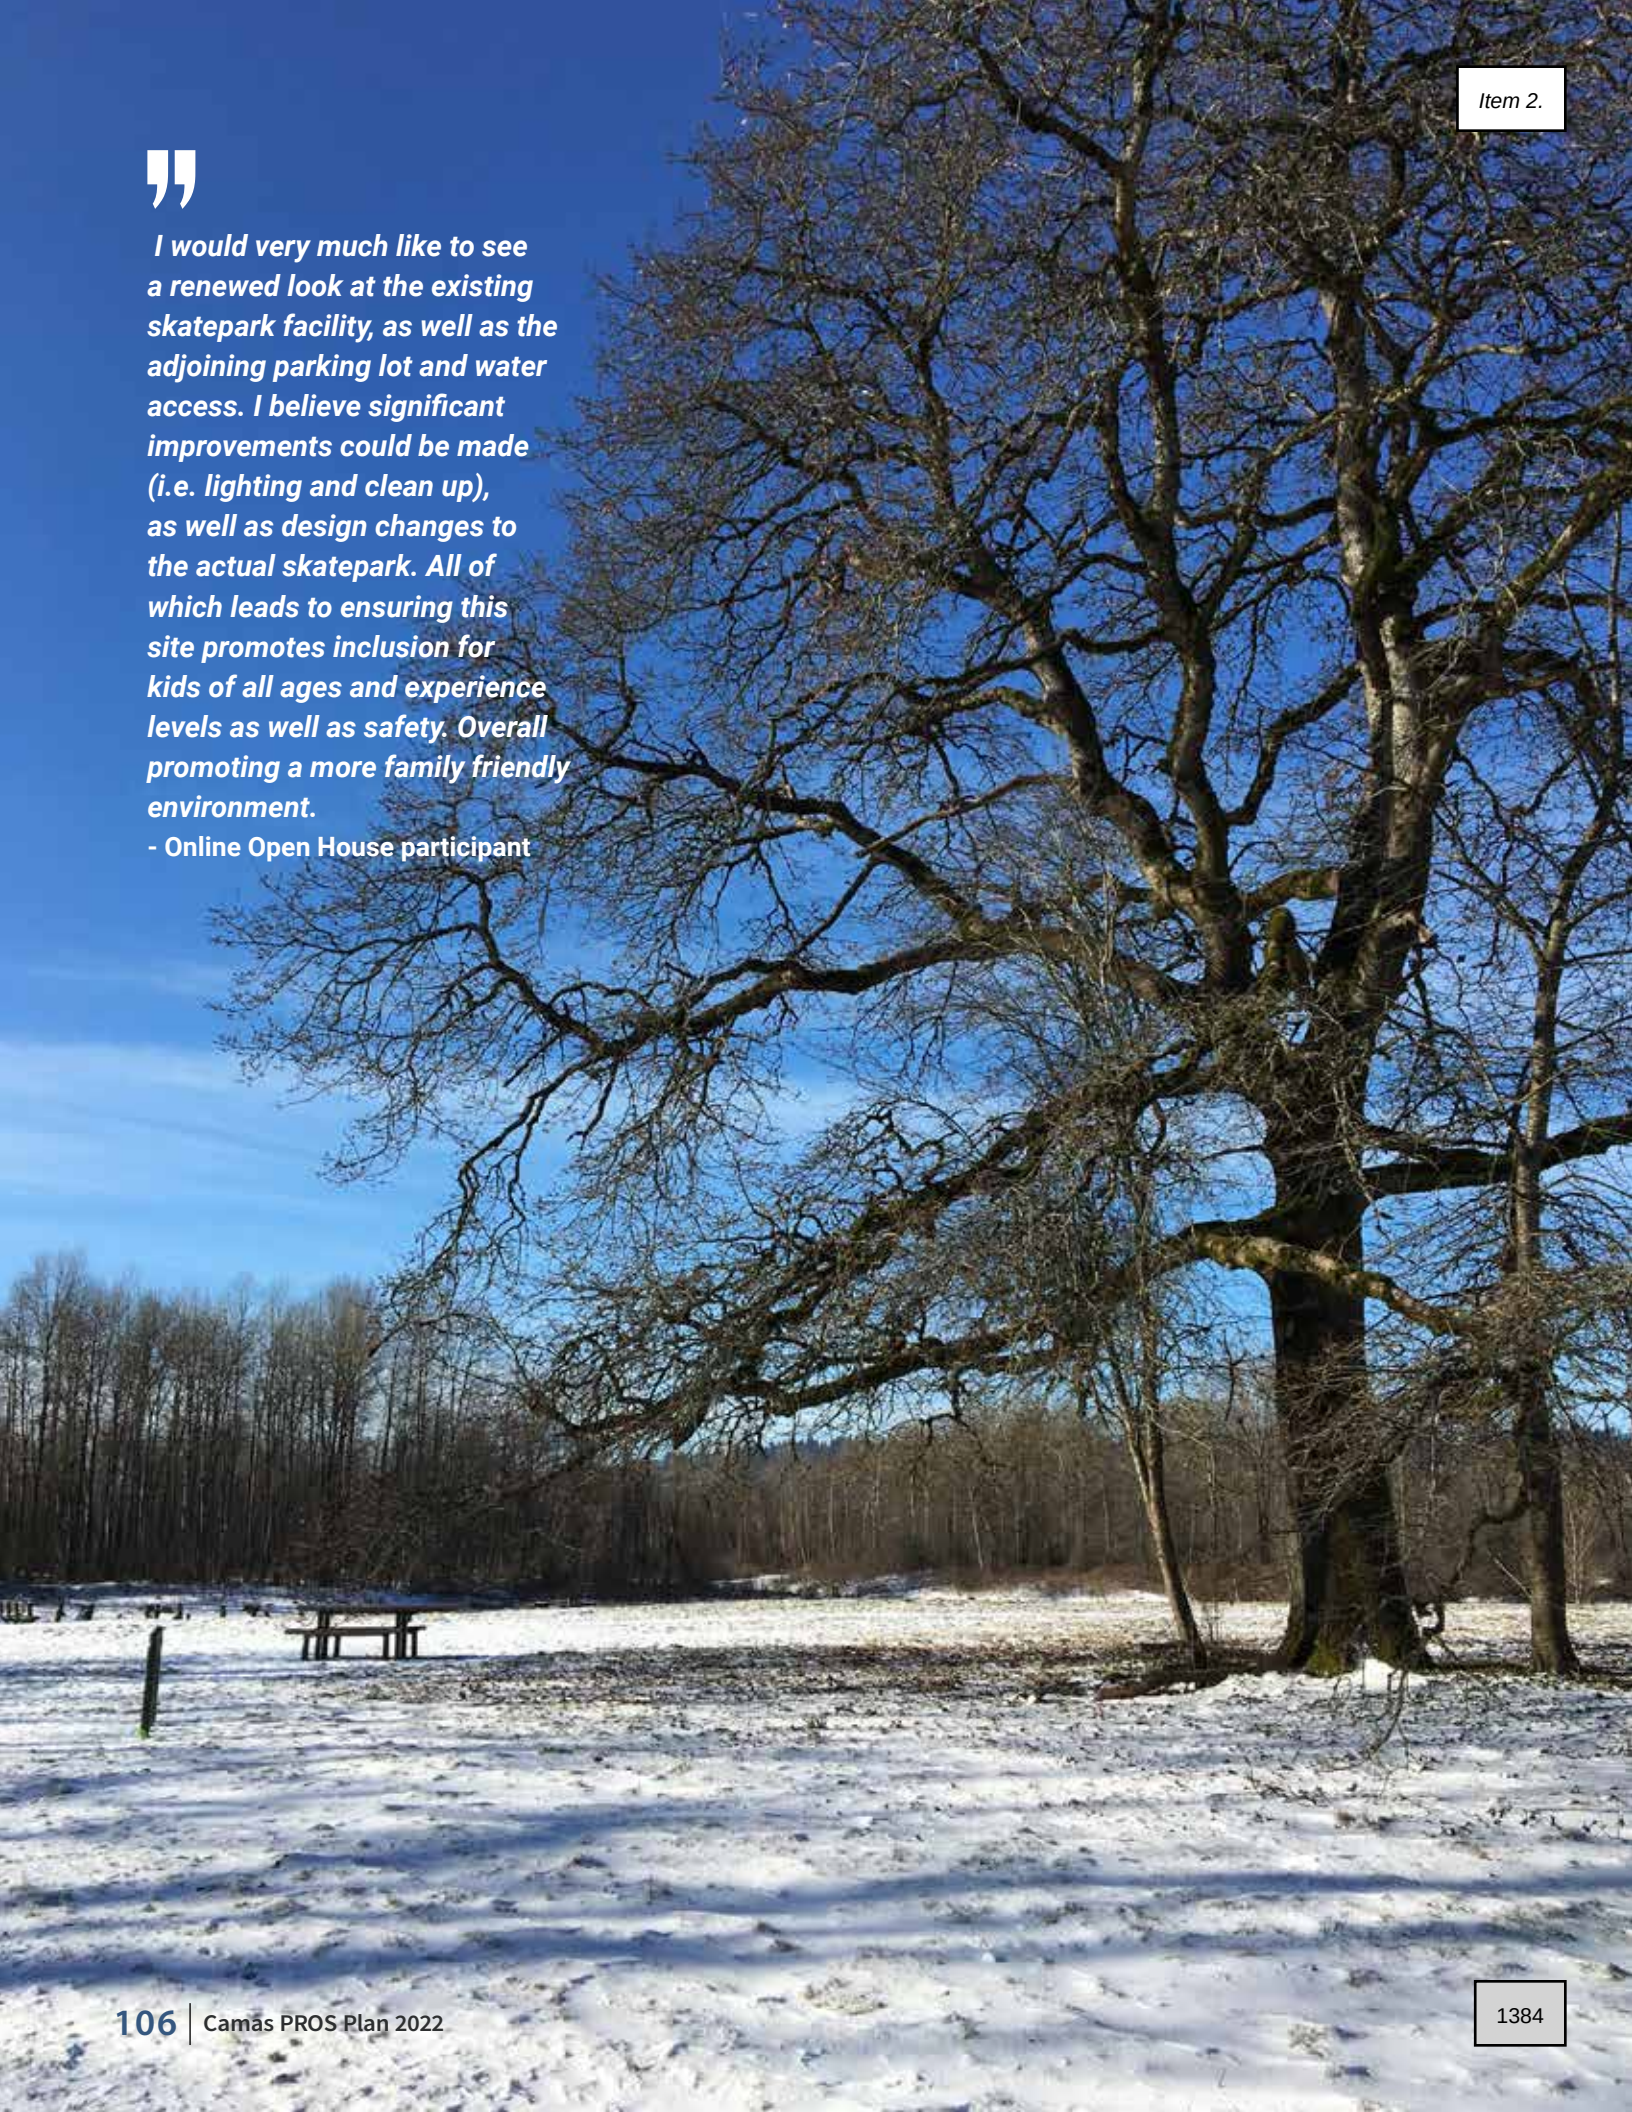
Better understand funding gaps and funding alternatives.

- Develop and implement a cost recovery policy that provides for an equitable fee structure for park facilities and recreation programs, with high-community benefit programs and event funded appropriately to ensure accessibility for all residents.
- Periodically revise the park impact fee methodology and rates to accurately reflect changes in level of service standards and/or the costs of expanding the park infrastructure to accommodate population growth.
- Review and update the adopted six-year Parks Capital Facilities Plan (CFP) every two years to remain current with local recreational interests and account for the capital needs of the parks and recreation system.
- Pursue alternative funding options and dedicated revenues, including engaging and exploring with the City of Washougal a feasibility study to assess the potential of establishing a regional financing tool for recreation service.

Provide equitable access to parks and open space system.

- Prioritize park and trail development in areas where service gaps exist (e.g., where households are more than ½-mile from a developed park, open space or trail) and in areas of the City facing population growth and residential and commercial development.
- Evaluate and update design and development standards for parks and recreation amenities within private development to promote and achieve equitable levels of service and provide amenities that are complementary to the city park.

Expand recreational services.



- Re-examine the opportunity for new recreational center with aquatics facility, taking into consideration financial feasibility and partnership opportunities.

Coordinate collaborative discussions on policy matters.

- Bring together Parks and Recreation Commission, City Council, and other standing City boards, such as the Planning Commission, to discuss policy matters pertaining to recreational resources, opportunities and funding.

Page Left Intentionally Blank

Page Left Intentionally Blank

> ***I would very much like to see a renewed look at the existing skatepark facility, as well as the adjoining parking lot and water access. I believe significant improvements could be made (i.e. lighting and clean up), as well as design changes to the actual skatepark. All of which leads to ensuring this site promotes inclusion for kids of all ages and experience levels as well as safety. Overall promoting a more family friendly environment.***

CHAPTER 10

Capital Planning & **Implementation**

KEY PROJECT RECOMMENDATIONS

The following is a summary of key project recommendations which will require commitment from the City and its residents for the continued support of a healthy park and recreation system that preserves and enhances the safety, livability, and character of the community.

Trail Connections

Trail connections, including sidewalk and bike lane improvements, are needed to help link destinations across the community. Acquire easements, corridors and parcels to create the comprehensive linkages for Camas' future trail system. Develop larger trails desired by the community, such as North Shores of Lacamas, Mill Ditch, Lewis & Clark. Coordinate with the Transportation System Plan (and subsequent updates), as well as coordinate with local subdivision and site development projects.

Park Design & Planning

Prepare an updated site master plan for Ash Creek Park and a new site plan for the flat, upper shelf of Ostensen Canyon Park. As development and maintenance funding allow, prepare site plans for Lacamas Heights, Green Mountain and Benton Park.

Sport Field Improvements

Conduct a city-wide assessment of sport fields to plan for drainage improvements and other field improvements, including turfing existing fields, installing lights to expand play seasons, and the development of additional fields to accommodate demand.

Splash Pads / Spray Parks

Install at least one spray park to serve residents as an option for summertime water play in a park that provides parking and restrooms.

Bike Skills & Mountain Bike Trails

Plan for a pump track and connecting flow track in a visible location that can accommodate parking and can enable a synergy with other park uses. Pursue options for mountain bike trails during the planning for the new Green Mountain property.

Skate Park Upgrade

Upgrade and enhance the existing concrete skatepark to improve the design and flow, as well as improve adjoining recreational amenities such as access to the Washougal River.

All-Inclusive Playgrounds

Develop fully-accessible, all-inclusive play areas as new parks are built or playground upgrades occur to provide for users of all abilities.

Off-Leash Dog Area

Coordinate with the City of Washougal on off-leash dog park planning for the potential of a joint use facility for Camas residents to use.

Sport Courts

Convert existing tennis courts to multi-sport courts through striping and examine the need for additional multi-sport courts in the future.

Community Gardens

Partner with local community groups for the installation of community gardens in community or neighborhood parks or in stand-alone locations with parking and access to water.

Acquisitions to Fill Park System Gaps

Acquire strategically located sites for future parks to ensure reasonable access to walkable parks. Coordinate with local residential developers to include public parks in new subdivisions and utilize tools, such as park impact fee credits, to facilitate the process.

Universal Accessibility

Complete a system-wide ADA assessment and make improvements to existing parks as needed to offer universal accessibility of park features and grounds.

Water Access

Improve shoreline and water access for motorized and non-motorized launches, including user conveniences such as restroom facilities and parking.

Recreation Programming

Continue to foster agreements or partnerships with programming partners and contract vendors for providing recreation services. Coordinate and partner with the City of Washougal on programming options. Explore new pilot programs, and partner where possible, to broaden the portfolio of offerings to youth. Explore options for access to additional flexible indoor recreation space to accommodate programs, classes and fitness.

North Shore Subarea Plan

Maintain strong role in planning for future parks and trails along the North Shore.

Open Space Management Plan

Prepare an updated, science-oriented open space management plan to guide City staff in the care, maintenance and stewardship of open space, as well as forecast maintenance needs and staffing resources.

Urban Forestry Management Plan

Prepare an urban forestry management plan to examine the health and coverage of the urban forest, define maintenance and operations strategies, and respond to the challenges of climate change, as well as other environmental and fiscal factors on long-term tree health and forest resiliency.

Wayfinding & Signage

Continue to implement a wayfinding program that includes both visual graphic standards. Colors, sign types, and information can help users navigate the outdoor recreation experiences offered by the City.

Communications

Maintain the website for easy-to-access park system maps, trail maps and an up-to-date listing of park sites and amenities to enhance the experience of the on-the-go user. Continue to promote via social media and highlight events, volunteer opportunities and parks and trails to visit. Utilize QR codes or comparable technology on signage as a means to share with or receive information from visitors about maintenance, restoration or monitoring data. Utilize the network of partners to help disseminate information on parks and recreational programs and events.

Implementation Tools

A number of strategies exist to enhance and expand park and recreation service delivery for the City of Camas; however, clear decisions must be made in an environment of competing interests and limited resources. A strong community will is necessary to bring many of the projects listed in this Plan to life, and the Camas City Council has demonstrated its willingness in the past to support parks and recreation, legacy land acquisitions and a high quality of life.

The recommendations for park and recreation services noted in this Plan may trigger the need for funding beyond current allocations and for additional staffing, operations and maintenance responsibilities. Given that the operating and capital budget of the Parks and Recreation Department is finite, additional resources may be needed to leverage, supplement and support the implementation of proposed objectives, programs and projects. While grants and other efficiencies may help, these alone will not be enough to realize many ideas and projects noted in this Plan. The following recommendations and strategies are presented to offer near-term direction to realize these projects and as a means to continue dialogue between City leadership, local residents and partners. The tools presented only capture development of the capital improvements and not the long-term operations of the new assets.

Additionally, a review of potential implementation tools is included as Appendix F, which addresses local financing, federal and state grant and conservation programs, acquisition methods and others.

Enhanced Local Funding

According to the city budget, Camas maintains reserve debt capacity for local bonds and voter approved debt. The city's non-voted general obligation debt is under its debt capacity limit of $41 million for non-voted debt. Community conversations regarding the potential to develop a recreation center with aquatics and/or bundle several projects from the Capital Improvements Plan warrant a review of debt implications and operating costs for the City, along with the need to conduct polling of voter support for such projects.

Park Impact Fees & Real Estate Excise Tax

Park Impact Fees (PIF) are imposed on new development to meet the increased demand for parks resulting from the new growth. PIF can only be used for parkland acquisition, planning and/or development. They cannot be used for operations and maintenance of parks and facilities. The City of Camas currently assesses impact fees, but the City should review its PIF ordinance and update the methodology and rate structure, as appropriate, to be best positioned to obtain future acquisition and development financing from the planned growth of the community. The City should prioritize the usage of PIF to secure new park properties and finance park or trail development consistent with the priorities within this Plan.

The City currently imposes both of the quarter percent excise taxes on real estate, known as REET 1 and REET 2. The REET must be spent on capital projects listed in the City's capital facilities plan element of their comprehensive plan. Eligible project types include planning, construction, reconstruction, repair, rehabilitation or improvement of parks, recreational facilities and trails. Acquisition of land for parks is not a permitted use of REET 2. REET is used for other City projects, such as facility construction and public works projects, and may be used to make loan and debt service payments on permissible projects. Through annual budgeting and with discussions with City Council, the Parks and Recreation Department should seek access to REET funds and use the capital facilities plan to compile compelling projects to enhance service delivery of the amenities the community has provided voice to.

Conservation Futures & Legacy Lands Program

Clark County assesses the maximum allowable excise of $0.0625 per $1,000 assessed value to fund the Conservation Futures program and provides cities a venue to access these funds through a local grant process. The City should continue to submit applications for support in financing the acquisition of additional natural areas identified in the most recent Legacy Lands Program Natural Areas Acquisition Plan to facilitate the protection of these lands and enable improved linkages to expand the trail network.

Parkland Donations & Dedications

Parkland donations from private individuals or conservation organizations could occur to complement the acquisition of park and open space lands across the City and urban growth boundary. Gift deeds or bequests from philanthropic-minded landowners could allow for lands to come into City ownership upon the death of the owner or as a tax-deductible charitable donation. Also, parkland dedication by a developer could occur in exchange for Park Impact Fees or as part of a planned development where public open space is a key design for the layout and marketing of a new residential project. Any potential dedication should be vetted by the Department to ensure that such land is located in an area of need or can expand an existing City property and can be developed with site amenities appropriate for the projected use of the property.

Grants & Appropriations

Several state and federal grant programs are available on a competitive basis, including WWRP, ALEA, and LWCF. Pursuing grants is not a panacea for park system funding, since grants are both competitive and often require a significant percentage of local funds to match the request to the granting agency, which depending on the grant program can be as much as 50% of the total project budget. Camas should continue to leverage its local resources to the greatest extent by pursuing grants independently and in cooperation with other local partners.

Appropriations from state or federal sources, though rare, can supplement projects with partial funding. State and federal funding allocations are particularly relevant on regional transportation projects, and the likelihood for appropriations could be increased if multiple partners are collaborating on projects.

Internal Project Coordination & Collaboration

Internal coordination with the Public Works and Community Development Departments can increase the potential of discrete actions toward the implementation of the proposed trail and path network, which relies heavily on street right-of-way enhancements, and in the review of development applications with consideration toward potential parkland acquisition areas, planned path corridors and the need for easement or set-aside requests. However, to more fully expand the extent of the park system and recreation programs, additional partnerships and collaborations should be sought.

Public-Private Partnerships

Public-private partnerships are increasingly necessary for local agencies to leverage their limited resources in providing park and recreation services to the community. Corporate sponsorships, health organization grants, conservation stewardship programs and non-profit organizations are just a few examples of partnerships where collaboration provides value to both partners. The City has a variety of existing agency and community-based organization partners and should continue to explore additional and expanded partnerships to help implement these Plan recommendations.

Volunteer & Community-based Action

Volunteers and community groups already contribute to the improvement of park and recreation services in Camas. Volunteer projects include park clean-up days, invasive plant removal, tree planting and community event support, among others. Camas should maintain and update a revolving list of potential small works or volunteer-appropriate projects for the website, while also reaching out to civic groups and the high school to encourage student projects. While supporting organized groups and community-minded individuals continues to add value to the Camas park and recreation system, volunteer coordination requires a substantial amount of staff time, and additional resources may be necessary to more fully take advantage of the community's willingness to support park and recreation efforts.

Metropolitan Park District

Metropolitan park districts (MPD) may be formed for the purposes of management, control, improvement, maintenance and acquisition of parks, parkways and boulevards. Several years ago, the City started a preliminary look at a metropolitan park district as a tool for Camas Parks and Recreation. The City should continue to evaluate the potential of an MPD along with other implementation tools as part of a long-term funding strategy.

Other Implementation Tools

Appendix F identifies other implementation tools, such as voter-approved funding, grants and acquisition tactics, that the City could utilize to further the implementation of the projects noted in the Potential Projects List.

Capital Improvements Plan

The following Capital Improvements Plan (CIP) identifies the park, trail and facility projects considered for the next six to twenty years, along with brief project descriptions. The majority of these projects entail the maintenance, acquisition and development of parks, recreational amenities and trails. Based on survey results and other feedback, Camas residents have indicated an interest in park facility upgrades and enhanced trail connections as priorities, and the Capital Improvements Plan is reflective of that desire.

2022 Camas PROS Plan

Capital Facilities Plan

Amended per ORD 22-002

Project Type	Site	Project	Current Cost
A	Trail Corridors	Acquisition to link corridors	$2,500,000
D	Crown Park	Park development per site master plan	$6,200,000
P	Open Space Management Plan	Develop Plan	$200,000
P	Urban Forestry Management Plan	Develop Plan	$150,000
P/D	System-wide	Trails & Trailheads - planning and development	$1,800,000
D	T-3 Trail - East segment of N. Shore Trail	Development of trail	$350,000
P/D	Closing the Loop - Heritage and N. Shore trails	Planning and development	$1,500,000
P	Mill Ditch Trail	Trail corridor access point & stairway planning	$225,000
R	System-wide	Minor repair/replacement (parks amenities) projects	$250,000
D	Forest Home Park	Picnic shelter, drainage, building replacement & minor upgrades	$300,000
P	Skate Park	Phase I - Redesign and construct skate park	$250,000
D	3rd Ave. Trailhead	Trailhead development	$700,000
P	Legacy Lands - Phase I, develop site master plan	Using existing draft Vision Plan, phased approach to Master Planning. This would be Phase I.	$200,000
D	Legacy Lands - Phase I, implementation site master plan	Phase I Implementation - interim use, trails, trailhead, boat ramp, parking, Rose facility, Leadbetter facility	$4,000,000
D	Mill Ditch Trail	Shared-use trail development	$3,500,000
D	Skate Park	Phase II - Water access, trail and parking improvements	$2,000,000
D	Bike pump track	Install bike pump track at selected site	$350,000
D	Dog Park	Install dog park at selected site	$125,000
D	All-inclusive playground	Install all-inclusive playground at selected site	$600,000
P/R	System-wide	ADA compliance projects: facilities, pathway & amenities	$200,000
P	System-wide	Sports Field - assessment of existing fields & planning for system gaps	$100,000
R	Fallen Leaf Softball Field	Field improvements, new fence, infield dirt/grading, etc.	$200,000
P	Green Mountain property	Site master plan	$250,000
P/D	System-wide	Wayfinding and Park Signage program	$150,000
R	Heritage Park	Modify dock, staging to separate non-motorized launches and Gate access control upgrades	$125,000
R	System-wide	Playground replacements	$1,000,000
R	Dorothy Fox Park	Sport field drainage/renovations	$150,000
R	Grass Valley Park	Sport field drainage/renovations	$150,000
D	Green Mountain property	Park development (Phase 1 trails)	$1,500,000
R/D	Heritage Park	Picnic shelter installation & minor upgrades	$280,000
R	Prune Hill Sports Park	Sport field drainage/renovations	$150,000
R	Heritage Park	Install additional parking	$250,000
D	Prune Hill Sports Park	Picnic shelter installation & minor upgrades	$200,000
P/D	Sports Complex *	Site selection, site master plan, implementation	$20,000,000
P	Ash Creek Park	Site master plan	$90,000
D	Goot Park	Picnic shelter installation, replace bleachers & minor upgrades	$150,000
D	Louis Block Park	Upgrade baseball facilities (fencing, restroom, concession, etc.)	$750,000
P	Ostensen Canyon Park	Site master plan	$100,000
P/D	Leadbetter House redevelopment	Feasibility analysis and redevelopment	$2,000,000
D	Community garden support	New garden to fill gap in the system	$50,000
P	Lacamas Heights Park	Site master plan	$75,000
D	Oak Park	Restroom installation & minor site upgrades	$400,000
A	Neighborhood park	Acquisition to address distribution gap (Area A, 2-3 ac.)	$4,500,000
A	Neighborhood park	Acquisition to address distribution gap (Area B, 2-3 ac.)	$4,000,000
P/D	Camas Community Center *	Feasibility analysis and redevelopment	$10,000,000
R	Heritage Park	Upgrade playground & restroom	$450,000
R	Grass Valley Park	Replace playground	$250,000
D	Ash Creek Park	Park development per site master plan	$2,200,000
A	Neighborhood park	Acquisition to address distribution gap (Area C, 2-4 ac.)	$3,500,000
D	Fallen Leaf Lake Park	Park development per site master plan	$2,600,000
D	Lacamas Heights Park	Park development per site master plan	$1,000,000
D	Ostensen Canyon Park	Park development per site master plan	$3,000,000
P	Goot Park - area under powerline	Site master plan and development	$1,750,000
P/D	Aquatic Center *	Site selection, master plan, implementation	$19,000,000
P/D	Public Plaza	Master Planning and development	$1,000,000
P/D	Pickelball Courts	Master Planning and development (upto 8 courts)	$895,000

Total Estimated Project Costs $107,665,000

Project Type

A	Acquisition
P	Master planning
D	Development - new
R	Replacement/Upgrade

NOTES:

This list identifies planning-level cost estimates and does not assume the value of volunteer or other non-City contributions.

Detailed costing may be necessary for projects noted.

Legacy Lands and Green Mountain projects will have additional phase in the future (i.e. 20+ years).

This list is not an official budget and intended as a guiding document for City staff in the

*Additional public and policy discussion needed to refine project

Items highlighted in green are top priortity for the next 2-3 years (2022-24).

Items highlighted in blue bing high priority as opportunities arises.

Survey Summary

To: Trang Lam, Parks & Recreation Director

From: Steve Duh, Conservation Technix, Inc.

Date: July 19, 2021

Re: **City of Camas Park, Recreation & Open Space Plan**
Community Survey Summary Results

Conservation Technix is pleased to present the results of a survey of the general population of the City of Camas that assesses residents' recreational needs and priorities.

KEY FINDINGS

Camas residents strongly value their parks and recreation facilities.

Nearly all respondents (97%) think parks and recreation are important or essential to quality of life in Camas. Very few, less than 4%, feel they are useful, but not necessary, or not important at all.

Residents visit frequently and are generally very satisfied with existing parks, trails and recreation facilities and programs.

Respondents visit the city's parks, trails, and recreation facilities frequently – most at least once a week – often for fitness or exercise, to walk or run, or to relax. Respondents are less likely to have participated in the City's recreation programs, classes, and camps, with less than one in four households participating in 2019. Those who had participated were most likely to have participated in youth-oriented classes and camps.

Overall, respondents feel that the City's parks and trails are in good condition. Not all respondents are familiar enough with Lacamas Lake Lodge & Conference Center and the Fallen Leaf Park Shelter, but those who are feel they are in very good condition. However, nearly six in ten respondents who rated the Camas Community Center responded that it is only in fair to good condition, signaling a potential need for maintenance and improvements at this facility.

Respondents generally feel the City has sufficient parks, water access, community events, and other recreation opportunities. The notable exception is trails, which 44% of respondents would like to see expanded. Most expressed a preference for more unpaved trails in natural areas over other trail types.

While residents prioritize maintaining existing parks and facilities, they are generally supportive of improving the City's park and recreation system as well.

When asked to rank their priorities for future City investment, respondents prioritized maintain existing parks, expanding trails, and building new parks. More than three in four respondents are very or somewhat supportive of the City adding walking trails, updated and accessible playgrounds, and more picnic shelters to the existing park system. A majority of respondents are also supportive of developing more biking trails, splash pads, off leash dog areas, pools or aquatic centers, tennis or pickleball courts, a new community center, disc golf course, and basketball courts.

As a whole, respondents are most supportive of raising revenue through reservation fees for rentals of part facilities, rather than through parking passes or raising taxes. Again, developing trails is a notable exception, where nearly six in ten respondents were willing to pay additional taxes to support improvements. Younger respondents and respondents with children at home are generally more supportive of expanding the City's park, trail, and recreation system and of increasing taxes or other revenue sources to support system expansion.

SURVEY METHODOLOGY

In close collaboration with City of Camas staff and the Parks and Recreation Commission, Conservation Technix developed the 17-question survey that was estimated to take less than ten minutes to complete.

The City mailed 2,500 surveys to randomly chosen households in Camas on May 29, 2021, of which 509 surveys were completed and returned. Online versions of the survey in English and Spanish were posted to the City's website on June 4, 2021. An additional 874 surveys in English and two in Spanish were completed from the general, community-wide online surveys. In all, 1,385 surveys were completed.

Information about the survey was provided on the City's website and on the EngageCamas site for the PROS Plan project. It was promoted via multiple social media postings, city email blasts and an email blast through Camas school district mailing list. Print copies were made available at the Camas library and the Camas School District Family Community Resource Center Also, flyers with QR codes were placed at numerous parks and local businesses. The survey was closed on July 2, 2021, and data were compiled and reviewed.

Although households were randomly chosen to receive the mail survey, respondents were not necessarily representative of all City residents. However, age group segmentation shows general alignment with current Census data. The table below shows the age demographics for the mail and online surveys, as well as comparative percentages for Camas' population.

	Survey Respondents			Camas population	
Age group	Mail	Online-only	Combined	All	Over 20
Under 20	<1%	<1%	<1%	31%	--
20 to 34	7%	9%	8%	12%	17%
35 to 44	25%	36%	32%	16%	23%
45 to 54	25%	31%	28%	19%	27%
55 to 64	17%	13%	15%	11%	16%
65 to 74	18%	8%	12%	9%	12%
75 and older	8%	2%	4%	3%	5%
Total	100%	100%	100%	100%	100%

This report includes findings of community opinions based principally on mailed survey responses. Each section also notes key differences between different demographic groups and among responses to the online-only survey, where applicable. Percentages in the report may not add up to 100% due to rounding.

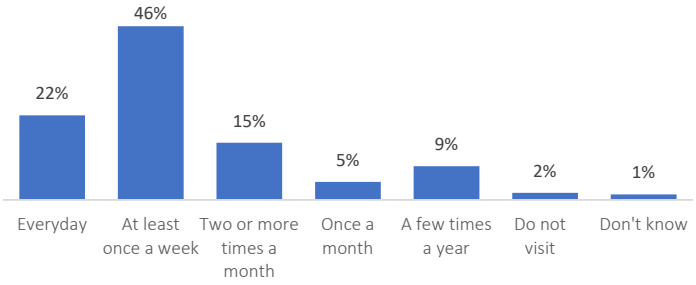
DETAILED FINDINGS

Value and use of parks and recreation

How much do residents value parks and recreation?

Virtually all respondents (97%) feel that local parks, recreation opportunities are important or essential to the quality of life in Camas. More than eight in ten respondents feel that they are essential; while an additional 16% believe that they are important to quality of life, but not essential. Less than 1% of respondents believe parks are "Useful, but not important".

1. When you think about the things that contribute to the quality of life in Camas, would you say that public parks and recreation opportunities are…



Response options	Mail		Online-only	
Essential to the quality of life here	81%	97%	88%	99%
Important, but not really necessary	16%		11%	
Useful, but not important	3%		<1%	
Not important or don't know	1%		<1%	

Though respondents of all ages value parks and recreation, younger respondents were significantly more likely to deem them essential to quality of life. Respondents with children at home, as well as those who responded to the online survey, also valued parks and recreation even more strongly than the general population.

How often do residents use Camas' parks, trails, recreation facilities, and natural areas?

Respondents were asked how often they, or members of their household, visited a City of Camas park, trail, recreation facility, or natural area (prior to the COVID-19 pandemic). Respondents tend to visit frequently, with more than two in three visiting at least once a week (68%) and another 20% visiting one to three times per month. Only 9% of respondents visit just a few times per year. Very few (2%) did not visit a park at all.

3. Prior to the COVID-19 quarantine, how often did you visit or use Camas' parks, trails, recreation facilities, or natural areas?

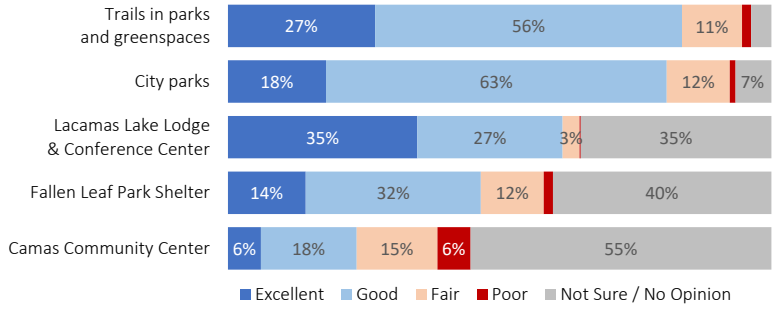
While younger respondents visit the City's parks, trails, and natural areas more frequently than older respondents, over half of respondents over 75 years old still visit at least once a week. Those in households with children also visit significantly more frequently than those without children, with participation increasing in correspondence with the number of children in the home. Respondents who live in the southwest portion of the city are less likely than respondents elsewhere to use parks and recreation facilities frequently. Online-only survey respondents tend to visit at similar frequencies as mail survey respondents.

Why do residents visit parks, trails and recreation facilities?

Respondents visit local parks and recreation facilities for a variety of reasons. The most popular activities are walking or running (80%), followed by fitness and exercise (70%), and relaxation (56%). More than three in ten respondents visited to walk their dog (40%), view wildlife (36%), visit a playground (33%), ride their bike (33%) or attend a family gathering or picnic (30%). Between 15% and 30% of respondents visit parks for non-motorized boating, like canoeing or kayaking, to attend a community event or concert, play on a sports field, swim, or use an outdoor sports court. Less than one in six respondents visit fish, participate in a recreation program, use a motorized boat, or play disc golf.

With a few exceptions, respondents who responded to the online-only survey were more likely to visit recreation facilities and parks for each reason listed than mail respondents were.

4. Prior to the COVID-19 Pandemic, what would you say are the main reasons you visited Camas recreation facilities, parks or open spaces in the past year?



Reason	Mail	Online
Walking or running	80%	79%
Fitness / exercise	70%	73%
Relaxation	56%	54%
Dog walking	40%	45%
Wildlife viewing	36%	35%
Playgrounds	33%	47%
Bike riding	33%	44%
Family gatherings / picnics	30%	38%
Boating – non-motorized	28%	34%
Community events / concerts	23%	32%
Sport fields	21%	35%
Swimming	18%	24%
Outdoor sport courts	17%	20%
Fishing	13%	13%
Recreation program, class, or camp	10%	21%
Boating – motorized	9%	7%
Frisbee or disc golf	5%	8%

Respondents under 44 years of age are more likely than other groups to visit for community events, playgrounds and recreation programs. Respondents over 65 are more likely than younger respondents to visit to view wildlife. Some activities, including fitness and exercise, family gatherings, walking or running, and relaxation are similarly popular with all age groups. Respondents with children in their home are more likely to visit for playgrounds, recreation programs, sports fields, swimming, and family gatherings, than respondents without children who are more likely to visit to view wildlife.

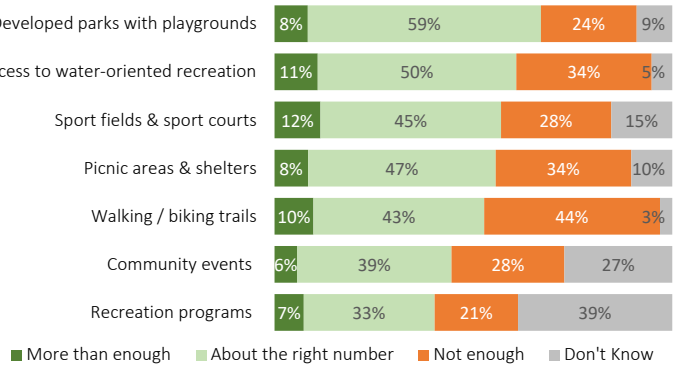
How would residents rate the condition of Camas' parks and recreation facilities?

Respondents were asked to rate the condition of a variety of park and recreation facilities on a scale from poor to excellent. Respondents gave overwhelming high marks to the condition of the City's trails in parks and greenspaces and the parks themselves.

5. How would you rate the condition of the following parks or recreation facilities?

Overall, the Lacamas Lake Lodge & Conference Center received the highest condition ratings, with 95% of respondents who provided a ranking rating it as excellent or good. About 40% of respondents did not rate the condition of the Fallen Leaf Park Shelter – of those who did, nearly eighty percent rated its condition as either

excellent or good. The Camas Community Center received the lowest ratings, with 58% of respondents rating its condition as fair or poor (excluding those who responded not sure/no opinion). Notably, more than half of respondents were unsure and may have not visited this facility recently.



There were no significant variations in how respondents rated the condition of parks and facilities based on age, number of children in the home, or location of residence.

Does the number of existing park and recreation amenities meet residents' needs?

Respondents generally feel that the City already provides enough, or more than enough, of all of the amenities listed.

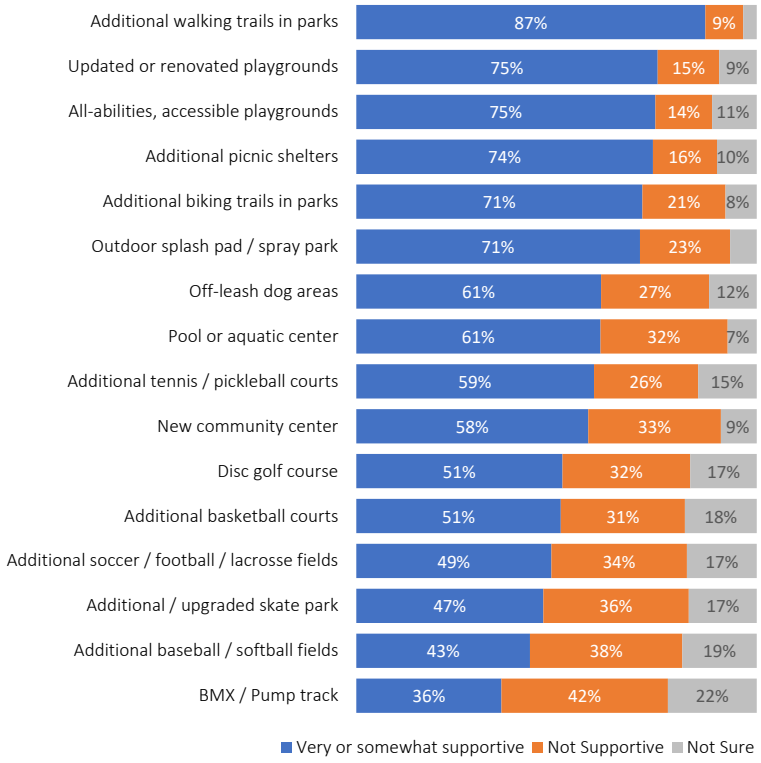
If respondents who answered "Don't Know" are excluded from the results, 46% of respondents believe there are not enough walking and biking trails. Between 33% and 39% of respondents who rated the options believe that there is not enough access to water-oriented recreation, picnic areas, sports fields and courts, community events, and developed parks.

2. When it comes to amenities provided by the City of Camas for meeting your needs for parks, trails and recreation facilities, would you say there are…

Younger respondents – those under 44 – were more likely than older respondents to feel there were not enough developed parks with playgrounds, picnic areas, recreation programs, and community events. Respondents between 55 and 64 years of age were far more likely than respondents of other ages to want more walking and biking trails in Camas. Respondents with children in their home are more likely than those without to believe there are not enough of every listed amenity except walking and biking trails. Respondents who live in southwest Camas (Council Ward 3) were more likely than respondents of other areas to feel there are not enough walking and biking trails.

Parks

What park improvements would Camas residents like to see?



More than three in four respondents are very or somewhat supportive of adding walking trails (87%), updated (75%) and accessible (75%) playground features, and more picnic shelters (74%) to the City's existing parks.

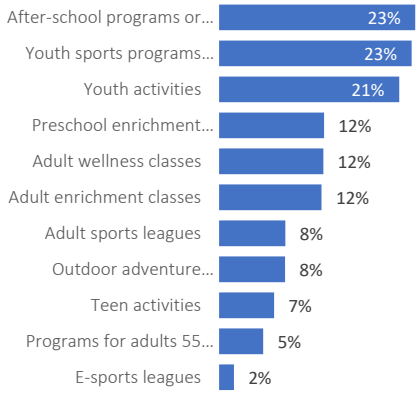
A majority of respondents are also supportive of developing more biking trails, splash pads, off leash dog areas, pools or aquatic centers, tennis or pickleball courts, a new community center, disc golf course, and basketball courts.

Less than half of respondents were supportive of adding more basketball courts, sports fields, skate parks, and BMX or pump tracks.

Respondents under 45 years old were more likely than older respondents to support every improvement listed in the survey.

6. The following list includes park amenities that the City of Camas could consider adding to the park system. Please indicate whether you would be very supportive, somewhat supportive, not sure, or not supportive of each.

Respondents with children in their household were more supportive of city investment in playgrounds (including accessible playgrounds), sports fields and courts, community and aquatic centers, outdoor splash pads, BMX/bike skills courses, skate parks, and disc golf courses than those without children.

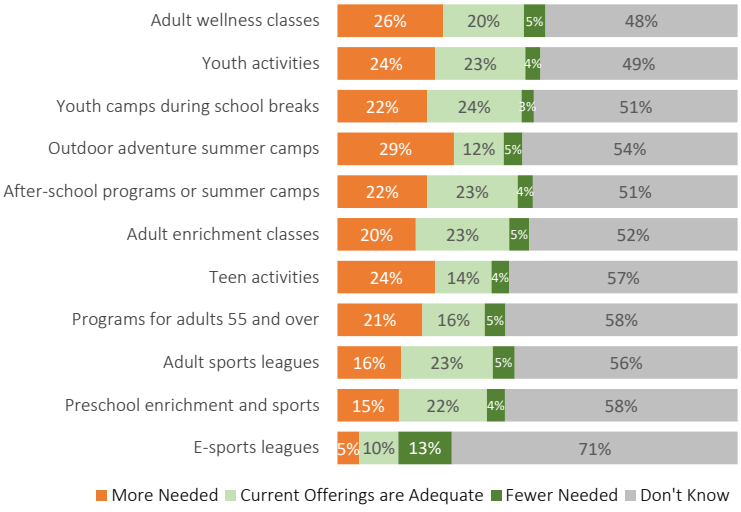


Recreation programs

What recreation programs have residents participated in?

Less than one in four respondents who took the mailed survey have participated in the City's recreation programs. Of the listed activities, the greatest number of respondents had participated in after-school programs or summer camps for children (23%), youth sports programs (23%), and youth activities (21%). In general, respondents were less likely to have participated in activities for teens, adults, and older adults.

Members of households of younger respondents (under age 44) were more likely to have participated in youth-oriented programming, while those of older respondents were more likely to have participated in adult programs and classes. Respondents with children in their home were significantly more likely to have participated in youth-oriented programs and camps than those without.

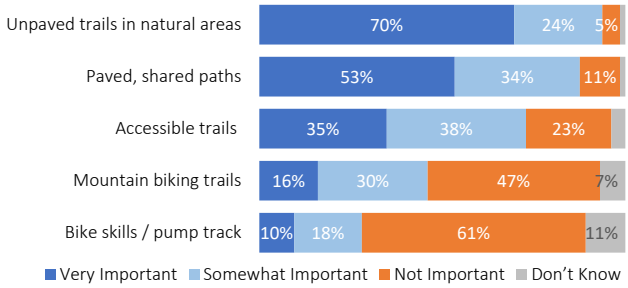


8. Please indicate if your household used each of the listed recreation program types in 2019 (pre-COVID-19).

What recreation options do residents have a need for?

The survey asked respondents which types of recreation programs, classes, and activities they would like to see more of. Notably, approximately half of respondents responded that they did not know whether current offerings are adequate or not. Of those who expressed an opinion, more than half felt the City needed more outdoor adventure summer camps, teen activities, adult wellness classes, and programs for adults over 55.

9. Please indicate whether you think there should be more less of each of the listed program types.



Respondents under 34 years of age were more likely than older respondents to feel the City needs more adult sports leagues, youth camps and after-school programs, pre-school activities, and E-sports leagues. Adults over 55 had the greatest unmet needs for classes and programs specific to people over 55. Respondents of all ages expressed similar levels of need for adult enrichment and wellness classes. Households with children were more likely than those without to feel like their need for youth activities were not well met. In general, respondents of southwest Camas (Ward 3) were more likely than respondents of other areas to feel that current offerings are adequate or more than enough.

Trails

What trail types do residents think are important?

Of various types of trails, respondents overwhelmingly rate unpaved trails in natural areas as important – 94% believe they are very or somewhat important. Majorities of respondents also feel paved, shared use paths for pedestrians and cyclists (87%) and accessible trails (73%) are at least somewhat important. Respondents are less likely to feel mountain biking trails (46%) and bike skills / pump tracks (28%) are important. In general, the importance of each type of trail decreased with the age of respondent. However, similar percentages of adults in each age group from 35 to 64 considered mountain biking trails to be very or somewhat important, with slightly stronger levels of importance noted by respondents between 45 and 64. There were no significant differences in importance based on where respondents live or whether they have children at home.

10. Please rate how important each trail type or amenity is to your household.

Investment and revenue priorities

What recreation and park investments would residents prioritize?

Respondents were asked to rank a list of potential recreation, park, and open space investments. Generally, respondents to both the mail and online survey ranked maintaining existing parks, expanding trail opportunities, building new parks, and acquiring land for future parks as their top priorities. Respondents ranked offering building a new community or aquatic center and expanding program offerings as their lowest priorities in both the mail and online surveys.

Respondents of different ages prioritized the investment options similarly, with the exception of building a new community or aquatic center, which was a higher priority for significantly more younger respondents. Respondents with children in their home tended to rate building a new community or aquatic center higher than those without children in the home, who were more likely to rate expanding trail opportunities as a high priority. Respondents did not vary significant in their priorities depending on which part of the city they live in.

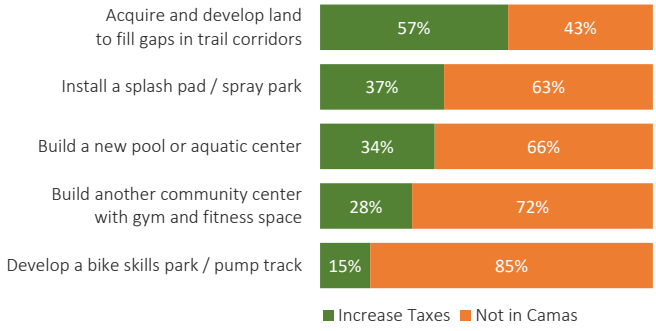
8. For the following list, indicate how you would rank the priority for each.

	Mail	Online
Highest	▪ Focusing on existing parks & delayed maintenance	▪ Focusing on existing parks & delayed maintenance
	▪ Expanding trail opportunities	▪ Building new parks on undeveloped, city parkland
	▪ Building new parks on undeveloped, city parkland	▪ Expanding trail opportunities
	▪ Acquiring land for future parks	▪ Acquiring land for future parks
	▪ Building a new community center or aquatic center	▪ Building a new community center or aquatic center
Lowest	▪ Expanding recreation classes & camps	▪ Expanding recreation classes & camps

What revenue generating options would residents support?

The survey asked respondents whether they would support various revenue generating options. Large majorities of respondents were either very or somewhat supportive of a) charging advertising fees for outfield fence banners at sports fields (88%), b) increasing rental scheduling for private events and gatherings (72%), and instituting a reservation system and rental fees for additional group picnic shelters (70%). A slight majority (54%) were supportive of instituting a reservation and fee program for sports fields and courts. Significantly fewer respondents (29%) were supportive of implementing a parking pass program at major City parks.

There were no consistent, significant differences in support for revenue generating options across respondents of various ages or between respondents with children at home and those without.

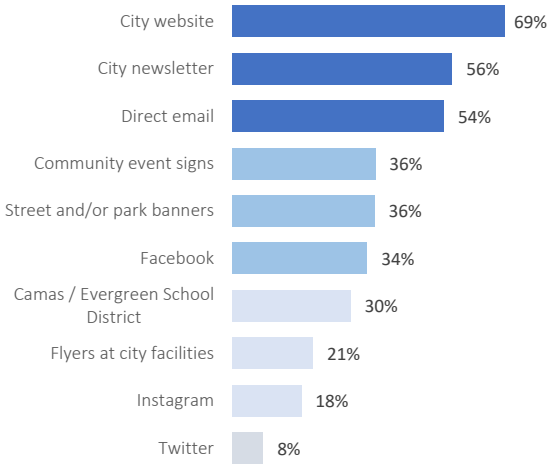


11. The Parks & Recreation Department has limited budget to deliver parks and recreational services, and the City is exploring options to enhance revenue generation to support the delivery of services. How would you rate your level of support for each of the following options?

Are residents willing to support increased taxes to fund new amenities and experiences?

Respondents with children at home were significantly more likely that those without to support increasing taxes for all improvements other than expanding trails (which received similarly high support levels). However, building a community or aquatic center was the only option for which more than half of respondents with children supported raising taxes. Respondents under 44 years of age were significantly more likely than older respondents to support raising taxes to fund a new pool or aquatic center or to install splash pads. There were no significant differences based on respondents' location of residence.

12. There may be some park and recreation experiences that are limited or not available in Camas but are available in neighboring communities. If it came down to a choice between increasing taxes to develop that facility in Camas versus not having that in Camas, which would you choose?



Communication preferences

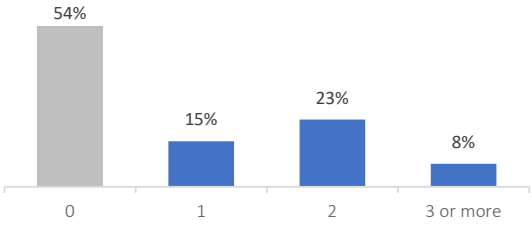
How do residents want to hear about Camas' parks, programs, and events?

More than two-thirds of respondents would prefer to learn about City parks, programs, and events through the City's website. The City newsletter and direct email are also popular communication options, preferred by 56% and 54% of respondents respectively. These sources were popular with respondents to both the mail and online-only surveys and with respondents of all ages.

About a third of resident preferred to learn about City offerings through various types of promotional signs, including community event signs (36%), street or park banners (36%), and flyers at City facilities (21%). Thirty percent of respondents would like to hear about programs and events through local school districts.

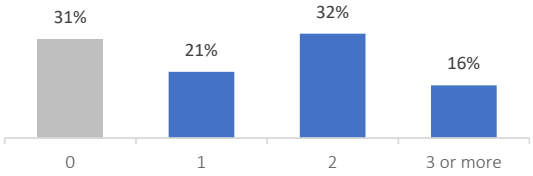
13. Please check ALL the ways you would prefer to learn about Camas' parks, programs, and events.

Fewer than about one in three respondents would like to hear about park and recreation opportunities through social media (Facebook (34%), Instagram (18%), and Twitter (8%)). However, social media – especially Facebook and Instagram – is a significantly more popular source of information for respondents under 44 years of age. Respondents who responded to the online-only survey were also significantly more likely to prefer social media sources – 61% prefer Facebook, 29% Instagram, and 13% Instagram.



Respondents with children at home were significantly more likely to prefer receiving information through the school district than those without. There were no significant differences in communication preferences between respondents living in different areas of the city.

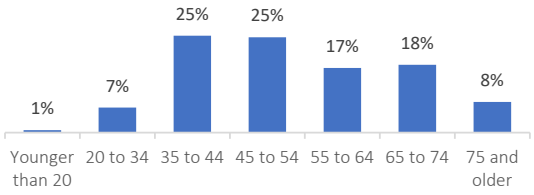
Demographics



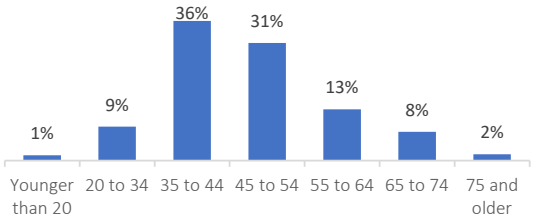
Number of children in household

The majority (54%) of respondents to the mail survey live in households with no children under 18, while about just under half live in a household with either one (15%), two (23%), or three or more (8%) children. Online-only survey respondents were significantly more likely to live in households with children than respondents to the mail survey – nearly 70% had children in the home.

Mail survey responses



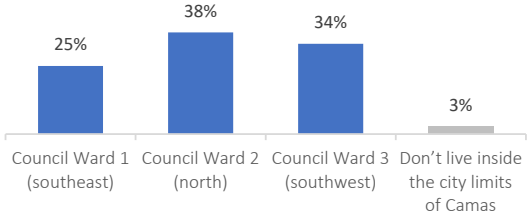
Online-only survey responses



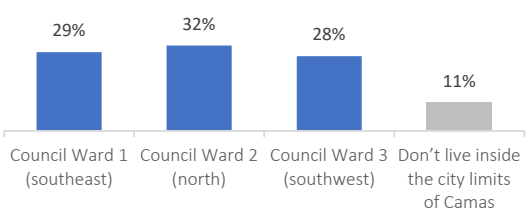
Age

Approximately half of respondents to the mail survey were between the ages of 35 and 54. Another 35% were between 55 and 74, while 8% were older than 75 years. Fewer than 8% of respondents were less 35 years old. The online-only survey tended to be younger than those who responded to the mail survey – 10% were under 35 years old, 67% were between 35 and 54 years, and only 23% were over 55.

Mail survey responses



Online-only survey responses



Location of residence

Respondents were relatively evenly distributed throughout the City of Camas. Thirty-eight percent live in Council Ward 2 (north Camas), 34% live in Ward 3 (southwest), and 25% live in Ward 1 (southeast). The mail survey garnered a few responses (3%) from people who live outside the City of Camas, however all live within the 98607 zip code. Respondents to the online survey were similarly distributed across the city, with slightly higher representation of residents in Ward 1. However, a larger portion (11%) of online-only respondents do not live in the city.

ATTACHMENT 1. SURVEY INSTRUMENT

City of Camas WASHINGTON

Community Survey on Parks and Recreation

Dear Camas Resident:

The City of Camas is beginning a community-led process to update its citywide Recreation, Parks and Open Space Plan (PROS Plan, for short). We need your help to determine how to prioritize projects and what we should focus on to keep our parks and programs thriving for the next 6-10 years. As an initial step, the City is conducting this short survey to assess the community's recreation needs. We understand that COVID-19 has impacted your ability to participate in programs and visit parks this year. We ask that you consider needs for the future as you evaluate recreation amenities. Your opinions are important to the City.

The survey has 16 questions and will only take a few minutes to complete. Use the QR code to take this survey online at https://www.surveymonkey.com/r/CamasPROS

1. **When you think about what contributes to the quality of life in Camas, would you say that public parks and recreation opportunities are... (CHECK ONE OPTION)**

   ☐ Essential to the quality of life here
   ☐ Important, but not really essential
   ☐ Useful, but not necessary
   ☐ Not Important
   ☐ Don't know

2. **When it comes to amenities provided by the City of Camas for meeting your needs for parks, trails and recreation facilities, would you say there are... (CHECK ONLY ONE BOX IN EACH ROW)**

	More than Enough	About the Right Amount	Not Enough	Don't Know
Developed parks with playgrounds	☐	☐	☐	☐
Walking / biking trails	☐	☐	☐	☐
Sport fields & sport courts	☐	☐	☐	☐
Picnic areas & shelters	☐	☐	☐	☐
Access to water-oriented recreation (lakes, rivers)	☐	☐	☐	☐
Recreation programs (camps & classes)	☐	☐	☐	☐
Community events (such as the Movies in the Park)	☐	☐	☐	☐

3. **Prior to the COVID-19 pandemic, how often did you visit or use Camas parks, trails, recreation facilities or natural areas?**

   ☐ Everyday
   ☐ At least once a week
   ☐ Two or more times a month
   ☐ About once a month
   ☐ A few times over the year
   ☐ Do not visit facilities / parks / open spaces
   ☐ Don't know

4. **Prior to the COVID-19 pandemic, what would you say are the main reasons your household visited Camas parks, recreation facilities or open spaces in the past year? (CHECK ALL THAT APPLY)**

   ☐ Fitness / Exercise

Install and institute a reservation system and rental fees for additional group picnic shelters	☐	☐	☐	☐	☐
Charge advertising fees for the installation of outfield fence banners at sport fields	☐	☐	☐	☐	☐
Institute a parking pass program at major parks	☐	☐	☐	☐	☐
Institute a reservation system and rental fees for sport fields and courts	☐	☐	☐	☐	☐
Increase rental scheduling for private events and gatherings	☐	☐	☐	☐	☐

11. There may be some park and recreation experiences that are limited or not available in Camas but are available in neighboring communities. If it came down to a choice between increasing taxes to develop that facility in Camas versus not having that in Camas, which would you choose?

	Increase Taxes	Not in Camas
Install a splash pad / spray park	☐	☐
Build a new pool or aquatic center	☐	☐
Acquire and develop land to fill gaps in trail corridors	☐	☐
Build another community center with gymnasium and fitness space	☐	☐
Develop a bike skills park / pump track	☐	☐

12. Please check ALL the ways you would prefer to learn about Camas's parks, programs and events.

- ☐ City website
- ☐ City newsletter
- ☐ Facebook
- ☐ Twitter
- ☐ Instagram
- ☐ Camas / Evergreen School District
- ☐ Direct email
- ☐ Community event signs
- ☐ Flyers at city facilities
- ☐ Street and/or park banners
- ☐ None of these
- ☐ Other: _____

The following questions help us understand whether we have a cross-section of the community responding to this survey. It's important that you provide a response to each question.

13. How many children under age 18 live in your household?

- ☐ 0
- ☐ 1
- ☐ 2
- ☐ 3 or more

14. What is your age?

- ☐ Younger than 20
- ☐ 20 to 34
- ☐ 35 to 44
- ☐ 45 to 54
- ☐ 55 to 64
- ☐ 65 and 74
- ☐ 75 and older

15. In which section of Camas do you live?

- ☐ (1) Council Ward 1 - southeast Camas
- ☐ (2) Council Ward 2 - north Camas
- ☐ (3) Council Ward 3 - southwest Camas
- ☐ Don't live inside the city limits of Camas

16. If you don't live in Camas, what is your zip code? _____

Thank you for taking the time to complete this survey!

Your input will help guide the development of the Camas Parks, Recreation & Open Space Plan.

ATTACHMENT 2. OPEN-ENDED RESPONSES

Question 4. Prior to the COVID-19 pandemic, what would you say are the main reasons your household visited Camas parks, recreation facilities, or natural areas in the past year? (open-ended "other" responses)

Mail

- The parks are why I moved here
- Photography
- Cemetery - pry of Parks responsibility
- Meeting a friend or getting out of the house
- DOG PARK PLEASE!!!!
- Miss public swim pool
- Kayaking, paddle boarding
- Too much noise, dangerous bikes, boats disruptive
- We moved here during the pandemic
- Kites
- Just moved here
- Internet access and restrooms
- Hiking Lacamas park
- Getting out of yard work!!!
- Overall enjoyment of nature in its natural state on maintained trails
- Visit my wife's cemetery plot
- We moved to Camas during the pandemic.
- Skatepark
- Moved here during PHE
- Photography
- Hiking
- Skateboarding

Online

- Bike Riding
- Bird watching
- Did not live in Camas
- Didn't live here prior to COVID
- Disc Golf
- Gather with friends
- Horseback riding
- I moved here during the pandemic, so the question doesn't really apply to me, but I'm utilizing many of these now and have been since arriving.
- I moved to Camas during COVID.
- Lacamas Lake is toxic and should be cleaned and filtered, currently unsafe
- Mental health / forest bathing

- Mental health, community health
- Mountain biking
- Mountain biking
- Moved here during COVID
- Moving to Camas during COVID
- Nature immersion
- Paddle boarding
- Photos
- Pickleball at Crown Park!!!
- pump track and dirt jumps
- Relaxing
- Scouts
- Skateboarding
- Skatepark
- sketching
- Soaking up nature
- SUP
- To be outside for no reason
- To practice disc golf throws!
- Turf the baseball fields. For how much u make it taxes stop wasting money and invest in the youth or I'll move to Ridgefield
- Visiting with out-of-town guests
- We just moved here last June during the pandemic.
- We just moved to Camas in July 2020, so we didn't have experiences before the pandemic.
- We need an off-leash dog park
- We recently moved here during the pandemic.
- Would have gone to pool if still had one

Question 13. Please check ALL the ways you would prefer to learn about Camas' parks, programs and events. (open-ended "other" responses)

Mail

- Advertising/information around downtown Camas
- Camas Post Recorder
- Direct mail
- Direct mail - USPS
- Direct mailing
- Direct mailing once or more per year
- Do not know
- Don't care. Any.
- Email/mailers
- Google or ask Siri
- Mail

- Mailed brochure of schedule
- Newspaper
- Newspaper - Columbian
- Next Door
- NextDoor app
- Nextdoor
- NextDoor app
- NextDoor app
- Send with water bill
- The Columbian
- USPS
- Word of mouth

Online

- "Opt-In" texts with links to website with the relevant information
- All
- Believe Street and park banners are currently prohibited by city ordinance.
- Camas and Columbian Newspapers
- Camas Library
- Camas Washougal Post Record, Nextdoor
- City App with updated info
- Email
- Emails through the Camas schools are a great way to advertise events.
- Everything you can think of
- I believe a community / city announcement board in DT Camas would be good.
- Insert with city water bill
- Newspaper
- Next door app
- Nextdoor
- Nextdoor
- NextDoor
- post on nextdoor riverview
- Push Notifications Text
- Send links w/ event info via text
- text
- Text and/or mobile app
- The Columbian and Post Record Newspaper
- This seems the only place where I can say that I am supportive of a Firstenburg style aquatic center, but at $70 million.
- Turf the baseball/softball fields, maintain the parks and put in a pump track for the youth. Ur taxes are already higher than any other city in SW Washington. Our community is pissed off with the waste of funds our leaders have shown and not using that money to enrich our quality of life.

INTRODUCTION

The City of Camas conducted outreach between July 29 and August 22, 2021 to share information about the Camas Parks, Recreation and Open Space (PROS) Plan Update with the public and solicit input about which park and recreation programs, services and facilities are important to them. Feedback received through this outreach period will help the city build the draft PROS Plan, which will be shared in late fall through a second round of outreach.

OVERALL PARTICIPATION AND NOTIFICATION

To gather feedback to inform the PROS Plan update, the project team developed an **online open house, online interactive map,** and held **three (3) tabling events** in Camas to build project awareness and solicit feedback.

Overall, **we reached approximately 131 people**, with 74 participating in the online open house, approximately 50 visiting with the team at tabling events, and 7 people contributing to the interactive map.

Community members were informed about the online open house and tabling events through the following:

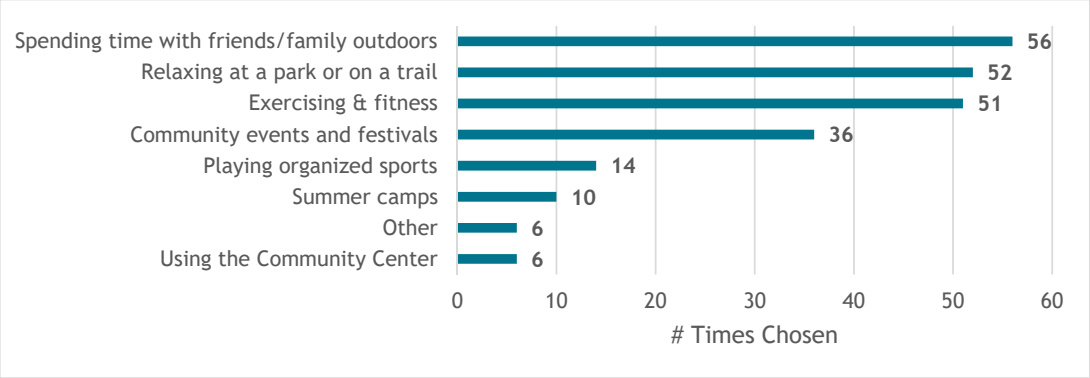
- Social media posts to the City of Camas Facebook page and Twitter account
- Social media posts to the Camas Parks & Recreation Facebook page
- Posts on the project Engage Camas page
- Emails sent to the Parks and Recreation distribution list
- Media release
- Announcements at Council and Parks & Recreation Commission public meetings
- Announcements at Stakeholder Focus Group meetings

FEEDBACK SUMMARY

OPEN HOUSE QUESTIONS

This section summarizes the feedback received through the online open house.

ONLINE OPEN HOUSE RESPONSES



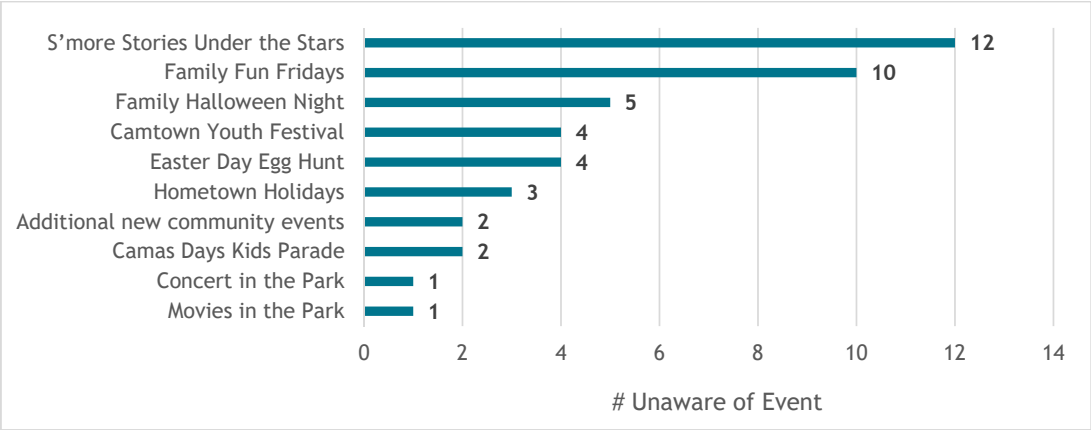
Online open house participants were given the opportunity to respond to a series of questions about park and recreation programs, services, and facilities. Feedback is summarized below.

Note: Unless otherwise stated, the percentages listed in the analysis of each question take into consideration the number of participants who responded to the question, not the total number of people who participated in the online open house.

1. **What are you most looking forward to doing again in City parks and facilities as COVID-19 restrictions are lifted? (Select all that apply.)**

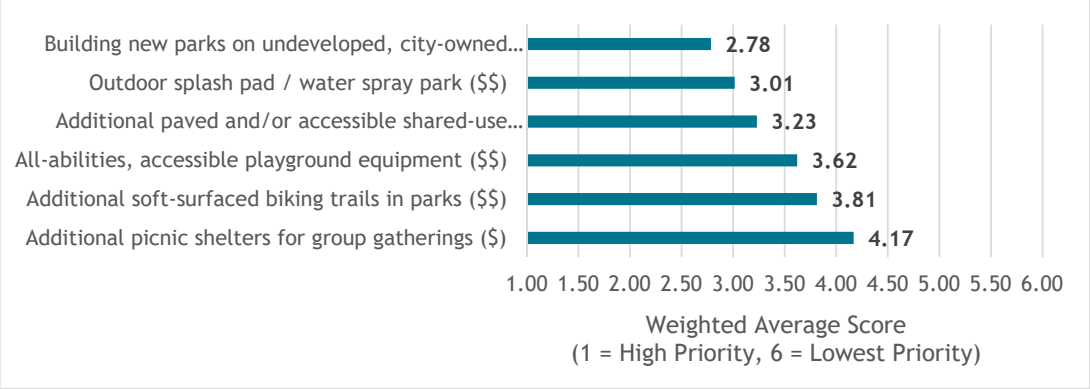
   As COVID-19 restrictions are lifted, participants are most looking forward to spending time with friends/family outdoors, relaxing at a park or on a trail, and exercising and fitness.

   For those who selected "Other," kayaking, floating on the river, swimming, and taking children to the playgrounds was mentioned. Someone mentioned splash pads at Crown Park and that bathrooms are needed. Please see **Appendix A** to read the individual, unedited comments.

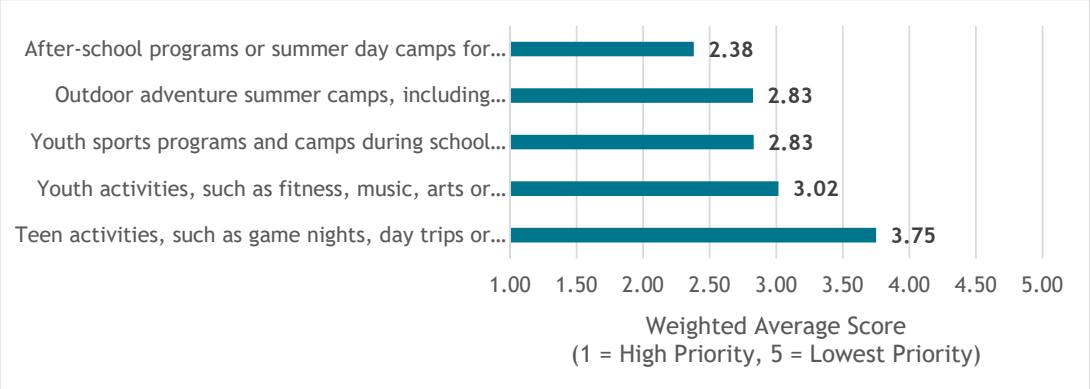


2. **The City of Camas offers or supports many community events throughout the year that are free to the public but utilize city staff resources and funding. Below is a list of Camas community events that are currently offered. For each event, indicate whether you think it is a High Priority, a Medium Priority, a Low Priority, or Not a Priority for your household.**

   "Concert in the park" scored the highest, indicating it was a high priority for respondents. This was followed by "Hometown Holidays" and "Movies in the Park." Respondents indicated that "S'more Stories Under the Stars" was the lowest priority community event.

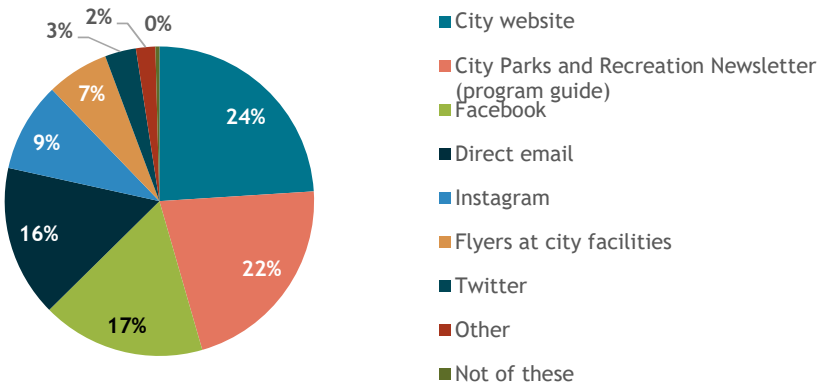


12 respondents indicated that they were unaware of S'more Stories Under the Stars, 10 were unaware of Family Fun Fridays, and 5 were unaware of Family Halloween Night.



3. **The spring 2021 community survey identified six priorities for the park system. For the following list of park system priorities, indicate how you would rank the priority for each (first (1) priority is highest and sixth (6) priority is lowest). Cost estimates are shown as $ (somewhat expensive), $$ (moderately expensive) or $$$ (expensive).**

   Respondents ranked **"Building new parks on undeveloped, city-owned parkland ($$$)" highest,** followed by "Outdoor splash pad / water spray park ($$)." Respondents ranked "Additional picnic shelters for group gatherings ($)" the lowest.



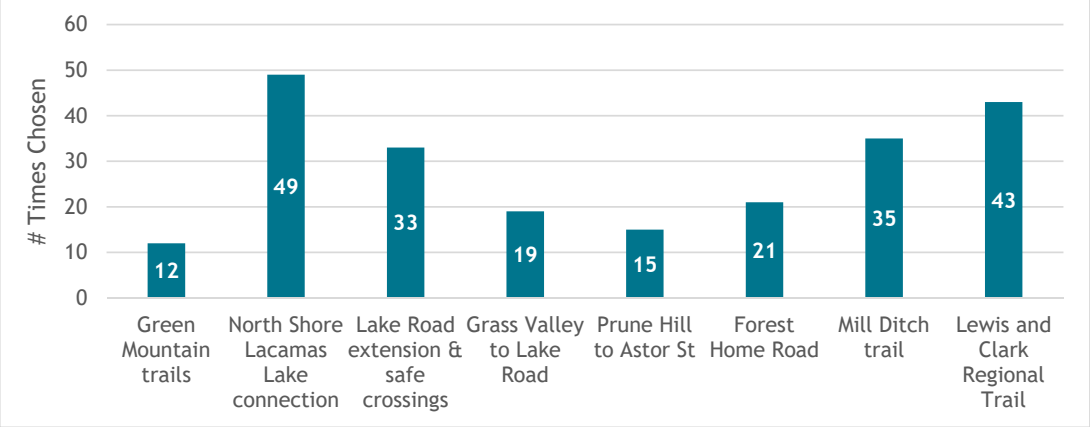
4. **The spring 2021 community survey identified five priorities for recreation programs and activities. For the following list of recreation programs and activities, indicate how you would rank the priority for each (first (1) priority is highest and fifth (5) priority is lowest).**

   Respondents ranked **"After-school programs or summer day camps for children" highest,** followed by "Youth sports programs and camps during school breaks" and "Outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education." Respondents ranked "Teen activities, such as game nights, day trips or camps during school breaks" the lowest.

5. **Please check ALL the ways you would like to get information about Camas' recreation programs and activities.**

   Most people would like to get information about Camas' recreation programs and activities through the **city's website and/or through the City Parks and Recreation Newsletter.**

For those who indicated "Other," text messaging, events on Facebook, Camas Library, and Nextdoor were mentioned as ways people like would to get information



6. **The following list of new facilities/amenities may be considered in the new PROS Plan. For each item, please tell us if it should be a top priority, a high priority, a low priority or not a priority at all. Cost estimates are shown as $ (somewhat expensive), $$ (moderately expensive), $$$ (expensive) or $$$$ (very expensive).**

"Acquire and develop land to fill gaps in trail corridors ($$)" scored the highest, indicating it was a high priority for respondents. This was followed by "Install an outdoor splash pad / spray park ($$)" and "Provide an off-leash dog park ($)."

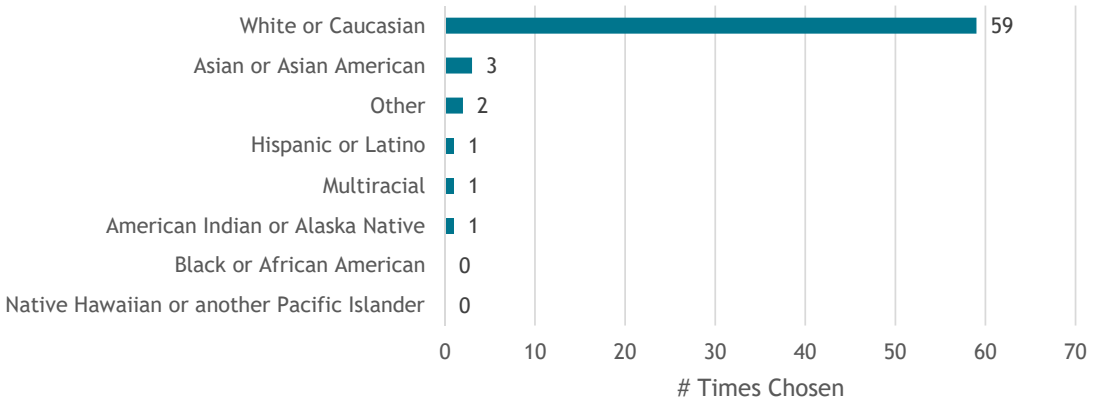
7. **Thinking about trails and paths, which potential trail connections are the highest priority for your household? (Select up to 4.)**

Respondents chose the **North Shore Lacamas Lake connection the most (49 times),** followed closely by Lewis and Clark Regional Trail, chosen 43 times, indicating that these two trails were highest priority for households. Green Mountain trails was chosen the least.

8. **Please share any additional needs for park and recreation improvements, programs or activities that you think are important and relevant to the growth of our community for the next five years.**

   36 people left feedback in this open text box. Below are some common themes found for those who responded. Please see **Appendix A** to read the individual, unedited comments.

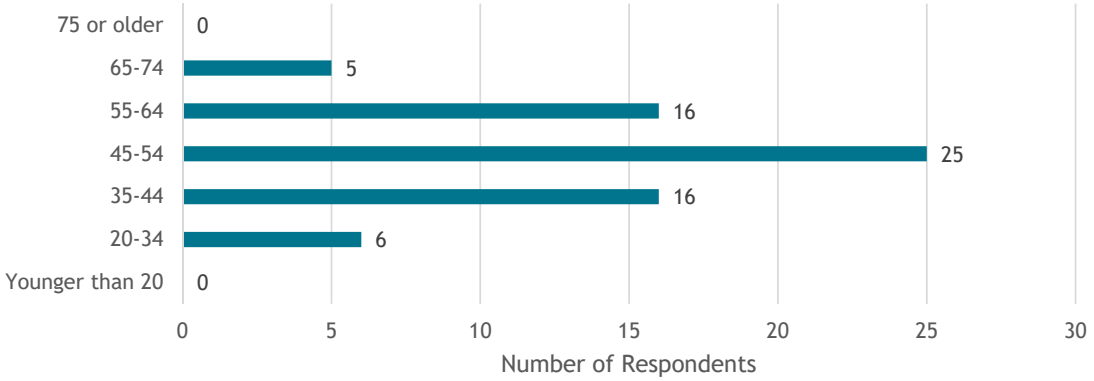
   - 7 said that maintenance of existing parks needs to be a priority.
   - 5 said they would like to see more water features, such as pools and splash pads, at parks.
   - 6 said they want expanded bicycle facilities.
   - 6 said there is a need for an accessible and safe system of interconnected trails.
   - 4 said they want more and improved/expanded sports fields and courts.
   - 2 said the restrooms at Crown Park need to be improved.



DEMOGRAPHIC INFORMATION

Participants from the online open house were asked a series of optional demographic questions.

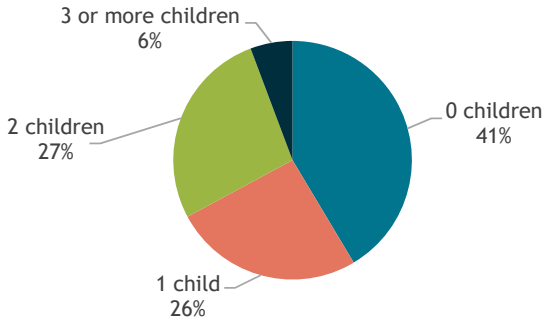
Note: Unless otherwise stated, the percentages listed in the analysis of each question take into consideration the number of participants who responded to the question, not the total number of people who participated in the online open house.



Racial or Ethnic Identity

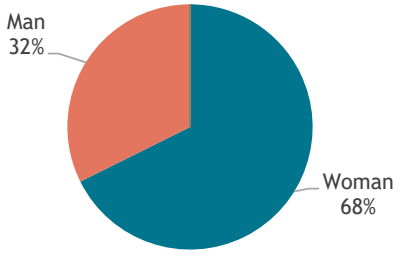
The majority of participants identify as white (88%). The second largest group of participants selected Asian or Asian American (4%).

Age



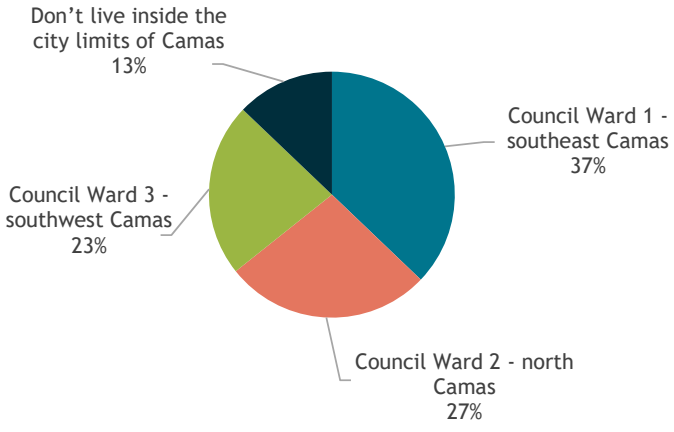
Of those that responded, the **largest group of participants were between the ages of 45 – 54 (37%).** The second largest groups were between the ages of 55 – 64 (24%) and 35-44 (24%)

Number of children in household

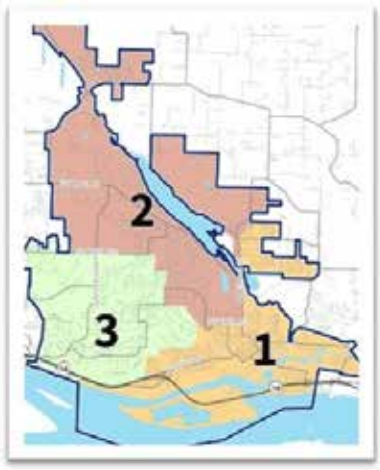


The majority of participants **(41%) indicated they had no children under the age of 18 living in their household.** This was followed by a little more than a quarter (27%) having two children

and 26% having one child.

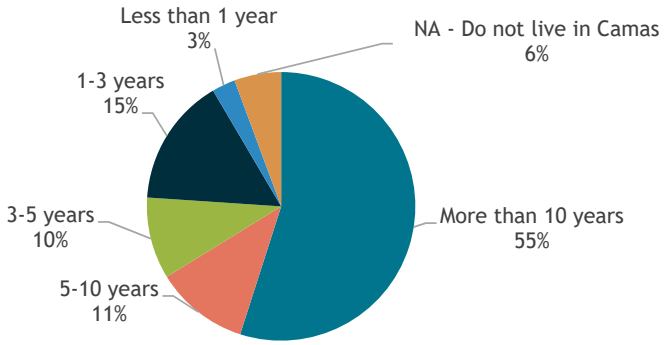


Gender



The majority of participants (68%) identified as women, while 32% identified as men. No one identified as transgender, non-binary, genderqueer, or third gender.

Primary Residence



Most respondents (37%) indicated that they live in Council Ward 1 – southeast Camas. About a quarter of respondents live in Council Ward 2 and a quarter also live in Council Ward 3.

Time living in Camas

Most respondents, 55%, have lived in Camas for over 10 years. This was followed by 15% of respondents saying they have lived in Camas for 1-3 years.

TABLING EVENTS FEEDBACK SUMMARY

This section summarizes the feedback received at the three (3) tabling events held in July and August to build awareness of the PROS Plan Update and share information about the project. Approximately 50 people were engaged at these events. Tabling was held at the following times and places:

- July 31st at Heritage Park from 10a-12p and 1-2p
- August 17th at Concert in the Park from 6:30-8:30p
- August 18 at Camas Farmer's Market from 3-7p

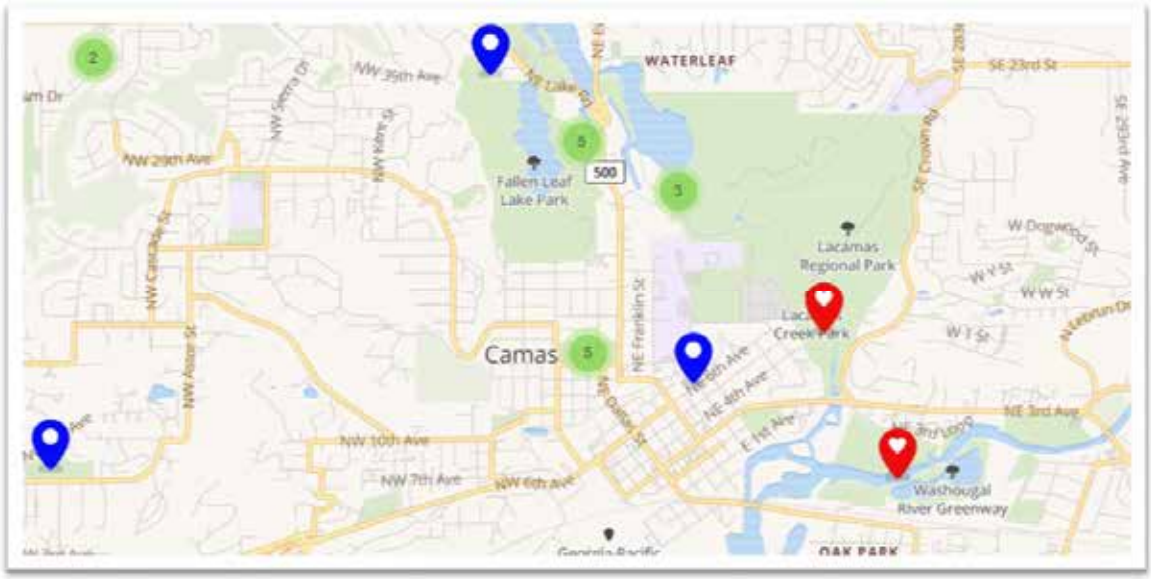
Below is a summary of the feedback we received organized by common theme:

- **Heritage Park and Surrounding Lakes:**
  - **Trail signage is needed** at Heritage Park and Lacamas Lake; topographic maps may be helpful
  - **More outreach, promotion and notification** are needed about the annual Drawdown Event
  - Someone asked **if the lakes are stocked with fish** or if the fish are being studied
  - People expressed **concern about algal blooms** at the lakes
  - Desire for **more tree protection policies**
  - **Recycling bins** are needed
  - Desire for **more educational and interpretive offerings and facilities**
  - More **lake access and beaches** needed
  - **Parking at the lakes is an issue**. A few people mentioned that parking could be added on the north side of Lacamas Lake

  - Concern about **filtration at Lacamas Lake**
  - Concern about **erosion and wear-and-tear to trails around Round Lake** due to bikes
  - Someone mentioned that **Lacamas Creek Trail is blocked**
  - Consider **cutting back foliage in Lacamas Lake** sooner
  - **Fallen Leaf Lake is peaceful**, but sometimes it is easy to get lost
- **Crown Park:**
  - People like that **Crown Park is clean and quiet** – it is the heart of the neighborhood
  - Desire for **restrooms and sprinklers/splash pad**
- **Parks and Recreation in Camas:**
  - Desire for **more facilities to serve people in Camas** (i.e., parks, trails for bicyclists and pedestrians, etc.)
  - Would like to see **better bike connections** from downtown waterfront area to Crown Park
  - Need **more promotion for Concert in the Park** events
- **Other:**
  - People expressed **concern about population growth** in Camas, as well as **increased traffic** – especially when thinking about development in North Shore area
  - Someone mentioned that people are having **survey fatigue** and would have liked to have seen open text questions on the Spring PROS Plan survey
  - Someone mentioned that a **Parks and Recreation QR code** from a month ago is not working
  - There was some **confusion about the summer online open house** – some people thought it was the same as the spring survey

People were able to share on a map the places they like to visit and areas that need improvement. They are as follows:

- **Places people like to visit** (indicated by green dot):
    - Lacamas Lake
    - Heritage Park
    - Fallen Leaf Lake
    - Lacamas Regional Park
    - Lacamas Creek Park
    - Washougal River Greenway
- **Places needing improvement** (indicated by red dot):
    - Open space area on lower end of Lacamas Lake
    - Area between Lacamas Lake and Round Lake
    - Forest Home Park



INTERACTIVE MAP

On the Engage Camas project page, the public was given the opportunity to share which parks, trails, and open spaces they currently visit in Camas (denoted by a red heart pin); where they think improvements need to be made (denoted by a blue pin); and what new things they would like to see offered in Camas' park system (denoted by a yellow star pin). **11 unique users** submitted a total of **22 comments.** Below is a summary of their comments:

- **Places people currently visit:** Fallen Leaf Lake, Washougal River Greenway, Lake to Lake Trail, Lacamas Lake
- **Improvements needed:**
    - **Lake to Lake Trail:** Replace the broken fences and add danger signs around cliffs on both sides of the river, place more trashcans along the trail, replace maps
    - **Mill Ditch Trail:** Fill in Mill Ditch and make it a large accessible walking path
    - **Grass Valley Park:** Play equipment is in disrepair and needs to be replaced
    - **Lacamas Lake Dam:** Extend the fence for safety
    - **Klickitat Park:** Landscaping and removal of dead trees
    - **Roof cleaning and painting** of buildings near Fallen Leaf Lake and Lacamas Lake
    - **Parking on the north side** of Lacamas Lake needed

    - Someone indicated there are **overgrown brambles** behind houses on NW 31st Ave and NW Dahlia Dr
- **Ideas for new park offerings:**
    - **Crown Park:** New/updated programming to tie in with programs/activities to be offered at new Garfield Performing Arts Center, splash pad or kids pool, new restroom
    - **Fallen Leaf Lake:** Splash pad or community fountain, parking lot and picnic tables; retaining walls and a sort of "art walk" fencing could highlight local artistry and sculptures.
- **Other:** Someone was concerned about the Sierra/43rd Street corridor and that because of increased traffic, it needs improvement

Please see **Appendix B** for more details about the comments as well as the specific addresses of the locations or places participants submitted comments about. It may be helpful to view the comments in context with the location they were placed. The issues map and comments are viewable at this link: **https://engagecamas.com/parks-recreation-open-space-comprehensive-plan/maps/camas-park-system-interactive-map**

APPENDICES

APPENDIX A: ONLINE OPEN HOUSE OPEN TEXT QUESTIONS

Below are the unedited comments respondents submitted for the open text questions in the open house.

QUESTION 1: What are you most looking forward to doing again in City parks and facilities as COVID-19 restrictions are lifted? (Select all that apply.)

Those who chose "Other," wrote the following in the open text box:

- Kayaking on the lakes
- River Access for inner tubing
- Skatepark
- Swimming
- Taking child to playgrounds
- Using the splash pad at Crown Park that replaced the pool you tore down. Oh, that's right, you haven't fulfilled that promise yet. And the new bathrooms at Crown Park are wonderful 😉.

QUESTION 5: Please check ALL the ways you would like to get information about Camas' recreation programs and activities.

Those who chose "Other," wrote the following in the open text box:

- Camas Library
- Events Page on Facebook so I can simply add it to my google calendar with ease. Also include link to register there.
- NextDoor
- text
- text

QUESTION 8: Please share any additional needs for park and recreation improvements, programs or activities that you think are important and relevant to the growth of our community for the next five years.

- Algae bloom control at Lacamas Lake

- Crown Park is in dire need to be updated to make the playgrounds safe for children. The community was promised a splash pad when the pool was removed.
- I think providing a walking path from Green Mountain to the Heritage Trail is imperative. I don't know why this wasn't insisted upon during annexation and development approval.
- The current parks are a mess. Weeds are so bad at some parks that you can't even sit on the grass or put a baby on it. The small park area on NW 8th, really?? Weeds up to my knees and so brown. No reason for this. Hire some new employees instead of office workers and suits.
- I'd like to see the existing parks better maintained. I live near Klikitat Park and have had to comment several times over the past several years about how poorly the park is cared for. Oversight is needed apparently. New neighborhoods should be required to have natural green space. Camas has needed sports fields and practice fields for over a decade. Consider turfing existing fields for improved playability ie. GV ball park is almost never game-ready (picture of it on city website is not a real representation.) Better and more access points to put kayaks, canoes, etc. into Lacamas and Round Lakes. Make known how residents can donate or buy new sports equipment/uniforms, etc. for kids who need it. Trail connections are super important with the increased road traffic.
- The city buys LaCamas Swim and Sport and makes it into a Camas recreation center. The loss of crown park pool means no public pools in Camas. Parks department works to get public support to build an aquatics center with a pool that local swim teams can rent and use. Less emphasis on the splash pads, pools get more use by a range of age groups."
- #1 Lighted pickleball courts. #2 Soccer fields/basketball courts #3 Walking trails Pickleball, pickleball, pickleball
- Would like to see development of parking, picnic shelters, and water entry to fallen leaf lake on opposite side off Lake Road.
- Bike safety improvements between north end of Heritage trail and Green Mountain and North Shore Lacamas Connection. That segment of road is very dangerous for bikes and there are no alternate routes.
- We are in desperate need of additional sports fields and a multi use complex. Other cities seem to be way ahead with their facilities vs Camas
- Hi there! I would love recycling options at our parks and promote leave nothing behind. Education about recycling. Also, more education about our native trees, how trees provide oxygen etc., mainly environmental education. Signs and interactive "stations" for this. Educating how we can all make a difference to keep and maintain our natural beauty.

- Please add to the high priority, 2 way Bike paths off the freeway to share with Joggers path along SR500 from downtown all the way to Fern Prairie Market and up or down Lake Road. Huge safety issue!
- Most wanted: Car-free , soft-surfaced walking/running trails
- More adult sports options please!! Would love to see volleyball or a tennis league offered
- Both Forest Home Road and Leadbetter Road have tremendous recreational potential as multi-use roads but current traffic speeds are just too dangerous. Please consider lowering and enforcing traffic speeds on these roads so walkers and bikers can also enjoy the routes. Thanks!
- Sidewalks that connect our neighborhoods and get us to the paths and the trails should be a priority. There are many areas in our city that we cannot access because the sidewalks end.
- Maybe a few trash receptacles on the trails for dog poop bags. Bags are all over the trail.
- Number 1 priority is restrooms - Crown Park, trail heads and open space. This is a public health issue. Life stage definitely affects my priorities. When my kids were young activities such as the Easter Egg Hunt and Boo Bash were important as was safe, accessible and fun playground equipment. Without children in our household, I'm more interested in trails, both walking and biking.
- Please limit horsepower (speed) of boats allowed on Lacamas Lake to reduce/eliminate dangerous wakes and ensure safety of fishing boats, canoes, kayakers and swimmers. Thank you.
- I previously submitted a review on making current renewal or repairs to the current skatepark facility and would be thrilled to have that issue become a part of the discussion. Having past engaged, in discussions with the skatepark committee for tualatin hills park and recreation as well as assisting in maintenance and promotion of a popular indoor skatepark facility in portland. I would very much like to see a renewed look at the existing skatepark facility off of 3rd avenue as well as the adjoining parking lot and water access. I believe significant improvements could be made i.e. lighting and clean up as well as design changes to the actual skatepark. All of which leads to ensuring this site promotes inclusion for kids of all ages and experience levels as well as safety. Overall promoting a more family friendly environment.
- Improvements made on the existing skate park, utilizing someone with actual skatepark design knowledge or experience. Re-designing or rebuilding of the skatepark. Possibly building an all new skatepark with a bike/pump track next to it. The facility could offer a recreational area for kids of all ages to enjoy and stay out of trouble. However the current facility does not meet all levels of experience and is designed poorly, it has resulted in users bringing in outside equipment in order to make it somewhat usable. Also cleaning up the area around it i.e. the parking lot and water access/trails as well as

adding lighting for the park and parking lot would add safety and promote a more family friendly atmosphere.

- We would like to see a pool in Camas again, but perhaps not on the scale of a full aquatic center.
- I walk and bike the Mill Dutch trail regularly and am wondering what is going to happen with the stagnant water in the ditch. It's turning into a mosquito farm. Is the city going to do something with it such as flush it out or fill it in?
- I have been wondering why the play areas aren't covered. Children could play on rainy days and hot days
- The little green space on NW 8th is disgusting. It needs to be taken care. Kids want to play there and the weeds have taken over the grass. City really needs to wake up and take care of what we it has before it adds more to the list. Can't go to any park and put a toddler or crawler down to play in the grass, to many weeds.
- What would be most beneficial is a network of *connected* bike paths and hiking trails not a series of separate, non-contiguous trails, in order to provide safe and extensive opportunities for families and people of all ages. In particular new bike patgs should be integrated with the side walk NOT the road as this is much safer, particularly for children, and will encourage more use by families and bike commuting.
- Exercise equipment in select parks -- pull-up and dip bars, etc.
- It would be great if you could adjust the Camas rules regarding new housing developments to require more green space and/or trails for each large development. This way the city of Camas isn't competing with developers to purchase land for parks and other recreational activities. Allow the developer to buy the land and then require that they build the park you wanted!
- Maintenance on some city-owned trials is non-existent. Vegetation, especially blackberries, hang over the trail in many areas. Some of the trails are so steep in sections that they are pretty much non-usable, especially when it is wet or icy. The city-owned so-called "natural" area and collection pond north of Knapp Street in Parker Estates had maintenance delayed so long that many of the trees have died and beavers moved in further making a mess of the whole thing (project is currently in process to hopefully mitigate). I wish there were more safe places to ride bicycles (road bikes, not mountain or off-road) and that the trail system was more continuous. Ash Creek Park was promised to be developed MANY years ago and nothing has been done with it yet. Parker Estates (where I live) would appreciate it. I would like city staff to walk the full distance of all the trails in the area to get a good understanding of what it is like to live in the neighborhoods and walk them.
- No need for a million dollar pool, just build a splash pad or fountains with wading pools. Keep is accessible and add more parking. Better fishing opportunities on lacamas lake would be good.

- We need to see bathroom facilities in our parks. Crown Park is a beautiful park with ugly dirty porta potties. It's kind of sad. Also since The pool was destroyed CrownmPark has big wide open areas that aren't used for anything.
- I just wish so badly we could have an outdoor pool again! It made Camas so unique and we used it all summer long! I don't understand the cost issue when it comes to an outdoor pool. If you can build an aquatic center, why not an outdoor pool? I will forever be sad that the outdoor pool was taken away. It was a yearly tradition in our family and made Camas unique. It seems like all the fun things for kids are being taken away!!!!
- I love the walking trails through the natural areas SO MUCH!! Would love to have more of them connected. However, would also love to know that they are safe since I'm a woman walking a medium-size, cuddly-looking dog. The recent attack near Round Lake has me avoiding the trails right now. Are there regulations about camping in the local parks, or any way to help our law enforcement actually do the enforcing (they can't do anything about someone breaking a law if the law doesn't exist)? Official programs and organized events aren't particularly useful to me. I just love the natural spaces, so if they're there and accessible (and safe), I'll be so grateful to walk for miles and miles. Thank you!
- I put as my top priority "Outdoor adventure summer camps, including archery..." I would be very interested in these types of activities/camps not only for children and youth, but adults as well. I am a single adult in Camas, and would love to participate in all of the activities that were listed under that option, not only to learn more but also to meet more people in the community. I would love to support the city in creating such programs for kids and adults as well, I'm assuming we have a lot of untapped talent here, i.e. I'm an Herbalist/Botanist/Teacher who already does plant walks, I would be happy to volunteer for the city in putting together some sort of program/activity around that with our trails and greenspaces.
- Need to provide facilities for additional outdoor activities that create community connection and activity. With the number of sporting families Camas lacks facilities that other communities provide.
- Water quality improvements at all of our local lakes/rivers. Also, would like to ensure we don't see homeless camps springing up in our parks/shared forest lands.

APPENDIX B: INTERACTIVE MAP COMMENTS

Below are the unedited comments respondents submitted in the issues map, grouped by address.

Category	Comment	Address

Place I visit now	A trash can at the waterfall would be really wonderful please.	1644 Northeast 5th Court, Camas, Washington 98607, United States
Place I visit now	Love the accessible trail with benches for our elderly family members to rest during their walks, and viewing the wildlife here throughout the seasons	1906 Northeast 3rd Loop, Camas, Washington 98607, United States
Place I visit now	We love the solitude of Fallen Leaf and are here almost daily.	2911 Northeast Everett Street, Camas, Washington 98607, United States
Place I visit now	Great place to hike or trail run	Round Lake Loop Trail, Camas, Washington 98607, United States
Place I visit now	Love the lake for open swimming and kayaking. It's peaceful	2911 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Trash cans next to the map signs would be really wonderful. Additionally, all the maps need to be redone (they've been peeled away).	2700 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Replace the broken fences and add danger signs around cliffs on both sides of the river.	Camas School District #117, 841 NE 22nd Ave, Camas, Washington 98607, United States
Needs improvement	At one point (2-3 years ago) Jerry Atkinson had shown us a concept for filling in the Mill Ditch and making it a large accessible walking path through the town to the trails. Would love to see that happen, or at the very least, clean the mill ditch.	935 Northeast 6th Avenue, Camas, Washington 98607, United States

Needs improvement	Used to take the kids here frequently. Would love to still, but the play equipment is in disrepair. Swings broke a while ago and still aren't replaced. When a bench near the play area was wrecked years back it took months for it to be replaced. The large slide has been broken for over a year and the receiving pole dangerously stuck out where kids run without removal. It gets a ton of use - an upgrade and better maintenance is a must.	2949 Northwest 38th Avenue, Camas, Washington 98607, United States
Needs improvement	I get nervous with small children on the sides of the dam particularly one end that has only half the fence covering the drop	2828 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Multiple trees are dead, pruning of shrubs is half done, mulch needed in landscaping areas, general weed management	824 Northwest Klickitat Street, Camas, Washington 98607, United States
Needs improvement	Roof cleaning and painting of building is needed	2911 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Roof cleaning is needed	Round Lake Loop Trail, Camas, Washington 98607, United States
Idea for something new	Please add a splash pad to Crown Park (similar to beautiful, architecturally-designed Jamison Park splash pad in Pearl District in Portland) which will be a wonderful activity for kids/families	126 Northeast 15th Avenue, Camas, Washington 98607, United States
Idea for something new	Consider new/updated Crown Park programming to tie in with programs/activities to be offered at new Garfield Performing Arts Center -- 2 blocks away, such as regional Art Fair similar to nationally-known Salem Art Fair (Oregon), family	1437 Northeast Everett Street, Camas, Washington 98607, United States

	athletic event similar to Pole Pedal Paddle (Bend, OR), etc. which would boost local economy, increase tourism, and highlight our "Crown Jewel" of a park!	
Idea for something new	A water feature for the kids- pool or splash pad. Something safe and fun for all ages.	Camas Municipal Pool, 120 Northeast 17th Avenue, Camas, Washington 98607, United States
Needs improvement	Adding a splash pad or community fountain, parking lot and picnic tables could be a nice addition to Fallen Leaf Lake area for the community. Retaining walls and a sort of "art walk" fencing could highlight local artistry and scultures.	252 Northwest Lake Road, Camas, Washington 98607, United States
Needs improvement	This Sierra/43rd Street corridor needs speed improvements. With the addition of 7% growth in traffic (prior to new homes being actually completed), the daily traffic including large earth moving vehicles and construction vehicles has dangerously increased speed down this TWENTY FIVE MPH corridor.	1642 Northwest 43rd Avenue, Camas, Washington 98607, United States
Idea for something new	Splash pad would be great	120 Northeast 17th Avenue, Camas, Washington 98607, United States
Needs improvement	Parking at Heritage Park and Round Lake always fill up quickly. Making the north side of the lake more of an attractive destination (with parking) could help distribute the congestion	811 Southeast Leadbetter Road, Camas, Washington 98607, United States
Needs improvement	Brambles overgrowing the path	3105 Northwest 31st Avenue, Camas, Washington 98607, United States

Needs improvement	Needs a nice restroom. A splash park would be nice here since they removed our pool.	120 Northeast 17th Avenue, Camas, Washington 98607, United States

	Karen Gibson, Camas Lacrosse		Trang Lam, Camas Parks & Recreation		
	Nick Kralj, Camas Little League		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion with Field Sport Associations**

PURPOSE

To discuss current interests and future needs addressing sport field improvements and capacity. The meeting took place on July 9, 2021, via a Zoom video conference from 3:30 – 5:00 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about field usage, capacity, maintenance and potentially needed improvements to local sport fields.

Lacrosse Comments

- Lacrosse can only use school-owned facilities due to need for larger field and fencing to manage errant balls. It has been a challenge using Camas School District (CSD) facilities, and the league can't use fields until 5 or 5:30p, which is difficult for elementary and middle school age players
- Prune Hill is the only other field, but it is on a first come, first served arrangement.
- School field have maintenance and quality issues; there are a lot of mole/gopher holes
- Lacrosse is at capacity for the fields it uses. There is competition for field space with soccer (which has every school field booked, except Cardon). If Lacrosse had more field access, then it could accommodate more teams and more localized competition (instead of competing against Portland, Hood River, etc.). All games are on turf fields. The season is in the spring – generally March through June

Little League Comments

- Little league uses a mix of city fields and rents fields from CSD. Little League has a use rights agreement with City for Forest Home Park, which is used primarily for games. Softball is exclusively at Doc Harris. Lower divisions use Doc Harris and Woodburn. Younger players use Crown Park, Goot and Klickitat.

Interview Notes (continued)

Other Comments

- CSD is starting middle school soccer and spring football. These will impact field availability.
- Within Camas, there are only two turf fields, and both are at CSD. High school sports get priority use, and CSD charges a lot for field rental ($100/hr.). Little League pays CSD $15,000 annually for field rentals.
- Soccer mostly uses Doc Harris, with Woodburn as an alternative
- CYSF (fall) plays at Sky Ridge, upper and lower
- Pop Warner practices at Prune Hill; they would like more field space and turf
- Babe Ruth is exclusively at Louis Bloch, but the league seems to be diminishing and numbers are down

Sport Field Needs

- Near-term – increase field capacity by improving field quality
- Prune Hill is turfed for baseball and football. The baseball infield is in rough shape and is weedy
- Prune Hill has infrastructure (bleachers, fencing, parking, restroom), so improve the function of the field
- Adding lights adds capacity, and there are few neighbors near Prune Hill who might be impacted
- The property across the street from Prune Hill is for sale again. Maybe consider this as an expansion site to accommodate a complex
- Grass Valley and Prune Hill are weedy. City could do weed mitigation to improve field grass quality
- Drainage issues at Grass Valley (doesn't dry out until June) and Forest Home (outfield is wet)
- The irrigation system at Forest Home Park is aging – leaks, broken sprinkler heads, etc.
- Fallen Leaf Park could be utilized for more capacity as a single event space. Parking is limited and a challenge, but it has lights and restroom
- The leagues need to work with school district to build out other CSD property

Collaboration with City

- Communication with City for Little League has been tremendous. Dennis Ryan has helped with weed control, plugging the outfield, fertilizing and providing dumpster use
- Little League volunteers add a lot of value by improving field conditions
- Leagues can support field improvements and development with fundraisers, grant support and sweat equity
- The field turf program offered as part of the pool levy was rejected, but it could have made improvements to Prune Hill, Dorothy Fox and Forest Home
- Sport leagues are volunteer organizations and have transient membership. Is there a role for the city in helping with continuity of leadership – maybe a leadership forum. Continuity of leadership could help develop a more collective voice across sports

Other Feedback: Annette and Nick provided written comments via email to the discussion questions. These are attached on the following pages.

-- End of Notes --

City of Camas
Parks, Recreation & Open Space Plan Update
Camas Parks and Recreation

July 9, 2021
Sport Fields Group – 3:30 p.m.
Discussion Questions

The following are intended to spark group discussion and interaction; questions posed/topics addressed might not follow as shown.

Introductions & Background
- Brief overview of PROS Plan & process
  Camas Lacrosse - 7/6/21 by Annette Anderson Youth Girls VP

Group Discussion Questions
- What has been the trend in participation by your league/sport over the past 3 years? (i.e., trending up/down; number of participants by age group/gender) **Trending up. K-12 girls and boys. 2019 - 280 2020 - 410 2021- 201**

- What sport recreation opportunities are missing? What facilities do you see as the most needed in the community? **Turfed fields.**

- Discuss coordination between leagues (overlapping calendars, multi-use fields, seasonality, etc). Do you have any concerns about availability and scheduling? Would a coordinated annual booking system, with a nominal fee help? **Our concerns have been with the High School kicking us off the only turf fields in the city. The youth have no other options. Also with only being able to use school run fields we are not allowed to use them until 5:30 at night which causes problems with booking so many teams and also with the younger elementary players. If they were city run fields we could have the elementary kids start practices after school gets out at 2:30.**

- Besides Camas Parks & Rec fields, what other fields does your group/organization use? **The school distrtict. ZAC, Doc Harris, Cardon.**

- What does your organization see as the key priorities for the city's system of parks and sport fields? **Short term capacity increase - turf at Prune Hill, Grass Valley, Dorothy Fox. Long term - new complex**

- Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project completed to improve the parks system and/or local sport facilities.
  2 turf fields at Prune Hill

- How is field maintenance? Are there ways to improve this, especially through partnerships?
  We have been maintaining Prune Hill, ZAC, and Doc Harris E & F fields filling the mole holes multiple times a year. If the dirt/sand was provided that would be nice.

- With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years? **Getting fields turffed so that we can be competitive with the teams in Portland and Vancouver.**

- What contribution, collaboration, and responsibilities can your organization bring to the future implementation of the City's public park and recreation system? Are there opportunities for more collaborative projects between the leagues and City? **We could help provide funding through fundraising activities and sponsorships for the turf fields.**

Additional Information Request (not for group conversation – please email feedback)

- Describe the current state and quality of City of Camas-managed athletic fields and sport courts (quantity, quality, geographic distribution, etc.) **The quantity is good, quality is lacking in turf (all of our games in Vancouver and Portland are played on turf, their players practice on turf. Our players practice on grass and it is a hard transition for them during game days because the ball bounces different and is harder to pickup.). Geographic distribution is good.**
- How is the geographic distribution of fields / courts? Are they well distributed? Where are more needed? **Yes well distributed.**

City of Camas
Parks, Recreation & Open Space Plan Update
Camas Parks and Recreation

July 9, 2021
Sport Fields Group – 3:30 p.m.
Discussion Questions

The following are intended to spark group discussion and interaction; questions posed/topics addressed might not follow as shown.

Introductions & Background
- Brief overview of PROS Plan & process

Camas Little Leage Responses - 7/5/2021 by Nick Kralj, president

Group Discussion Questions
- What has been the trend in participation by your league/sport over the past 3 years? (i.e., trending up/down; number of participants by age group/gender)
  Trending steady; 2020 = 483 participants, 2019 = 513 participants, 2018 = 476 participants
  Boys and girls baseball and softball ages 5-13 (could be thru 15 soon)
- What sport recreation opportunities are missing? What facilities do you see as the most needed in the community?
  Field capacity is and will be the primary issue. Under-utilization of existing space due to weather or infastrucure issues. Growing community will make it even harder. Could be solved in some cases with turf and lights and other infrastucture like ADA dugouts and bathrooms, and drainage
- Discuss coordination between leagues (overlapping calendars, multi-use fields, seasonality, etc). Do you have any concerns about availability and scheduling? Would a coordinated annual booking system, with a nominal fee help?
  We feel the above would create more opportunities for all leagues. For instance, Fallen Leaf turfed could be used for football, lacrosse and soccer offseason, and with turf and lights, even during season with proper scheduling
- Besides Camas Parks & Rec fields, what other fields does your group/organization use?
  Camas school district rental Doc, other leagues fields, such as Schmid and others in Washougal
- What does your organization see as the key priorities for the city's system of parks and sport fields?
  Short term capacity increase - turf, lights at key facilities that are not optimized, such as Prune Hill, Fallen Leaf, Grass Valley, Dorothy Fox, and Goot Park. Long term - new complex
- Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project completed to improve the parks system and/or local sport facilities.
  Turf and lights added to parks facilities to increase time available/not waste existing space
- How is field maintenance? Are there ways to improve this, especially through partnerships?
  This is good. We utilize our field rights usage agreement to maintain fields with support from Cama
  We appreciate our relationship with Parks and Rec today.
- With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years?
  Creating more capacity for our growing community. With more people coming, the fields are close to maxed in their current state. New opportunities will be needed
- What contribution, collaboration, and responsibilities can your organization bring to the future implementation of the City's public park and recreation system? Are there opportunities for more collaborative projects between the leagues and City?
  We can provide seed funding to contribute to grants for lights and turf. Our membership base is passionate and ready to help support. We can also reach out to business community partners as we
- Are there other organizations/individuals that the City could bring to the table as partners?
  Yes, we can work with other business organizations to provide loand, donations and other financial support. We have run this exercise before and would be able to leveage our network.

Additional Information Request (not for group conversation – please email feedback)

- Describe the current state and quality of City of Camas-managed athletic fields and sport courts (quantity, quality, geographic distribution, etc.) See below**
- How is the geographic distribution of fields / courts? Are they well distributed? Where are more needed? Distribution is reasonably good. We have land/parks that are nicely spread out; however, we cannot use them fully due to poor drainage, poor maintenance, lack of infastructure such as lights, dugouts, restrooms, etc.
  Long-term, we feel that a new complex would benefit Camas the most, as it has the ability to generate rental income as well as provide tourism revenue to the local area from tournaments.

** Forest Home Park - 2 baseball fields with lights. Needed: ADA dugouts, bathrooms, and pathing, as well as outfield drainage and turf. Already has lights.
** Prune Hill - excellent setting, however, hardly used due to exceptionally poor drainage and no lights. Turf and lights needed. Dugouts and storeage are needed as well
** Fallen Leaf - excellent facility, but limited parking and poor drainage. Not really available until late June/early July which is too late. Our spring season is primary and is late Feb thru July. Turf recommended.
** Grass Valley Park - limited parking and poor drainage. Not really available until late June/early July which is too late for baseball/softball.
** Goot Park - limited parking and poor drainage. Not really available until late June/ early July which is too late for baseball/softball
**Dorothy Fox - no infastructure available. Need to build out.
** Other practice fields used include today Klickitat Park, Crown Park, Doc A, B, C, Liberty

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	July 6, 2021	**Time:**	8:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Patty Barnard, Mountain bike advocate		Katy Daane, Parks & Recreation Commissioner		
	Jeff Cary, Camas Bikes		David Dewey, Parks & Recreation Commissioner		
	Jeremy Mores, Evergreen Mountain Bike Alliance		Trang Lam, Camas Parks & Recreation		
	Ross Swanson, Portland Parks & Recreation		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion on Mountain Biking & Pump Track Interests**

PURPOSE

To discuss current trends, interests and future needs addressing mountain biking and skills development. The meeting took place on July 6, 2021, via a Zoom video conference from 8:00 – 9:30 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion. Ross Swanson from Portland Parks and Recreation was invited to share information about Gateway Green to offer context about design, development and management considerations. The remainder of the session focused on local interests for trail and biking facilities.

Overview of Gateway Green in Portland

- Ross provided an overview of the Gateway Green project and some lessons learned. The 24-acre site lies between TriMet and railroad property. It is a bike to and walk to site only. It has 70-80' of vertical drop and offers good length on laps. It was built in three phases, in part to see how people use the site. The city legitimized the park with restrooms and designed it as a four-hour experience.
- It provides for a range of users: dirt jumpers & BMX, mountain bikers, skaters and runners
- Cross country runners use the site; it is a compatible use
- Pump track is paved and designed/built by Velos

  Tips:
  - Don't assume your rider base is just 24-35 year old white men.
  - Gather data to prove users
  - Consider other features (Gateway Green added nature play area) to give parents an opportunity to play with one kid while the other rides

Interview Notes (continued)

- Re-frame the perceptions about users: everyone wants to progress and get better; most are willing to help each other

Comments on Camas' Parks and Trails System

- Camas has great trails
- Current usage is outgrowing Lacamas Park
- Heritage Trail is a way to get to Lacamas Park for mountain bikers; trail usage on Heritage Trail is heavy
- Fallen Leaf Lake offers more advanced options for mountain bikers
- New neighborhoods northeast of lake attract residents with interests in trails and mountain biking; however, since COVID, there is more trail usage overall
- Need to have trails built by experienced trail builders and in places sanctioned for trails. Installation of rogue trails by people cutting/digging routes is a problem the City is trying to address.
- There is a need for places for kids to practice on stryders/skoots
- There is a need for a pump track and more mountain bike trails
- Camas has become more of a destination and will continue as new trails are added.
- Have the information to keep people in town and as part of the circuit of regional tourism

Usage & Potential

- COVID has super-charged trends: more usage on trails, wider age distribution of riders, wider age groups
- Consider dedicated infrastructure, directional trails and signage for mountain bikers.
- Green Mountain has potential and could use lower slope area for bike park/skills – perimeter could be for climbing trail and multi-use trail
- New trails are being installed on Larch Mountain / Livingstone
- Consider 'competition-ready' facilities, whether mountain bike trail or pump track or both; people will travel for different experiences. Have a destination bike park with a 'race worthy' track. Design it large to avoid user conflicts. Promote the city/region as a destination and tap into tax and tourism revenue
- Hub-type trail system – how do we find places to build or connect to grow the system over time
- Lake Oswego is building a hub and starting with a network of one trail. It will be a catalyst project to hold the growing system together

Connections to Consider

- Have a network of trails connecting all parts of town. Include a network of flat dirt trails as a great start. Kids can build confidence with beginner mountain bike rides – provide a place for youth to go (i.e., lighted pump track)
- Make connections in areas near Everett and Everett to Leadbetter
- Mill Ditch could act as a longer, linear ribbon
- Make connections along the north side of Lacamas Lake
- Improve road crossings and safety between Fallen Leaf Lake and Lacamas Park

Interview Notes (continued)

Future Investments

- Pump track with lights, parking and restroom, signage/maps, app coordination so people know what to expect
- Have (city) staff who knows community, culture and mountain biking; utilize consultant teams to guide growth and development of a trail system or biking facility
- Use sustainable trail design principles (i.e., 5-7% grade slopes with switchbacks)
- Know the stumbling blocks and how to overcome, especially related to regulations, development codes and local leadership.
- Environmental overlays (development code, zoning, SEPA) – educate regulators
- Be aware of the potential neighbors to act as NIMBYs
- Policymaker rides and outings to buoy interest and build relationships/support

Other examples noted

- Hood River, OR
- Duthie Hills (Issaquah), WA
- Valmont, CO
- Whistler / BC
- Bentonville, AR
- Bend, OR
- Klamath Falls, OR
- Tiger Mountain (Issaquah/Maple Valley area), WA

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	July 7, 2021	**Time:**	12:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Cassi Marshall, Ivy League		Janet Nenadic, All Weather Walkers		
	Duff Linde, Evergreen Mountain Bike Alliance		Ryan Bridges Golb, Intern with WTA		
	Lyndee Cunningham, local volunteer		Trang Lam, Camas Parks & Recreation		
			Steve Duh, Conservation Technix		
Subject:	**Stakeholder Group Discussion with Bike and Pedestrian Interests**				

PURPOSE

To discuss current interests and future needs addressing bicycle and pedestrian facilities and trails. The meeting took place on July 7, 2021, via a Zoom video conference from noon – 1:30 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about bicycle and pedestrian trail needs.

Initial Comments

- The City has great trails and has done a great job building trails for the community
- Quality of life in Camas is good because of trails
- There are concerns about growth and expansion - houses getting closer together. With population growth and more people on the trails, what can the city do to expand use and access to trails?
- There is some confusion of who maintains/owns the different trails (i.e., city/county)
- Love the Trails to Tables challenge
- Connectivity is important; complete loops and circuits. Connect to Washougal, to the Port and to levee trail. Educate Camas residents about the trail linkages
- Link neighborhoods to downtown via ped/bike friendly routes;
- Develop the Mill Ditch alignment; it's ripe for something amazing. In the short-term, start with basic use and pathway. In long-term, build a shared-use trail
- Create stronger linkages between Camas and Washougal, via Oak Park or Goot Park or WRG
- In the North Shore and around the lake trail, that loop will require work for water crossings, safe street crossings and road segment closures to make it work in the long-term

Interview Notes (continued)

- The regional Lewis & Clark Trail from refuge to refuge is not well known to the group, but they noted interest and support.

Conflicts

- Users are generally getting along and sharing trails; conflicts are limited and sharing trails is better than it has been in recent years
- Sometimes walkers are intimidated by bikers
- Since COVID, usage on trails has increased, but there has been a low number of conflicts
- Conflict issues are a two-way street. Some walkers have earplugs and dogs and are not paying attention to the surroundings
- Heritage Trail is getting crowded, especially with families and groups of riders. The trail is undersized. If Lake Road had better bike lanes, that might alleviate some of the demand from Heritage Trail. Some users are starting to avoid Heritage Trail due to overuse.
- One spillover trail is Lacamas Creek, but there is simply more trail usage on all the trails. Ostensen Canyon is also underutilized. If improved, this trail could make for better connections to neighborhoods near downtown

Amenities

- Provide restrooms at trailheads. For organized walking groups, they tend to plan the routes to have a restroom at a mid-point during their walks.
- All Weather Walkers prefer paved or gravel trails
- Trails with views should be a priority

Hierarchy

- Should single track trails be shared or not. One-way routes, like Red Tape Trail, is one approach to managing users and flow. Larch Mountain has all shared use trails, and most are 'green' and 'blue' trails
- Family rides – Little Washougal River Greenway Trail – gets washed out each year. The city has changed the design and improved, so it has been recently fixed
- Waterfront Trail (Port) and Dike Trail (Refuge) are not in the Camas system, but these are great destinations to link to
- Improve sidewalks and wayfinding for connections from Prune Hill to downtown. Maybe improved connectivity will reduce parking demand at parks. Sidewalk network is an important part of the overall trail network. Work to fill gaps
- Forest Home Park – Forest Home Road might make for a good connection.

Collaborations

- The Evergreen Mountain Bike Alliance will continue to be involved for trail maintenance; will want to stay informed about trail projects
- All Weather Walkers has trail days to encourage people to come out on trails (5K & 10K routes); will help get the word out and make for bigger events

Interview Notes (continued)

Getting youth and next generation involved

- Engage kids at young age with volunteer projects and outings, like Watershed Alliance and trail/beach clean-ups
- Scouts bring packs out for clean-ups and other projects
- Camas has a deep pool of volunteers to call on to help
- High School has a 'green club' and could assist with park/trail care
- Have mini Sunday Parkways (ala Portland) throughout Camas

Other Feedback (emailed responses)

From Ryan Ojerio, SW Washington Regional Manager, Washington Trails Association

How do you feel the City is doing in meeting the needs for recreational trails and connectivity in its park system?
I don't think I have enough information to have a solid opinion on this question since I don't live in Camas. My personal experience is limited to using the Lacamas Heritage Trail and the trails at Lacamas Park which I think are really fun to hike run and mountain bike on. I think that a survey of local residents who use the trail system would have a better opinion than mine. We do have WTA members and volunteers who live in Camas, but I haven't talked with them about this question.

What are the gaps, missing links or barriers that need to be addressed? What destinations need to be connected?
Similar to the first question I think I need more information to have a really solid opinion. I'm assuming that the question pertains to all sorts of parks, trails and places that people living in Camas recreate in regardless of the ultimate land manager (e.g., Camp Bonneville will be a Clark County facility, but I expect it will be a destination for local residents.) My guess is that people experience barriers getting to the Waterfront and eventually when Steigerwald is finished they may want to get down there without having to use the car. Likewise, Green Mountain and perhaps Camp Bonneville to the north seem like good destinations for trail-based recreation. Getting to those places may prove difficult for people who don't have ready access to a car or the physical ability to ride a bike all the way there and have enough energy left over to recreate. Some sort of public transit option would be ideal for a future where personal automobiles are less common than they are today.

There seems to be an unmet demand for trail experiences specific two bicycles I think that the proliferation of user-created routes that were adopted into the Lacamas Park trail system is an example of rapidly changing demographic trends over the past 20 years that outpaced agencies' abilities' to evolve and adapt the trail system accordingly.

At WTA we are generally supportive other user types such as mountain bikes and equestrians more and more we find that people who wreck rate on trails enjoy a variety of modes. leave that working with our partners Hugh create Trail systems that meet a diversity of Interest helps people to find Trail base Recreation experiences matched to their particular interest at that time in their life.

Back in the 80s I was heavily into mountain biking in high school which continued through college. Later on I became passionate about hiking and backpacking. Once I had kids I got really excited about trails where I could take our stroller. I enjoy hiking with my parents and their physical limitations are best served by accessible fails. I'm fortunate at this point in my life that I can enjoy a hard trail run, bombing down a mountain bike downhill trail and spending

Interview Notes (continued)

time with my young children and older parents on a quiet path. I think that this whole-life-cycle approach to designing trail systems is the right lens to look at planning processes.

Are there any conflicts on multi-use trails? Please share some examples. Besides making the trail a single-use trails (i.e., Pedestrian or Bicyclist) what other ideas do you have for reducing these conflicts?
I think that there are always tensions between users on trails. Rather than focusing on specific examples of conflict I think it makes more sense to seek examples where there are many users on a trail system and the tensions are minimal. In the last few decades, a lot of effort has gone into education and promoting empathy between trail users which is good, but I think more emphasis needs to go into thoughtful system design that provides areas within the trail system where users are more likely to find an experience free from intrusions. An "intrusion" is an interaction with a different trail user that breaks sense of peace or flow or rhythm that takes the person's mind off the enjoyment of the experience.

I think that ski areas are a good example of making the most out of a limited geographic footprint to serve a lot of people. A busy downhill ski area and serves a wide range of physical abilities and people seeking different types of experiences from snowboarding in a terrain park to skiing steep powder in the trees. The design of the system allows people to find activity zones that are matched to their skill and even when it gets crowded, they're sharing those spaces with like-minded people generally traveling at similar speeds. In this way the sense of intrusion is minimized, and the design of the system helps reduce the number of times incompatible uses clash like having the dual slalom dump out into the bunny hill - that would be a very bad idea.

But at ski areas there are also places where everybody shares the same space in relative harmony like on lift lines, in the lodge, or even on those wide cat tracks that people use to get from one place to another. Any trail system needs to have segments that are shared use. Some facilities like bathrooms in parking lots that are shared best parts of the trail system or people in or immersed in their particular activity might be designed for that particular activity and that particular speed; these are directional to avoid head-to-head encounters which are particularly intrusive.

I think that single use designations are useful tool, but I also think you can get a lot of use segregation with thoughtful design that nudges people into trail segments where they want to be, and they will naturally congregate with other people doing the same type of activity.

What does you and/or your organization see as the key priorities for the city's local trail system?
One of our focal areas is providing natural surface trail experiences that connect people with nature in their neighborhood. this could include regional parks that someone might take a bus to or ride their bike to, essentially, it's trying to lower the barriers for everyone to have access to healthy physical activities.

Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project or connection completed to improve the city's trail system.
5 years goes pretty fast when it comes to planning trails at least that's been my experience! there are probably several other projects that other folks would know more about but there is an area adjacent to Round Lake that used to have a user created BMX track could be developed in a thoughtful way to provide trail recreation and environmental protection.

With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years?

Interview Notes (continued)

I find our organization can work more efficiently if we have good relationships and open lines of communication with agencies and other trail user groups sometimes this coordination is driven by the land manager but often due to lack of capacity is informal and based on relationships between trail user groups that evolve organically. Perhaps a good goal for the city would be to figure out how to tap into the different volunteer organizations that could help with maintenance and new construction in the future.

What contribution, collaboration and responsibilities can your organization bring to the future implementation of your vision for the City's trail system? Are there other organizations/individuals that the City could bring to the table as partners?
We've done new trail design, construction and do lots of maintenance work throughout Clark County and the state. Depending on the project and how it aligns with our focal areas we could become heavily engaged or act more as advisor; it all depends on what elements come out of the planning process.

From Jean M. Avery, Vancouver, WA

Heart-felt thanks to Camas for the excellent park system (close to me in East Vancouver). I especially enjoy:
- Round Lake
- Fallen Leaf Lake
- Lacamas Heritage Trail

Overall, I think the parks, trails, and restrooms are in excellent condition. The concerns I have probably relate more to the nature of society, rather than to any improvements that Camas can make, per se.

My thoughts:
1. When the Camas lilies bloom, please mark off the trails (as was done at the end of this season). The fragile blooms got stepped on, with the increased foot traffic.
2. Consider closing off informal side trails, which trample fragile vegetation.
3. Similarly, clarify which trails are for walkers only, without bikers. (I think you do this.)
4. Please provide more trash containers and more dog poop bags. (Unfortunately, folks don't always pick up after themselves.)
5. I'm not a dog owner, but I believe there is a leash law. I'm not sure how that can be enforced. (I see MANY more dogs in recent months, and quite a few off-leash.)
6.. As you know, there is some graffiti (mostly under the bridge). Does it last if the graffiti is painted over? Maybe this could be a service project for a civic group?
7. There's a lot of invasive ivy. Bravo to the Ivy League for removing some of it. But the job is a huge one.
8.The recent news article about the assault near Round Lake was very disturbing. I don't know what can be done. It may come down to individual vigilance.
9. I have not yet seen overnight campers around Round Lake or Fallen Leaf Lake. I hope it stays that way.
10. If things reach the point where "monitors" are needed, here's an idea from the Hoyt arboretum: They have volunteers who walk the trails, direct folks, identify trees, and (yes) pick up trash.
11. I did not realize that Fallen Leaf Lake park can be closed for private events. If so, I hope the revenue collected outweighs the inconvenience to the public.

My requests:

Interview Notes (continued)

1. In the past, I attended a civic meeting regarding the North Shore of Lacamas Lake. Please limit the amount of tree removal. (It still is a jolt to me when I see the houses on the edge of the Round Lake trails. Do we have to have more houses so close to the park??)
2. The new turnaround at the foot of 1st Ave. (before Everett) is VERY confusing. (I've heard this from other folks as well.)

Thank you for requesting public input.

From Lyndee Cunningham (to Cassi Marshall and forwarded to Trang Lam)

Cassi, I asked a lot of people of varying ages about current and future state of our Camas parks and trails. Some of them had done the survey, but most had not heard of it. A few found it on "Next Door' site. I wish we'd all remember to check out the Parks Dept website more often.

Some common consensus follows:
- Everyone mentions more and expansive trails and connecting all possible ones.
- All want a trail around Lacamas Lake some day.
- Some are afraid there will soon be charges for parking at parks and trails. Everyone prefers to pay more taxes to compensate.
- Too many are confused by the new roundabout.

The Osprey Walking Group input:
- Asking about new property north of Lacamas and hope it will be connected easily to Lacamas Park trails. Also, asking about trail east of Steigerwald continuing farther east.
- Reporting dangers of loose gravel on down slopes of Service roads. Two of their group fell last rainy season when the gullies and rivulets formed, and gravel became loosened. Suggested scraping of those downhill slopes.
- No one enforcing leash law and poop bags not being picked up. One person leaving her bag trailside informed Osprey gal that because bag was biodegradable it was okay. False information. I know that the bag may be, but feces is not. Watershed Alliance informed us volunteers that feces and cigarette butts are the worst toxins for fish and wildlife in waterways.
- Would like to use the ditch more if filled in and looking more appealing.
- Will there be a trail someday around Fallen Leaf Lake?
- Worried about the browning of our trees. Will it become as bad as on Oregon side of river? One gal would like to start a campaign called Save Our Trees before it is too late.
- All are still angry that Crown Park pool is gone. Would like to pay more taxes to get it back.
- They all love and respect the quality of our parks and trails and seem genuinely grateful for them. All are aware of maintaining that same quality with a growing population, yet change is inevitable.

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan /Vancouver PROS Plan		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	September 16, 2021	**Time:**	10:30 am
Notes by:	Laura Hoggatt, City of Vancouver Steve Duh, Conservation Technix				
Participant:	Jenna Kay, Clark County Community Planning / Commission on Aging Rebecca Royce, Clark County Community Services / Community Development Block Grant Scott McCallum, Superintendent at Washington State School for the Blind Terese Rognmo, Director of the SW Washington Center of the Deaf and Hard of Hearing		Gigi Olguin, Hispanic Metropolitan Chamber of Commerce of SW Washington Trang Lam, City of Camas, Parks and Recreation Director Laura Hoggatt, City of Vancouver Parks, Recreation and Cultural Services Planner Steve Duh, Conservation Technix		
Subject:	**Stakeholder Group Discussion on Under-Represented Voices**				

PURPOSE

To discuss current interests and future needs addressing community members of traditionally under-represented voices. The meeting took place on September 16, 2021, via a Zoom video conference from 10:30 am – noon.

DISCUSSION

The discussion began with brief introductions and an overview of the PROS Plan updates for Camas and Vancouver. A set of questions were used to initiate the group discussion.

Trang Lam, City of Camas Parks and Recreation Director, provided an overview of their PROS Plan update, noting that it began in the spring of this year. The PROS Plan will cover the six-year period from 2022-2028 and provide a decision-making framework to steward and build upon a park, trail and recreation system that serves and enhances our community's health and quality of life – now and into the future.

Laura Hoggatt provided a brief overview of the City of Vancouver, Parks, Recreation and Cultural Services Comprehensive Plan update and stressed that the plan fundamentally is based on community engagement. A variety of methods were used for public involvement that include two surveys, in-person community outreach at multiple locations, stakeholder group discussions, and information dispersion through multiple resources.

Interview Notes (continued)

Steve Duh, Conservation Technix, provided additional background for the purpose of the comprehensive plan framework and noted that the adoption and certification of the plan for each city fulfills the requirements of the State of Washington Recreation and Conservation Office (RCO) for grant funding eligibility.

Introductions:

- Gigi Olguin is a Business Development Coordinator for the Hispanic Metropolitan Chamber of Commerce in the Clark County area. She works with Hispanic community members to develop a business plan, provides support through business coaching, connects them to resources and additional services.
- Scott McCallum is the Superintendent for WA State School for the Blind, serves on multiple boards and commissions, including the State of WA Commission for blind children. He currently Lives in the Salmon Creek area.
- Terese Rognmo is the Director for the SW Washington Center for the Deaf and Hard of Hearing. She is currently responsible for three regions that includes Clark County, Cowlitz County and the Yakima area. The center was established in 1993 and located in Vancouver, Washington. The center provides advocacy, assistance for basic needs, training services, referrals, advocacy workshops and general support. Their mission is to improve and enhance the lives of deaf and hard of hearing community members in the southwestern Washington region.
- Rebecca Royce, Clark County Community Services oversees the Community Development Block Grant (CDBG) program for affordable housing and community development. She also oversees programs for the community action program. There is a requirement to complete a comprehensive community assessment. The most recent report is available at: https://clark.wa.gov/community-services/community-action
- Jenna Kay is a Land Use Planner for Clark County Community Planning. She also provides support for the Commission on Aging. Part of her participation role in the conversation will center on advocacy for the goals and objectives of the Commission.

Comments on Improving Access to Recreational Opportunities

- Connect directly with blind and low vision people. Some resources include the National Federation for the Blind and the Washington Council for the Blind and Low Vision People.
- Conduct an accessibility audit of the website and signage. Communications and signage need to be accessible.
    - Partner with people who have expertise in varying abilities and pay them for their time.
    - Provide signage in braille.
    - Use simple language.
    - Easier fonts that can be accessed brail are important.
    - Dark backgrounds with yellow/gold colored text are helpful.
    - Pictures in signage are sometimes distracting; they are difficult to read linguistically.
- The Commission on Aging has talked about universal design going beyond ADA accessibility. For instance, benches with backs areas to rest. Utilize an audit of current amenities to help move toward universal design.
- Walking trails are very popular for aging. Many are mobility device (e.g., walkers, scooters) friendly, and others are not.
- Access to bathrooms and water (fountains) is important for all users.

Interview Notes (continued)

- Parks provide multi-generational spaces, and the placement of amenities (such as benches or picnic tables near playgrounds) should be accommodated.
- For those who are struggling financially, accessing parking and having to pay to park are barriers.
- It would be beneficial to provide free parking passes for low income where fees are required. Consider creating options for income-qualified users for free parking or nearby parking in neighborhoods. Also, consider public transportation access and overlay transit route maps with park planning and design.
- It would be nice if the parks had a visual identifier in the park or along a trail, like a map or wayfinding signs that are visually accessible and for the user to know 'you are here'.
- Another thing to consider is disaster events (e.g., flood, wind, ice). How is the park system going to notify people at the park that something is happening if they are blind or hearing impaired? Some ideas could include a flashing light for hearing impaired, a loudspeaker and clear messaging to get people to safety.
- For some in the Latinx community, they don't consider hiking as something to do. The trail areas do not feel welcoming, there are concerns there may not be any phone reception, and the signs are only in English and English units (miles only, instead of miles plus kilometers).
- Many families enjoy picnic shelters and large gatherings in the parks; however, the fees that are added are often intimidating, such as a pinata fee. Re-branding fees as clean-up fees is a better direction.
- There are Hispanic business owners who would like to opportunities to provide pop-up vendors booths at games and events to sell their food or commercial goods. The process to get a permit or who to contact is challenging. Opportunities could be shared with community members to participate at events besides the Farmer's Market.
- Consider paying community members as consultants for advice for development and design. A list of vendors to assist could be developed, and then continue to add folks to the list. If this approach is used, consider what kind of insurance or licensing might be needed. Get help from community-based groups to build up the roster or list.

<u>Age groups or communities needing more focus</u>

- Provide opportunities for a wide range of users that are inter-generational and inter-cultural, so the design does not silo people by age.
- Restrooms should be gender-inclusive and not binary. Gender specific bathrooms are not good for the LBGTQ community.
- Restrooms with baby changing stations should always be provided.

<u>Other barriers to address</u>

- Not everyone knows what is available.
- Make sure communications are provided in the top languages, such as Russian, Vietnamese and Pacific Island languages.
- Schools are trusted resources, use trusted community-based organizations to build trust for both culture and community.
- If tapping into local residents as support for outreach or translations, do not expect them to do this for free. Provide a fee for the service; compensate people for the experience they bring to the community.

Interview Notes (continued)

- The association for blind athletes a great resource. The athletes have provided tandem bike rides for individuals who would otherwise never get to have the experience of riding a bicycle. The program is run by a person who is low vision. They have also conducted hikes and kayak/paddleboard experiences.
- Larger parks are well advertised. More information is needed to help people be aware of all of the parks. A key or legend of what is available at each location and other information would also be helpful.
- There is wonderful new signage in Vancouver for the Waterfront park. There is little signage for neighborhood parks.
- In terms of access to parks, there is a lack of sidewalks to get to a park to walk or roll, and many are not located near public transit etc.
- The Community Development Block Grant (CDBG) can help with funding to build or improve sidewalks in low-income neighborhoods.

Future Investments

- Add interpretive cultural and historical information to the parks or trails to honor local heritage. Highlight tribal history. This information can draw people into a park, and it helps teach kids. This is very important to tribal members. Provide signage in a blind/deaf-friendly way.
- Expand access for transportation. A shuttle bus could be considered to get people to Vancouver Lake, Frenchman's Bar or other regional parks.
- The Hispanic Chamber of Commerce has clients that would like an opportunity to set up a booth for soccer or other events. Is there a way to help provide support or do something in the future? For example, during a Sunday league championship there are clients who would like to set up a booth for a couple of hours. This is common in the communities where they used to live.
- The COVID pandemic has left us to reimagine what life could be like in the future. For the aging community we are considering how future of programming might need to look different. If recreation programs and senior centers were the only socializing people utilized before the pandemic, how are they doing now? What can we do to make it better?
- The old papermill sight could be used for a venue that might provide indoor and outdoor amenities. Expand the site to provide a great variety of opportunities that brings the whole community together. The old Torpedo Factory in Alexandria, VA was repurposed as an Arts Center, this could provide some ideas.
- If there was a web page that would provide more history, please include video with captions.

Elements to prioritize to advance diversity, equity and inclusion in the park and open space system

- Hire diverse staff and appoint diverse commissions/advisory boards. Provide support, such as a stipend, childcare, free parking, transportation if needed, etc. Don’t make it a burden.
- Make sure to provide communication access for any kind of meetings, such as live captioning. This includes having back up plans in place.
- Make sure you provide the opportunity and hear from the voices of diverse individuals. Talk to the people who are experiencing challenges.
- Go beyond just the requirements for ADA per code. We can all do much better and make our parks and recreation spaces accessible for all.

Interview Notes (continued)

Other Feedback (emailed response)

From Yasmina Aknin, Clark County Chronic Disease Prevention Team Input

A wide array of amenities exists today – from sport fields and courts, to aquatics, to walking/running trails, to playgrounds, to lake and river water access. What recreation opportunities are missing or should be improved to meet the needs of the group(s) you regularly work with and/or support? For example, what is missing and needs to be addressed.

- More public pools needed.
- Extend and expand paved trails for multi-use (example: extend Round Lake pavement)
- Ensure and expand recreation equipment for children living with disabilities
- Improve lighting and other safety features to existing trails (i.e., Burnt Bridge Trail)
- Add more parks (even small ones) or nature spaces in low-income areas
- Add pump station/repair station near recreation water areas for paddle boarders
- Ensure all parks have picnic/gathering places (ideally near play structures, etc.)
- Ensure access to clean bathrooms at all parks, even small ones or porta-potty service during Summer

At recreation centers:

- Affordable childcare services on a regular basis/schedule.
- Breastfeeding/breast-pumping clean, safe spaces and/or family "rooms" for changing diapers/ breastfeeding
- Information about parks/park amenities in different languages
- Bilingual staff
- Grants for children's memberships
- Add a private shower section for respect to some cultures/families

What age groups or communities need more focus in general?

- Community members that don't speak English
- People with disabilities (including youth)
- Seniors
- Low-income communities
- BIPOC
- Teens (offer varied sport opportunities at parks- pickle ball, tennis, skateboarding, etc.)
- New moms/parents (fitness classes/support groups like lactation support, post-partum blues, play groups)

Jump forward 5 years and imagine Vancouver and Camas in 2026. Please share your vision for one stand-out project/amenity to be completed or initiative started to improve access to the park and recreation system.

- Big Dream: add at least two recreation centers in priority areas (low-income areas) with full amenities that are welcoming to all.
- Realistic Dream 1#: Make Burnt Creek Trail more inviting with enhanced safety features, improved signage in multi-language (graffiti free) and other improvements to increase use/value to community
- Realistic Dream #2: Add water fixture and restroom to the Evergreen Park on the Fourth Plain corridor/add camera surveillance system

Interview Notes (continued)

What, if any, barriers do you see or face in accessing either city's park and recreation systems? (e.g., physical access, safety, cultural concerns, communications/information)

- Reduce parking fees
- Make recreation memberships more accessible via multi-lingual applications, promotional materials, diverse staff, etc.
- Some community members may not feel welcome, work to make recreation systems/parks more inviting to diverse cultures/BIPOC communities
- Language/multiple language spoken and offered
- Increase connectivity of trails/transportation systems
- Increase access to off-leash dog parks with walking areas
- Multi-use areas (i.e., play structures next to soccer areas, etc.)

How would you suggest increasing awareness about parks, trails or recreation programs within your community?

- Promote recreation opportunities in multiple languages
- Host Open Houses with multi-cultural activities (pinata-making, etc.)
- "If You Build It, They Will Come" (Washington County does a great job of building inviting spaces and collaborating with schools/youth programs to promote them)
- Create culturally specific trail groups so community members feel safer exploring new trails/being out in nature (i.e., not alone)
- Host walking events for older adults (partner with senior centers/AAA/independent living centers)
- Host day trips to fun places/trails, rivers in our county i.e., Salmon related activities, nature conservancy related, etc. select days for different language hosts/guides

What should the City of Vancouver and the City of Camas prioritize in order to advance diversity, equity and inclusion in its parks and facilities?

- There are significant language barriers. More bilingual staff and multi-lingual signage, promotional materials and forms in multiple language needed at recreation facilities/centers. Translated signs on trails.
- Increase safety -lighting, visibility (open-spaces)
- Add parks/recreation areas in areas of density that are easily accessibility
- Reduce barriers to accessing fee-based programs, streamline application processes and eligibility for paid programming
- Promote services in diverse areas

What contribution or collaboration can you or your organization bring to the advancement of inclusion in either city's park system?

- CCPH shares the vision of encouraging people being active (indoor and outdoors) and could assist with community engagement.

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	August 11, 2021	**Time:**	10:30 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Monica Tubberville, City of Vancouver		Sadie Prodanovich, Port of Camas-Wahougal		
	Michelle Wright, City of Washougal		Trang Lam, Camas Parks & Recreation		
	Kevin Tyler, Clark County		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion with Parks & Recreation Agencies**

PURPOSE

To discuss current park system planning issues and explore opportunities for future partnership or collaboration efforts. The meeting took place on August 11, 2021, via a Zoom video conference from 10:30am to noon.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process.

Past Collaborations with Camas

- Clark County worked with the city on past Legacy Land acquisitions around Lacamas Lake and leveraged Conservation Futures dollars to secure some fantastic property, such as CJ Dens. The County has also participated in visioning exercises for planning the Lacamas Lake north shore area.
- The Port coordinated with Camas and Washougal on the wayfinding system.
- Vancouver appreciated Camas' support for the Joint Agency Review for the Lewis and Clark Regional Trail. The city also coordinated with Camas on a code amendment to extend service limits/areas related to park impact fees. Vancouver has also coordinated with Camas on land acquisitions.

Initial Comments on Park System

- The city's focus around Lacamas Lake has been exemplary. The collection of properties is becoming a regional park in a bigger fashion
- Continue to explore grant pursuits that serve Camas and neighboring jurisdictions
- Camas has done a great job land banking for open space and recreation. Some properties are developed, but there exists more opportunities for trail connections
- The city should also spread park development around the city and not place all of its focus around the lakes

Interview Notes (continued)

- Washougal is just starting recreation programming and is looking for partners, especially with regard to access to fields and facilities for future program offerings. For example, Washougal doesn't have a full court basketball court in its system, so it is looking for partners with facilities available for use.
- Communications – consideration should be given to a joint publication serving a wider area of the county. Monica referenced that a joint park and trail map was compiled about 4-5 years ago, and it should be updated. Washougal commented that for partnership project(s), coordinate to bring each jurisdictions' Parks Board/Commission along so that project funding can be prioritized similarly in each jurisdiction.

Future Needs

Comments that are not site specific are needs that are also generally needed in other jurisdictions.

- With its waterfront development, the Port has had a lot of requests for pickleball
- A recreation center for indoor programming is a need and should be reconsidered at a lower cost point
- Green Mountain is underutilized, and more emphasis should be placed on access, trails and viewpoints. Trails should be multi-use, as well as consider equestrian use. It could function a bit like Whipple Creek Park and would attract folks for vistas and wildlife.
- Reservable space for gatherings, parties and picnics.
- Clean and safe spaces – address encampment encroachments
- Playgrounds with universal accessibility
- Access to water in some form – during high heat periods, the waterfronts are overrun. Consider a splash pad as an alternative. Access to rivers and lakes is a big draw for users from across the region – including from Multnomah County
- Opportunity for Camas & Washougal to partner on dog park

Coordination with School Districts

- Be cautious developing city amenities on land owned by the school district. In Vancouver, there has been some push back on utilizing school sites for community needs.
- If possible, pursue joint use or maintenance agreements and develop relationships with the local principals to have conversations specific to each school site.
- As the school districts have staff who oversee sport field and facility rentals, the city should also have a staff person who is responsible for coordinating and programming city sport fields and assets.

Other Comments

- Vancouver is working with County GIS to develop a DEI mapping tool that also includes finer grain details about the park system, such as the quality of amenities, and not just whether a site is developed or undeveloped.
- Camas and Vancouver staff suggested the potential to partner on a stakeholder session to engage underrepresented community groups/members
- The group also agreed on the value of sharing contact information for stakeholders, including tribal contacts

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 28, 2021	**Time:**	10:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Nan Henriksen, former Mayor		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Nan Henriksen**

PURPOSE

To discuss current interests and future needs for parks, recreation and trails in Camas with a former mayor. The meeting took place on June 28, 2021, via a Zoom teleconference from 10:00 – 10:40 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park, recreation and open space system.

Background

- Value the abundance of parks, open space and trails
- In the 1980s, the City of Camas set out a new vision for itself, knowing that the mill was not going to be sustained. The immediate concerns were on replacing the economic drivers of the city, but, as mayor, Nan also aimed to maintain focus on 'softer' things, such as parks and open space, related to the city's quality of life. At the time, Crown Zellerbach represented about 80% of the tax base of the city.
- In the '80s and '90s, the City was blessed with a high ratio of parklands to population, and her goal was to maintain a high ratio into the future. She worked with community members to position the city for a $1 million bond to acquire parks and open space. Bond funds were leveraged with donations to acquire some of the lands along the Washougal River.
- She convinced City Council to hire a City Administrator (Lloyd Halverson), and he maintained a focus on securing additional lands for the community.

Interview Notes (continued)

Facility Improvements & Ideas

- Connectivity of trails relies on development occurring. The City may need to think through the issue of timing and connections more, since development happens in a haphazard manner.
- With Trang, the focus should be to secure connectivity of trails where development hasn't occurred yet.
- The City has great trails now, but many of them go nowhere. Connectivity for wildlife is also important.
- There should be easy access for and use of parks and trails by people who have disabilities or physical limitations. ADA improvements and universal access are important, so are benches along trails.
- The City should get an off-leash area established and consider working with Washougal to make it happen. Do a joint project.
- On a pool and community center, the focus should be on a more modest pool project. The City needs to keep the project going, but some trust has been lost with the community after the most recent attempt for voter approval.
- Parks and Recreation can be a bit of a bastard child regarding the city budget. Staff have done wonderfully putting on events. The City should work out an arrangement with Camas Community Education to offer more programs. Find ways to augment and coordinate.
- Would like to see more programs designed for those with physical disabilities – whether through old age or other health issues (e.g., seated exercises, stretching or 'walks for walkers')
- On the whole, Parks and Recreation has done a great job with what they have had

Focus areas

- Finish planning and then implement a splash pad at Crown Park
- Develop an off-leash area
- Develop a modest pool and community center
- Trail connectivity

Other Comments

- Keep a focus on 'old' Camas for improvements and enhancements to parks and amenities. Development regulations that are in place will ensure newly developed areas have parks and open spaces.
- Kids at Oak Park and other older areas need to see upgrades and improved access close-in to Camas downtown. The City should aim to provide similar opportunities as those who live in new areas up on the hill.
- Offer programs in Spanish if possible and coordinate with Washougal to make it happen

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Telephone call	**Interview Date:**	June 18, 2021	**Time:**	1:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Lloyd Halverson, former city administrator		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Lloyd Halverson**

PURPOSE

To discuss current interests and future needs for parks, open space and trails in Camas with a former city administrator. The meeting took place on June 18, 2021 via a telephone call from 1:00 – 1:40 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background Comments

- PROS Plan is a guide and vision for the city, and it will unlock resources.
- The parks and open space part of the PROS Plan and park system is about public space, and public space builds community (meeting people on trails, being in parks)
- City has done a great job with downtown, open spaces, trails and parks.
- Lloyd is a strong proponent of acquire now and develop later mantra. Plan for the next 10-15 years for open space – define what is needed and what gaps exist. Then, pursue purchases with help of dedications, donations, grants and partnerships. For the PROS Plan, a special emphasis should be on identifying the missing pieces in the open space system. The parks and open space elements of the plan should be opportunistic and seize opportunities as the arise or are created.

Future Improvements & Opportunities

- Ostenson Canyon to Dorothy Fox Park – has missing link. Also connect to Drake St Park. Use sidewalk and acquire additional lands to make trail linkage happen.
- The former GPO site (Benton triangle) will have reclamation costs, but it could be used to link a looped trail to Lacamas Park

Interview Notes (continued)

- On recreation, volunteer groups have been exceptionally strong in Camas for youth sports, along with private groups filling a need, such as gymnastics through Vega??
- Downtown events have been the shining star and have help build place together.
- Local taxpayers have financed significant amounts of public land, and too much is locked up to keep the public out. Coordinate more with the school district to explore how to let more people use school district lands and facilities. That would be a great step.
- Trang is dynamic and has the energetic drive to gets plan done. Amazing things will happen, and the community and Council will support it.
- The future is bright.

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 18, 2021	**Time:**	10:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Carrie Schulstad, Downtown Camas Association		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Downtown Camas Association**

PURPOSE

To discuss current interests and future needs for parks, recreation and trails in Camas with a representative of the local downtown business association. The meeting took place on June 18, 2021 via a Zoom teleconference from 10:00 – 11:10 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background

- The Downtown camas Association (DCA) is a Main Street program and has been established for 15 years. In the early 2000s, several local business owners worked with a city committee to do visioning for the Camas downtown. Events and activities were planned and added, and the 1st Fridays has been ongoing since 2005. During the 2008-2009 recession, the City decided it could no longer support the downtown, and the association found organizational support and resources via the Main Streets program.
- The DCA supports numerous events, including 1st Fridays and the passport program, to promote downtown businesses. The refurbished downtown hotel and improvements to the Port waterfront continue to attract visitors to Camas.

Coordination with City

- The City Parks & Recreation Department partnered with the Camas School District for a socially distanced holiday event in 2020 during the pandemic. It included a passport, story walks and displays in downtown.

Interview Notes (continued)

- In discussions with Trang, the idea of connecting 'urban and nature' surfaced, which could be a way to encourage and link restaurant visits with exploring the trail network – especially trails close to downtown. Trails to Tables was conceived as a five hike passport with five restaurant visits for a pint glass give-away and entry into a raffle for a gift card.
- Another idea is to work with the city for a joint community calendar for the website, so more people can see all of the activities available in Camas.
- The City's acquisition of the Mill Ditch property will create a wide, walking/biking trail to connect downtown to the lakes. It would go by the Performing Art Center and connects businesses, the arts and recreation.
- Downtown is like a park, and the city has made investments over time, with tree plantings in the 1960s and landscaping in the 1990s. Planters on 3rd Avenue are not irrigated, and the city should find resources to care for the past investments.

Facility Improvements & Ideas

- Directional signage and wayfinding to direct people to downtown from the lakes and associated trails.
- Include brochure holders for maps and trail brochures
- A pool and community center that is affordable for Camas could bring people together. Maybe a seasonal, covered outdoor pool could suffice, instead of a large aquatic center. The city should look at the GP property as a potential site. It doesn't require a lot of clean-up, and it is close to downtown.
- According to DCA surveys, other local interests include a bowling alley, rock wall for climbing and splash pad.
- Emphasizing the trail system could be a communications piece, with signage to support a mural tour, bronze bird art or connections to other trails.
- Camas has a history of providing top tier sports through the school district, but there needs to be more accommodation for community recreation sports for all, not just elite players.
- Explore collaborations with the library and Journey for additional studios or classes (i.e., jazz, dance, art)
- Consider food carts or concessions at Heritage Park, especially since it is a popular venue for paddle boarding and kayak launching.

Other Comments

- See Fort Collins CO as an example of an extended downtown promenade that integrates art, fountains, recreation, plaza/stage space to restaurants and shops along the way.

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 30, 2021	**Time:**	12:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Kurt Stonex, Olson Engineering		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Development Community Representative**

PURPOSE

To discuss coordination and future needs for parks, open space and trails in Camas with a representative of the local residential development community. The meeting took place on June 30, 2021, via a Zoom teleconference from 12:00 – 12:45 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background & Opening Comments

- Camas has been very aggressive in acquiring parks and open space property during the time Lloyd Halverson was city administrator.
- With its older regulations, the city used to require 30% set-aside for open space. The City was sued and lost. The Planned Unit Development regulations still require land dedication.
- Camas staff have been good with coordinating with and negotiating with developers for layout and design to accommodate set-asides and the use of PIF payments and credits. Developers are generally willing to provide parks with their projects, since the City is willing to use cash and credits and have the developer build the requested parks and trails. Staff have been very flexible and good to work with, and the CIP has accommodated that flexibility.

Recreation-related Improvements Seen as Positive for Developers

- Trails
- Critical area set asides / open space
- Small neighborhood parks and pocket parks

Interview Notes (continued)

Facility Improvements & Ideas

- Green Mountain will be hard to develop. It could have trails, and there is a flatter area on top that might work for picnic area and viewpoint. Depending on access and need, the site might be good for an outdoor education center or nature park. More extensive mountain biking trails might work as well.
- In the Lacamas Lake area, trails are critical to connect the north side of the lake to Green Mountain and to downtown.
- Looking out 50 years, the City should consider what to do with the GP site on the Columbia River.

Coordinating with Developers

- Ridgefield example, staff worked through development agreement and used PIF credits and outright purchase to secure land from developer (required some, credited some and bought some to compile a larger site that was desired). Deer Creek subdivision and Grass Valley were put together in a similar manner.
- Regarding PIF, the development community is resigned to the fact that they will pay impact fees, and most are fine with building parks or trails as part of a project and getting PIF credit. It's important for the public to know that PIF is passed through to the buyer as part of the cost of the home.
- Going forward, City staff should continue working with the same attitude of 'working together' with the development community as a partner. Continue to have flexibility with the CIP and adjust project cost allocations as appropriate with the projects considered and negotiated with developers.

-- End of Notes --

Appendix D
Site Observations

ASH CREEK PARK

9.5 acres (acquired: 2000) **Neighborhood /Undeveloped**

Capital Improvement & Planning Opportunities:

- This site is a wooded natural area. There is a fenced in storm facility on the site. On street parking is available and there is pedestrian access.
- The natural area has potential to be an amenity in the park with trails and interpretive signs. This undeveloped site is in the middle of a neighborhood and would be a good location for a small play area and shelter.

Maintenance Considerations:

- Manage as Open Space until developed.
- The site is very wet, especially on the south and west sides.
- Currently, no public access is provided.

Amenities:

- Wooded natural area

BAZ RIVERFRONT PARK

0.79 acres (acquired: 1989) **Special Facility**

Capital Improvement & Planning Opportunities:

- Opportunity for park master plan process to define site and connect to the river.
- Add interpretive signs.
- Add ADA accommodations for parking and paths to picnic table and trail.

Maintenance Considerations:

- Manage as Open Space with an added emphasis on weed/invasive plant management.

Amenities:

- Limited on street parking along road shoulder
- Picnic table
- Access to Washougal River Greenway Trail
- Narrow deer paths to waterfront
- Fishing
- Swimming
- Natural areas
- Scenic views of the Washougal River

BENTON PARK

4.8 acres (acquired: 1988, 2004) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Improve pedestrian connection from Couch Street to asphalt path.
- Add more walking paths and trails with interpretive signs and rest areas.
- Add benches or tables along asphalt path.
- Standardize site furnishings to match other parks.

Maintenance Considerations:

- Most of the park is wooded area with a trail. Maintain trail surface.
- Enhance natural areas and remove invasive weeds.
- Add additional gravel and compact trail to provide a firm surface that is ADA accessible. Remove drops and elevation changes between the trail and the sidewalk and concrete table pads to provide a smooth transition.

Amenities:

- Earthen/Gravel trail
- Asphalt path
- Tables
- Passive lawn
- Community garden (partner managed)
- Natural areas
- View of creek

COOPERS VIEW PARK

2.5 acres (acquired: 2007) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Consider adding a restroom and drinking fountain.
- Install dog waste station.
- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Currently there are not accessible routes around the tables under the shelter for accessibility. Remove some of tables to provide more space and allow better circulation & accessibility.
- Install a ramp into play area with a slide.

Maintenance Considerations:

- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- On street parking
- Picnic tables with built in checkerboard
- Bike racks
- Bench
- Asphalt path
- Playground age 2-5 years old with nature play area
- Slide
- Trash receptacle
- Passive/active lawn

CROWN PARK

7.1 acres (acquired: 1987) **Community**

Capital Improvement & Planning Opportunities:

- Implement site master plan.

Maintenance Considerations:

- Address drainage problems in T-ball field and around shelter.
- Repair/re-surface tennis court.
- Repair asphalt paths.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Off street parking
- Park building
- Picnic tables
- Benches
- Tennis courts with storage unit for pickleball nets
- Trash receptacles
- Trash dumpster
- Water spigot
- Playground 1 (Swing set and play equipment)
- Playground 2 (Age 5-12, Slide and play equipment)
- Playground 3 (Age 2-5, Swings and play equipment)
- Double sided wall ball court
- Carousel play equipment
- Lending library
- 20x20 shelter with lighting and electrical outlet
- T-ball field
- Passive/active lawn
- Volleyball court
- Horseshoe Pits with fence
- Porta putties

DOROTHY FOX PARK

4.8 acres (acquired: 1986, 1989) **Neighborhood**

Capital Improvement & Planning Opportunities:

- ADA improvements: playground ramp, pathway to tables, companion seating.

Maintenance Considerations:

- Replace faded on-leash sign.
- Annual evaluation and supplement of playground safety surface.
- Lawn and pathway repairs.
- Standardize furnishings.

Amenities:

- Interior parking
- Trash receptacles
- Restroom with storage chase
- Gear storage box
- Soccer field with goals
- Playground, age 2-5
- Benches
- Picnic table
- ½ basketball court
- Open lawn areas
- Storm water swale/facility

FALLEN LEAF LAKE PARK

32.9 acres (acquired: 2011) **Regional**

Capital Improvement & Planning Opportunities:

- Implement park master plan.
- Remove volleyball nets.
- ADA improvements: accessible route to lawn, install ADA accessible tables.
- Consider a nature play area for this park.

Maintenance Considerations:

- Clear vegetation around picnic tables along waterfront.
- Cleanup shelter.
- Inspect and repair roof.
- Repain tables.
- The ramp connection the gravel parking area to the shelter has a 1-2” lip, repair to remove lip and provide ADA access from parking lot to shelter.

Amenities:

- Off street gravel parking (inside gate)
- Informal gravel parking for day use parking (outside gate)
- RV host site
- Rough lawn/game area
- Lawn along lake
- Volleyball
- Tables
- Benches
- Large shelter with moveable tables (sinks, preparation tables, lights and power outlets)
- Restroom in shelter
- Trails
- Trash receptacles
- Trash dumpster

FOREST HOME PARK

5.3 acres (acquired: 1987) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Add accessible routes to existing picnic tables, playgrounds and baseball fields and provide accessible clearance around amenities.
- Provide a drinking fountain and shelter.
- Provide additional ADA Parking spaces.
- Replace picnic tables with accessible models.
- Provide bike racks.
- Add other baseball amenities.
- Consider replacing wood bleachers with metal for easier maintenance.

Maintenance Considerations:

- Annual evaluation and supplement of playground safety surface.
- Pathway repairs.
- Standardize furnishings.

Amenities:

- Off street parking
- Trash receptacles
- Trash dumpster
- Picnic tables
- Baseball fields with dugouts, backstops, commentator boxes and bleachers
- Playground 1 (age 2-12)
- Playground 2 (age 2-5)
- Bench
- Passive/active lawn
- ½ Basketball court (no striping)
- Dog waste stations
- Concession building
- Maintenance building
- Porta potty

GOOT PARK

17.0 acres (acquired: 1987, 2006) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Repair or replace bleachers.
- Replace picnic tables with accessible models.
- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Consider adding a shelter to this site.

Maintenance Considerations:

- Remove graffiti from maintenance structures.
- Repaint rusted play equipment.
- Annual evaluation and supplement of playground safety surface.
- Remove weeds in paved areas, shrub beds and lawn.
- Striping at basketball court is worn, restripe basketball court.
- Standardize furnishings.

Amenities:

- Off street parking
- ½ Basketball court
- Maintenance building
- Restroom
- Picnic tables
- Benches
- Bike rack
- Trash receptacles
- Soccer field with goals
- Baseball field with backstop and bleachers
- Wayfinding signs
- Passive/active lawn
- Dog waste station
- Drinking fountain
- Lending library
- Playground 1 (age 2-12, Swings and play equipment)
- Playground 2 (1 piece of play equipment)
- Water spigot
- Natural area

GRASS VALLEY PARK

24.9 acres (acquired: 1999, 2006) **Community**

Capital Improvement & Planning Opportunities:

- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Currently there are not accessible routes around the tables under the shelter for accessibility. Remove some of tables to provide more space and allow better circulation & accessibility.
- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- ADA improvements: accessible routes to tables, drinking fountain and trash grills, install playground ramp, provide companion seating.

Maintenance Considerations:

- Replace the missing restroom signs.
- Repair/re-surface tennis court.
- Remove weeds in paved areas, shrub beds and lawn.
- There are drainage problems in softball field that need to be resolved.
- Lawn has damage from gophers, control gopher population and repair lawn.
- There are minor cracks in paths that need repair.
- Vegetation is encroaching onto asphalt path, clear vegetation.
- Annual evaluation and supplement of playground safety surface.
- There is missing playground equipment, either repair or remove.
- Standardize furnishings.

Amenities:

- Off street parking
- Memorial brick pavers
- Picnic tables
- Bike rack
- BBQ grill
- Restrooms w/storage chase
- Drinking fountains
- Trash receptacles
- Tennis courts with practice wall and fence
- ½ Basketball court
- Softball field w/ backstop
- Playground ages 2-12
- 35’x45’ Shelter with lighting and electrical outlets
- 12’x20’ Shelter
- Asphalt loop path
- Signed natural areas

GREEN MOUNTAIN PARK

4.6 acres (acquired: ----) **Neighborhood**

Capital Improvement & Planning Opportunities:

- ADA improvements: accessible route to picnic tables, provide companion seating.

Maintenance Considerations:

- Replace the missing volleyball net.
- Remove weeds in lawn area and reseed bare spots.
- There are drainage problems in lawn area that need to be resolved.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- On street parking
- Restroom building
- Picnic tables
- Bike racks
- Benches
- Drinking fountains
- Full basketball court with striping
- Volleyball court
- 20’x20’ Picnic shelter
- Playground age 2-12 years old
- Asphalt paths
- Trash receptacles
- Passive/active lawn
- Dog waste station

HERITAGE PARK

26.9 acres (acquired: 1993) **Community**

Capital Improvement & Planning Opportunities:

- Gate access control improvements.
- Separate motorized & non-motorized launching.
- Opportunity for bird watching and interpretive signage. These could be combined with rest areas along the Lacamas/Heritage trail.
- Improve waterfront/fishing.
- Consider a large shelter for bigger groups.
- ADA improvements: signs for ADA parking stalls, provide access to grills.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Pathway repair.
- Enhance natural areas and remove invasive weeds.
- Standardize furnishings.

Amenities:

- Off street parking
- Lacamas/Heritage Trail (asphalt or crushed rock)
- Mowed meadows
- Benches along trail
- Views of lake
- Watercraft rentals (kayaks, standup paddle boards)
- Asphalt paths
- Restroom with drinking fountain
- Playground age 2-5
- Grills
- Boat ramp with floating docks and staging area
- Fishing/waterfront area
- Trash dumpster

KLICKITAT PARK

9.4 acres (acquired: 2001) **Neighborhood**

Capital Improvement & Planning Opportunities:

- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- ADA improvements: accessible routes to tables and benches, provide alternate route to viewing area, provide accessible routes to the play areas.

Maintenance Considerations:

- Remove weeds in shrub areas and lawn and play areas
- Annual evaluation and supplement of playground safety surface.
- Control gopher population and repair lawn.
- Replace broken table.
- Clear storm grates.
- Add mulch to plant beds and redefine edges.
- Pathway repair and clearing.
- Add restroom signs.
- Remove tennis backboard.
- Replace unhealthy/failing trees.
- Re-stripe basketball court.
- Replace missing signs.
- Standardize furnishings.

Amenities:

- Interior parking
- Trash dumpster
- Drinking fountain
- Bike rack
- ½ basketball court w/ ¾ fence and wall ball
- Dog waste dispenser
- Play area 1 w/ swings
- Play area 2 age 2-12
- Trash receptacles

LACAMAS HEIGHTS PARK

2.3 acres (acquired: 2006) **Neighborhood /Undeveloped**

Capital Improvement & Planning Opportunities:

- The location is in the middle of a neighborhood and adjacent to Camas High School. Existing pedestrian access is easy and the high school parking lot is close enough that it could be used for parking during off school hours.
- About half of this site is covered in mature trees with lawn cover. There are gentle slopes throughout site. The Butler reservoir facility is located on the adjacent parcel to the west, with a fence around it.
- A playground, basketball court, picnic tables, shelter, walking paths should be considered for future development. This site might be a good location for a future dog park.

Maintenance Considerations:

- Manage as Open Space until developed.

Amenities:

- Trash receptacles
- Bike rack
- Picnic tables
- Bench
- Parking
- Playground
- Baseball/softball field
- Portable toilet

LACAMAS LAKE LODGE & CONFERENCE CENTER

4.3 acres (acquired: 2000) **Regional**

Capital Improvement & Planning Opportunities:

- None noted.

Maintenance Considerations:

- Enhance natural areas and remove invasive weeds.
- Manage and cleanup goose waste.

Amenities:

- Off street parking
- Passive lawn
- Trash receptacles
- Recycling receptacle
- Conference center building
- Patio with view of lake
- Access to pier
- Connecting path to heritage park

LOUIS BLOCH PARK

4.9 acres (acquired: 1987) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Future park site planning to determine potential new amenities.
- ADA improvements: accessible routes to picnic tables, enlarge pads to provide accessible clearance, provide paved access to playgrounds.
- Consider adding another drinking fountain.
- Replace picnic tables in baseball area.

Maintenance Considerations:

- Restripe parking spaces.
- Control gopher population and repair lawn.
- Remove weeds in paved areas, shrub beds and lawn.
- Re-stripe basketball court and repair pavement.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Off street parking
- Fenced in baseball field with backstop, bullpens
- Picnic tables
- Benches
- Concession building
- Commemorative plinth
- Restroom in baseball area
- Restroom in park
- Maintenance building
- Commentators building
- Lending library
- Playground 1 (swings)
- Playground 2
- Trash receptacles
- Recycling receptacles
- Trash dumpster
- Drinking fountain
- Dog waste station
- Bleachers
- ½ Basketball court
- Wayfinding signs
- Passive/active lawn

OAK PARK

2.5 acres (acquired: 1995) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Replace porta potty with a permanent restroom.
- Consider a shelter and picnic area.
- ADA improvements: accessible routes to tables, basketball court and trash grills, provide playground ramp.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Annual evaluation and supplement of playground safety surface.
- Clean moss from asphalt path.

Amenities:

- On street parking
- Playground age 2-5
- Picnic tables
- Benches
- Grill
- Passive/active lawn
- ½ Basketball court
- Porta potty

OSTENSON CANYON PARK

8.2 acres (acquired: 2013) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Conduct park site master plan process to guide development of open, upper shelf as neighborhood park.

Maintenance Considerations:

- Manage as Open Space until developed.

Amenities:

- Trash receptacles
- Bike rack
- Picnic tables
- Bench
- Parking
- Playground
- Baseball/softball field
- Portable toilet

PRUNE HILL SPORTS PARK

8.8 acres (acquired: 1997) **Community**

Capital Improvement & Planning Opportunities:

- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- Add benches, tables and consider a small shelter.
- Add more shade trees near playground, behind bleachers and dugouts and along perimeter of sports fields.
- Stripe basketball courts and install a perimeter fence.
- Install a ramp into playground to provide an ADA accessible route. Sidewalk is sunken next to curb, repair to provide an accessible route into the playground.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Repair drainage problems in baseball field.
- Replace ball fence on east side of park.
- Control gopher population and repair lawn.
- Pathway repair.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Shared off street parking with school
- Free library box
- 2 trash receptacles
- Ramp into park
- Asphalt paths with loop path
- Multisport fields with permanent and moveable soccer goals
- Baseball field with backstop, bleachers and storage bin
- Playground age 2-12
- ½ Basketball courts with no striping
- Storage bin near soccer fields
- Natural area next to fields with radio tower and access drive
- Passive/active lawn

SANDY SWIMMING HOLE

1.4 acres (joint property with Washougal) **Special Facility**

Capital Improvement & Planning Opportunities:

- Parking improvements and expansion.

Maintenance Considerations:

- This swimming hole is very popular. The beach access and experience looked great, but the minimal parking was a major limitation.
- No ADA accessible route to beach.

Amenities:

- 17 – standard stalls
- 1ADA stall (not on designated accessible route, not compliant, not properly signed)
- 6 Movable Recycling and Trash Receptacles
- Paved Overlook/Deck area with 2-picnic tables and 1 – bench
- Identification sign
- Various regulatory signs.

SKATE PARK

0.9 acres (acquired: 1987) **Special Facility**

Capital Improvement & Planning Opportunities:

- Redesign/add to skate park.
- Add permanent restroom, drinking fountain and shelter with lawn area.
- Existing parking lot is large, if it isn't fully utilized part of the parking lot could be repurposed for shelter, lawn area and day use activities.
- Enhance river access and provide more beach area.
- Replace picnic tables and benches.
- ADA improvements: accessible routes to existing picnic tables, replace ADA parking signs, provide companion space.

Maintenance Considerations:

- Restripe parking lot to identify parking stalls and drive aisle.
- Repair cracks or replace skate park.
- Enhance natural areas and remove invasive plant species..
- Standardize furnishings.

Amenities:

- Skate park
- Off street parking
- Trash receptacles
- Picnic tables
- Porta potty
- Benches
- Natural area with river access
- Trails
- Boat launch ramp

Appendix E
Recreation Trends

The following summaries from recognized park and recreation resources provide background on national, state and local park and recreation trends. Examining current recreation trends may guide potential park and recreation improvements and opportunities to enhance programs and services.

2020 NRPA Agency Performance Review

The 2020 National Recreation and Park Association (NRPA) *Agency Performance Review* summarizes the key findings from their Park Metrics benchmarking tool and is intended to assist park and recreation professionals in effectively managing and planning their operating resources and capital facilities. The report offers a comprehensive collection of park- and recreation-related benchmarks and insights to inform professionals, key stakeholders, and the public about the state of the park and recreation industry. The 2020 NRPA Agency Performance Review contains data from 1,053 unique park and recreation agencies across the United States as reported between 2017 and 2019.

Key Findings and Characteristics

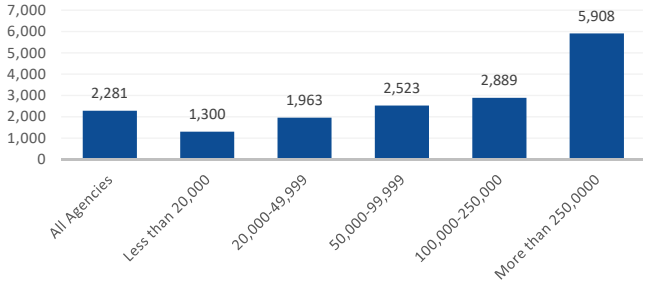
Park facilities and operations vary greatly across the nation. The typical agency participating in the NRPA park metric survey serves a jurisdiction of approximately 42,500 people, but population size varies widely across all responding jurisdictions. The typical park and recreation agency has jurisdiction over 20 parks comprising over 430 acres. Park facilities also have a range of service levels in terms of acres of parkland per population and residents per park. These metrics are categorized by the agency's population size.

Park Facilities

Nearly all (96%) park and recreation agencies operate parks and related facilities. The typical park and recreation agency has:

- One park for every 2,281 residents
- 9.9 acres of park land for every 1,000 residents in its jurisdiction
- 11 miles of trails for walking, hiking, running and/or biking

Figure E1. Median Residents per Park Based On Population Size



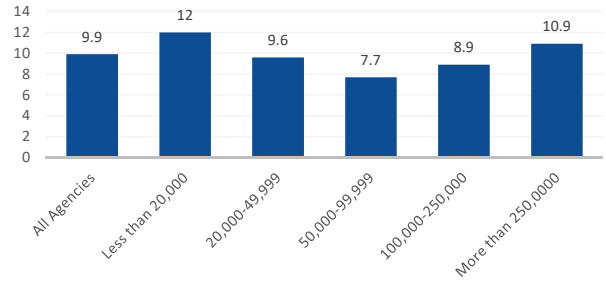


Figure E2. Acres of Parkland per 1,000 Residents based on Population Size

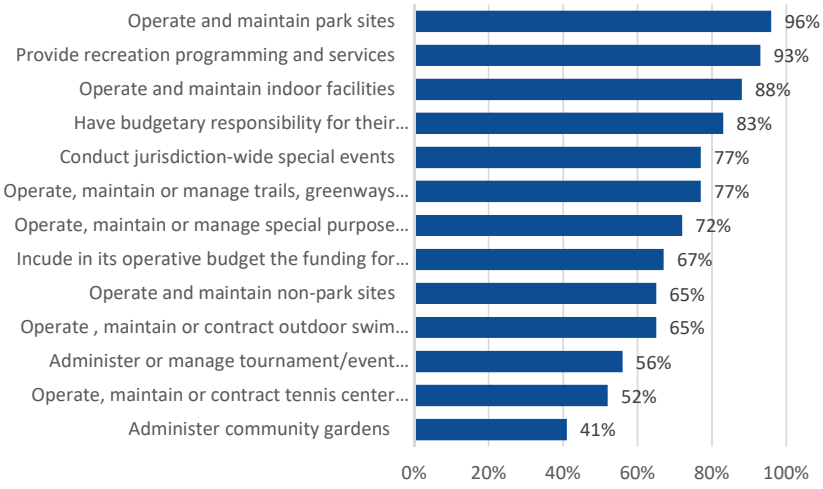


A large majority of park and recreation agencies provide playgrounds (93.9%) and basketball courts (86.5%) in their portfolio of outdoor assets. Most agencies offer community and/or recreation centers (60%) while two in five offer senior centers.

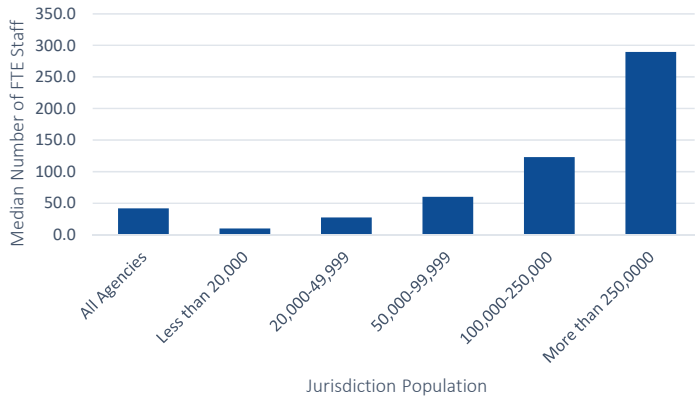
The typical park and recreation agency that manages or maintains trails for walking, hiking, running and/or biking has 11.0 miles of trails. Agencies serving more than 250,000 residents have a median of 84.5 miles of trails under their care.

Park and recreation agencies often take on responsibilities beyond their core functions of operating parks and providing recreational programs. Other responsibilities may include tourist attractions, golf courses, outdoor amphitheaters, indoor swim facilities, farmer's markets, indoor sports complexes, campgrounds, performing arts centers, stadiums/arenas/racetracks, fairgrounds and/or marinas.

Figure E3. Key Responsibilities of Park and Recreation Agencies

Programming

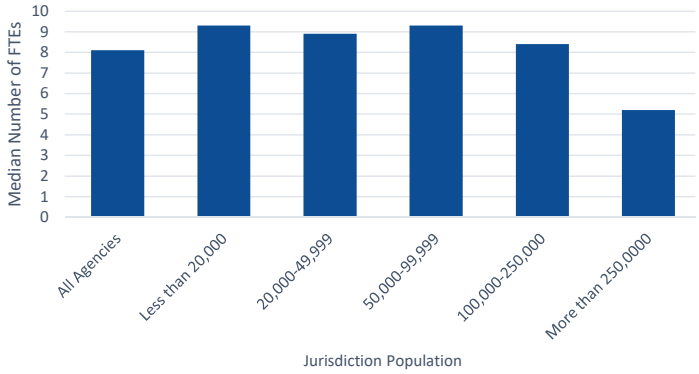
Nearly all (93%) of park and recreation agencies provide recreation programs and services. More than eight in ten agencies provide themed special events (88%), team sports (87%), social recreation events (87%), youth summer camps (83%), fitness enhancement classes (82%), and health and wellness education (81%).



Staffing

Park and recreation employees are responsible for operations and maintenance, programming and administration. The typical park and recreation agency has:

- 41.9 full-time equivalent staff (FTEs) on payroll
- 8.1 FTEs on staff for every 10,000 residents in its jurisdiction



Median FTE counts also positively correlate with the number of acres maintained, the number of parks maintained, operating expenditures, and the population served. For example, agencies that serve populations between 20,000 and 49,999 residents employ an average of 27.3 FTE, while agencies that serve 50,000 to 99,000 people employ an average of 60 FTE.

Figure E4. Park and Recreation Agency Staffing: Full-Time Equivalents (By Jurisdiction Population)

Another way of comparing agency staffing across different park and recreation agencies examines number of staff per 10,000 residents. These comparative numbers hold fairly steady across population sizes with the median for all agencies at 8.1 FTEs.

Figure E5. Park and Recreation Agency FTEs Per 10,000 Residents

Capital and Operating Expenses

For capital expenses, the typical park agency:

- Dedicates about 55% to renovation projects and 32% to new development projects.
- Plans to spend about $5,000,000 million on capital expenditures over the next five years.

For operations, the typical park agency spends:

- $4.3 million per year on total operating expenses
- $7,000 on annual operating expenses per acre of park and non-park sites managed by the agency
- $81.00 on annual operating expenses per capita
- $97,000 in annual operating expenditures per employee
- 54% of the annual operating budget on personnel costs, 38% on operating expenses, and 5% on capital expenses not included in the agency's capital improvement plan (CIP)
- 44% of its operating budget on park management and maintenance, 43% on recreation, and 13% on other activities

2020 State of the Industry Report

Recreation Management magazine's *2020 Report on the State of the Managed Recreation Industry* summarizes the opinions and information provided by a wide range of professionals (with an average 22.3 years of experience) working in the recreation, sports, and fitness industry. Given the emerging COVID-19 pandemic, Recreation Management also conducted a supplemental survey in May 2020 to learn about both the impacts to the industry and what mitigation steps organizations were taking in response.

Partnerships

The 2020 report indicated that most (89%) recreation, sports, and fitness facility owners form partnerships with other organizations as a means of expanding their reach, offering additional programming opportunities or as a way to share resources and increase funding. Local schools are shown as the most common partner (64%) for all facility types. Youth-serving organizations (Ys, JCC, Boys & Girls Clubs) and park and recreation organizations were the most likely to report that they had partnered with outside organizations, at 100% and 95% respectively.

Revenue Outlook

In January 2020, half of respondents expected revenues to increase in both 2020 and 2021. Survey respondents from urban communities are more optimistic about revenue increases as compared to rural respondents.

In last year's report, parks respondents had reported increases in their average operating expenditures with operating costs that grew by 14% between fiscal year 2018 and 2019. Respondents generally expected their operating expenses to continue to increase between 2019 and 2021, with camps expecting a 10% increase, recreation centers at 8%, and parks at 6%.

Relative to costs and revenues, few facilities covered by the survey reported that they cover more than 75% of their operating costs via revenue. The percentage recovered varied with type of organization with the average percentage of costs recovered for all respondents hovering near 50% and private for-profit organizations achieving the highest cost recovery rates. For parks, the cost recovery rate remained steady at 44%.

Over the past decades, public park and recreation departments and districts have faced a growing expectation that facilities can be run like businesses. Many local facilities are expected to recover much of their operating costs via revenues. While this is the business model of for-profit facilities like health clubs, it is a relatively recent development for publicly owned facilities, which have typically been subsidized via tax dollars and other funding sources. Most recreation providers (81%) have been taking actions to reduce expenditures. Cost recovery actions typically involve reduction in expenses with improving energy efficiency as the most common action (51% of respondents). Increased fees and staffing cost reductions and putting off construction or renovation plans were reported as other common methods for reducing operating costs.

As of May 2020, nearly 90% of respondents anticipated that total revenues would decline in 2020 due to the COVID-19 pandemic. Most anticipated a revenue drop of 30-50%, though one in seven expected a decline of more than 50%. In general, respondents are split on when they expect that revenues will begin to recover – 44% believe revenues will begin to rebound in 2021 while 40% expect further revenue declines.

Facility Use

The majority of respondents reported an increase in use of their recreational facilities as of January 2020. Looking forward, more than half of respondents (53%), including 60-65% of park and recreation centers, were expecting to see further increases in the number of people using their facilities over the next two years.

In 2020, 22% of respondents said they were planning to add more staff at their facilities, 75% were planning to maintain existing staffing levels, and 3% were planning to reduce staffing. The May 2020 survey found, however, that nearly half of responding organizations had laid off or furloughed staff due to the impacts of COVID-19 and nearly two-thirds had suspended hiring plans.

Facilities and Improvements

Over the past seven years, the percentage of respondents who indicate that they have plans for construction, whether new facilities or additions or renovations to their existing facilities, has grown steadily, from 62.7 percent in 2013 to 72.9 percent in 2020. Construction budgets have also risen. The average amount respondents were planning to spend on their construction plans was up 10.8% in 2020, after an 18.4% increase in 2019. On average, respondents to the 2020 survey were planning to spend $5.6 million on construction.

A majority of park department respondents (54%) reported plans to add features at their facilities and were also the most likely to be planning to construct new facilities in the next three years (39%).

The top 10 planned features for all facility types include:

1. Splash play areas (25.4% of those with plans to add features were planning to add splash play)
2. Playgrounds (20.3%)
3. Park shelters (17.3%)
4. Dog parks (17.1%)
5. Park restrooms (16.1%)
6. Synthetic turf sports fields (14.8%)
7. Walking and hiking trails (14.8%)
8. Fitness trails and outdoor fitness equipment (14.8%)
9. Disc golf courses (12.9%)
10. Outdoor sports courts (11.3%)

The COVID-19 pandemic is having a significant impact on construction plans. As of May 2020, over one-third (34%) of respondents had put construction on hold due to the impacts of the pandemic, rising costs, and supply shortages.

Programming

Nearly all respondents (97%) offer programming of some kind. The top 10 most commonly offered programs include: holiday events and other special events (provided by 65.3% of respondents); educational programs (59%); group exercise programs (58.8%); fitness programs (57.6%); day camps and summer camps (57.3%); youth sports teams (55.2%); mind-body balance programs such as yoga and tai chi (51.2%); adult sports teams (46%); arts and crafts programs (45.8%); and programs for active older adults (45.4%).

Respondents from community centers, parks and health clubs were the most likely to report that they had plans to add programs at their facilities over the next few years. The ten most commonly planned program additions were:

1. Fitness programs (24% of those who have plans to add programs)
2. Group exercise programs (22.4%)
3. Teen programs (22%)
4. Environmental education (21.8%)
5. Day camps and summer camps (20.9%)

6. Mind-body balance programs (20.5%)
7. Programs for active older adults (18.1%)
8. Special needs programs (17.9%)
9. Holidays and other special events (17.4%)
10. Arts and crafts (17%)

Addressing the COVID-19 pandemic required many respondents to either put programs or services on hold (82%) or cut programs or services entirely (34%). Additionally, many respondents have had to rethink their programming portfolios. Two-thirds of respondents (67%) had added online fitness and wellness programming as of May 2020, 39% were involved in programs to address food insecurity, and one in four was involved in programs to provide educational support to out-of-school children.

General Challenges

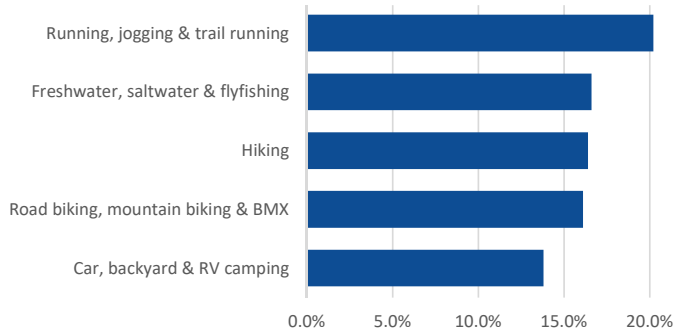
In January 2020, facility managers were asked about the challenges they anticipated impacting their facilities in the future. Generally, overall budgets are the top concern for most respondents including their ability to support equipment and facility maintenance needs (58%) and staffing (54%). Marketing, safety/risk management, and creating new and innovative programming also remain continuing challenges for facility managers. Facility managers also report that environmental and conservation issues (13%) and social equity and access (10%) are posing increasing challenges. However, as of May 2020, many respondents concerns had shifted to addressing the COVID-19 pandemic impacts described in the sections above.

2020 Outdoor Participation Report

Overall Participation

According to the 2020 Outdoor Participation Report, published by the Outdoor Foundation, just over half of Americans ages 6 and older participated in outdoor recreation at least once in 2019, the highest participation rate in five years. This increase was not universal, however, and there was significant variation in participation between age, gender, and racial groups.

Despite the overall increase in the percentage of Americans engaging in outdoor recreation, the total number of recreational outings declined in 2019. Outdoor participants went on a total of 10.9 billion outdoor outings in 2019 – a 12% drop from the 2012 high-water mark of 12.4 billion outings. In addition, the number of outings per participant declined 17% in the past five years, from 85 outings per participant in 2014 to 71 in 2019.



This drop mirrors a decline in the total number of outings per participant. Each year for over a decade, participants have engaged less often in outdoor activities. As a result, the percentage of ‘casual’ participants in outdoor recreation (i.e. those who participate one to 11 times per year) has grown by about 4% over the past 15 years, while the percentage of ‘core’ participants (i.e. weekly participants) has declined.

Figure E6. Frequency of Outdoor Outings: Trending Over Many Years

Frequency of Outdoor Outings	2007	2010	2013	2016	2019
Casual (1 to 11 times)	28.2%	27.9%	28.4%	31.7%	32.6%
Moderate (12 to 51 times)	32.5%	31.8%	33.1%	32.5%	32.6%
Core (52+ times)	39.3%	40.4%	38.5%	35.8%	34.9%

Running, jogging and trail running is the most popular outdoor activity by level of participation, as shown in the chart below, followed by fishing, hiking, biking and camping.

Figure E7. Most Popular Outdoor Activities by Participants, Nationwide

Youth Participation Declines

The youngest participants, children 6 to 17, were outdoors far less than in previous years. Their average outings fell from a high of 91 in 2012 to just 77 per child in 2019. Youth participation declined across the board in 2019, with the biggest declines seen in girls aged 18 to 24 (-5%) and boys ages 13 to 17 (-4%). Households with children, however, continue to drive growth in participation. Adults with children had much higher outdoor recreation participation rates (57%) than adults without children (44.4%).

Female Participation Continues to Grow

In 2019, women made up 46% of participants in outdoor recreation while men made up 53.8%, representing the smallest gender gap measured in the report's history. Women's participation has increased from 43% of all participants in 2009 to 46% in 2019.

Diversity Gap Remains

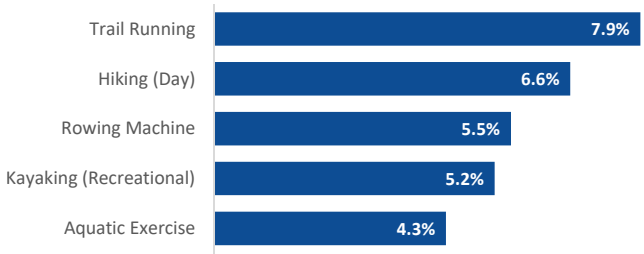
Despite increases in participation, Black/African American and Hispanic Americans continue to be significantly underrepresented in outdoor recreation. Hispanics made up 11.6% of outdoor recreation participants, a 35% shortfall relative to their proportion of the population ages 6 and over (17.9%). Similarly, Black/African Americans represented 12.4% of the U.S. population ages 6 and over in 2019, but just 9.4% of outdoor participants, a 24% participation deficit. Black youth were the least likely to participate in outdoor recreation as compared to Asian, Hispanic, and Caucasian youth – signaling a potential future gap in outdoor participants. However, those Black and Hispanic Americans who do participate in outdoor recreation do so frequently – more often, on average, than members of other racial groups.

In 2019, 62% of Asian Americans participated in outdoor recreation, followed by 53% of White, 48% of Hispanic, and 40% of Black/African Americans.

Impacts of COVID-19

An August 2020 report from the Outdoor Industry Association indicated that COVID-19 impacted recreation participation in April, May and June as Americans flocked to outdoor recreation amid COVID restrictions. Americans took up new activities in significant numbers with the biggest gains in running, cycling, and hiking given that these activities were widely considered the safest activities during pandemic shutdowns. The hardest hit activity segments during COVID shutdowns were team sports (down 69%) and racquet sports (down 55%). Reviewing just April, May and June 2020, participation rates for day hiking rose more than any other activity, up 8.4%.

2020 Sports, Fitness, and Leisure Activities Topline Participation Report



Prepared by a partnership of the Sports and Fitness Industry Association (SFIA) and the Physical Activity Council (PAC), this February 2020 participation report summarizes levels of activity and identifies key trends in sports, fitness, and recreation in the US. The report is based on over 18,000 online interviews of a nationwide sample that provides a high degree of statistical accuracy using strict quotas for gender, age, income, region, and ethnicity. The study looked at 122 different team and individual sports and outdoor activities.

Compared to 2014, eight million more Americans were casually active in 2019 indicating a positive movement toward an increasingly active population. Sports that made great strides in the last six years include trail running, cardio tennis, BMX biking, and day hiking. Over the last year, only 2.1 million additional people reported participating in an activity that raises their heart rate for more than 30 minutes. Participation in active high calorie activities has remained flat for the last four years.

The percentage of people reporting no physical activity during the past year declined to 27% in 2019 - its lowest point in six years – continuing an increasing trend in activity. Rates of inactivity continue to be linked to household income levels, with lower income households having higher rates of inactivity. However, in 2019, households across the income spectrum saw declines in inactivity.

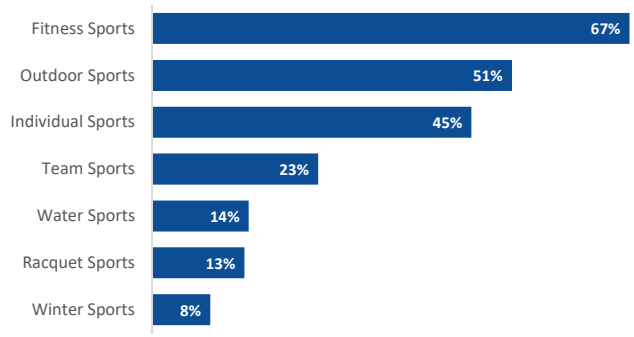
Fitness sports continue to be the most popular activity type for the 5th consecutive year. Other sports activities, including individual sports, racquet sports, and water sports have seen a modest decline in participation since 2018. Team sports experienced a slight increase in participation, driven by the increasing popularity of basketball and outdoor soccer. While racquet sports lost about 2% of participants since 2018, mostly due to declines in squash and badminton participation, the rising popularity of pickleball and cardio tennis may reverse this declining trend.

Figure E8. Total Participation Rate by Activity Category

When asked which activities they aspire to do, all age-groups and income levels tend to show interest in outdoor activities like fishing, camping, hiking, biking, bicycling, and swimming. Younger age groups are more interested in participating in team sports, such as soccer, basketball and volleyball, while older adults are more likely to aspire to individual activities like swimming for fitness, bird/nature viewing, and canoeing.

Physical education (PE) participation shows 96% of 6 to 12-year old youth and 82% of 13-17 year olds participated in PE in 2019. While younger children were more likely to participate in PE, older youth had higher average days of participation. Children were more than twice as likely to be inactive if they did not attend PE. Overall, all ages saw an increase in PE 2019. Participation in PE is thought to lead to an increase of active, healthy lifestyles in adulthood.

Figure E9. Sports with the Highest 5-year Increase in Participation



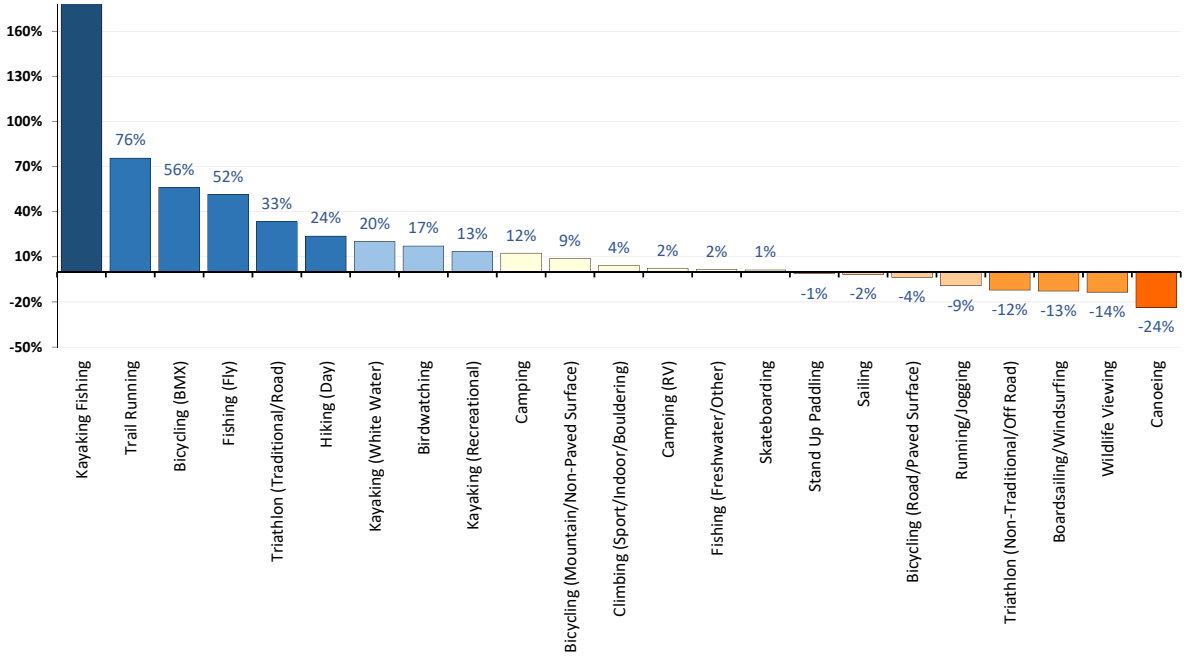


Figure E10. 5-Year Change in Outdoor Sports Participation

2020 Americans Engagement with Parks Survey

This annual study from the National Park and Recreation Association (NRPA) probes Americans' usage of parks, the key reasons that drive their use, and the greatest challenges preventing greater usage. Each year, the study examines the importance of public parks in Americans' lives, including how parks compare to other services and offerings of local governments. The survey of 1,000 American adults looks at frequency and drivers of parks/recreation facilities visits and the barriers that prevent greater enjoyment. Survey respondents also indicate the importance of how park and recreation plays in their decisions at the voting booth and their level of support for greater funding.

In 2020, NRPA conducted a shorter-than-typical Engagement survey because of the dynamic nature of life during the COVID-19 pandemic. The 2020 Study focused on the impacts of the COVID-19 pandemic on park and recreation usage, whether residents see public parks as an essential public service, and whether people vote for political leaders based on their support for park and recreation funding.

Key findings include:

- Eighty-two percent of U.S. adults agree that parks and recreation is essential.
- Seventy-seven percent of survey respondents indicate that having a high-quality park, playground, public open space or recreation center nearby is an important factor in deciding where they want to live.
- U.S. residents visit local park and recreation facilities more than twice a month on average.
- Three in five U.S. residents — more than 190 million people — visited a park, trail, public open space or other recreation facility at least once during the first three months of the pandemic (mid-March through mid-June 2020).

Impacts of the COVID-19 Pandemic

According to the Americans Engagement with Parks report,

> "In many communities across the nation, parks, trails and other public open spaces have been crucial resources available to people seeking a brief respite from the public health crisis. As businesses shut down operations during the spring, many parks and trails remained open, providing people with opportunities to safely enjoy outdoor physical activity with its many attendant physical and mental health benefits. According to NRPA Parks Snapshot Survey data (nrpa.org/ ParksSnapshot), 83 percent of park and recreation agencies kept some/all of their parks open during the initial wave of COVID-19 infections in April 2020, while 93 percent did the same with some/all of their trail networks.
>
> Consequently, people flocked to their local parks, trails and other public open spaces. Three in five U.S. residents — more than 190 million people — visited a park, trail, public open space or other recreation facility at least once during the first three months of the pandemic — from mid-March through mid-June 2020. Park and recreation usage was particularly strong among GenZers, Millenials, Gen Xers, parents, people who identify as Hispanic/Latinx and those who identify as nonwhite.
>
> As has been the case with virtually every aspect of life, the COVID-19 pandemic has altered the frequency with which most people engage with their local park and recreation amenities. Still, slightly more than half of people have been visiting parks, trails and other public open space amenities as often — if not more often — since the start of the pandemic than they had during the same period in 2019. Twenty-seven percent of U.S. residents report that their use of parks, trails and other public open spaces increased during the first three months of the pandemic relative to the same period in 2019. A quarter of survey respondents indicates their park and recreation usage during the period from mid-March to mid- June 2020 matched that of the same three months in 2019. Forty-eight percent of people report that their usage of parks, trails and public open spaces declined during the early months of the pandemic."

Washington State Recreation and Conservation Plan

The 2018-2022 Recreation and Conservation Plan for Washington State provides a strategic direction to help assure the effective and adequate provision of outdoor recreation and conservation to meet the needs of Washington State residents. The plan identifies the following five near and long-term priority areas and establishes specific actions within each priority to help meet the outdoor recreation and conservation needs within the state:

1. Sustain and Grow the Legacy of Parks, Trails, and Conservation Lands
2. Improve Equity of Parks, Trails, and Conservation Lands

3. Meet the Needs of Youth
4. Plan for Culturally Relevant Parks and Trails to Meet Changing Demographics
5. Assert Recreation and Conservation as a Vital Public Service

Sustain & Grow the Legacy

A wealth of existing recreation and conservation areas and facilities should be kept open, safe, and enjoyable for all. Some modifications to meet the interests of today's population may be needed at some facilities. Sustaining existing areas while expanding and building new facilities to keep up with a growing population is one of the five priority goals.

Improve Equity

The National Recreation and Park Association's position on social equity states:

> "Our nation's public parks and recreation services should be equally accessible and available to all people regardless of income level, ethnicity, gender, ability, or age. Public parks, recreation services and recreation programs including the maintenance, safety, and accessibility of parks and facilities, should be provided on an equitable basis to all citizens of communities served by public agencies."

The Washington plan restates that equity goal for all its citizens. Improving equity is also a strategy for improving a community's health. Current statewide participation rates in outdoor activities were surveyed as part of the plan.

Figure E11. Participation Rates for Washington Residents in Outdoor Activities

Participation Rates for Top 12 Categories	
Activity	**%**
Walking	94%
Nature activities	89%
Leisure activities at parks	82%
Swimming	68%
Sightseeing activities	67%
Hiking	61%
Outdoor sports	48%
Water-based activities (freshwater)	46%
Camping	45%
Trending activities	33%
Snow and ice activities	30%
Bicycling	28%

Get Youth Outside

Washington State youth participate in outdoor activities to a greater extent than youth nationally. Park and recreation providers are urged to offer a variety of outdoor activities for youth and to support youth programs. Most youth are walking, playing at a park, trying new or trending activities, fishing in freshwater, exploring nature, and riding bikes. Other activities of interest to youth are activities in freshwater such as boating and paddling, fishing in saltwater, target shooting, hiking, outdoor sports, and riding off-road vehicles.

Figure E12. Youth Participation Rates for Washington Residents in Outdoor Activities

Youth Participation Rates Activity	%
Walking	88%
Leisure in parks	78%
Trending activities	77%
Fishing in freshwater	77%
Nature-based activities	75%
Bicycling	74%
Freshwater-based activities*	66%
Target shooting	62%
Hiking	57%
Outdoor sports	57%
Off-road vehicle riding	57%
Fishing in saltwater	53%

*(not swimming)

Plan for Culturally Relevant Parks and Trails to Meet Changing Demographics

Washington's population is expected to grow by 2 million people by 2040 leading to more congestion and competition for recreation resources. Between 2010-2040, the percent of people of color are expected to increase from 27 percent to 44 percent. With the cultural change in the population, preferred recreational activities also will change. By 2030, more than one of every five Washingtonians will be 65 years old or older. By 2040, there will be more seniors than youth. Park and recreation providers should be prepared to create new and diverse opportunities and accommodate the active senior population.

Assert Recreation and Conservation as a Vital Public Service

The plan recognizes that outdoor recreation contributes to a strong economy and is a public investment like other public services and infrastructure. The report cites the Outdoor Industry Association and other economic studies that reinforce the importance of park and recreation services locally, regionally and statewide.

2019 Special Report on Paddlesports & Safety

In 2019, the Outdoor Foundation produced a report focused on paddlesports data based on a participation survey (over 20,000 online interviews with a nationwide sample of individuals and households). In 2018, 22.9 million Americans (approximately 7.4% of the population) participated in paddle sports. This represents an increase of more than 4 million participants since the study began in 2010. Over the last five years, there continues to be an increase in paddlesports popularity among outdoor enthusiasts, with significant portions of the nationwide growth occurring in the Pacific region.

Recreational kayaking continues to grow in popularity but may be driving some of the decline in canoeing. The popularity of stand-up paddling has soared, increasing by 1.5 million participants over the past five years, though it does not have nearly as high a participation rate as either recreational kayaking or canoeing.

Most paddlers are Caucasian, other racial and ethnic groups are largely under-represented. However, Caucasian participation has remained relatively flat while participation by people identifying as Hispanic

or Black/African American has grown by 0.5% to 1% per year since 2013. This growth has led to more than 773,000 new Hispanic paddlers in just six years, signaling the importance and potential of engaging minority groups in paddlesports.

One in eight paddlers have been participating in the sport for 21 years or more. However, many participants – between thirty and sixty percent, depending on the discipline – tried a paddlesport for the first time in 2018. Such high levels of first-time participation may produce longer term growth in paddling, assuming participants continue to enjoy the sport.

Among adult paddlers, most participate for excitement and adventure, for exercise, or to be close to nature. Kayakers, rafters, canoers and stand-up paddlers often enjoy, or would be willing to try, other paddlesports. Many also enjoy similar outdoor "crossover" activities such as hiking, camping, walking, and nature viewing.

Appendix F
Implementation Tools

LOCAL FUNDING OPTIONS

The City of Camas possesses a range of local funding tools that could be accessed for the benefit of growing, developing, and maintaining its parks and recreation facilities and programs. The sources listed below represent potential funding sources, but some also may be dedicated for numerous other local purposes which limit applicability and usage. Therefore, discussions with City leadership are critical to assess the political landscape to modify or expand the use of existing City revenue sources in favor of park and recreation programs.

Councilmanic Bonds

Councilmanic general obligation bonds may be sold by cities without public vote. The bonds, both principal and interest, are retired with payments from existing city revenue or new general tax revenue, such as additional sales tax or real estate excise tax. The state constitution has set a maximum debt limit for councilmanic bonds of 1½% of the assessed value of taxable property in the city.

Voted General Obligation Bond

For the purposes of funding capital projects, such as land acquisitions or facility construction, cities and counties have the authority to borrow money by selling bonds. Voter-approved general obligation bonds may be sold only after receiving a 60 percent majority vote at a general or special election. If approved, an excess property tax is levied each year for the life of the bond to pay both principal and interest. The maximum debt limit for voted debt is 2.5% of the assessed value of taxable property in the city. The state constitution (Article VIII, Section 6) limits total combined debt to 5% of the total assessed value of property in the jurisdiction.

Property Tax Excess Levy – One Year Only

Cities and counties that are levying their statutory maximum rate can ask the voters, at any special election date, to raise their rate for one year (RCW 84.52.052). As this action increases revenue for one-year at a time, it is wise to request this type of funding for one-time uses only. Majority approval by voters is required.

Regular Property Tax - Lid Lift

Cities are authorized to impose ad valorem taxes upon real and personal property. A city's maximum levy rate for general purposes is $3.375 per $1,000 of assessed valuation. Limitations on annual increases in tax collections, coupled with changes in property value, causes levy rates to rise or fall; however, in no case may they rise above statutory limits. Once the rate is established each year, it may not be raised without the approval of a majority of the voters. Receiving voter approval is known as a lid lift. A lid lift may be permanent, or may be for a specific purpose and time period.

A levy lid lift is an instrument for increasing property tax levies for operating and/or capital purposes. Taxing districts with a tax rate that is less than their statutory maximum rate may ask the voters to "lift" the levy lid by increasing the tax rate to some amount equal to or less than their statutory maximum rate. A simple majority vote of citizenry is required.

Cities and counties have two "lift" options available to them: Single-year/basic or Multi-year.

Single-year: The single-year lift does not mean that the lift goes away after one year; it can be for any amount of time, including permanently, unless the proceeds will be used for debt service on bonds, in which case the maximum time period is nine years. Districts may permanently increase the levy but must use language

in the ballot title expressly stating that future levies will increase as allowed by chapter 84.55 RCW. After the initial "lift" in the first year, the district's levy in future years is subject to the 101 percent lid in chapter 84.55 RCW. This is the maximum amount it can increase without returning to the voters for another lid lift.

The election to implement a single-year lift may take place on any election date listed in RCW 29A.04.321.

Multi-year: The multi-year lift allows the levy lid to be "bumped up" each year for up to a maximum of six years. At the end of the specified period, the levy in the final period may be designated as the basis for the calculation of all future levy increases (in other words, be made permanent) if expressly stated in the ballot title. The levy in future years would then be subject to the 101 percent lid in chapter 84.55 RCW.

In a multi-year lift, the lift for the first year must state the new tax rate for that year. For the ensuing years, the lift may be a dollar amount, a percentage increase tied to an index, or a percentage amount set by some other method. The amounts do not need to be the same for each year. If the amount of the increase for a particular year would require a tax rate that is above the maximum tax rate, the assessor will levy only the maximum amount allowed by law.

The election to implement a multi-year lift must be either the August primary or the November general election.

The single-year lift allows supplanting of expenditures within the lift period; the multi-year left does not, and the purpose for the lift must be specifically identified in the election materials. For both single- and multi-year lifts, when the lift expires the base for future levies will revert to what the dollar amount would have been if no lift had ever been done.

The total regular levy rate of senior taxing districts (counties and cities) and junior taxing districts (fire districts, library districts, etc.) may not exceed $5.90/$1,000 AV. If this limit is exceeded, levies are reduced or eliminated in the following order until the total tax rate is at $5.90.

1st.	Parks & Recreation Districts (up to $0.60)
	Parks & Recreation Service Areas (up to $0.60)
	Cultural Arts, Stadiums & Convention Districts (up to $0.25)
2nd.	Flood Control Zone Districts (up to $0.50)
3rd.	Hospital Districts (up to $0.25)
	Metropolitan Parks Districts (up to $0.25)
	All other districts not otherwise mentioned
4th.	Metropolitan Park Districts formed after January 1, 2002 or after (up to $0.50)
5th.	Fire Districts (up to $0.25)
6th.	Fire Districts (remaining $0.50)
	Regional Fire Protection Service Authorities (up to $0.50)
	Library Districts (up to $0.50)
	Hospital Districts (up to $0.50)
	Metropolitan Parks Districts formed before January 1, 2002 (up to $0.50)

Sales Tax

Paid by the consumer, sales tax is a percentage of the retail price paid for specific classifications of goods and services within the State of Washington.

Governing bodies of cities and counties may impose sales taxes within their boundaries at a rate set by state statute and local ordinances, subject to referendum.

Until the 1990 Legislative Session, the maximum possible total sales tax rate paid by purchasers in cities was 8.1 percent. The 8.1 percent is allocated as follows: State, 6.5 cents on the dollar; counties, 0.15 cents; cities, 0.85 cents; and transit districts, a maximum of 0.6 cents (raised to 0.9 cents in 2000). Since then multiple sales options were authorized. Those applicable to Parks and Recreation include: counties may ask voters to approve a sales tax of up to 0.3 percent, which is shared with cities. At least one-third of the revenue must be used for criminal justice purposes.

Counties and cities may also form public facilities districts, and these districts may ask the voters to approve a sales tax of up to 0.2 percent. The proceeds may be used for financing, designing, acquisition, construction, equipping, operating, maintaining, remodeling, repairing, and re-equipping its public facilities.

Revenue may be used to fund any essential county and municipal service.

If a jurisdiction is going to change a sales tax rate or levy a new sales tax, it must pass an ordinance to that effect and submit it to the Department of Revenue at least 75 days before the effective date. The effective date must be the first day of a quarter: January 1, April 1, July 1 or October 1.

Business and Occupation Tax

Business and occupation (B&O) taxes are excise taxes levied on different classes of business to raise revenue. Taxes are levied as a percentage of the gross receipts of a business, less some deductions. Businesses are put in different classes such as manufacturing, wholesaling, retailing, and services. Within each class, the rate must be the same, but it may differ among classes. Cities can impose this tax for the first time or raise rates following referendum procedure.

B&O taxes are limited to a maximum tax rate that can be imposed by a city's legislative body at 0.2 percent (0.002), but grandfathered in any higher rates that existed on January 1, 1982. Any city may levy a rate higher than 0.2 percent, if it is approved by a majority of voters (RCW 35.21.711). Beginning January 1, 2008, cities that levy the B&O tax must allow for allocation and apportionment, as set out in RCW 35.102.130.

Admissions Tax

An admissions tax is a use tax for entertainment. Both cities and counties may impose this tax through legislative action.

Cities and/or counties may levy an admission tax in an amount no greater than five percent of the admission charge, as is authorized by statute (cities: RCW 35.21.280; counties: RCW 35.57.100). This tax can be levied on admission charges (including season tickets) to places such as theaters, dance halls, circuses, clubs that have cover charges, observation towers, stadiums, and any other activity where an admission charge is made to enter the facility.

If a city imposes an admissions tax, the county may not levy a tax within city boundaries.

The statutes provide an exception for admission to elementary or secondary school activities. Generally, certain events sponsored by nonprofits are exempted from the tax; however, this is not a requirement. Counties also exempt any public facility of a public facility district for which admission is imposed. There are no statutory restrictions on the use of revenue.

Impact Fees

Development impact fees are charges placed on new development in unimproved areas to help pay for various public facilities that serve new development or for other impacts associated with such development. Both cities and counties may impose this tax through legislative action.

Counties that plan under the GMA, and cities, may impose impact fees on residential and commercial development activity to help pay for certain public facility improvements, including parks, open space, and recreation facilities identified in the county's capital facilities plan. The improvements financed from impact fees must be reasonably related to the new development and must reasonably benefit the new development. The fees must be spent or encumbered within ten years of collection. Camas currently assesses a parks impact fee and also utilizes impact fee credits as a tool to work with local developers.

Real Estate Excise Tax

Excise tax levied on all sales of real estate, measured by the full selling price, including the amount of any liens, mortgages, and other debts given to secure the purchase. Both cities and counties may impose this tax through legislative action.

Counties and cities may levy a quarter percent tax (REET 1); a second quarter percent tax (REET 2) is authorized. First quarter percent REET (REET 1) must be spent on capital projects listed in the city's capital facilities plan element of their comprehensive plan. Capital projects include planning, acquisition, construction, reconstruction, repair, replacement, rehabilitation, or improvement of parks, recreational facilities, and trails.

The second quarter percent REET (REET 2) must also be spent on capital projects, which includes planning, construction, reconstruction, repair, rehabilitation, or improvement of parks. Acquisition of land for parks is not a permitted use of REET 2. Both REET 1 and REET 2 may be used to make loan and debt service payments on projects that are a permitted use of these funds. The City of Camas currently assesses both REETs and uses this funding for a variety of capital project needs.

Lodging Tax

The lodging tax is a user fee for hotel/motel occupation. Both cities and counties may impose this tax through legislative action.

Cities and/or counties may impose a "basic" two percent tax under RCW 67.28.180 on all charges for furnishing lodging at hotels, motels and similar establishments for a continuous period of less than one month.

This tax is taken as a credit against the 6.5 percent state sales tax, so that the total tax that a patron pays in retail sales tax and hotel-motel tax combined is equal to the retail sales tax in the jurisdiction. In addition, jurisdictions may levy an additional tax of up to two percent, or a total rate of four percent, under RCW 67.28.181(1). This is not credited against the state sales tax. Therefore, if this tax is levied, the total tax on the lodging bill will increase by two percent.

If both a city and the county are levying this tax, the county must allow a credit for any tax levied by a city so that no two taxes are levied on the same taxable event. These revenues must be used solely for paying for tourism promotion and for the acquisition and/or operating of tourism-related facilities. "Tourism" is defined as economic activity resulting from tourists, which may include sales of overnight lodging, meals, tours, gifts, or souvenirs; there is no requirement that a tourist must stay overnight.

Conservation Futures Tax (Clark County)

The Conservation Futures Tax (CFT) is provided for in Chapter 84.34 of the Revised Code of Washington. Clark County imposes a Conservation Futures levy for the purpose of acquiring open space lands, including green spaces, greenbelts, wildlife habitat and trail rights-of-way proposed for preservation for public use by either the county or the cities within the county. Funds are allocated annually, and cities within the county, citizen groups and citizens may apply for funds through the county's process. The CFT program provides grants

to cities to support open space priorities in local plans and is administered by the County's Legacy Lands Program in the Parks & Lands Division of Public Works.

FEDERAL & STATE GRANTS AND CONSERVATION PROGRAMS

RIVERS, TRAILS AND CONSERVATION ASSISTANCE PROGRAM

The Rivers, Trails and Conservation Assistance Program, also known as the Rivers & Trails Program or RTCA, is a technical assistance resource for communities administered by the National Park Service and federal government agencies so they can conserve rivers, preserve open space and develop trails and greenways. The RTCA program implements the natural resource conservation and outdoor recreation mission of NPS in communities across America.

RECREATION AND CONSERVATION OFFICE GRANT PROGRAMS

The Recreation and Conservation Office was created in 1964 as part of the Marine Recreation Land Act. The RCO grants money to state and local agencies, generally on a matching basis, to acquire, develop, and enhance wildlife habitat and outdoor recreation properties. Some money is also distributed for planning grants. RCO grant programs utilize funds from various sources. Historically, these have included the Federal Land and Water Conservation Fund, state bonds, Initiative 215 monies (derived from un-reclaimed marine fuel taxes), off-road vehicle funds, Youth Athletic Facilities Account and the Washington Wildlife and Recreation Program.

Aquatic Lands Enhancement Account (ALEA)

This program, managed through the RCO, provides matching grants to state and local agencies to protect and enhance salmon habitat and to provide public access and recreation opportunities on aquatic lands. In 1998, DNR refocused the ALEA program to emphasize salmon habitat preservation and enhancement. However, the program is still open to traditional water access proposals. Any project must be located on navigable portions of waterways. ALEA funds are derived from the leasing of state-owned aquatic lands and from the sale of harvest rights for shellfish and other aquatic resources.

Washington Wildlife & Recreation Program (WWRP)

Funding sources managed by the RCO include the Washington Wildlife and Recreation Program. The WWRP is divided into Habitat Conservation and Outdoor Recreation Accounts; these are further divided into several project categories. Cities, counties and other local sponsors may apply for funding in urban wildlife habitat, local parks, trails and water access categories. Funds for local agencies are awarded on a matching basis. Grant applications are evaluated once each year, and the State Legislature must authorize funding for the WWRP project lists.

Land and Water Conservation Fund (LWCF)

The Land and Water Conservation Fund (LWCF) provides grants to buy land and develop public outdoor facilities, including parks, trails and wildlife lands. Grant recipients must provide at least 50% matching funds in either cash or in-kind contributions. Grant program revenue is from a portion of Federal revenue derived from sale or lease of off-shore oil and gas resources.

National Recreational Trails Program

The National Recreational Trails Program (NRTP) provides funds to maintain trails and facilities that provide a backcountry experience for a range of activities including hiking, mountain biking, horseback

riding, motorcycling, and snowmobiling. Eligible projects include the maintenance and re-routing of recreational trails, development of trail-side and trail-head facilities, and operation of environmental education and trail safety programs. A local match of 20% is required. This program is funded through Federal gasoline taxes attributed to recreational non-highway uses.

Youth Athletic Facilities (YAF) Program

The YAF provides grants to develop, equip, maintain, and improve youth and community athletic facilities. Cities, counties, and qualified non-profit organizations may apply for funding, and grant recipients must provide at least 50% matching funds in either cash or in-kind contributions.

OTHER TOOLS & OPTIONS

Metropolitan Park District

Metropolitan park districts may be formed for the purposes of management, control, improvement, maintenance and acquisition of parks, parkways and boulevards. In addition to acquiring and managing their own lands, metropolitan districts may accept and manage park and recreation lands and equipment turned over by any city within the district or by the county. Formation of a metropolitan park district may be initiated in cities of five thousand population or more by city council ordinance, or by petition, and requires majority approval by voters for creation. Several years ago, the City started a preliminary look at the MPD as a tool for Camas Parks and Recreation. With some existing information, the City could continue evaluation of MPD along with other implementation tools to develop their long-term funding strategy.

Park and Recreation District

Park and recreation districts may be formed for the purposes of providing leisure-time activities and recreation facilities (parks, playgrounds, pools, golf courses, paths, community centers, arboretums, campgrounds, boat launches, etc.) and must be initiated by petition of at least 15% percent of the registered voters within the proposed district. Upon completion of the petition process and review by county commissioners, a proposition for district formation and election of five district commissioners is submitted to the voters of the proposed district at the next general election. Once formed, park and recreation districts retain the authority to propose a regular property tax levy, annual excess property tax levies and general obligation bonds. All three of these funding types require 60% percent voter approval and 40% percent voter turnout. With voter approval, the district may levy a regular property tax not to exceed sixty cents per thousand dollars of assessed value for up to six consecutive years.

Park and Recreation Service Area (PRSA)

A quasi-municipal corporation with independent taxing authority whose purpose is to finance, acquire, construct, improve, maintain or operate any park, senior citizen activities center, zoo, aquarium and/or recreation facilities; and to provide higher level of park service.

Sponsorships / Donations / Naming Rights

Business sponsorships for programs may be available throughout the year. In-kind contributions are often received, including food, door prizes and equipment/material. Naming rights could be considered for substantial gifts and may have time limitations, depending on local policy.

Interagency Agreements

State law provides for interagency cooperative efforts between units of government. Joint acquisition, development and/or use of park and open space facilities may be provided between Parks, Public Works and utility providers.

Private Grants, Donations & Gifts

Many trusts and private foundations provide funding for park, recreation and open space projects. Grants from these sources are typically allocated through a competitive application process and vary dramatically in size based on the financial resources and funding criteria of the organization. Philanthropic giving is another source of project funding. Efforts in this area may involve cash gifts and include donations through other mechanisms such as wills or insurance policies. Community fundraising efforts can also support park, recreation or open space facilities and projects.

ACQUISITION TOOLS & METHODS

Direct Purchase Methods

Market Value Purchase

Through a written purchase and sale agreement, the city purchases land at the present market value based on an independent appraisal. Timing, payment of real estate taxes and other contingencies are negotiable.

Partial Value Purchase (or Bargain Sale)

In a bargain sale, the landowner agrees to sell for less than the property's fair market value. A landowner's decision to proceed with a bargain sale is unique and personal; landowners with a strong sense of civic pride, long community history or concerns about capital gains are possible candidates for this approach. In addition to cash proceeds upon closing, the landowner may be entitled to a charitable income tax deduction based on the difference between the land's fair market value and its sale price.

Life Estates & Bequests

In the event a landowner wishes to remain on the property for a long period of time or until death, several variations on a sale agreement exist. In a life estate agreement, the landowner may continue to live on the land by donating a remainder interest and retaining a "reserved life estate." Specifically, the landowner donates or sells the property to the city, but reserves the right for the seller or any other named person to continue to live on and use the property. When the owner or other specified person dies or releases his/her life interest, full title and control over the property will be transferred to the city. By donating a remainder interest, the landowner may be eligible for a tax deduction when the gift is made. In a bequest, the landowner designates in a will or trust document that the property is to be transferred to the city upon death. While a life estate offers the city some degree of title control during the life of the landowner, a bequest does not. Unless the intent to bequest is disclosed to and known by the city in advance, no guarantees exist with regard to the condition of the property upon transfer or to any liabilities that may exist.

Gift Deed

When a landowner wishes to bequeath their property to a public or private entity upon their death, they can record a gift deed with the county assessors office to insure their stated desire to transfer their property to the targeted beneficiary as part of their estate. The recording of the gift deed usually involves the tacit agreement of the receiving party.

Option to Purchase Agreement

This is a binding contract between a landowner and the city that would only apply according to the conditions of the option and limits the seller's power to revoke an offer. Once in place and signed, the Option Agreement may be triggered at a future, specified date or upon the completion of designated conditions. Option Agreements can be made for any time duration and can include all of the language pertinent to closing a property sale.

Right of First Refusal

In this agreement, the landowner grants the city the first chance to purchase the property once the landowner wishes to sell. The agreement does not establish the sale price for the property, and the landowner is free to refuse to sell it for the price offered by the city. This is the weakest form of agreement between an owner and a prospective buyer.

Conservation and/or Access Easements

Through a conservation easement, a landowner voluntarily agrees to sell or donate certain rights associated with his or her property (often the right to subdivide or develop), and a private organization or public agency agrees to hold the right to enforce the landowner's promise not to exercise those rights. In essence, the rights are forfeited and no longer exist. This is a legal agreement between the landowner and the city that permanently limits uses of the land in order to conserve a portion of the property for public use or protection. The landowner still owns the property, but the use of the land is restricted. Conservation easements may result in an income tax deduction and reduced property taxes and estate taxes. Typically, this approach is used to provide trail corridors where only a small portion of the land is needed or for the strategic protection of natural resources and habitat. Through a written purchase and sale agreement, the city purchases land at the present market value based on an independent appraisal. Timing, payment of real estate taxes and other contingencies are negotiable.

Park or Open Space Dedication Requirements

Local governments have the option to require developers to dedicate land for parks under the State Subdivision Law (Ch. 58.17 RCW) and the State Environmental Policy Act (SEPA) (Ch. 43.21C RCW). Under the subdivision law developers can be required to provide the parks/recreation improvements or pay a fee in lieu of the dedicated land and its improvements. Under the SEPA requirements, land dedication may occur as part of mitigation for a proposed development's impact.

Landowner Incentive Measures

Density Bonuses

Density bonuses are a planning tool used to encourage a variety of public land use objectives, usually in urban areas. They offer the incentive of being able to develop at densities beyond current regulations in one area, in return for concessions in another. Density bonuses are applied to a single parcel or development. An example is allowing developers of multi-family units to build at higher densities if they provide a certain number of low-income units or public open space. For density bonuses to work, market forces must support densities at a higher level than current regulations.

Transfer of Development Rights

The transfer of development rights (TDR) is an incentive-based planning tool that allows land owners to trade the right to develop property to its fullest extent in one area for the right to develop beyond existing regulations in another area. Local governments may establish the specific areas in which development may

be limited or restricted and the areas in which development beyond regulation may be allowed. Usually, but not always, the "sending" and "receiving" property are under common ownership. Some programs allow for different ownership, which, in effect, establishes a market for development rights to be bought and sold.

IRC 1031 Exchange

If the landowner owns business or investment property, an IRC Section 1031 Exchange can facilitate the exchange of like-kind property solely for business or investment purposes. No capital gain or loss is recognized under Internal Revenue Code Section 1031 (see www.irc.gov for more details). This option may be a useful tool in negotiations with an owner of investment property, especially if the tax savings offset to the owner can translate to a sale price discount for the City.

Current (Open Space) Use Taxation Programs

Property owners whose current lands are in open space, agricultural, and/or timber uses may have that land valued at their current use rather than their "highest and best" use assessment. This differential assessed value, allowed under the Washington Open Space Taxation Act (Ch.84.34 RCW) helps to preserve private properties as open space, farm or timber lands. If land is converted to other non-open space uses, the land owner is required to pay the difference between the current use annual taxes and highest/best taxes for the previous seven years. When properties are sold to a local government or conservation organization for land conservation/preservation purposes, the required payment of seven years worth of differential tax rates is waived. The amount of this tax liability can be part of the negotiated land acquisition from private to public or quasi-public conservation purposes. Clark County has a current use taxation program that offer this property tax reduction as an incentive to landowners to voluntarily preserve open space, farmland or forestland on their property.

OTHER LAND PROTECTION OPTIONS

Land Trusts & Conservancies

Land trusts are private non-profit organizations that acquire and protect special open spaces and are traditionally not associated with any government agency. Columbia Land Trust is the regional land trust serving the Camas area, and their efforts have led to the conservation of more than 50,000 acres of forests, shorelines, parks and natural areas in the region. Other national organizations with local representation include the Nature Conservancy, Trust for Public Land and the Wetlands Conservancy.

Regulatory Measures

A variety of regulatory measures are available to local agencies and jurisdictions. Available programs and regulations include: Critical Areas Ordinance, Camas; State Environmental Policy Act (SEPA); Shorelines Management Program; and Hydraulic Code, Washington State Department of Fisheries and Department of Wildlife.

Public / Private Utility Corridors

Utility corridors can be managed to maximize protection or enhancement of open space lands. Utilities maintain corridors for provision of services such as electricity, gas, oil, and rail travel. Some utility companies have cooperated with local governments for development of public programs such as parks and trails within utility corridors.

Appendix G
Site Acquisition & Development Guidelines

ACQUISITION GUIDELINES

Planning and land acquisition for future parks is a recognized component in land use and urban growth management, since the provision of parks and open space is considered essential to the livability of urban areas. For the recreation resource planner, the land acquisition process is an important task for ensuring the availability of future recreation resources for the majority of the community. The established planning goals for a community's comprehensive plan recognize the development of parks and retention of open space with conservation values as a tool for managing the effects of increased density and fostering livability.

Specific Site Suitability for Developed/Active Parks

While existing neighborhood parks may range from 2.3 to 10 acres in size, some basic location and land characteristics influence how accessible, "developable" and convenient a potential site might be for a future public park. Evaluating a potential land parcel should include consideration of the following property features:

- Access and visibility to the property. An adequate amount of public right-of-way is needed to allow for creating bike/pedestrian pathways, at a minimum, and either on-street parking or a parking lot for park visitors who must drive a vehicle.
- Existing publicly owned lands, easements and right-of-way. Are there existing lands under public ownership that could be converted to public park use? What other public amenities are proximate and complementary to a future park development (e.g., schools, police stations, etc.)?
- Connectivity to trails, schools, parks, neighborhoods and connectivity of the trail links. Connections to and from related land uses can add value to a potential park location.
- Environmental constraints, field assessment (does not include Environmental Assessment level detail), regulatory and permitting requirements and GIS data for critical areas. Sensitive environmental lands should be protected, but often they are not the best sites for development of recreational amenities for public parks. Protected and conserved lands can provide complementary value to public parks, while the public park land can create a buffer for the conserved land.
- Topography. Existing landforms, whether flat or hilly, will influence the park's design and best fit for provision of recreational facilities.
- Technical analysis of park standards and development costs should be evaluated to help provide realistic site development costs. For example, existing road improvements within the public right-of-way or lack of public water and sewer may trigger additional park development costs.

Within identified neighborhoods that may lack or have limited access to public parks, potential properties should be evaluated for suitable site conditions for the development of future recreational amenities and/or access to natural resources and water.

Neighborhood/Community Park Site Suitability Criteria:

- Access / visibility
- Parcel size / configuration
- Contiguous public land / connectivity
- Extent of sensitive areas
- Cost factors (acquisition, development & maintenance.)
- Compatibility with surrounding uses
- Vacant land preference

Trail Site Suitability Criteria:

- Development feasibility
- Continuity / connectivity (“safe routes”)
- Natural, cultural, historic value
- Public ROW access
- Land costs / value

Urban Natural Areas Site Suitability Criteria:

- Ecological, cultural, historic value
- Continuity / connectivity
- Public right of way access
- Development pressure (threat of conversion)
- Acquisition costs, donations, grants, third-party support (i.e., land trusts), etc.

Site-Specific Concerns

- Once a targeted park land acquisition has been identified and evaluated with consideration to its potential suitability as a future pubic park, more specific assessments should be conducted to ensure a measure of known development variables for future park use.
- A boundary survey and review of the title is important to identify an existing encroachments, encumbrances or entitlements that need to be addressed or corrected prior to closing.
- Environmental constraints, such as wetlands, waterways, other sensitive habitats and any associated buffers, should be identified to determine their impact on developable park spaces.
- An environmental site assessment should be conducted to identify environmental conditions that could have resulted from a past release of hazardous substances and determine any potential mitigation requirements to protect public health. Additionally, environmental law typically leaves the burden of responsibility on the property owner, so conducting an environmental site assessment is important to protect the City’s liability.
- An archaeological assessment to review potential cultural resources may also help bring to light future park development costs and variables.
- Any underground tanks, wells, septic systems and existing structures should be evaluated for the need to remove, decommission, or demolish after closing of land sale.
- Preliminary analysis of O&M cost for holding property until development.

Design Standards for Environmental Site Assessment

Considering a current use of a property is typically not sufficient for evaluating potential environmental concerns. For example, a vacant lot may previously have been used for agricultural purposes and may contain pesticide residues in the soil, or a current retail building formerly may have housed an auto repair business with underground tanks. Additionally, properties that are considered low-risk, such as a residence, could have a leaking underground heating oil tank or other concerns. Therefore, conducting an environmental site assessment is an important step in purchasing and managing property.

Prior to purchasing or accepting ownership of a property, the City should conduct an environmental site assessment to determine if contaminated soil, sediment or groundwater could be present. This process typically begins with a Phase I Environmental Site Assessment (ESA) per ASTM E1527-13 to identify environmental conditions or other business risk issues that could impact site development, pose a liability to the City, or present a risk to human health or the environment. Depending on the results of the Phase I ESA, a subsequent Phase II ESA may be warranted to sample and test soil, sediment or groundwater for the presence of contamination.

For property currently owned by the City, conducting an ESA prior to redevelopment can help to identify issues that could affect building design or result in construction delays.

For property that will be leased by the City, conducting a baseline environmental assessment may be warranted to establish initial conditions prior to the City occupying the site.

PRESERVING FUNDING ELIGIBILITY

Public outdoor park and recreation areas and facilities are eligible for funding assistance through the Washington Recreation and Conservation Office (RCO). Land acquisition projects must be consistent with the outdoor recreation goals and objectives contained in the Statewide Comprehensive Outdoor Recreation Plan (SCORP) or the recreation elements of local comprehensive plans and local master plans. Acquisition of land and waters for public outdoor recreation areas and facilities, including new areas or additions to existing parks, forests, wildlife areas, open spaces and other similar areas dedicated to outdoor recreation are eligible for assistance through the RCO. To be eligible, the acquisition procedures set forth by the RCO should be closely followed.

DESIGN & DEVELOPMENT GUIDELINES

With planned park upgrades and the potential for development of park acquisitions, Camas would benefit from park design and facility standards that help unify the system's amenities, operations and maintenance going into the future. Standards can begin with the adoption of typical bench details and expand to incorporate graphic sign styles, materials, colors and specific site furnishings. With the desire for Camas to create a unifying identity and enhance park maintenance efficiencies, guidelines for park standards should be planned, endorsed and implemented.

If the City should annex its urban reserve area, the acquisition and development of additional parks will be necessary. There may be opportunities to partner with residential development projects for providing new parks to be dedicated to the City upon completion. The establishment of park design and development

standards with predetermined requirements for consistency and quality of site amenities would ensure that new parks could readily fit within on-going park operations and maintenance.

All newly developed parks and trails shall adhere to the Final Guidelines for Outdoor Developed Areas as set forth by the United States Access Board.

Design Standards for Parks

Public park space should be clearly identifiable and provide a safe and secure environment for outdoor recreation and enjoyment. To help communicate the identity, amenities and uses within the park, some unified design standards should be applied. These standards are intended to help with public access, communication of safety and appropriate behaviors, and efficiency in operations and maintenance without creating a park system of identical "cloned" urban parks. Standardizing the designs for park signage, benches, picnic tables, drinking fountains, lighting, bollards, irrigation systems and fencing can allow for easier and less expensive procurement, installation, maintenance and replacement. The visual character of unified park amenities can quickly convey to the park visitor that the space is part of an overall system of public spaces where they are welcome.

While sharing standard site furnishings and signage styles helps unify the system identity, each individual park should have its own unique character. The shape and size of the land, the layout of circulation and location of key features, the styles, types and colors of play equipment, the architecture of restrooms, picnic and other park structures should be specific to that park. Even though each park contains some standardized site furnishings, each park site master plan design should strive to create a sense of place that highlights the character of that park in its local context and for its primary purpose (such as passive park with natural area or active sports-oriented facility).

The following tables highlight the range and considerations of various amenities that may be provided within urban parks (community and neighborhood parks) and can provide guidance for negotiating facility development opportunities in situations when private entities propose park development in-lieu of payment or for other, alternative arrangements, such as density bonuses.

Figure G1. Minimum Site Design Considerations for Neighborhood Parks

Amenity	Considerations - where feasible
Playground	▪ Minimum of 4,000 sq.ft. play area ▪ Equipment should be suitable for and developmentally-appropriate for toddlers and elementary school-aged children ▪ Playground should be ADA Accessible and play equipment should be ADA Compliant
Loop Walking Path	▪ Minimum 8' wide ▪ ADA-compliant surface to accessible elements (benches, tables, play area) ▪ Pathway slope not to exceed 5% grade or no more than 8% for more than 30 lineal feet without switchbacks or railings
Picnic Tables	▪ Minimum of 2, Use standard ADA compliant picnic table style
Drinking Fountain	▪ Provide ADA-compliant standard fixture. Install water bottle fill station as appropriate
Benches	▪ Minimum of 2, Use standard ADA compliant bench style
Open Turf Area	▪ Provide at least 15% of total lawn area with irrigation, preferably adjacent to the play area
Trees & Landscaping	▪ Provide shade for portion of playground area ▪ New trees and shrubs should be irrigated for a minimum of 2 years until established
Bicycle Racks	▪ Minimum of 2, with capacity to serve 4 bikes
Trash Receptacles & Dog Waste Disposal Stations	▪ Minimum of 1

For community parks, any or all of the following outdoor recreation features should be considered in addition to the same amenities provided in neighborhood parks.

Figure G2. Minimum Site Design Considerations for Community Parks

Amenity	Considerations - where feasible
Parking	▪ Based on types of amenities and their parking quantity requirements ▪ Include requisite number of handicapped parking stalls at appropriate locations ▪ Consider need for parking provision at multiple access points, where appropriate
Loop Walking Path	▪ Provide a perimeter trail in addition to pathways accessing all major park amenities
Multiple Access Points	▪ Provide connectivity to neighborhoods, nearby trails and public rights-of-way
Restrooms	▪ Provide ADA-compliant standardized design facilities
Picnic Shelter	▪ Provide minimum of 1 group picnic shelter
Sports fields	▪ Type and quantity dependent on available space and current public demand for each sport facility. Also depends on proximity to similar amenities within the city and/or region
Sports courts	▪ Type and quantity dependent on available space and current public demand for each sport facility. Also depends on proximity to similar amenities within the city and/or region
Tree Canopy	▪ Target a 25-45% tree canopy dependent on other park amenities and feasibility
Open Grass Area	▪ Open play area with sun exposure ▪ Minimum target of 1 acre
Natural Areas	▪ Based on existing and restored environmental characteristics
Off-leash Dog Area	▪ Minimum target of 1 acre ▪ Fenced enclosure with double-gate access ▪ Provide doggy waste dispenser and trash receptacle at entrance

Figure G3. Design Considerations for Other Park Amenities

Amenity	Considerations
Picnic Shelter	▪ Minimum of 400 sq.ft.
Sport field	▪ Practice level for youth soccer, T-ball, baseball and/or softball
Sport court	▪ ½ court basketball court
Tennis court	
Alternative recreation court	▪ Such as bocce ball, pickleball, horseshoes, lawn bowling
Skate spot	▪ 600 to 1,200 sq.ft. with small ramps, bowls or features for beginners
Disc golf course	▪ Minimum 9 baskets
Splash pad	
Natural area	
Water feature	▪ Such as a passive water-based amenity that provides a visual focal point, i.e. fountains, ponds, or waterfalls
Restroom	
Utilities	▪ Automatic Irrigation, Electricity, Water
Parking	

Design Standards for Open Space & Natural Areas

Open space and natural areas are primarily intended to conserve places with ecological sensitivity or natural landscape value. Most natural areas have some space where low-impact recreational uses and trails can be accommodated without reducing the environmental integrity of the land or water resource. Since the open space can range from wetlands and riparian corridors to fields and forests, design standards are not applied uniformly across the site. Each natural landscape is treated according to its level of sensitivity, need for conservation/restoration and tolerance for outdoor recreational use. However, where passive recreation opportunities such as trails can be provided, the standardized designs for park benches, picnic tables, signs and other site amenities should be applied.

Design Standards for Special Use Facilities

Consideration should be given in the design and renovation of any special use facility as to how and how much the site and its amenities should be identifiable within the park system through the application of standardized park signage and site furnishings. For example, a future sport field complex could accommodate some of the standardized park benches, picnic tables and signage, but it would also require its own specialized features, such as bleachers, backstops, field lighting, score boards and other equipment, that are unique to the facility. Each master plan design for new facilities should give careful consideration as to how a unique sense of place and identity is conveyed while still communicating that the facility is part of a system of outdoor recreation accommodation provided by the City of Camas.

Design Standards for Trails

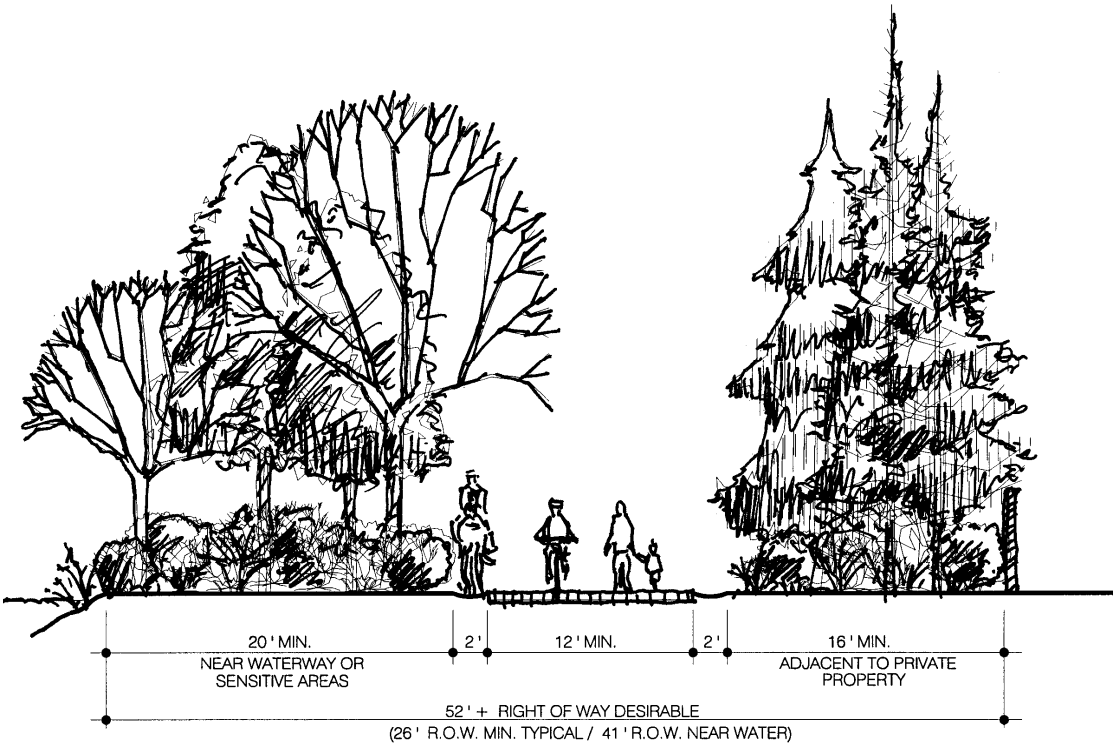
A successful trail system is integrated with other transportation alternatives to include a range of trail, sidewalk, bike path and connection opportunities designed to the human scale. The typical recreational trail hierarchy is aligned from regional shared-use trails to local neighborhood paths and park trails. Trail systems can also incorporate specially designated trails for single track mountain biking, primitive hiking and equestrian uses.

Designing the actual physical trail starts with overall purpose of the trail, connecting travelers from one location to another (point A to point B) or through a particular environment (loop trail through a park). With a clear purpose for the trail, an appropriate alignment can then be determined to help provide the desired outdoor recreation experience or transportation value. For example, regional multi-use shared trails should be designed to a minimum width of 12 feet. In expanding urban centers, providing a 16-foot trail width can help accommodate significant bike and pedestrian use as the community grows and linkages to public transit enable increased trail usage. The most heavily used urban trails benefit from the installation of permanent pavement to withstand heavy traffic in a variety of weather conditions.

It should be noted that changes in transportation engineering and trail construction methods may warrant the need to update trail design standards over time. Site furnishings along the trail are one method for standardizing trails as part of the outdoor recreation system provided by Camas. The same benches, picnic tables, bollards and other site furnishings used throughout Camas' park system could be installed along its trails to help unify the sense of place, reduce procurement costs and simplify maintenance.

The unifying standard for Camas' trail system can be visually expressed through a designed wayfinding plan. Linked with the park system wayfinding, the trail signage should provide identification, direction, destination, travel information and safety messaging, while clearly reinforcing Camas' sense of place.

Trails should be constructed according to City specifications. It is recommended that trail layout and surfacing materials be approved by the City and meet the following general requirements:



- Surfacing should be appropriate to the location; paved asphalt or concrete is recommended for upland areas, and wood chip, crusher waste or boardwalks are appropriate in lowland, wet or sensitive areas (City codes shall apply)
- Hard-surfaced trails should comply with ADAAG guidelines for slope and cross-slope; soft-surfaced trails should include properly placed and designed water bars or other surface water management techniques to minimize run-off and erosion.
- Entry signage should be provided at trailheads or access points, and boundary signage should be placed, as appropriate, to demarcate sensitive edges or private property boundaries.
- Trash receptacles should be provided at trailheads.

The four classifications of trails include: Regional, Local, Rustic, and Semi-Primitive. A primary distinguishing feature of City-owned trails is that these trails predominantly serve community-wide and regional purposes and receive this level of use. Local and secondary trails generally serve a local scale, at the neighborhood level. Such local and secondary trails will generally be owned and maintained by Homeowners Associations. While Regional and Local trails are designed as multiple use trails, Rustic and Semi-Primitive trails can be designed as single use trails.

Regional Trail

This trail type is designed to accommodate multiple uses (walking, running, bicycling) and connect to adjoining jurisdictions or destinations. The surfacing should be a minimum of 12 feet wide and be constructed of a hard surface material such as asphalt or concrete. Exceptions to surfacing materials may occur to mitigate impacts to critical or sensitive areas. Equestrian use could be permitted if an additional unpaved shoulder area is provided. The right-of-way required for regional trails should be 26 to 52 feet, depending on their location and surroundings. This type of trail is typically located off roadway surfaces and within its own corridor. A diagram of this trail standard is located in Figure G4.

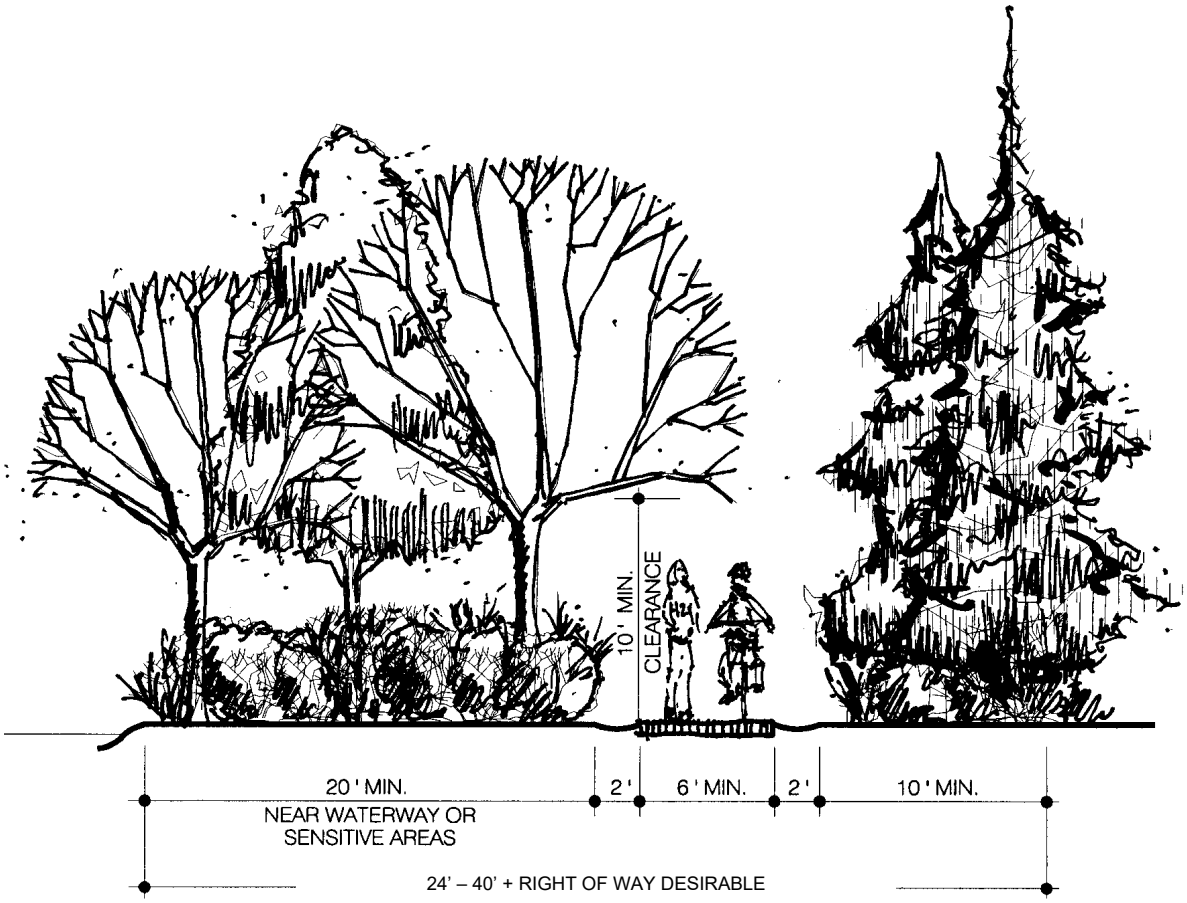


Figure G4. Regional Trail Cross Section

Local Trail

This trail type is designed to serve the local community and also provide access to the regional trail systems. It should be considered the “backbone” of the city’s trail network. The trail width should range from six to ten feet depending on the use and the terrain involved. It can be designed to accommodate the same uses listed for the regional trail. The surface for this type of trail may be paved or crushed aggregate depending on the use. Exceptions to surfacing materials may occur to mitigate impacts to critical or sensitive areas. The right of way for the local trail can range from 24 feet to 40 feet and can also be located on-road or off-road. Figure G5 is a typical configuration of a local trail.

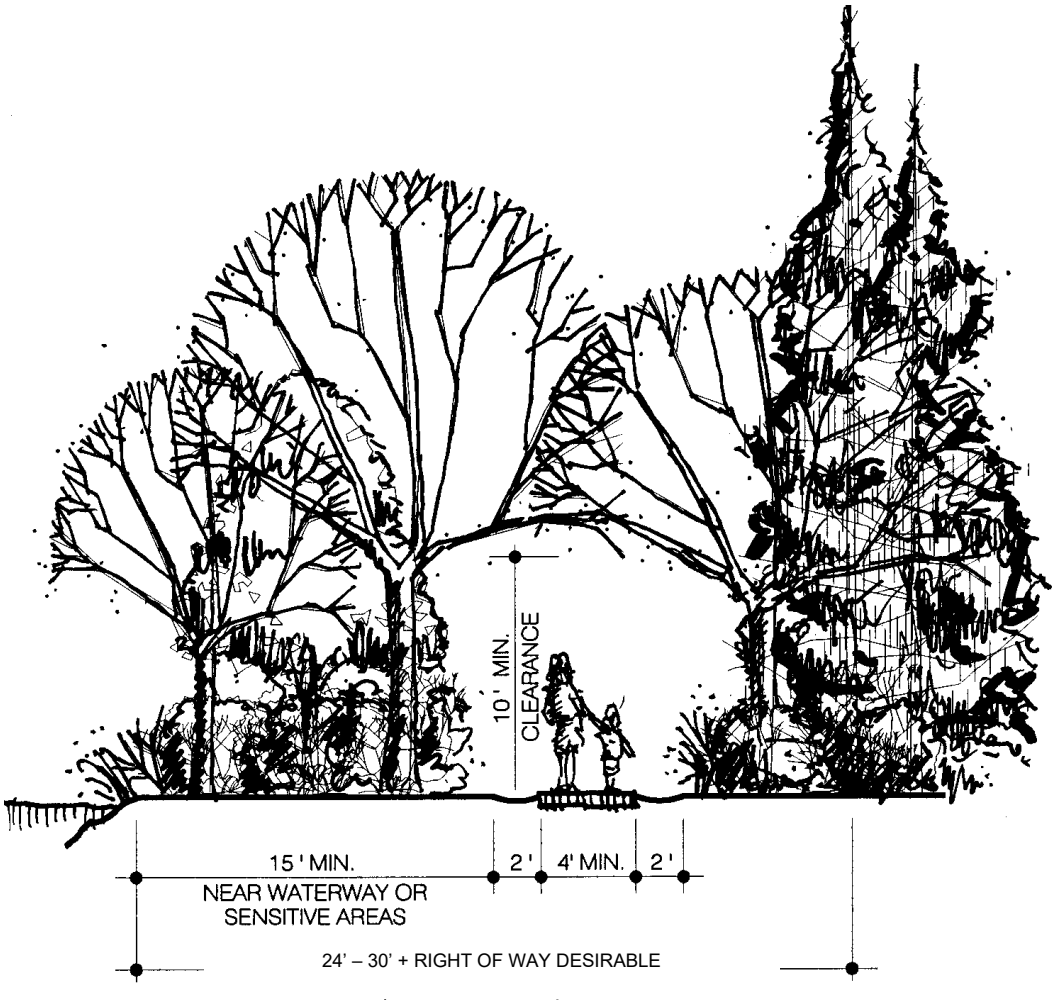

Figure G5. Local Trail Cross Section

Rustic Trail

This trail type provides access to local trails, and is more neighborhood-oriented. These trails will act as collectors for neighborhoods or developments and provide links to the community-wide trail system and other adjoining destinations. The rustic trail should be a minimum of four feet wide and be surfaced with stable accessible surfacing. The primary uses of a rustic trail are intended to be walking, bicycling and equestrian. The right-of-way widths desired for the rustic trail can range from 24 feet to 30 feet or more. These trails are always off-road in nature. Figure G6 details this trail classification.

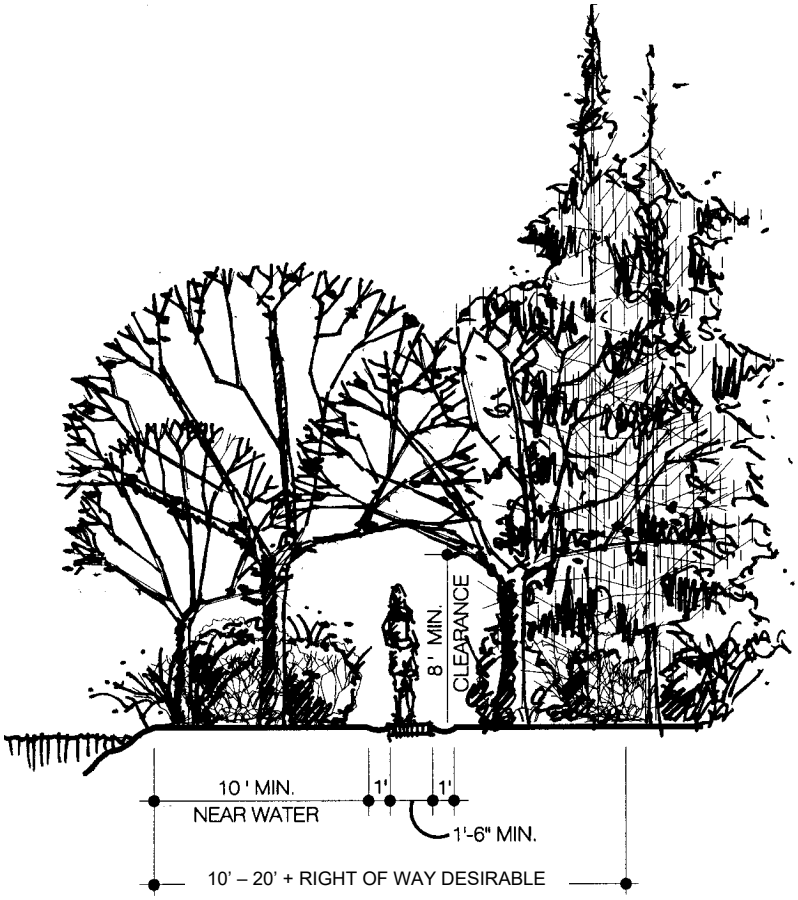

Figure G6. Rustic Trail Cross Section

Semi-Primitive Trail

This trail type is more specialized with regard to use, but it is more easily adaptable to the open space areas. It will serve in the more sensitive open space areas located within the city. It is designed to accommodate walkers, hikers, bicyclists, and equestrian users. It is typically two to four feet in width and is made up of compacted earth or other stable surfacing. The right-of-way width can range from ten to 20 feet. Typically, maintenance of these trails is minimal. Figure G7 below details the standards for this trail.

Figure G7. Semi-Primitive Trail Cross Section

Locating Trails in Sensitive (Critical) Areas

The large number of environmentally sensitive (critical) areas in Camas makes it likely that trails will be developed in some of these areas. The benefits of public access to natural areas (bird watching, nature appreciation, and environmental education) need to be balanced with the impacts of access.

Trails in environmentally sensitive areas will need to be carefully and appropriately located and designed. Exceptions to the trail improvement standards set forth in this Plan may be authorized in sensitive areas consistent with current best practices. This document recommends a thorough review and assessment of existing and proposed trail corridors, and careful placement of trails within sensitive areas to aid in minimizing the impacts. Guidelines for determining the suitability of trail locations in sensitive areas include the following:

1) Provide a minimum 20-foot wide vegetated buffer between wetland, sensitive area or water edge and the trail.
2) Construct boardwalks, railings, see-through fences and viewpoints to allow visual access to the areas and to keep trail users on the trail and away from the habitat.
3) Design wetland crossings for maximum protection of the wetland and locate them in an area suitable for public use.
4) Provide adjacent vegetation at access points that is dense enough to discourage off-trail travel. If necessary, install additional thick or thorny vegetation to prevent access.

5) Cover earthen based trails with dense turf where it crosses floodplains or other areas subject to periodic flooding to reduce puddling and walkers skirting the area.
6) Site trails away from active stream channels to prevent local bank erosion cause by trampling. In streamside locations where access is permitted or encouraged, provide access via boardwalks.
7) Locate bridge crossings in locations that will provide minimum impact to the water's edge and habitat while providing a rewarding experience for the trail user.

Recommended Trail Segments

The recommended trails plan provides a linked system based on a hierarchy of trail types. Linkages are provided at the neighborhood scale, at the community-wide scale, and regionally. The Potential Trails Map (Map 8) provides an overview of the segments, described in detail below. Proposed segments of the trail system are generalized to make connections or follow the direction of natural corridors. Final alignments are subject to change due to environmental conditions, development or alternate routes.

The following trail segment descriptions are excerpted from the 2014 PROS Plan.

Trail T-1

Trail T-1 runs along the west side of Camas, paralleling Parker Road. This trail segment provides a north-south connection and links two regional trails. About half of the alignment has been constructed. This segment passes from Prune Hill Park, to Ash Creek Park, past Sky Ridge Middle School and ending at its junction with T-3.

Trail T-2

Trail T-2 parallels the Columbia River. This regional trail is an extension of the Vancouver-Clark County trail system, and connects to neighboring Washougal's trail system. This trail provides visual access to the Columbia River, and makes an important regional connection.

Trail T-3

Trail T-3 is a regional trail running along the north shore of Lacamas Lake and connecting Lacamas Park, Camp Currie and the County's Green Mountain Trail heading north. Trails T-3 and T-4 make a loop around Lacamas Lake. This trail segment will include bridges or boardwalks across wetlands and water features in some locations. T-3 continues just north of Lacamas Park and then south, crossing T-4 at the Washougal River and continuing on to the Columbia River and trail T-2.

Trail T-4

Trail T-4 is the Heritage Trail, a regional trail running along the south side of Lacamas Lake and connecting Lacamas Park and Camp Currie. It passes through Heritage Park and will link to planned segment T-3, creating a loop around Lacamas Lake. T-4 links through Lacamas Park, continues into the Washougal River Greenway, and includes a bridge across the Washougal River to connect with T-17.

Trail T-5

Trail T-5 provides a loop around Prune Hill, with linkages to parks and neighborhoods. The northern half of the loop connects from Lake Road through the Open Space Network to the proposed Ash Creek Park. The southern half of the loop connects from Klickitat Park, continues through the Open Space Network, and connects Fallen Leaf Park. Camas has been completing pieces of trail T-5 as development has occurred along the alignment.

Trail T-6

Trail T-6 parallels Lake Road, connecting from T-1 to T-21. This segment has been partially constructed.

Trail T-7

Trail T-7 connects from T-5 through Grass Valley Park and parallels NW 38th Avenue toward the west boundary of Camas. The segment of the trail in the vicinity of Grass Valley Park has been constructed.

Trail T-8

Trail T-8 is a north/south connector that connects through the center of the T-5 loop. This trail connects through the Open Space Network and passes Dorothy Fox Elementary School and Dorothy Fox Park. The trail also includes several spur connections to T-9 and T-7 as well as a pedestrian bridge connection to T-9 across Ostensen Canyon.

Trail T-9

Trail T-9 connects from T-3/T-4 past Zellerbach Elementary School and Liberty Middle School (the renovated high school), through downtown, and then passes through the Benton Park and Ostensen Canyon sites. This trail then connects to trail T-8 at a bridge across Ostensen Canyon and at Dorothy Fox Park before turning south to reconnect to T-5.

Trail T-10

Trail T-10 includes a mini network of connections from neighborhoods to Klickitat Park and Prune Hill Sports Park. The trails also link to T-1, T-5 and T-11. This trail is owned and maintained by local Homeowners' Associations, is located largely within the Open Space Network, and is nearly complete.

Trail T-11

Trail T-11 is a loop that connects Klickitat Park to the overlook at SU-9.

Trail T-12

Trail T-12 connects from T-5 at Fallen Leaf Lake to a proposed neighborhood park.

Trail T-13

Trail T-13 is the trail network around Fallen Leaf Lake. This trail connects to Fallen Leaf Park as well as T-4 and T-5. The City has already completed several sections of this trail.

Trail T-14

Trail T-14 connects from T-3 and Lacamas Park to a planned neighborhood park, Lacamas Heights Elementary School, and Camas High School. T-14 also forms a loop with T-3 and T-27.

Trail T-15

Trail T-15 includes the Lacamas Park trail network. This system provides important community connections between T-3 and T-4.

Trail T-16

Trail T-16 provides a linkage from Louis Bloch Park to the Washougal River Greenway.

Trail T-17

Trail T-17 is the Washougal River Greenway trail system on the south river bank. This trail segment passes through the Washougal River Greenway, providing access to the river corridor for Camas, Washougal, and regional residents. This trail segment is joined to T-4 by a pedestrian bridge across the Washougal River to link the Greenway corridor and increase access. T-17 links to Oak Park, Goot Park, and T-2, the Columbia River trail.

Trail T-18

Trail T-18 follows a utility corridor from Washougal and meets up with Trail T-4 in the Washougal River Greenway. T-18 is also a proposed trail in the Washougal Comprehensive Park and Recreation Plan.

Trail T-19

Trail T-19 connects Lacamas Park trails to the north-south trail T-18 and to the Washougal trail system. This trail should be a jointly maintained connection between the two cities.

Trail T-20

Trail T-20 provides a secondary east-west connection between T-1 and T-21 in the northwestern corner of the City.

Trail T-21

Trail T-21 is a north-south connection on the western edge of Camas. It connects from T-4 south to T-1. East-west connections to T-21 are provided by trails T-6, T-7, T-20, T-22 and T-24.

Trail T-22

Trail T-22 includes the Leadbetter Corridor and connects T-6 east/west across T-1 to T-21.

Trail T-23

Trail T-23 connects through the open space network from the intersection of trails T-1 and T-22 to trail T-21.

Trail T-24

Trail T-24 connects trail T-23 with Prune Hill Sports Park and Trail T-1.

Trail T-25

Trail T-25 connects T-5 to Forest Home Park.

Trail T-26

Trail T-26 connects T-5 and T-8 to Grass Valley Park through a portion of the Open Space Network.

Trail T-27

Trail T-27 is the primary trail that will connect uses along the north shore of Lacamas Lake. This route will run parallel to the future realignment of Leadbetter Road and provide a continuous trail from the northern corner of the city towards Lacamas Park to the southeast.

Trail T-28

Similar to Trail T-32, Trail T-28 will link land uses on the north shore of Lacamas Lake. The City should design and construct this segment concurrent with future utility lines and pump stations planned to serve future uses.

Trail T-29

Trail T-29 will provide an alternative trail connection for residents of this future growth area.

Trail T-30

Trail T-30 will provide an alternative trail connection for residents of this future growth area.

Trail T-31

Trail T-31 will connect opposite sides of Camp Currie with a more direct route.

Trail T-32

Similar to Trail T-28, Trail T-32 will link land uses on the north shore of Lacamas Lake. The City should design and construct this segment concurrent with future utility lines and pump stations planned to serve future uses.

Figure G8 summarizes the recommendations for the Camas trail network.

Figure G8. Summary of Trail Recommendations (excerpted from 2014 PROS Plan)

Trail #	Name	Total Miles	Comments	City Maintained
T-1	West Camas Regional Trail	2.1	Completion/ Acquisition/ Development	✓
T-2	Columbia River Regional Trail	6.6	Acquisition/ Joint Development	✓*
T-3	East Camas Regional Trail*	7.9	Clark County Development	✓
T-4	Heritage Trail	1.8	Minor Additions/ Improvements/ Development of Washougal River crossing	✓
T-5	Camas Neighborhood Loop Trail	3.1	Additional Acquisition/ Development	✓
T-6	Lake Road Connector Trail	1.0	Completion/Upgrade to Standard	✓
T-7	West Camas Connector Trail	2.1	Completion/Upgrade to Standard	✓
T-8	Prune Hill Connector Trail	0.9	Completion/Upgrade to Standard	
T-9	Downtown Connector Trail	0.4	Completion/Upgrade to Standard	✓
T-10	Deer Creek Connector Trail	0.2	Completion/Upgrade to Standard	
T-11	View Ridge Connector Trail	0.3	Completion/Upgrade to Standard	✓
T-12	East Hilltop Connector Trail	0.2	Acquisition/ Development	✓
T-13	Fallen Leaf Lake Trails	1.8	Development/ Completion of Acquisition	✓
T-14	Lacamas Heights Connector Trail	1.1	Acquisition/ Development	
T-15	Lacamas Park Trails	3.7	No Changes	
T-16	Louis Bloch Connector Trail	0.3	Acquisition/ Development	
T-17	South Camas River Loop	3.3	Acquisition/ Development	✓
T-18	Washougal Connection	1.5	No Action	
T-19	Washougal Connection 2	0.6	No Action	✓*
T-20	Northwest Connector	0.8	Acquisition/ Development	
T-21	Westside Route	3.4	Acquisition/ Development	✓
T-22	Leadbetter Corridor	0.3	Acquisition/ Development	✓*
T-23	Natural Trail	2.6	Acquisition/ Development	
T-24	Prune Hill West Trail	0.9	Acquisition/ Development	
T-25	Forest Home Park Connection	0.8	Acquisition/ Development	
T-26	Grass Valley Link	0.9	No Changes	
T-27	North Camas 1	4.7	Acquisition/ Development	✓
T-28	North Camas 2	1.1	Acquisition/ Development	✓
T-29	Green Mountain 1	2.8	Acquisition/ Development	
T-30	Green Mountain 2	0.3	Acquisition/ Development	
T-31	Camp Currie Connection	0.3	Acquisition/ Development	✓
T-32	North Camas 3	0.8	Acquisition/ Development	✓
	TOTAL	58.6	Total City/Joint Maintained Trails	40.0 miles

*Jointly maintained

CRIME PREVENTION THROUGH ENVIRONMENTAL DESIGN (CPTED)

The inventory assessment highlighted an opportunity to consider incorporating crime prevention through environmental design (CPTED) principles to enhance park and trail safety and facilitate the monitoring of park uses and behaviors. CPTED applies four principles that are used to deter criminal behavior in outdoor environments:

- Natural surveillance
- Natural access control
- Territorial reinforcement
- Maintenance

CPTED natural surveillance ("see and be seen") asserts that sight lines for better visibility can deter undesirable behavior and increase the perceptions of safety and comfort by park patrons. Lowering understory vegetation or raising lower tree branches through intentional vegetation management can provide more clear lines of sight in and around trails and other areas of use. Providing clear visibility and reducing blind corners can also improve safety by limiting conflicts between different users (e.g. runners, cyclists, dog walkers), where unanticipated encounters may result in crashes or entanglements.

Natural access control in park design is often very subtle. Controlling where vehicles enter and exit park facilities through designed barriers, bollards, boulders, and post and cable fencing can protect park users and minimize park property damage from misguided vehicular traffic. Walkways, lighting, fencing and landscaping provide explicit direction for park users. The flow of users through a park will help decrease the opportunity for crime and improve clarity for the intended park behaviors.

Territorial reinforcement comes through clear demarcation of boundaries. For public parks, those boundaries between public and private lands, safe and unsafe areas, and special use, limited access or reserved sites can be delineated with the appropriate placement of fencing, signs, landscaping or other physical or visual design techniques.

Finally, clearly visible, high-quality maintenance is an important element of CPTED, as well as general public safety. CPTED recognizes the "broken window" theory where neglected and poorly maintained amenities are more attractive targets for vandalism or other criminal activity. Deferred maintenance can also result in park amenities that put users at risk. Broken pavement, worn decking, uneven playing fields and missing play safety surfacing can create injuries. Overall attention to CPTED principles can help ensure safer public park environments.

This project was a collaboration between the City of Camas staff and commissioners, the consulting team, the Camas community, and other Washington agencies. It was built upon previous plans and engagement processes in order to move community values and goals into implementation. A big thank you to everyone who contributed and gave the support needed to carry the work forward.

Project Introduction: 2024 Parks and Open Space Management Plan

POSMP Goal:

Optimize the management of our resources through data-driven decision making and operational efficiencies and effectiveness.

POSMP Objective:

The City of Camas aims to create a framework to help prioritize efforts in a way that **aligns with community, city, and funding resource goals and shared values**. Effectiveness in our own operations will allow for a focus on BMPs in order to set an example, provide clear guidance, and collaborate more with the community.

Executive Summary

The Camas Parks & Open Space Management Plan (POSMP) responds to the community's feedback in Camas' long-range Parks, Recreation and Open Space Plan by outlining a strategic vision for the thoughtful management of parks and open spaces within the City of Camas, ensuring that they continue to serve as resources for all users. Camas recognizes the vital role that parks and open spaces play in fostering community well-being, recreation and environmental sustainability. Camas' parks, open space, greenways and waterways are a critical component of the City's green infrastructure and play critical roles in supporting healthy, well-functioning ecosystems.

Scope of the POSMP

The POSMP took a multi-prong approach to understanding existing conditions and practices in order to provide data-based recommendations on how to align with the goals of the project and values of the community. Key aspects of this effort included:

- City-wide urban tree canopy analysis
- Sample public land tree inventory
- Operations, organizational, and financial assessment
- Project prioritization approach to align with community values
- Best practices and recommendations
- Planning recommendations

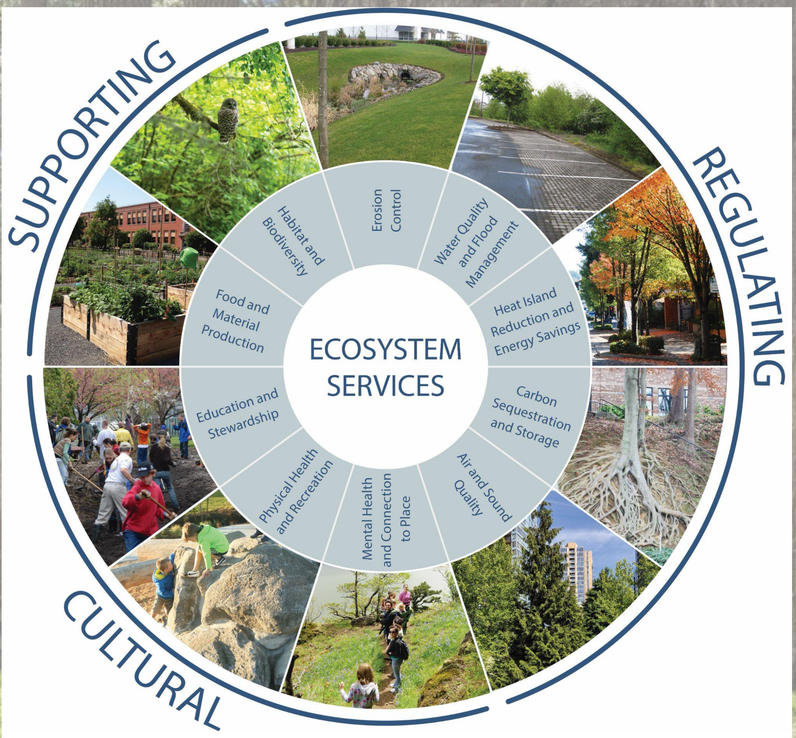
The project also engaged with the public through the Parks & Recreation Commission meetings, a public open house, online survey, and tree inventory training.

Key Takeaways

- Nature is a valuable, critical infrastructure that serves the community in many ways
- Management of Camas' Parks and Open Spaces should utilize a systems-based approach in order to optimize ecosystem performance long-term
- Retaining canopy and character will have to be a public:private partnership with alignment on goals and expectations

The 5 Camas Community Values

Equitable access



Asset protection and public safety

Preserve and enhance natural features

Outreach and education

Financial and resource allocation

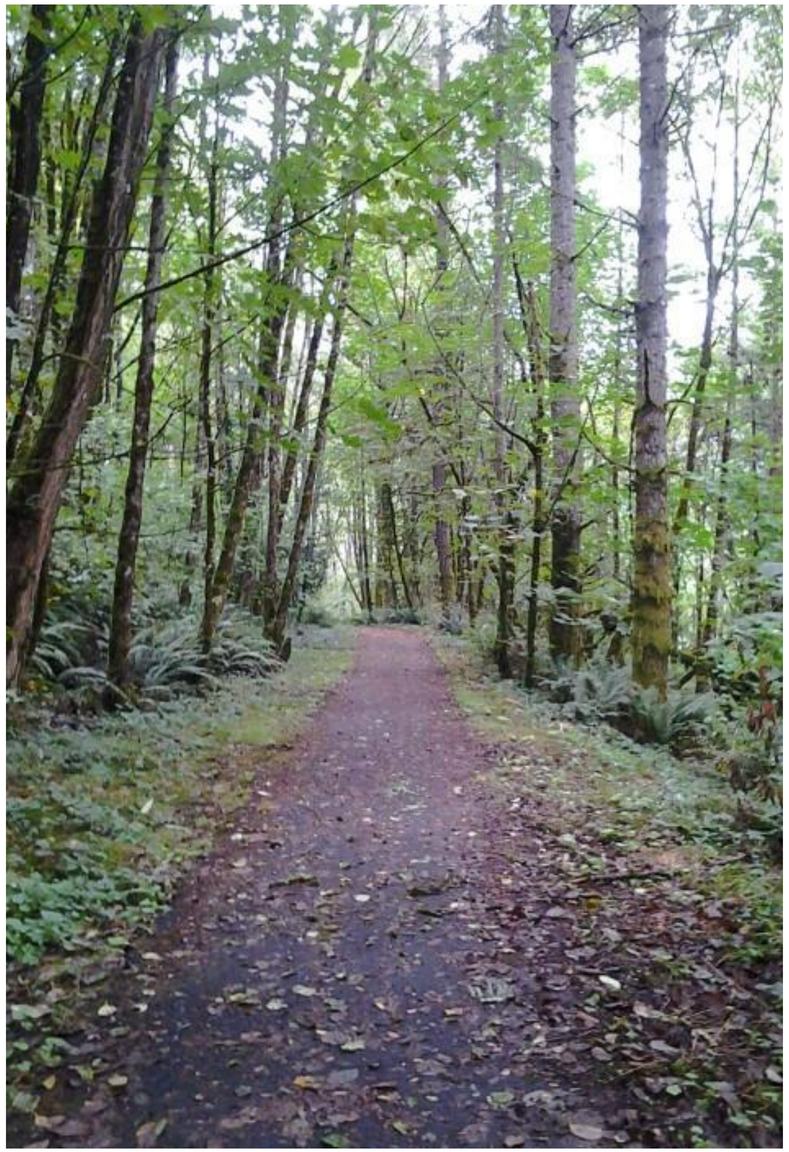
Collectively increase the resilience of parks, open spaces and natural ecosystems in Camas

Best practice and planning recommendations took into account the multiple values that natural systems can provide the community.

Goals of this effort

We recognize the intrinsic value of our **parks and open spaces as essential assets** that contribute to the City's character and residents' quality of life. Through this Parks and Open Space Management Plan, we can increase the resilience of open spaces that will enrich the lives of current and future generations in Camas.

Enhance external communication and collaboration



- Raise public awareness
- Encourage and support use of best management practices
- Make a Call to Action

Improve internal decision making

- Develop a clear inventory of existing conditions and best management practices
- Encourage and support use of best management practices
- Prioritize resource use with a science/ data-backed tool
- Identify opportunities for more investment

Collectively increase the resilience of parks, open spaces, and natural ecosystems

From challenges to opportunities

What challenges are we facing?

Tree canopy and open space service gaps

Without clear guidance and best management practices, coordinated management of open spaces is difficult. Gaps remain in the city that could serve the needs of those who need it most.

Climate change and extreme weather

Climate change and extreme weather events pose threats to ecosystem health and asset preservation. Longer term hazards and stressors not only impact the health of vegetation and habitats, but likely add risk to adjacent buildings and infrastructure.

Lack of data

There is a need for more comprehensive data on inventory, resources and best practices to help inform decision making on prioritizing work scope, resource allocation and funding.

Unclear guidance for private landowners

Lack of clarity around different planning documents and ordinances and the role and impact on private land owners. Limited resources limit the ability of consistent maintenance between public and private lands.

Lack of resources

Most resources are spent being reactive to ongoing safety issues and performing routine maintenance and upkeep across public lands. Proactive prioritization is needed in order to work toward the desired performance and use of parks and open space.

Community Values

Equitable access

Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.

Asset protection and public safety

Protect ecosystems, human health, safety and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change and other potential impacts .

Preserve and enhance natural features

Maintain the existing natural character of Camas in ways that bolster community identity.

Outreach and education

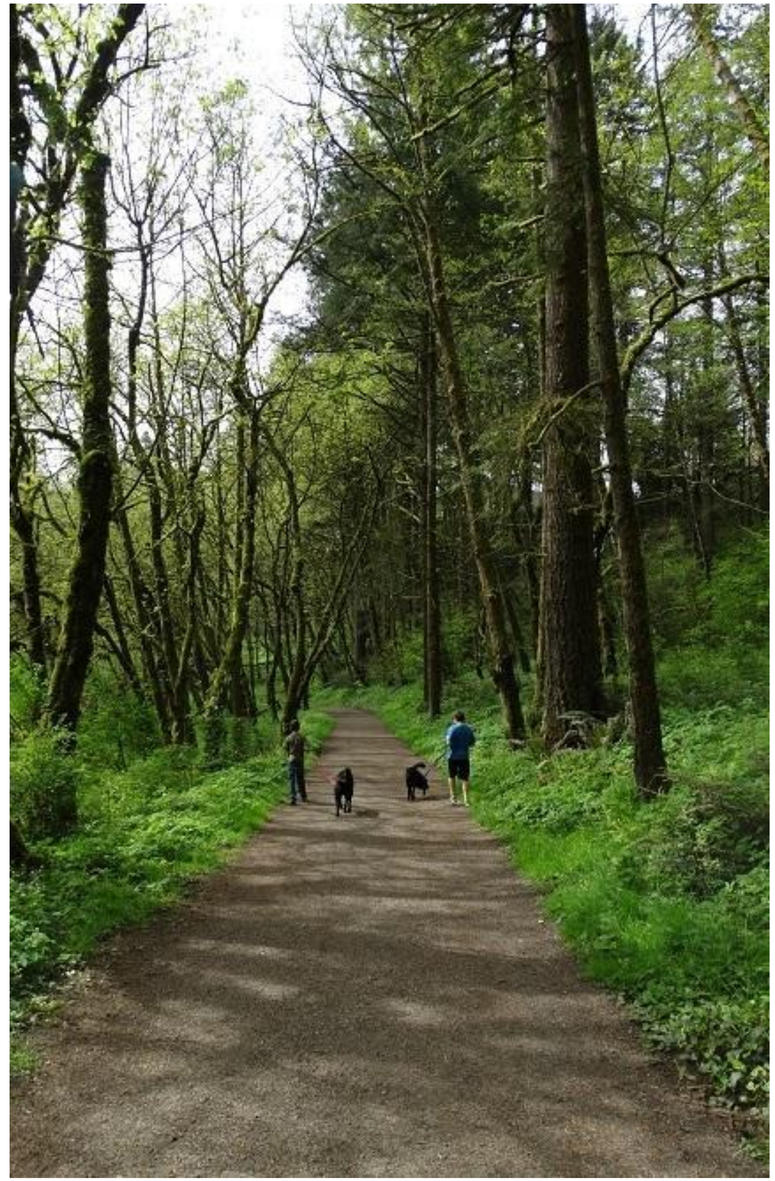
Provide opportunities for learning to gain efficiencies, institute best practices and engage the community.

Financial and resource allocation

Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.

We all have a role to play

How can I help my community?

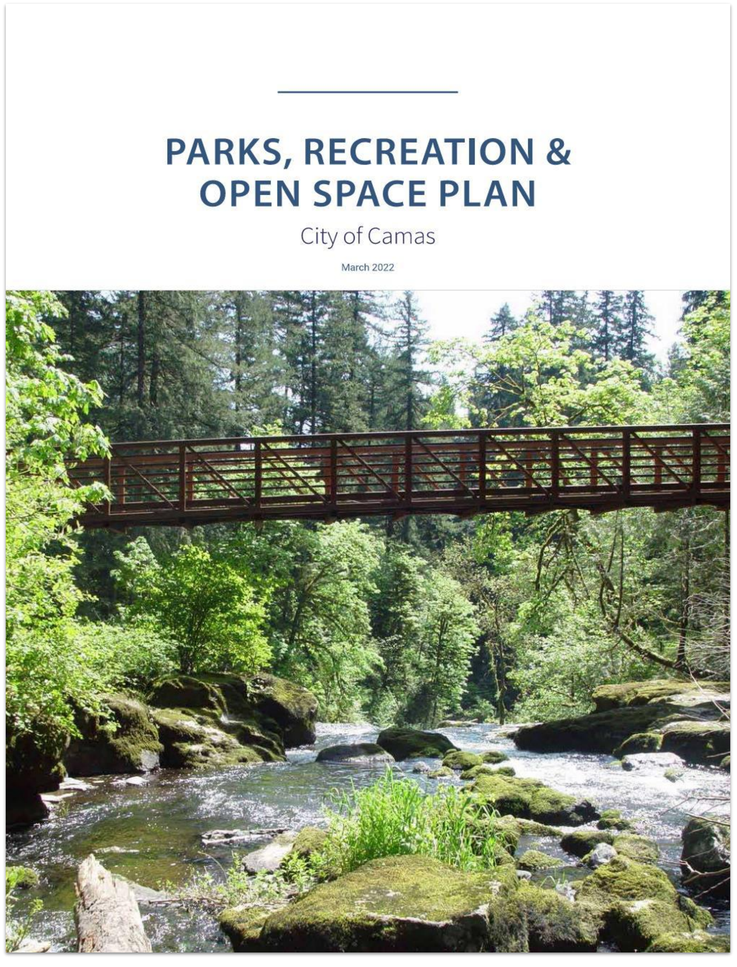


- Follow guidelines of Parks and Open Space Management Plan and other city codes and ordinances.
- Support trees and other natural systems on your properties and within your HOA.
- Volunteer your time and effort towards management of parks and open spaces through initiatives such as community tree inventory events.

How can the City of Camas help me?

- Provide clear incentives and guidelines for managing private open spaces.
- Lead by example through public land management efforts.

How can I help the City of Camas?



- Contribute feedback to shape resource priorities and next steps of the POSMP.
- Participate in the Comprehensive Plan update process

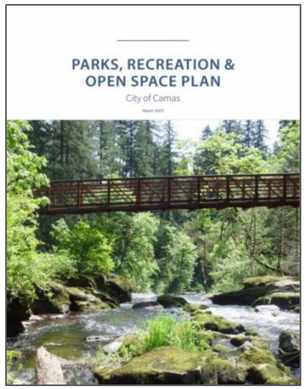
Setting the stage: Parks, Recreation & Open Space (PROS) Plan

Open space and stewardship

Camas' open space, greenways and waterways are a **critical component of the City's green infrastructure** and play critical roles in supporting healthy, well-functioning ecosystems.

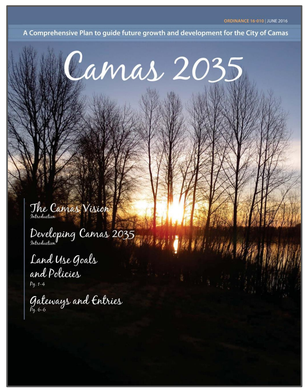
This Parks and Open Space Management Plan responds to the community's feedback in the **2022 PROS Plan** to:

1) **Maintain what we have**
2) **Fill gaps and improve trail connections**
3) **Develop and improve existing parks**



PROS Plan action

New plans should reflect the **realities of limited program funding** and the challenges presented by **climate change** to include the following considerations:



1. **Maintain the functional benefits** of open space vegetation.
2. Foster **resilient plant communities** that can recover from disturbances and adapt to climate change and its impacts, such as forest fires.
3. Implement work **based on the value** of these functional benefits, the community's priorities for the open space properties and the condition of the vegetation found there.
4. **Maximize the return** on available funding through volunteers, matching grants, and donations.

How does this plan align with existing practices and guidelines?

As part of the information gathering process, the team reviewed existing planning documents to understand the goals, challenges, and community feedback on how parks and open spaces are currently managed. They used this process to identify opportunities for improvements going forward to align better with city-wide goals.

2022 PROS Plan

2016 Comprehensive Plan

ORDINANCE NO. 18-014

AN ORDINANCE amending certain provisions of the Camas Municipal Code, repealing Chapter 18.31, and adding a new Chapter 3.54, relating to the Camas Urban Tree Program.

The Council of the City of Camas do ordain as follows:

Section I

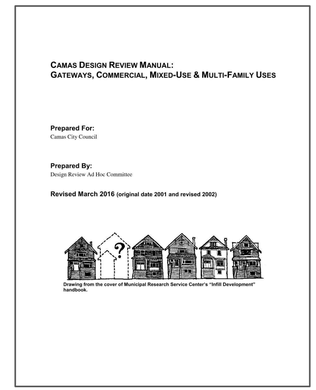
A new Chapter 3.54 of the Camas Municipal Code, entitled City Tree Fund is hereby adopted as follows:

3.54.010 City Tree Fund

A. There is created a city tree fund into which all penalties and revenues received for tree protection under Chapters: 12.04 Sidewalk and Street Tree Maintenance: 16.51 General Provisions for Critical Areas; and Chapter 18.13 Landscaping shall be placed. In addition, the following sources of funds may be placed in the city's tree fund:

1. Donations and gifts;
2. Donations and grants for the purposes of the fund;
3. Sale of trees or wood from city property where the proceeds from such sale have not been dedicated to another purpose;
4. Fines and penalties imposed under Chapters 12.04, 16.51 and 18.13, or settlements in lieu of penalties.

B. The city shall use the city tree fund for the following purposes:



1. Acquiring, maintaining, and preserving areas of healthy soil and native vegetation within the city;
2. Planting and maintaining trees within the city to compensate for loss of canopy coverage;
3. Support community urban forestry education;
4. Support the management of urban forest areas to include eradicating aggressive non-native vegetation species;
5. Other purposes relating to trees as determined by city council.

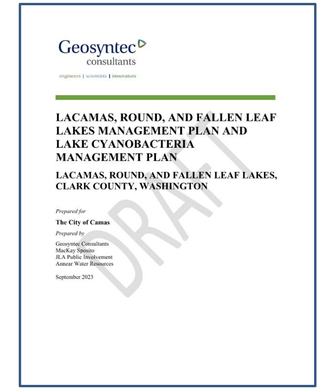
3.54.020 Tree Removal Fine Table

A.

Tree Removal Infractions (measured as diameter at breast height "dbh")				
2" to 6"	$250	25" – 30"	$750	
7" to 12"	$375	25" – 36"	$875	
13" – 18"	$500	Greater than 37"	$1,000	
19" – 24"	$625			

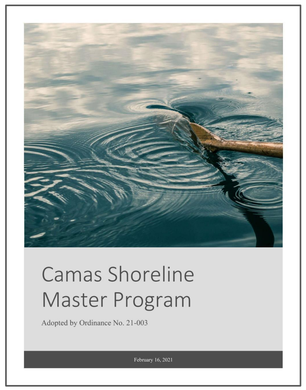
Tree Ordinance 18-014

CAMAS DESIGN REVIEW MANUAL:
GATEWAYS, COMMERCIAL, MIXED-USE & MULTI-FAMILY USES



Prepared For:
Camas City Council

Prepared By:
Design Review Ad Hoc Committee



Revised March 2016 (original date 2001 and revised 2002)

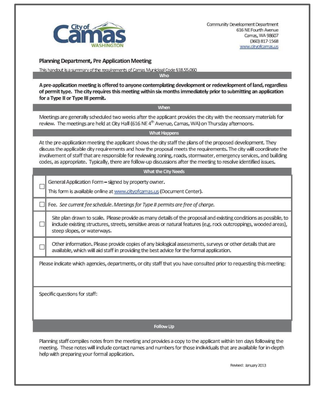
2023 DRAFT Lakes Management Plan

2021 Shoreline Master Program



2023 Street Tree Succession Plan (for Downtown Camas)

TREES FOR NARROW SPACES
(Plant 15'-25' apart, compatible with mature tree size)
Typical size at time of planting: 2" minimum caliper (B&B or container)

Common Name	Botanical Name	Height	Spread	Min. Planter Width (ft.)	Form	Remarks
Adirondack Crabapple	Malus 'Adirondack'	18	10	4	Columnar	Densely upright in an inverted cone. Medium-green foliage. White flower bright red fruit.
Amanogawa cherry	Prunus serrulata 'Amanogawa'	20	6	4	Columnar	Very narrow and upright structure, pale pink spring flowers.
American smoketree	Cotinus obovatus	30	30	4	Globe	Tolerant of hot and dry sites, bluish-green color, purple flower clusters.
Beauty plum semi-dwarf	Prunus cultivar'Beauty'	15	15	4	Globe	Large fruit early summer, needs regular pruning.
Big cityplum	Prunus x cistena 'Schmidtcis'	14	12	4	Globe	Light pink and very fragrant spring flowers, dark purple foliage
Black hawk mountain ash	Sorbus aucuparia 'Black Hawk'	25	15	4	Columnar	Bright selection for hardiness and resistance to sunscald. Rounded with maturity
Black Hawthorne	Crataegus douglasii	25	20	4	Oval	Native to portland metropolitan region, has thorns
Butterfly Japanese Maple	Acer palmatum 'Butterfly'	12	6	4	Umbrella	Shifty upright in habit. Deeply dissected, bright green foliage with magenta tint in fall.
Callery Pear 'Capital'	Pyrus calleryana 'Capital'	35	12	4	Pyramidal	It is noted for its early profuse spring bloom, quality glossy green foliage and effect
Carmichael Crabapple	Malus 'Carmichael'	20	15	4	Oval	Purple to bronze foliage in summer. Flower is rose red. Bright red fruit.
Chinese Pistache	Pistachia chinensis	25	25	4	Globe	Impressive red-orange fall color, attracts wildlife
Chokeculb Crabapple	Malus trichocarpa	30	15	4	Oval	Dark green foliage turns orange, red and purple in fall. Sparse fruit, bright red.
Cleveland Select Pear (Chanticleer)	Pyrus calleryana 'Chanticleer'	30	20	4	Pyramidal	Glossy green foliage. White flowers. Purplish-red foliage in fall.
columnar goldenchain	Laburnum anagyroides 'Calynarius'	20	10	4	Vase	Dense clusters of bright yellow flowers in spring
Columnar Siberian Crabapple	Malus baccata 'Columnaris'	30	10	4	Columnar	White flower, yellow-red fruit. Good or not in fall, resistant to vertictillium
Cornelian cherry dogwood	Cornus mas	20	20	4	Umbrella

Planning Department, Pre Application Meeting

This handout is a summary of the requirements of Camas Municipal Code 9.18.55.060

Who

A pre-application meeting is offered to anyone contemplating development or redevelopment of land, regardless of permit type. The city requires this meeting within six months immediately prior to submitting an application for a Type II or Type III permit.

When

Meetings are generally scheduled two weeks after the applicant provides the city with the necessary materials for review. The meetings are held at City Hall (616 NE 4th Avenue, Camas, WA) on Thursday afternoons.

What Happens

At the pre-application meeting the applicant shows the city staff the plans of the proposed development. They discuss the plans, and the applicant asks questions about the requirements. The city staff may also determine the involvement of staff that are responsible for reviewing zoning, roads, stormwater, emergency services, and building codes, as appropriate. Typically, there are follow-up discussions after the meeting to resolve identified issues.

What the City Needs

- ☐ General Application form—signed by property owners.
  This form is available online at www.cityofcamas.us (Document Center).
- ☐ Fee. *See current fee schedule. Meetings for Type II permits are free of charge.*
- ☐ Site plan drawn to scale. Please provide as many details of the proposal and existing conditions as possible, to include existing structures, streets, sensitive areas or natural features (e.g. rock outcroppings, wooded areas), steep slopes, or waterways.
- ☐ Other information. Please provide copies of any biological assessments, surveys or other details that are available, which will aid staff in providing the best advice for the formal application.

Please indicate which agencies, departments, or city staff that you have consulted prior to requesting this meeting:

Specific questions for staff:

Follow Up

Planning staff compiles notes from the meeting and provides a copy to the applicant within ten days following the meeting. These notes will include contact names and numbers for those individuals that are available for in-depth help with preparing your formal application.

Revised: January 2013

Camas Development Code

2016 Design Review Manual

2023 DRAFT Lakes Management Plan

….and many more

Key Concepts

Active Recreation
Activities that require physical exertion and typical require specialty facilities or equipment.

Ecosystem services
The benefits that ecosystems provide to humans. This can include things like clean air and water, temperature regulation, and recreational opportunities.

Maintenance
Maintenance responds to immediate issues and addresses day-to-day conditions through routine tasks and activities.

Management
Management addresses long-term goals through strategic planning, decision-making, and resource allocation.

Nature-based solutions / Green Infrastructure
Approaches that use natural processes and ecosystems to address challenges or provide functions to humans.

Naturescaping
Naturescaping involves designing landscapes using native plants and natural elements to create habitats that support local wildlife and conserve resources.

Passive Recreation
Outside activities that utilize the natural environment for exercise, relaxation, or entertainment.

Quantitative vs qualitative metrics
Qualitative metrics describe qualities or characteristics, while quantitative metrics measure quantities or amounts. Both can be valid ways to understand value.

Resilient
The ability to withstand or bounce back from a variety of shocks and stresses.

Stewardship
Restoring and guiding natural processes and systems to enable them to regenerate and function mostly on their own.

Succession planning
Managing the growth and replacement of species to maintain a healthy ecosystem over time. Includes using a diversity of species and ages to provide variety.

Vulnerability
A vulnerable system is prone to adverse impacts from stressors such as climate change, human activity, or natural disasters.

Project Schedule

	2023				2024							
	September	October	November	December	January	February	March	April	May	June	July	August

Valuing Nature

This plan recognizes the value and multiple ways that natural systems contribute to the Camas community and underlines the importance for providing effective management practices to preserve and enhances those functions. It will look to identify and incorporate nature's value in prioritization, resource allocation, and ongoing management practices.

The Role of Natural Areas to Meet Our Needs

Parks and Open Spaces are critical infrastructure that provide a variety of benefits to our communities

Parks & Open Space contribute to human physical and mental health, economic wellbeing, climate mitigation and asset protection. Sometimes referred to as “Green Infrastructure” or “Nature-based solutions,” natural systems integrated into the built environment provide a variety of valuable services that make them a crucial part of the places we live, work, and play.

Mental Health and Connection to Place: Contributes to cognitive restoration, emotional connections and a sense of identity.

Physical Health and Recreation: Provides a venue for individual or group activities and exercise. Can contribute to safety and security.

Education and Stewardship: Provides learning opportunities, ways to contribute and a sense of community.

Food and Material Production: Plays host to a variety edible plants and berries, as well as raw materials that contribute to the economy.

Habitat and Biodiversity: Is home to or can support native or migratory fauna.

Erosion Control: Prevents degradation of soils and sedimentation.

Water Quality and Flood Management: Filters sediment, nutrients, and pollution and controls water temperature. Absorbs water during rain or snow events.

Heat Island Reduction and Energy Savings: Provides shade to surfaces and structures to reduce air and surface temperature and reduce glare.

Carbon Sequestration and Storage: Absorbs carbon dioxide and stores it in vegetation and soil.

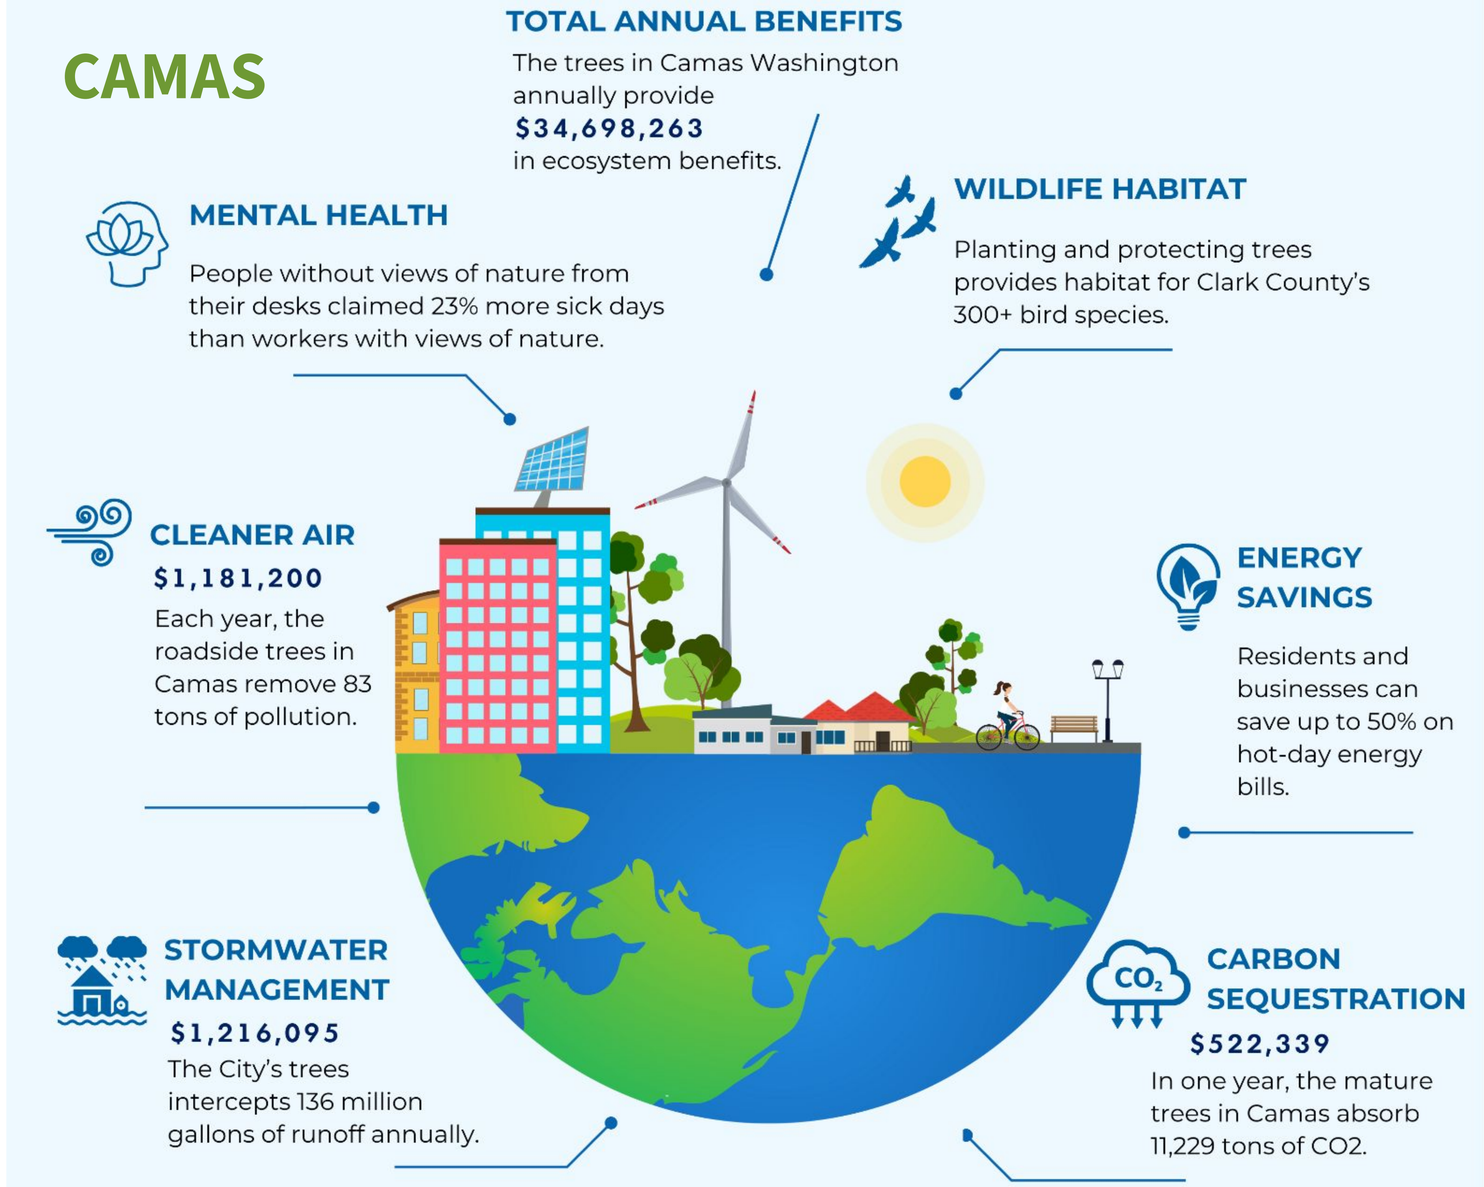
Air and Sound Quality: Captures gases and particulates to reduce them in the environment. Provide buffers to block or absorb noises and contribute to positive soundscapes.

NATURE AS A VALUABLE ASSET

National and Research Trends

The benefits of nature are being quantified across multiple sectors and entities

National trends around ecosystem service valuations have been undertaken by FEMA, NOAA, EPA, USFS, and a variety of public and private research institutions.



2022 Proposed Values	
Land Cover Category	Value (2021 USD/acre/year)
Forest	12,589
Urban Green Open Space	15,541
Rural Green Open Space	10,632
Riparian	37,199
Coastal Wetland	8,955
Inland Wetland	8,171

"Park access was associated with ***better mental health among children and parents***, and more parent physical activity and ***parent–child co-participation in outdoor activity during the COVID-19 pandemic***. Access to nearby parks may be an important resource to promote health and well-being, for both individuals and families."

Hazlehurst, M.F., Muqueeth, S., Wolf, K.L. *et al.* Park access and mental health among parents and children during the COVID-19 pandemic. *BMC Public Health* 22, 800 (2022). https://doi.org/10.1186/s12889-022-13148-2

Mental, physical, and social health benefits of being in or having access to nature has been studied in hundreds of research papers.

Eco. Benefit	Description	Camas Citywide*	Urban Tract	Rural Tract	Units
Air Quality	Particulates intercepted	$347.53	$347.57	$17.85	$/year/acre
CO		$0.60	$0.60	$0.01	$/year/acre
NO2		$1.40	$1.40	$0.07	$/year/acre
O3		$39.71	$39.72	$1.87	$/year/acre

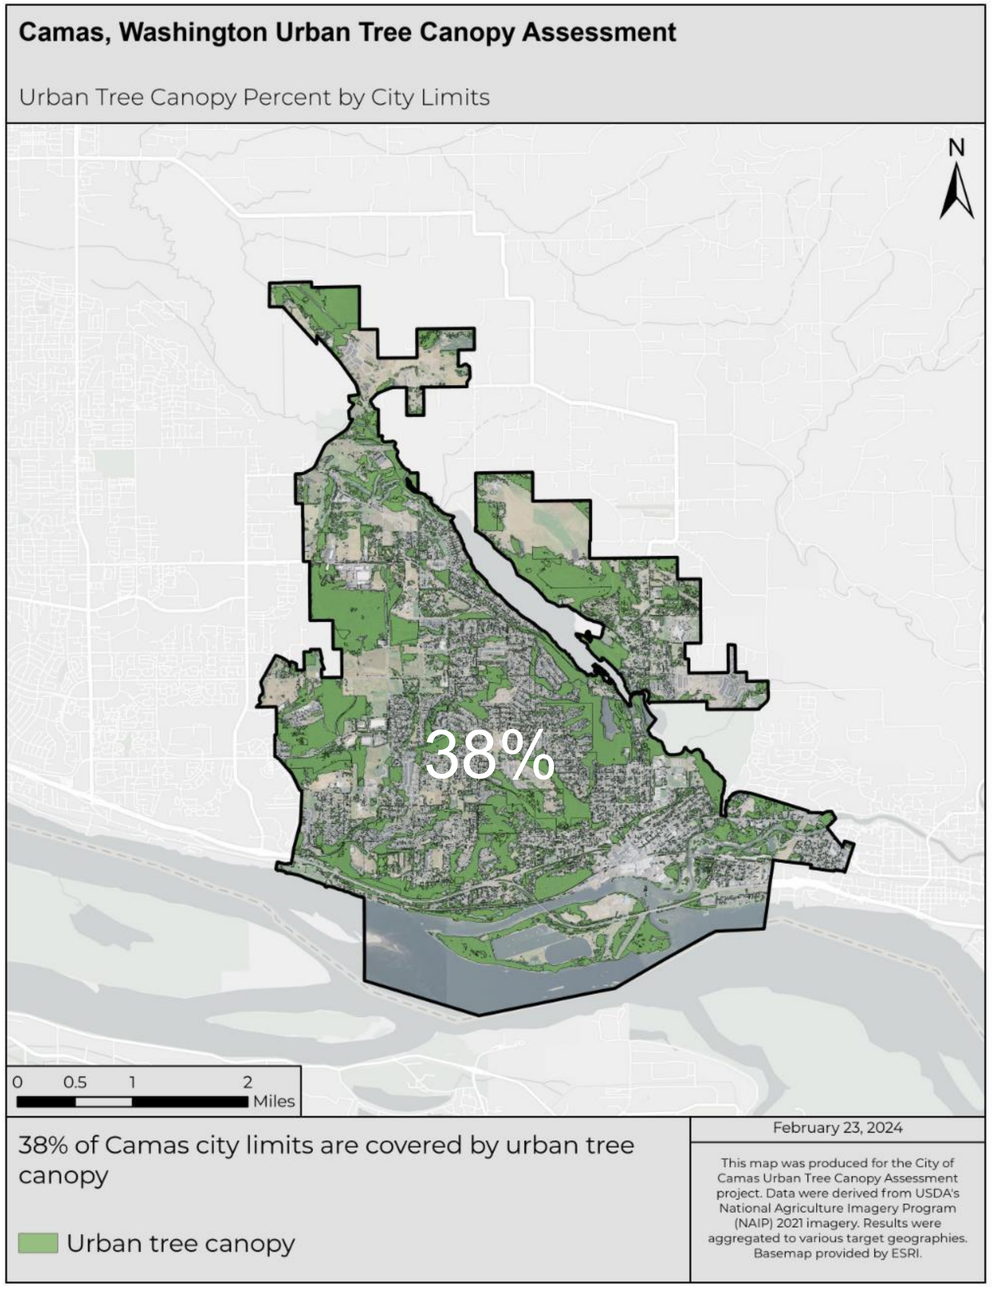
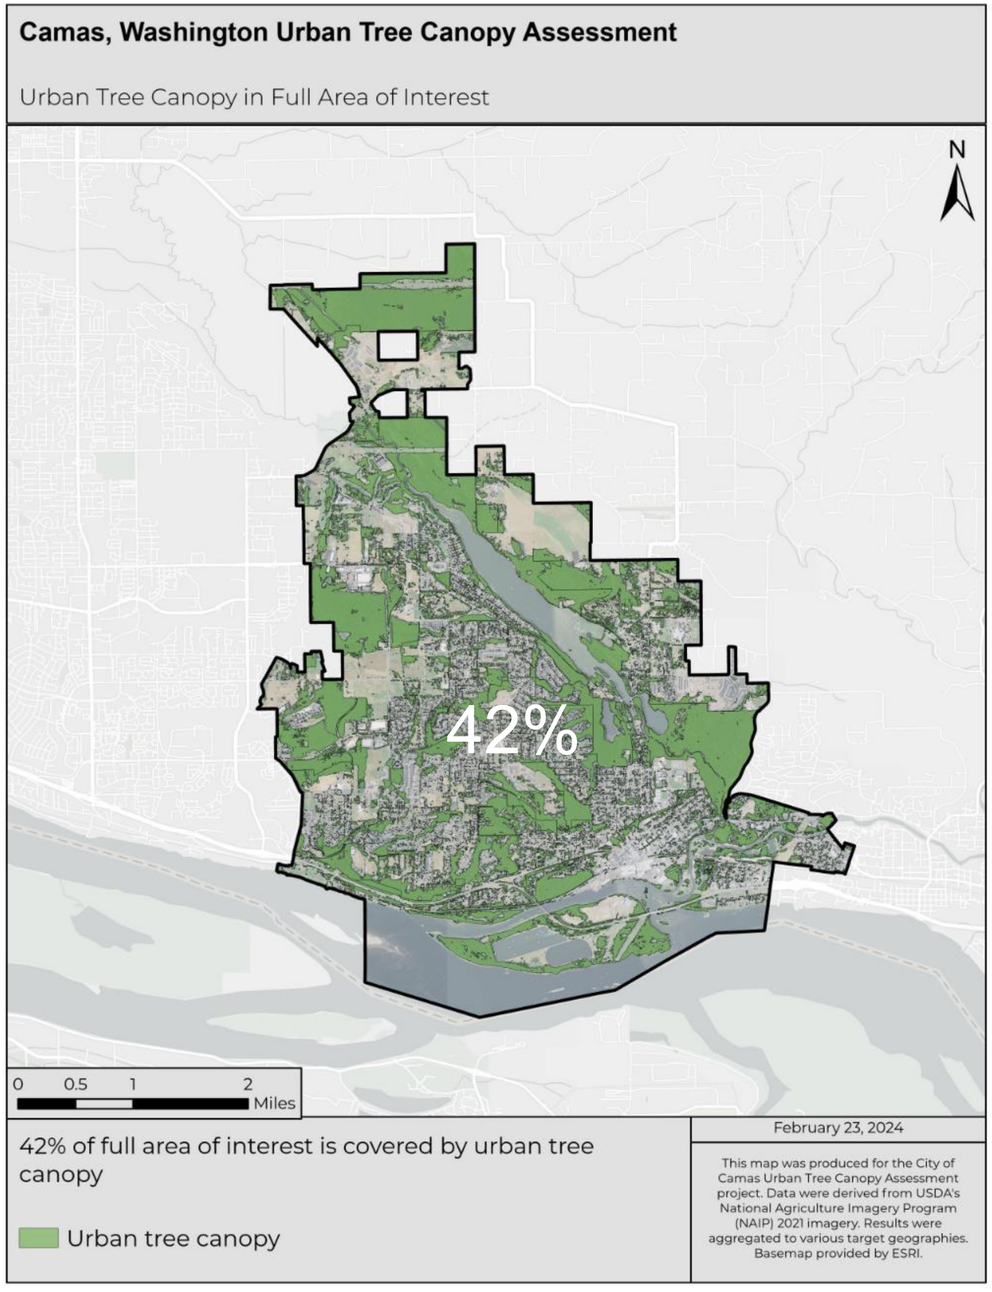
Carbon Sequestration	Accumulated carbon	$153.68	$168.14	$145.75	$/year/acre
Total		**$859.00**	**$873.54**	**$193.60**	**$/year/acre**
Carbon Storage		$9,349.72	$8,166.75	$10,004.32	$/acre



*Metrics are taken from iTree tool database. The tool classified a majority of the Camas area as "urban" which is reflected in the citywide calculations. With a more nuanced evaluation, some of the Camas land area may act as more rural, depending on the land use.

The annual economic benefits of Camas' urban tree canopy were quantified based on a commonly used standard (right). These numbers do NOT include benefits to energy savings, mental and physical health, wildlife, and other ecosystem services. They are for the tree canopy only, and do NOT quantify the benefits provided by other natural features and systems like wetlands, understory vegetation, lawns, and lakes. The quantified benefits are over 10x the annual Camas Parks and Recreation Department budget.

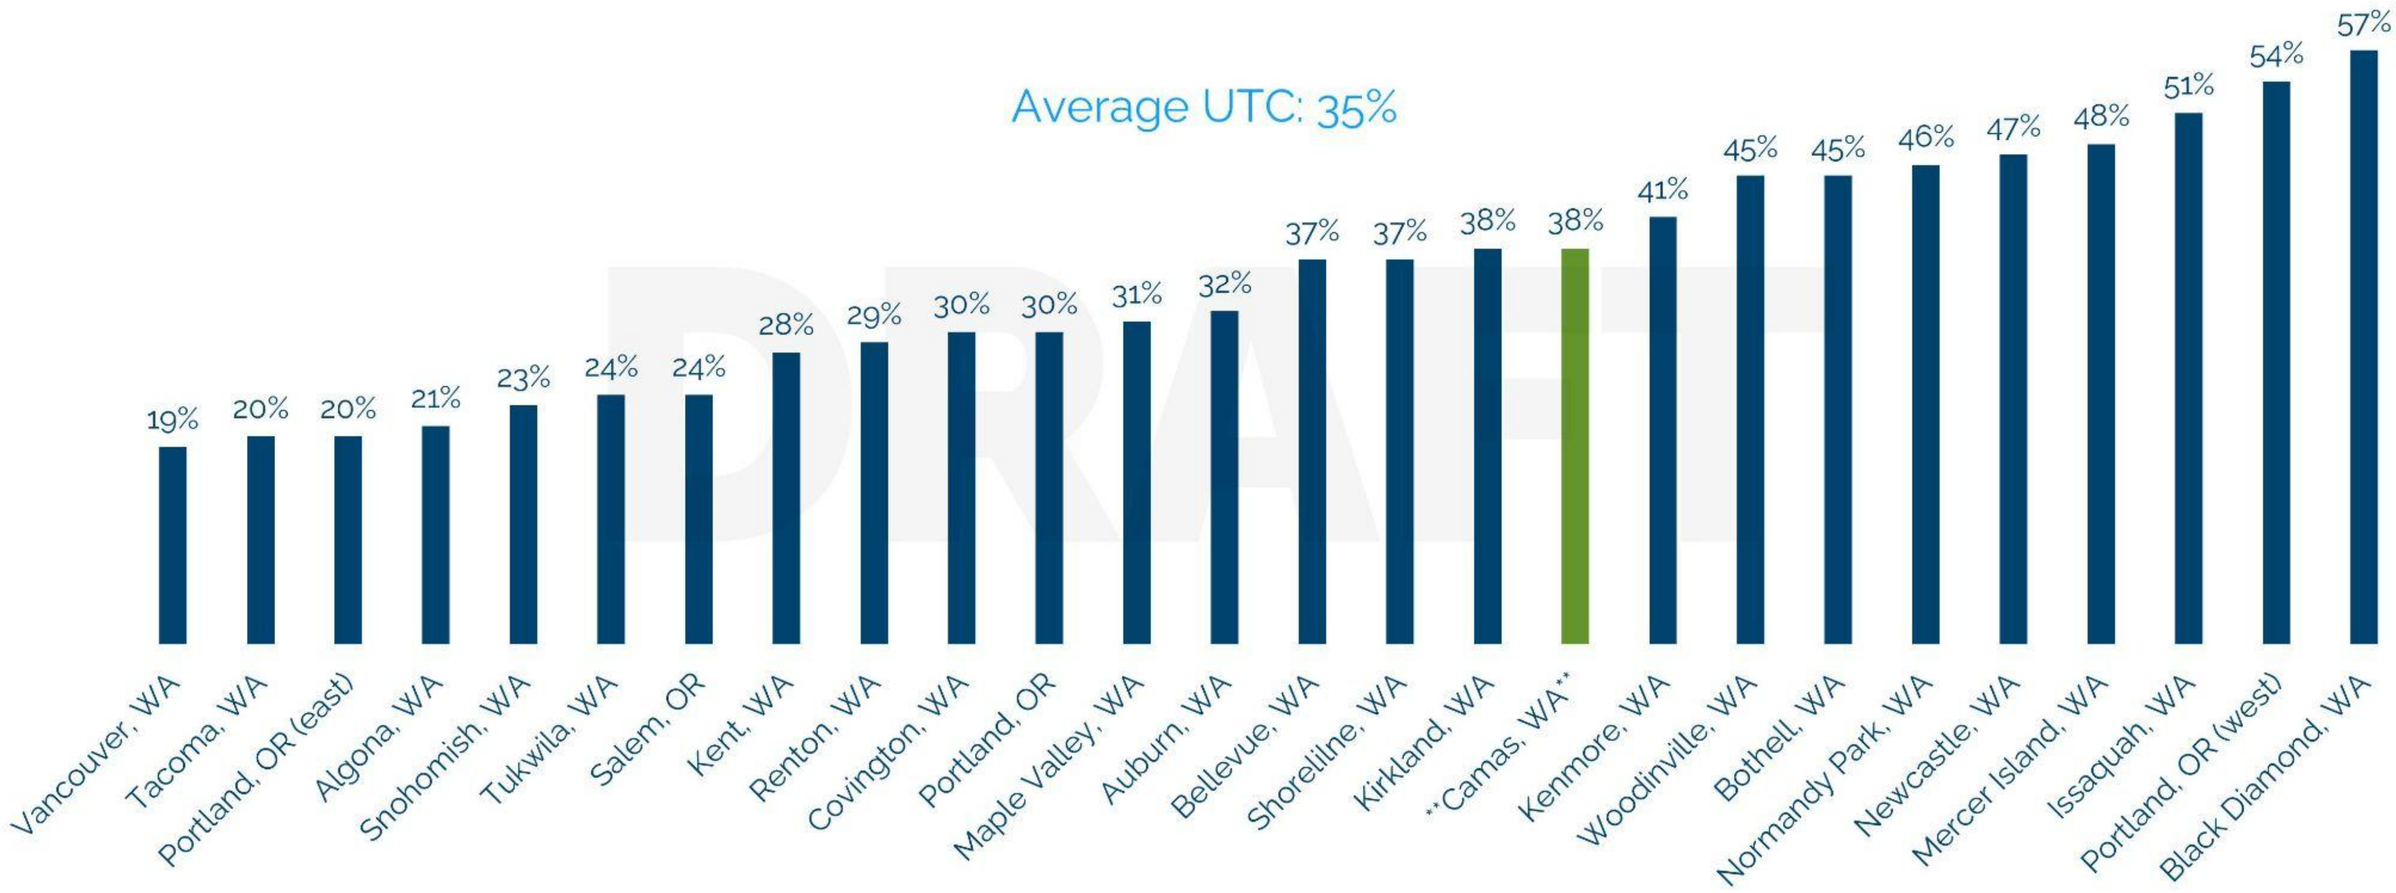


ECOSYSTEM SERVICES: CAMAS TREE CANOPY

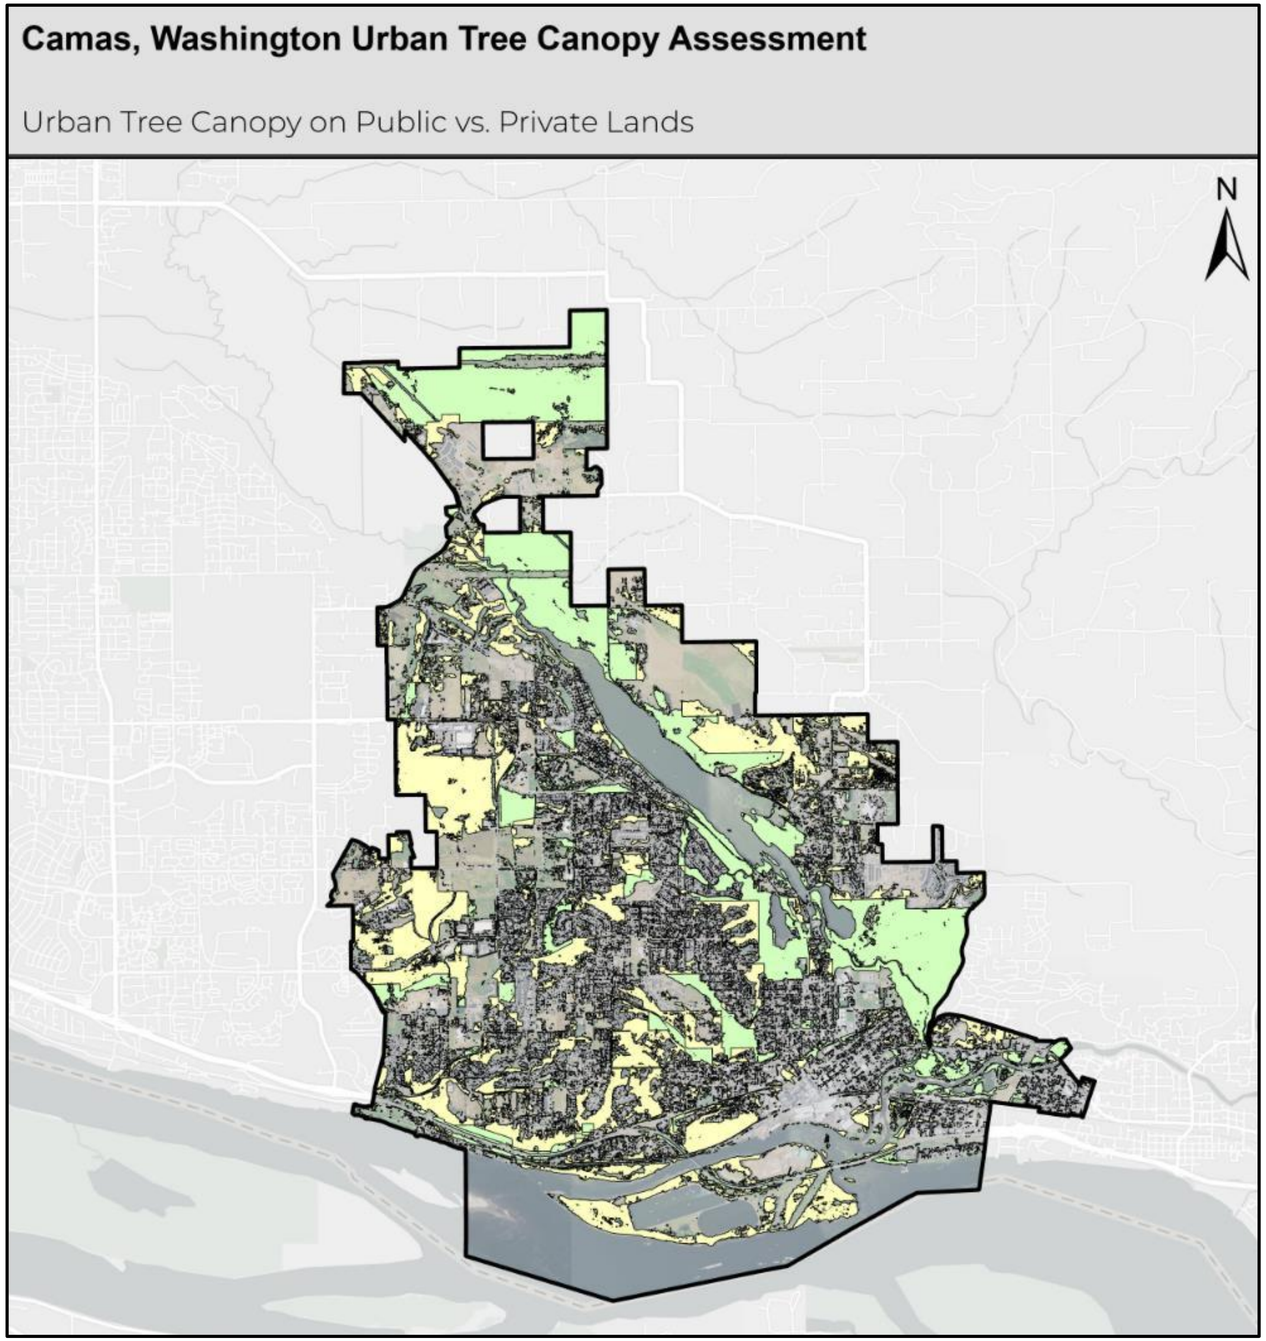
Tree Canopy Assessment

As part of the POSMP, the team analyzed the existing conditions of the city-wide tree canopy as a whole, as well as inventoried a group of individual trees. These assessments establish a data-backed baseline to measure future conditions in order to track progress against goals. They looked at current conditions, change over the last decade, and potential for canopy enhancements.

CITY LIMITS



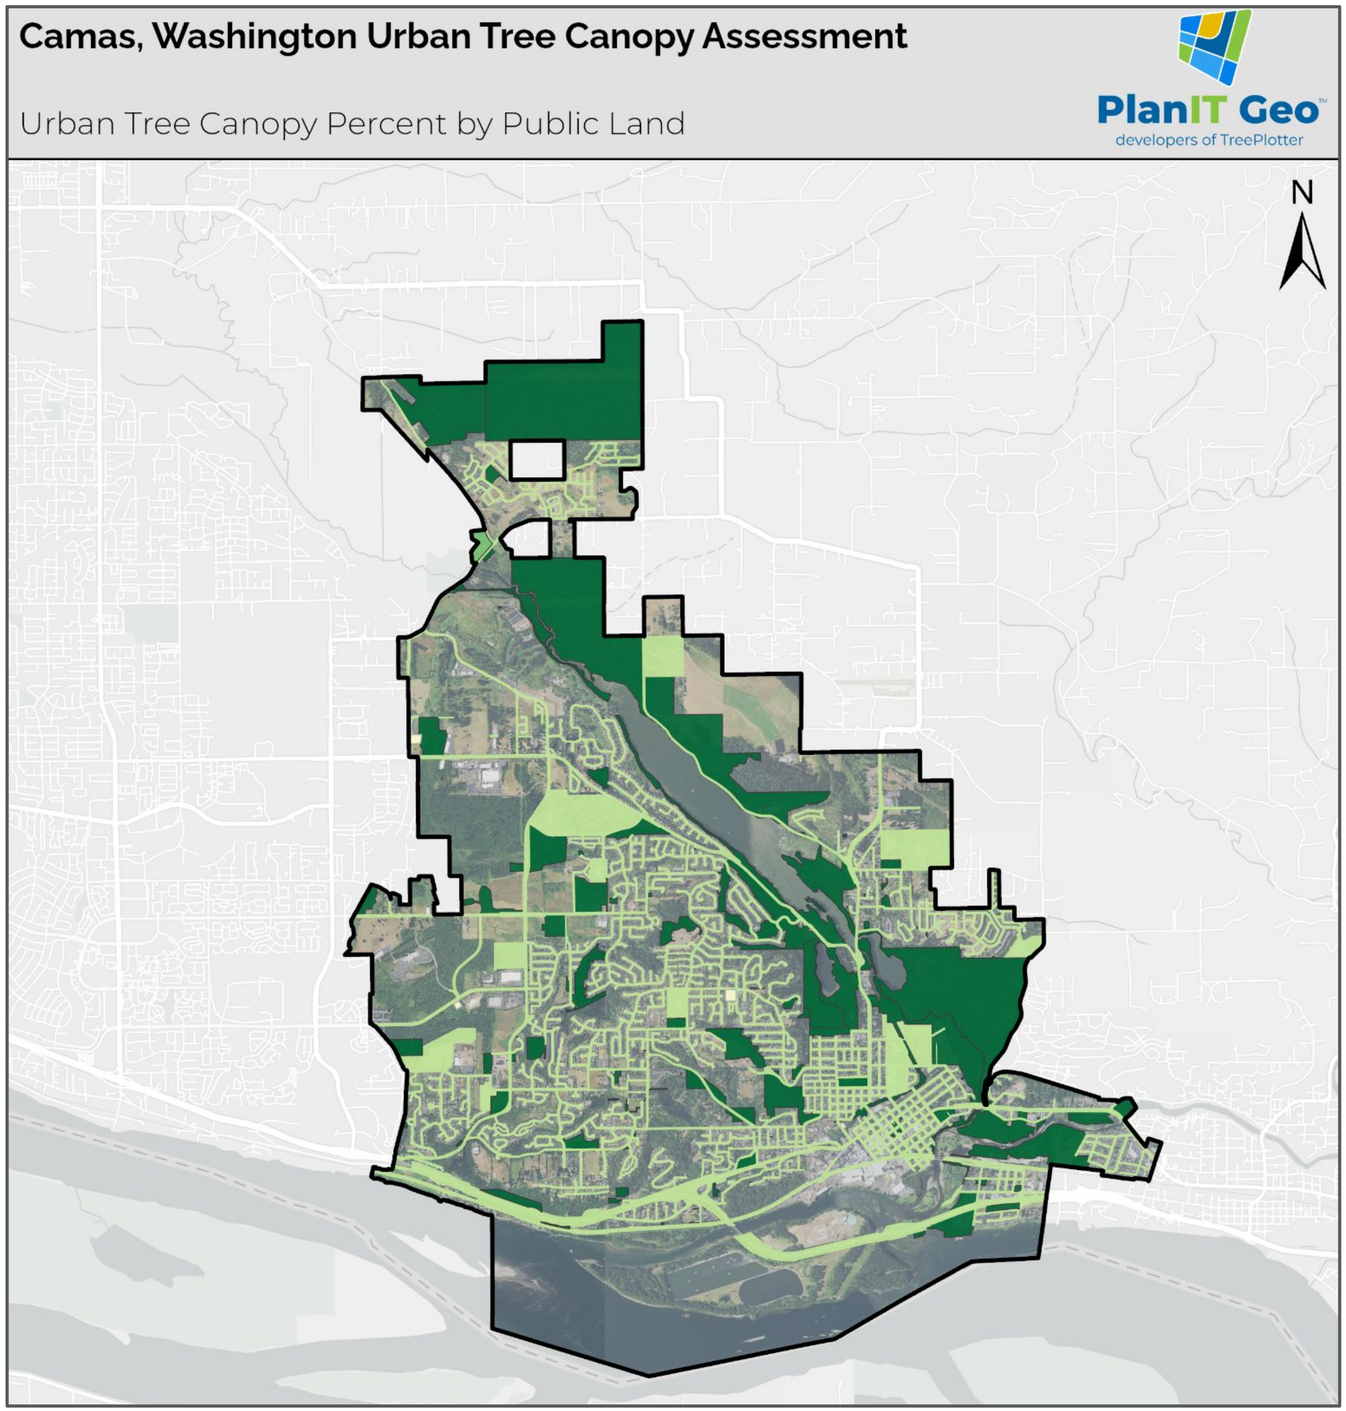
CITY LIMITS + COUNTY OPEN SPACE



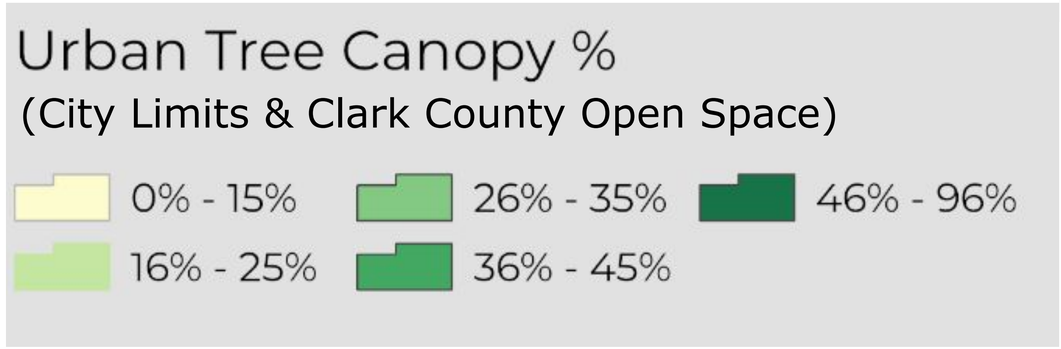
Land Type	Area
City Limits	3,399 acres
City Limits + County Open Space	4,205 acres

EXISTING

Percent canopy coverage within city limits as compared to other local communities.
Camas has more coverage than many urban areas, but less than more rural and suburban ones.

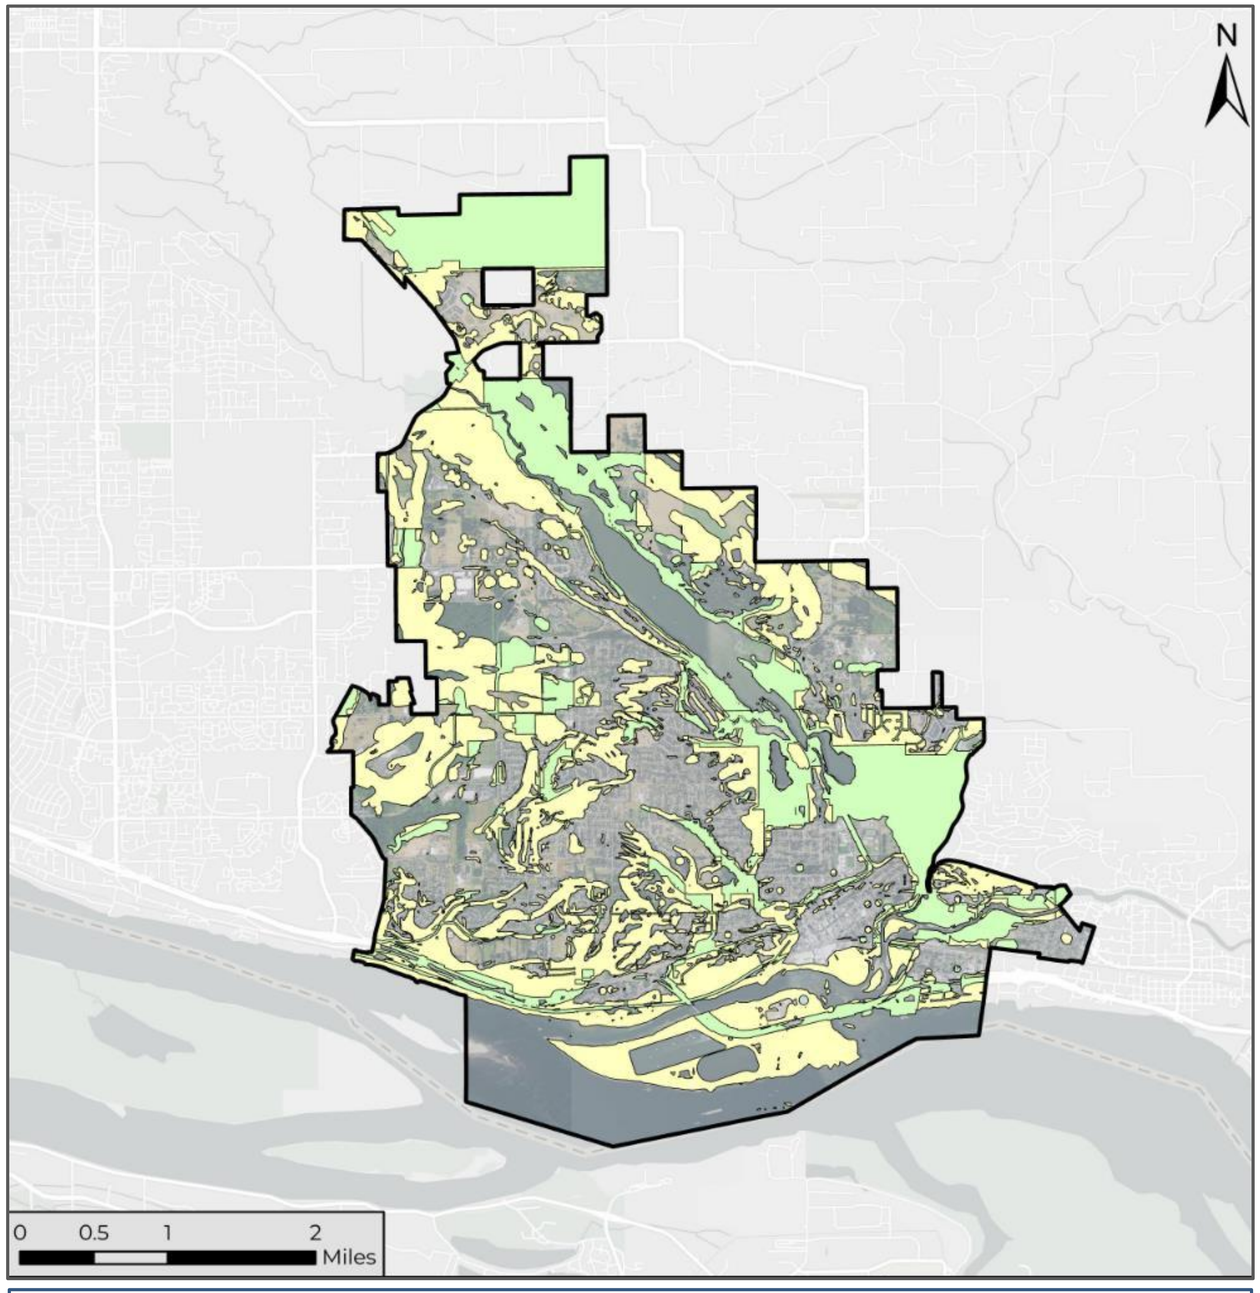


URBAN TREE CANOPY COMPARISONS



Land Type (City Limits & Clark County Open Space)	%	Area
Tree canopy on private lands	54.91%	2,293 acres
Tree canopy on public lands	45.09%	1,883 acres
All tree canopy (within POSMP area)	100%	4,176 acres

About half of all urban tree canopy in Camas is on private property.



EXISTING - URBAN TREE CANOPY

Much of the public tree canopy is concentrated around Lacamas Lake and Green Mountain. Developed parks and street trees provide coverage throughout the city.

EXISTING - PUBLIC LANDS

	Land Type (City Limits & Clark County Open Space)	%	Area
	Privately-owned critical lands (within POSMP area)	53.96%	3,425 acres
	Publicly-owned critical lands (within POSMP area, includes bodies of water)	46.04%	2,922 acres
	All critical lands (within POSMP area)	100%	6,347 acres

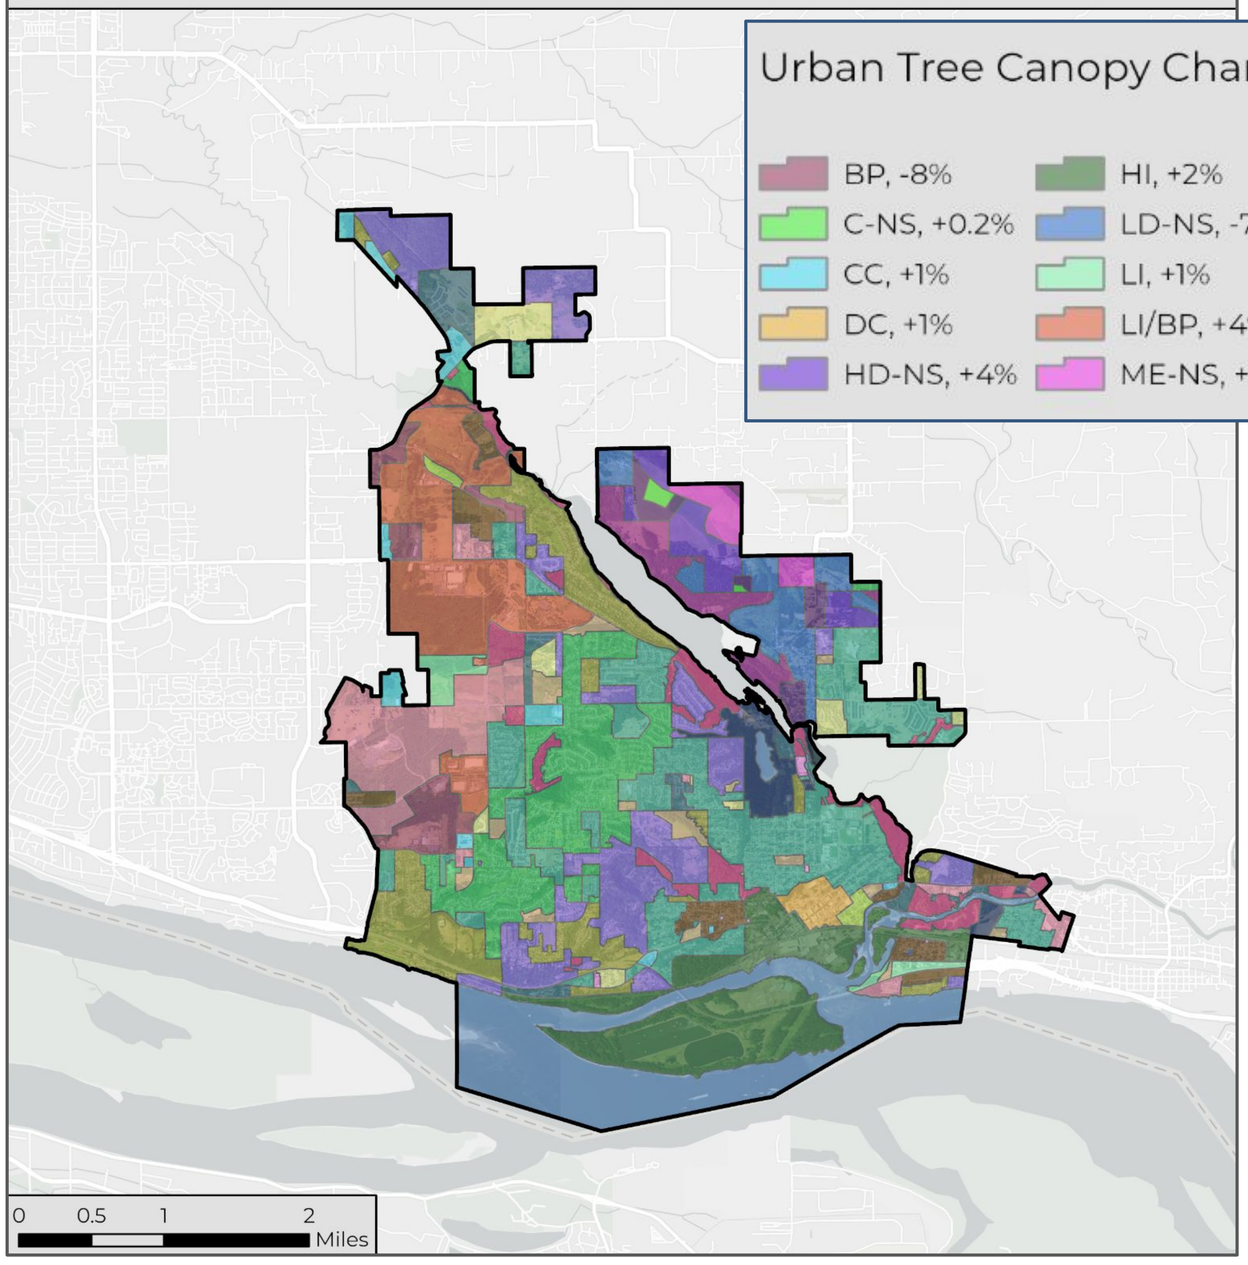
About half of all critical areas in Camas are on private property.

Wetlands | Steep Slopes | Sensitive Habitat

Shoreline Master Program:

The City finds that critical areas provide a variety of valuable and beneficial biological and physical functions that benefit the City of Camas and its residents, and/or may pose a threat to human safety, or to public and private property.

Goals:



1. Protect members of the public and public resources and facilities from injury, loss of life, or property damage due to landslides and steep slope failures, erosion, seismic events, or flooding;
2. Protect unique, fragile, and valuable elements of the environment, including ground and surface waters;
3. Direct activities not dependent on critical area resources to less ecologically sensitive sites, and mitigate necessary impacts to critical areas by regulating alterations in and adjacent to critical areas; and
4. Prevent cumulative adverse environmental impacts to critical aquifer recharge and frequently flooded areas.

EXISTING - CRITICAL AREAS

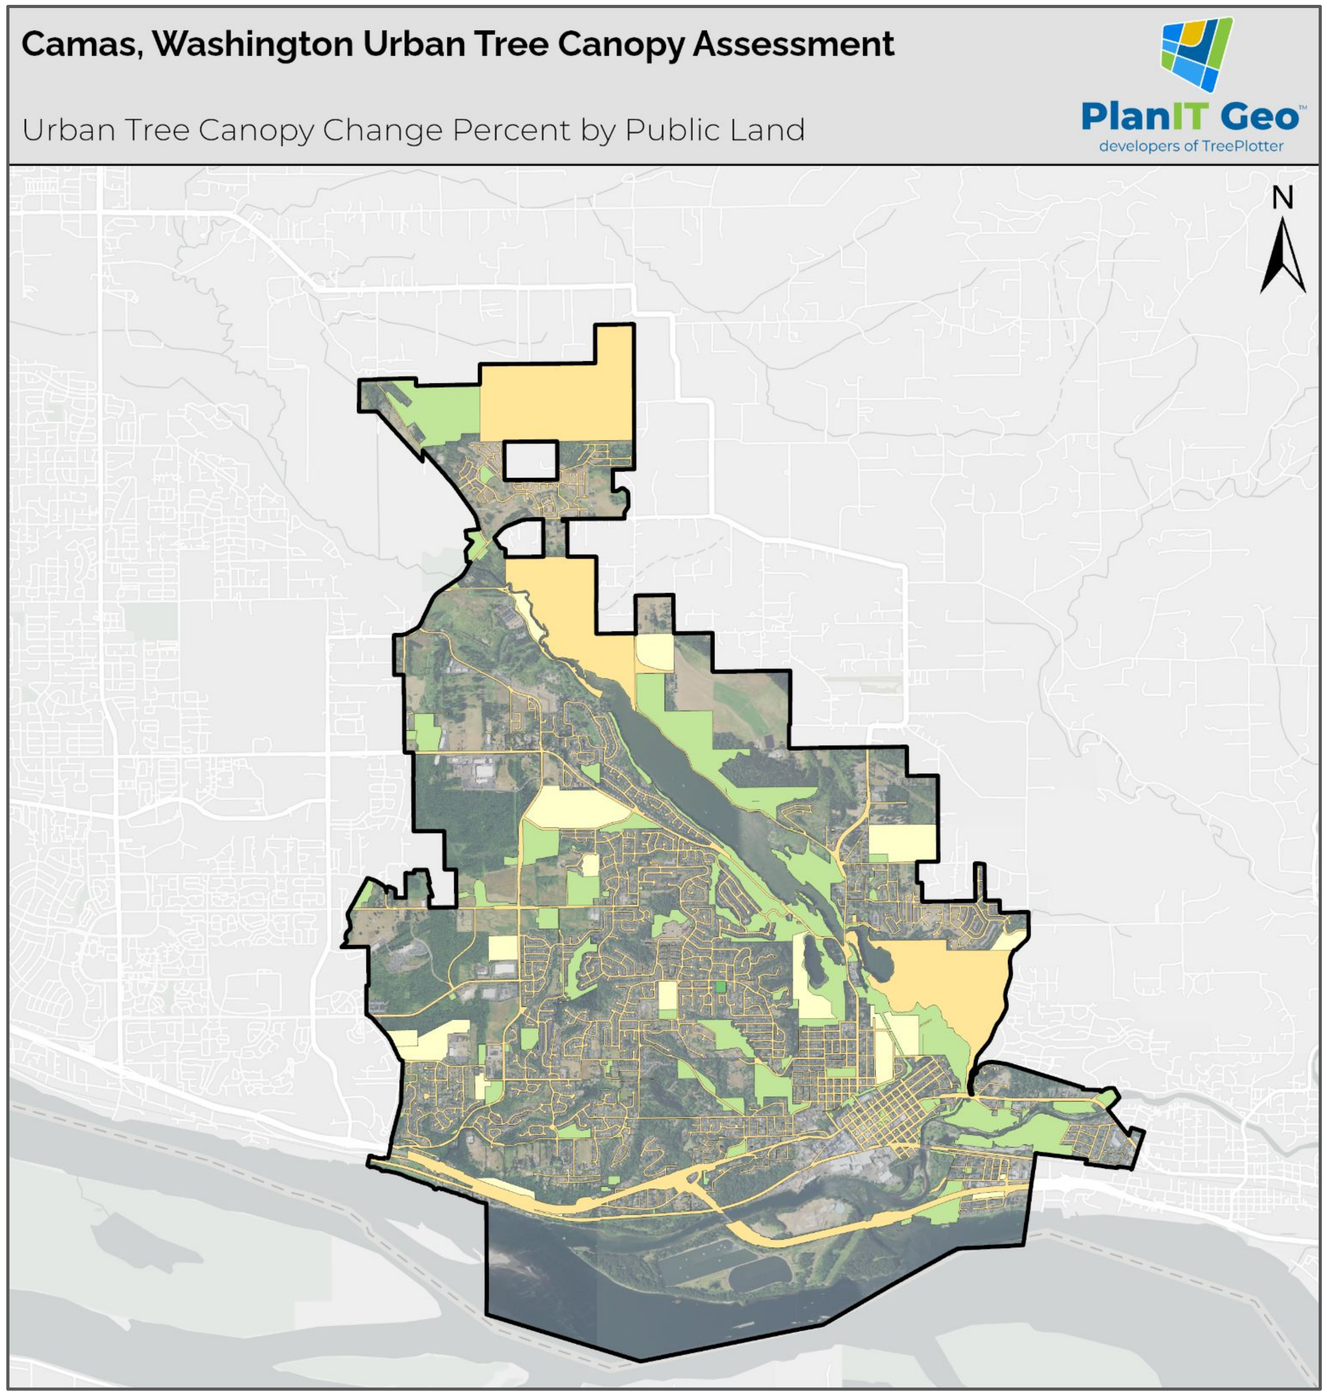
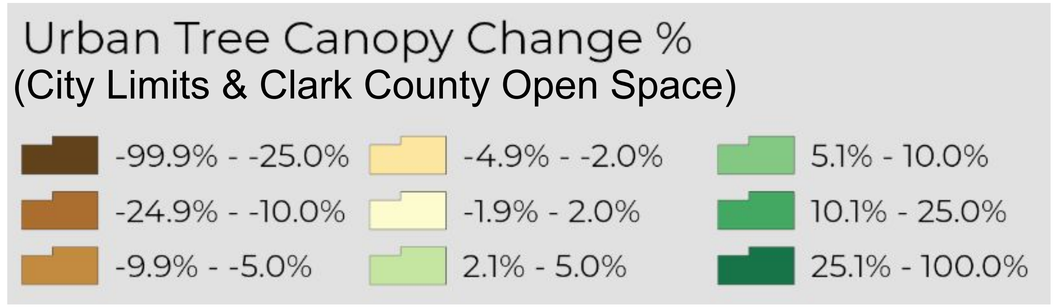
This analysis did not include an assessment of individual parcels or land types and their potential reasons for gain or loss.



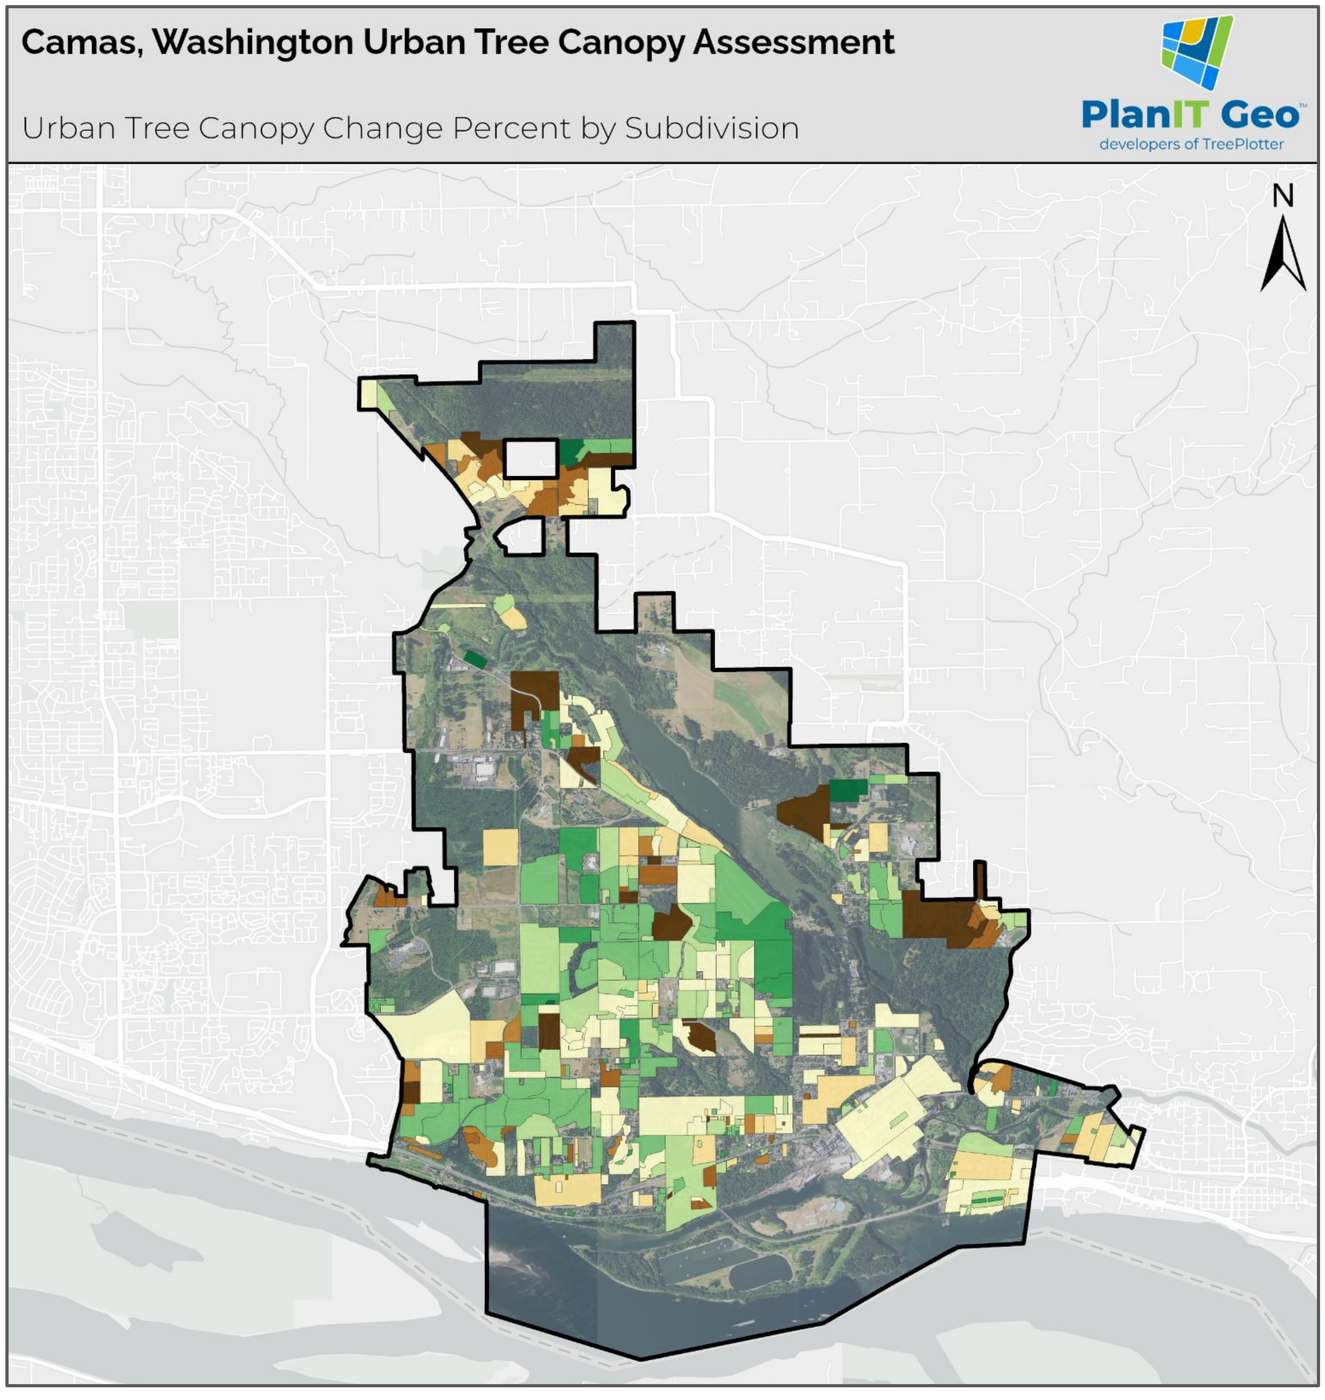
Common Reasons for %Gain



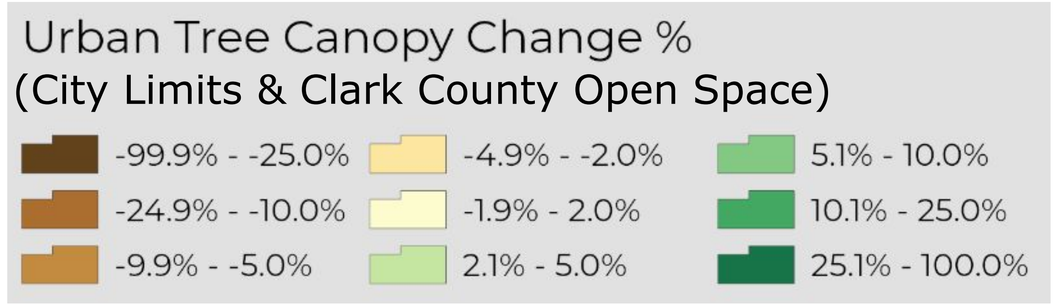
- Fallow field establishment
- Natural canopy expansion
- Restoration or infill

Common Reasons for % Loss

- Development
- Wildfire
- Expansion of land type
  - i.e. Right of Way added with small trees.

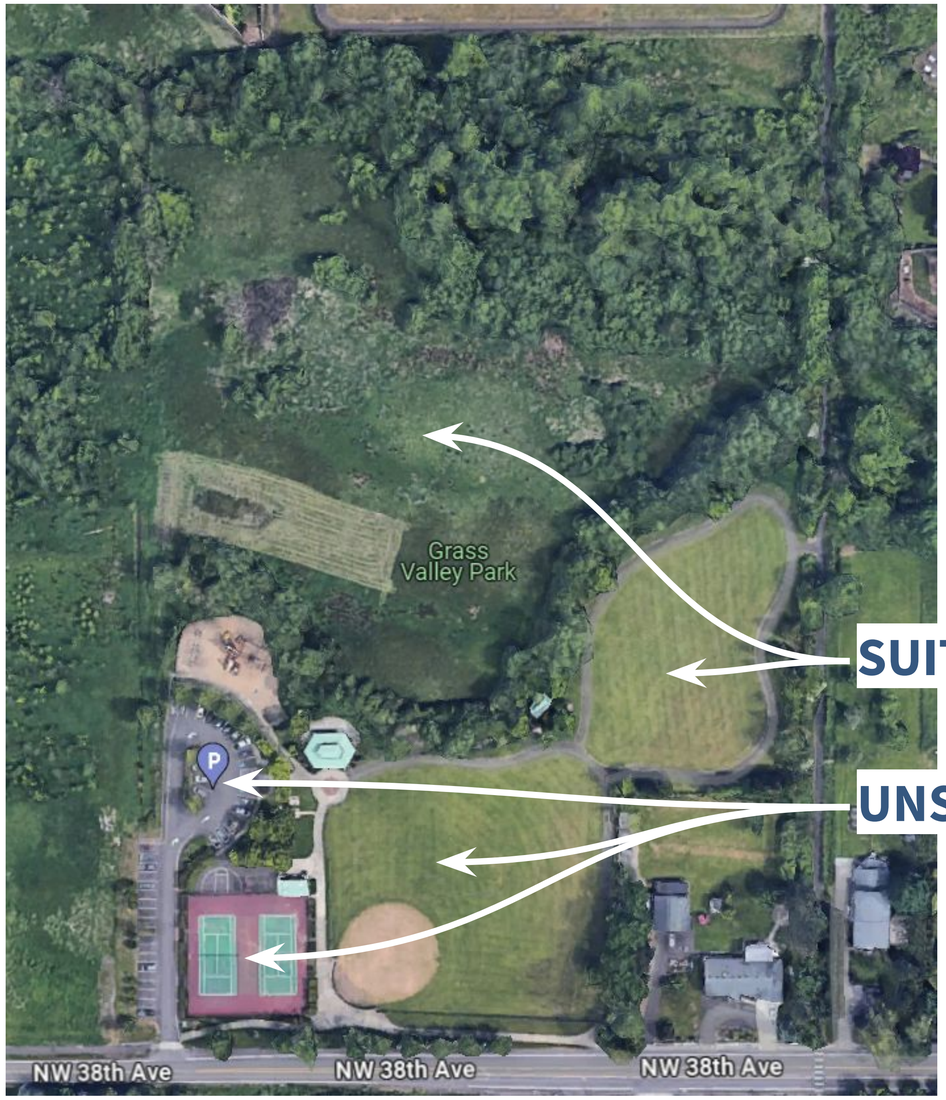


CHANGE (2011 - 2021)



Low to moderate gains and losses occurred on public lands

CHANGE (2011 - 2021): PUBLIC LAND



Biggest losses on subdivision land is likely due to private land development.

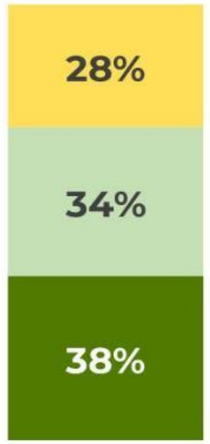
CHANGE (2011 - 2021): SUBDIVISIONS

All land areas in the City of Camas that were not currently tree canopy were classified as either possible planting areas (PPA) or unsuitable for planting.

POTENTIAL PLANTING AREAS

- Lawn, open fields, or grass areas
- Shrub and ground cover vegetation
- Bare or fallow soils

UNSUITABLE AREAS



- Recreation fields
- Utility corridors
- Stormwater facilities
- Roadways
- Building Structures

POSSIBLE PLANTING AREA: EXAMPLE

26% - 35%
36% - 45%
46% - 98%

HOAs carry a lot of potential to contribute to canopy gain.

POSSIBLE PLANTING AREA: SUBDIVISIONS

An assessment was done to determine priority areas for future planting. It was based on the following factors, equally weighted, which align with many grant applications with equity requirements:

- **Low UTC** - areas currently low in canopy cover
- **High PPA** - areas currently high in possible planting area
- **Economic vitality** - average annual household income
- **Poverty %** - percentage of population living below poverty line
- **Vulnerable population %** - percentage of residents under 18 or over 65
- **% unemployed** - percentage of residents considered unemployed
- **Educational attainment** - percentage of the population w/o GED or HS diploma
- **People of color** - percentage of residents of color

DEMOGRAPHIC PRIORITY AREAS

Plan for Adaptability

Urban areas around the world are facing dramatically intensifying extreme weather and climate impacts including drought, long-term water shortages, flooding, extreme weather events, and prolonged heat. Urban trees can play a significant role in making Camas, Washington resilient to weather and climate extremes, and in protecting human and ecosystem health and safety.

Increased temperatures and prolonged heat have a dramatic effect on urban trees. Urban trees already face many struggles of the urban environment, including competition for space, elements of an urban environment, vandalism, and harmful pests and diseases. Some of Camas's established trees are unlikely to survive the changes in the climate and weather patterns over the next 50-75 years. Planting the right trees for Camas today and in the future will play a vital role in the resiliency of the City's urban forest as well as overall community sustainability.

In pursuit of a sustainable and resilient urban forest, the City of Camas may seek to apply climate adaptation strategies to urban forest management planning. Building toward this objective, the City maintains a recommended tree list of small, medium, and large trees and trees that are prohibited for planting in public areas or through private development projects as a requirement of City Code. The Camas Urban Forest Vulnerability Report provides a summary of the changing climate, an analysis of urban tree species vulnerability to changing climate, and considerations for new tree species to integrate into Camas's urban forest over time. See Appendix for full report.

Climate Change Vulnerability Ratings for Northwest Urban Trees

Table Key:					
Urban Adaptability:		**Zone Suitability:**		**Vulnerability:**	
+	High: Species may perform better than modeled	√	Suitable	▼	Low: Suitable zone, high adaptability
●	Medium	X	Not Suitable	●	Low-moderate: Suitable zone, medium adaptability
–	Low: Species may perform worse than modeled			⊖	Moderate: Suitable zone, low adaptability or zone suitable, high adaptability
				○	Moderate-high: Zone not suitable, medium adaptability
				△	High: Zone not suitable, low adaptability

*Invasive species

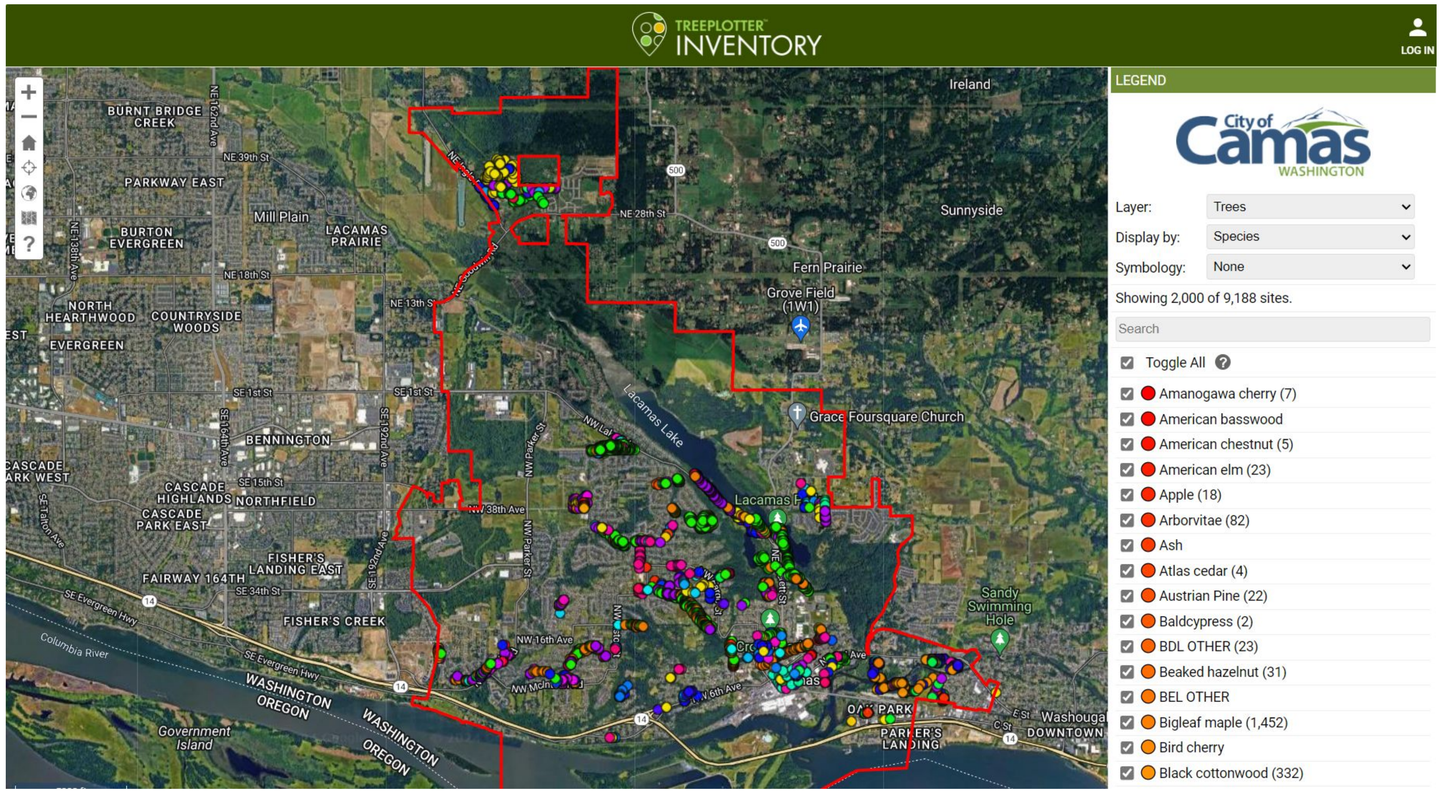
Example tree species list. See report for full list.

Measure What You Have

As part of assessing the urban tree canopy, this project inventoried over 9000 individual trees on public land across the city. This effort is a start to understanding the species and size diversity, health, and potential long- and short-term maintenance issues that may occur. The City will be adding to and managing this database in order to track changes over time in order to align more with the recommendations of this plan.



Street Trees

While not all street trees were inventoried, a snapshot of the diversity in species and size provides an overview of the overall conditions and can set a baseline for tracking future conditions. Many new trees were recently added, so care should be taken to allow them to mature and adapt to a changing climate.

Richards, N. A. 1983. "Diversity and Stability in a Street Tree Population." Urban Ecology 7(2):159–171.

Richards, N.A. 1993. Reasonable guidelines for street tree diversity. Journal of Arboriculture 19:344–349.

Visit [TreePlotter (pg-cloud.com/CamasWA/)](pg-cloud.com/CamasWA/) to see more details on the inventoried trees on Camas public lands. The first 9000 trees were prioritized to include downtown street trees, developed parks, and trail and open space corridors that might pose potential hazards to recreational uses. It also included a few sample Right of Way areas in residential neighborhoods.

Value & Resource Use

The POSMP used budget and spending data over the past several years to get a sense of existing resource allocation. These were compared to other local agencies and best practices to produce recommendations for re-aligning to meet Camas' Community Values.

Current Practices and Allocated Resources Assessment

Identifying gaps and opportunities in service delivery

In order to shift operations towards a long-term management and stewardship model, this plan summarized and assessed existing staffing, time and resource use, and relationships with other organizations. Understanding the gaps and strengths helped to focus recommendations on potential methods of improvements.

Best Practices focused on these three key areas. Finding a balance across these goals can lead to alignment with the priorities of this plan:

More efficient service delivery and resource allocation.
Changes to service delivery methods that reduce costs, level of staff effort, and timelines can more efficiently use public funding and resources, and typically lead to a greater quantity of services provided.

More equitable distribution of and access to services in the community.
A more equitable distribution of public resources can address deficiencies within communities that have been historically underserved by public programs, investments, and processes.

Higher quality ecosystem services and social benefits.
Public-sector agencies are recognizing parks, trails, and open space as critical infrastructure. Improving services in the context of natural resources can mean improving outcomes directly for the ecosystem (e.g. air and water quality) and social benefits (e.g. recreation and improved health outcomes).

Recommendations Summary

STRENGTHEN COLLABORATION WITH PARTNERS

- Create full time position focused on development, coordination, and implementation of a partnership and volunteer program that engages with HOAs, community-based groups, volunteers, and other government entities.
- Establish management standards that can give clear guidance to City staff and private landowners to help meet the goals of climate resiliency, best management practices, and effective resource allocation.
- Establish agreements with HOAs and other partners for collaborative management of ecosystem services and recreational resources.
- Create ongoing channels with state and county level partners.

ALIGN INTERNAL ORGANIZATION AND METRICS WITH POSMP FRAMEWORK

- Reorganize maintenance staff by land type and train or hire champions to provide overall stewardship practices and goals.
- Implement per-capita and/or per-acre spending targets and tracking metrics to ensure adequate funding levels for maintaining high-quality parks and recreation amenities that meet the needs of the community in Camas.

Service Delivery: Department Spending

In terms of spending per acre and level of service, Camas provides more acres per 1,000 residents than any comparable district while spending the second lowest amount per acre.

PARK PROVIDERS	POPULATION ESTIMATE	PARKS BUDGET	PARKLAND ACRES	PER-CAPITA SPENDING	PER-ACRE SPENDING	ACRES/1000 RESIDENTS
City of Tumwater	27,100	$7,608,421	514.5	$280.8	$14,788	19.0
City of SeaTac	31,740	$8,317,584	352	$262.1	$23,630	11.1
City of Port Angeles	20,240	$3,914,100	270	$193.4	$14,497	13.3
Park Districts of Si View	42,060	$6,250,632	890	$148.6	$7,023	21.2
PenMet Park District	40,000	$5,866,627	570.9	$146.7	$10,276	14.3
City of Camas	**27,420**	**$3,437,438**	**1,064**	**$125.4**	**$3,231**	**38.8**
City of Mercer Island	25,800	$2,127,581	479	$82.5	$4,442	18.6
City of Kenmore	24,230	$1,873,638	146	$77.3	$12,833	6.0
City of Longview	38,130	$2,170,690	488	$56.9	$4,448	12.8
City of Mountlake Terrace	23,810	$1,306,090	269	$54.9	$4,855	11.3
City of Maple Valley	29,250	$1,069,653	370.8	$36.6	$2,885	12.7

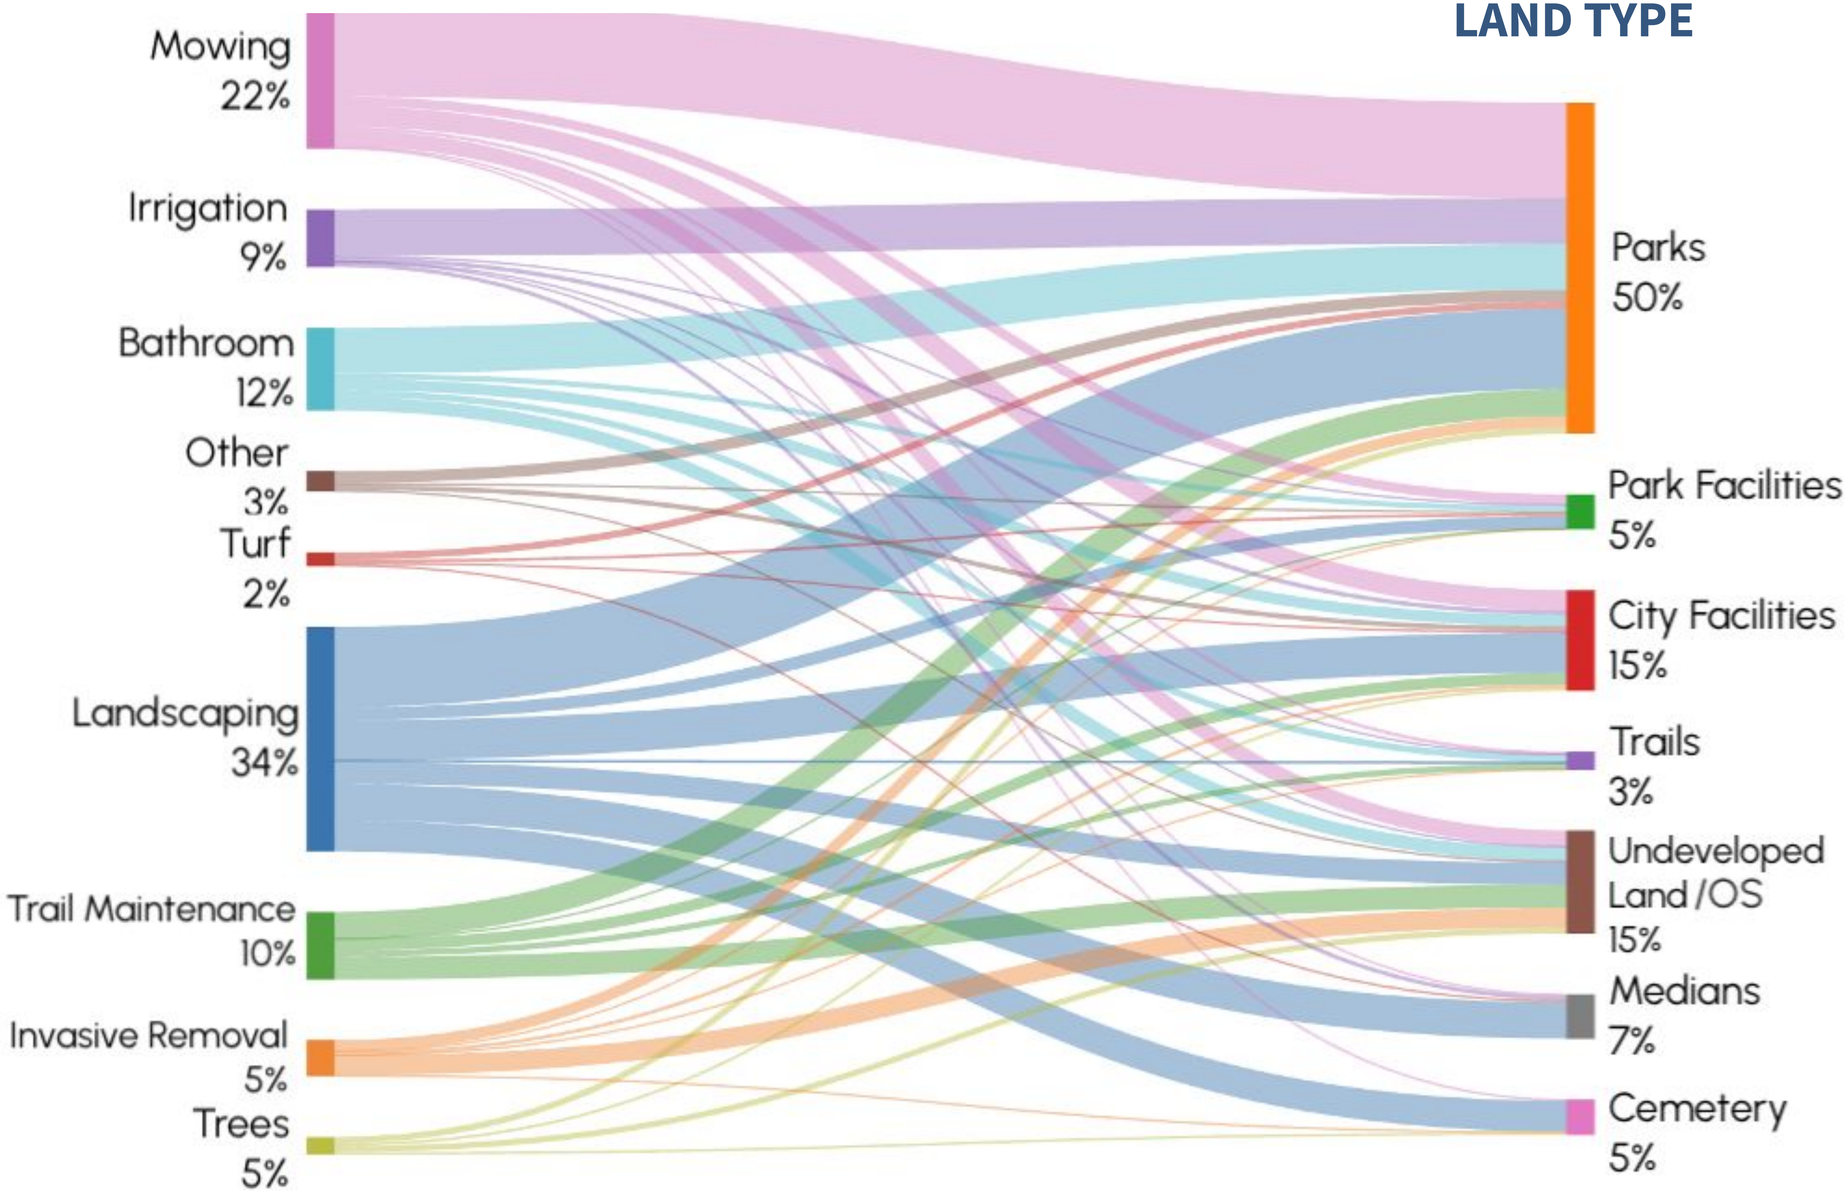
WA State Comparisons

In its 2022 Parks, Recreation, and Open Space (PROS) Plan, Camas identified comparisons with other cities in Washington with similarities to Camas to understand the variation in operations. The PROS Plan found that in 2018 data reviewed, Camas had considerably lower spending and operating budget on parks and recreation services compared with peer cities, allocating the equivalent of $78.65 per person. The PROS Plan used 2018 data to avoid pandemic distortions in local budget data. An updated comparison using 2023 data of park providers in Washington, Camas fell in the middle of per-capita spending looking at a broad section of cities but was still less than half of the cities with the greatest spending (the Cities of Tumwater and SeaTac). Total budget numbers include all O&M including recreational services.

Strengths, Weaknesses, Opportunities, and Threats

Summary of existing conditions to provide context for efficient service delivery related to operations and allocating resources

Strengths:
- Large and growing inventory of parks and open spaces
- High level-of-service acreage with 38.8 acres per resident (the highest among comparison districts analyzed)
- Skilled Parks and Recreation staff
- Diverse schedule of recreation activities for residents accessible for different ages
- Currently leveraging County resources to expand portfolio (Legacy Lands program) and other grant resources for capital projects
- Community member interest in parks and open space stewardship and greater involvement; existing Camas Parks Foundation and Ivy League for fundraising and invasive plant removal volunteers

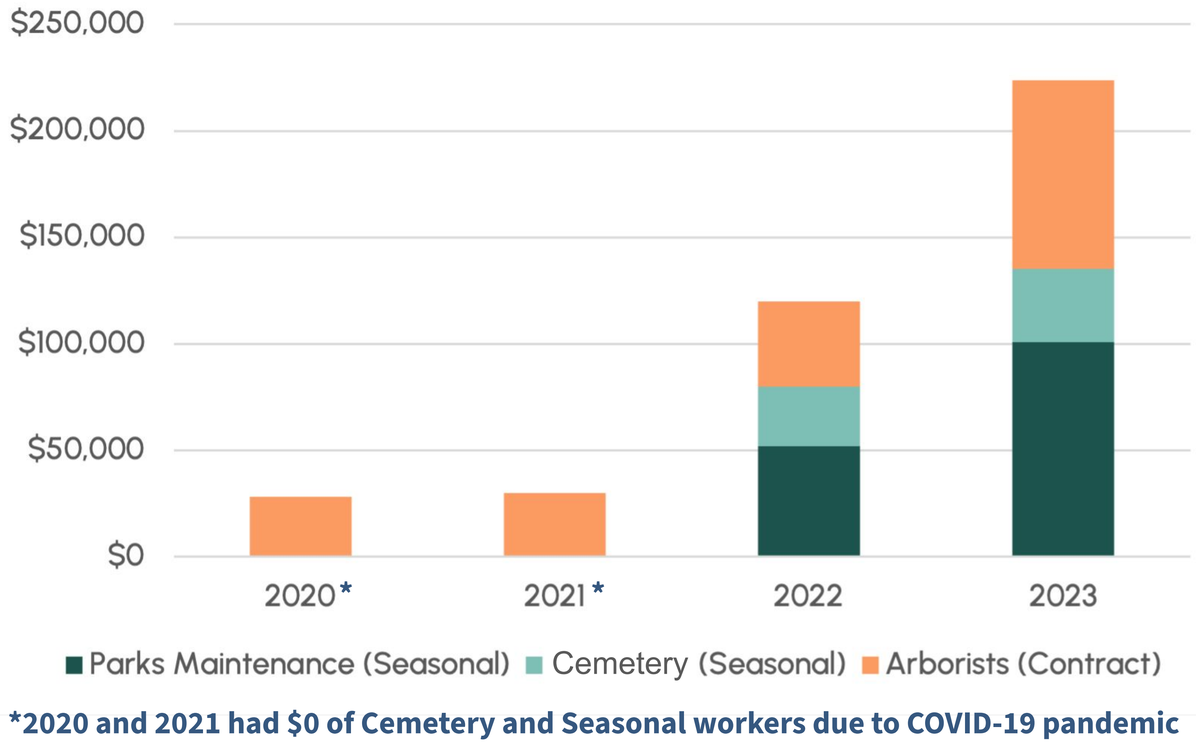


Weaknesses:
- City subsidizes community use through low facility-rental fees and charges
- High amount of effort towards mowing/landscaping
- Significant time and resources spent on non-Parks and non-Open Space facilities
- Need for additional invasives removal in open spaces (citywide)
- Resources spent on reactive management to extreme weather events
- Lack of specialized stewardship experience for different land types or natural systems
- Lack of established standards, agreements or ongoing conversations with private entities (HOAs) about parks and natural system expectations

Opportunities:
- Increase staff capacity to grow partnerships with community-based groups and leverage potential volunteer efforts
- Identify opportunities for joint training for both staff and community members to improve knowledge and best practices
- Work with Homeowners Associations (HOAs) to collectively address natural area needs on private property (e.g. invasives removal, trail maintenance, replanting of native plants/trees)
- Identify best design practices that reduce need for ongoing maintenance to free up staff time to address long-term or proactive issues

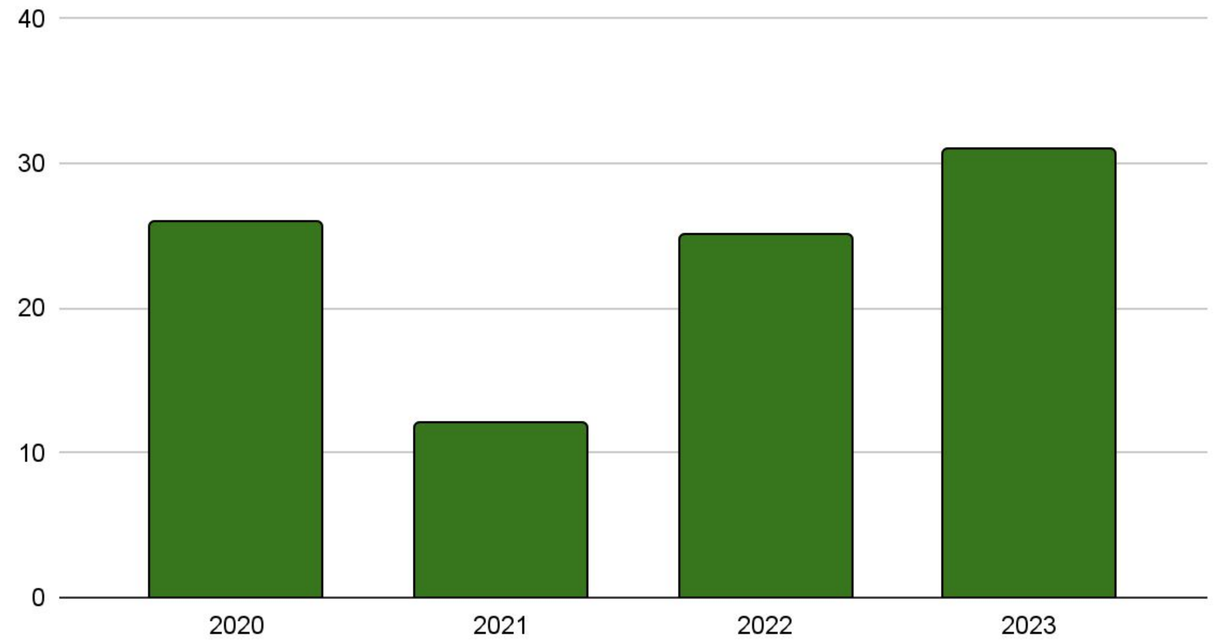
Threats:
- Lack of additional external resources (grants) for maintenance and ongoing operations with new assets
- Low capacity at current staff levels to engage with volunteer/community partners
- Increasing need for more specialized contract services (e.g. arborists) to handle reactive issues
- Unpredictable weather patterns associated with climate change that create unexpected costs and maintenance needs and increase system-wide vulnerabilities.

TIME SPENT PER ACTIVITY



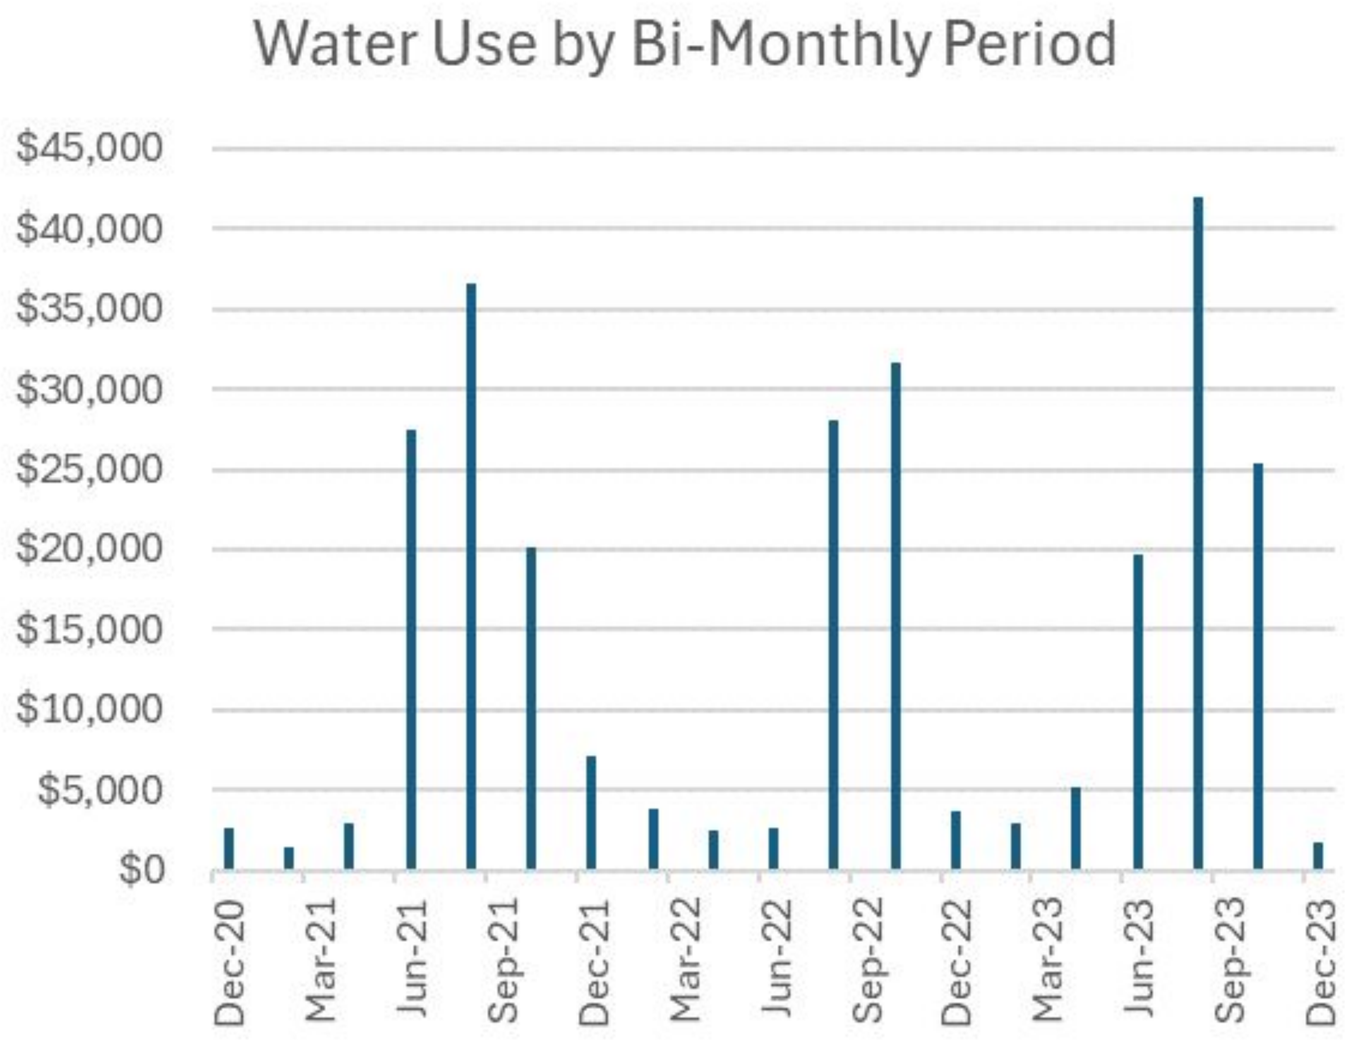
TIME SPENT PER LAND TYPE

Parks and Recreation staff maintenance hours for the 2023 year were also assessed as part of this process in order to understand how time and resources were being prioritized. As the graph indicates, about a third of the time was being spent on maintaining lawns and irrigation, with another third on more detailed landscaping. About half of all time spent was on developed parks, while much of the time was also spent on non-Park facilities.

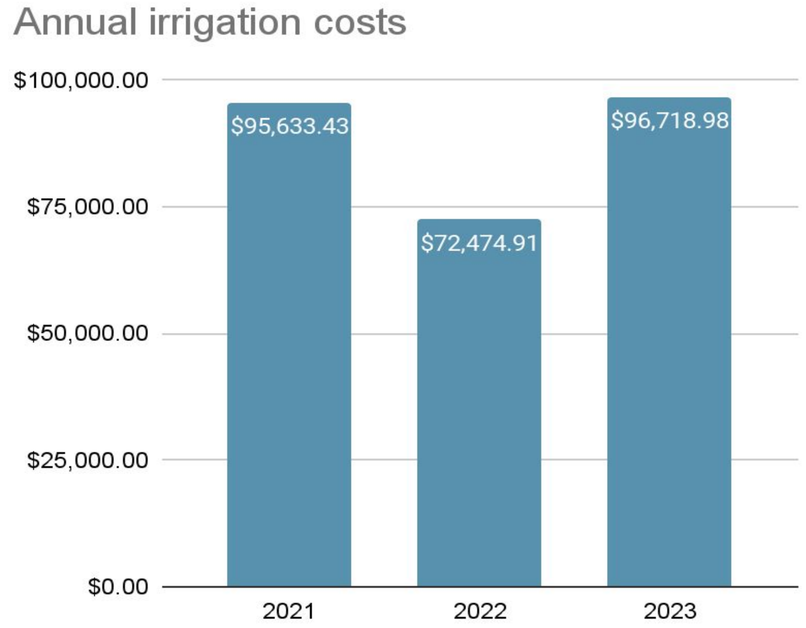


ANNUAL MAINTENANCE STAFF HOURS: 2023

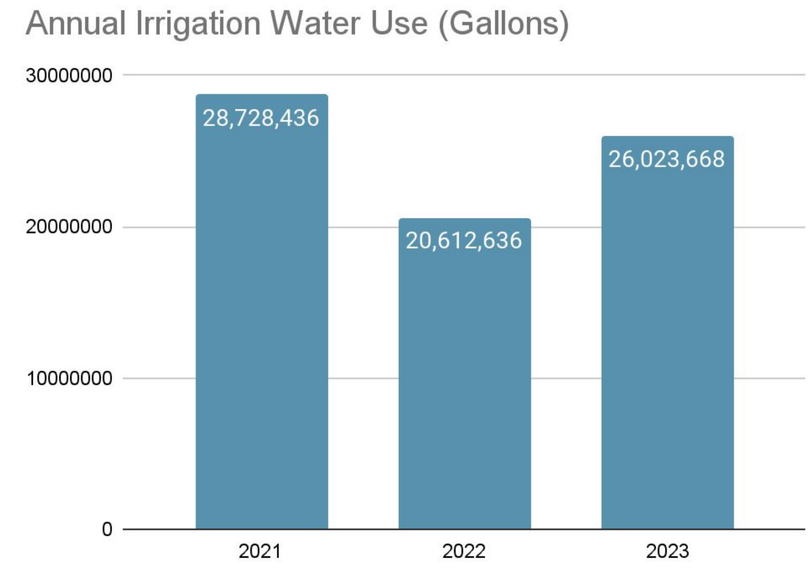
Annual Contract Employee Costs



***2020 and 2021 had $0 of Cemetery and Seasonal workers due to COVID-19 pandemic**

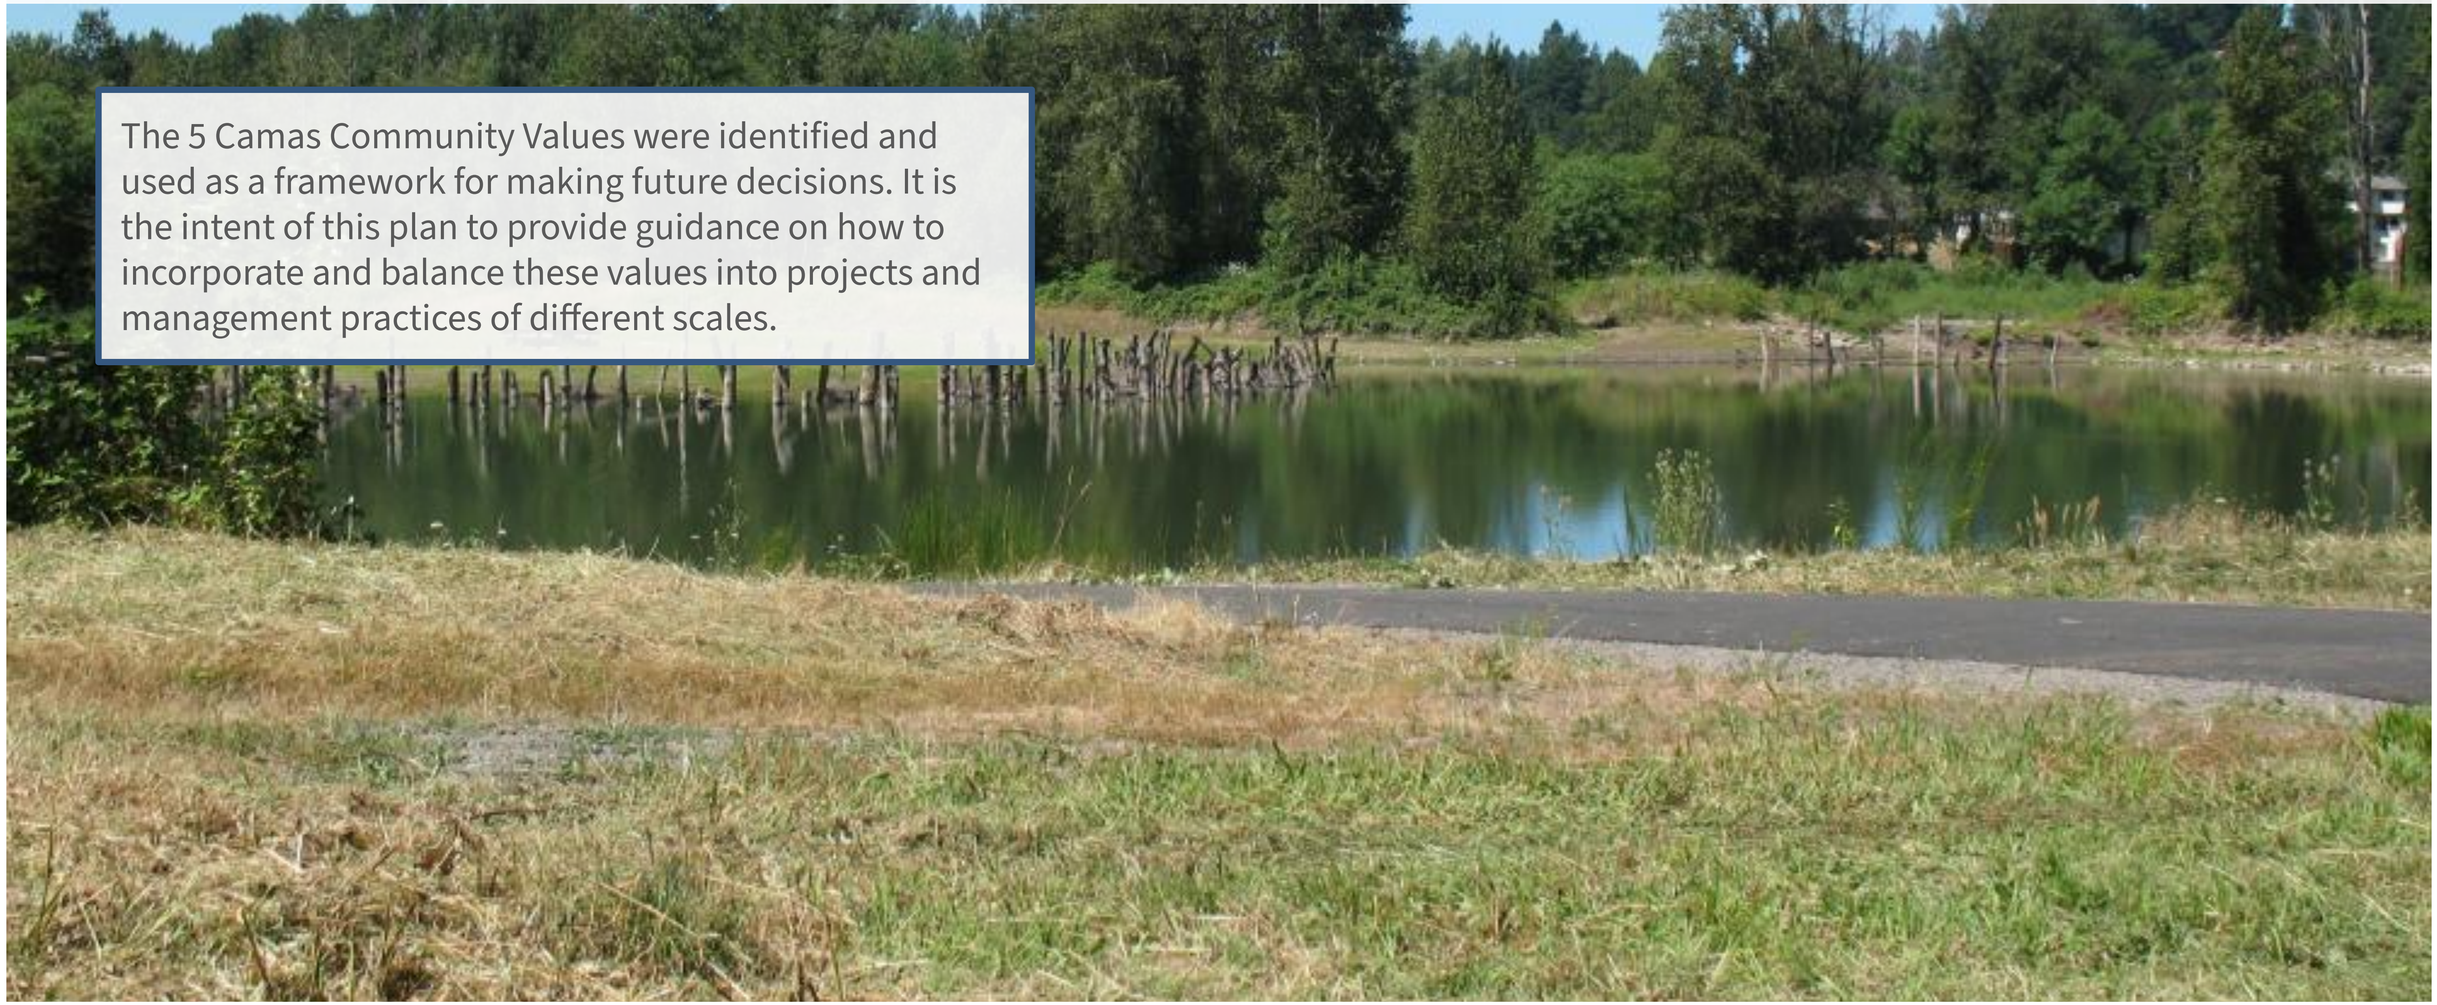


Number of Public Tree Requests



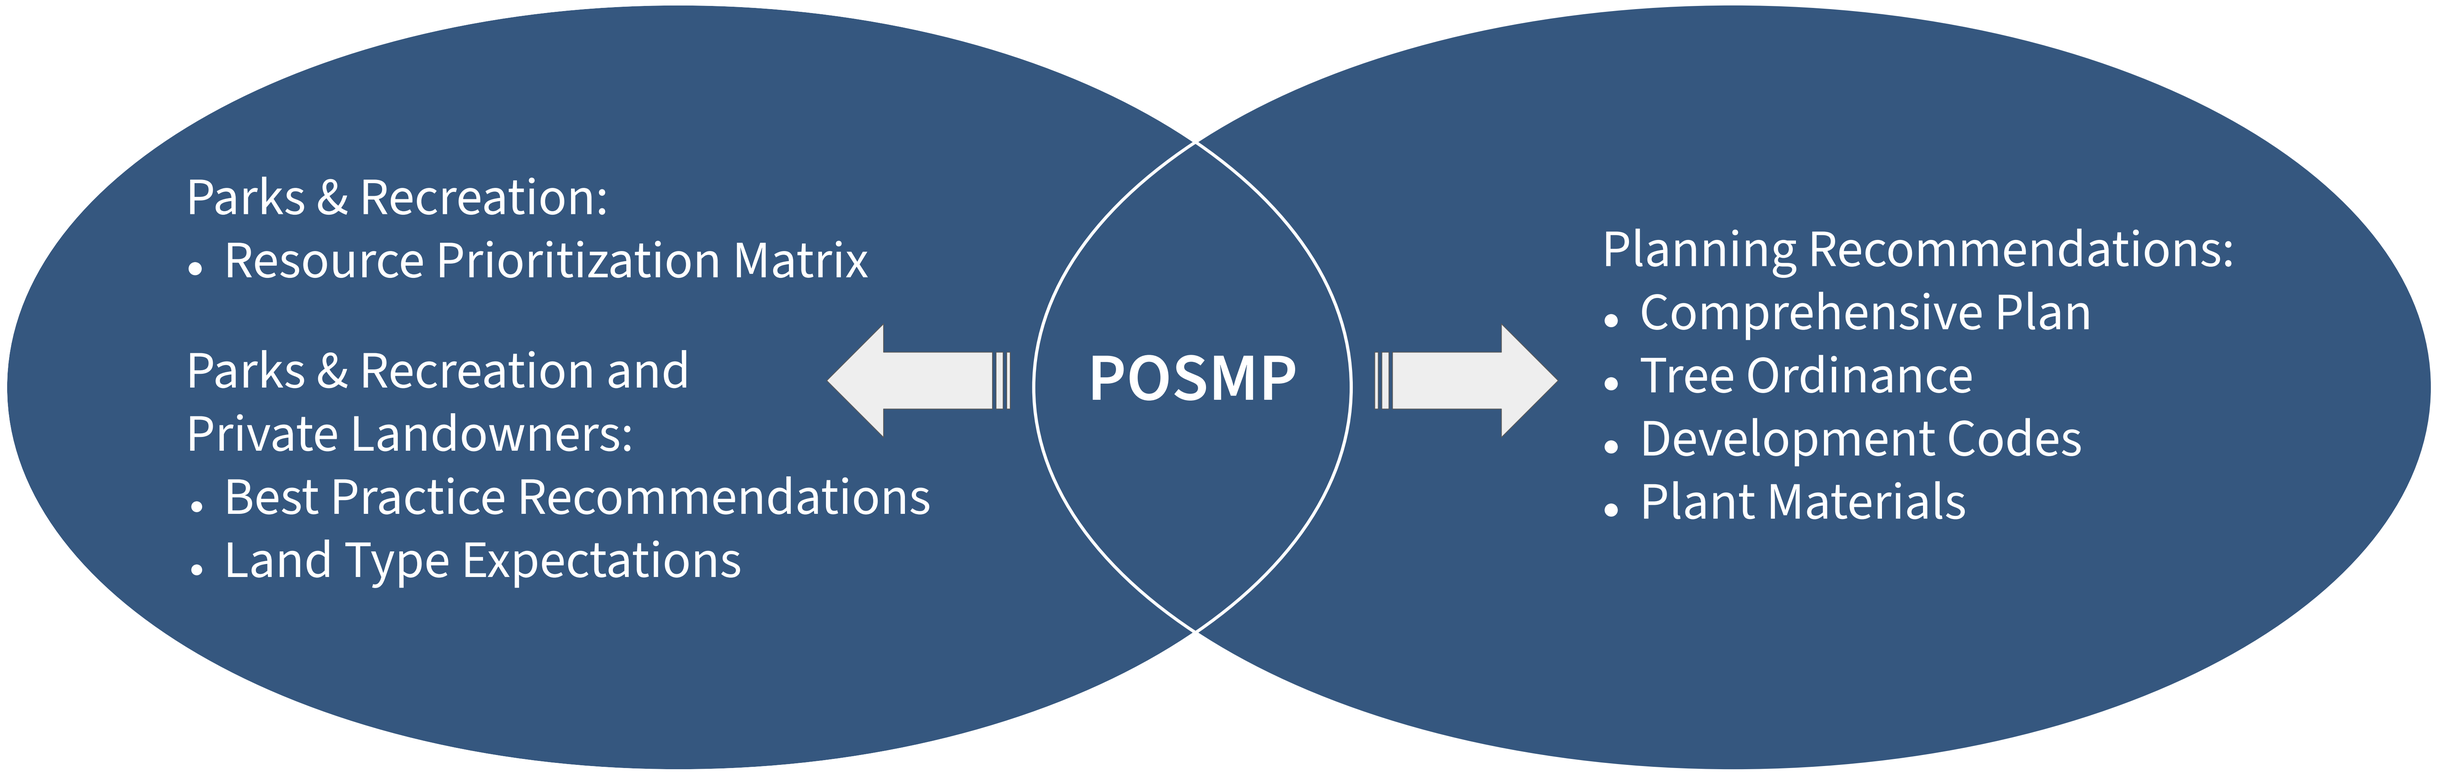
As extreme weather events and tree health and structural issues cause branch failures or risks, the number of public tree maintenance requests and other instances have increased. As public safety is a top priority, the city has been reactionary with the resources they have had, but mostly have contracted out arborists to handle these instances with costs increasing over the last several years.

ANNUAL CONTRACT EMPLOYEES: 2020-2023

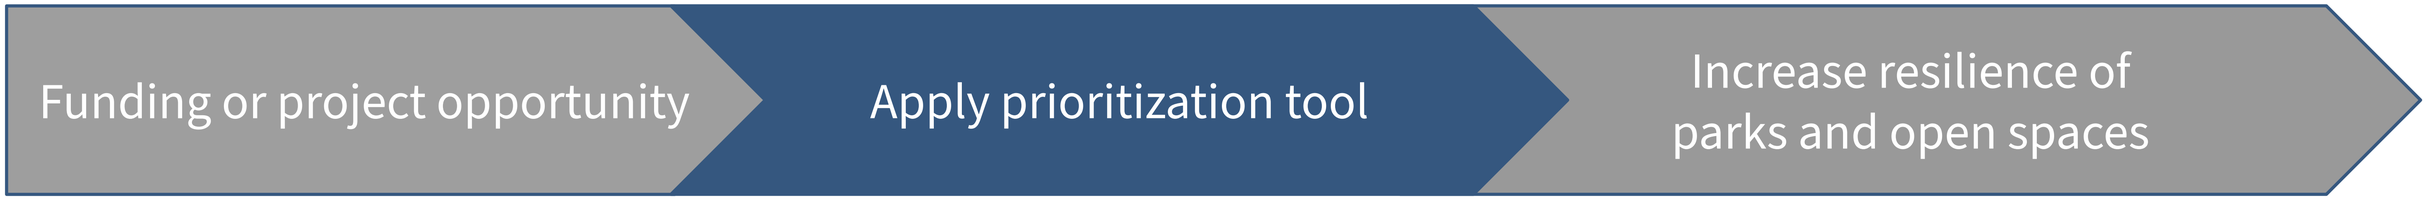


A significant portion of time and money goes into watering the public landscapes of Camas. The best practice recommendations look to find ways to reduce water use through use of native and adaptive vegetation.

ANNUAL IRRIGATION WATER USE: 2021-2023



Resource Prioritization



The 5 Camas Community Values were identified and used as a framework for making future decisions. It is the intent of this plan to provide guidance on how to incorporate and balance these values into projects and management practices of different scales.

Recommendations

Based on the community values and existing conditions analysis performed by this plan, several types of recommendations were developed in order to find better alignment between the POSMP goals and the public and private practices that influence the resilience of the Parks and Open Spaces of Camas.

Building a prioritization tool

How can we use our resources strategically to support our parks and open spaces when a funding source or project opportunity becomes available?

We can use a set of criteria to make good management decisions and prioritize opportunities.

By using a data-backed prioritization tool, we can effectively use resources and increase the resilience of our parks and open spaces.

Project Approach Matrix: Overview

Values	Goal
Financial and Resource Allocation	Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.
Outreach and Education	Provide opportunities for learning to gain efficiencies, institute best practices, and engage the community.
Natural Character	Maintain the existing natural character of Camas in ways that bolster community identity.
Equitable Access	Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.
Asset Protection + Public Safety	Protect ecosystems, human health, safety, and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change, and other potential impacts .

Legend

Establishes system-wide resilience

Considers connectivity and impacts to other sites or organizations

Makes site or process improvements

Status Quo Current practices

Roadblocks Obstacles to implementation

Where most cities are required to focus and start from

Additional values Camas wants to incorporate into decision making and resource allocation

It is the intent of this tool to use these 5 community values as a guide to prioritize resources and projects in order to maximize the potential impact of the work. The following matrix should be used by each project team to initiate a conversation and develop an intentional approach for how each project is addressing these values. Each value can be addressed in a variety of ways to contribute to the project site, the surrounding area, and the system as a whole.

Community Value: Financial and Resource Allocation

Goal: Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.

Challenges with available resources have led to some misalignment between public expectations and the abilities of current staff to keep up with the needs across the management portfolio. These resource challenges have also been amplified as the City of Camas has acquired a substantial amount of land in the last 10 years. While additional funding opportunities may become available through the treatment of parks and open spaces as valuable infrastructure, decisions have to be made to shift time and resources to the most impact tasks in order to align with the community values and POSMP goals.

Key Opportunities for Allocating Resources

- **Incorporate the value of ecosystem services**
- **Expand decision making to intentionally incorporate the 5 community values**
- **Align goals with grant funding requirements**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Do the goals and strategies open up opportunities for additional ongoing funding sources? • Does it reduce liability? • Can it utilize current practices or resources? • Are operational savings or ecosystem services quantified to support future assessments and tracking?	• Are off-site ecosystem services, trade-offs, or mitigation being considered? • Do the goals and strategies open up opportunities for supplemental grant funding?	• Does it reduce resource use or operational costs? • Are on-site ecosystem services included in the project goals and value discussions? • Does it reduce the need to hire outside vendors?	• Not currently funded or intentionally pursuing resources • Maintains status quo in funding for maintenance and operations • Is reactive to comprehensive ecosystem services.	• Increase maintenance costs or resource use. • Removes ecosystem services without mitigation.

Community Value: Outreach and Education

Goal: Provide opportunities for learning to gain efficiencies, institute best practices, and engage the community.

With so much natural land to manage, it will take public, private, and non-profit collaboration and efforts to meet the long-term management goals of the POSMP. The City is constantly looking for new partnering opportunities to improve skills, increase capacity, or supplement funding or resources. This plan also looks to provide alignment across organizations for goals and identify needs for training and knowledge gaps.

Priority Education and Training Needs

- **Tree hazard identification**
- **Tree pruning strategies**
- **Invasive identification**
- **Value of retaining existing mature trees and protecting natural systems**
- **Maintenance guidelines for HOAs**
- **Maintenance practices for residential wildfire prevention**
- **Maintenance for stormwater facilities**
- **Benefits of using native species vs ornamentals or lawns**
- **Pest management and chemical use**
- **Soil health**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it enable a path for long-term community stewardship or collaborative partnerships? • Does it establish or implement a pilot program to test practices and capture learnings.	• Does it collaborate with outside organizations or volunteers? • Does it build public-private partnerships or shared knowledge, goals, or expectations?	• Does it include public educational opportunities to learn about a resource, site, or culture? • Does it adjust practices or provide training for staff or the public on innovative or Best Management Practice methods that improve performance?	• Utilizes existing internal staff to perform a routine task. • Supplement with contractor for tasks that require specific training and/or technical skills.	• Requires resources for extra staff training.

Community Value: Natural Character

Goal: Maintain the existing natural character of Camas in ways that bolster community identity.

The natural features of Camas contribute to a sense of beauty and place that makes it a great place to live, work, play, and visit. There are many different types of features, each requiring their own care, attention, and stewardship to maintain their character and functionality.

Types of Features

- Street Trees and Medians
- Park and Open Space Tree Canopy
- Habitat and Wildlife
- Creeks and Wetlands
- Bodies of Water and Shorelines
- Trails
- Forest Understory
- Meadows
- Wooded Hillsides
- Open Lawns
- Manicured Landscapes
- Sports Facilities
- Cemetery

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it incorporate and honor community connection to place? • Does it prioritize natural features over built ones? • Does it help to retain or enhance city-wide natural systems?	• Does it provide consistency that aligns with native ecosystems? • Does it consider impressions from arrival and departure?	• Does it preserve or protect significant natural features beyond code? • Does it replace or improve out of character or invasive landscapes?	• No additional considerations during planning or development to exceed existing code to benefit and/or preserve ecological systems.	• Does not align with the ecological or cultural context of Camas. • Removes significant features that have community value without mitigation.

Community Value: Equitable Access

Goal: Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.

Obstacles to resources can exist in many forms. Considerations should be made to avoid or remove barriers due to mode of transportation, connectivity, physical abilities, demographics, schedule, type of recreational activity, or feeling welcome or safe. All community members and guest of Camas should be able to experience and enjoy the natural environment and associated programming in ways that align with their needs and abilities.

Access for Who?

- **Children**
- **Parents**
- **Elderly**
- **Mobility impairments**
- **Sensory impairments**
- **Racial and Cultural Diversity**
- **Mixed-age groups**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it fill a major gap or provide significant connectivity in the system. • Does it preserve large areas of natural resources in neighborhood of need?	• Does it support multi-modal transportation? • Does it provide connectivity between adjacent public and private lands?	• Does it maintain or enhance existing recreational amenities, programs, or resources? • Does it preserve recreational opportunities? • Does it improve site wayfinding?	• Service to neighborhood or demographic in need will be reactive and on an as needed basis.	• Is remote and does not serve a neighborhood or demographic in need. • Cuts off access to an existing resource.

Community Value: Asset Protection + Public Safety

Goal: Protect ecosystems, human health, safety, and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change, and other potential impact.

Parks and open spaces are valuable infrastructure that can help mitigate effects of disruptions or stresses to the community. Projects should understand what potential vulnerabilities exist and plan on how to address them through planning, design, and management. Resources should ultimately shift from less reactionary to more preventative efforts

Key Assets to Protect

- Community and Human Health
- Trails and Recreation Amenities
- Urban Tree Canopy
- Public Facilities and Private Structures
- Road and Utility Infrastructure
- Natural Ecosystems
- Habitat and Wildlife

Priority Concerns

- Water quality
- Hazard trees due to ice or wind storms
- Disease, pests, and invasive species
- Facility closure due to extreme weather
- Wildfire
- Drought
- Climate change

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks
• Does it significantly reduce the risk or liability of asset loss or damage due to stress or disruption? • Does it implement best practices to reduce or prevent long-term stressors, risks, or health issues?	• Does it assess the potential for risks to assets or humans across property lines? • Does it create collaboration between neighbors to address larger issues?	• Does it address a durability or wellbeing concern through routine maintenance and replacement program. • Does it eliminate a significant hazard or liability to human safety or health?	• Reactive to future disruptions, hazards or ongoing stressors to assets or people. • Reactive to addressing human safety and/or health needs. → • Takes priority. Reduces resources for other activities

Community Values: Project Approach Summary Matrix

	System	Connectivity	Local Improvements	Status Quo → Roadblocks	
Financial and Resource Allocation	• Do the goals and strategies open up opportunities for additional ongoing funding sources? • Does it reduce liability? • Can it utilize current practices or resources? • Are operational savings or ecosystem services quantified to support future assessments and tracking?	• Are off-site ecosystem services, trade-offs, or mitigation being considered? • Do the goals and strategies open up opportunities for supplemental grant funding?	• Does it reduce resource use or operational costs? • Are on-site ecosystem services included in the project goals and value discussions? • Does it reduce the need to hire outside vendors?	• Not currently funded or intentionally pursuing resources • Maintains status quo in funding for maintenance and operations • Is not intentional about valuing all ecosystem services. • Is reactive in responding to and mitigating hazards from extreme weather events and other effects of climate change.	• Increase maintenance costs or resource use. • Removes ecosystem services without mitigation.
Outreach and Education	• Does it enable a path for long-term community stewardship or collaborative partnerships? • Does it establish or implement a pilot program to test practices and capture learnings.	• Does it collaborate with outside organizations or volunteers? • Does it create new collaborations with outside organizations or volunteers? • Does it build public-private partnerships or shared knowledge, goals, or expectations?	• Does it include public educational opportunities to learn about a resource, site, or culture? • Does it adjust practices or provide training for staff or the public on innovative or Best Management Practice methods that improve performance?	• Utilizes existing staff to provide ad-hoc outreach and education to the public. • Supplement with contractor for tasks that require specific training and/or technical skills. • Partner with community and volunteer groups for invasive species removal.	• Requires resources for extra staff training. • Requires additional staff resources to provide and outreach and education program to the public.
Natural Character	• Does it incorporate and honor community connection to place? • Does it prioritize natural features over built ones? • Does it help to retain or enhance city-wide natural systems?	• Does it provide consistency that aligns with native ecosystems? • Does it consider impressions from arrival and departure?	• Does it preserve or protect significant natural features beyond code? • Does it replace or improve out of character or invasive landscapes?	• No additional considerations during planning or development to exceed existing code to benefit and/or preserve ecological systems.	• Does not align with the ecological or cultural context of Camas. • Removes significant features that have community value without mitigation.
Equitable Access	• Does it fill a major gap or provide significant connectivity in the system. • Does it preserve large areas of natural resources in neighborhood of need?	• Does it support multi-modal transportation? • Does it provide connectivity between adjacent public and private lands?	• Does it maintain or enhance existing recreational amenities, programs, or resources? • Does it preserve recreational opportunities? • Does it improve site wayfinding?	• Service to neighborhood or demographic in need will be reactive and on an as needed basis.	• Is remote and does not serve a neighborhood or demographic in need. • Cuts off access to an existing resource.
Asset Protection + Public Safety	• Does it significantly reduce the risk or liability of asset loss or damage due to stress or disruption? • Does it implement best practices to reduce or prevent long-term stressors, risks, or health issues?	• Does it assess the potential for risks to assets or humans across property lines? • Does it create collaboration between neighbors to address larger issues?	• Does it address a durability or wellbeing concern through routine maintenance and replacement program. • Does it eliminate a significant hazard or liability to human safety or health?	• Reactive to future disruptions, hazards or ongoing stressors to assets or people. • Reactive to addressing human safety and/or health needs.	• Takes priority. Reduces resources for other activities

Land Types and Minimal Expectations

There are many types of land that make up the parks and open spaces of Camas. Each type of land brings its own set of characteristics, values and management considerations.

Privately-owned properties

Privately owned properties play a key role in the parks and open space system by contributing to connectivity and management patterns within the larger landscape. Accountable management and stewardship of these lands are a crucial part of establishing a city-wide resilient system.

Publicly-owned properties

Publicly owned properties provide essential resources for conservation, recreation, and enjoyment. These properties often serve as the foundation for establishing protected areas and demonstrating best practices for management.

Homeowners associations

A homeowners association is an organization established within a residential community to manage and enforce rules and regulations. Homeowners associations manage common areas, which can include open spaces such as trails and stormwater facilities.

Minimum Maintenance Expectations: Alignment with expectations of other land types plus opportunity to partner with the City to improve overall ecosystem performance.

Private landowners

Private landowners own and manage significant portions of natural areas within or adjacent to critical areas. They are key partners in contributing to stewardship of our ecosystems.

Minimum Maintenance Expectations: Opportunity to align with the overall network and improve ecosystem performance.

Steep slopes

Hillsides having a 15 foot, or greater, vertical rise over 100 feet of horizontal run, or 15% slope

Minimum Maintenance Expectations: Human access should be limited and vegetation managed in order to minimize erosion. Development should be mindful of stability and impacts downslope, including beyond the property line.

Stormwater facilities

Stormwater facilities play a crucial role in managing runoff by capturing and treating rainwater to prevent flooding and pollution.

Minimum Maintenance Expectations: Facility inlets and outlets should be regularly cleaned of waste and sediment. Dead vegetation should be replaced in rain gardens. Grass should be mowed and saplings removed in detention ponds.

Open spaces

Open space is left primarily in its natural environment.

Minimum Maintenance Expectations: Maintenance of natural system functionality should take priority over recreational activities.

Trails

Pathways that provide access into natural areas and linkages across properties.

Minimum Maintenance Expectations: Safety hazards (including tree branches at-risk of falling) and waste should be removed. Uneven surfaces should be repaired.

Wetlands

Wetlands are transitional ecosystems that manage flood waters, create unique habitats and protect water quality. They are subjected to regulations by public agencies at the state, local, federal and tribal level.

Minimum Maintenance Expectations: Remove waste and invasive species. Prevent intrusion of contaminated water or excessive sediment.

Rights-of-way

A public right of way is land that is set aside for transportation purposes. This can include public roads, sidewalks, or medians.

Minimum Maintenance Expectations: Safety hazards (including tree branches at-risk of falling) and waste should be removed. Uneven surfaces should be repaired. Weeds should be removed or killed, and planting beds mulched. Dead plantings (especially trees) should be replaced.

Shorelines

Shorelines are linear spaces along bodies of water, managed in accordance with the state Shoreline Management Act.

Minimum Maintenance Expectations: Ensure access points are safe and devoid of hazards. Remove waste.

Parks

Parks are publicly accessible spaces that are developed to support recreational activities and programming.

Minimum Maintenance Expectations: Inspect equipment for safety. Assess and maintain trees and vegetation for health. Remove waste and repair furnishings. Maintain lawns to support recreational uses.

Recommendations

Best management practices for planning, operations, and site development were organized by system and aligned with each land type to provide guidance for moving beyond minimal expectations and towards systems-level resilience.

A systems approach

A systems approach to management involves understanding and optimizing the benefits each component can contribute to the overall community, while understanding potential trade-offs and synergies.

We are organizing the Management Plan Recommendations into these components in order to work towards giving each the attention they need to help the overall system thrive.

Best Practice Recommendations

In order to move beyond minimal expectations towards the goals of the city-wide system approach, the following recommendations are proposed to be considered for each project. Recommendations are organized by system and laid out by the template below. Utilizing these strategies can unlock the potential for more optimal management of resources that align with the 5 Camas Community Values.

HOW TO USE: Each project team should identify the applicable **Project Type** and **Land Types** that align with the project objectives and outcomes. The team should discuss and intentionally weigh the applicability of each relevant recommendation across the 7 systems as they apply to the project's goals, scope, and budget. A balance should be applied in order to equitably address the 5 Camas Community Values, and the Summary **Project Approach Matrix** should be referenced to ensure alignment.

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Best practices to unlock the most potential…		•••	•••	•••	•••	•••

Best management practices are listed here for the following **Project Types** for each system:

- **Operations & Maintenance -** Ways to manage established resources
- **Planning & Programming -** Ways to plan for future resources
- **Site Development -** Ways site design can impact management

The **Land Types** that can be managed using this practice are shown here using icons.

See Land Types page for descriptions and minimal expectations. These recommendations go beyond these expectations and work toward the community values at the site, organization, and system levels.

Each management practice is evaluated using the **Project Approach Matrix** and the alignment with each community value**.**

Water

Water is essential for life. Managing water in our parks and open spaces is vital for preserving natural ecosystems, ensuring access to clean water, and providing cooling and recreational opportunities for the community.

How does water impact us?

Stormwater
Stormwater management plays a crucial role in preventing flooding, recharging groundwater and mitigating pollution.

Irrigation
Irrigation is a valuable resource that provides a consistent water supply to vegetation when rainwater is scarce.

Water Quality
Water quality directly affects the health of humans, pets, vegetation, and wildlife.

Water Access
Water can be a calming presence and provide cool relief, a place for recreation, and sense of community - especially during extreme heat events.

What are the risks and concerns?

Flood Control
Floods can result in displacement of communities, damage to infrastructure, erosion and vegetation damage, and increased costs of living.

Drought
Droughts have adverse effects on ecosystems and communities such as tree and vegetation health, water scarcity, food shortages and economic losses.

Water Costs
High water costs can lead to disparities in water access, affecting both individual well-being and community development.

What are some key strategies?

Green infrastructure
Allowing rainwater to infiltrate the ground reduces runoff, prevents flooding and filters pollutants.

Stormwater facility sediment removal
Effective drainage systems ensure the longevity of stormwater infrastructure and prevent downstream pollution.

Water conservation practices
Reduce overall water consumption and promote efficient water use through use of native plantings, reduction in lawn, and efficient irrigation systems.

Engage Water
Improve access to water for drinking, cooling down, and supporting wildlife.

Privately-owned lands

Support water management through water-saving practices and integrating green infrastructure solutions.

Publicly-owned lands

Manage lands that absorb, celebrate, and provide access to clean and safe water.

Recommendations: Water

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Manage sediment before it impedes infiltration capacity. Remove sediments from drains, rain gardens, etc. annually, before the rainy season.		Opportunity to collaborate with HOAs.	Promote the use of green infrastructure.	Use resources proactively instead of reacting to stormwater facility failures. Improves natural infrastructure functionality.		Reduce flooding risks.
Apply filtration bags at storm drains before major storms, especially in the autumn to prevent leaves from clogging the system.				Reduce maintenance resources needed to clean out debris.		Reduce flooding risk.
Reduce chemical fertilizer and pesticide use to protect water quality downstream.	**All**	Opportunity to collaborate with private landowners.	Maintain healthy lakes, streams, and other bodies of water. Reduces potential damage to habitat and wildlife.	Reduce costs and labor for purchasing and applying chemicals.		Reduce risk of algal blooms and other water quality hazards.
Assess existing recreational water access points for safety, accessibility, and durability issues.			Increase engagement with natural water bodies for enjoyment.	Catch issues early to avoid full replacement of infrastructure.	Ensure recreational opportunities are maintained for all.	Reduce liability and risk of injury.
Designate lawn areas to go dormant during summer months to reduce water use.		Opportunity to educate public about water conservation practices.	Requires cultural shift in expectations to support desired uses.	Save on irrigation costs as well as mowing labor costs.		
Promote city-led inspection, guidelines, and education to private landowners and HOAs on ways to manage stormwater facilities.		Opportunity to collaborate with private landowners to improve system performance.	Promote the use of green infrastructure.	Improves natural infrastructure functionality.	Promote use of natural infrastructure on both public and private land.	Reduce flooding risk.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Water

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Size stormwater facilities to handle 100-year (1%) storms.				Reduce recovery costs and efforts to flooded areas.		Reduce flooding risk.
Ensure that shoreline and wetland trails account for future changes to water levels.					Protect future access to shorelines and wetlands.	Reduce potential for future damage.
Utilize water access to provide opportunities for cooling during hot days.					Ensure all community members have access to cooling resources.	Support public health.
Assess critical areas within the floodplain and ensure the plantings, soil, and materials can withstand flooding events.			Improve habitat and natural resources.	Save on rebuilding costs.		Plan for future floods to protect current resources.
See Lacamas, Round, and Fallen Leaf Lakes Management Plan for further actions						

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Water

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Look for opportunities to use a captured or recycled water source for irrigation use.	HOA, Private land, Parks	Opportunity to collaborate with private landowners.		Reduce irrigation costs.		Preserve water resources during extended drought.
Divert water running perpendicular to pathways from uphill sources into culverts or other durable structures.	Steep slopes, Trails, Parks, HOA			Reduce costs of replacing paths and trails.	Increase longevity of paths and trails.	Increase safety of paths and trails.
Use drought-tolerant and/or adaptive plant species and cluster plantings by water use to reduce over-watering.	HOA, Private land, Parks	Opportunity to collaborate with private landowners.	Native planting supports habitat and wildlife.	Reduce irrigation costs.		
Celebrate the experience of rain water through ground surface treatments, artwork, and daylit water conveyance channels.	Parks, Stormwater facilities	Stormwater education opportunity.	Promotes nature engagement with all ages.	Reduces the need for underground utilities.		
Ensure runoff is minimized and all stormwater is treated and infiltrated on site when possible. Consider the use of pervious surfaces.	**All**		Reduces impacts to downstream habitats.	Reduce future costs of repairing erosion impacts.		Reduces risk to adjacent property owners. Replenish local groundwater.
Plant trees adjacent to stream banks to provide shade, keep the water cool and reduce erosion into streams.	Wetlands, Shorelines		Protects habitat. Increases tree canopy cover.			Reduces erosion risks.
Protect waterways by not installing wood chip mulch below the ordinary high-water mark.	Wetlands, Shorelines					Reduce impacts to water quality.
Incorporate water sources to provide wildlife with a place to drink or cool down.	HOA, Private land, Parks	Opportunity to collaborate with private landowners to provide habitat connectivity.	Promote wildlife viewing and enhance enjoyment of natural spaces.			
Provide access to emergency water to protect non-irrigated trees and vegetation from extreme heat events.	HOA, Private land, Parks, ROW		Preserves tree canopy.	Reduce replanting costs.		Protects vegetation during extreme heat events.
Additional Best Practices found in the Rain Garden Handbook for Western Washington

Operations

Effective operations through stewardship and conversation can ensure optimized use of public funding, foster community engagement, promote safety and accessibility, and enhance the experience of these spaces.

How do operations impact us?

Safety
Well-maintained parks and open spaces are accessible and safe.

Enhanced experience
Visitors and community members will have a better experience in spaces that are functional, safe and well-kept.

Longevity
Taking care of assets ensures that they are still around in the future.

What are the risks and concerns?

Resource availability
Scarcity of resources limits the ability to maintain infrastructure, provide adequate programming and ensure visitor safety.

Lack of specialty knowledge
The lack of specialty knowledge can result in ineffective decision-making as well as missed opportunities for enhancement of parks and open spaces. It can also pose safety risks.

Loss of Recreational Opportunities
Inability to meet all of the maintenance tasks may lead to closures or reduced usage in parks and open spaces.

What are some key strategies?

Partnerships
Work with businesses, nonprofits and other community groups to establish project/program goals and partnerships.

Volunteer Coordinator
Hire a volunteer coordinator in order to best utilize volunteer groups to help focus on Management Plan goals.

Community engagement
Foster community engagement and connection to place in order to support long-term stewardship, a sense of ownership and investment in public spaces.

Privately-owned lands

Private landowners can partner with the City and learn from each others' operations practices, benefitting from shared knowledge and resources.

Publicly-owned lands

Public entities can provide opportunities for the community to participate in maintenance and learn about best practices.

Recommendations: Operations

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Consider reorganizing maintenance staff by land or system type and training or hiring champions to provide overall stewardship strategies, practices and goals.	**All**	Provide specialized knowledge to staff to align with systems approach.	Preserve and enhance the natural elements, features, and systems that contribute to the community identity.	Take a proactive approach to management and land stewardship.		System knowledge helps to identify issues early and work towards preventative measures.
Consider performing observations, evaluations, and surveys to help determine how spaces are currently used and capture ideas for potential improvements.		Engages community members to help form future efforts and priorities.	Allow management to focus on efforts that support current uses.	Allocate resources strategically.	Facilitate use of spaces by Camas residents. Help identify obstacles to desired uses.	
Hire city urban forester to provide overall stewardship, strategy, monitoring, and education to staff and the community.	**All**	Can coordinate educational opportunities for staff and community.	Support long-term health of tree canopy.			Address hazard trees and mitigate risk.
Hire a volunteer and/or HOA coordinator to organize and focus non-profit and community groups to align with POSMP goals.	**All**	Improve coordination and knowledge sharing amongst public and private groups.		Increase capacity for maintaining natural resources.		
Explore more potential funding sources that promote natural resources, parks, and open spaces as valuable, resilient infrastructure.	**All**	Align with other agencies on the value that nature can bring to communities.		Increase funding sources.		Explore resilience funding to reinforce natural infrastructure.
Partner with the Landscape Architecture Foundation and/or other institutions to create case studies or research to support ongoing monitoring and data-collection.	**All**	Bolster data-backed research and education around natural systems.		Better inform decision making and resource allocation.		

Recommendations: Operations

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Work with local businesses, nonprofits and other community groups to establish project goals, programs and partnerships.	**All**	Align with other agencies on the value that nature can bring to communities.	Align on expectations and provide consistency across the community.			
Establish agreements with HOAs and other partners for collaborative management of ecosystem services and recreational resources.			Align on expectations.	Maintain and enhance performance of ecosystem services.	Maintain and enhance trail and open space access through HOAs.	
Create ongoing channels with state and county level partners. Align and integrate ecosystem services with other City, County and State department goals, initiatives, funding sources, plans, and projects.	**All**	Align with other agencies on the value that nature can bring to communities.		Incorporate the valuation of ecosystem services into project planning across Washington.		Improve preparedness for inclement weather, fire, and other potential hazards.
Considering partnering with Camas School District as well as regional universities for citizen science programs or ongoing environmental monitoring initiatives.	**All**	Build partnerships and collect metrics that can inform decision making.		Collect data that can lead to more efficient utilization of available resources.		
Provide more volunteer orientation sessions to help familiarize them with the natural systems and expectations.	**All**	Increase hands-on experience and nature immersion to improve knowledge of natural systems.	Create opportunities for more connection to place.			
Obtain Tree City USA certification from the Arbor Day Foundation and pursue Growth Awards through innovative urban forest management efforts.	**All**	Increase awareness of efforts and progress through 3rd party organizations.				
Identify opportunities for joint training for both staff and community members to improve knowledge and best practices.	**All**			Use resource effectively though consolidating training efforts and promoting best practices.		Strengthen safety by creating shared understanding of operational and emergency procedures.
Engage tribal communities to build long-term relationships and understand best land management practices that could be incorporated into operations.	**All**	Opportunity for staff to move towards a stewardship model of land management.	Could lead to improved habitat and restoration of native ecosystems.	Could lead to increased ecosystem service perform across systems.	Is inclusive of tribal groups, practices, and knowledge.

Recommendations: Operations

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide staff review of design projects to identify potential maintenance efficiencies or improvements.				Ensure new designs align with maintenance expectations and capacity.		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Materials and equipment

Materials and equipment selection and maintenance directly impact the functionality, durability, safety and aesthetic quality of parks and open spaces.

How do materials and equipment impact us?

Circulation and Gathering
Hardscapes allow for vehicular parking, pathways and open spaces to support programming.

Aesthetics and Character
Materials and furniture contribute to the overall character of Camas' parks and open spaces. Color selection, materiality and finish can provide consistency or a unique sense of place for each site.

Places for Recreation and Rest
Playground equipment, benches and picnic tables provide places for both active and passive recreation.

What are the risks and concerns?

Heat island effect
The heat island effect, characterized by elevated temperatures in urban areas, underscores the importance of selecting materials that minimize heat absorption.

Safety
It is critical to select materials that minimize potential hazards, reduce the risk of accidents or injuries and ensure the well-being of users.

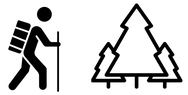
Wear and Tear
Many materials degrade over time due to outdoor exposure to sun, water, soil, and frequent use.

What are some key strategies?

Consistent sourcing
Utilize a short list of standard furnishings, materials and colors to simplify replacement and maintenance costs and provide a consistent character across spaces.

Durability
Selecting durable materials ensures long-term functionality and minimizes the need for frequent maintenance or replacement.

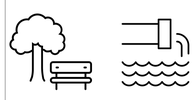
Universal access
Provide universal access to program areas and for equipment options for people of all ages and abilities.



Privately-owned lands ← → **Publicly-owned lands**

Private landowners can provide durable surfaces for any publicly accessible trails or amenities.

Public lands can provide durable and accessible products to ensure long-term use for all.



Recommendations: Materials and Equipment

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Continue to perform safety assessments annually to ensure that playground and other equipment is durable and safe for use.				Reduce liability risks.	Identify challenges to universal access and assess potential for universally accessible equipment.	Ensure safety of community members.
Provide recycling options next to all trash receptacles.		Support responsible habits for resource management.	Reduce impacts of landfills.			
Use materials for maintenance and repair of paving that reduce harm to environmental and human health, such as low-emitting sealants.		Set example of best practices.	Reduce risk of habitat contamination.			Protect health and safety of staff and end-users.
Pave existing highly-used soft-surface trails in popular areas.				Reduce liability from degradation.	Improve accessibility.	Provide long-term durability.

Recommendations: Materials and Equipment

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide universal access to program areas and equipment options for people of all ages and abilities.		Expand reach and impact of programming and educational signage.	Allow all community members to appreciate natural features and habitats of Camas.		Ensure that everyone can enjoy outside activities equitably.	
Design facilities to handle extreme events with minimal effects on continued functionality.		Promote disaster preparedness of community members.				Preserve building functionality overtime. Facilities could act as a resource for community members in an emergency event.

HOA  Private land  Steep slopes  Stormwater facilities  Open spaces  Trails  Wetlands  ROW  Shorelines  Parks 

Recommendations: Materials and Equipment

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Use contrasting material at stair nosing to promote visibility.						Increase safety of stairs.
Use durable materials that can handle UV exposure and flowing and standing water.				Reduce replacement costs.		Increase resistance to wear and tear.
Consider the use of high albedo materials to reduce heat absorption. Manage potential glare impacts.						Reduce urban heat island effect.
Select exterior luminaires that reduce light pollution.			Preserve connection to the night sky and reduce impacts to habitat.	Reduce energy costs for illumination.		
Select nature-based play equipment, seating, and climbing areas.			Aligns with the natural character of developed playgrounds and parks.			
Utilize a short list of standard furnishings, materials and colors.			Provide a consistent character across spaces.	Simplify replacement and maintenance costs		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Access and amenities

It is critical to ensure that people of all ages and abilities can access and enjoy the variety of parks and open spaces that Camas has to offer.

How do access and amenities impact us?

Equity
Managing parks and open spaces to ensure everyone can access and enjoy them creates inclusive spaces that benefit the entire community.

Program
Amenities provide essential infrastructure and resources to support visitor experience. This creates spaces where people can recreate and gather.

Wayfinding
Wayfinding bolsters sense of place by guiding visitors through the parks and open spaces, and facilitates meaningful interactions with natural and cultural elements.

What are the risks and concerns?

Safety
Inadequate or poorly maintained facilities can compromise visitor safety and lead to underutilization of the place.

Exclusion
Lack of access creates barriers that prevent community members from fully participating in recreational activities, limiting their ability to enjoy and benefit from parks and open spaces.

Lack of amenities
Inadequate amenities such as lack of seating or restroom facilities may deter visitors from diverse backgrounds, increasing disparities in access to parks and open spaces.

What are some key strategies?

Avoid hazards
Lay out pathways to avoid hazards and sensitive or protected areas, and reduce bike and pedestrian conflicts with vehicles.

Universal access
Incorporate universally accessible pathways, amenities, and access to the extent practicable.

Education
Provide educational, wayfinding, and interpretive signage. Use multiple languages to address potential language barriers.

Privately-owned lands ← Private landowners can build partnerships to contribute and connect to the city-wide network of open spaces.

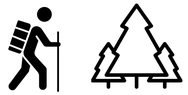
Publicly-owned lands → Public lands can ensure amenities accomodate the needs of all community members.

Recommendations: Access and Amenities

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Add or improve amenity spaces for gathering, playing or resting.		Increase community engagement.	Strengthen opportunities for connecting with natural spaces.		Prioritize in areas that lack similar amenity or feature.	Promote social and physical health.
Provide a higher level of maintenance to trailheads and main entrances to enhance visibility as well as visitor sense of safety.					Enhance visitor experience and attract new visitors.	Reduce crime and vandalism.
Utilize best management practices and caution when performing maintenance tasks that use excavation in areas with high probability of cultural, archeological, or historical resources.		Preserve and protect cultural resources.		Reduce project delays and costs.	Respect process and history of indigenous cultures.	
Improve ADA accessible pathways and access into parks and open spaces.		Increase community engagement.			Make parks and open spaces accessible to all by accommodating all levels of mobility.	Decrease risk of accidents and hazards.

Recommendations: Access and Amenities



Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide low-impact access to natural areas and wetlands.		Opportunity for visitors to understand the value and purpose of natural resources.	Opportunity to experience wildlife and natural systems.		Diversify recreational opportunities.	Preserve critical areas from impacts of human use.
Identify public lands or facilities to act as community gathering and resource distribution in an emergency.		Increase community awareness and preparedness.		Increase eligibility for resilience-based grants.	Provides resources in an emergency where it is needed most.	Enhance emergency preparedness and increase community resilience
Incorporate universally accessible pathways, amenities and access to all program areas.					Expand user base and access.	Reduce liability risk.
Consider trail connectivity enhancements when planning subdivisions.			Provide increased opportunities for experience nature.		Increased recreational opportunities. Expand network connectivity.	
Consider multimodal transportation access when planning parks and trails.					Increased recreational opportunities.	Promote physical activity and public health.
Ensure that some amenities remain accessible year-round.		Increase community engagement.	Support experiences of natural systems in different seasons.	Maximize utilization of amenities and increase of rental revenue.	Opportunities to enjoy spaces all year.	
Develop a difficulty scale for trails and provide maps and/or signage to indicate appropriate skill levels - consider surface material, slope, and elevation gains.		Provide clarity on expectations and current conditions.			Ensure users are matched to the appropriate activities.	Protect health and safety of users.
Develop a consistent signage standard for use on public and private trails that define rules, etiquette, and trail conditions.		Ensure city-wide consistency on expectations, behavior, and management.	Provide consistent conditions and alignment on goals.			Protect health and safety of users.
Develop trail grade standards for both public and private lands that provide consistency of width, material, maintenance, and other supporting features.		Ensure city-wide consistency on expectations and management.	Provide consistent character and alignment on goals.		Ensure all trails are equitable and safe.	Protect health and safety of users.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Access and Amenities

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Locate parking to minimize intrusion into open spaces and avoid pedestrian conflicts.			Maximize utilization of open space.	Reduced maintenance and infrastructure costs.	Provide safe and efficient access to recreation opportunities.	Increase pedestrian safety.
Provide educational and interpretive signage.		Promote stewardship and community engagement.	Share value of preserving natural systems and features.		Enhance visitor experience.	
Look for small opportunities to provide comfort or interest along trails - seating, potable water, fitness equipment, shade, etc.			Create moments to appreciate natural surroundings.		Increase utilization of parks and open spaces.	Improve public health and wellness.
Provide clear visibility and wayfinding at key intersections.		Provide orientation and promote options.			Enhance visitor experience.	Provide effective emergency response.
Place signs in and around open spaces and critical areas, clearly identifying permitted and restricted uses.		Clarifies intent of public spaces and balance between human uses and natural functions.	Protects sensitive areas and natural features.	Reduce costs for enforcement and repair of misused assets.	Enhance visitor experience.	Prevent property damage and liability claims.

HOA  Private land  Steep slopes  Stormwater facilities  Open spaces  Trails  Wetlands  ROW  Shorelines  Parks 

Soil

Implementing appropriate soil management practices is essential for supporting vegetation growth, regulating water infiltration and drainage, and influencing ecosystem health and resilience.

How does soil impact us?

Water infiltration and quality
Soils that can absorb and filter water help to mitigate flooding, reduce erosion, and support healthy ecosystems.

Tree and vegetation health and stability
By supporting nutrient cycling, supporting microorganisms, and providing space for root growth, soils are a critical part of plant health.

Carbon storage
Healthy soils are typically able to sequrester and store more carbon than the vegetation they support.

What are the risks and concerns?

Erosion
Erosion can degrade landscapes, disrupt pathways and trails, harm vegetation, increase sedimentation in water bodies and compromise ecosystem health and recreational opportunities.

Soil loss and Contamination
Loss of healthy topsoil through removal or pollution can harm plant health and soil microorganisms.

Compaction
Compacted soils have a decreased ability to infiltrate water. They also impact ecosystem health by limiting root growth of plants, especially when surrounded by hardscape and heavy foot traffic.

What are some key strategies?

Soil protection zones
Protect soil areas during construction and operations to reduce compaction or contamination.

Increase soil volumes for trees
Provide trees with adequate space for root growth to ensure long term health and stability.

Plantings
Use dense plantings to discourage walking through planting areas and reduce compaction. Amend soils as needed to ensure long-term health.

Privately-owned lands

Private landowners can restore soils after disturbance to provide long-term plant health.

Publicly-owned lands

Public lands can protect soils by limiting access through sensitive conditions.

Recommendations: Soil

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Consider natural and/or constructed bank stabilization techniques in conjunction with any crossing projects.			Preserve and protect natural resources.	Increase asset longevity and reduce replacement costs.	Enhance recreational opportunities and user experience.	Risk and liability reduction.
Establish soil protection zones during construction projects to minimize compaction of adjacent areas.			Preserve and protect natural resources.	Reduce soil restoration costs.		Minimize erosion and sedimentation risk.
Use a single access route to work zones and minimize trips through the access route in order to decrease soil compaction and erosion.			Preserve and protect natural resources.	Reduce restoration and maintenance costs.		Minimize erosion and sedimentation risk.
Limit access routes across steep slopes and install access routes parallel to slope contours and perpendicular to water flow.			Preserve and protect natural resources.	Reduce restoration and maintenance costs.		Minimize erosion and sedimentation risk.
Limit crew size in wet areas and establish a project staging area outside of the wet areas.			Enhance wetland and water quality.	Increase crew efficiency and productivity.		Protect critical areas and worker safety.
Identify and address potential hazards or erosion concerns, especially after large storm events.				Reduced replacement and maintenance costs.		Protect infrastructure and property.
Increase soil areas of existing street trees through hardscape removal.			Protect character of large mature trees.	Preserve ecosystem services from tree canopy in urban areas.		Protect critical urban tree canopy.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Soil

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Prioritize the location of stormwater treatment facilities away from structures, at site low points, and where infiltration is likely to be effective.				Reduced stormwater management costs.		Reduce stabilization risks.
Use a phased approach to weed removal and restoration to minimize exposed soils and erosion.	**All**		Preserve aesthetic appeal of the space. Prevent return of invasive species.	Reduced stormwater management costs.		Mitigate erosion risks.
Find alignments that allow for <5% slopes for pathways through open spaces. Incorporate switchbacks when needed.					Provide accessible circulation.	Reduce bank destabilization risks.
Limit development and disturbance on steep slopes greater than 15%. Consider protecting them as publicly-owned critical areas.		Ensure land owners understand the potential risks and downstream impacts involved when building on steep slopes.	Preserve sensitive habitat areas.			Reduce bank destabilization risks.

Recommendations: Soil

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Maximize vegetated ground coverage as early as possible to reduce erosion impacts.			Preserve natural resources.	Cost savings on erosion control measures.		Protect infrastructure and property.
Use dense plantings, tree grates, other barriers, and/or signage to discourage walking through planting areas to avoid compaction, especially in high traffic areas.			Maintain attractive and well-preserved landscapes.	Reduce replanting and maintenance costs.		Protect long-term health of trees in urban spaces.
Utilize proper soil amendments to improve health and increase water storage. Perform a soil analysis as needed.		Develop an understand of soil health in public spaces.	Maintain healthy vegetation.	Reduced irrigation and maintenance costs.		Resist drought.
Allow for adequate soil volumes to support trees adjacent to hardscape paving. Allow for 8’ wide planting areas for large trees unless other measures are taken to provide the needed soil volumes and protection (see references).			Maintain mature tree canopy.	Reduce replacement costs.		Protect long-term health of trees in urban spaces.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Vegetation and habitat

Proper vegetation management provides vital habitat, reduces risks, and contributes to the overall quality of Camas' natural aesthetic.

How does vegetation impact us?

Biodiversity
Plants support biodiversity by providing suitable conditions for a variety of organisms to thrive and serving as habitat for wildlife. Biodiverse ecosystems are more resilient and provide support for human health and wellbeing.

Ecosystem services
Healthy plant communities purify the air, water and soil, stabilize soils and regulate temperature.

Aesthetic appeal
Vegetation provides colors, textures and shapes throughout the landscape. Plants provide shade and can support recreational activity such as hiking, nature appreciation and birdwatching.

What are the risks and concerns?

Fire management
Vulnerability to wildfires increases the risk of harm to infrastructure, human communities and wildlife.

Invasive species
Invasive species compete with native plants and disrupt ecosystem processes. They also result in increased management costs to control their spread and mitigate ecological impacts.

Improper pesticide use
Improper pesticide use harms non-target organisms, can contaminate soil and water resources and have negative impacts to human health.

What are some key strategies?

Preserve and re-establish key plant communities
Prioritize native and adaptive plant species that enhance ecosystem resilience and biodiversity. Protect and create key forest structures that are important habitat features for multiple wildlife strategies.

Integrated pest management
Utilize established integrated pest management plans and prioritize no-chemical pest control options when appropriate. Prioritize careful removal of invasives.

Support pollinators
Integrate native pollinator restoration to the greatest extent possible. Convert passive turf areas to native naturescaping.

Privately-owned lands

Private landowners can shift plant species selection to more native palettes and minimize the use of chemical inputs. They can be aware of and implement fire management best practices around their homes and businesses.

Publicly-owned lands

Public lands can establish and protect large-scale and connected native and adaptive plant communities to provide long-term habitat opportunities.

Recommendations: Vegetation and Habitat

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Protect and create key forest structures (standing dead trees/snags, downed logs, old trees, open gaps) that are important habitat features for biodiversity.			Enhance natural character and provide homes for wildlife.	Decrease maintenance costs of removing forest structures.	Enhance recreation opportunities such as birdwatching.	Work with arborists and other specialists to ensure safety.
Develop an integrated pest management plan and prioritize non-chemical pest control options as appropriate. Include regular tree inspection for pests and disease to reduce spread.	**All**			Reduce pesticide costs and staff time.		Increase resilience of ecosystems and landscapes.
Ban the use of neonicotinoids.	**All**	Communicate the value of protecting pollinator health.	Protect wildlife health.	Reduce pesticide costs and staff time.		Protect public health and water quality.
Take precautions to avoid spreading noxious weeds or invasive species between work/restoration sites. Designate "haul and drag" routes for removing plant material to minimize disturbance.	**All**			Reduce future invasive species removal costs.		
Consider using a mulching mower and leaving plant material in place over winter.		Share strategies for different ways to provide habitat.	Provide winter habitat to support biodiversity.	Enhance the health of turf and reduce maintenance costs.		
Provide educational material for fire mitigation maintenance practices including minimizing fire fuels, species to avoid, spacing, materiality, and defensible space zones		Educate Camas residents about wildfire resilience.	Balance expectations around safety and vegetation density.			Increase resilience to wildfires, and reduce fire spread potential across natural areas.
Provide training or educational materials on invasive species identification, monitoring, and removal.	**All**	Educate Camas residents about invasive species management.	Reduce competition with native plant species	Weed removal reduces competition for water with desired vegetation, reducing water use.		Protect health and functionality of native ecosystems.
When manually removing noxious weeds or invasive species from areas near waterways, prevent sediment and vegetative debris from entering the waterway.			Enhance aesthetic appeal of recreation areas.	Reduce future invasive species removal costs downstream.		Protect native habitat.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Vegetation and Habitat

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Partner with local nurseries to find alignmentment with native plant lists, prohibited species, and plant availability.	**All**	Builds partners to support native and adaptive plant goals	Supports wildlife.		Increases availability of native plant species.	
Preserve and enhance large, connected patches of undeveloped native vegetation.			Preserve key habitat patches and corridors. Retain urban tree canopy.		Increase access to recreational opportunities.	Mitigate flood risk. Improve air and water quality. Reduce urban heat island effect.
Use succession planning to identify species that will thrive in Camas as the climate changes.	**All**	Identify climate-adaptive plantings to encourage use.	Ensure natural character of Camas persists for future generations.	Reduce long-term maintenance costs.		Reduce tree mortality, fall hazards, and wildfire fuels.
Perform a needs assessment based on surrounding neighborhood densities and service area to determine how much open lawn space is needed in developed parks to support the community.		Work with residents to understand use needs and balance of natural spaces.	Right size turf use to allow space for native plant communities.	Reduce the need for lawn care and water use for under-utilized turf.	Ensure communities have amenities that supplement home uses.	
Integrate native pollinator restoration into urban design and municipal open space plans.		Share value of support pollinators.	Increase aesthetic value of space. Encourage wildlife.	Reduce maintenance costs from water use.		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Vegetation and Habitat

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Support crime prevention through environmental design by planting trees with high canopy, preserving view corridors, and utilizing vegetation with transparency.			Balance expectations around safety and vegetation density.		Increase use of existing spaces.	Increase public safety.
Use plant stock from multiple seed zones for a given species to increase genetic diversity and enhance long-term survival.	**All**			Reduce long-term arborist and maintenance costs for removal and replacement.		Biodiversity provides resilience to pests and changing climate conditions.
Convert existing underutilized lawn area to native naturescaping (i.e. meadow or forest understory).		Share potential value for wildlife habitat.	Increase habitat and wildlife value.	Reduce maintenance costs.		
Provide interpretive signage for native/adaptive plantings or restoration areas.	**All**	Educate visitors about ecological best practices. Encourage native plant use on private property.				
Provide appropriate plant materials to shade stormwater facilities and other shallow water bodies to reduce temperature impacts downstream.			Preserve quality habitat in and around water bodies.	Reduce cost of downstream interventions to reduce stream temperature.	Enhanced recreational opportunities.	Mitigate urban heat island effects.
Integrate native flowering plants and habitat structure into vegetated stormwater infrastructure.			Increase aesthetic value of natural areas. Improve habitat.			
Increase turf diversity by seeding passive turf areas with drought-tolerant flowering perennials.			Increase aesthetic value of space.	Reduce water use.		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Tree Canopy

The tree canopy is the keystone to the natural character of Camas while also providing essential ecosystem services to benefit the community.

How do trees impact us?

Shade and cooling
Trees help to mitigate the urban heat island effect and enhance comfort by providing shade and cooling.

Air and Water purification
Trees absorb pollutants and carbon dioxide, improving air and water quality as well as human health.

Natural character
Trees are a major contributor to the natural character of Camas and its location within the Pacific Northwest.

What are the risks and concerns?

Fall hazards
Unhealthy or storm-damaged trees may fall unexpectedly, potentially causing damage or injury.

Development
While new construction is needed to accommodate the growth of the Camas community, it sometimes comes at the cost of land clearing and canopy loss.

Disease, Pests, and Die off
Disease, pests, or extreme climate events can weaken the health of trees and reduce their resilience to other environmental stresses.

What are some key strategies?

Revise planning regulations
Adjust planning codes and work with private landowners and public property to at least maintain the amount of tree canopy city-wide as land continues to develop.

Training and education
Provide training and education for staff and the public on forestry and tree health.

Adaptive tree palette
Develop a plant palette and succession plan strategy to establish a diverse canopy that reduces vulnerabilities to climate change.

Privately-owned lands

Private landowners can preserve large clusters of mature trees and work with best practices to maintain their health and reduce hazards.

Publicly-owned lands

Public lands can provide opportunities to expand canopy coverage, transition to adaptive species, and improve the health of right of way trees.

Recommendations: Tree Canopy

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Remove or prune hazard or dead trees or branches where they pose a risk to safety or property damage.	**All**		Maintain tree canopy health.	Reduce liability.		Protect people and property from damage.
Ensure newly installed trees have a minimal watering period of two years to ensure establishment	**All**		Ensure succession and healthy establishment.	Reduce replacement costs.		
Replace trees adjacent to hardscapes when they get removed or die off. Consider removing some hardscape around tree well.			Retain Camas' identity as a tree-friendly city.	Preserve critical urban ecosystem services over time.		Ensure long-term resistance to natural hazards from canopy coverage.
Provide training for staff and public on forestry and tree health. Include protocols and procedures for public tree risk assessments, pruning, risk mitigation, and emergency preparedness and response.	**All**	Educate Camas residents and staff to promote tree health.	Maintain tree canopy health.	Increase maintenance capacity through partnerships.	Increase access to knowledge to be applied locally.	Identify issues before they become hazards.
Remove invasive species and provide training for the public on how to identify and remove invasive species.	**All**	Educate Camas residents about invasive species management.	Create healthier environment for native plants to survive.			
Utilize climate-adaptive species for new or replacement plantings.	**All**		Ensure long-term succession of healthy ecosystems.	Decrease long-term replacement costs.		Resist die-off from extreme weather and climate change.
Prioritize protection, maintenance, and restoration of at-risk species or plant communities.	**All**	Opportunity to partner with nonprofits or community stewardship groups.	Preserve most valuable ecosystems and habitat.			Ensures longevity for vulnerable resources.
Establish a free tree planting program to increase canopy coverage and promote community engagement.		Partner with nonprofit for funding and outreach.			Support tree canopy coverage in at-risk communities.	
Complete a comprehensive tree inventory of public trees and maintain and update data over time.		Support public education with data-backed assessments.	Identify trends to help preserve existing canopy.	Use data to track long-term health and influence decision making.	Identify gaps in canopy.	Identify trends and issues holistically.
Partner with HOAs to generate tree inventories to track health and adaptability over time.		Support public education with data-backed assessments.	Identify trends to help preserve existing canopy.	Use data to track long-term health and influence decision making.	Identify gaps in canopy.	Identify trends and issues holistically.

Recommendations: Tree Canopy

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Work with local nurseries to adjust supplies to meet future needs and remove invasives or problem species.	**All**	Increase public awareness about problem species. Look for opportunities to subsidize through partnerships.	Shift market to align with native natural character.		Increase availability of native trees for more land owners.	Reduce ecosystem impacts from invasives.
Introduce tree infill planting on public lands.			Offset canopy loss.	Mitigate ecosystem services lost from development.		
Align trails, pathways, and amenities to avoid impacting mature trees and other sensitive habitat.	**All**		Preserve key specimen trees that promote connection to place.	Reduce damage and replacement costs.		Protect existing resources.
Work with schools to identify opportunities for additional canopy cover or educational opportunities.			Promote natural identity in public areas		Provide canopy in public areas	
Require ecosystem service mitigation for reduction in tree canopy for new development.		Promote value that nature provides to built environment.	Relocate key natural features when lost.	Require compensation for loss of infrastructure	Retain natural systems on private lands.	Reduce stress on remaining natural infrastructure.
Develop succession plans to establish a species, age, and structurally diverse canopy that reduces vulnerabilities to climate change.	**All**		Ensure long-term succession of healthy ecosystems.	Decrease long-term replacement costs.		Resist die-off from extreme weather and climate change.
Reduce the required DBH size for preservation/significant tree designation. Pair with a heritage tree program that includes both public and private specimen.	**All**		Maintain a diversity of canopy ages and mature tree coverage.	Preserve ecosystem services performed by largest existing trees.		
Establish a tree canopy project preservation goal beyond code requirements for any project where existing canopy is above the city average			Offset canopy loss and preserves mature canopy coverage.	Reduce ecosystem services lost from development.		
Prioritize new tree plantings in areas that have low existing canopy coverage and a high possible planting area percentage.	**All**		Expand natural character across Camas.		Improve access to benefits of tree canopy.	Reduce heat island effect.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Tree Canopy

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Introduce a minimum tree well size/width for when trees are planted adjacent to paved surfaces.			Maintain mature tree canopy over time.	Reduce replacement costs.		Ensure longevity of trees in urban areas.
Ensure pathways, gathering, and resting areas are shaded to reduce surface and air temperatures.			Provide enjoyment of natural areas in multiple seasons.		Support recreation for a variety of user needs.	Protect public health and safety.
Plant trees quickly after site disturbance, such as construction or invasive removal.	**All**		Reduce chance of invasive establishment.	Reduce erosion impacts and rework.		
Implement a species diversity requirement for new plantings.	**All**		Biodiversity supports wildlife.			Resist pests, disease, and climate vulnerability.
When feasible, use a soil cell system to provide more growing space for trees.			Maintain mature tree canopy over time.	Reduce replacement costs.		Ensure longevity of trees in urban areas.

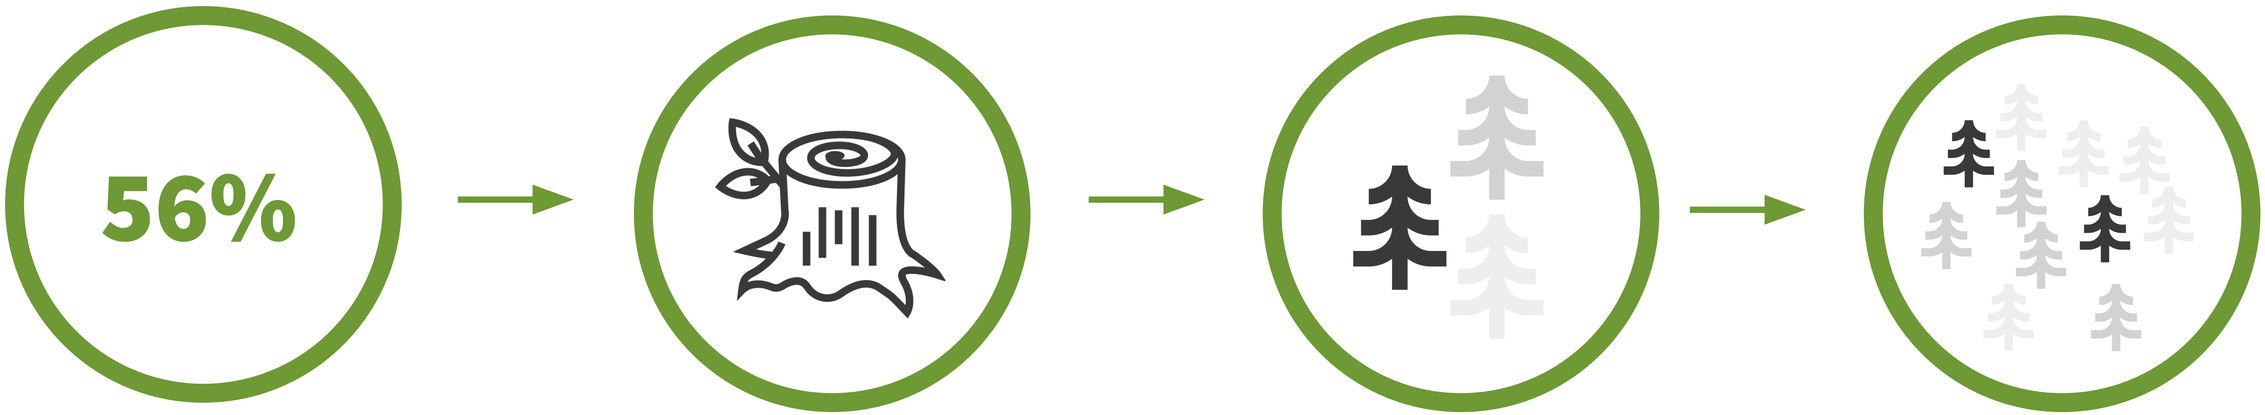
HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Monitoring and Performance Metric Recommendations

What are realistic and implementable ways of measuring progress and success?

One of the goals of this plan was to establish a data-driven process to help make more-informed decisions. While decisions cannot be made on numbers alone, there are some ways to help better inform the process to understand how progress is being made towards the goals, priorities and values in the POSMP.

Recommended metrics to incorporate into Operational practices:



- Coordination with Comprehensive Plan and future PROS Plan updates
- Annual tracking and review of staff hour allocations by task and land type
- Annual tracking and review of water use
- Annual tracking and review of contract worker expenses
- Annual tracking and review of volunteer hours by project type or system (i.e. invasive removal)
- Perform city-wide canopy assessment every 10 years
- Maintain and expand tree inventory database
  - Completion of public tree canopy inventory
  - Coordination with HOA's and private land owners to perform tree canopy inventory
- Implement per-capita spending targets and tracking metrics to ensure adequate funding levels for maintaining high-quality parks and recreation amenities that meet the needs of the community in Camas.
- Require master plans and site development projects to propose site-base performance metrics to align with POSMP goals and prioritization criteria
  - Based on different land uses and ecosystem types
- Regular assessments of planted tree species should be conducted to identify any issues and take necessary corrective measures. This could involve adjusting watering schedules, providing additional care during extreme weather events, and replanting trees that fail to thrive.
  - Camas could establish a dedicated team or partner with existing organizations to monitor and manage the program. Utilizing technology like remote sensing and data analysis tools can aid in effectively tracking the health and progress of the planted trees. By continuously adapting to the changing environment, Camas can ensure the sustainability and success of its tree planting program, contributing to a greener and more resilient future for the City.

Planning Recommendations

In order to achieve alignment with the goals of this plan, updates to planning, code, and ordinance documents are recommended. These will help supplement the management practices on public land with adjustments to private development practices.

Planning Recommendation Path

The current city-wide tree canopy coverage is ~38%. As the population of Camas continues to grow, development could have significant impacts. If no changes to current regulations or practices are made, tree canopy losses will accumulate over time. Understanding existing code and development patterns reveals several opportunities to adjust planning approaches and change the trajectory.

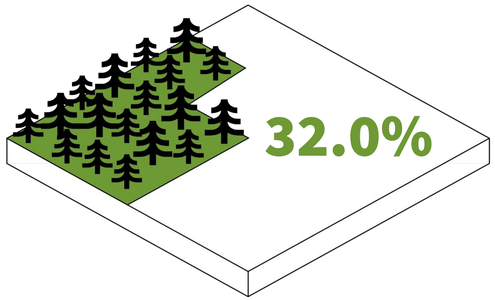
About half of canopy is on private lands

While the City can do their best to maintain and enhance canopy on public lands, it will take efforts on the private side to make sure city-wide canopy retains its value and benefits to the community.

Canopy on private lands is being lost

For example, residential lots had a net loss of tree canopy of **99 acres** from 2011-2021 (or a 5.8% loss in canopy area in those zones).

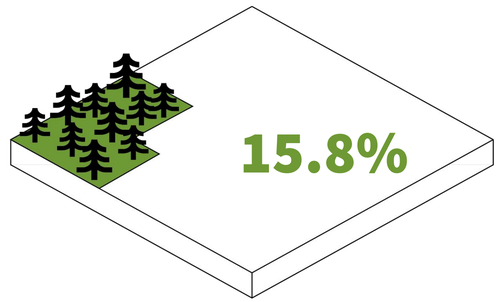
Tree ordinance requirements are not preserving existing canopy

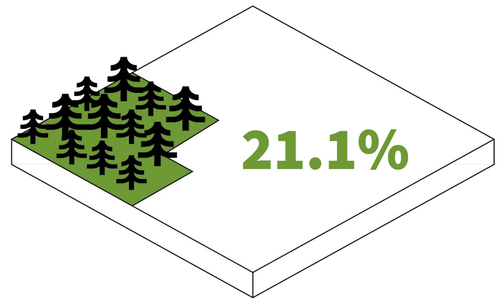


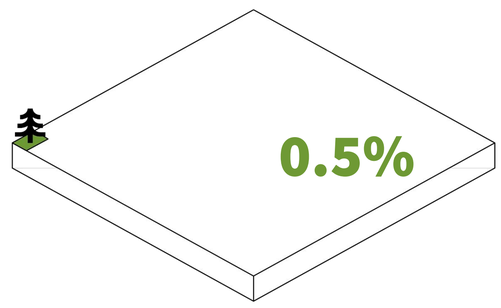
The current tree ordinance only replaces/preserves a portion of lost existing canopy because it allows the removal of large trees, while mitigating some losses with much smaller new trees (see next page).

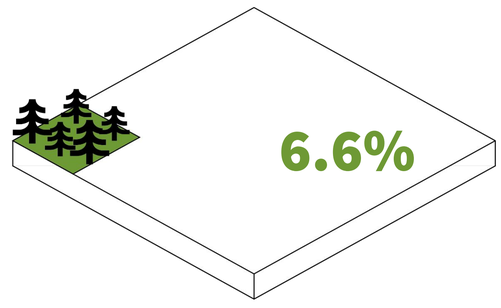
These losses will be compounded over time

As development on private land continues and canopy is lost, the canopy will see an immediate reduction in coverage and value. It will take decades for mitigation of removed trees with smaller trees to regain their benefit as mature trees.









Tree Density Requirements

Comparing existing conditions to tree code minimal requirements, there is potential for significant immediate tree canopy loss as lands develop. Mitigation with new trees will increase canopy over decades if species are adaptive and well maintained, but immediate ecosystem services are mostly lost with removal of existing mature trees.

City-wide Average Canopy Coverage of Existing Residential Zones (40 - 80 tree units per acre)

Many existing, undeveloped, private properties are at or above the city average for canopy coverage. If those developments stick to the code minimum, the chart to the right shows the best- and worst- case scenarios for immediate canopy coverage after development.

	Potential Development (per acre)	
	Standard tree code (20 units)	**North Shore tree code (30 units)**
Best-case immediate scenario	 **Maximum Immediate Canopy Coverage - Preserve a few large existing trees**	 **Maximum Immediate Canopy Coverage - Preserve a few large existing trees**
Worst-case immediate scenario	 **Minimum Immediate Canopy Coverage - (20) New 2” Trees**	 **Minimum Immediate Canopy Coverage - Half new 2” trees, half preserve existing**

Planning Recommendations: Tree Ordinance

Issues, Lack of Clarity or Misalignments with POSMP Goals	Recommendations	Notes
Tree Unit quantities do not relate to canopy area	Adjust tree units to reflect tree canopy area in addition to DBH	Adjust to give higher tree unit value to larger trees. This would only be effective if the total tree unit requirement is raised proportionately.
Tree Unit requirements are not defined for public parks	Define tree density requirement specifically for parks and open spaces. Units should be greater than other developed areas and align with canopy goals.	
Tree Unit requirements lower than existing conditions could result in significant canopy reduction over time	Increase total Tree Unit requirements to reflect canopy goals.	Could provide overlay zones in the Comp Plan for areas with existing higher coverage.
Preservation of significant trees is confusing and loosely defined and at only a higher DBH	Redefine significant tree size and require a higher tree unit replacement for damaged or removed significant trees. Develop a Heritage Tree Program that restricts all removal above a certain size for certain species. Require all properties (not just North Shore) to include the preservation of existing trees as a portion of the total Tree Unit requirement.	Replacement could be a 1:1 for DBH removed. If larger trees are used for replacement (not a requirement), extra care should be given to them for establishment as they are typically more challenging to keep alive.
Preservation or mitigation of native / adaptive species is not recommended or required	Give more value to native and adaptive species and/or prohibited/non-adaptive trees get a value of 0.	This could come in the form of a higher tree unit value or be part of a Heritage Tree program that values mature native trees.
No value or guidance is given regarding tree removal or preservation strategies for stability	Provide guidance and recommendation language on preservation and removal of clusters of trees.	The goal is to preserve clusters as-is to keep stability of the root system. If a tree needs to be removed in a cluster, it is recommended to leave the stump if possible.
Planter widths are given, but there is no guidance on soil volumes in Rights of Way. Many trees are planted in spaces that are too small to promote long-term health	Provide guidance and requirements on minimum soil volumes in Rights of Way	Require 8’ wide widths for all large trees unless other measures are taken to provide adequate soil volumes, stability, and protection.

Planning Recommendations: Plant Materials

Issues, Lack of Clarity, or Misalignments with POSMP Goals	Recommendations
Current Plant Materials List identifies species name, size, form, and some character descriptions (deciduous for some trees but not others). Some additional info would be helpful to align with code and POSMP goal expectations to help in decision making and long-term success.	Include more info for each species to help guide plant selection to meet planning development code and POSMP goals. Add the following columns for recommended plantings: • Evergreen • Drought-tolerance • Native • Sun exposure • Fire resistance/hazard • Climate change heat and hardiness vulnerability rating (per Urban Tree Canopy Vulnerability Report)
Private residents or developers may have a difficult time selecting the right tree species from a long list of options.	A tree selection tool could be developed that streamlines species that meet site-specific criteria in order to simplify decision making and ensure proper adherence to the criteria. Care should be taken to still promote diversity in selection.
Some species listed are projected to not adapt to climate change	Consider moving some or all of the non-adaptive, non-native species to prohibited list.
The shrubs, grasses, and groundcovers lists contain many non-native species and few native ones	Expand shrubs, grasses, and groundcovers lists to include native species and their benefits.
Some tree species listed will have a difficult time growing and staying healthy in the planter width allocated for them without many other supportive measures.	Revise planter widths for tree species as appropriate.

Planning Recommendations: Development Code

Issues, Lack of Clarity, or Misalignments with POSMP Goals	Recommendations
18.13.050 B provides a good list of the benefits of trees, but reads like tree species should be selected specifically for these functions.	Existing development code could be revised to clarify direction versus benefits, and be supported by additional information on species to help with selection. Clarify if evergreen requirement is for trees, vegetation, or both and how percentage requirements are counted (i.e. % species, % plants, % area coverage).
Parking lot are significant contributors to urban heat island effect and stormwater runoff.	18.13.060 H - Consider increasing planting and tree requirements to achieve a higher percent coverage. Reduce number of spaces between landscape dividers.
Desired ecosystem service mitigation may not be feasible on sites where building density is needed to support community needs.	18.13.052 C - Set up mitigation banks for invasive removal, wetland restoration, or tree planting if unable to meet requirements on-site.
It is common practice to use a small variety of trees in the right of way and in large developments. This can lead to vulnerability to pests and disease and does not align with habitat goals.	Include direction, requirements, or incentives for utilizing a variety of native tree species in rights of way or large development.

18.13.050 Standards for landscape, tree and vegetation plans.

A. The property owner shall be responsible for any future damage to a street, curb, or sidewalk caused by landscaping.

B. Landscaping and trees shall be selected and located to deter sound, filter air contaminants, curtail erosion, minimize stormwater run-off, contribute to living privacy, reduce the visual impacts of large buildings and paved areas, screen, and emphasize or separate outdoor spaces of different uses or character.

C. Landscape, Tree and Vegetation Plan must include a combination of trees, shrubs, and ground cover to achieve the purposes of this chapter.

1. Required landscaping shall be comprised of a minimum of sixty percent native vegetation (or adapted to northwest climate), or drought-tolerant vegetation, and fifty percent evergreen.

Existing code language

17.19.030F Tract, block and lot standards: Landscaping

2. The city council finds that the existing mature landscaping of trees, and shrubs provide oxygen, filter the air, contribute to soil conservation and control erosion, as well as provide the residents with aesthetic and historic benefits. For these reasons,the city encourages the retention of existing trees that are not already protected as significant trees under the Camas Municipal Code. Generally, the city may allow the tree requirements under subsection (F)(1) of this section to be reduced at the request of the developer, by a ratio of two new trees in favor of one existing tree, provided such trees have been identified on approved construction plans.

Existing code language

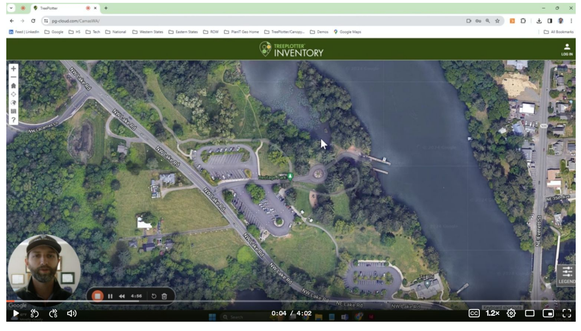
Planning Recommendations: Comprehensive Plan

Section	Recommendations
Natural Environment Element Overview	Revise Natural Environment element language to include the concept of natural systems as valuable infrastructure.
NE-1.1: Consider the immediate and long-term environmental impacts of policy and regulatory decisions.	Incorporate the use of ecosystem services as a reference point for these discussions and evaluations.
1.4.4 Natural Environment	Develop tree preservation overlay zones for priority canopy areas to be maintained ● Increase tree unit requirement ● Require preservation or steep mitigation for trees above **X** DBH
1.4.4 Natural Environment	Develop an urban forestry program that works to implement the best practice recommendations that are a part of this POSMP in order works towards system-wide stewardship and resilience.
3.4.2 Critical Areas	Consider designating large areas of connected tree canopy as critical areas to be preserved.
3.4.3 Shorelines	Consider adding a goal that addresses providing the community with safe and accessible ways to engage with shorelines that balances recreation with ecological needs.
3.4.4 Landscape Enhancement and Tree Preservation	Include heat island reduction, improved air quality, and stormwater management as additional added values for protecting the urban tree canopy.
3.4.4 Landscape Enhancement and Tree Preservation	Identify public lands that can act as mitigation banks to counteract canopy loss over time. Spread throughout the city to make sure replacement is within ½ mile of development site ● Prioritize more urban conditions to maximize ecosystem service value ● Provide incentives for private land to preserve existing or mitigate losses
4.4.4 Design and Low-Impact Development	Consider adding a goal that addresses tree canopy coverage, health, and replacement.
5.7.3 Park Impact Fees	Consider the Level of Service needed as large areas of land develop and population density increases (i.e. North Shore)
5.7.3 Park Impact Fees	Assess specialized amenities and programming as a system and consider repurposing land based on density and walkability vs driving - i.e. ball fields (specialized use) vs parks (universal use) near dense housing

Community Outreach

The planning process included outreach and education events in order to capture community feedback and raise awareness of the plan.

Public Participation & Education Strategy



The POSMP builds off of previous planning efforts in Camas around parks, open spaces, and recreation. Community feedback and priorities from efforts like the PROS plan were reviewed, summarized, and built upon to lead to the 5 Camas Community Values that provided a framework for this plan. The POSMP provides a pathway on how to prioritize and implement those values. Drafts of the plan and its strategies were reviewed with the Camas Parks and Recreation Commission 2/28/24 and 7/31/24) and City Council (5/6/24 and 8/5/24) to ensure alignment with other city goals and collect feedback.

Education, training, and public feedback was a key part of the plan development process. A project website was set up to keep the community informed about the process and engagement opportunities.

Camas Parks and Open Space Management Plan | Engage Camas

The team hosted an open house to share progress of the plan, answer questions, and collect feedback on the overall approach. There were interactive sessions that explained the system-based approach to management and gathered ideas around impacts, risks, and strategies to inform the best practices recommendations. Feedback was collected on the 5 Community Values in order to inform the project approach matrix. An online survey was set up and posted on the project website to duplicate these activities and a recording of the presentation was included to provide the background context.

Finally, a public tree inventory session* was co-hosted by the City of Camas, PlanIT Geo, and Washington Department of Natural Resources (DNR). It was held the day after the open house on Earth Day weekend to align with other community events. On-site training was provided on how to use the the inventory tool as well as education on tree health and maintenance. Plan IT Geo's arborists verified the data in order to include it in the city-wide inventory database for future use.

Camas Volunteer Inventory Training Video
provided to the community before the event through the website to prepare for the inventory.

*The original plan was to work with local students to provide education and a sample inventory. Due to the local teachers strike at the onset of the project, student availability and class curriculum didn't align with the time of year to perform the inventory. It was decided to open it up to the public later on in the project timeline.

This flyer was used to advertise the public events, as well as social media, and local newsletter postings.

Camas Parks and Open Space Management Plan

Community Open House

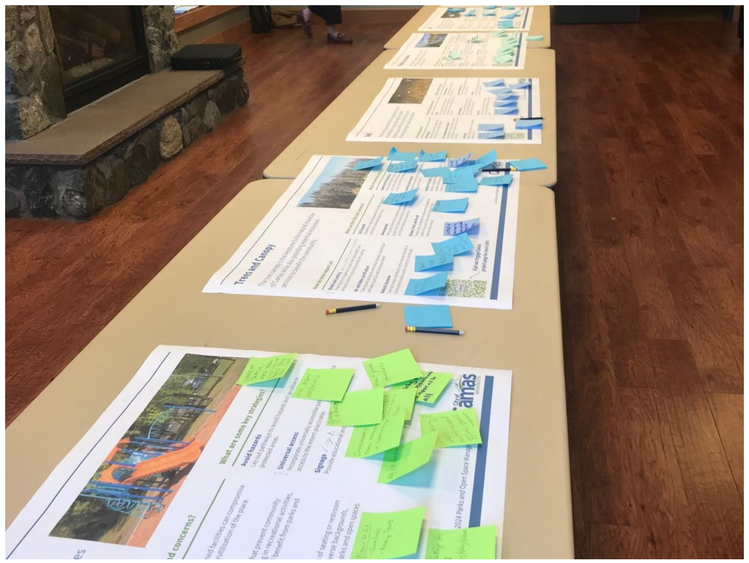
April 19th, 2024

Agenda

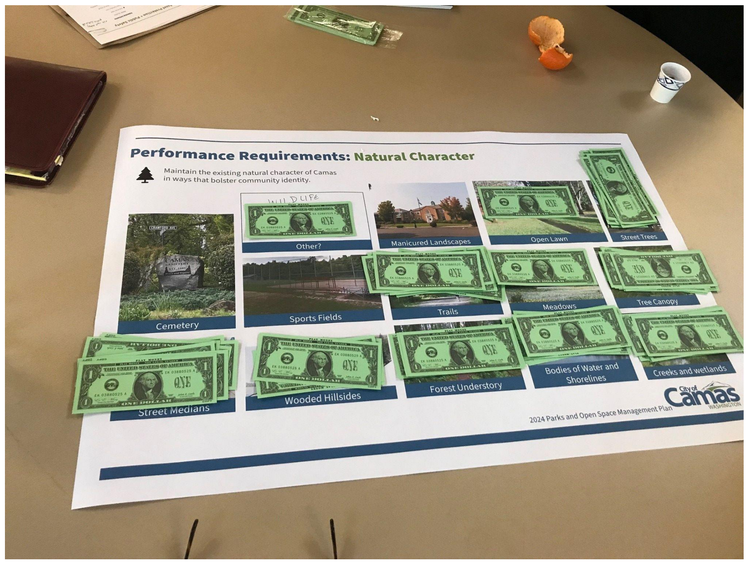
Presentation (30 minutes)

- Project overview and goals
- Tree Canopy Analysis
- Financial and Operations Assessment
- A Systems Approach, Valuing Nature
- Resource Prioritization

Activity #1 - Poster feedback (30 minutes)



Activity #2 - Table discussions (30 minutes)



Community Feedback

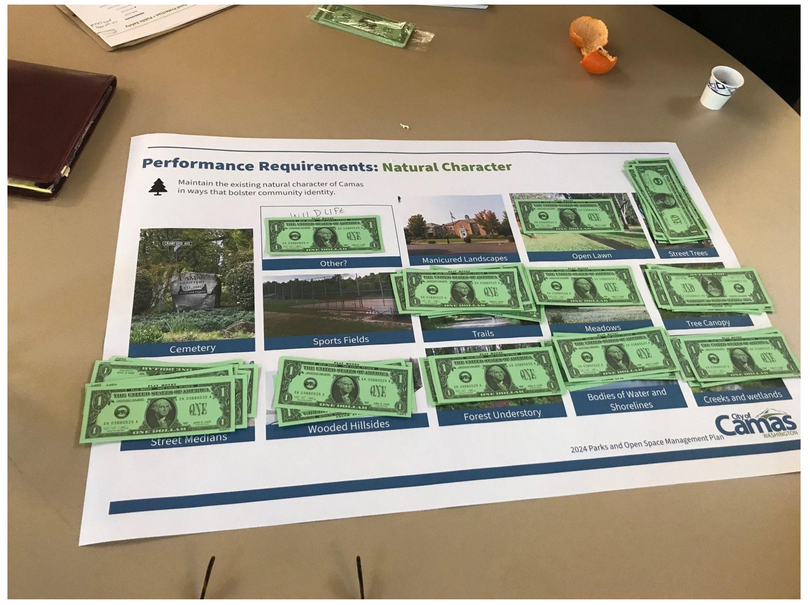
Community Open House

An open house was held at Lacamas Lodge on April 19, 2024. Participants provided feedback on the systems through discussions and through annotating posters. Group activities were used to obtain feedback on the performance requirements identified for the Parks and Open Space management plan.

Online survey feedback

An online survey was provided through Engage Camas. The survey was open until May 5, 2024. There were 9 survey responses. The survey questions explored the following:

- **Outreach & Education:** What are potential gaps in knowledge that require training for land management practices for public and/or private landowners?
- **Natural Character:** What does natural character mean to you and which features contribute most to the identity of Camas?
- **Equitable Access:** What are the biggest obstacles to access natural resources and park amenities?
- **Financial & Resource Allocation:** How else does nature benefit you and the community?
- **Asset Protection & Public Safety:** What are your priority natural impacts, human activity, and safety concerns that (will) have impacts on Camas?



- **Systems Approach:** Is there anything missing or other ideas to consider as it relates to the following systems?
  - Water
  - Operations
  - Materials & Equipment
  - Access & Amenities
  - Soil
  - Vegetation & Habitat
  - Trees & Canopy

Open House Feedback Summary

Key Takeaways:

- This will be a large change initiative for the city and community.
- Camas' natural resources, parks, and open space are a **valuable asset** and serve as **key infrastructure** to the city.
- Clear incentives, restrictions, and guidelines should be put in place for basic maintenance tasks, tree preservation, and appropriate planting practices.
- Program, amenities, and assets should be looked at from a system-wide perspective and located based on diversity of uses, population density, and adjacencies to other land uses and natural resources.
- There's a lot of potential in the volunteer organizations and HOA residents if organized and educated properly
- There was a long-term desire to progress from reactive maintenance to systemic stewardship.

Community Feedback: Performance Requirements

Online survey feedback

The ecosystem services graphic above identifies the many ways our parks and open space system provides benefits and value to our community. How else does nature benefit you and the community?

- Opportunities to learn more about nature
- Social/emotional wellbeing and resilience to stress, particularly stress from climate change
- Enhanced community connection
- Physical health
- Access to nature and developing sense of place
- Environmental benefits: carbon storage, cooling
- Economic benefits: tourism destination, attract investment

Community Feedback: Performance Requirements

Online survey feedback

What does natural character mean to you and which features contribute most to the identity of Camas?

- 5 mentions: Trails, Tree Canopy
- 4 mentions: Bodies of Water and Shorelines, Creeks and Wetlands
- 3 mentions: Forest Understory, Meadows, Street Trees
- Other comments:
  - Buildings and other urban features seen as elements that detract from the natural character of Camas.
  - Bike paths contribute to natural character of Camas, as do wooded hillsides that are not built upon.

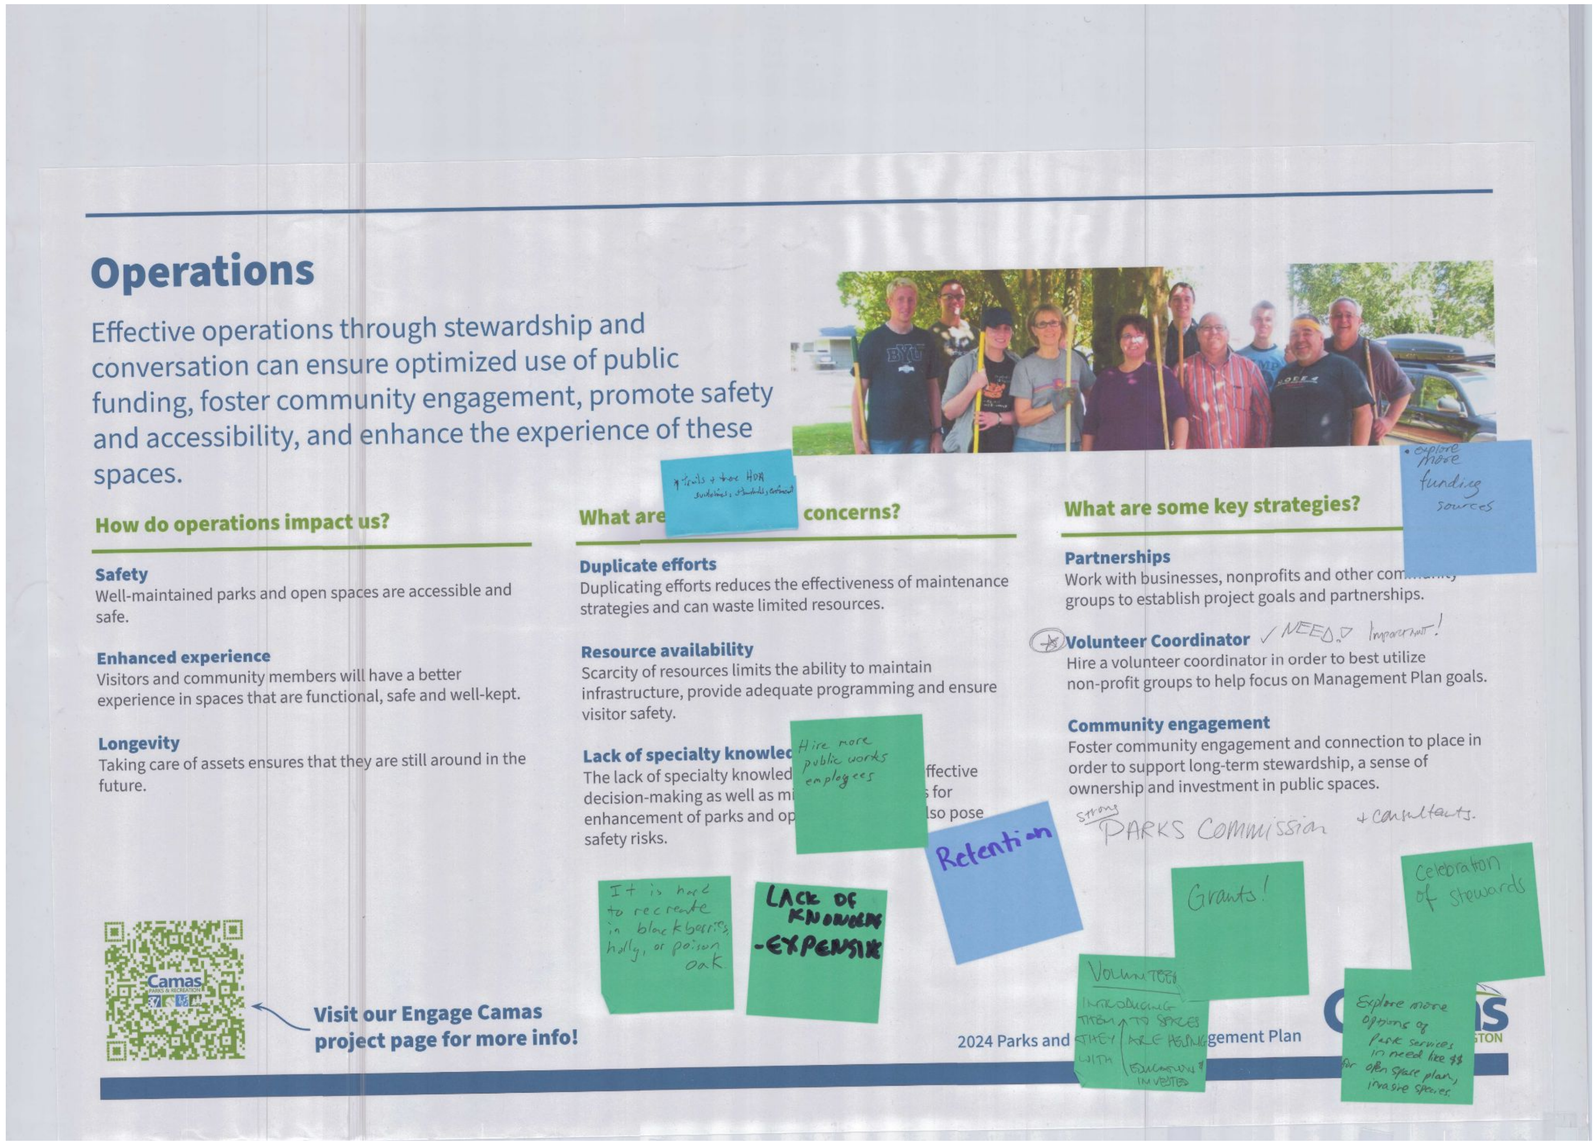
Community Feedback: Performance Requirements

Online survey feedback

What are your priority natural impacts, human activity, and safety concerns that (will) have impacts on Camas?

- Water quality was mentioned frequently in the survey results. Safe and clean household water was mentioned as a concern. Toxic bacteria in Lacamas Lake was also specifically mentioned as a concern.
- Wildfire was mentioned frequently in the survey results. Respondents noted that climate change brings increasing threat of wildfire, and that there is a need for education and management of fuels.
- Invasive species and their threats to tree health and native vegetation were mentioned. Blackberries were specifically mentioned as an invasive species of concern.
- Several respondents were concerned about the impacts of development; specifically, that development might come at a cost of investment in existing assets. There were additional concerns about the potential strains on existing infrastructure and natural ecosystems that might occur as a result of future development.
- Loss of outdoor programming and wilderness education was shared as a concern by several respondents.
- Climate change was mentioned as a major threat, including impacts such as extreme changes in heat and water availability.
- Tree canopy loss was also a concern mentioned repeatedly in the survey responses.

Community Feedback: Systems



Online survey feedback

Managing water in our parks and open spaces is vital for preserving natural ecosystems, ensuring access to clean water, and providing cooling and recreational opportunities for the community. Is there anything missing or other ideas to consider as it relates to water?

- Access to clean and safe water is critical.
- Increase outreach to homeowners and private landowners to educate them about best practices for managing water quality. Work with them to address water quality issues upstream of stormwater infrastructure.
- Consider reducing irrigation as well as reducing lawns.
- What long-term measures is Camas taking to enhance climate resilience, beyond just focusing on climate mitigation?
- Lacamas Lake water quality is a concern.
- Could a user fee at lakes and boat ramps provide fiscal support for maintaining water quality?

Community Feedback: Systems

Online survey feedback

Effective operations through stewardship and conversation can ensure optimized use of public funding, foster community engagement, promote safety and accessibility, and enhance the experience of these spaces. Is there anything missing or other ideas to consider as it relates to operations?

- Continue efforts to engage Camas citizens in stewardship events and parks cleanups - these have been successful so far.
- Consider partnerships with universities as well as local K-12 schools.
- Lots of support for a volunteer coordinator position. Are there other opportunities to support community volunteer efforts?
- Funding is a concern when it comes to implementing operational changes through the Parks and Open Space Management Plan.

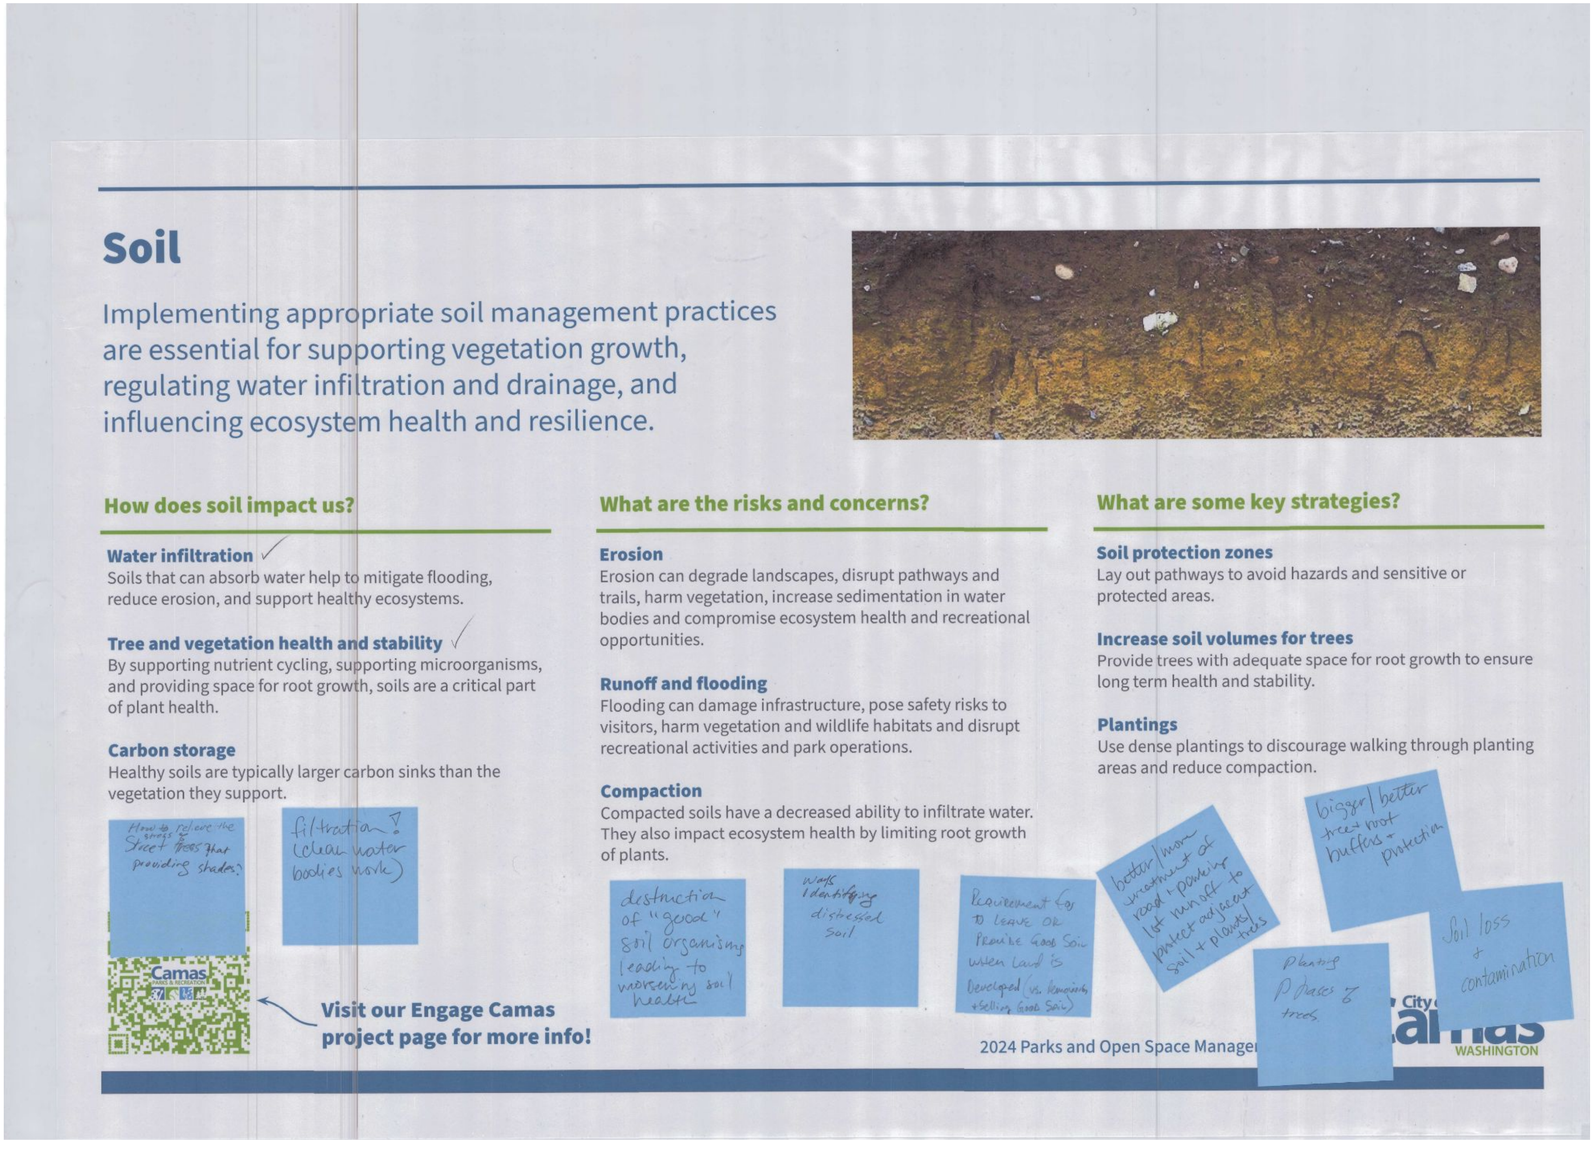
Community Feedback: Systems

Online survey feedback

Materials and equipment selection and maintenance directly impact the functionality, durability, safety, and aesthetic quality of parks and open spaces. Is there anything missing or other ideas to consider as it relates to materials and equipment?

- Prioritize access when selecting materials. Camas has a large aging population, so this will continue to be a critical consideration.
- Retain natural character to the greatest extent possible, balancing this with needs for equitable access. Incorporate naturescaping and sustainable materials.
- Consider paving high-use trails to decrease degradation and enhance access in the long term.
- Maintain existing materials and equipment to a sufficiently high standard.

Community Feedback: Systems

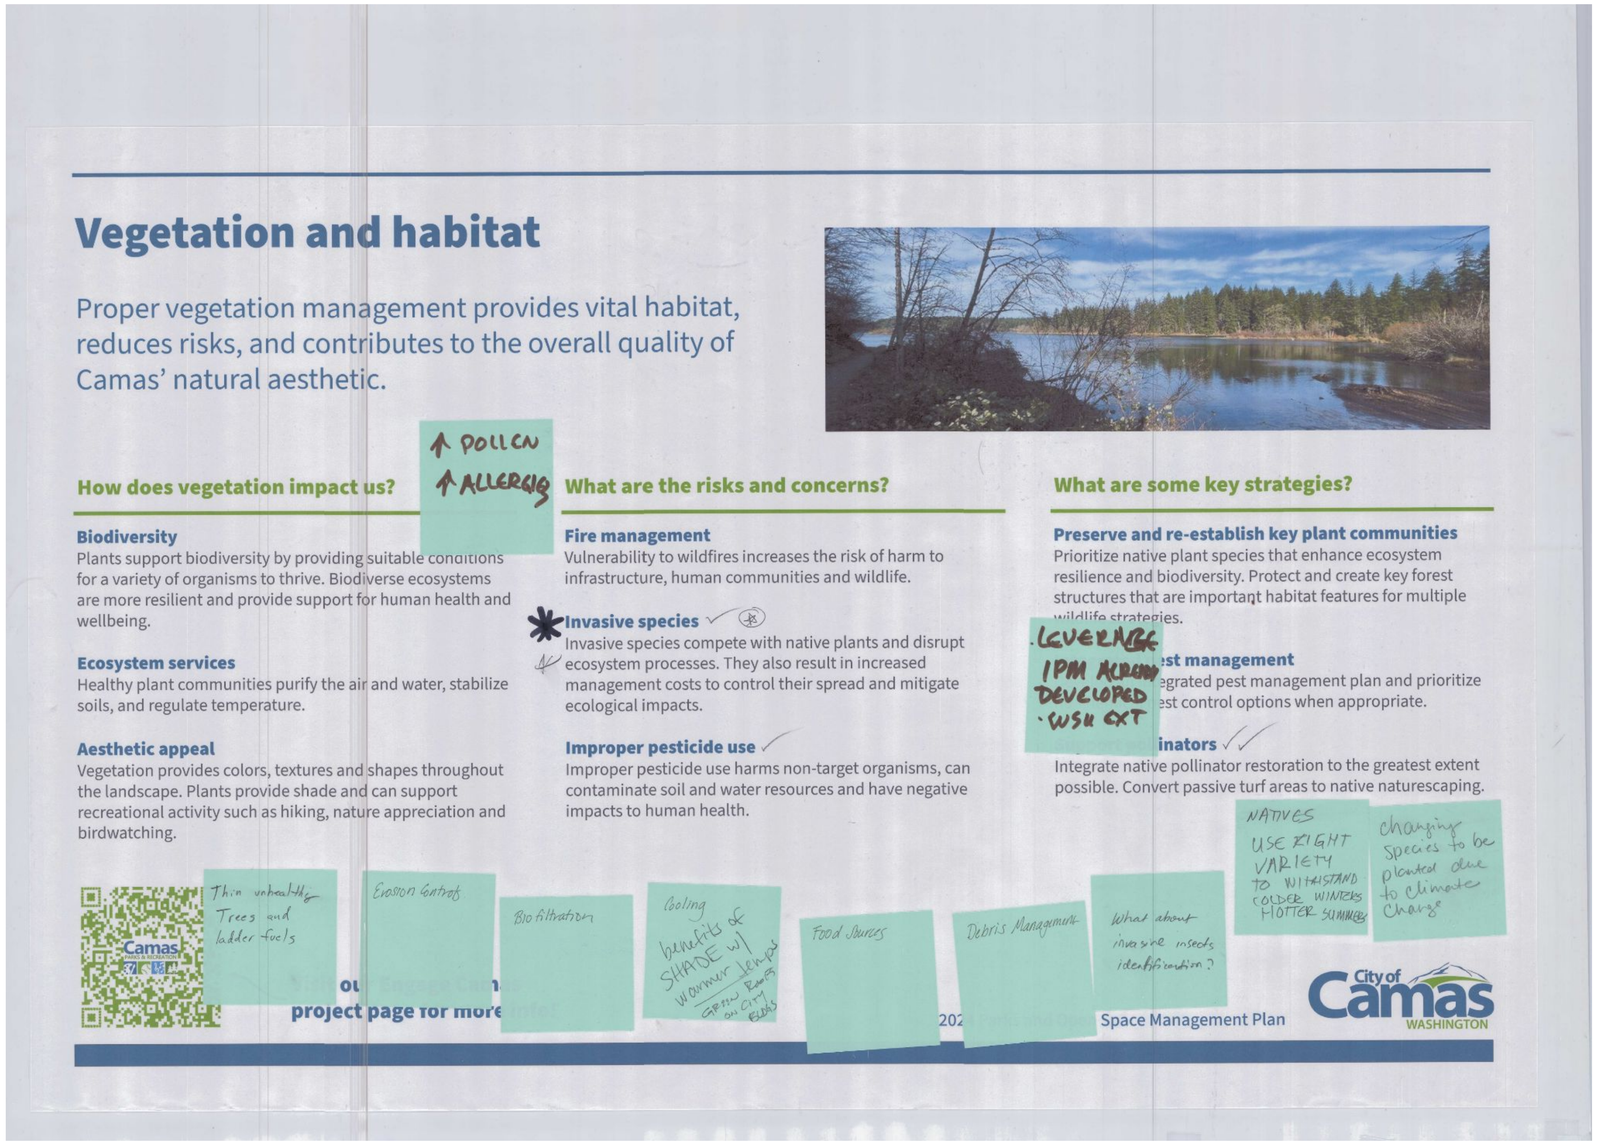


Online survey feedback

It is critical to ensure that people of all ages and abilities can access and enjoy the variety of parks and open spaces that Camas has to offer. Is there anything missing or other ideas to consider as it relates to access and amenities?

- Providing more information on amenity options as well as their costs and benefits would increase buy-in from the community.
- Safety and vandalism are concerns.
- Consider signage options that can be used by individuals with vision limitations.
- Explore ways that signage can be integrated into the existing natural character, as well as ways that signage can complement opportunities for education and outreach.
- Improve connections and wayfinding through the City.
- Incorporate universal access into parks and amenities.
- Ensure that people of all backgrounds can feel welcome in parks and open spaces.

Community Feedback: Systems



Online survey feedback

Implementing appropriate soil management practices are essential for supporting vegetation growth, regulating water infiltration and drainage, and influencing ecosystem health and resilience. Is there anything missing or other ideas to consider as it relates to soil?

- Enhanced wayfinding and signage could help keep people and trails and reduce compaction in sensitive areas.
- Consider long-term resilience when selecting and placing plantings.
- Enhance planting vaults for street trees.
- Support composting. This could include a City compost facility as well as infrastructure for residents in apartment complexes and new developments who wish to compost.

Community Feedback: Systems

Vegetation and habitat

Proper vegetation management provides vital habitat, reduces risks, and contributes to the overall quality of Camas' natural aesthetic.

How does vegetation impact us?

Biodiversity
Plants support biodiversity by providing suitable conditions for a variety of organisms to thrive. Biodiverse ecosystems are more resilient and provide support for human health and wellbeing.

Ecosystem services
Healthy plant communities purify the air and water, stabilize soils, and regulate temperature.

Aesthetic appeal
Vegetation provides colors, textures and shapes throughout the landscape. Plants provide shade and can support recreational activity such as hiking, nature appreciation and birdwatching.

What are the risks and concerns?

Fire management
Vulnerability to wildfires increases the risk of harm to infrastructure, human communities and wildlife.

Invasive species
Invasive species compete with native plants and disrupt ecosystem processes. They also result in increased management costs to control their spread and mitigate ecological impacts.

Improper pesticide use
Improper pesticide use harms non-target organisms, can contaminate soil and water resources and have negative impacts to human health.

What are some key strategies?

Preserve and re-establish key plant communities
Prioritize native plant species that enhance ecosystem resilience and biodiversity. Protect and create key forest structures that are important habitat features for multiple wildlife strategies.

…est management
…egrated pest management plan and prioritize …est control options when appropriate.

…inators
Integrate native pollinator restoration to the greatest extent possible. Convert passive turf areas to native naturescaping.

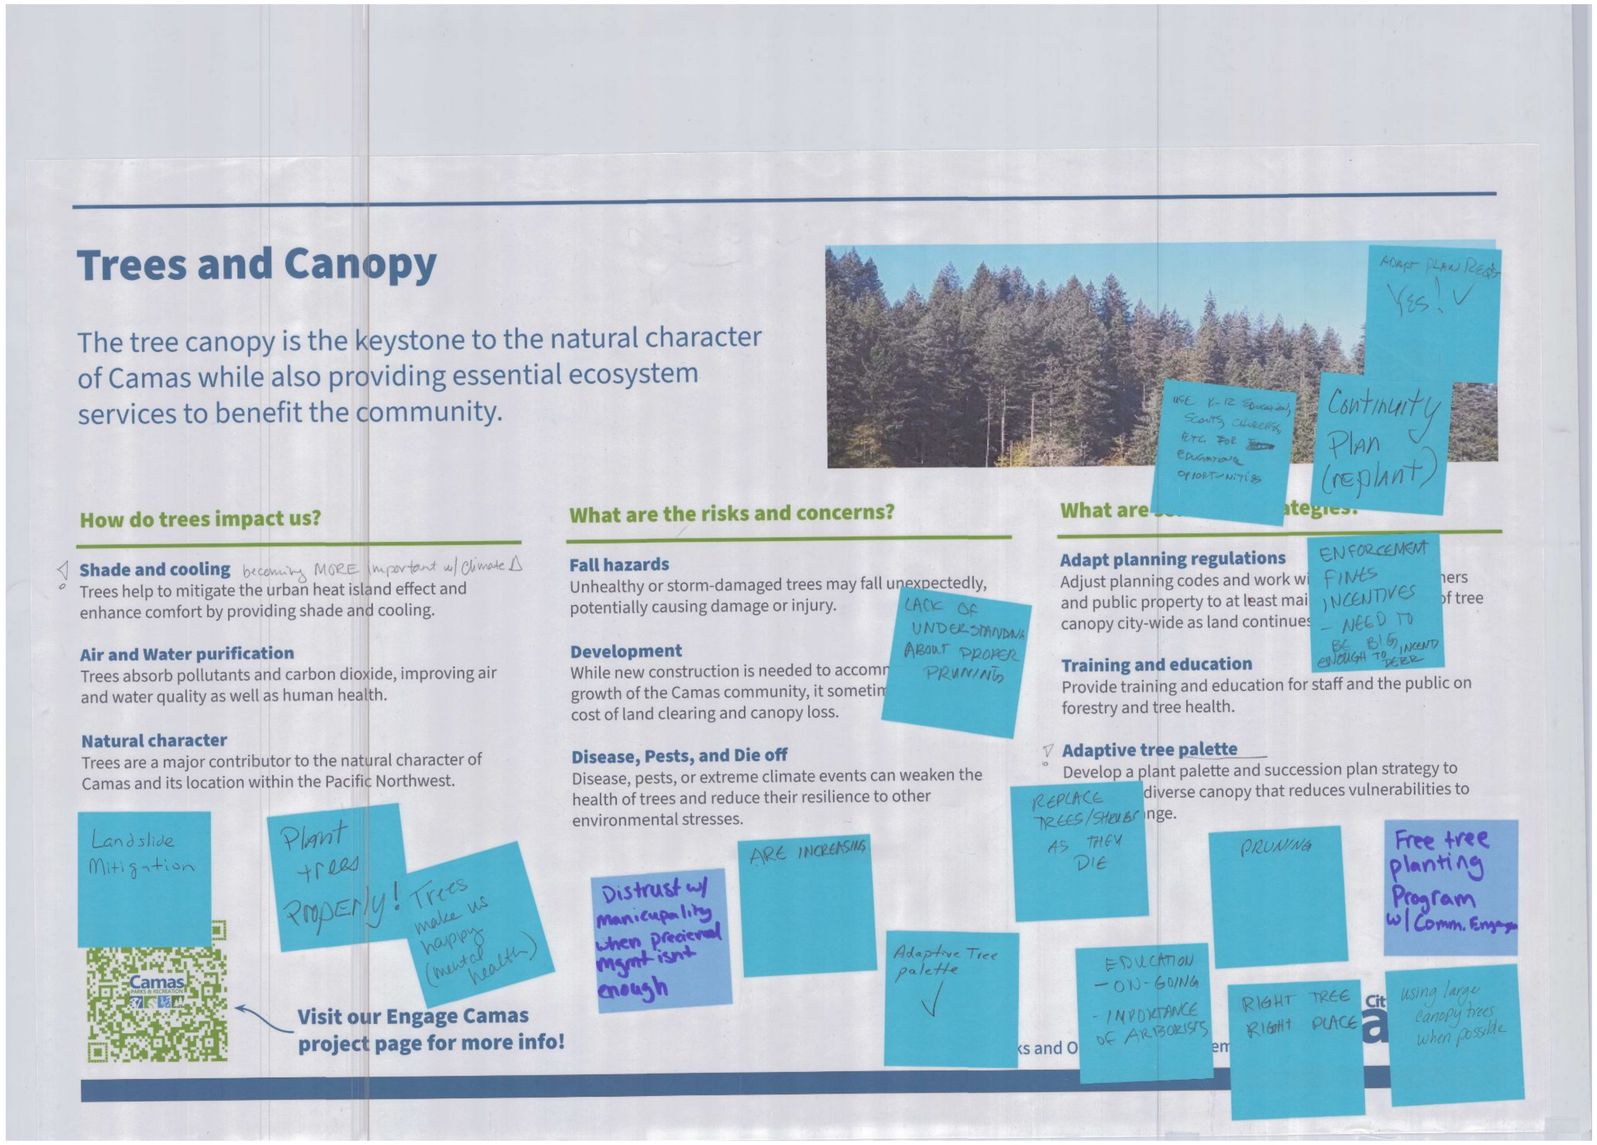
2024 Space Management Plan



City of Camas WASHINGTON

Online survey feedback

Proper vegetation management provides vital habitat, reduces risks, and contributes to the overall quality of Camas' natural aesthetic. Is there anything missing or other ideas to consider as it relates to vegetation and habitat?

- Emphasize wildfire prevention and management practices.
- Consider changing maintenance practices such as reducing mowing frequency or leaving areas unmowed.
- When selecting plants, account for the impacts of climate change - "native species" may need to be redefined.
- What efforts are being made to reintroduce native plants that have been previously displaced?
- Establish a maintenance schedule that allows for proactive management of vegetation.

Community Feedback: Systems

Online survey feedback

The tree canopy is the keystone to the natural character of Camas while also providing essential ecosystem services to benefit the community. Is there anything missing or other ideas to consider as it relates to trees and canopy?

- Wildfire is a major threat to trees and canopy.
- How will environmental justice be incorporated into how the City manages trees and canopy?
- Seek guidance of foresters or forest management experts to balance selective thinning of trees with the need to preserve biodiversity.
- Canopy is a huge part of what makes Camas a wonderful place.
- Provide clearer guidance to private landowners about managing trees and use tree permits to avoid unnecessary removal of trees.
- Use planning and code to shift development away from sites that require land clearing and to prioritize retention of existing mature trees.
- Young trees used in mitigation plantings cannot replace the many benefits of mature trees.
- Trees in sidewalk strips have been removed by homeowners because of their impacts on the sidewalk. Permeable sidewalks and more planning for trees could address this problem.

Table 1: Stewardship calendar

STEWARDSHIP CALENDAR	1 JAN	2 FEB	3 MAR	4 APRIL	5 MAY	6 JUNE	7 JULY	8 AUG	9 SEPT	10 OCT	11 NOV	12 Dec	NOTES
planting considerations:													
primary planting season	go	go	go	go	go	stop	stop	stop	stop	stop	stop	stop	optimal planting is when plants are dormant during the rainy season
wetland planting season	stop	stop	stop	stop	proceed with care	go	go	go	go	stop	stop	stop	applies to soils that dry out during part of year
wetland planting season	stop	stop	stop	stop	stop	proceed with care	proceed with care	go	go	go	go	go	applies to soils that are saturated year-round
wildlife considerations:													
primary bird nesting season	go	go	go	go	go	stop	stop	stop	stop	stop	stop	stop	includes majority of songbird species; some birds nest later into end of August
early bird nesting season	go	go	proceed with care	proceed with care	proceed with care	stop	stop	stop	stop	go	go	go	includes larger species such as herons, geese, raptors, and hummingbirds
duck nesting season	go	go	go	stop	stop	stop	stop	go	go	go	go	go	avoid shoreline/adjacent areas
amphibian reproduction	stop	stop	stop	stop	stop	stop	go	go	go	go	go	stop	applies to sites with 10 cm standing open water, avoid 25 feet from waters edge
professional crew considerations:													
steep slope work	stop	stop	stop	stop	proceed with care	go	go	go	go	proceed with care	stop	stop	do not carry out activities that have potential for soil disturbance in winter without BMPs in place
knotweed herbicide treatment	stop	stop	stop	stop	stop	stop	stop	go	go	proceed with care	stop	stop	early or late applications may be acceptable to avoid impacts to pollinators
ivy herbicide treatment	stop	stop	stop	proceed with care	proceed with care	proceed with care	proceed with care	go	go	stop	stop	stop	early applications may be acceptable, but not as effective for long-term control
blackberry herbicide treatment	stop	stop	stop	proceed with care	proceed with care	proceed with care	proceed with care	go	go	stop	stop	stop	do not make applications to fruiting vegetation

Legend: go; proceed with care; stop

CHAPTER 5 - WATER REQUIREMENTS

5.1 HISTORICAL WATER USE 5-2
5.1.1 Historical Accounts 5-2
5.1.2 Historical Consumption 5-3
5.1.3 Water Use per Account and Equivalent Residential Units 5-6
5.2 SEASONAL DEMANDS 5-7
5.3 HISTORICAL PRODUCTION 5-7
5.3.1 Distribution System Leakage 5-7
5.3.2 Historical Average and Maximum Demands 5-11

5.4 DEMOGRAPHIC FORECAST 5-13
5.4.1 Land Use 5-13
5.4.1.1 Existing Land Use 5-13
5.4.1.2 Future Land Use 5-13
5.4.2 Demographic Growth Rates 5-19
5.4.3 Service Area 542 Projections 5-24
5.5 PROJECTED NUMBER OF CONNECTIONS 5-24
5.6 PROJECTED WATER DEMAND 5-27
5.6.1 Potential Range in Future Water Demand 5-27
5.6.2 Large Users Demand Forecast 5-28
5.6.3 Projected ERUs 5-29
5.6.4 Projected Average Day and Maximum Day Demands 5-29

CHAPTER 6 - WATER USE EFFICIENCY

6.1 WUE PROGRAM BACKGROUND 6-1
6.1.1 Current WUE Program 6-1
6.1.1.1 Supply-Side Measures 6-2
6.1.1.2 Demand-Side Measures 6-2
6.1.2 Distribution System Leakage 6-3
6.1.3 Historical Effectiveness of Current WUE Program 6-4
6.2 FUTURE WUE PROGRAM 6-5
6.2.1 Mandatory Measures 6-5
6.2.1.1 Rate Structure 6-5
6.2.1.2 Reclaimed Water 6-5
6.2.2 Future WUE Program Supply-Side Measures 6-6
6.2.3 Future WUE Program Demand-Side Measures 6-6
6.2.4 Projected Demands with WUE Goals 6-6
6.2.5 Future WUE Program Effectiveness 6-8
6.2.6 Budget 6-8
6.3 WATER SHORTAGE PLAN 6-9

CHAPTER 7 - WATER QUALITY

7.1 INTRODUCTION 7-1
7.2 OVERVIEW OF REGULATORY REQUIREMENTS 7-1
7.3 SOURCE WATER QUALITY 7-4
7.3.1 National Primary and Secondary Drinking Water Standards 7-4
7.3.2 Inorganic Chemicals 7-5
7.3.2.1 Monitoring Requirements 7-6
7.3.2.2 Compliance 7-7
7.3.3 Volatile Organic and Synthetic Organic Compounds 7-7
7.3.3.1 Monitoring Requirements 7-9
7.3.3.2 Compliance 7-9
7.3.4 Radionuclides 7-9
7.3.4.1 Monitoring Requirements 7-10
7.3.4.2 Compliance 7-10
7.3.5 Arsenic Rule 7-10
7.3.5.1 Monitoring Requirements 7-11
7.3.5.2 Compliance 7-11
7.3.6 Surface Water Treatment Rules 7-11
7.3.6.1 Surface Water Treatment Rule 7-11

7.3.6.2 Long Term 2 Enhanced Surface Water Treatment Rule 7-12
7.3.6.3 Monitoring requirements 7-13
7.3.6.4 Compliance 7-13
7.3.6.5 Filter Backwash Recycling Rule 7-14
7.3.7 Groundwater Rule 7-14
7.3.7.1 Monitoring Requirements 7-15
7.3.7.2 Compliance 7-16
7.3.8 Unregulated Contaminant Monitoring Rule 7-16
7.3.8.1 Monitoring Requirements 7-16
7.3.8.2 Compliance 7-17
7.4 DISTRIBUTION SYSTEM WATER QUALITY 7-17
7.4.1 Total Coliform Rule 7-17
7.4.1.1 Monitoring Requirements 7-18
7.4.1.2 Compliance 7-18
7.4.2 Stage 1 Disinfectants and Disinfection Byproducts Rule 7-18
7.4.2.1 Monitoring Requirements 7-19
7.4.2.2 Compliance 7-19
7.4.3 Stage 2 Disinfectants and Disinfection Byproducts Rule 7-19
7.4.3.1 Monitoring Requirements 7-20
7.4.3.2 Compliance 7-20
7.4.4 Lead and Copper 7-20
7.4.4.1 Monitoring Requirements 7-21
7.4.4.2 Compliance 7-21
7.5 WATER QUALITY MONITORING PROGRAM 7-22
7.5.1 Consumer Confidence Report 7-22
7.5.1.1 Compliance 7-22
7.5.2 Public Notification Rule 7-22
7.5.2.1 Compliance 7-23
7.5.3 Operator Certification 7-23
7.5.3.1 Compliance 7-24
7.6 FUTURE REGULATORY REQUIREMENTS 7-24
7.6.1 Unregulated Contaminant Monitoring Rule 7-25
7.6.2 Contaminant Candidate List 7-25
7.6.3 Radon Rule 7-25
7.6.4 Perchlorate 7-26
7.6.5 Revisions to the Lead and Copper Rule 7-26
7.6.6 Carcinogenic Volatile Organic Compounds (cVOC) Rule 7-26
7.7 SUMMARY AND RECOMMENDATIONS 7-26

CHAPTER 8 - WATER RESOURCES

8.1 WATER RIGHT ANALYSIS 8-1
8.1.1 Water Rights Summary 8-2
8.1.2 Water Rights Analysis 8-4
8.2 ABILITY TO PUMP 8-5
8.2.1 MDD Ability to Pump 8-6
8.2.1.1 MDD Supply Analysis 8-7
8.2.2 ADD Ability to Pump 8-7
8.2.2.1 ADD Supply Analysis 8-13
8.3 INTERTIES 8-15
8.4 WATER SUPPLY STRATEGY 8-15

8.4.1 Washougal Wellfield Renewal 8-15
8.4.2 Construct Wells for Existing Water Rights 8-16
8.4.3 Secure Additional Water Sources 8-16
8.4.4 Continue a Water Use Efficiency Program 8-17
8.4.5 Summary of Improvements 8-17
8.5 GROUNDWATER MANAGEMENT 8-23
8.5.1 Wellhead Protection Program 8-23
8.5.2 Wellhead Protection Area 8-23
8.5.3 Existing and Potential Contamination Hazard Identification 8-24
8.5.4 Protection Strategies and Implementation Tasks 8-24

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

This executive summary presents a brief overview of the City of Camas (City) Water System Plan Update (Plan). The Plan meets state, county, and local requirements. It complies with the requirements of the Washington State Department of Health (DOH) as set forth in the Washington Administrative Code (WAC) 246-290-100, Water System Plan. This Plan is an update of the City's 2010 Plan. The City's DOH water system identification number is 108002.

The purpose of the Plan is to develop a long-term planning strategy for the City's Retail Water Service Area (RWSA), which is shown in Figure ES.1. The Plan evaluates the ability of the water system to meet demand growth over a twenty year planning period. Water system improvements are recommended to meet the expanding water system (primarily in the North Shore), growing demands, and infrastructure repair and replacement. The Plan also identifies planning level costs for capital improvement projects and a financial plan for funding the projects.

A State Environmental Policy Act (SEPA) Checklist has been prepared for this Plan. The City anticipates the Plan does not have probable significant adverse impacts on the environment in accordance with WAC 197-11-340(2). The SEPA Checklist is included in Appendix B. The City will submit this Plan to DOH, the Washington State Department of Ecology (DOE), Clark County, and adjacent Utilities as part of the Agency Review process. See Appendix B for comment letters by these Agencies. The City's Adopting resolution will be included in Appendix A, upon Plan approval by the City Council.

ES.2 PLANNING CONSIDERATIONS

Chapter 2 summarizes the City's water planning considerations that influence the Plan, including background on the study area, policies, criteria, and related documents. The City maintains a Duty to Serve customers within the RWSA:

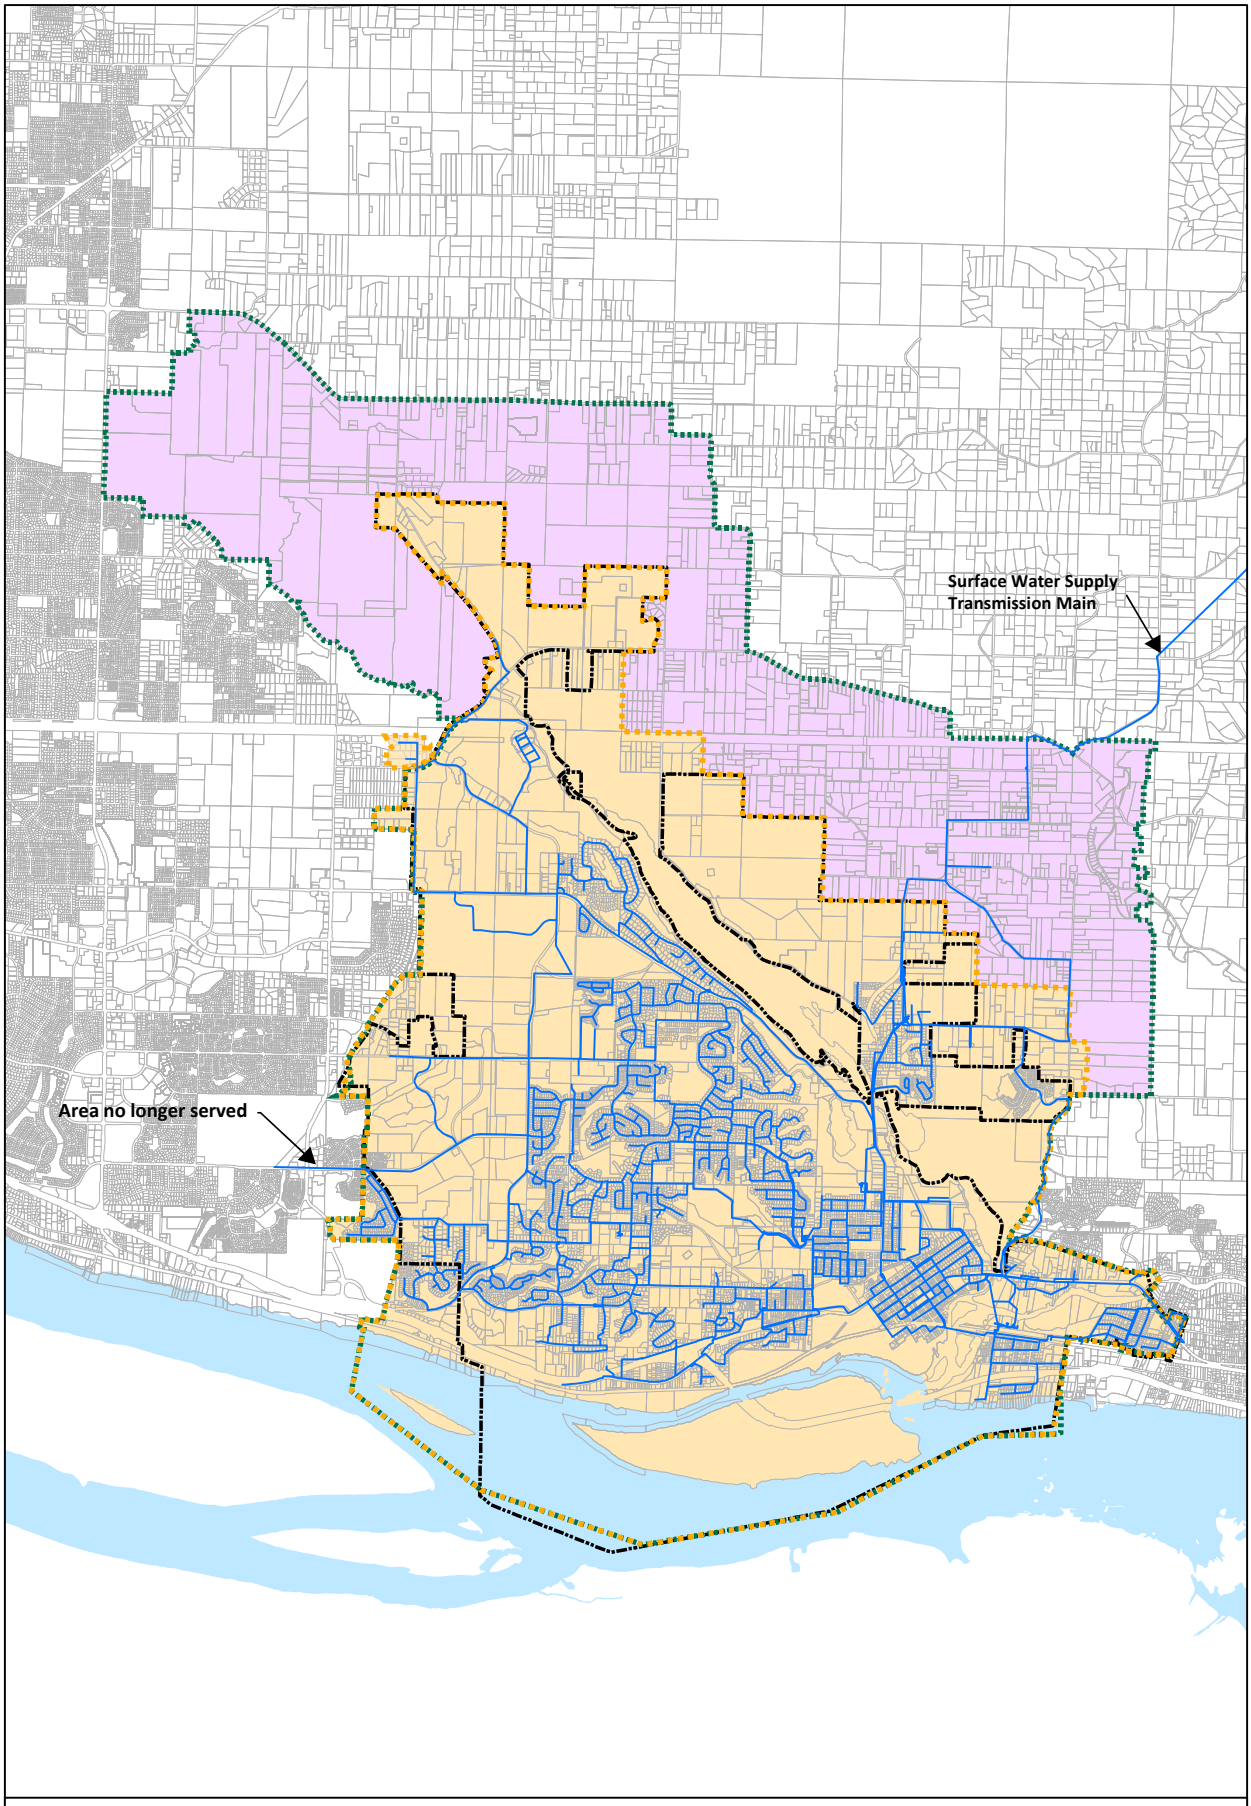
> *The City will exercise reasonable diligence and care to furnish and deliver a continuous and sufficient supply of pure water to the customer, and to avoid any shortage or interruption of delivery of same.*

The City's Water Service Area is shown in Figure ES.1.

Water system planning is based on a careful analysis of a water utility's responsibility to comply with applicable regulatory requirements while providing service to existing and future customers. These laws are monitored and enforced by a number of federal, state,

and local agencies. The Plan incorporates several regional and local plans of the southwest region of Washington, such as Clark County, that affect the water utility.

The City has adopted many resolutions regarding water system planning that are included in the City Code. The City manages its water utility in accordance with established water system policies. The policies provide a consistent framework for the design, operation, maintenance, and service of the water system for appropriately implementing programs, designing new infrastructure, and serving additional customers. The Plan summarizes many of these policies and provides criteria needed to evaluate the water system.

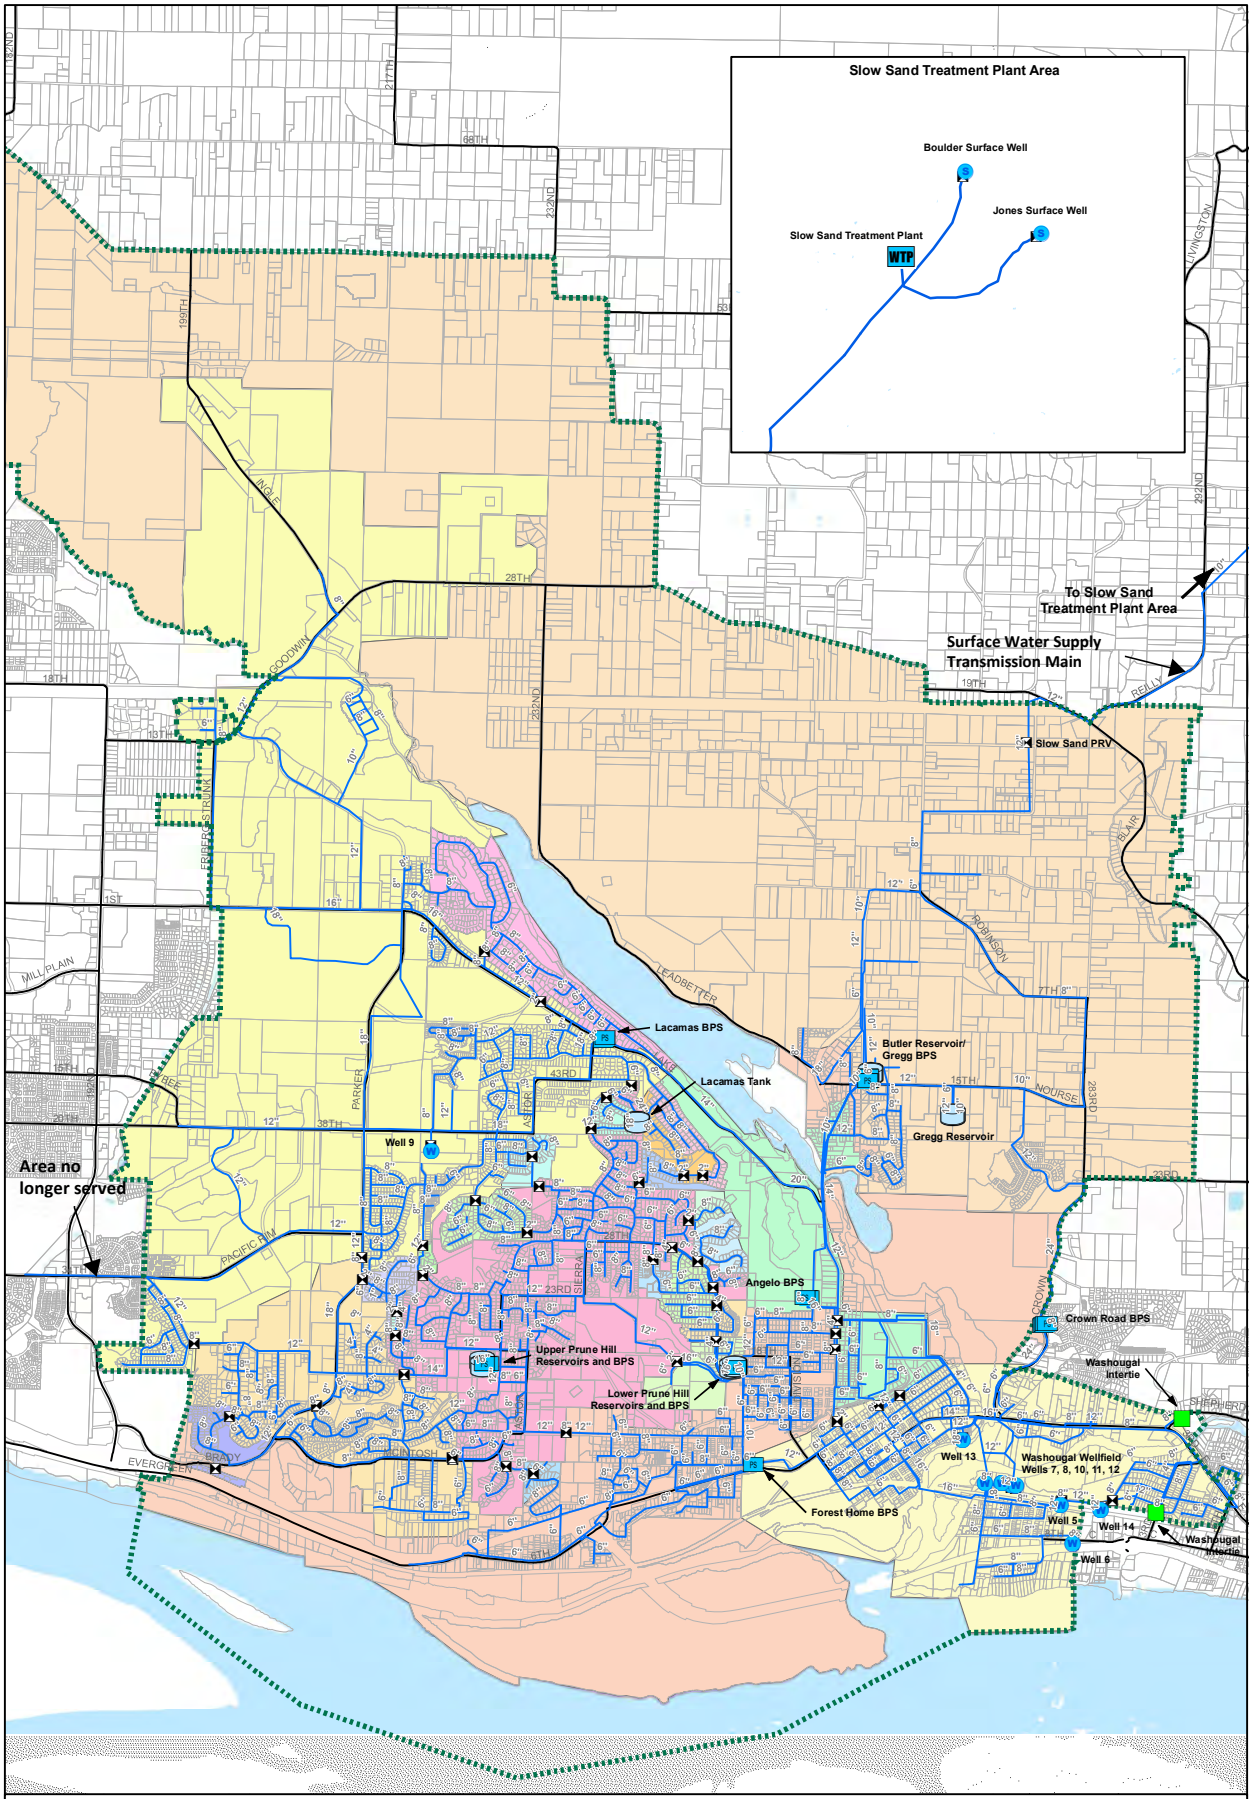


ES.3 EXISTING SYSTEM

The City owns and operates a multi-source municipal water system- summarized in Chapter 3 - which includes supply, treatment, storage, and distribution of potable water to residential and commercial customers. The City currently obtains its water from ten groundwater wells and two surface water sources that are treated to provide high quality water to customers. The City owns over 143 miles of pipelines in its water transmission and distribution system. Service is provided to customers across five major pressure zones and 18 subzones. Eight booster pumping stations are used to move water between pressure zones. Seven storage facilities with a combined total of 8.45 million gallons (MG) provide storage for normal and emergency conditions, such as fire suppression. Additionally, distribution system includes numerous meters, isolation valves, and hydrants. Major elements of the water system are shown in Figure ES.2.

ES.4 OPERATIONS AND MAINTENANCE

The water system is operated and maintained (O&M) by the City staff, with contractor provided services that City staff are not trained or equipped to perform. O&M of the water system requires the combined effort of the Public Works Department, Engineering Department, and Finance Department. The City's water system operators are experienced and well trained, exceeding the minimum state requirements (WAC 246-292-050). The City provides opportunities for its staffs' professional growth and training to maintain up-to-date knowledge.



The City has a well operated and maintained system, as documented in Chapter 4. As part of the Plan, a high-level condition assessment identified repair and replacement projects for above ground assets (i.e., pump stations, wells, and reservoirs, etc.). The majority of projects were necessary due to aging electrical equipment and normal replacement of pumps and motors. The City also plans to replace two reservoirs, built prior to 1940, that have reached the end of their usable life.

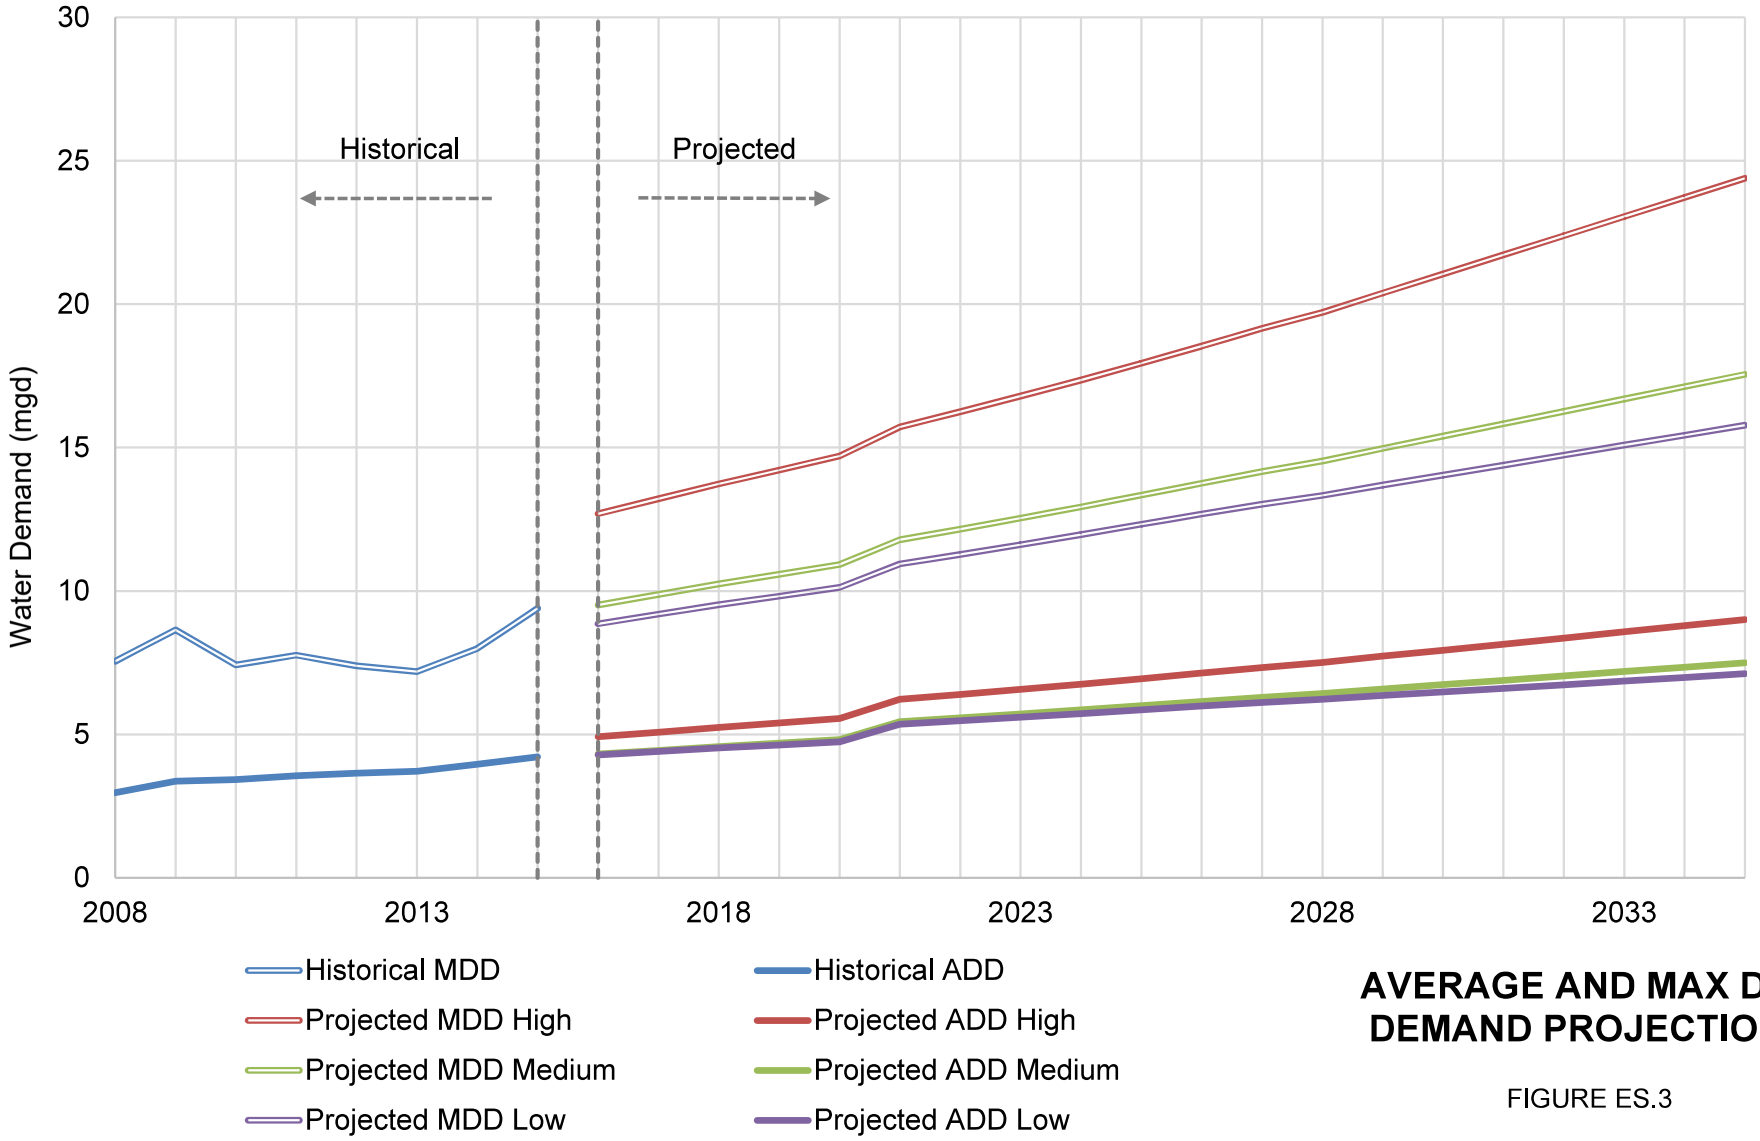
ES.5 WATER REQUIREMENTS

Projecting realistic future water demand is necessary for planning infrastructure projects and securing adequate water supply to meet future growth. Chapter 5 projects the water system requirements, i.e., demand, for the next 20 years. Demographic projections were used to predict where and how much growth will occur in the water system based on the City's comprehensive planning. The resulting future accounts were converted to projected demands using the historical water use patterns and parameters.

Demand projections were generated for the planning period of 2015 to 2035 for the City's established RWSA. The projections were divided into three planning scenarios: Short-term, 6-year (2015 - 2021), Medium-term, 10-year (2022 - 2025), and Long-term, 20-year (2026 - 2035).

Demand projections were expressed as average day demand (ADD), and maximum day demand (MDD). The ADD is typically used in operational evaluations. The MDD represents the single largest day water demand during the year and is a key parameter for infrastructure sizing.



Changes in water use, conservation activities, system growth, and other factors may result in higher or lower than projected water use. Planning for the potential changes allows the City to better manage potential risks from these changes. Therefore, three demand scenarios were developed and shown in Figure ES.3: Low, Medium, and High demand scenarios. The low demand scenario represents future demand with conservation; the medium demand scenario is a conservative projection between the low and high projections; the high demand scenario generally reflects the highest demands in the last eight years.

ES.6 WATER USE EFFICIENCY

The City promotes efficient water use to conserve and protect their existing water supplies for present and future residents. Chapter 6 summarizes the City's Water Use Efficiency (WUE) efforts. The WUE Program goals established in 2013, which have been maintained, are:

- **Demand-Side Goal:** Reduce customer consumption per equivalent residential unit (ERU) by 1 percent or approximately 2 gallons per day (gpd) per year over the next 6 years.
- **Supply-Side Goal:** Continue to reduce distribution loss to at or below 10 percent for the next 5 years.

To meet these goals, the City promotes water conservation and efficient use of water through a variety of activities with the aim of reducing customer water use (conservation) and water loss through leak detection activities. The City's new Advanced Meter Reading (AMR) meters support both WUE aims.

AVERAGE AND MAX DAY DEMAND PROJECTIONS

FIGURE ES.3

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

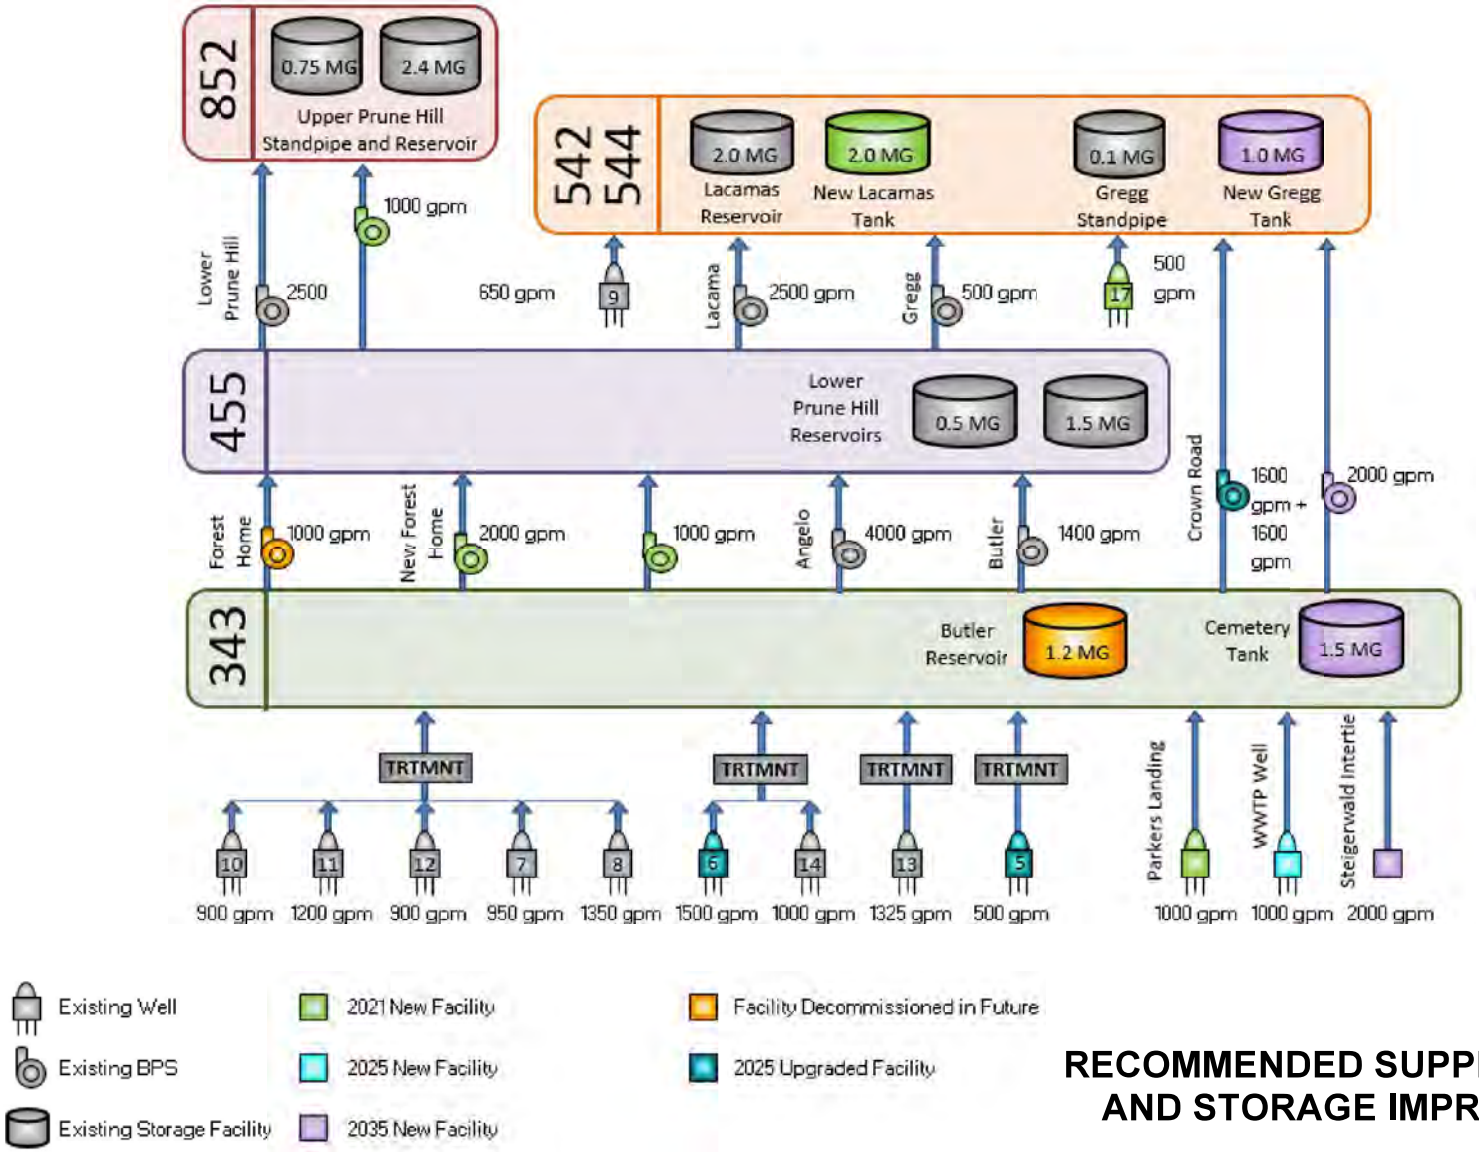
ES.7 WATER QUALITY

The City is defined as a Group A – Community Water System and must comply with the drinking water standards of the federal Safe Drinking Water Act (SDWA) and its amendments, as regulated by the United States Environmental Protection Agency (USEPA). DOH adopted the updated federal standards under WAC 246-290, of which the most recent version became effective April 8, 2016. The City is in compliance with all requirements, as described in Chapter 7. Alternatively to the Chapter, the City publishes an annual Water Quality Report that keeps consumers informed as to the quality of the City's water supply and water delivery systems.

The City does not anticipate issues with meeting future regulatory requirements based on the limited available information.

ES.8 WATER RESOURCES

To meet future demands, the City will be required to fully use its water resources and develop new sources to continue to provide a high level of service. Chapter 8 presents a water right strategy for future water rights and supply needs.



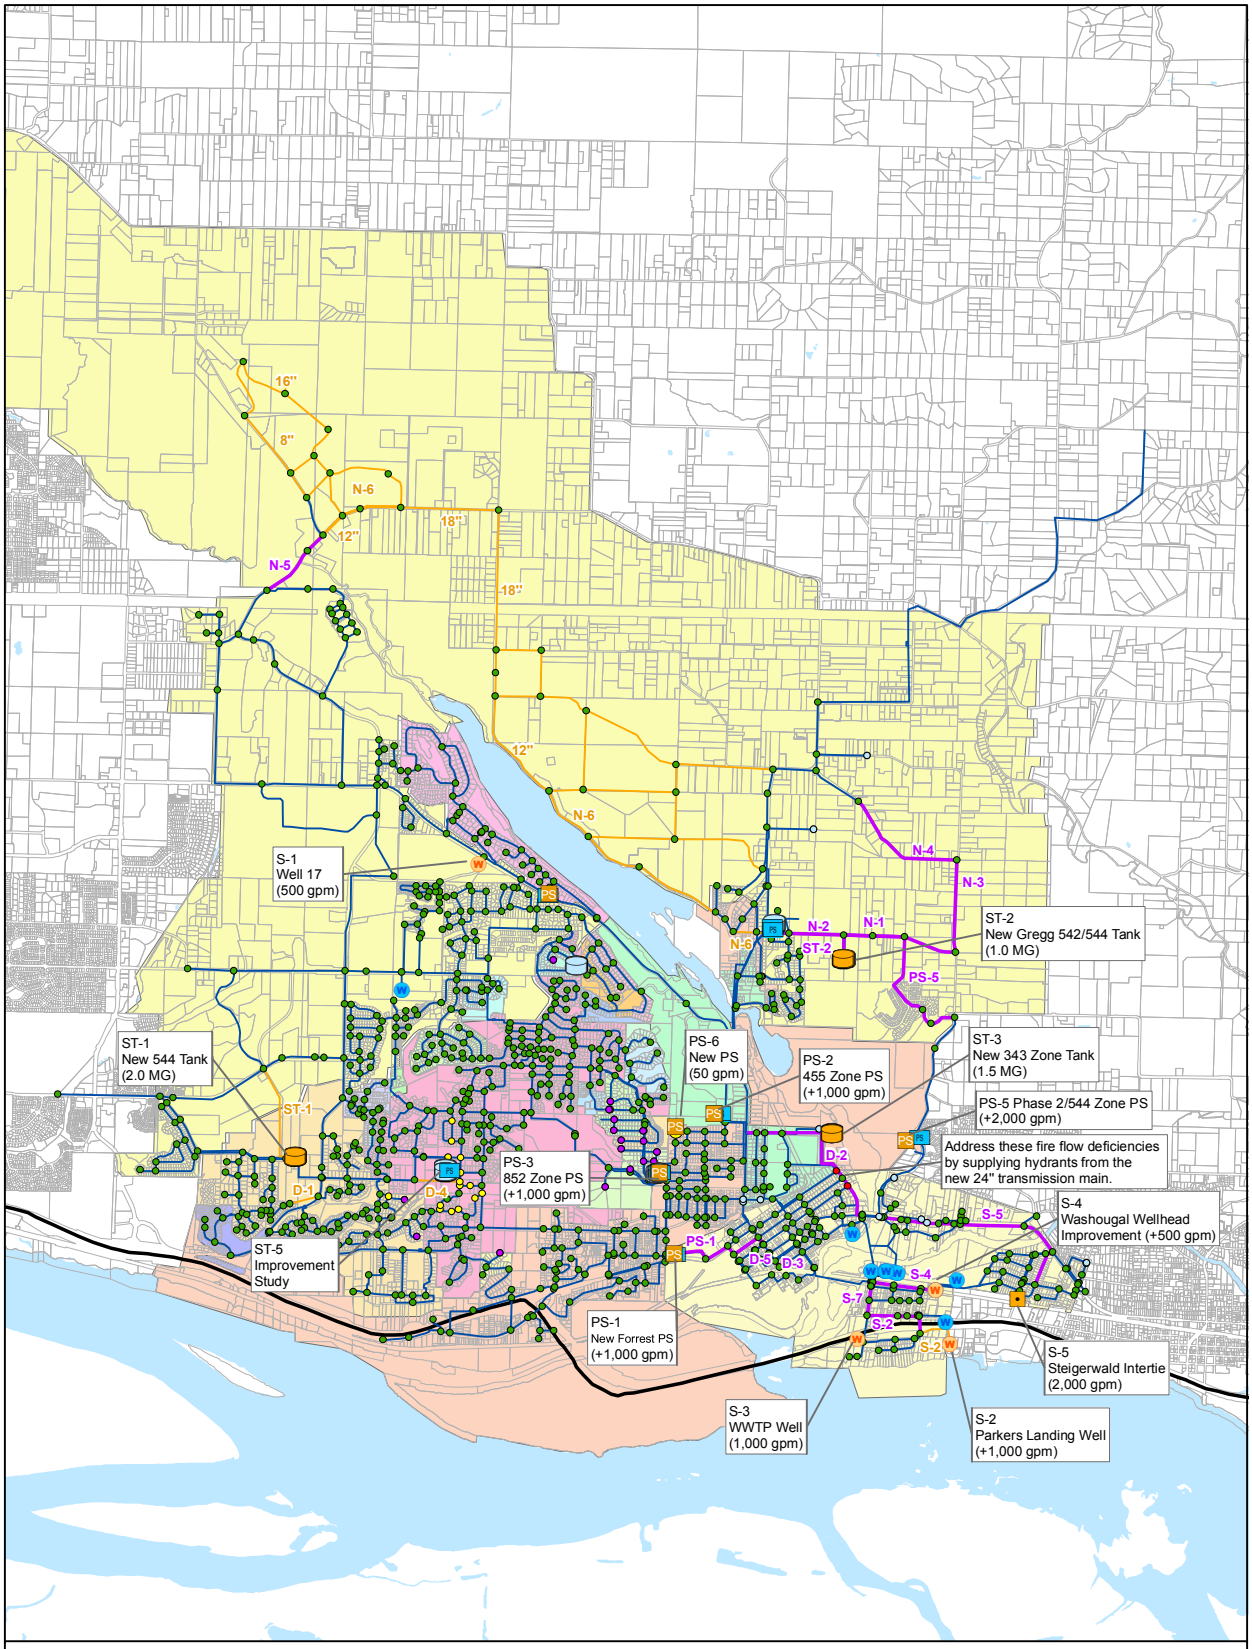
The City water supply strategy largely continues previously planned water supply projects and new water sources. Previously planned projects will be needed to meet growth, including Well 17 and the Parkers Landing Well. In addition to previously planned projects, the City anticipates completing the Washougal Wellfield Renewal Project to increase the ability to pump and reliability of the wellfield. Future supplies beyond the City's existing or planned wells will be from the Steigerweld Regional Supply.

In addition to new supplies, it is recommended that they continue its WUE program efforts to reduce the risk of very high peak demands.

ES.9 SYSTEM ANALYSIS

The City's water distribution system was evaluated for its ability to meet the City's performance criteria under 2021, 2025, and 2035 future conditions. The distribution system was evaluated for its pumping reliability and redundancy and the availability of storage using a desktop system analysis. Service pressures and available fire flows for both MDD and ADD conditions were evaluated using the City's updated hydraulic model.

Chapter 9 presents the results of the system analysis and discusses in detail recommended improvements to meet the City's level of service goals. These recommendations form the basis of the City's capital improvement program (CIP) outlined in Chapter 10. Supply, pumping, and storage project will be necessary during the planning horizon to meet the City's projected substantial growth in water demand, as shown in Figure ES.4.



RECOMMENDED SUPPLY, PUMPING, AND STORAGE IMPROVEMENTS

FIGURE ES.4

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

The existing distribution system was evaluated for pressure during peak demand use and during fire flow events. Capacity improvements recommended to address pressure and fire flow deficiencies. Overall, the City had relatively few distribution system improvements, which are shown in Figure ES.5. The majority of deficiencies occur on dead-end mains or areas of high elevation. Additional flows can be supplied to these areas through small, local projects likely completed when the parcels redevelop or a nearby project occurs. It is recommended that the City address these as a programmatic manner that provides funds to address one or two of these areas per year. Additional distribution system improvements are recommended in conjunction with supply or pump station projects.

Within the planning period the City expects significant expansion of the water system in the North Shore area. Future pipelines were sized for the North Shore area.

ES.10 CAPITAL IMPROVEMENT PLAN

Chapter 10 summarizes the City's comprehensive CIP for the water system that is based on the analyses presented in previous Chapters. The purpose of the CIP is to provide the City with a guideline for planning and budgeting of its water system. The CIP consists of schedule and cost estimates in present dollars for each project, as shown in Table ES.1.

The CIP cost estimates presented in this chapter are American Academy of Cost Engineers (AACE) Class 4 estimates. Class 4 estimates are budget level estimates. Actual costs may vary from these estimates by -30 percent to +50 percent. These costs were determined based on the City's and Consultant’s perception of current conditions at the project locations.

This Plan contains time fames that are the intended framework for future funding decisions. However, these timeframes are estimates and may change depending on factors involved in the growth, project implementation, and availability of funding. The framework does not represent actual commitments by the City.

ES.11 FINANCIAL PLAN

FCS GROUP provided a financial program that allows the City's water utility to remain financially viable during the planning period, which is summarized in Chapter 11. This financial viability analysis considers the historical financial condition, current and identified future financial and policy obligations, O&M needs, and the ability to support the financial impacts related to the completion of the capital projects identified in this Plan. Furthermore, this Chapter provides a review of the water utility’s current rate structure with respect to rate adequacy and customer affordability.

The results of this Financial Plan indicate that rates must increase to provide revenue sufficient to cover all utility financial obligations, including the addition of new debt and partial cash funding of the capital program through 2026. A rate increase of 5.0 percent in 2018, followed by annual rate increases of 2.5 percent through 2026 should provide for continued financial viability while maintaining generally affordable rates.

Table ES.1 CIP Project Summary

Chapter 1

INTRODUCTION

1.1 PURPOSE

The City of Camas (City) prepared this Water System Plan (Plan) Update to document the water system, its programs, and analyze the future needs of the water system. The Plan is an update to the City's 2010 Plan. The purpose of this Plan is to document changes to the City's water system, to identify required system modifications, and to appropriately outline capital improvement projects to meet system growth and address aging infrastructure. Maintaining a current Plan is required to meet the regulations of the Washington State Department of Health (DOH) and the requirements of the Washington State Growth Management Act. This Plan complies with the requirements of DOH as set forth in the Washington Administrative Code (WAC) 246-290-100, Water System Plan.

1.2 LOCATION

The City is located in Clark County, WA and is considered part of the greater Portland, OR metropolitan area. The City is bordered to the south by the Columbia River, the west by the City of Vancouver, WA water system, the City of Washougal, WA water system to the east, and unincorporated Clark County to the north.

1.3 OWNERSHIP AND MANAGEMENT

The City owns and operates their water system (DOH ID 108002) and serves the City and portions of its Urban Growth Area (UGA) as defined by tis water service area. The water service boundaries are further discussed in Chapter 2. The City provides internal staffing for the management, operations, and maintenance of the water system.

1.4 ENVIRONMENTAL ASSESSMENT

A State Environmental Policy Act (SEPA) Checklist and determination of non-significance (DNS) has been prepared for this Plan. The City anticipates the Plan does not have probable significant adverse impacts on the environment in accordance with the DNS under WAC 197-11-340(2). Many of the projects proposed within the Plan will require subsequent project specific environmental review and SEPA checklists as part of their design process. The SEPA Checklist and DNS are included in Appendix B.

1.5 APPROVAL PROCESS

This Plan is required to meet state, county, and local requirement. The City will submit the Plan to DOH, Clark County, and adjacent Utilities as part of the Agency Review process.

See Appendix B for Agency comment letters, responses, and approvals. As required by WAC 246-290-108, a local government consistency review checklist has been prepared and is included in Appendix B. The Adopting Resolution by City Council documenting the final approval of the Plan will also be included in Appendix A.

1.6 DOH WATER SYSTEM PLAN CHECKLIST

To assist review of the Plan, the DOH Water System Plan checklist is provided in Table 1.1 with references to the required information.

Table 1.1 DOH Water System Plan Checklist
Water System Plan Update
City of Camas

Required	*Content Description*	*WSP Page #*
	Description of Water System	
(✓)	Updated Water Facility Inventory (WFI), signed and dated	8.1.1/ App. F
(✓)	Ownership and management	1.3
(✓)	System history and background	2.2.2
(✓)	Inventory of existing facilities	Chapter 3
(✓)	Description of and discussion about related plans: CWSP, groundwater management plan, WRIA and City/County land use plans & zoning.	Chapter 3/5
(✓)	Service Area Maps: clearly identifying existing, retail and future service areas.	Figure 2.1
(✓)	Policies: Service area, SMA, conditions of service, annexation	2.7
(✓)	Duty to serve requirement: procedures, conditions, appeals	2.7
(✓)	Consistency from local planning agency (LGC checklist)	2.7
	Planning Data	
(✓)	Demand analysis based on water use: • Include analysis of population, service connections & ERUs • Source and service meter data (preferably three or more, typically 6 years). Provide monthly and annual production and consumption totals. • Provide usage by customer class. Analyze industrial and commercial demands separate from the residential demand and multifamily structures separate from the single family residences. • Define ERU • Provide data and assumptions (including DSL) for calculation MDD, PHD, and ADD • Demand analysis per pressure zone and the whole system • Consider water supplied to other systems • If >1000, include seasonal variations in consumption by customer class	Chapter 5

Table 1.1	DOH Water System Plan Checklist Water System Plan Update City of Camas	
(✓)	Provide 6 & 20 year projections: • Provide 6 & 20 year projections for demand forecasts with and without expected efficiency savings (conservation)	5.6
(✓)	Interties – discussion of all existing and proposed interties and copies of agreements	8.3
(✓)	Provide 6 & 20 year projections for land use and zoning	3.8
(✓)	Distribution System Leakage percentage and volume	5.4
	System Analysis	
(✓)	Provide assumptions and basis of analysis: • System design standards • Policies on operations and expected level of service (such as standby storage, pumping restrictions and emergency back-up power) • Fire flow requirements and if nesting is allowed. May need a confirmation from local fire authority.	Chapter 9
(✓)	System inventory and description	Chapter 3
(✓)	Capacity analysis (legal and physical capacity): • Limiting factor analysis (WSDM worksheet 6-1) • Include the results of the limiting factor analysis in a table • Analysis per pressure zone and the whole system • Water rights analysis – include water right self-assessment forms for existing, 6 & 20-year projections, including copies of water right certificate(s) • Consider source, pumping, treatment, storage, and distribution	
(✓)	Hydraulic analysis of distribution system: • Describe the model used • Evaluate the system based on PHD and MDD + Fire flow • Evaluate the current conditions, and 6- and 20-year planning periods • Check minimum pressures and maximum velocities • Include assumptions of model, pressure zone boundary conditions, and a summary of model in/out information. Storage assumptions should be based on minimum reservoir levels. • Include verification and calibration methods and results • Summary of system deficiencies	Chapter 9
(✓)	Analysis of possible improvement projects	9.6

Table 1.1	DOH Water System Plan Checklist Water System Plan Update City of Camas	
	Water Use Efficiency Program	
(✓)	Water Use Efficiency (WUE) Program per WAC 246-290-810:	Chapter 6
	• Describe the current WUE program	
	• Describe WUE goal & document public adoption process	
	• Describe measures that will be implemented to achieve the goal & include schedule & costs in the budget	
	• Describe process used to evaluate the WUE measures you did not implement	
	• Describe yearly consumer education	
	• Estimated projected water savings from selected measures	
	• Describe process that will be used to determine effectiveness of the program	
	>= 1000 Connections	
	• Estimate water saved from efficiency measures over the past 6 years	
	• Quantitative evaluation of measures to determine if they are cost-effective, include marginal costs of water production	
	• Evaluate measures for cost-effectiveness if shared with other systems	
	• Quantitative of qualitative evaluation of measures to determine if they are cost-effective from the societal perspective	
(✓)	Source & Service Meters - or schedule w/ activities to minimize leakage	6.1.1.1
(✓)	Water Loss Action Plan WAC 246-290-820	Not Required
(✓)	Water supply characteristics, description & discussion on effect of water use	Chapter 8
(✓)	Source of supply analysis and evaluation of supply alternatives	Chapter 8
(✓)	>= 1000 connections explore reclaimed water opportunities	6.2.1.2
	Source Water Protection	
(✓)	Wellhead protection program	8.5
	2 year update (contaminant inventory, letters and map)	
(✓)	Analysis and discussion of Water Quality	Chapter 7
(✓)	Watershed control program	2.6.2.9
	Operation and Maintenance Program	
(✓)	Water system management and personnel	Figure 4.1
(✓)	Operator certification	Figure 4.1
(✓)	Routine operating procedures and preventative maintenance:	4.2
	• Standard Operating Procedures (SOP Manual-Surface Water Treatment Plant)	
(✓)	Water quality sampling procedures & program	Chapter 7

Table 1.1	DOH Water System Plan Checklist Water System Plan Update City of Camas	
(✓)	Coliform monitoring plan, including maps (and triggered source monitoring plan)	Provided Separately
(✓)	Emergency response plan:	4.4
	• Water system contacts	
	• Vendor contacts (Equipment replacement, water haulers, etc.)	
	• Example notices (water outages, BWA, coliform MCL, emergency conservation)	
	• Emergency government officials contact info (ODW, County Health Dept., State and County Emergency Operations Centers)	
	• List of emergency sources ad interties	
	• Emergency response planning activates to ensure preparedness	
(✓)	Water shortage plan and service reliability	6.3
(✓)	Cross-connection control program	4.5
(✓)	Recordkeeping, reporting, and customer complaint program	4.7
(✓)	Summary of O&M deficiencies	4.9
	Distribution Facilities Design and Construction Standards	
(✓)	Standard construction specification for distribution mains	Appendix K
	Improvement Program	
(✓)	Capital improvement schedule for 6 and 20 years	Chapter 10
	• Include inventory and assessment of existing system components	
	Financial Program	
(✓)	Summary of past Income and Expenses (at least 2 years)	11.1/11.2
(✓)	>= 1000 connections – Balanced 1-year budget	11.1/11.2
(✓)	Show revenue and cash flow stability to fund capital and emergency improvements	11.4
(✓)	Affordable rate structure that covers the full cost of producing, treating, storing and distributing water to customers now and into the future	11.15
	Miscellaneous Documents	
(✓)	Meeting of the consumers (may be combined with WUE public meeting)	At later date
(✓)	Date, agenda, meeting minutes	At later date
	• County/Adjacent Utility Correspondence	
(✓)	>= 1000 connections – State Environmental Policy Act (SEPA) Determination	At later date
(✓)	Agreements: franchise, wheeling, financial aid, inter-local and other agreements (if any exist)	At later date
(✓)	Satellite Management Program	At later date

Chapter 2

PLANNING CONSIDERATIONS

2.1 INTRODUCTION

The objective of this chapter is to document the City of Camas (City) water system planning considerations that influence the plan including background on the study area, policies, criteria, and related documents.

2.2 STUDY AREA

2.2.1 Water System History

The first known settler, David Parker, came to the City of Camas in 1845. In 1883 the La Camas Colony Company of Portland purchased 2,600 acres encompassing Lacamas, Round, and Dead Lakes, the stream connecting them to the Columbia River, and constructed dams for water power for new flour and paper mills, a sawmill, and a furniture factory in the area. The City was incorporated in 1906. In 1913, the City's first water system was storing Jones Creek supply in Butler Reservoir. The system has continued to expand and adapt to new challenges and regulations, as described in Table 2.1. This Plan provides a roadmap to continue to provide high quality water into the future.

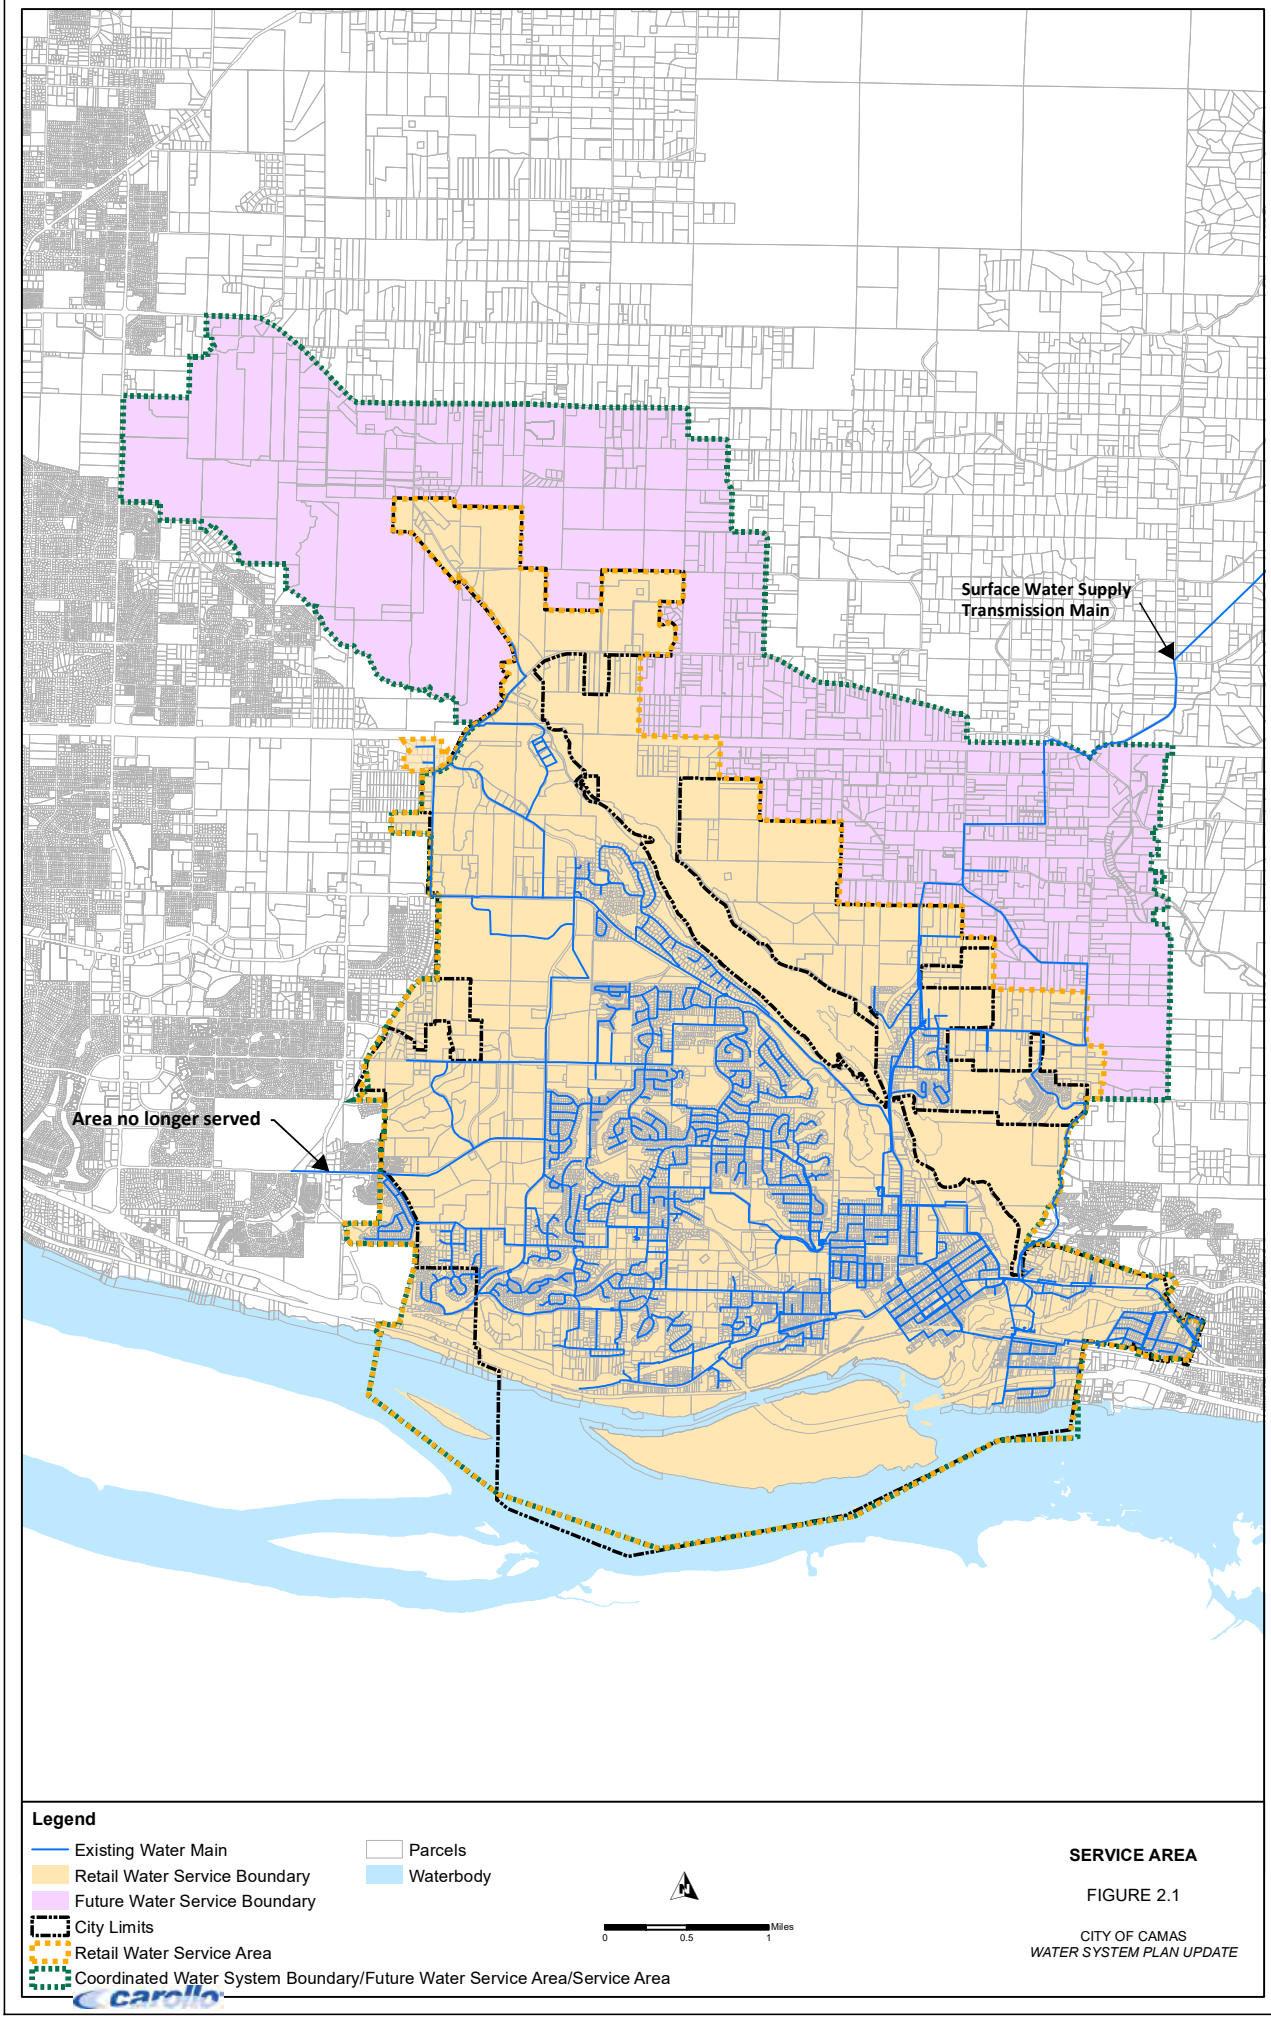
Table 2.1 Water System Historical Timeline
Water System Plan Update
City of Camas

1845	Camas first settled
1913	Jones Creek Intake constructed
1913	0.6 MG(1) Butler Reservoir, South Half
1923	0.6 MG Butler Reservoir, North Half (1.2 MG total)
1931	Boulder Creek Intake constructed
1935	0.5 MG Lower Prune Hill Reservoir
1936	Wells 1 and 2 constructed
1945	Well 3 constructed
1948	Butler Booster Station - 800 gpm(1)
1949	Forest Home Booster Station - 450 gpm
1952	Chlorination Plant - injects chlorine into water from Jones Creek and Boulder Creek before it goes to the Filter Plant
1959	Well 4 constructed
1965	Filter Plant - 1,200 gpm - filters water from Jones Creek and Boulder Creek intakes
1965	10th Street Booster Station

Table 2.1 Water System Historical Timeline Water System Plan Update City of Camas	
1968	Well 5 constructed
1969	Well 6 constructed
1971	Well 7 constructed
1971	1.5 MG Lower Prune Hill Reservoir
1971	0.75 MG Upper Prune Hill Reservoir
1971	Lower Prune Hill Booster Station - 500 gpm, 500 gpm, 750 gpm
1977	Well 8 constructed 1,350 gpm
1978	0.1 MG Gregg Reservoir
1978	Old Gregg Booster Station - 500 gpm
1988	SCADA(1) System installed
1993	2.0 MG La Camas Reservoir
1993	La Camas Booster Station - 500 gpm, 500 gpm, 1,500 gpm
1998	Forest Home Booster Station Upgrade - 1,000 gpm
1999	Butler Booster Station Upgrade
2000	Well No. 9 constructed - 650 gpm
2001	Angelo Booster Station constructed - 3,000 gpm capacity
2001	Lower Prune Hill Booster Station Upgrade - 1,000 gpm replacement pump
2002	Upper Prune Hill Reservoir (2.4 MG) and Booster Station (2,900 gpm capacity) construction
2002	New Gregg Zone Booster Station Constructed, 1,500 gpm
2002	Lower Prune Hill Upgrade, 2,000 gpm
2002	Jones and Boulder Creek intake metering
2002	Chlorine and CT(1) improvements
2002	Well 1 & 2 abandoned
2003	Well 3 decommissioned
2003	Well 11 (1,200 gpm) & Well 12 (900 gpm) constructed, Washougal Wellfield Chemical Feed Facility installed
2003	New Gregg Booster Pump Station - 1,500 gpm
2004	Well 10 constructed - 900 gpm
2007	Well 4 decommissioned
2008	Well 13 constructed, 1,325 gpm
2008	Washougal River 24-inch pipe crossing installed
2008	Ostenson Canyon Pipeline installed

Table 2.1 Water System Historical Timeline Water System Plan Update City of Camas	
2008	City and Department of Ecology sign agreement regarding use of service water sources and increased water rights associated with groundwater
2009	Well 14 constructed - 1,000 gpm
2009	Sodium hypochlorite disinfection system installed at Well 5 and 9
2011	Crown Road Booster Pump installed - 1,600 gpm

Note:
(1) CT - contact time; gpm - gallons per minute; MG - million gallons; SCADA - Supervisory Control and Data Acquisition.



2.2.2 Ownership and Management

The City's water system is owned and operated by the City of Camas. The City is governed by a mayor and seven council members, all of which are elected officials. The Public Works Director is appointed by the council and, as one of his or her duties, heads the City's water department. The water department is divided into two branches: engineering and operations.

The City has both surface water and groundwater sources. The surface water sources, Boulder and Jones Creeks, are located on the south side of Larch Mountain, northeast of Camas. The ground water sources include nine wells near the Washougal River, and one well in Grass Valley. The City treats all of its water with chlorine for disinfection, fluoride, and sodium. Water pressure and fire flows are maintained throughout the service area with seven distribution reservoirs, nine pump stations, and over 143 miles of piping to serve their 23,000, and growing, customers.

2.2.3 Service Area

In accordance with the Municipal Water Law, the City is required to designate a retail service area within that it has a duty to serve all customers meeting the City's stated conditions of service – the City's service policies are summarized in Table 2.3 - and also designate a future service area. The City's retail water service area, future service areas, and service area are shown in Figure 2.1. The retail water service area is largely defined by the City's urban growth boundary. The City's service area, defined by the Clark County Coordinated Water System Plan, expands the retail service area to the urban growth boundary. The Regional planning does not anticipate the entire future service area to develop during the planning period (next 20-years); however, the City reserves the first right of refusal for providing water service to developments in its Service Area. Note, the map shows pipelines outside of the service area are associated with the surface water supply transmission (to the northeast) or that reflect historical retail water sales that no longer occur (to the west).

SERVICE AREA

FIGURE 2.1

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

2.2.4 Regional Environment

2.2.4.1 Climate

The climate in the City and the surrounding greater Clark County area is influenced by the Coast Mountain Range to the west and the Cascade Mountain Range to the east. The Coast Mountain Range provides some limited protection from the direct influence of the Pacific Ocean. Moist heavy air from the Pacific is cooled as it rises over the Coast Mountain Range and releases moisture as rainfall. The air is further cooled as it approaches the Cascade Mountain Range, resulting in moderate rainfall for lower lying area, and heavier precipitation along the west slopes of the Cascades. This results in a large variation of rainfall across the county. The Cascade Mountains also provide a barrier against continental air masses originating over the Columbia Basin to the east.

Clark County has wet, mild winters and warm, dry summers. Average annual precipitation in the City of Camas is 45 inches, while the northeastern end of the County receives 144 inches. Approximately 80 to 85 percent of the precipitation occurs between the months of October and May and the City receives 143 days of sunshine per year.

Temperatures across Clark County average 33.6 degrees Fahrenheit in January, increasing to an 82-degree high in July. Winter storms come generally from the southwest, with infrequent snowstorms originating from the Gulf of Alaska. Fall and winter storms can be accompanied by high winds, resulting in power outages.

2.2.4.2 Topography

Clark County is located in the Willamette-Puget Trough, a geographic basin formed by the Cascade and Coast Mountain Ranges. The county is bounded on the south and west by the Columbia River, on the north by the Lewis River, and on the east by the foothills of the Cascades. The City of Camas itself resides in the Southeast side of the county, with Vancouver to its west and Washougal to its east.

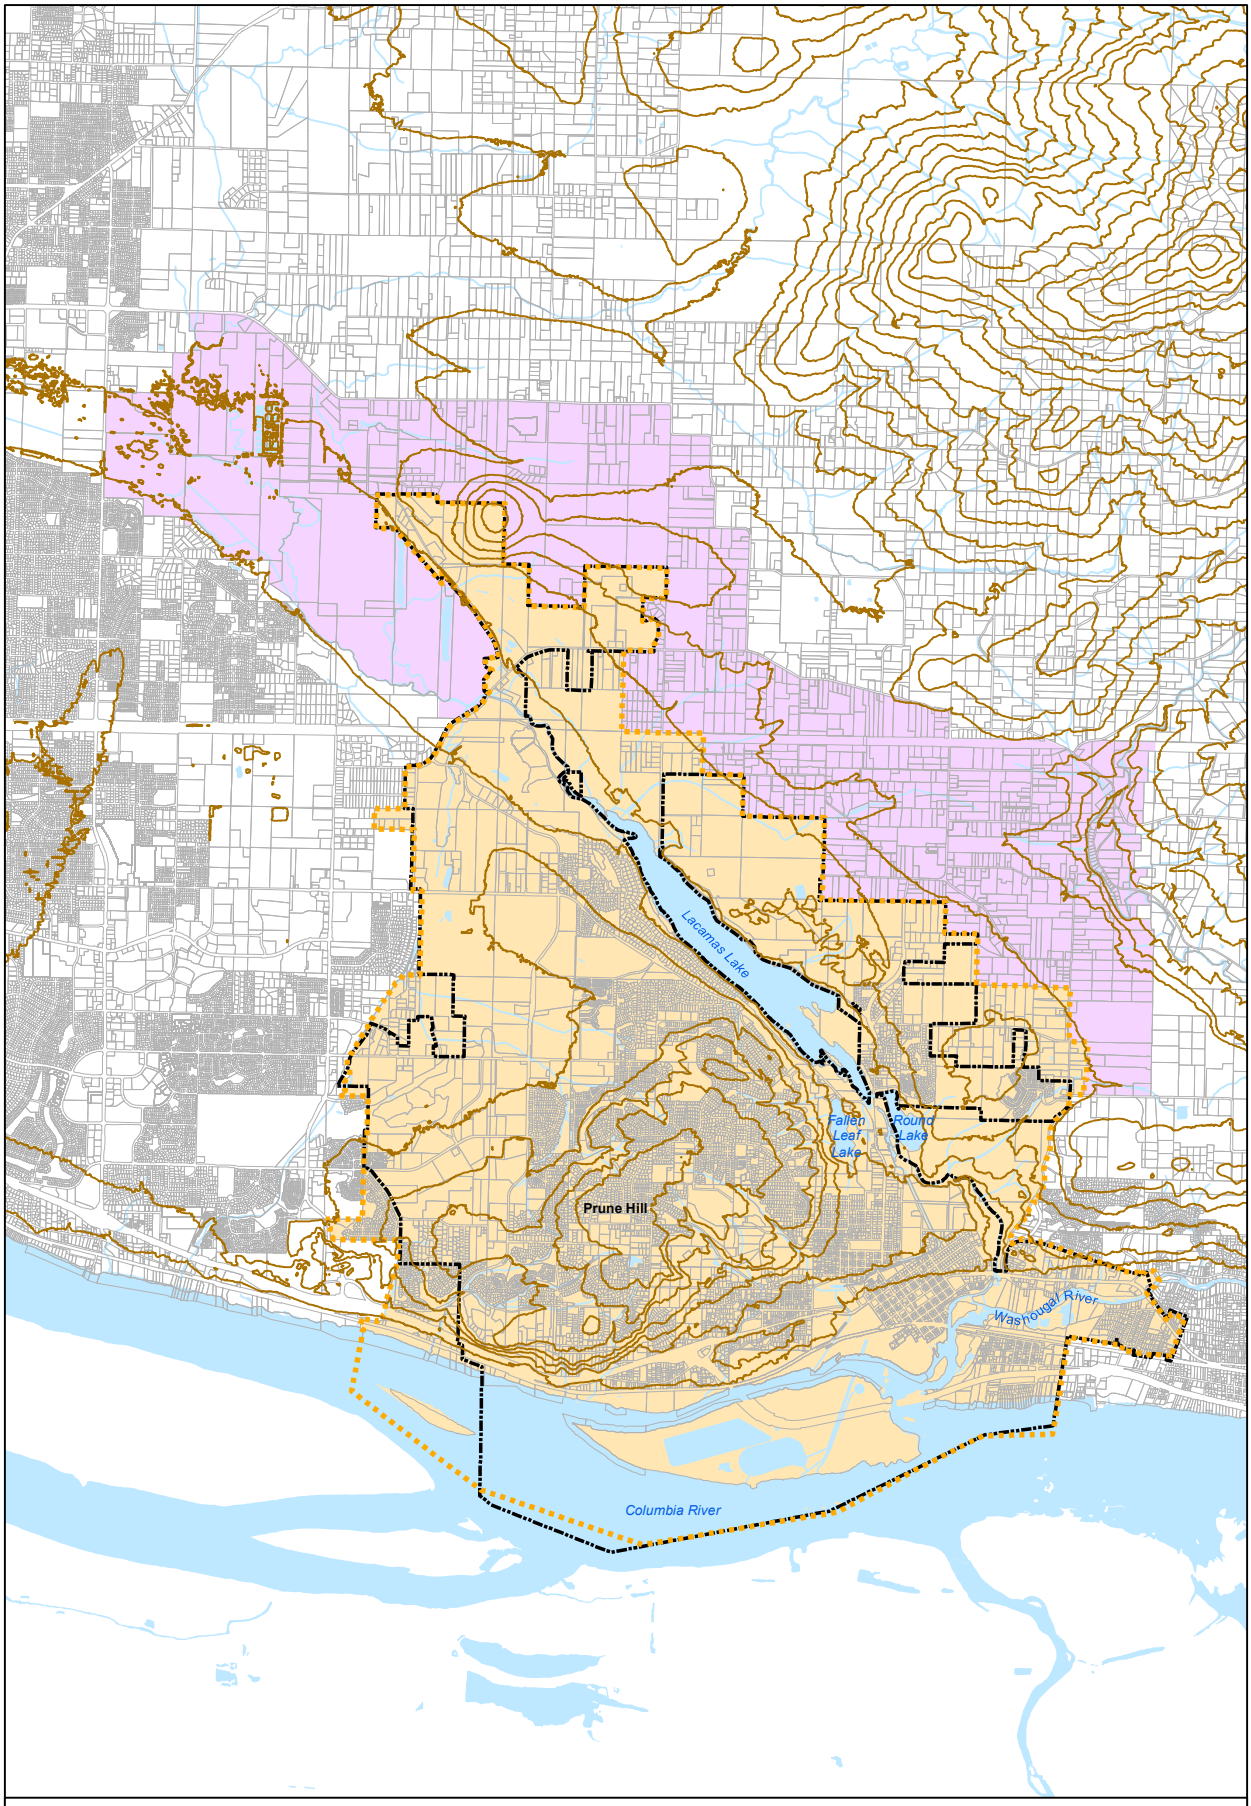
The ground slope and natural drainage features within the City play a significant role in the planning and design of the water distribution storage facilities. The elevation within the City ranges from about 20 feet above sea level along the shores of the Columbia and Washougal Rivers, to approximately 752 feet (NGVD 29) at the Upper Prune Hill Standpipe located at the top of Prune Hill. The terrain in the City includes a flat plateau in the Downtown area and generally increasing elevations to the North, as shown in Figure 2.2.

2.2.4.3 Surface Water

The surface water features within the City urban growth area (UGA) boundary include Lacamas Lake, the Columbia River, the Washougal River, Lacamas Creek, Fallen Leaf Lake, and Round Lake. The City also owns the majority of the watershed for the Jones and Boulder Creeks north of the City's intakes for these sources. Jones and Boulder Creek are

tributaries of the Little Washougal River, which is a tributary of the Washougal River. The basin characteristics for the creeks, streams, and rivers discussed below were obtained from stream gauging published by the U.S. Geological Survey.

The Columbia River begins in Canada, enters the United States in northeastern Washington, continues traveling southwest through eastern Washington, where it travels over a series of dams until it empties into the Pacific Ocean. The Columbia River forms the border between the states of Washington and Oregon from the point where it crosses the 46th Parallel until it empties into the Pacific Ocean. The Columbia River drainage area is approximately 241,000 square miles, with an average flow of 603,000 cubic feet per second (cfs).

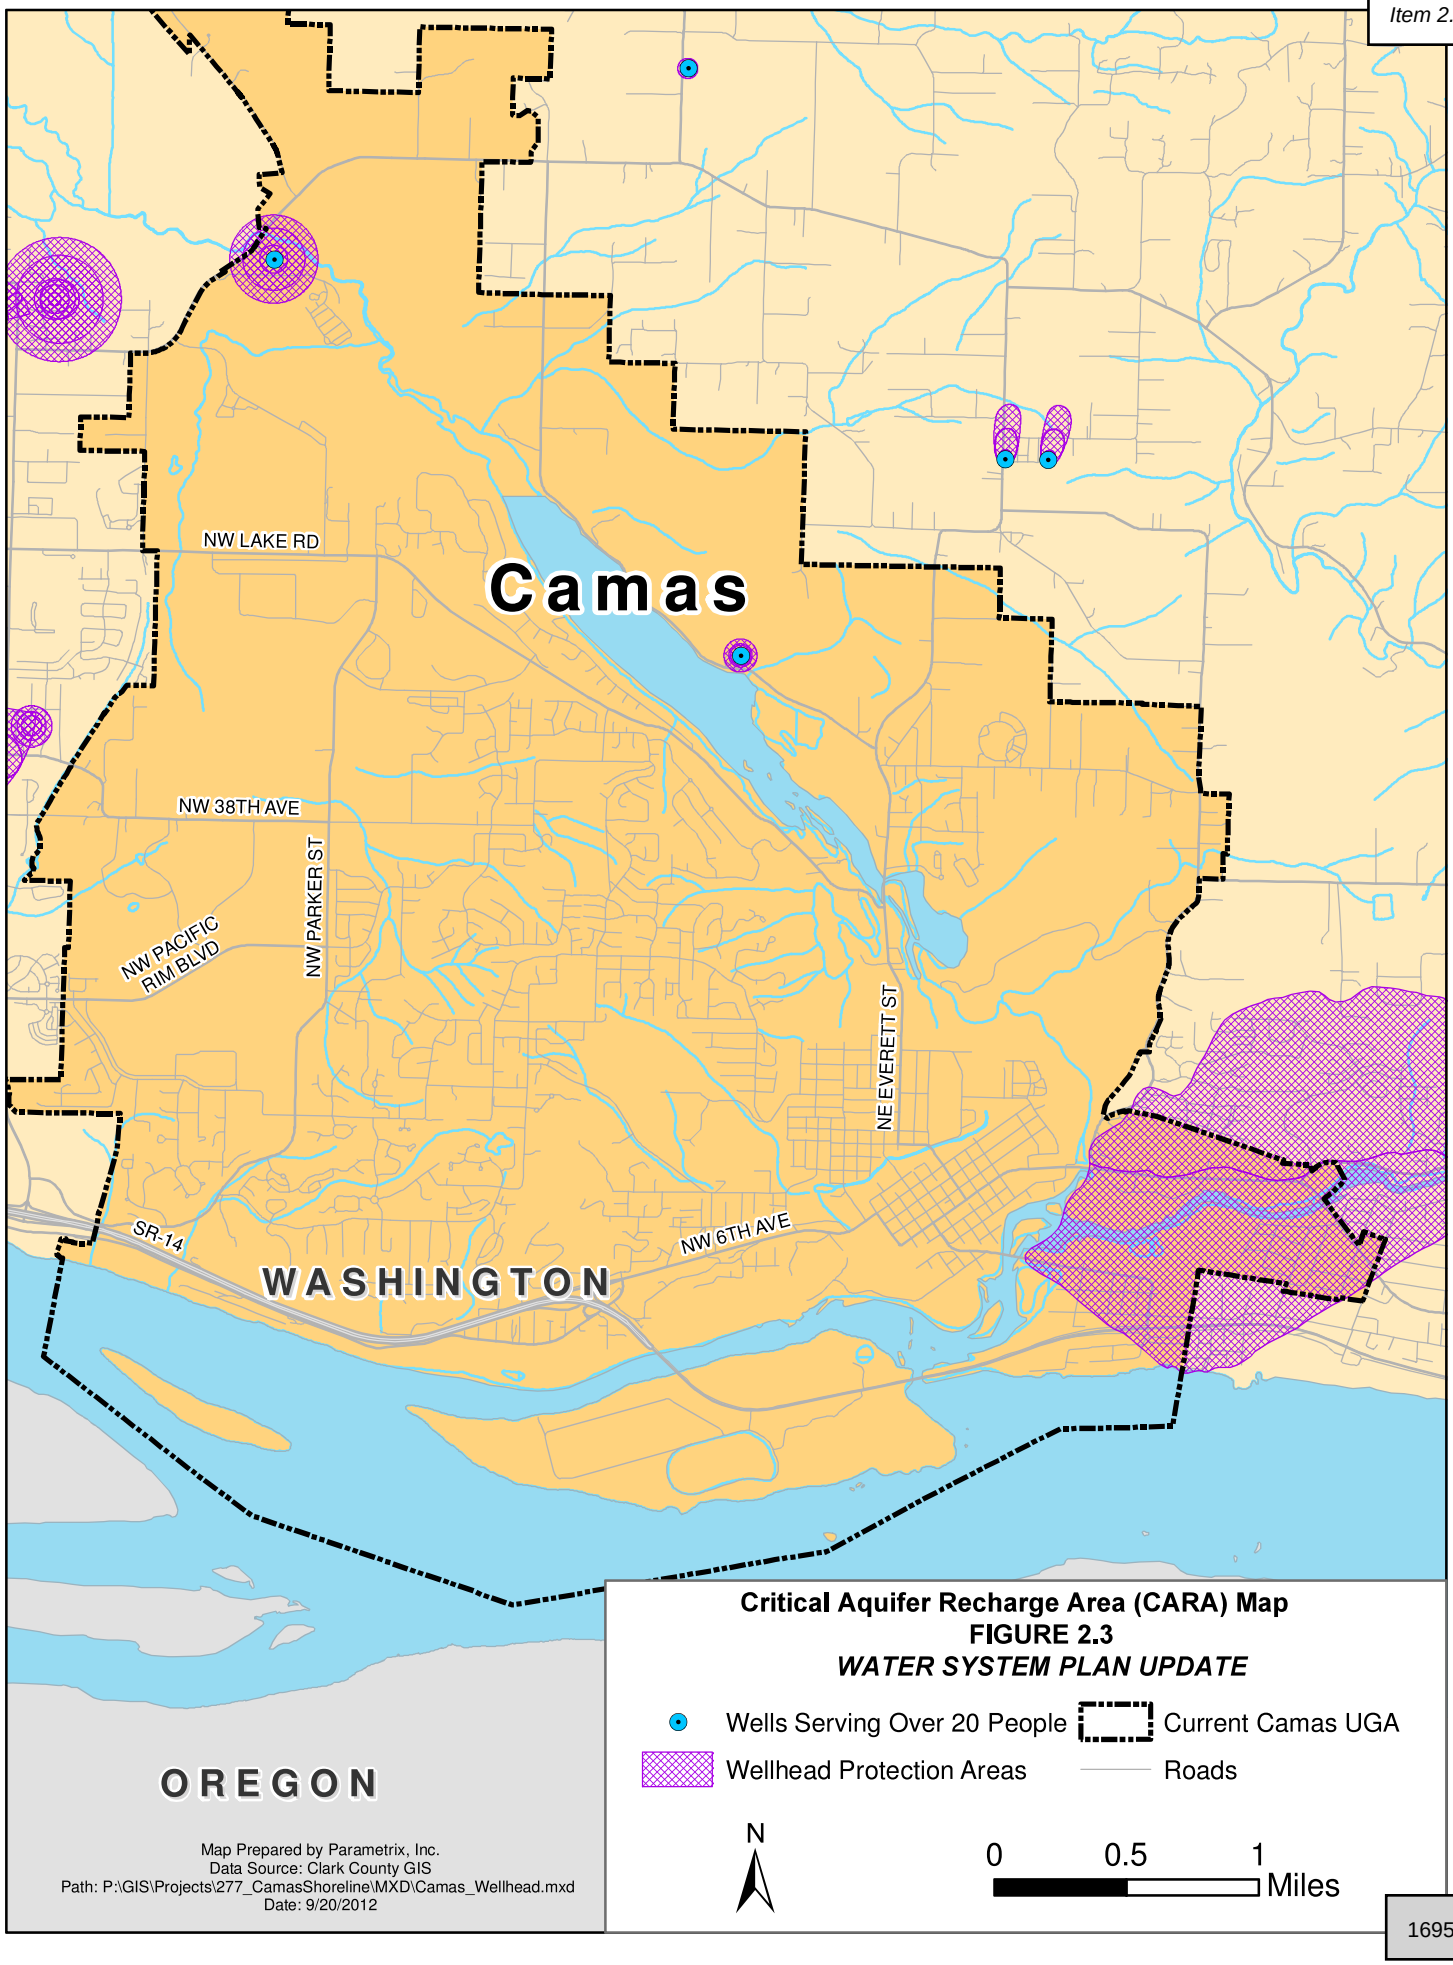


Lacamas Lake is over 60 feet deep in places. It receives flow from Lacamas Creek and Dwyer Creek. The Lake then discharges into Lacamas Creek, which flows into the Washougal River. The water level is controlled by dam located at the south end of the lake. Fallen Leaf Lake and Round Lake are man-made lakes and are smaller parts of Lacamas Lake, separated from Lacamas Lake by Everett Street.

The Washougal River flows southwest from the Cascade Mountains to the City of Camas, where it empties into the Columbia River. The Washougal River drainage basin is approximately 108 square miles in size and historical records report average flows at approximately 9,000 cfs.

The Little Washougal River, of which Jones and Boulder Creeks are tributaries, flows to the southwest out of the Cascade Mountains. The Little Washougal turns to the southeast before it crosses into the City of Camas UGA and empties into the greater Washougal River. The Little Washougal drainage basin covers approximately 23 square miles with historical average daily peak flows of approximately 1,317 cfs.

2.2.4.4 Critical Areas



Critical areas within the City include those classified as Critical Aquifer Recharge Areas, Fish and Wildlife habitat conservation areas, frequently flooded areas, geologically hazardous areas and wetlands. Given its importance to the water system, the City's Critical Aquifer Recharge area map is included as Figure 2.3. Please refer to the City's website for the up-to-date description and mapping of its Critical Areas.

2.2.4.5 Geology

The Clark County area exhibits traces of its geologic history, including repeated inundation by fluctuating sea levels during glacial epochs, the sedimentary processes of repeated flooding of the Columbia River, volcanic activity, periodic earthquakes, and other tectonic activity. The geologic units in Clark County reflect this varied history and can be placed into two general categories: older consolidated rocks and volcanic rocks. These include Columbia River Basalts and Skamania and Goble volcanic series, and sedimentary rocks incorporating unconsolidated gravels, silts, sands, and clays created by glacial and alluvial processes.

The main geological feature of Camas is Prune Hill, which is an extinct volcanic vent that much of the residential area resides on. Prune Hill is at the Northwest end of Camas and the City elevation drops off to the west and the Columbia River Gorge to the south. Lady Island, in the Columbia River Gorge, is separated from the mainland by the Camas Slough, and is mostly used for industrial purposes.

2.3 LEGISLATION, REGULATIONS, AND PERMITS

Water system planning is based on a careful analysis of a water utility's responsibility to comply with applicable regulatory requirements while providing service to existing and future customers. These regulatory requirements are the result of a number of state and federal laws. These laws are monitored and enforced by a number of federal, state, and local agencies.

In this section, the various state and federal legislation that may affect City operations are discussed, as well as other relevant permits, programs, and regulations

2.3.1 Federal Clean Water Act

The Federal Water Pollution Control Act is the principal law regulating the water quality of the nation's waterways. Although originally enacted in 1948, it was significantly revised in 1972 and 1977, when it was given the common title of the "Clean Water Act." The Clean Water Act (CWA) has been amended several times since 1977. The 1987 amendments replaced the Construction Grants program with the State Revolving Fund (SRF) which provides low-cost financing for a range of water quality infrastructure projects.

A CWA Section 401 Water Quality Certification is required for any activity that may result in discharge to surface waters including excavation activities that occur in streams, wetlands, or other Waters of the United States. In Washington State, CWA Section 401 responsibility has been assumed by the Washington State Department of Ecology (DOE), and is required for projects with CWA Section 404 Permits.

Section 404 of the CWA regulates discharges of fill or dredged materials in wetlands, including any related draining, flooding, and excavation. Pipeline and pump station projects

in wetlands will require a Section 404 Permits, in addition to any related local permits. CWA Section 404 Permits require Endangered Species Act (ESA), Section 7 consultation with the United States Fish and Wildlife Services (USFWS) and the National Marine Fisheries Service (NMFS) as a result of recent listings of salmonids. Biological Assessments, Biological Opinions, and their review have significantly lengthened the time required for issuance of CWA Section 404 Permits.

The Clean Water Rule (CWR), implemented by the United State Environmental Protection Agency (USEPA) in 2015, is an extension to the CWA whose purpose is to better define which waterways must be protected and to what extent. The CWR does not regulate groundwater but should be used to confirm the definition of all other waterways during City projects.

2.3.2 Safe Drinking Water Act

The Federal Safe Drinking Water Act (SDWA) was passed in 1974 and amended in 1986 and 1996. The Washington State Department of Health (DOH) adopted the federal standards under WAC 246-290, which became effective April 27, 2003. All public water systems as defined by the USEPA are affected by the SDWA. A public water system is defined as one that serves piped water to at least 25 people, or 15 connections for at least 60 days per year. The SDWA contains regulations regarding water quality, sampling, treatment, and public notification requirements that are applicable to the City.

2.3.3 Endangered Species Act

The purpose of the 1972 ESA is to "provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved…" In pursuit of this goal, the ESA authorizes USFWS and NMFS to list species as endangered or threatened, and to identify and protect the critical habitat of listed species. USFWS has jurisdiction over terrestrial and freshwater plants and animals such as bull trout and cutthroat trout, while NMFS is responsible for protection of marine species including anadromous salmon. Under the ESA, endangered status is conferred upon "any species within the foreseeable future throughout all or a significant portion of its range." The ESA defined critical habitat as the "geographical area containing physical and biological features essential to the conservation of species."

The Table 2.2 lists the Evolutionarily Significant Units (ESUs) of salmonid species present in the Camas area listed, or proposed for listing, under the authority of the ESA.

Table 2.2 Evolutionarily Significant of Listed Salmonid Species Water System Plan Update City of Camas		
Species	**Listing Status**	**Date Listed**
Columbia River Bull Trout	Threatened	June 1998
Lower Columbia River Chinook	Threatened	March 1999
Lower Columbia River Chum	Threatened	March 1999
Lower Columbia River Coho	Threatened	June 2005
Lower Columbia River Steelhead	Threatened	March 1998

Once a species is listed as endangered or threatened, the ESA makes it illegal for the government or individuals to "take" a listed species. "Take" has been interpreted by the federal courts to include "significant modification or degradation of critical habitat" that impairs essential behavior patterns. For species listed as endangered, the blanket prohibitions against "take" are immediate. However, threatened species may be protected through a more flexible Section 4(d) rule describing specific activities that are likely to result in a "take."

Since 2007, The City of Camas has updated its ordinance on critical areas and has adopted the Shoreline Master Program. These updates helped to clarify the specific activities in Section 4(d) and to increase the focus on migratory species.

2.3.4 Reclaimed Water Standards

The standards for the use of reclaimed water are outlined in the Revised Code of Washington (RCW) Section 90.46 and in a separate document published by DOE and DOH entitled "Water Reclamation and Reuse Standards." Reclaimed water is "the effluent derived in any part from sewage from a wastewater treatment system that has been adequately and reliably treated, such that it is no longer considered wastewater and is suitable for a beneficial use or a controlled use that would not otherwise occur" (Water Reclamation and Reuse Standards). The legislature has declared that "the utilization of reclaimed water by local communities for domestic, agricultural, industrial, recreational, and fish and wildlife habitat creation and enhancement purposes (including wetland enhancement) will contribute to the peace, health, safety, and welfare of the people of the State of Washington."

2.3.5 National Environmental Policy Act

The National Environmental Policy Act (NEPA) was established in 1969 and requires federal agencies to conduct environmental review or assessments of projects to determine impacts on all projects requiring federal permits or funding. If the project is determined to be environmentally insignificant, a Finding of No Significant Impact (FONSI) is issued,

otherwise an Environmental Impact Statement (EIS) is required. City activities requiring CWA Section 404 permits fall under the jurisdiction of NEPA.

The National Historic Preservation Act (NHPA) regulates federal activities with the potential to impact materials of historic, cultural, or archaeological significance under Section 106, which requires consultation with affected Native American Tribes and the Washington State Department of Archaeology and Historic Preservation. Documentation of this consultation is included in NEPA Environmental Reports and Assessments. Recent decisions by the United States Army Corps of Engineers (Corps) require an independent NHPA Section 106 consultation process for projects permitted by the Corps, which can result in significant delays to project implementation.

The State of Washington regulates state funded projects with the potential to impact material of historic, cultural, or archaeological significance under Governor's Executive Order 05-05, which requires consultation with the Department of Archaeology and Historic Preservation and affected Tribes similar to the NHPA Section 106 process.

2.3.6 State Environmental Policy Act

The State Environmental Policy Act (SEPA) that environmental issues are taken into consideration during the planning and process for Non-Federal projects. An EIS is required if a project will have a significant adverse environmental impact. The EIS looks at potential environmental problems that would be cause by the project; ways the project could be changed to minimize the impact; and mitigation options. The City is currently pursuing alternate source of supply, which may require an EIS depending on the type of projects that are involved. Most projects including water right applications and transfers, typically do not require an EIS. A SEPA checklist is prepared and a Determination of Non-significance is issued instead. This Plan will fall under the SEPA Checklist Non-Project Action requirement. The water system projects listed in the capital improvement plan will each be completed under a separate SEPA checklist. A SEPA checklist and determination of Non-significance for the Plan is indicated in the Appendix B.

2.3.7 Growth Management Act

The Washington State Growth Management Act (GMA) was enacted in 1990 and requires certain local governments to plan for the population growth that will occur over the next twenty years within an established UGA. The GMA also requires cities to classify critical areas (wetlands, aquifer, recharge areas, fish and wildlife habitat areas, geologically hazardous areas, and frequently flooded areas) and to establish development regulations to protect these areas. Clark County is updating its current plan, which was adopted in 2007, to extend through 2035. The update will include changes regarding population and employment growth for the next 20 years.

2.3.8 Shoreline Management Act Permit

A Shoreline Permit is required on all projects of $2,500 or more that are located on the water or shoreline area. Shorelines are lakes of reservoirs of 20 acres or greater, streams with a mean annual flow of 20 cubic feet per second or greater, marine waters, and an area within 200 feet of the ordinary high water mark. Areas within the City that are classified as shoreline are those areas along Lake Lacamas, Washougal River, Little Washougal River, and Columbia River.

2.3.9 Floodplain Development Permit

Local governments that are participating in the National Flood Insurance Program are required to review projects (including water system facilities) in a mapped flood plain and impose conditions to reduce potential damage from flood water. A Floodplain Development Permit is required prior to construction.

2.3.10 Hydraulic Project Approval

Under Washington Administrative Code (WAC) 220-110, the Washington State Department of Fish and Wildlife requires a hydraulic project approval (HPA) for activities that will "use, divert, obstruct, or change the natural flow or bed" of any waters of the state. For City activities such as pipeline crossings of streams or outfall and intake improvements, an HPA will be required, and must include provisions necessary to minimize project specific and cumulative impacts to fish.

Because of ESA listings throughout Washington, the Washington State Department of Fish and Wildlife and the NMFS revised the Hydraulic Code to protect species listed as threatened or endangered. The revisions to the code specifically aimed to, "incorporate up-to-date fish science technology, simplify the permitting of certain types of projects, improve procedural and administrative requirements to better align with statutory changes and, establish a structure for adaptive management that responds to changing science and technology and/or the results of effectiveness monitoring".

If NMFS determines that the revisions are sufficient to protect listed species, the State hopes the revised Code will constitute an accepted Habitat Conservation Plan under Section 10 of the ESA. If the Habitat Conservation Plan is approved, NMFS may issue an Incidental Take Permit allowing incidental take of a listed species if the permittee has complied with the Habitat Conservation Plan. This Incidental Take Permit expires after an agreed upon period of time, and may then be revised by NMFS.

2.3.11 Local Permits

The City has agreements with Clark County for the construction and maintenance of facilities in their respective rights-of-way. Under these agreements, an Encroachment Permit is issued that specifies construction standards such as traffic control, work hours, and safety issues, as well as design and restoration standards.

2.4 WATER RIGHTS

A water right is the legal authorization to use a specified amount of public water for a certain beneficial purpose. Washington State law requires that permission in the form of a water right permit or certificate be granted for most appropriations of public water. Water rights are issued by DOE and are required to ensure proper allocation and management of water resources. The following sections provide definitions of key terms with regards to water rights.

2.4.1 Water Right Claim

A water right claim is a statement of claim to water use that began before the State Water Codes were adopted and is not covered by a permit or certificate. A claim may represent a valid water right if it describes the use of a surface water source that began before 1917 or the use of groundwater source that began before 1945. It can also represent a water right claim that was filed with the State during an open filing period designated under RCW 90.14, or is covered by the groundwater exemption.

2.4.2 Water Right Permit

A water right permit is issued by the State for water right applicants to begin developing their water right. A water right is developed when the applicant follows the provisions outlined in their permit such as using the water for the purposes and limits stated in the permit. A water right permit will remain in effect until the water right certificate is issued, if all terms of the permit are met, or the permit is canceled.

2.4.3 Water Right Certificate

A water right certificate is issued by DOE to certify that the water user has the authority to withdraw a specific amount of water under certain conditions. The conditions are based on the beneficial use of the water under the water right permit. The water right certificate is a legal document recorded at the county auditor's office. Issuance of the water right certificate is the final step in obtaining a water right.

2.5 REGULATORY AGENCIES

The above regulations, permits, and programs, are administered by various local, state, and federal agencies. The history, purpose, and authority of these agencies are discussed below.

2.5.1 United States Environmental Protection Agency

The stated mission of the USEPA is to protect human health and to safeguard the natural environment upon which life depends. The USEPA's purpose includes protecting all Americans from significant human health risks, ensuring that national environmental efforts are based on the best available scientific information, ensuring that federal laws are

enforced fairly, and that the environmental protection contributes to making our communities and ecosystems diverse, sustainable, and economically productive. DOE currently administers the SRF loans for the USEPA.

2.5.2 United States Fish and Wildlife Service

Under the ESA, USFWS is responsible for the protection of all non-marine life including birds, mammals, and non-anadomous fish, including bull trout and sea-run cutthroat. Although USFWS may choose to invoke the blanket prohibitions of Section 9, the "threatened" status of Bull Trout allows more flexibility to establish regulations designed to protect these species. These regulations, known collectively as Section 4(d) rule, online activities likely to result in a "take" of a threatened species, as well as exempted activities.

2.5.3 The National Marine Fisheries Service

Under the ESA, the NMFS is responsible for the protection of marine life, including anadromous salmon such as the Columbia River Chinook, Chum, and Steelhead. When a species is listed as "endangered" the prohibitions against "take" of the species are immediate under Section 9 of the ESA of the Act. Although NMFS may choose to invoke the blanket prohibitions of Section 9, the "threatened" status of the Columbia River Chinook, Coho, Chum, and Steelhead allows more flexibility to establish regulations designed to protect these species. These regulations, known collectively as a Section 4(d) rule, outline activities likely to result in a "take" of a threatened species, as well as exempted activities. The final 4(d) Rule was adopted on June 20, 2000.

2.5.4 United States Army Corps of Engineers

Under Section 404 of the CWA, the Corps is authorized to regulate discharge of fill and dredged material to waters of the United States, including wetlands. A similar review process is employed for projects with the potential to impact navigable waters, including the Columbia River, under Section 10 of the Rivers and Harbors Act of 1899. This process applies to any work on outfalls to the Columbia River. The Corps employs a system of General or Nationwide Permits for blanket authorization of activities such as utility lines that have minimal adverse impact on the environment. In situations where projects are large and complex, or adverse impact is probable, the Corps may issue an Individual Permit after reviewing an alternatives analysis. Enforcement actions may be brought by the Corps or the USEPA. Activities subject to Corps jurisdiction require NEPA and ESA review and consultation.

2.5.5 Washington State Department of Health

DOH has three primary functions: to regularly assess the State's health needs and resources; to develop and implement sound public policy; and to ensure the capacity of public health agencies to manage daily operations and respond to public health emergencies. The DOH was granted full authority and responsibility for the regulation and

enforcement of the SDWA by the federal government in 1976. DOH also publishes guidelines for the preparation of water system plans, water conservation programs, design and drinking water quality standards, and watershed control programs. Water system comprehensive plans must be reviewed and approved by DOH. Construction plans and specifications must also be reviewed by DOH unless they are the transmission or distribution improvements included in the Water System Comprehensive Plan, Capital Improvement Program.

2.5.6 Washington State Department of Ecology

The mission of the DOE Water Quality Program is to protect, preserve, and enhance the State's surface and ground water quality and to promote the wise management of water for the benefit of current and future generations. DOE performs various functions under State and federal authority and has both local and regional offices. DOE oversees the allocation of water rights.

2.5.7 Washington State Department of Fish and Wildlife

Under the updated Hydraulic Code Rules WAC 220-660, and RCW 75.20, any form of work that uses, diverts, obstructs, or changes the natural flow or bed of any fresh water of the State requires hydraulic project approval from the Department of Fish and Wildlife. Approval would be required for all City construction projects that cross or otherwise take place in streams or shorelines.

2.5.8 Watershed Resource Inventory Area

Under WAC 173-500-040, Washington State was divided into 62 geographic areas, defined on the basis of surface water resource. These 62 geographic areas are defined as Water Resource Inventory Areas (WRIAs). The purpose of WRIA is to implement effective planning involving all jurisdictions that fall within WRIA, including county, city, and other local, state, and national agencies.

The City of Camas and the Jones and Boulder Creek watersheds reside within WRIA 28. The City owns and controls a majority of the Jones and Boulder Creek watersheds, Figure 1.2, which are both tributaries of the Washougal River. The City is an active participant in regional watershed planning efforts.

2.5.9 Local Health Departments

The Clark County Department of Health is the local health department governing the City. In general, local health departments may adopt and enforce local regulations when they are consistent with and more stringent than state regulations.

2.5.10 County Planning Policies

City planning policies should be consistent with those of Clark County. Accordingly, this Plan will require approval by Clark County.

2.6 CITY POLICIES

Planning policies are important in guiding the development of a water system. The City has adopted many resolutions regarding water system planning that are included in the City Code.

2.6.1 Related Documents

The City of Camas recognizes that planning activities of governmental entities can affect the water utility. These include several regional and local plans of the southwest region of Washington, such as Clark County. Some related plans affect how Camas operates its water system and how it plans to meet future growth. The following section summarizes these related plans.

2.6.2 Regional Planning Documents

2.6.2.1 Clark County Coordinated Water System Plan

Amended and adopted in 2012, the Coordinated Water System Plan (CWSP) serves as a primary planning document for water purveyors within Clark County. The CWSP was developed to fulfill the requirements of the 1977 Public Water System Coordination Act (RCW 70.116) and the 1971 Water Resource Act (RCW 90.54). The plan is in accordance with the Lewis and Salmon-Washougal Water Resources Management Program rules (WAC 173-527 and WAC 173-528). These acts work together to create a framework for water utilities, which allows for coordinated planning and construction programs among adjacent water utilities. Also, these acts allow utilities in a specified geographical area to reserve water rights required to meet projected municipal and industrial needs for a 50 year period. In order for reservation of water rights and coordination of water system planning to occur, a CWSP is required to be developed.

A Clark County Water Utility Coordinating Committee (WUCC) was created in 1977 and requested that the DOH assess the need for a designation of a Critical Water Supply Service Area. Such designation represents the first step toward the development of a CWSP. The assessment, which was completed in 1980, addressed problems within the county related to inadequate water quality, unreliable service, and the lack of coordinated planning by the water utilities. Based on the findings of the assessment, the County Commissioners declared Clark County a Critical Water Supply Service Area. Following that determination, development of the 1983 CWSP was initiated.

The Coordination Act requires that the CWSP be reviewed and updated by the water utility coordinating committee, if the water utility coordinating committee feels it necessary; the

last update occurring in 2012. The update serves as the regional supplement to local water system plans that have been or will be approved by DOH.

The 2012 CWSP:

- Addresses local legislative and CWSP policies.
- Updates water utility service area boundaries.
- Requires consistent water utility design standards.
- Adopts a utility service review procedure.
- Establishes a satellite system management agency.
- Assesses water resources.
- Reviews water supplies.

The 2012 CWSP addressed recent changes to Washington State's satellite system management agency regulations and the Lewis and Salmon-Washougal Water Resources Management Program rules.

2.6.2.2 Clark County Comprehensive Plan (2015 - 2035)

In response to rapid growth and growth-related pressures in the late 1980s, the State Legislature enacted the Washington State GMA to establish a framework for comprehensive planning efforts by local governments to accommodate anticipated growth and development. Under the GMA, each county is required to adopt a comprehensive plan and to do so in consultation with its cities.

The intent of the comprehensive plan is to build on the Community Framework Plan and the 20 Year Plan revised in 1997, 2004, 2007, and 2016 to present a clear vision for Clark County's future through 2035. The plan includes comprehensive planning elements addressing issues of land use, housing, rural and natural resources, environmental goals, transportation, capital facilities and utilities, parks and open space, historic preservation, economic development, school policies and goals, community design, annexation, Shoreline Master Program goals and policies, and procedures for planning for a twenty year planning horizon. For each element included there is an introduction, a discussion of that element's relationship to other elements, a description of existing conditions, estimates and projections of future needs, and goals and policies. Additionally, the plan contains strategies for implementation of these goals and policies.

2.6.2.3 Clark County Public Utilities Water System Plan

Clark Public Utilities 2011 Water System Plan (CH2M Hill) evaluates the long-term water supply needs and resources available for Clark Public Utilities (CPU). The following studies and investigations are included in the CPU Plan: an inventory of existing wells, water supply systems, and interties in the County; an analysis of the population, history, and water

requirements to the year 2029; and supplies to serve future water needs. Future supplies are expected to come from CPU's South Lake Wellfield.

2.6.2.4 Metropolitan Transportation Plan for Clark County

The Southwest Washington Regional Transportation Council is the region's principal transportation planning organization. As a means to link transportation and land use, the Council periodically produces a regional transportation plan for the metropolitan area of Clark County. The plan is developed through a coordinated process between local jurisdictions in order to develop regional solutions to transportation needs for the next 20 years and to direct the metropolitan transportation planning process.

The demographic analysis and water demand projections, documented in Chapter 5, were developed based on the best available information at the time, 2013, which was the Regional Transportation Plan (RTP) for Clark County, 2011. In order to establish transportation needs over the 20-year planning period, the Council used a regional travel forecasting model. The model is based on historic and future demographic data allocated by Clark County to 665 individual transportation analysis zones (TAZs) within Clark County. Each TAZ was populated with 2010 and future (2035) population, household, and employment demographic data. Historic demographic data was obtained from Census 2010 and future data was based on the results of forecasts performed by the Washington State Office of Financial Management.

2.6.2.5 City of Vancouver Comprehensive Water System Plan

The City of Vancouver's Comprehensive Water System Plan is updated every six years; most recently in 2015. The purpose of the plan is to develop a planning strategy for the city's retail water service area by evaluating the existing system and its ability to meet the anticipated requirements for water source, quality, transmission, storage, and distribution over a twenty-year planning period. Water system improvements were identified to meet changes in regulatory impacts, and population growth, as well as infrastructure repair and replacement. The plan also identified planning level costs of the improvement projects and provided a financial plan for funding the projects. The plan was prepared in accordance with DOH WAC 246-290 requirements

2.6.2.6 City of Washougal Water System Plan Update

The City of Washougal's Water System Plan Update was completed in 2015. The Plan states its purpose "is to document the City of Washougal's water system infrastructure and evaluate the system's physical and financial adequacy to provide water to existing customers and projected growth within the water service area. This plan includes an inventory of existing facilities, establishing criteria for water system analysis and analyzing the hydraulic capacity of the system, developing a capital improvement program (CIP) based on the hydraulic analysis and developing a financial plan to fund the proposed CIP and assess existing revenue and expenses. This plan also includes an assessment of the

City of Washougal's groundwater resources, water rights and water use efficiency program." The plan was prepared in accordance with DOH WAC 246-290 requirements.

2.6.2.7 Salmon-Washougal and Lewis Watershed Management Plan (Lower Columbia Fish Recovery Board, July 21, 2006)

The Watershed Management Act (RCW Chapter 90.82) provides a framework to address and resolve water resource issues in each of the state's 62 WRIAs. Planning units created for each WRIA are responsible for developing a watershed plan. The planning units consist of citizens, tribes, interest groups, and government agencies where appropriate. Camas's water system boundaries and the boundaries of surrounding water providers are within the Salmon-Washougal and Lewis watersheds (WRIAs 27 and 28). The Salmon-Washougal and Lewis Watershed Management Plan (WRIA Plan) was adopted in 2006. The WRIA Plan addresses a range of issues related to water resources, including water supply, stream flow management, water quality, and fish habitat. It reviews alternative approaches for managing water resources in the area and recommends select strategies for implementation.

The Salmon-Washougal and Lewis Water Resources Management Program rules were adopted in 2008 (WAC 173-527 and WAC 173-528). These rules were based on the WRIA Plan and had five key elements:

- Setting Instream Flows,
- Closing sub-basins to future withdrawals,
- Designating "regional supply areas" for future water supply,
- Establishing reservations for water for future use, and
- Specifying conditions of use for access to the water reserves.

2.6.2.8 City of Camas 2010 Water System Comprehensive Plan (Gray & Osborne, Inc.)

Camas' Water System Comprehensive Plan was developed to meet the City of Camas' water system needs for a 20-year planning period. The plan was prepared in accordance with DOH WAC 246-290 requirements and includes:

- A water system description.
- Historical and future water use.
- Service area population and water demand projections.
- Water quality and Safe Drinking Water Act impacts.
- A water system analysis, including a computer simulation model.
- CIP.

The base 6-year CIP includes pipeline, pumping, control, storage, and source improvements. These improvements include the development of multiple well sites and

future sources, developing or replacing storage reservoirs throughout the system, transmission and distribution improvements, and booster station improvements. New wells will provide 4,350 gpm of supplies within the 20-year planning period. The elements and the direction of Camas' plan were consistent with activities and plans of this WSP.

2.6.2.9 Jones and Boulder Creek Watershed Forest Management Plan

The City of Camas Boulder Creek and Jones Creek watershed consists of roughly 1,700 acres of forest where the City collects its water. There has been minimal amount of work done in the area to keep it managed. The largest work was in 2011 when AKS Engineering & Forestry (AKS) performed a timber inventory. This document summarizes the work that was done so that the City could periodically receive timber income while still protecting and maintaining water quality. The contents consists of an assessment of existing resources, a timber harvesting plan, an access and road plan, and implementation methods, guidelines and management recommendations.

2.7 DRAFT POLICIES AND CRITERIA

The City manages its water utility in accordance with established water system policies. The policies provide a consistent framework for the design, operation, maintenance, and service of the water system for appropriately implementing programs, designing new infrastructure, and serving additional customers. The policies and planning considerations set forth herein pertain solely to the water system; the City has additional land use, development, and finance policies that may specify additional requirements for development or extension of a water service. Table 2.3 summarized the City of Camas Service and Extension Policies.

The following documents were reviewed for this update of the City's water policies:

- City of Camas Municipal Code (CMC).
- City of Camas 2010 Water System Plan (2010 WSP).
- City of Camas Design Standards (City Design Standards).
- City of Camas Comprehensive Plan 2004 (2004 Comp Plan).
- Clark County Coordinated Water System Plan (CWSP).
- Clark County Coordinated Water System Minimum Standards & Specifications (CWSP MSS) (Appendix V-A to the CWSP).
- Clark County Code (CCC).
- Revised Code of Washington (RCW).
- Uniform Plumbing Code (UPC).
- International Fire Code (IFC).

Table 2.3 Service and Extension Policies
Water System Plan Update
City of Camas

Policy Name	City of Camas Policy and Criteria	Reference	Action Items
Duty to Serve	The City will exercise reasonable diligence and care to furnish and deliver a continuous and sufficient supply of pure water to the customer, and to avoid any shortage or interruption of delivery of same The City will meet all regulatory requirements for management of its water system and provision of water to its customers, including water quality, system pressure, and adequate supply.	CMC 13.16.010, 2016 WSP	
Government Consistency	The City's Water System Comprehensive Plan will be consistent with local, county, and state land use authorities and plans and will comply with the Washington State Growth Management Act.	2019 WSP	
Retail Water Service Area	The City will provide water service to all customers within its Retail Water Service Area meeting the City's requirements.		City to update text to be consistent with Comp Plan.
Future Water Service Area	The City's future water service area shall be determined through the Coordinated Water System Plan and adopted through the "Interlocal Agreement for Adjusting or Confirming Future Water Service Area Boundaries Between The Cities of Battle Ground, Camas, Ridgefield, Vancouver, and Washougal, and Clark Public Utilities".	2019 WSP	
Condition of Service	It is unlawful for any person, except duly authorized city employees, to make connections with any water main or water pipe belonging to the municipal water supply system, without first obtaining written permission to do so from the public works director or his designated representative.	CMC 13.32.030	
Annexation	Annexation to the City is required as a condition of the City's provision of water service for City and UGA Customers.		City to review and update language
Service to customers outside of UGA boundary	The City will continue to provide water service to [existing] customers outside of the City's Urban Growth Area (UGA) Boundary but within the established Water Service Area. The City is not required to provide fire flow to such customers. The City reserves the right to deny service to new customers outside the UGA that do not meet City requirements.	2010 WSP	City to review highlighted text.
Water Main Extensions	A. Extensions to water mains will be made only upon proper petitions to the City. The City shall have the right to reject such petitions or enter into contract with the petitioners under such conditions as the City may elect. B. All water main extensions installed, whether within or without the corporate limits of the City, shall be ~~six~~ [eight] inches in diameter or larger. C. All extensions of mains required to serve new customers shall be constructed at the expense of such customers. All extensions shall extend to and across the full width of the property served with water. No property shall be served with City water unless the water main is extended to the extreme boundary limit of the property line extending the full length of the front footage of the property.	CMC 13.48.010, 2016 WSP recommended change	City to review and update "to and through" language

Table 2.4 Service and Extension Policies
Water System Plan Update
City of Camas

Policy Name	City of Camas Policy and Criteria	Reference	Action Items
Oversizing	The City Council may enter into a development agreement pursuant to RCW 36.70(b).170 whereby it agrees to set aside and reserve capacity in the municipal water system for a prospective development. Such development agreement shall be permitted only if the city council makes a specific finding that the public good and general welfare will be benefited by such agreement.	CMC 13.12.085 (A)	
	If in the judgment of the water department of the city, it is in the best interest of the City and of the general area where a new main is contemplated to install a larger main than that required by the immediate development, the city may install such larger main and shall pay the increased difference in cost between installation of the smaller and of the larger main. The City may participate to the extent permitted by law, through SDC credits, Local Improvement District (LIDs), or other payback agreements to assist in the financing of such improvements. • Water system extensions needed to serve new development shall be built prior to or simultaneous with such development, according to the size and configuration identified by the Comprehensive Water Plan as necessary to serve future planned development. • The location and design of these facilities shall give full consideration to the ease of operation and maintenance of these facilities by the City. • Wherever any form of City finance is involved in a water line extension, lines that promote a compact development pattern will be favored over lines traversing large undeveloped areas where future development plans are uncertain.	CMC 13.48.010 (C), 2016 WSP	City to review and update to be consistent with current practices.
Latecomer Agreements	The City may choose to allow reimbursement contracts in exchange for permission to develop and allow for reimbursement to the initial developer by future users in the area who will benefit from the system expansion. The developer must be willing to front the initial expense of system expansion.		
Satellite Management Area	The City may assume the operation of a water district or private water system within the City limit, at the water system's request, if the following conditions are met and subject to approval of the City Council: 1. The district or private system is adjacent to or within the City's current or future RWSA as identified in the City's comprehensive plan. 2. The assumption of the district or private system is permitted by State law. 3. The district's or private system's facilities meet the City's performance criteria and engineering standards, or a plan is in place to assure that they will be brought up to City standards without adversely impacting City's existing customers financially or with regard to level of service. 4. Any extension of the City's system to connect the newly accepted system will be paid by the district or private system. 5. The City shall require the district or private system to transfer the ownership of its water supply sources and associated water rights to the City. Water rights must be successfully transferred to the City and approved for municipal water use by the DOE prior to commitment from the City for water service.	2019 WSP	City to review and update to be consistent with current practices

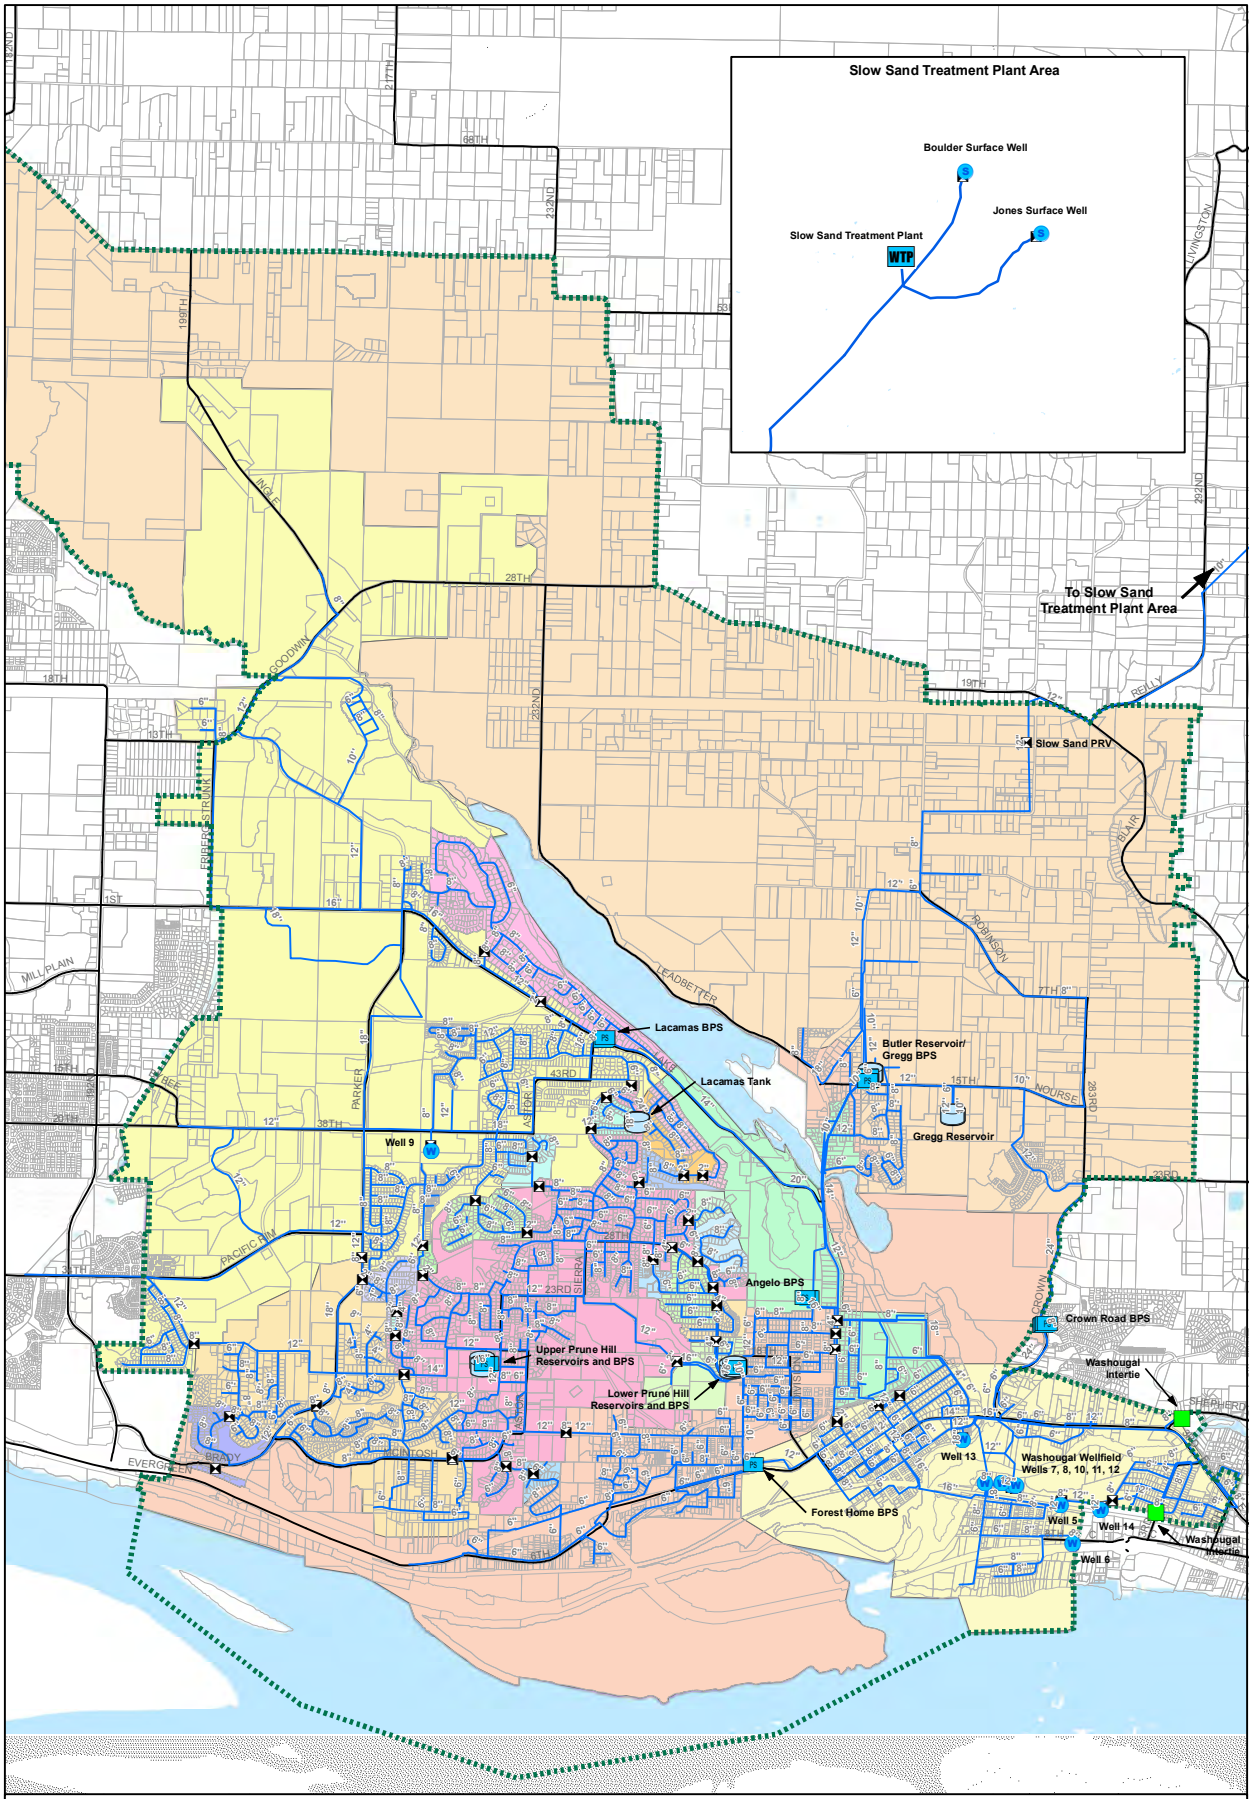
Table 2.5 Service and Extension Policies
Water System Plan Update
City of Camas

Policy Name	City of Camas Policy and Criteria	Reference	Action Items
Developer Extensions outside of City UGA Boundary	The City will provide water service to developer extensions outside the City's existing UGA but within the established Retail Water Service Area whenever reasonably possible. Developer extensions shall adhere to the established SDC.	2010 WSP	
New Customers with Existing Wells	Developer extensions shall adhere to the established SDC and shall abandon all private wells and relinquish associated water rights to the City as a provision of the SDC. Water rights procured in this manner will be used to accommodate growth in the Retail Water Service Area.	2010 WSP	
Metering	All services to the water system shall be metered.	CMC 13.40.010 (A)	
Source Metering	All supply sources will be metered either at individual wells or at a common flow meter.	2019 WSP	

Chapter 3

EXISTING SYSTEM

3.1 INTRODUCTION

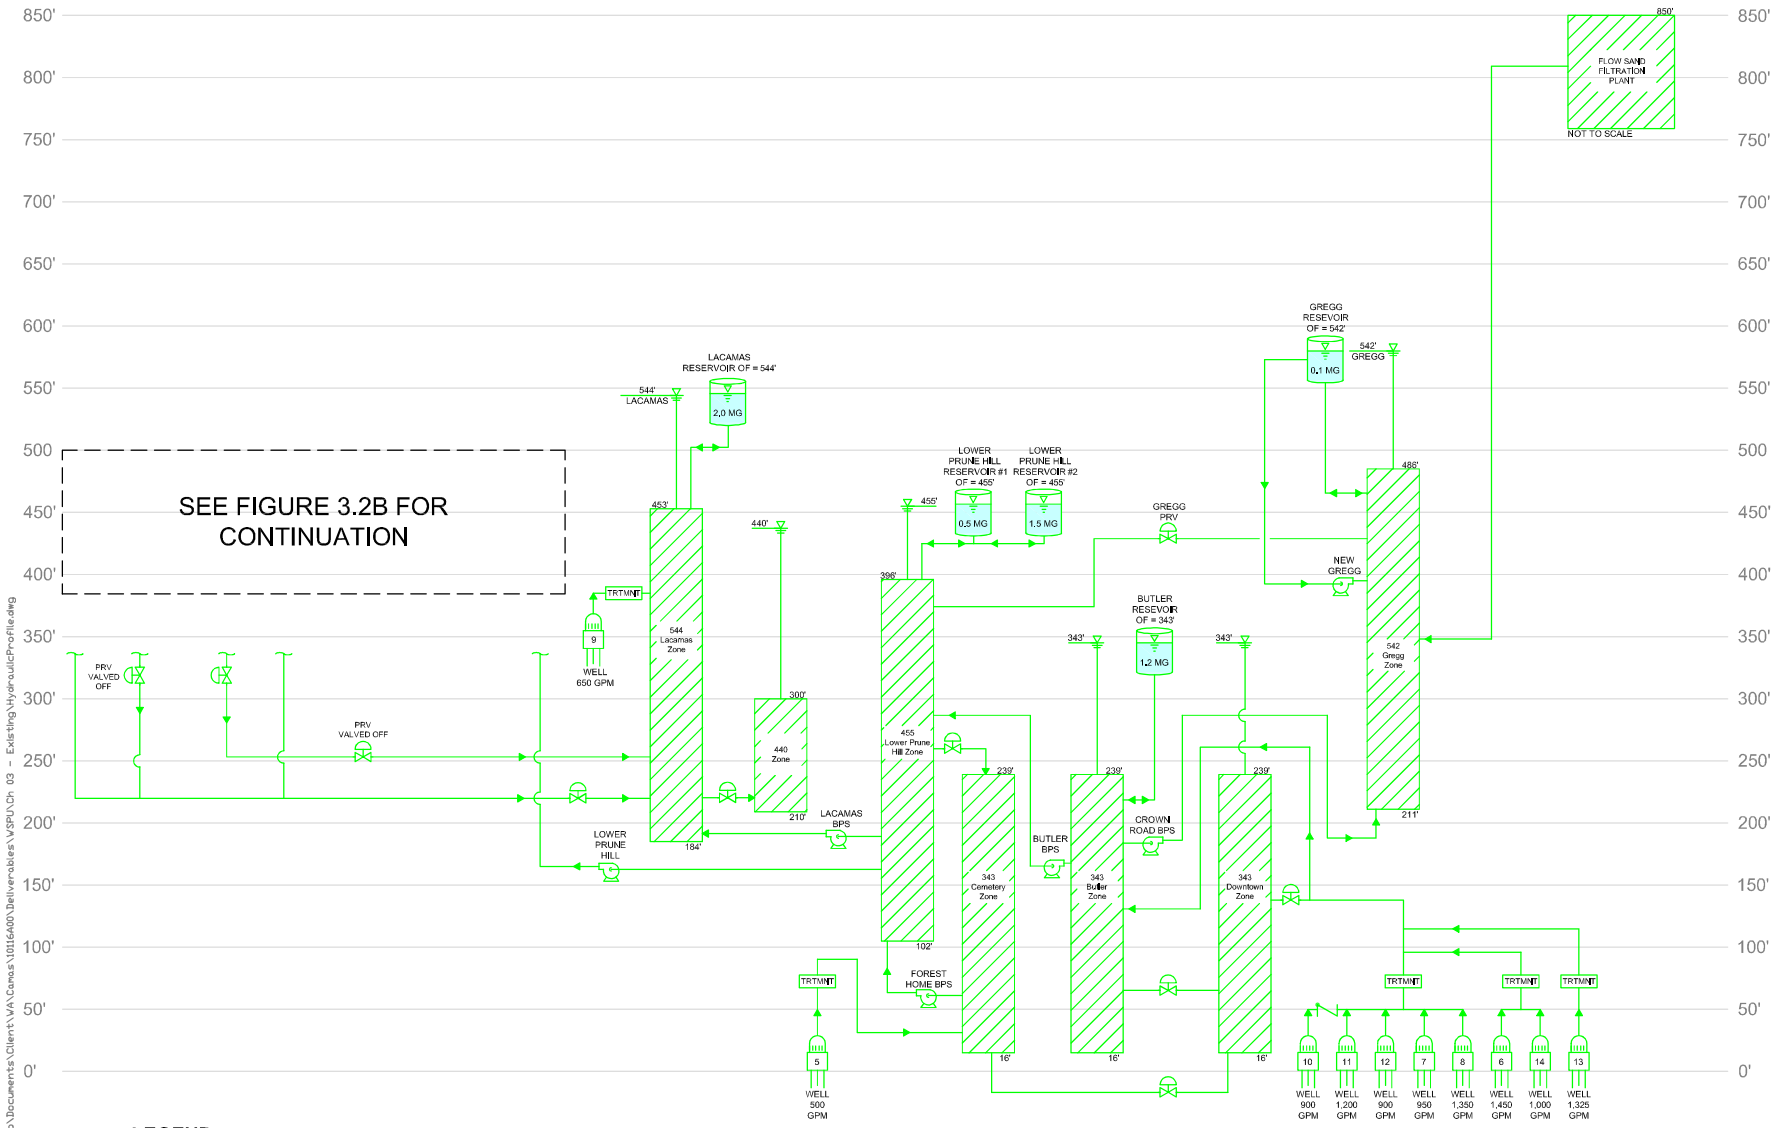


The City of Camas, WA (City) owns and operates a multi-source municipal water system (Washington State Department of Health (DOH) System Number 108002), which includes supply, treatment, storage, and distribution of potable water to residential and commercial customers. Service is provided to customers across 5 major pressure zones and 18 subzones. The locations of pressure zones and key elements of the water system are shown in Figure 3.1. The hydraulic profile of the City's water system is shown in Figure 3.2A and 3.2B. This chapter reviews all of the system components incorporated in the water supply system and provides a brief summary of each facility as shown below:

- Pressure Zones.
- Sources of Supply.
- Water Treatment.
- Storage Facilities.
- Transmission and Distribution Facilities.
- Booster Pumping Stations.
- Interties.
- Supervisory Control and Data Acquisition (SCADA).

3.2 PRESSURE ZONES

The City has five main areas that serve as pressure zones in the system, these are the 343 Zone - Butler, the 455 Zone - Lower Prune Hill (LPH), the 852 Zone - Upper Prune Hill (UPH), the 544 Zone - Lacamas, and the 542 Zone - Gregg, named for the reservoir that serves the area. Subzones are supplied through pressure reducing valves (PRVs) and are typically associated with a specific development. The 852 Zone serves 17 subzones while the 544 Zone serves the only other subzone. The maximum and minimum elevation served within each zone is shown Table 3.1.



The 343 Zone – Butler is unique in that customers are not served directly from the Zone. Customers are served from the subzones: 343 Zone - Downtown via the 343 Zone – Butler and 343 Zone - Cemetery (also known as the Upper Zone), which is supplied mainly from the 455 Zone – LPH.

Notes:
(1) Zone ID is based on hydraulic grade line (HGL).
(2) Elevation data based on interpolation of 2-ft contours.
(3) Location of service connections based on model node location.

3.3 SOURCES OF SUPPLY

The City currently obtains its water from ten groundwater wells and two surface water sources. Nine of the ten groundwater sources are located in the downtown area, in the Butler 343 Zone, and Well 9 is located in the Lacamas 544 Zone. The City's seasonal surface water sources are from Jones and Boulder Creeks to the north of the City as shown in Figure 3.1.

3.3.1 Surface Water Sources

Jones Creek has been providing the City of Camas with water since 1913. The Boulder Creek source was added in 1931. The intakes at Boulder and Jones Creeks consist of small settling basins and screens. Surface water sources may be operated between November 1st and May 15th. Seasonal raw water from the Boulder and Jones Creek intakes is conveyed to the recently constructed slow sand filtration treatment plant (SSF Plant) where the water is filtered prior to chemical treatment and discharge to the distribution system.

The SSF Plant has the capacity to treat the entire permitted flow of 1,570 gallons per minute (gpm) from the City's surface water sources. The surface water sources have lower operating expenses because they can provide flow toward two pressure zones without pumping, and have low silica content, which makes these sources more desirable to light industrial customers and their water quality sensitive industrial processes. However, these surface water sources are not available during peak water demand months. The City calls its groundwater sources only after demands cannot be met by production from the SSF Plant.

3.3.2 Groundwater Sources

The City currently operates ten groundwater wells. All of these wells are located in the 343 Zone with the exception of Well 9. Wells 7, 8, 10, 11, and 12 are located on SE 6th Avenue, in the eastern downtown area, and are referred to as the Washougal Wellfield. Wells 6 and 14 are located farther east along SE 6th Avenue near the Camas/Washougal border. The wellfield supply is conveyed across the Washougal River via a 14-inch steel line under the river and a 24-inch ductile iron pipe on a bridge over the river. The two pipes join and an 18-inch transmission line carries water from the Washougal Wellfield up toward the Angelo Booster Station. Well 5 is located south of Well 6 on SE 8th Street. Well 13 is located in the downtown 343 Zone on SE Cramer Lane. Well 9 is located in the 544 Zone on NW 38th Avenue near Parker Street. Table 3.2 lists the City's groundwater sources and their capacities. The City is currently investigating additional groundwater sources within its service area in anticipation of future demands.

Several of the City's groundwater sources must be operated with a booster pumping station in service to prevent over pressurization:

- When Well 5 is called into service, the Forest Home Booster Station must also be called on to prevent over pressurization of the downtown zone.
- Washougal Wellfield operations are matched by pumping at the Angelo Booster Station. For each well that is called on at the wellfield, for up to four total wells, a corresponding pump must be called on at the Angelo Booster Station.
- In addition, there are piping restrictions that prevent the City from operating Well 6 and Well 14 at the same time.

The J.D Currie Youth Camp (Camp Currie) Well was small shallow well with a hand pump that served the camp. The City has taken over Camp Currie and upgraded the well with a new pumping system, with electricity, concrete landing and a new yard hydrant. The City maintains the well and monitors it per DOH schedule. The City also previously operated a well at Camp Lacamas Retreat and Conference Center. The City has extended water service to Camp Lacamas and the well has been abandoned.

Table 3.2 Groundwater Sources
Water System Plan Update
City of Camas

	Depth (feet)	Rated Capacity (gpm)	Motor (hp)(1)	Casing (inch)	Control Valve	Auxiliary Power
Well 5	71	500	75	8	3-inch waste valve	No
Well 6	85	1,000	150	16	4-inch waste valve	No
Well 7	84	950	100	14	3-inch waste valve	No
Well 8	87	1,350	150	14	4-inch waste valve	Yes
Well 9	253	650	100	16	4-inch waste valve	No
Well 10	92	900	200	16	8-inch	No
Well 11	105	1,200	200	16	8-inch	Yes
Well 12	106	900	200	16	8-inch	Yes
Well 13	102	1,325	200	20	8-inch	Yes
Well 14	85	1,000	200	20	8-inch	Yes
Total Groundwater Source Capacity				**10,255 gpm**		

Note:
(1) hp - horsepower.

3.4 WATER TREATMENT

The City currently has approximately 15.5 million gallons per day (mgd) of total source water treatment capacity. A discussion of the treatment facilities is provided in the following sections. A summary of treatment facilities is provided in Table 3.3 and facility locations are shown in Figure 3.1.

3.4.1 Surface Water

The City's surface water is chlorinated and filtered. Chlorination of the surface water occurs at the City's slow sand facility with .840 sodium hypochlorite. The distance between the slow sand plant and the first customer provides 2.5 hours of contact time.

In 2013 the City began construction of the SSF Plant. This plant has a design capacity of 1,570 gpm and filter beds are comprised entirely of sand. The City also treats with sodium fluoride for dental benefits.

3.4.2 Groundwater

Treatment of the City's groundwater sources includes on-site chlorination, fluoridation, and caustic soda addition. A single chemical feed facility provides treatment for Wells 7, 8, 10, 11, and 12 due to their close proximity to one another. Water from Wells 6 and 14 are treated at the Well 14 site. The remaining wells each have individual treatment facilities at the well locations. Fluoridation always occurs downstream of the well pump and sodium fluoride is used at all facilities. Sodium hydroxide, also known as caustic soda, is added for corrosion control at each of the treatment facilities with the exception of Well 9 due to natural pH. The existing treatment facilities for the City's sources are shown in Table 3.3. The residual chlorine target for all facilities is 0.8 milligrams per liter (mg/L) with alarms if the concentration is above 2 mg/L or below 0.2 mg/L. The fluoridation target for all facilities is 0.7 mg/L for all facilities with alarms if the concentration is above 2.5 mg/L or below 0.25 mg/L.

Table 3.3 Treatment Facilities
Water System Plan Update
City of Camas

Treatment Facility	Sources Treated	Filtration	Chemical Addition
Slow Sand Filtration Treatment Plant	Boulder Creek, Jones Creek	Yes	Sodium Hypochlorite Sodium Fluoride Hydroxide
Washougal Wellfield Site 519	Well 7, Well 8, Well 10, Well 11, and Well 12	No	Sodium Hypochlorite Sodium Hydroxide Sodium Fluoride
Well 14 Site 518	Well 6 and Well 14	No	Sodium Hypochlorite Sodium Hydroxide Sodium Fluoride

Table 3.3 Treatment Facilities
Water System Plan Update
City of Camas

Treatment Facility	Sources Treated	Filtration	Chemical Addition
Well 13 Site	Well 13	No	Sodium Hypochlorite Sodium Hydroxide Sodium Fluoride
Well 9 Site	Well 9(1)	No	Sodium Hypochlorite Sodium Fluoride
Well 5 Site	Well 5	No	Sodium Hypochlorite Sodium Hydroxide Sodium Fluoride

Note:
(1) Well 9 pH is above the treatment limit.

3.4.3 Groundwater Under the Direct Influence of Surface Water

The federal definition of ground water under the direct influence of surface water (GWI) is a groundwater source located near a surface water such that it has significant occurrence of contamination from pathogens such as Giardia lamblia which is not normally found in groundwater. A GWI receives direct surface water recharge and is subject to rapid changes in water characteristics that correlate to surface water conditions. Sources determined as GWI are required to achieve 99.9 percent removal of Giardia lamblia and viruses by filtration and disinfection.

A hydraulic connection to nearby surface water is a potential GWI source. In order to determine if a hydraulic connection exists, a water system may conduct a hyrdogeologic investigation or use the water quality monitoring (WQM) method. The WQM method requires monitoring the groundwater and surface water source for 1 year for temperature and conductivity. If a significant correlation is determined from statistical analysis of the data, then the source is determined to be hydraulically connected to surface water. Less demanding requirements are required for hydraulically connected sources. These include eliminating the surface water influence, developing an alternate source, meet criteria to remain unfiltered, or install filtration.

A microscopic particulate analysis (MPA) is conducted in order to determine if a groundwater source is a GWI source. The City has completed MPA testing on Wells 6, 7, 8, 10, 11, 12, and 14 which indicate that these sources are hydraulically connected to surface water. Therefore, these sources are required by DOH to achieve a contact time (CT) of 6. An evaluation by Pacific Groundwater Group in 2006 states that Well 13 is not under the direct influence of surface water, but is hydraulically connected to surface water. Wells 5 and 9 are not hydraulically connected to surface water, so no CT is required.

3.5 STORAGE FACILITIES

The City currently operates seven storage facilities with a combined total of 8.45 million gallons (MG). A discussion of each storage facility is provided in the following sections. A summary of the storage facilities is provided in Table 3.4. A map showing the location of the key elements of the City's water system is provided as Figure 3.1.

3.5.1 Butler Reservoir

The Butler Reservoir consists of two adjacent, partially buried concrete reservoirs. The two reservoirs share a common wall, with the north half being constructed in 1913, and the south half being completed in 1923. The reservoirs are covered and have a total storage capacity of 1.2 MG. The base elevation of the reservoir is approximately 328 feet and the overflow elevation is 343 feet. The entire capacity of the Butler Reservoir is usable storage. The Butler Reservoir is shown in Figure 3.3.

BUTLER RESERVOIR

FIGURE 3.3

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

Under normal operating conditions, the Butler Reservoir is supplied through 6,420 lineal feet of 12-inch cast iron transmission main. This transmission main connects with the 18-inch main from Wells 6, 7, 8, 10, 11, 12, 13, and 14 at NE 22nd Avenue and NE Everett Street.

3.5.2 Gregg Reservoir

The Gregg Reservoir, a 100,000 gallon capacity steel standpipe, was constructed in 1978. It has a base elevation of approximately 472 feet, an overflow elevation of 542 feet, and is the only storage facility for the 542 Zone. The reservoir provides equalization and operational storage for the 542 Zone, but does not provide fire suppression storage. The Gregg Reservoir is supplied by the Gregg Booster Station and the Crown Road Booster Station. The Gregg Reservoir is shown in Figure 3.4.

3.5.3 Lacamas Reservoir

The Lacamas Reservoir, constructed in 1993, has a total capacity of 2.0 MG. It has a base elevation of approximately 504 feet, and an overflow elevation of 544 feet. The Lacamas Reservoir is a ground level reservoir. The Lacamas Reservoir is primarily supplied from the LPH Zone via the Lacamas Booster Station or from the newly constructed Well 9. PRV stations from the Upper Prune Hill zone can also provide fire flow to the Lacamas Zone. The Lacamas Reservoir is shown in Figure 3.5.

3.5.4 Lower Prune Hill Reservoirs

Storage in the LPH Zone is provided by two concrete ground level reservoirs with overflow elevations of 455 feet. The first reservoir was constructed in 1935 and has a total capacity of 0.5 MG. A second, 1.5 MG reservoir was added to the same site in 1971. The reservoirs are plumbed together to act as one reservoir, and both have a base elevation of approximately 432 feet. The Low Prune Hill Reservoirs are shown in Figure 3.6.

Storage in the LPH Reservoirs is accessible via gravity to the 455 Zone, or is pumped to the UPH Zone through the LPH Booster Station. Under normal system operation, water from the SSF Plant supplies the 455 Zone and the reservoirs. The 455 Zone can also be supplied through pumping from the 343 Zone via the Forest Home, Butler, and Angelo Booster Stations. The LPH Reservoirs can also supply the 544 Zone through the Lacamas Booster Station. When SSF is running the surface water can supply the 544 Zone through Lacamas Booster Station.

3.5.5 Upper Prune Hill Standpipe and Reservoir

The UPH Reservoir 1 and Reservoir 2 were constructed in 1971 and 2001, respectively. Reservoir 1 has an overflow elevation of 852 feet, stands 100-feet tall, and has a total capacity of 0.75 MG. This reservoir sets the HGL for the 852 Zone. The Upper Prune Hill Reservoirs are shown in Figure 3.7.

The UPH Reservoir 2 is below the HGL of the 852 Zone and serves the zone by pumping through the UPH booster pump station (BPS) to the UPH Reservoir 1. It has an overflow elevation of 816 feet, stands 64-feet tall, and has a total capacity of 2.4 MG. The booster station has a total pumping capacity of 2,900 gpm. Including the standpipe and reservoir, the 852 Zone is supplied by the LPH BPS, 12-inch transmission line, and 16-inch Ostenson Canyon transmission line.

3.6 TRANSMISSION AND DISTRIBUTION FACILITIES

Transmission and distribution facilities allow the water supply to reach the City's customers. These facilities include water pipelines, BPS, and pressure reducing stations that allow water to flow between pressure zones, from one hydraulic grade to another. BPS are discussed separately in Section 3.7.

3.6.1 Piping System

The City owns over 143 miles of pipelines in its water transmission and distribution system. An inventory of existing pipelines in the system, as reported from the City's hydraulic model, is summarized in Table 3.5. The system is predominately looped and located within public rights-of-way, giving the City access for repairs and maintenance. The City replaces aging and undersized pipes to serve the City's growing demands on an ongoing basis. Pipe materials within the City currently include the following:

- Cast Iron (CI) Pipe

- Polyvinyl chloride (PVC) Pipe
- Ductile Iron (DI) Pipe
- Steel (ST) Pipe

Percent	47%	15%	6%	1%	31%	100%	

3.6.2 Pressure Reducing Stations

In order to operate on the sixteen pressure zones, the City maintains numerous pressure reducing stations as shown in Table 3.6 and Figure 3.1. In most cases, there are two PRVs at each station. The smaller valve operates to provide the average daily demand to the zone that it serves. The larger valve, which is generally set five pounds per square inch (psi) lower than the small valve, is primarily used for fire protection or large demand situations. The City's PRVs have pressure sustaining features, which are set to ensure that upstream pressures are maintained. The City has a contract with GC Systems to service the 68 PRVs located within the water system. This contract allows GC Systems to perform general maintenance and ensure that the valves are operating correctly, both on an individual and system-wide level.

3.7 BOOSTER PUMPING STATIONS

The City currently operates eight booster pumping stations to move water between pressure zones.

3.7.1 Butler Booster Station

The Butler Booster Station is located at the Butler Reservoir site and pumps from the 343 Zone to the 455 Zone. The Butler Booster Station has one end suction centrifugal 50-hp pump and one end suction centrifugal 40-hp pump that are capable of supplying 800 and 600 gpm, respectively. When the New Gregg Booster Station is called on one of the Butler pumps is also turned on to feed the 14-inch suction line of the New Gregg Booster Station. This station does not have capacity for an additional pump. Figure 3.8 shows the interior of the Butler Booster Station and capacity details are summarized in Table 3.7.

3.7.2 New Gregg Booster Station

The New Gregg Booster Station is also located at the Butler Reservoir site and pumps water from the 455 Zone to the 542 Zone. The New Gregg Booster Station is equipped with two 100-hp double end suction split case pumps, each with a capacity of 1,500 gpm. In 2013 a third 500 gpm pump was added for domestic service and to maintain the level in the Gregg Reservoir. The two larger pumps are typically only called on when fire flow demands occur. The New Gregg Booster Station has suction side flow limitations due to insufficient head provided by the Butler Reservoir. When the New Gregg Booster Station is called on a pump in the Butler Booster Station must also be called on to supply adequate pressure for the Station's 14-inch suction line. Figure 3.9 shows the interior of the New Gregg Booster Station and capacity details are summarized in Table 3.7.

3.7.3 Forest Home Booster Station

The Forest Home Booster Station, located at 418 NW 10th Avenue, pumps from downtown in the Downtown 343 Zone to the 455 Zone. This station contains one pump at a rated capacity of 1,000 gpm. When Well 5 is called into service, this booster station is also called on to prevent over-pressurization of the Downtown 343 Zone. Figure 3.10 shows the Forest Home Booster Station and capacity details are summarized in Table 3.7.

FIGURE 3.9

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

FOREST HOME BOOSTER PUMP STATION

FIGURE 3.10

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

3.7.4 Lower Prune Hill Booster Station

The Lower Prune Hill Booster Station is located at the Lower Prune Hill Reservoir site and pumps water from the 455 Zone to the 852 Zone. This pump station contains three pumps at a total rated capacity of 2,500 gpm. This station has does not have capacity for an additional pumping unit. The Lower Prune Hill Booster Station is shown in Figure 3.11 and capacity details are summarized in Table 3.7.

3.7.5 Lacamas Booster Station

The Lacamas Booster Station, located at 4620 NW Sierra Street, pumps water from the 455 Zone to the 544 Zone. This station has two 25-hp turbine pumps that are capable of supplying 500 gpm each and one 100-hp turbine pump equipped with a VFD capable of supplying up to 1,500 gpm. The VFD is required for the largest pump due to suction side limitations. A fourth pump pedestal is provided in the booster station for future expansion. The Lacamas Booster Station is shown in Figure 3.12 and capacity details are summarized in Table 3.7.

3.7.6 Angelo Booster Station

The Angelo Booster Station is located at Fallen Leaf Park and is the primary booster station supplying the 455 Zone. It pumps from the 18-inch transmission main in the 343 Zone to serve the 455 Zone and feeds the suction side of the Lacamas Booster Station. This station has four 75-hp split case double end suction pumps capable of pumping 1,000 gpm each. A selected well is called on with the first pump of the Angelo Booster station to provide adequate suction side supply. If additional wells are called on to meet demand a corresponding pump is also called on at the station to prevent over pressurization of the 343 Zone. The Angelo Booster Station is shown in Figure 3.13 and capacity details are summarized in Table 3.7.

3.7.7 Upper Prune Hill Booster Station

The Upper Prune Hill Booster Station is located at 2822 NW 18th Avenue and is used to maintain level in the Upper Prune Hill Standpipe, which sets the HGL for the 852 Zone. This station has four pumps with two 20-hp split case double end suction pumps capable of providing 750 gpm each and two 40-hp split case double end suction pumps capable of providing 1,400 gpm each. The Upper Prune Hill Booster Station suction line is fed from the 2.4 MG reservoir. The 2.4-MG reservoir is fed from the Lower Prune Hill BPS. The Upper Prune Hill Booster Station is shown in Figure 3.14 and capacity details are summarized in Table 3.7.

3.7.8 Crown Road Booster Station

The Crown Road Booster Station is the City's newest booster station and is located at 3700 SE Crown Road and pumps from the 343 Zone to the 542 Zone. This station has two pumps capable of providing 800 gpm each for a total station capacity of 1,600 gpm. Pedestals are provided for two additional pumping units within the station. When the station is called into service a selected well is called on simultaneously to provide sufficient suction side supply. The Crown Road Booster Station is shown in Figure 3.15 and capacity details are summarized in Table 3.7.

Table 3.7 Booster Pump Station Summary
Water System Plan Update
City of Camas

	No. of Pumps	Rated Capacity (gpm)	Year Constructed
Butler	2	1,400	1948(1)
Forest Home	1	1,000	1949(2)
Gregg	3	3,500	2003
Lower Prune Hill	3	2,500	1971(3)
Lacamas	3	2,500	1993
Angelo	4	4,000	2001
Upper Prune Hill	4	2,900	2002
Crown Road	2	1,600	2011

Notes:
(1) Pumps were replaced in 1998.
(2) Pump was replaced in 1999.
(3) Pumps were replaced in 2002 and 2004.

3.8 INTERTIES

The City currently has an emergency intertie agreement with the City of Washougal. The City has two one-way PRV interties with Washougal, located on SE Shepherd Road and at the intersection of SE 3rd Street and Whitney Street. These interties provide water from the City of Camas to the City of Washougal under low pressure conditions. A physical intertie does not exist with Vancouver, but the City has an agreement for emergency use of two fire hydrants located at SE 1st and Friberg for firefighting purposes. Intertie agreements are provided in Appendix C.

CROWN ROAD
BOOSTER PUMP STATION

FIGURE 3.15

3.9 SCADA

The City has a SCADA system with master control located at the City Operations Center. The system uses programmable control software, which can be controlled by a personal computer at the operations center, or from remote by a modem connected to a remote computer. The system monitors reservoir levels, well status, well flow rate, booster pump flow rates, pump status, run time, power usage, and alarm conditions. The system is able to record and display trending data for everything the City monitors. The City continually rotates well and booster pump calls to exercise the pumps and to evenly distribute wear on the pumps.

Chapter 4

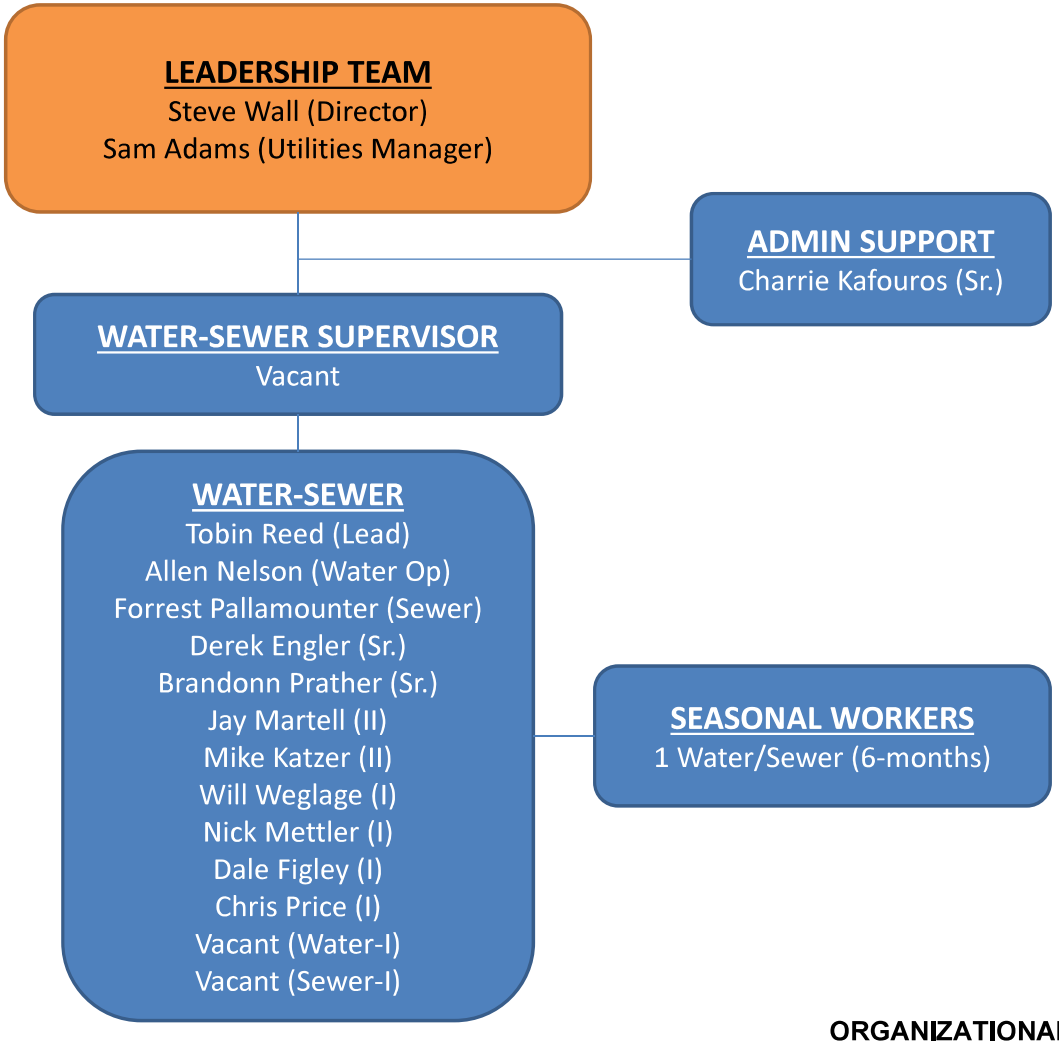
OPERATION AND MAINTENANCE

4.1 WATER SYSTEM MANAGEMENT AND PERSONNEL

The water system is operated and maintained by the City of Camas (City) staff, with contractors provided services that City staff are not trained or equipped to perform. The organization of the City's water utility is shown in Figure 4.1. The City is governed by a mayor and seven council members, all of which are elected officials. The Public Works Director reports to the mayor and council and directs the City's utilities, including water. The City's organization combines water and sewer operation to furnish domestic water and sanitary sewage disposal service to industrial, commercial, and residential areas within the City and surrounding areas. The Utility Manager directs the water system operations, supervising a Water Supply Operator, Lead Maintenance Worker, and maintenance crews. The Engineering Department is responsible for engineering services, including capital planning, project implementation, development review, and operational support. The Finance Department is responsible for all utility billing and accounting.

4.1.1 Operator Certification

The City's operators are experienced and well trained, exceeding the minimum state requirements (Washington Administrative Code [WAC] 246-292-050). As a Class 3 system (population between 15,000 and 50,000 people) the City is required to have at a minimum, a Water Treatment Plant Operator (WTPO) Level 3, a Water Distribution Manager (WDM) Level 3, and a cross-connection control specialist (CCS). The City certified operators are shown in Table 4.1. As staff change, the Water Works Certification Board is notified of any changes to the mandatory or supporting certificated personnel.



4.1.2 Professional Growth and Training

The City provides opportunities for its staffs' professional growth and training; planning for approximately 25 hours per year of professional growth and training for each employee. Through these activities, City staff are able to obtain the required continuing education unit (CEU) requirements for their operators' certifications. City staff are regular attendees of training programs sponsored by both Washington Environmental Training Resources Center (WETRC) and the Pacific Northwest Section of the American Water Works Association (AWWA). The professional growth requirement may also be met by advancement by examination or certification by examination to a different classification.

ORGANIZATIONAL CHART
FIGURE 4.2
CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

4.2 ROUTINE SYSTEM OPERATING PROCEDURES AND PREVENTATIVE MAINTENANCE

Basic system operation is described in Chapter 3 – Existing System and Chapter 9 - System Analysis. Detailed documentation of the system operation procedures and preventive maintenance can be found in the City's Operations and Maintenance (O&M) Manual. The manual provides detailed information on operator certification and training, water quality monitoring, operation and control, cross-connection control, and emergency planning/response. Routine operating procedures and preventative maintenance aspects of the O&M Manual are summarized below.

4.2.1 Routine Operating Procedures

The City updated its O&M Manual in 2016 to reflect recent changes in the system and capture the institutional knowledge of retiring operators. The O&M Manual provides the following kinds of operation and control information for wells, reservoirs, pump stations, and pipelines:

- Facility/process components, such as booster pumps, Supervisory Control and Data Acquisition (SCADA) telemetry, valves, chemical metering pumps, storage tanks, etc.;
- Description of facilities/processes, including area served and relationship to other facilities/processes;
- Operation and control, including set points and chemical usage guidelines;
- Guidance on performing maintenance activities such as cleaning, pump isolation, and meter/pump calibration;
- Alarm responses;
- Emergency operation, including use of safety equipment (i.e., emergency showers and eyewash, etc.) and facility operations on auxiliary power.

To aid in accessing the detailed information, the O&M Manual provides annotated pictures identifying all facility equipment.

A hard copy of the O&M Manual is kept at the City's operations center and is available electronically on the City's network. The slow sand filtration plant operations and control are documented in a separate O&M manual that is kept onsite at the plant and available electronically on the City's network.

4.2.2 Preventive Maintenance

The City staff are responsible for daily operation of the City's surface water sources, wells, treatment facilities, booster stations, pressure reducing valves (PRVs), storage facilities, and distribution system. In addition to daily operation, they also perform preventative

maintenance on the system based on City goals. These preventative maintenance goals help the City maintain its assets at an acceptable level of risk, while meeting the City's desired level of service goals. An activity's complexity and level of effort is generally greater the less frequently it is performed. Daily and weekly activities can likely be completed in an hour or less. In general, activities are intended to be grouped (i.e., weekly, semi-weekly, monthly, and quarterly during a single visit) to reduce inefficiencies in travel and site setup (i.e., traffic control at PRVs, etc.). Some activities may take several days and require specialized contractors.

Daily preventative maintenance focuses on inspections of the general condition and function of the facilities and maintaining and recording chemical levels. Frequency of inspections is based on industry practices and professional judgement. Weekly and monthly maintenance activities include more detailed inspections and cleaning of assets, as well as maintenance of the surface water sources. Annual preventative activities includes basic maintenance of equipment (i.e., oil and filter changes, exercising infrequently used valves and pumps, cleaning cooling systems on generators, etc.). All activities are completed to the extent possible based on available staff and resources.

4.3 CONDITION ASSESSMENT

4.3.1 Booster Pump Stations and Supply Wells

A high-level condition assessment was prepared for the City's water system facilities. The assessment included review of information for the existing facilities and inspection of the facilities on January 5 and 6, 2016. The assessment included each supply well and booster pump station (BPS). The City's storage reservoir, PRV stations, and piping were not included in the assessment.

Overall, the City's booster pump stations and supply wells were found to be in generally good condition. The facilities have been well-maintained with regularly scheduled maintenance and Capital Improvement Program (CIP) work being performed. Electrical equipment condition was the most common deficiency observed, primarily due to equipment age.

The conditions assessment recommended improvement projects based on the existing condition and are shown in Table 4.2. Improvement projects have been separated into booster pump station improvements, which are denoted "RP-" and supply projects, which are denoted "RS-". Each project has been scheduled based on the results of the condition and Remaining Useful Life (RUL) assessments. Projects with similar timing are ordered based on the criticality or consequence of failure. As seen in the table, the total condition assessment CIP estimate is anticipated to cost $1,369,000. It is anticipated that future project designs will further revise the cost estimates and prioritization of projects for the longer-term CIP items

The cost estimates presented in this section are opinions developed from bid tabulations, cost curves, information obtained from previous studies, City estimates, and Carollo Engineers' experience on other projects. The cost estimates have been prepared for general planning purposes and for guidance in project evaluation and implementation. Final costs of a project will depend on actual labor and material costs, competitive market conditions, final project scope, implementation schedule, and other variable factors.

All costs are in 2016 dollars, and are based on an Engineering News Record Construction Cost Index (ENR CCI) 20-City Average of 10379 (July, 2016). Cost estimates were developed using a Class 4 budget estimate, as established by the American Association of Cost Estimators. This level of estimate is used for budgeting and feasibility studies and assumes a 1 percent to 15 percent level of project definition. The expected accuracy range is -30 percent to +50 percent, meaning the actual cost should fall in the range of 30 percent below the estimate to 50 percent above the estimate.

4.3.2 Reservoirs

The City has previously assessed the condition of its reservoirs. The City's reservoirs are generally in good condition. The following projects were planned as part of the 2010 Water System Plan:

- The Butler Reservoir, the City's oldest reservoir, has reached the end of its usable life. The City intends to abandon the Butler Reservoir as soon as a replacement is constructed in the 343 Zone.
- The City's second oldest reservoir, the 0.5 million gallons (MG) reservoir at the Lower Prune Hill reservoir site is also reaching the end of its usable life. Replacement of the reservoir was recommended in the 2010 Water System Plan, which will include significant site and foundation work.

Table 4.2 Condition and Strategic Replacement CIP Summary
Water System Plan Update
City of Camas

Project Name	Project ID	Project Type	Estimated Cost	Short-term (2016-2021)	Medium-Term (2022 - 2025)	Long-Term (2026-2036)	Project Description
Replace or Refurbish Lacamas BPS Pumps and Motors	RP - 1	Strategic Replacement	$80,000	$80,000			Replace or refurbish pumps 1, 2, and 3
Replace or Refurbish Butler BPS Pumps and Motors	RP - 2	Strategic Replacement	$60,000	$60,000			Replace or refurbish pumps 1 and 2
Replace or Refurbish Angelo BPS Pumps and Motors	RP - 4	Strategic Replacement	$140,000	$140,000			Replace or refurbish pumps 1, 2, 3, and 4
Lower Prune Hill BPS Discharge Header Improvements	RP - 5	Condition	$5,000	$5,000			Add lateral support to the pump discharge header
Crown Road BPS Standby Generator Modifications	RP - 6	Condition	$5,000	$5,000			Remove vent caps and install new vent piping for the emergency generator's diesel tank as part of routine maintenance
Upper Prune Hill BPS Discharge Header Improvements	RP - 7	Condition	$5,000	$5,000			Add lateral support to the pump discharge header
Replace or Refurbish Upper Prune Hill BPS Pumps and Motors	RP - 8	Strategic Replacement	$110,000		$110,000		Replace or refurbish pumps 1, 2, 3, and 4
Replace or Refurbish Gregg BPS Pumps and Motors	RP - 9	Strategic Replacement	$80,000		$80,000		Replace or refurbish pumps 1 and 2
Replace or Refurbish Lower Prune Hill BPS Pumps and Motors	RP - 10	Strategic Replacement	$125,000		$125,000		Replace or refurbish pumps 1, 2, and 3
Replace or Refurbish Crown Road BPS Pumps and Motors	RP - 11	Strategic Replacement	$75,000			$75,000	Replace or refurbish pumps 1 and 2
Replace or Refurbish Gregg BPS Pump 3 and Motor	RP - 12	Strategic Replacement	$30,000			$30,000	Replace or refurbish pump 3
Lower Prune Hill BPS Electrical Equipment Replacement	RP - 13	Condition	$42,000			$42,000	Replace remote terminal unit (RTU) and general maintenance for motor control center (MCC)
Lacamas BPS Generator Maintenance	RP - 14	Condition	$3,000			$3,000	The generator at the Lacamas BPS requires general maintenance. Rust on the enclosure and exhaust pipe were observed during the condition assessment
Lacamas BPS Electrical Maintenance & Testing	RP - 15	Condition	$5,000			$5,000	
Upper Prune Hill BPS Electrical Equipment Replacement	RP - 16	Condition	$43,000			$43,000	MCC and RTU require general maintenance

4.4 EMERGENCY RESPONSE PROGRAM

The City has a Disaster Manual, which identifies the emergency response functions within the City using an “all hazards” approach. Within the City’s emergency response framework, the City has developed a Water System Emergency Response Plan that is documented in Chapter 5 of its O&M Manual. It defines risks, water system roles and responsibilities during an emergency, communication procedures, personal safety, alternative water sources, equipment replacement procedures, property protection procedures, and water sampling and monitoring procedures. The Emergency Response Plan also describes alternative system operations for the interruption of each major water supply facility (i.e., loss of a well, reservoir, or booster pump station). Further, it documents an incident specific response plan for major risks, such as drought, earthquake, flood, etc. The Emergency Response Plan is provided in Appendix E.

4.5 CROSS-CONNECTION CONTROL PROGRAM

As required by WAC 246-290-490, cross-connection control, utilities have the responsibility to protect customers from water contamination due to cross-connections. A cross-connection is any actual or potential physical connection between a public water system or the consumer's water system and any source of non-potable liquid, solid, or gas that could contaminate the potable water supply by backflow. City Ordinance 10504 addresses cross-connections and their prevention, which can be found as part of the Camas Municipal Code under Water Use Regulations 13.32.

This ordinance and corresponding Municipal Code provide the City’s water department the ability to protect the water supply from contamination by prohibiting cross-connections, requiring backflow prevention devices, establishing fees for the inspection of cross-connection assemblies, and adopting State standards for cross-connection regulations. The ordinance and corresponding Municipal Code provides procedures for the abatement of cross-connections and the installation of backflow prevention devices.

The City has two employees certified as cross-connection control specialists. The City’s cross-connection control program and records are continually updated and information of each cross-connection device are on file with the City. The Public Works Department and the Building Department coordinate notification to customers who have devices that need to be tested. The City’s backflow program management software will be upgraded from Backflow Prevention Management Software to XC2 in 2019, which will allow for higher efficiency when entering test report data and sending notifications to water customers regarding their backflow devices.

The City maintains the following information on file for its cross-connection control program:

- Date of last inspection.
- Results of inspection.
- Recommended protection.
- List of approved assemblies.
- Test and maintenance reports.
- List of certified testers.
- Customer account number, billing address, service address, phone numbers, device history and maintenance records.

The City's Cross-Connection Control Program requires the inspection of backflow prevention devices at the time of installation. These devices are also scheduled to be inspected annually after installation, after the device is repaired, after the device is relocated or reinstated, and as necessary if tests indicate repeated failure.

Owners of backflow prevention devices are notified by mail that their devices are due for inspection. An example of the backflow prevention postcard that is sent out to owners is shown in Figure 4.2. However, it is the responsibility of the customer to see that their device is tested. Failure to provide the City with a backflow prevention device inspection report from a certified cross-connection control specialist will result in the customer's water service being terminated. This termination is then reported to the Washington State Department of Health (DOH).

The cross-connection control specialist and assistant host an informational backflow booth at the City's annual Camas Days event to educate consumers. They answer questions regarding backflow and provide general knowledge to the public on the issues. Updated informational brochures with current contact information are distributed at the event, online, and at various City facilities.

ANNUAL BACKFLOW PROTECTION DEVICE TESTING

Our records indicate that the backflow prevention device(s) at your address is (are) due for testing. It is imperative that each assembly is working properly to safeguard your health and the health of others. Washington State Law (WAC 246-290-490) requires annual testing of backflow prevention assemblies. The testing is to be performed by a Washington State Certified Tester. Please have your assembly tested within 30 (thirty) days. A list of State Certified Backflow Testers has been included on the back of this postcard. Backflow Testers are private contractors and their fees are not regulated by the City of Camas.

Thank you for helping us to preserve our water quality. If you have questions or need information on assemblies at your location, please call the Backflow Hotline at (360) 817-1569 and leave a message. You will receive a return call as soon as possible.

Tobin Reed,
Lead Utility Maintenance Worker

4.6 CUSTOMER COMPLAINT RESPONSE REPORTING

Customers interact with the City through a variety of methods. Customer service representatives are available by phone and through an online Utility Service Request system on the City's website. Customer service agents are trained to answer typical questions and route service requests (complaints) to the appropriate department (Operations, Finance, Engineering, etc.). Calls are tracked by customer service agents and the resulting activities are documented in the maintenance management system if a work order is issued. The finance department also tracks billing related requests.

City operators also routinely interact with customers during maintenance activities. Often, these interactions are directly related to ongoing system maintenance such as hydrant flushing, and customer inquiries or concerns are resolved on the spot. Operators direct additional requests to customer service representatives, as needed.

4.7 RECORD KEEPING AND REPORTING

The City maintains detailed records of the water system. Substantial record keeping activities are required to record and report customer water usage, water production, water quality information, and maintenance activities. All recordkeeping and reporting follows DOH regulations as specified in WAC 426-290-480.

The City's finance department is responsible for billing customers for water use. The billing records include customer account data for classes of customers, water use, billing, service, and comments. Water production for the City's surface water sources and wells are tracked in real time via SCADA, which maintains approximately a year of historical data. Operators record production daily and report the production monthly to DOH. Based on these records and water consumption records, the City develops and submits an annual Water Use Efficiency Report to DOH.

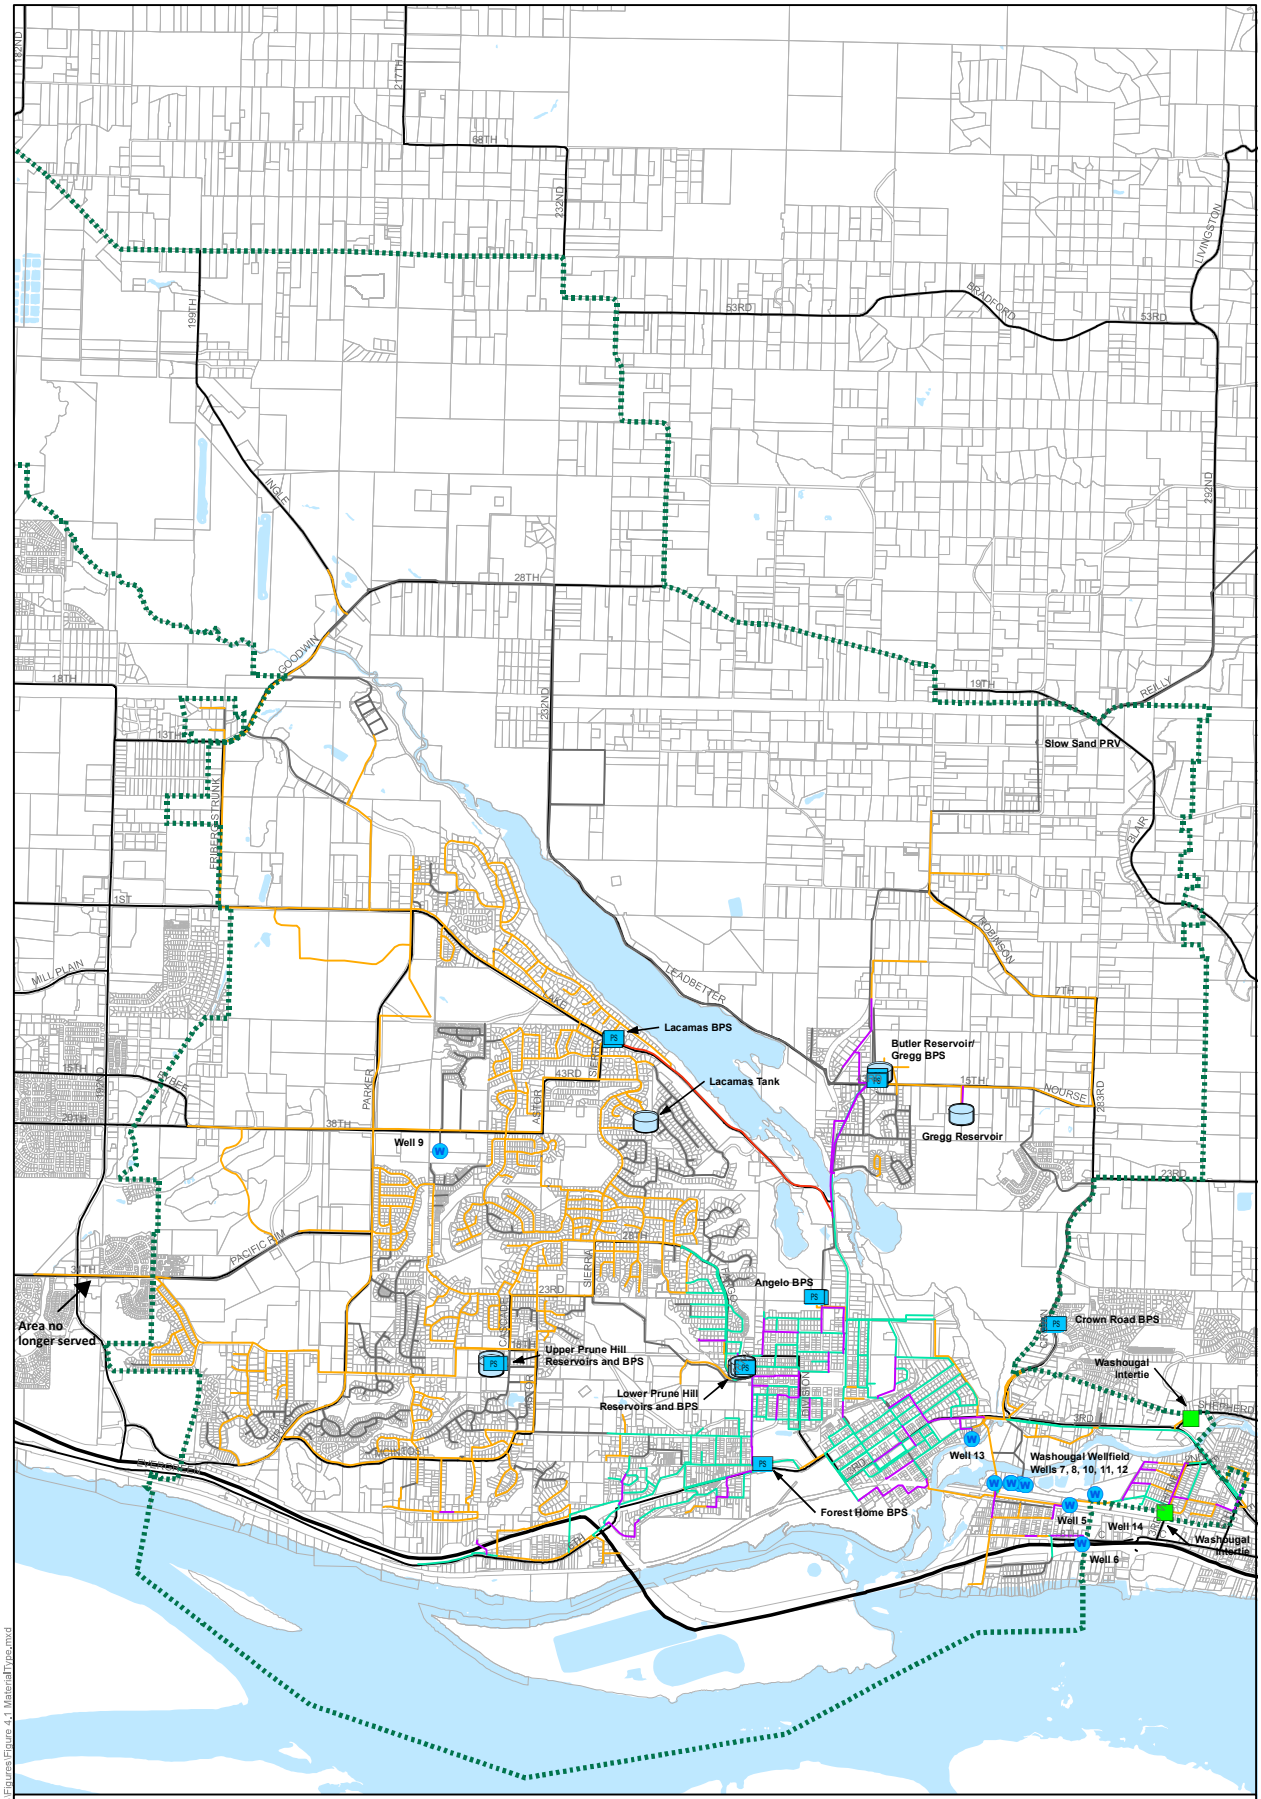
The City conducts substantial water quality testing, as summarized in Chapter 7. Hard copies of the water quality laboratory reports from the testing are kept at the City. In addition, analytical laboratories also submit reports directly to DOH. This data is summarized annually in the City's consumer confidence report that is available on its website.

The City maintains a maintenance management system to manage work order requests and document maintenance activities. Historically, the City has recorded work efforts on hard copy maintenance cards that are available for reference to City staff.

The City submits all required construction completion reports to DOH. Construction completion reports for distribution main projects are maintained on file at the City and are available upon request by DOH.

4.8 PIPELINE REPAIR AND REPLACEMENT

The City currently has a modest water main repair and replacement (R&R) program to address O&M and capacity concerns as opportunities arise, such as during redevelopment or in conjunction with other utility projects. While much of the City's distribution system was constructed after 1990, the distribution near downtown was constructed in the 1950s and early 1960s and is expected to begin reaching the end of its useful life during the next 20 years.



Useful life is the length of time that a pipe is anticipated to remain in service. Useful life depends largely on the pipe material, but can also depend on soil conditions, water constituents, and installation. When a pipe is in service beyond its useful life, the increasing costs of maintenance associated with a failing pipe typically exceed the cost of replacement. Useful life analyses do not predict exactly when and where failures will occur, rather it is a method to identify the pipes for inclusion in an ongoing (R&R) program.

RUL is simply the period of time remaining before the end of useful life is reached. A pipeline replacement schedule can be developed by looking at the remaining useful life of all the pipes in the distribution system. This replacement schedule is often reported in terms of average annual feet of pipe replacement over a ten-year replacement period due to limitations in historical installation records and difficulties in assessing the impact of environmental conditions and other factors limiting useful life. Within a given replacement period, pipes near or exceeding their useful life should be prioritized based on the criticality of the pipe to the system. For example, a large diameter transmission main or pipes that can be included in redevelopment or transportation projects may be a higher priority. By incorporating criticality, the City will be able to address existing priorities and adapt to changing priorities while maintaining an annual replacement program.

4.8.1 Pipe Material and Age

Pipe material and age are key data needed for an RUL analysis. Pipe material was available from the City's records. The information was reviewed by City staff and recent replacement projects were incorporated into the data. As a rule of thumb, pipes installed before or during the 1970s were classified as cast iron (CI) pipe, and pipes installed after the 1970s were classified as ductile iron (DI) pipe. Pipe material is shown graphically in Figure 4.3. Table 4.3 presents the total length of pipe in the City according to the decade installed and material type.

Pipe age was provided by City staff using the best available information. Generally, older pipes installed before the 1980s were assigned an installation decade (i.e., 1950s, 1960s, 1970s, etc.), as the exact year of installation was unknown. The resulting pipe age is shown graphically in Figure 4.4. The City has an ongoing major GIS update that is revising its asset inventory.

Decade Installed	**1950-1959**	**1960-1969**	**1970-1979**	**1980-1989**	**1990-1999**	**2000-2010**	**2011-2014**	**Total by Material**
CI	126,000	47,800	12,200	0	0	0	0	186,000
DI	0	0	63,900	50,500	232,000	99,500	73,700	519,600
PVC	0	0	0	6,900	0	0	0	6,900
Steel	11,600	19,800	1,700	800	3,200	4,600	800	42,500
Total by Decade	137,600	67,600	77,800	58,200	235,200	104,100	74,500	755,000

4.8.2 Useful Life

Useful life in combination with pipe age provides the basis for the RUL calculations. The estimated useful life of each pipe material based on industry standards and City staff knowledge, as presented in Table 4.4. The City chose a 75 year useful life for CI pipes, polyvinyl chloride (PVC) and steel pipes. Cast iron and steel useful life were conservatively selected at the lower end of the typical range. The PVC useful life is within industry ranges; however, it has little overall impact given less than 1 percent of the system is PVC. DI pipes were considered to have an 85 year useful life, which was the median of the industry range. It is important to note that the actual useful life of an individual pipe can vary widely due to soil, groundwater, and installation conditions. It is recommended that the condition of pipes being replaced be noted for consideration in future analyses, which will increase the accuracy of the useful life estimates.

Table 4.4 Useful Life of Pipes Water System Plan Update City of Camas	
Pipe Material	**Useful Life (yrs)**
CI	75
DI	85
PVC	75
Steel	75

4.8.3 Remaining Useful Life Analysis

RUL is defined as the length of time left before a pipe's maintenance costs will likely exceed its cost of replacement. Pipe age, material type, and chosen useful life for each pipe material were used to determine the RUL of the City's pipes. The useful life of each pipe was calculated based on the installation year and the material specific useful life. The period of time between the end of the useful life and today is the RUL. For example, a DI pipe installed in 2000 has a useful life of 85 years, where it will reach the end of its useful life by 2085. From the current year, 2016, this DI pipe's RUL would be 69 years. RUL were combined by decade, which was considered appropriate level of detail given the analyses assumptions. This level of detail is sufficient for use in an R&R program.

Where pipe age was unknown, the age was conservatively assumed to be constructed in the 1950s for CI pipe and 1970s for DI pipe. Where pipe material was unknown, pipes installed before or during the 1970s were assumed to be CI pipe, and pipes installed after the 1970s were assumed to be DI pipe. Where neither pipe age nor material were known, the pipes was assumed to be a 1950s CI pipe.

The replacement decade for each category of pipe is presented in Table 4.5. The City's oldest piping, which are anticipated to reach the end of its usable life by the 2020s, are raw water lines from the surface water sources and the transmission main to Butler reservoir. The City is currently repairing/lining the raw water line from the slow sand filtration plant to the system that is in poor condition. Therefore, it is anticipated that the remainder of the raw water line will likely need some level of repair or replacement in the short to medium-term. Butler Reservoir and its transmission main (12,500 feet of 12-inch piping) should be abandoned if the proposed 343 Cemetery Reservoir is constructed. However, if the Butler Reservoir remains in service, the City should consider R&R of this piping in the mid- to long-term.

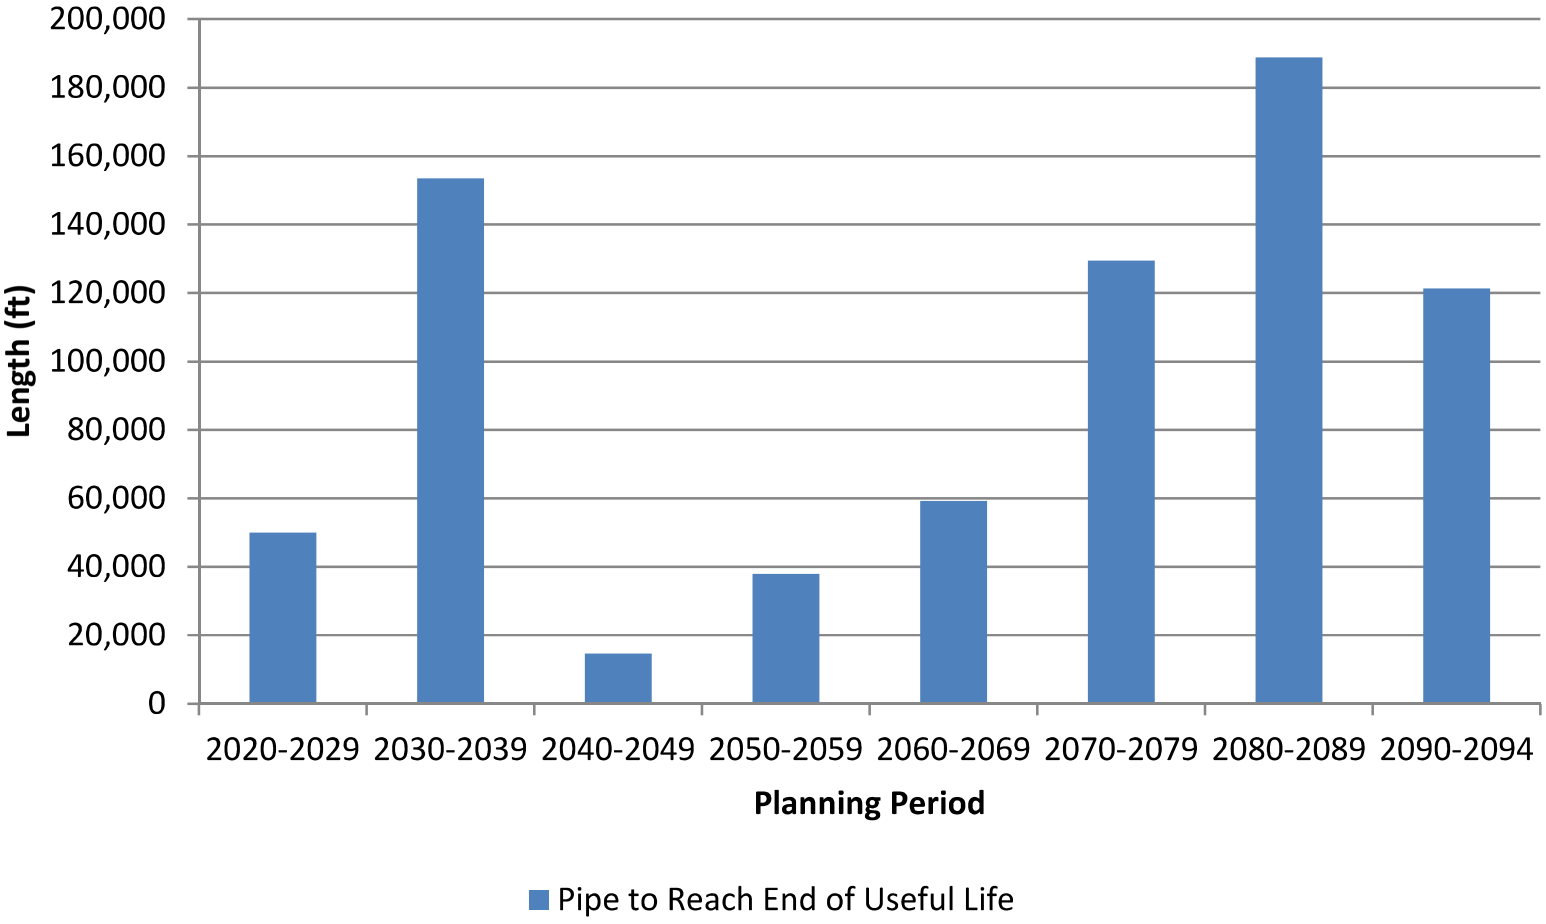
Much of the City's CI piping is anticipated to reach the end of its useful life by end of the planning period (2035). The majority of the City's CI pipe was installed in two periods: before 1955 and 1959 to 1960. It is recommended that the pipes installed on or before 1955, about 50,000 linear feet, be replaced in the 2020s. Replacement of those installed between 1959 and 1960, approximately 123,000 linear feet, are recommended to be replaced in the 2030s. Additionally, replacement of the majority of steel pipe, approximately 30,000 linear feet, is recommended in the 2030s. City's DI pipe along with some of the newer CI, PVC, and Steel pipe is not anticipated to reach the end of its useful life until after the planning period.

Table 4.5 Remaining Useful Life Water System Plan Update City of Camas				
Replacement Decade	**2020-2030**	**2030-2040**	**2040 or Later**	**Total by Material**
CI	50,000	122,900	13,100	**186,000**
DI	0	0	519,500	**519,500**
PVC	0	0	6,900	**6,900**
Steel	0	30,500	12,000	**42,500**
Total by Decade	**50,000**	**153,400**	**551,500**	**754,900**

Figure 4.5 presents the total length of pipe reaching the end of its assumed useful life by decade. The location of these pipes is shown in the map in Figure 4.6. The pipe recommended for replacement represents the majority of the City's downtown and surrounding areas. Pipes reaching their RUL serve all types of customers, including commercial, industrial, and residential customers. Pipes that exceed their useful life will continue to provide service, but are at a greater risk for pipe breaks and may have increased leakage. Therefore, replacement should be prioritized to base on criticality to the system to best manage the aging distribution infrastructure within the City's available budget.

4.8.4 Pipeline R&R Program

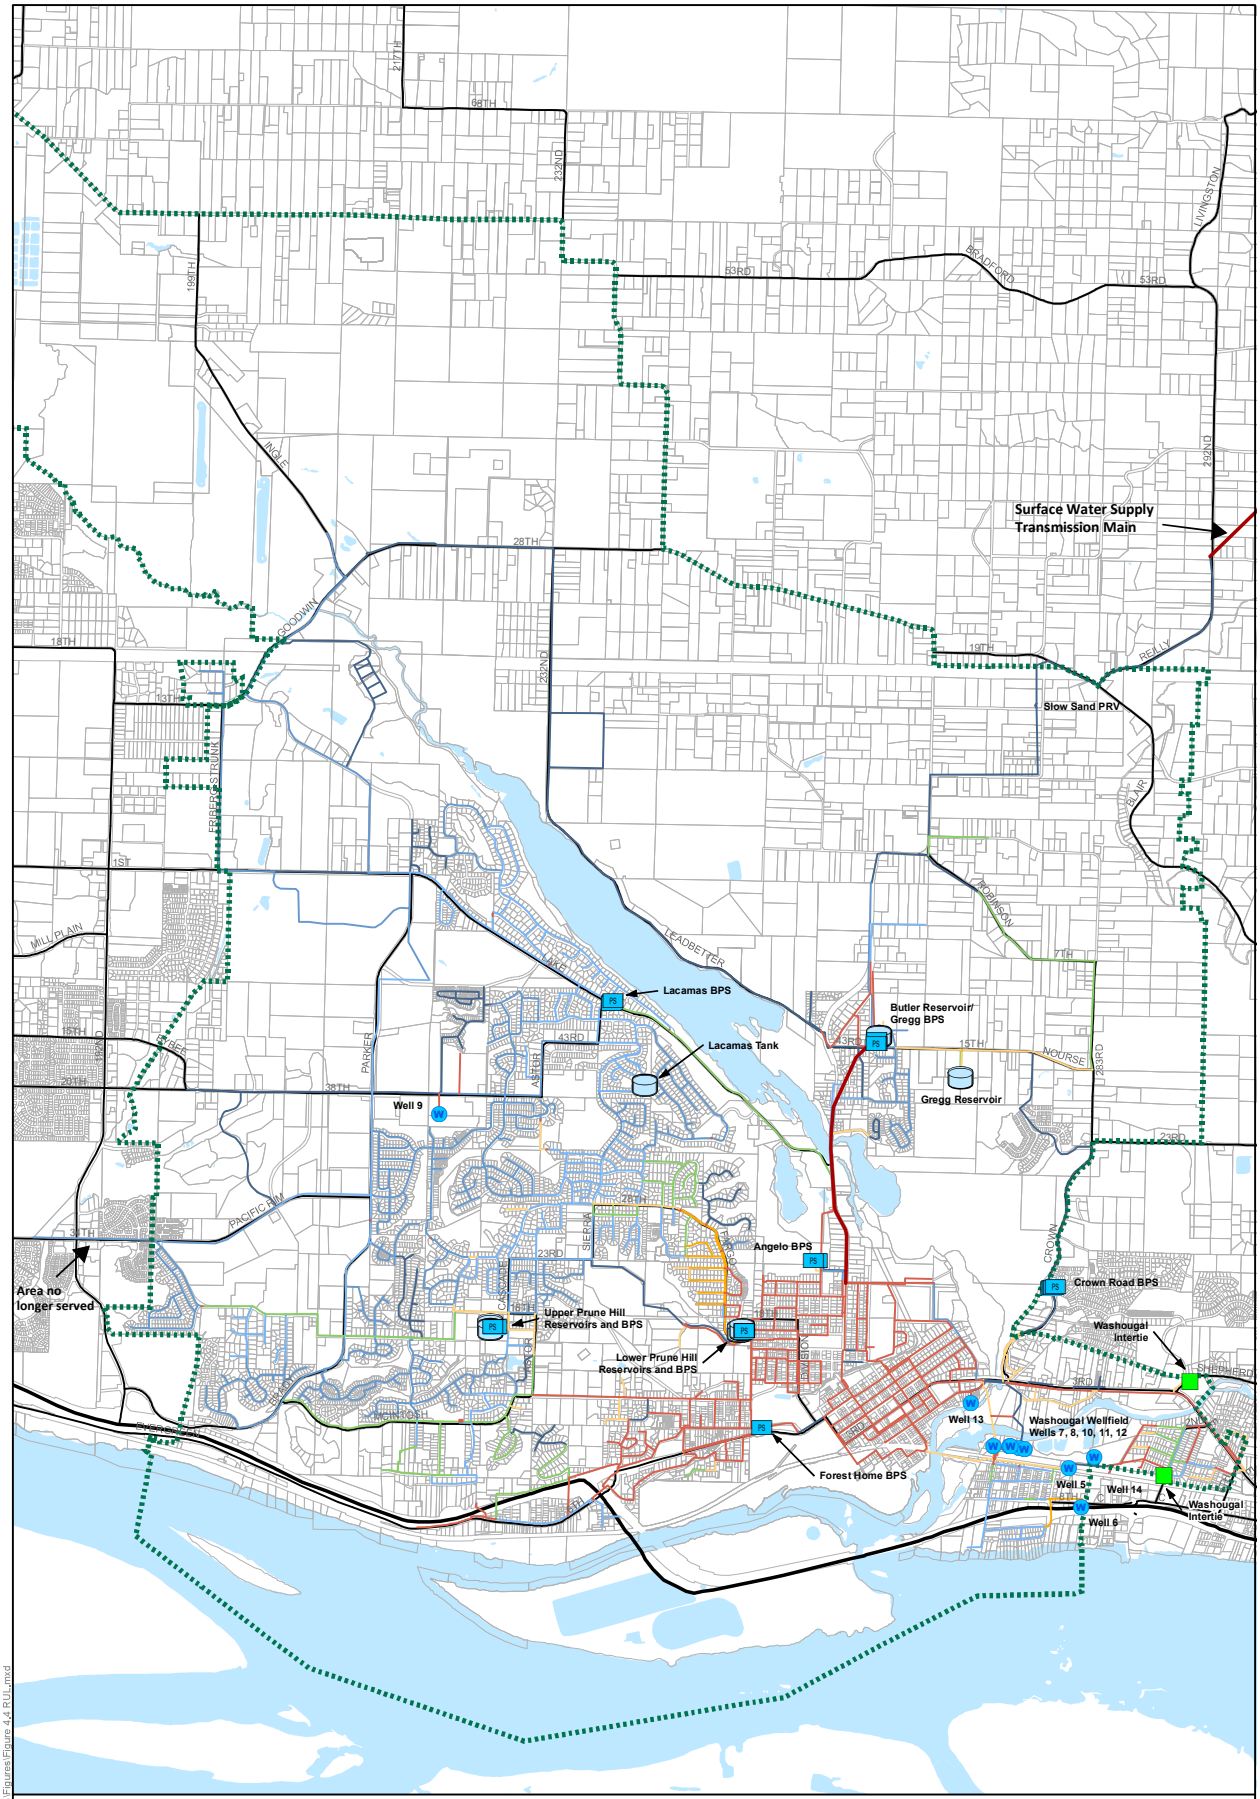
During the short and medium-term, it is recommended that the City maintain an annual R&R program to address localized issues or to participate in joint projects that cost-effectively replace aging piping. A programmatic approach is not recommended for the 50,000 feet of pipe to be replaced in the 2020s, but is recommended in the future. Due to its 37,500 feet length, a one-time CIP project is recommended to address the remaining raw water piping. As previously mentioned, the 12,500 feet of 2020s piping associated with the Butler Reservoir will likely be abandoned, rather than repaired and replaced.



The City water main R&R program will need to be expanded during the long-term planning horizon (late 2020s and 2030s) to address aging infrastructure near downtown that is anticipated to reach the end of its usable life in the 2030s. Approximately 15,300 linear feet of pipe per year would need to be replaced in the mid– to long-term. Small diameter mains (2-inch to 6-inch) should be upsized to 8-inch to meet current City standards. To gain economies of scale, the City should consider geographically concentrated projects that incorporate other utilities, such as sewer main R&R and roadway resurfacing.

4.9 O&M IMPROVEMENTS

The City has a well operated and maintained system. Condition Assessments identified repair and replacement projects for above ground assets (i.e., pump stations, wells, and reservoirs, etc.). The majority of projects were necessary due to aging electrical equipment and normal replacement of pumps and motors. The City plans to replace two reservoirs, built prior to 1940, that have reached the end of their usable life. A PRV study is recommended to evaluate settings, condition, and address normal, minor maintenance issues.



The RUL of the City's water mains were estimated to aid in planning for an annual pipeline repair and replacement program. The RUL analysis and recent operation challenges indicate that the City's surface water transmission mains are likely reaching the end of their usable life. It is anticipated that the piping in Downtown and surrounding areas will begin to reach the end of their life in the long-term planning horizon (2025 – 2035). The City's long-term goal is to create a risk prioritized water infrastructure rehabilitation program that addresses above and below ground assets. However, at this time, the City's financial resources are focused on meeting the rapid growth occurring in Camas.

To gain economies of scale during the replacement, the City should consider geographically concentrated projects that incorporate other utilities, such as sewer main R&R and roadway resurfacing.

Chapter 5

WATER REQUIREMENTS

Projecting realistic future water requirements, i.e. demand, is necessary for planning infrastructure projects and securing adequate water supply to meet future growth. Future water demands are a key component of the water system analyses presented in this Plan and in the City of Camas' (City's) Capital Improvement Program (CIP). Accurate demand projections require a thorough review of historical water use, predicting where and how much growth will occur, and estimating the future water use for existing and new customers.

Historical data provides the City's unique water use over a long period of time, which captures the range of water use due to weather, economic conditions, conservation practices, and other factors. This Chapter presents an analysis of historical water use from 2008 to 2015 based on customer billing and production records. These data provide information on the City's different types of customers, as well as water use parameters on an average annual basis, seasonally, and for the maximum day. Historical water use patterns and parameters were established from these data to predict future water use for existing and new customers.

Demographic projections were used to predict where and how much demand will occur in the water system. The demographic projections were developed based on the City's comprehensive planning. Future customer accounts were developed based on existing customer accounts and the demographic growth rates of each Service Area. The resulting future accounts were converted to projected demands using the historical water use patterns and parameters.

Demand projections were generated for the planning period of 2015 to 2035 for the City's established Retail Water Service Area (RWSA). The projections were divided into three planning scenarios:

- Short-term, 6-year (2015 - 2021).
- Medium-term, 10-year (2022 - 2025).
- Long-term, 20-year (2026 - 2035).

Dividing the planning period into three scenarios aids in the development and phasing of improvement projects and the CIP, as well as being consistent with Washington Department of Health (DOH) requirements.

Demand projections were expressed as Equivalent Residential Units (ERUs), average day demand (ADD), and maximum day demand (MDD). One ERU is defined as the average quantity of water beneficially used by one average, full-time, single-family residence per day. The quantity of water used by other customer classes, and by the whole system, can be expressed in terms of ERUs. The ADD is typically used in operational evaluations. It is

calculated by dividing the total water produced by the number of days per year (2008 and 2012 were leap years and include 366 days per year). The MDD represents the single largest day water demand during the year and is a key parameter for infrastructure sizing.

Changes in water use, conservation activities, system growth, and other factors may result in higher or lower than projected water use. Planning for the potential changes allows the City to better manage potential risks from these changes. For example, lower than projected water use may be a concern for the City's financial planning, while higher than projected water use may be a concern for water supply planning. Therefore, three demand scenarios were developed: Low, Medium, and High demand scenarios. The low demand scenario represents future demand with conservation; the high demand scenario generally reflects the highest demands in the last eight years; the medium demand scenario is a conservative projection between the low and high projections. Details on the historical water use, demographic projections, and demand calculations used to develop these projections are presented in this Chapter.

5.1 HISTORICAL WATER USE

Historical water use data, i.e., consumption data, were obtained from City records to characterize the demands of the City's customers. Annual water use data for the years 2008 to 2015 were used to develop historical demand patterns and parameters, which represent current and likely future water use. Two key demand parameters were generated from the data: typical water use per customer class, and typical water use per ERU. These parameters were used as the basis of future demand projections.

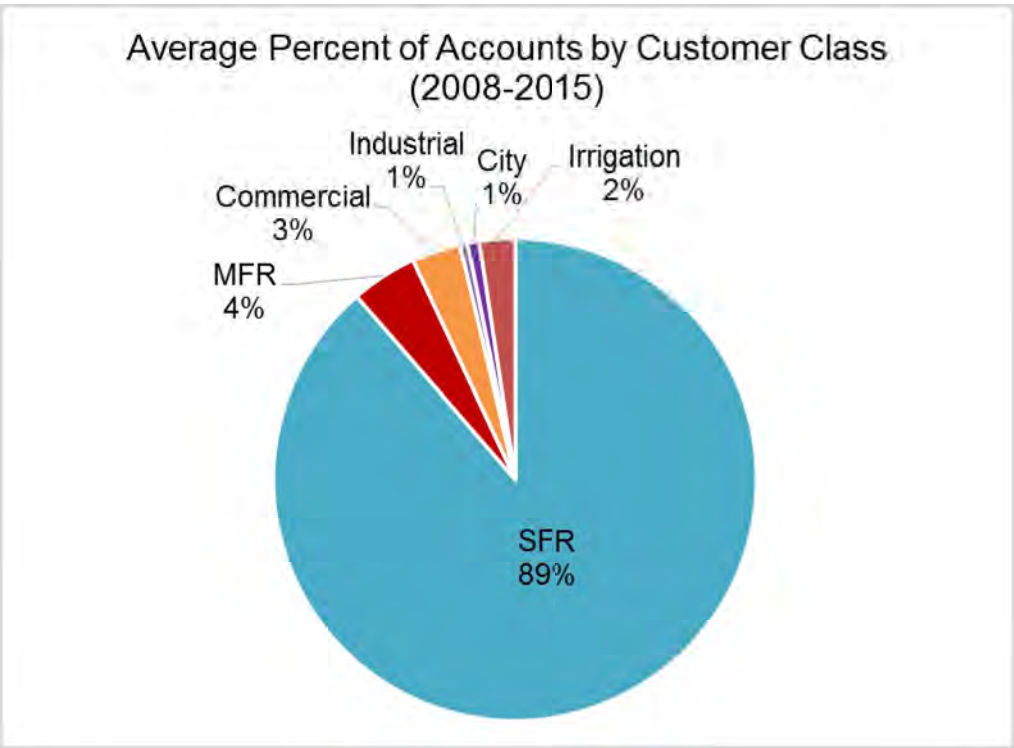
5.1.1 Historical Accounts

The City customers were divided into six customer classifications. These customer classes are:

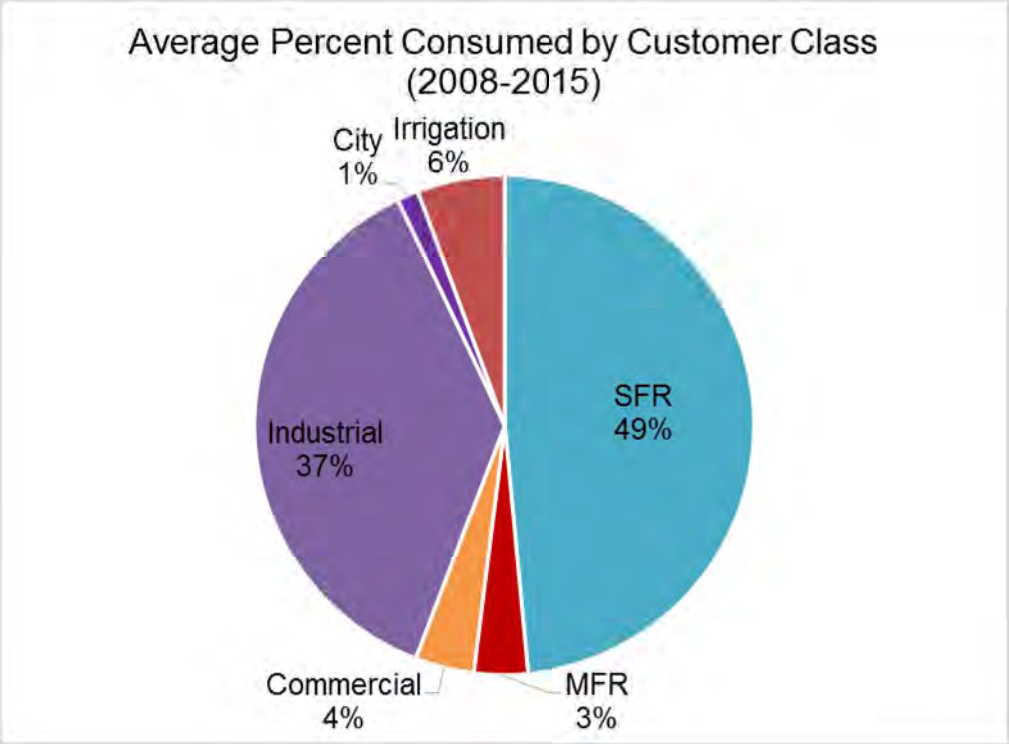
- City Accounts.
- Commercial.
- Industrial.
- Irrigation.
- Multifamily Residential (MFR).
- Single-family Residential (SFR).

The number of accounts for each customer class is summarized in Table 5.1. As seen in the table, SFR makes up approximately 89 percent of accounts. The total number of accounts has increased by approximately 32 percent from 2008 to 2015 due to growth and development in the City.

Table 5.1 Historical Number of Accounts by Customer Class Water System Plan Update City of Camas							
Year	**SFR**	**MFR**	**Commercial**	**Industrial**	**City**	**Irrigation**	**Total**
2008	4,205	159	163	27	37	121	**4,712**
2009	4,518	237	174	28	49	129	**5,135**
2010	4,851	250	182	28	48	133	**5,492**
2011	5,194	257	189	28	35	145	**5,848**
2012	5,523	271	217	33	52	151	**6,247**
2013	6,002	305	217	34	55	160	**6,773**
2014	6,499	342	237	36	56	175	**7,345**
2015	7,157	369	244	38	57	179	**8,044**
Avg.	5,494	274	203	32	49	149	**6,200**
Avg. Percent Per Class	89.0%	4.6%	3.0%	0.5%	0.7%	2.2%	



The City's top ten water users, herein termed "Large Users," were also evaluated in this study. The Large Users class includes the following customers: Wafertech Industries, Linear Technologies, Georgia Pacific Mill, Camas School District, the City of Camas, Underwriter's Labs, SE Incorporated, Sharp Electronics, Bodycote, and Karcher North America. These customers are the largest water users in their Service Areas, which warrants careful consideration. Therefore, individual demand projections were developed for each Large User to provide additional accuracy in the demand projections, as well as the system analyses. The development of the Large User demand projections is detailed in Section 5.6.2.



5.1.2 Historical Consumption

The City’s historical annual water consumption was provided for each customer class based on City billing data, as presented in Table 5.2 in units of million gallons per day (mgd). The table also includes the average, 75th percentile, and 3-year average statistics on historical consumption. Notably, total demand has increased over the 2008 to 2015 period for every customer class except City. This increase is due to the increase in number of connections shown in Table 5.1.

Table 5.2 Historical Water Demand by Customer Class (mgd) Water System Plan Update City of Camas							
Year	**SFR**	**MFR**	**Commercial**	**Industrial**	**City**	**Irrigation**	**Total**
2008	1.46	0.10	0.13	1.17	0.04	0.15	**3.05**
2009	1.62	0.11	0.13	1.12	0.06	0.15	**3.18**

The average percentage of accounts and annual water consumption by customer class from 2008 to 2015 are presented in Figure 5.1. Comparing accounts and water consumption illustrates the differences in water use between the customer classes. As seen in these figures, SFR customers represent 89 percent of the accounts, yet only comprise 49 percent of the demand. By contrast, industrial customers represent less than one percent of the accounts, but account for 37 percent of the total demand. This difference in proportional water use was quantified by comparing the historical water use per account for each customer class (in Table 5.3), as described in the Section 5.1.3.

DISTRIBUTION OF WATER CONSUMPTION AND ACCOUNTS BY CUSTOMER CLASS

FIGURE 5.1

CITY OF CAMAS
WATER SYSTEM PLANT UPDATE

5.1.3 Water Use per Account and Equivalent Residential Units

The demand of each customer class can be expressed in terms of ERUs for forecasting and planning purposes. As discussed previously, one ERU is defined as the average quantity of water beneficially used by one average, full-time, single-family residence per day. Importantly, the ERU calculation is based on historical consumption (i.e., billing records) and therefore does not include distribution system leakage.

Table 5.3 shows the historical annual average water consumption by customer classification. The table also includes the average, 75th percentile, and 3-year average consumption statistics. Based on the data from 2012 through 2015, the average quantity of water used by one typical, full-time single-family residence ERU is equal to 260 gallons per day (gpd). From 2008 through 2015, the 75th percentile of water consumption per ERU was 315 gpd.

Table 5.3 Historical Annual Water Use per Account (gpd/account)
Water System Plan Update
City of Camas

Year	SFR	MFR	Commercial	Industrial	City	Irrigation
2008	348	651	781	43,273	994	1,273
2009	358	468	736	40,100	1,127	1,149
2010	304	450	634	42,480	718	914
2011	288	465	608	43,617	887	1,235
2012	288	419	582	36,743	819	1,275
2013	277	400	565	35,573	693	1,185
2014	246	324	514	37,180	842	1,232
2015	258	326	584	34,066	1,382	1,585
3-Year Avg.	**260**	350	555	35,606	972	1,334
Avg.	**290**	417	616	38,718	936	1,244
75th Percentile	**315**	466	659	42,679	1,027	1,274
ERUs per Account(1)	**1.0**	**1.5**	**2.1**	**135.7**	**3.3**	**4.1**

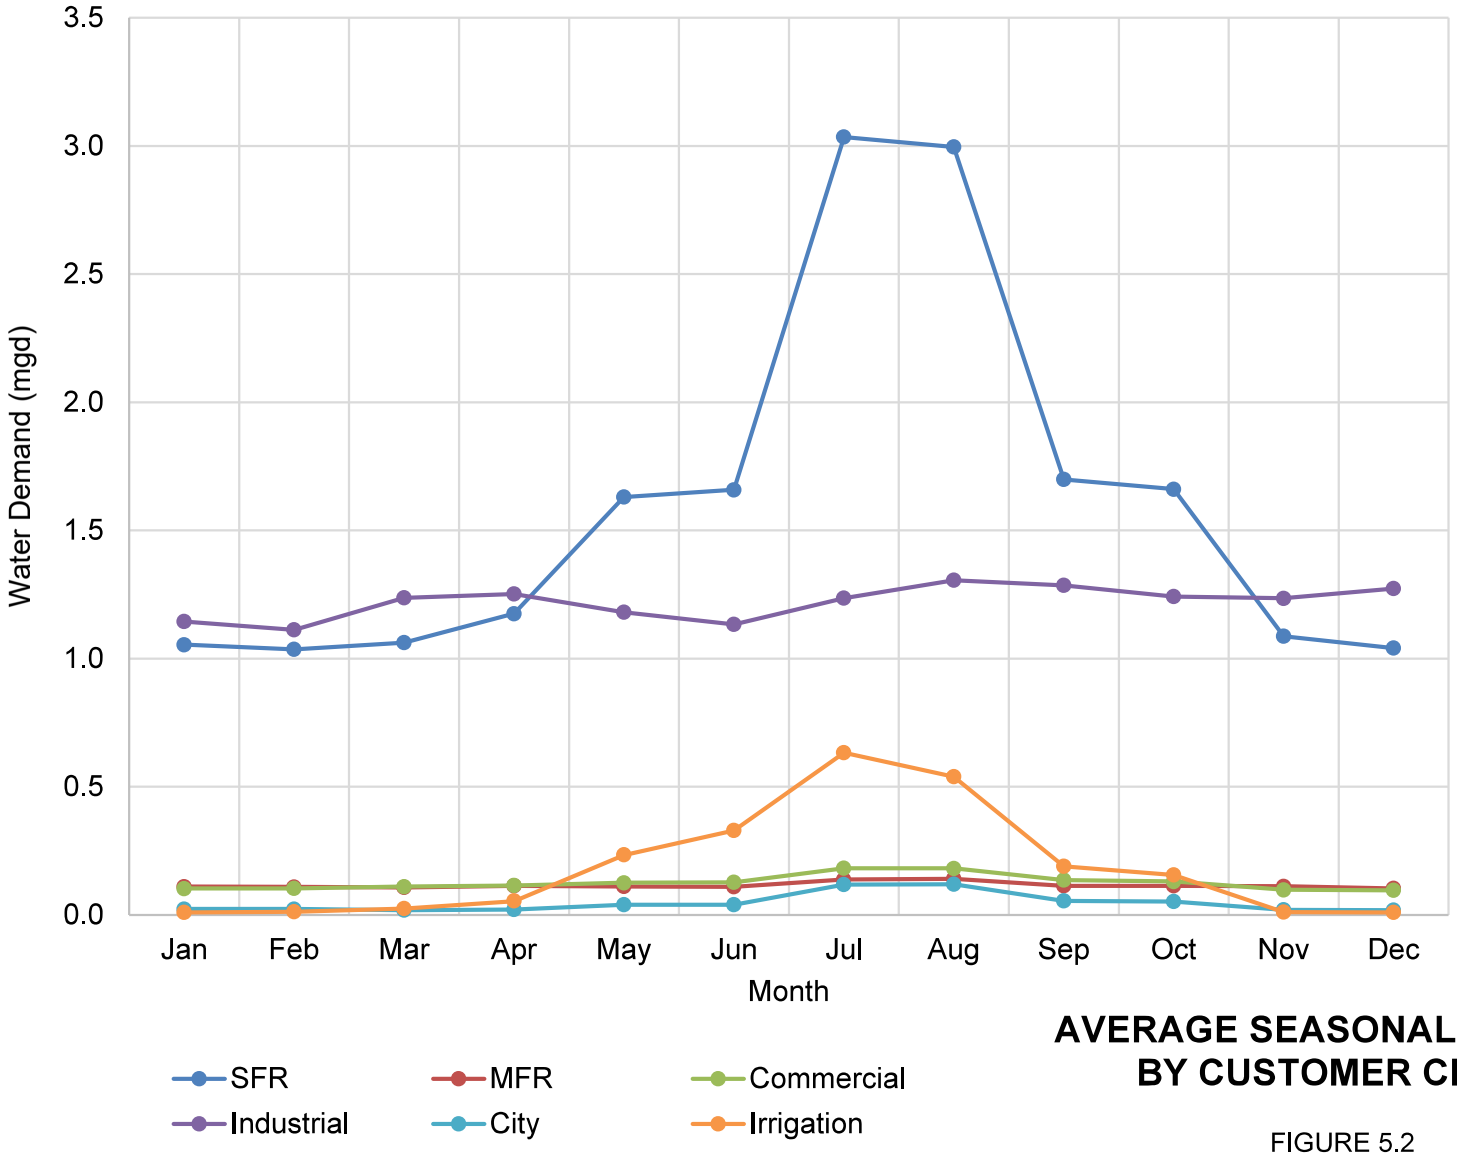
Notes:
(1) ERUs per Account based on 75th percentile of annual water consumption.

Compared to other utilities evaluated by Carollo Engineers, the City's water use per SFR account appears slightly high, possibly indicating larger properties requiring irrigation or lower than usual replacement rates of high-flow appliances and fixtures. Additionally, the City's MFR water use per account appears low, possibly due to a higher percentage of low-density MFR accounts (such as tri-plexes or quad-plexes), or due to monitoring MFR irrigation needs in separate irrigation meters (under the "Irrigation" customer category).

Calculating the City's water use in terms of ERUs provides a means to express water use by non-residential customers as an equivalent number of SFR accounts. The ERUs per account for MFR and all non-residential accounts are obtained by dividing the average water use per account for each customer class by the ERU water use. For example, the average Commercial account uses approximately 2.1 times the water use of an average SFR account; therefore, each Commercial account is equivalent to 2.1 ERUs. Table 5.3 presents the ERUs per account for each customer class based on 75th percentile of historical water use. The number of ERUs per account ranges from 1.5 for MFR accounts to 135.7 for Industrial accounts.

5.2 SEASONAL DEMANDS

The pattern of water consumption differs between the customer classes. Water use increases significantly during the summer when daylight hours are longer and lawn and landscape watering is prominent. Other outdoor uses, including car washing and recreation, are also at their highest during summer months. Figure 5.2 presents average total monthly consumption by customer class from 2008 through 2015. Note that, with some exceptions, the City conducts bi-monthly meter reading; therefore the water consumption was averaged between months to better reflect the actual water consumed in the month.



As seen in Figure 5.2, SFR and irrigation accounts show a significant peak in total consumption during the summer months. By contrast, industrial users do not demonstrate significant seasonal variation in demand. These monthly variations in demand for each customer class can be used to target water use efficiency efforts and/or to project future water-use patterns for planning purposes.

5.3 HISTORICAL PRODUCTION

The historical average and maximum water demands are important parameters when performing system and supply analyses. The term “water demand” refers to all the water requirements of a system including metered customers, unmetered water use, and unaccounted-for water such as leakage. For this reason, the City’s production data, which accounts for all water demand, was used to calculate the ADD and MDD for each year. Additionally, historical production allows the City to track system-wide demands on a daily basis, rather than monthly or bi-monthly billing records.

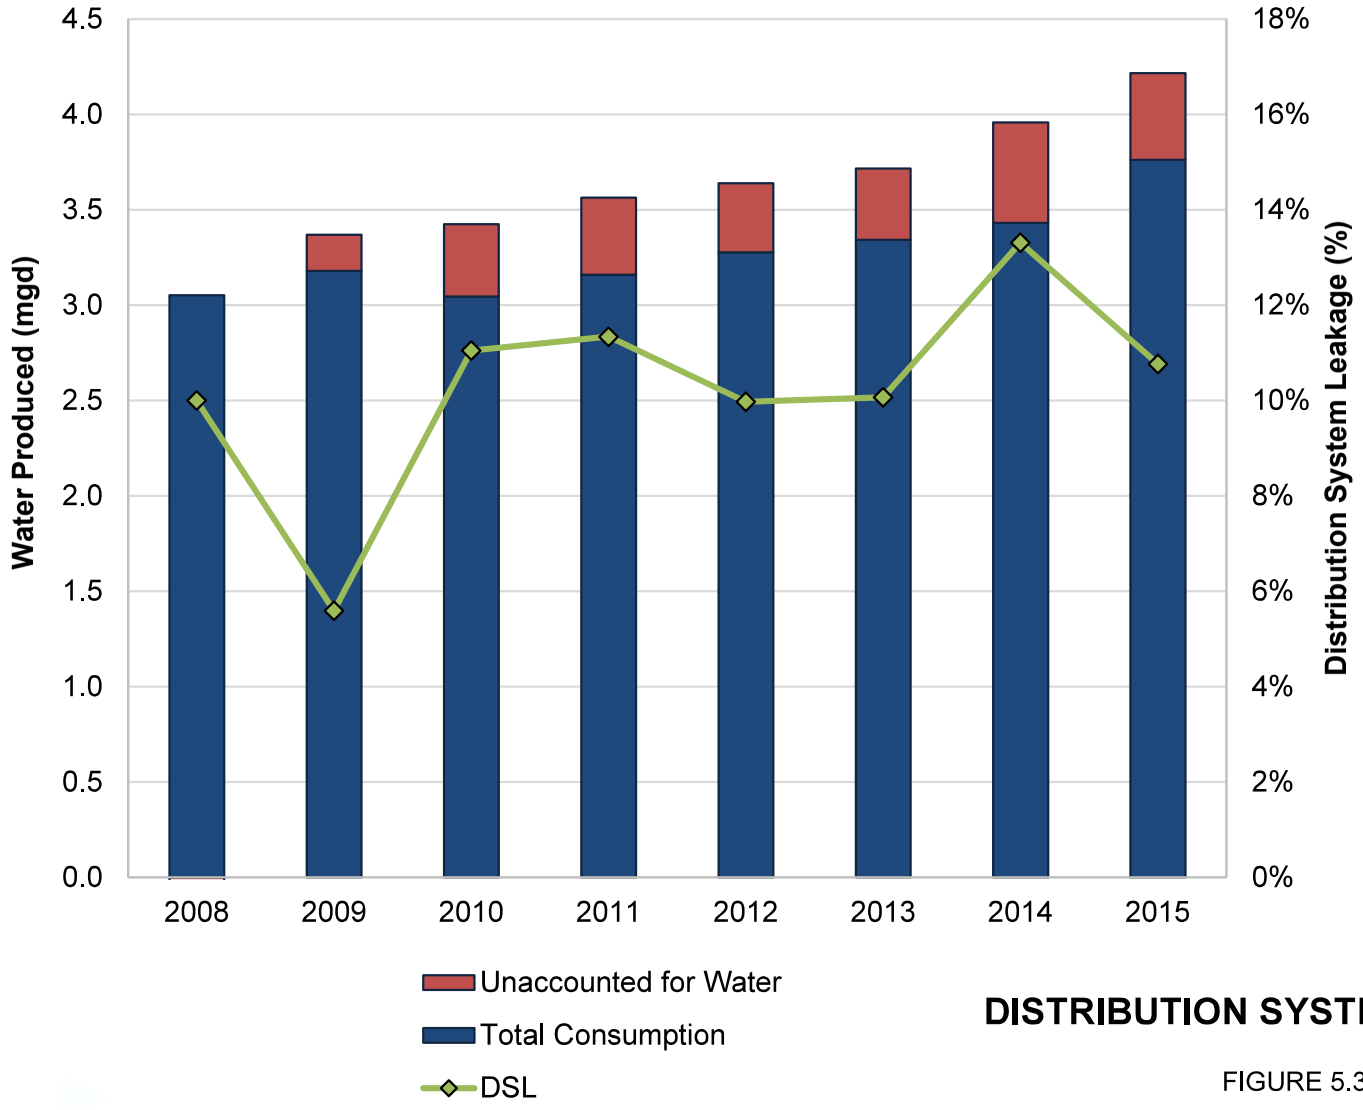
5.3.1 Distribution System Leakage

Distribution System Leakage (DSL) represents the difference between production and documented water use (retail and authorized unmetered). It may include inaccurate master and service connection meters, unaccounted-for non-revenue water use, pipeline leakage, and unauthorized use. DSL does not include authorized water usage such as water used for fire protection, flushing, construction, and other maintenance and operations practices. However, to be credited, this usage must be metered or estimated using credible means.

AVERAGE SEASONAL DEMAND BY CUSTOMER CLASS

FIGURE 5.2

CITY OF CAMAS
WATER SYSTEM PLANT UPDATE



DSL is calculated as the difference between the total amount of water produced and the sum of water sold and authorized unmetered water usage. The City's total water production and consumption in millions of gallons, or MG, as well as estimates of DSL for 2008 through 2015 are shown in Table 5.4 and presented graphically in Figure 5.3. The City's average annual DSL over the period was 10.3 percent.

Table 5.4 Historical Distribution System Leakage
Water System Plan Update
City of Camas

Year	Total Production (MG)	Total Consumption (MG)	Unaccounted for Water (MG)	DSL (%)
2008(1)	1,086	1,117	-31	10.0%
2009	1,230	1,161	69	5.6%
2010	1,250	1,112	138	11.1%
2011	1,301	1,153	147	11.3%
2012	1,332	1,199	133	10.0%
2013	1,357	1,220	137	10.1%
2014	1,445	1,253	192	13.3%
2015	1,539	1,373	166	10.8%
			Average	**10.3%**

Notes:

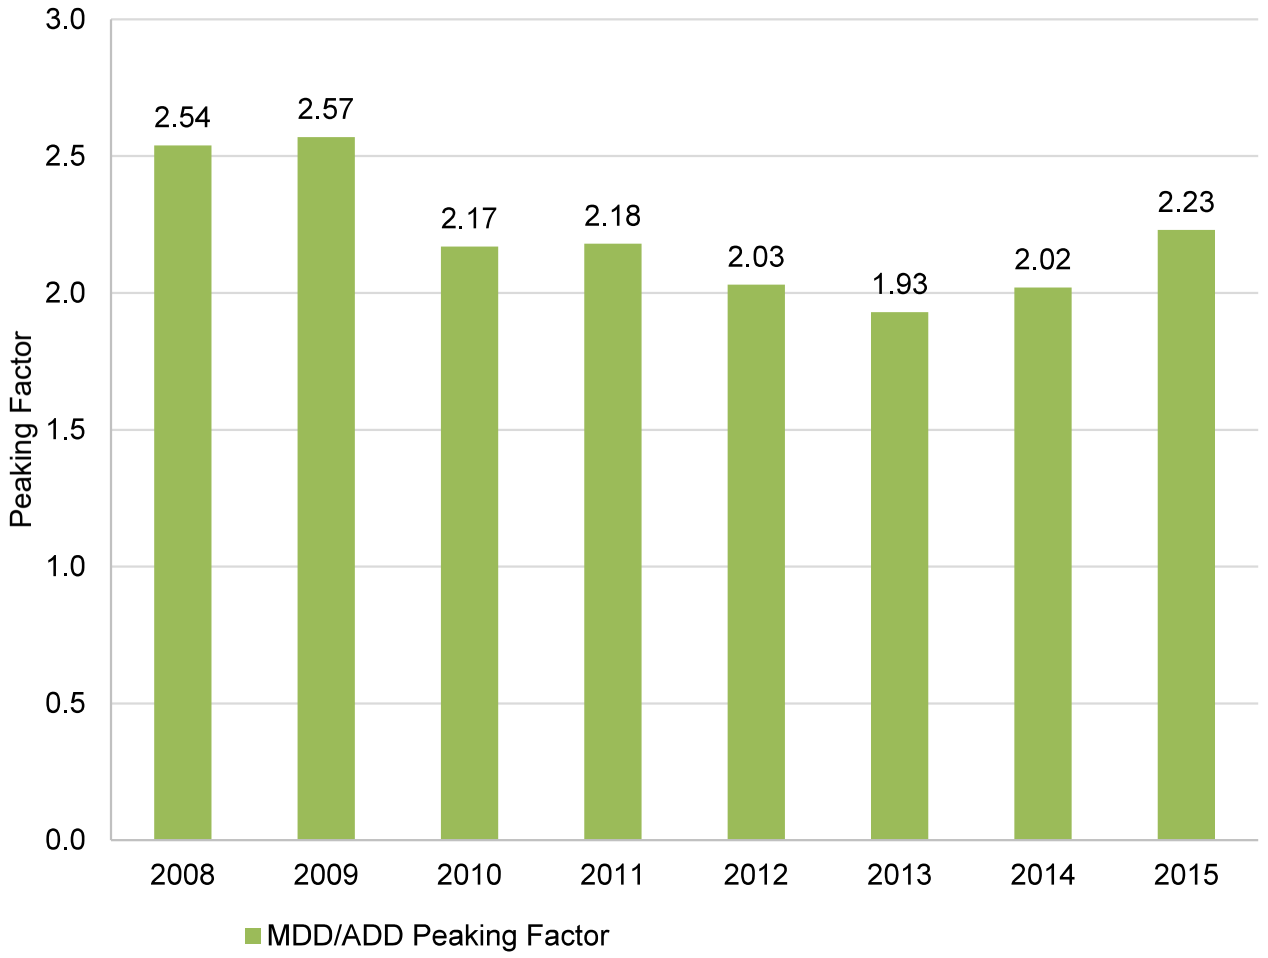
(1) In 2008, the total consumption reported by the City exceeded the total reported production. Therefore, these data are considered erroneous and a DSL of 10.0% was assumed instead for 2008 to be consistent with other years in this period.

DISTRIBUTION SYSTEM LEAKAGE

FIGURE 5.3

CITY OF CAMAS
WATER SYSTEM PLANT UPDATE

5.3.2 Historical Average and Maximum Demands



The City produces water for its customers through ten wells and two surface water sources. Table 5.5 presents the ADD and MDD (based on production) for the period of 2008 through 2015. The average annual water produced from 2008 through 2015 was 1,317 million gallons per year. The average ADD over the period was 3.61 mgd. The annual ADD trends strongly upward over this period, reflecting the growing number of City water customers.

Table 5.5 Historical Average Production, Maximum Day Demand, and Peaking Factor
Water System Plan Update
City of Camas

Year[1]	Date of MDD	MDD (mgd)	ADD (mgd)	Peaking Factor
2008	8/16	7.55	2.97	2.54
2009	7/31	8.65	3.37	2.57
2010	8/15	7.42	3.42	2.17
2011	8/20	7.76	3.56	2.18
2012	8/16	7.39	3.64	2.03
2013	7/27	7.19	3.72	1.93
2014	8/9	7.99	3.96	2.02
2015	7/4	9.40	4.22	2.23
	3-year Avg.	**8.19**	**3.96**	**2.06**
	75th Percentile	**8.48**	**3.90**	**2.46**
	Maximum	**9.40**	**4.22**	**2.57**

The MDD is a key benchmark for supply capability, pump station discharge rates, reservoir capacity, and pump sizes. The MDD is the highest production in one day in a given year, and usually occurs during the summer when irrigation is prevalent. Table 5.5 presents the historical MDD from 2008 to 2015. MDD is less dependent on indoor water use (which drives the ADD), and more dependent on irrigation. The highest MDD value (9.40 mgd) occurs in 2015, which had record-setting high temperatures and low rainfall. The next highest MDD occurred in 2009, six years earlier.

The last column of Table 5.5 presents the historical MDD to ADD peaking factor, which normalizes the historical data to compare between years. The peaking factor is also a key parameter in developing the future MDD projections, as discussed later in this chapter. The maximum peaking factor of 2.57 occurred in 2009 and the minimum peaking factor of 1.93 occurred in 2013. The MDD to ADD peaking factor over the period is shown graphically in Figure 5.4. Figure 5.4 illustrates the variability in the peaking factor over the period. Section 5.6.4 discusses the peaking factor to be used for future projections.

MDD/ADD PEAKING FACTOR

FIGURE 5.4

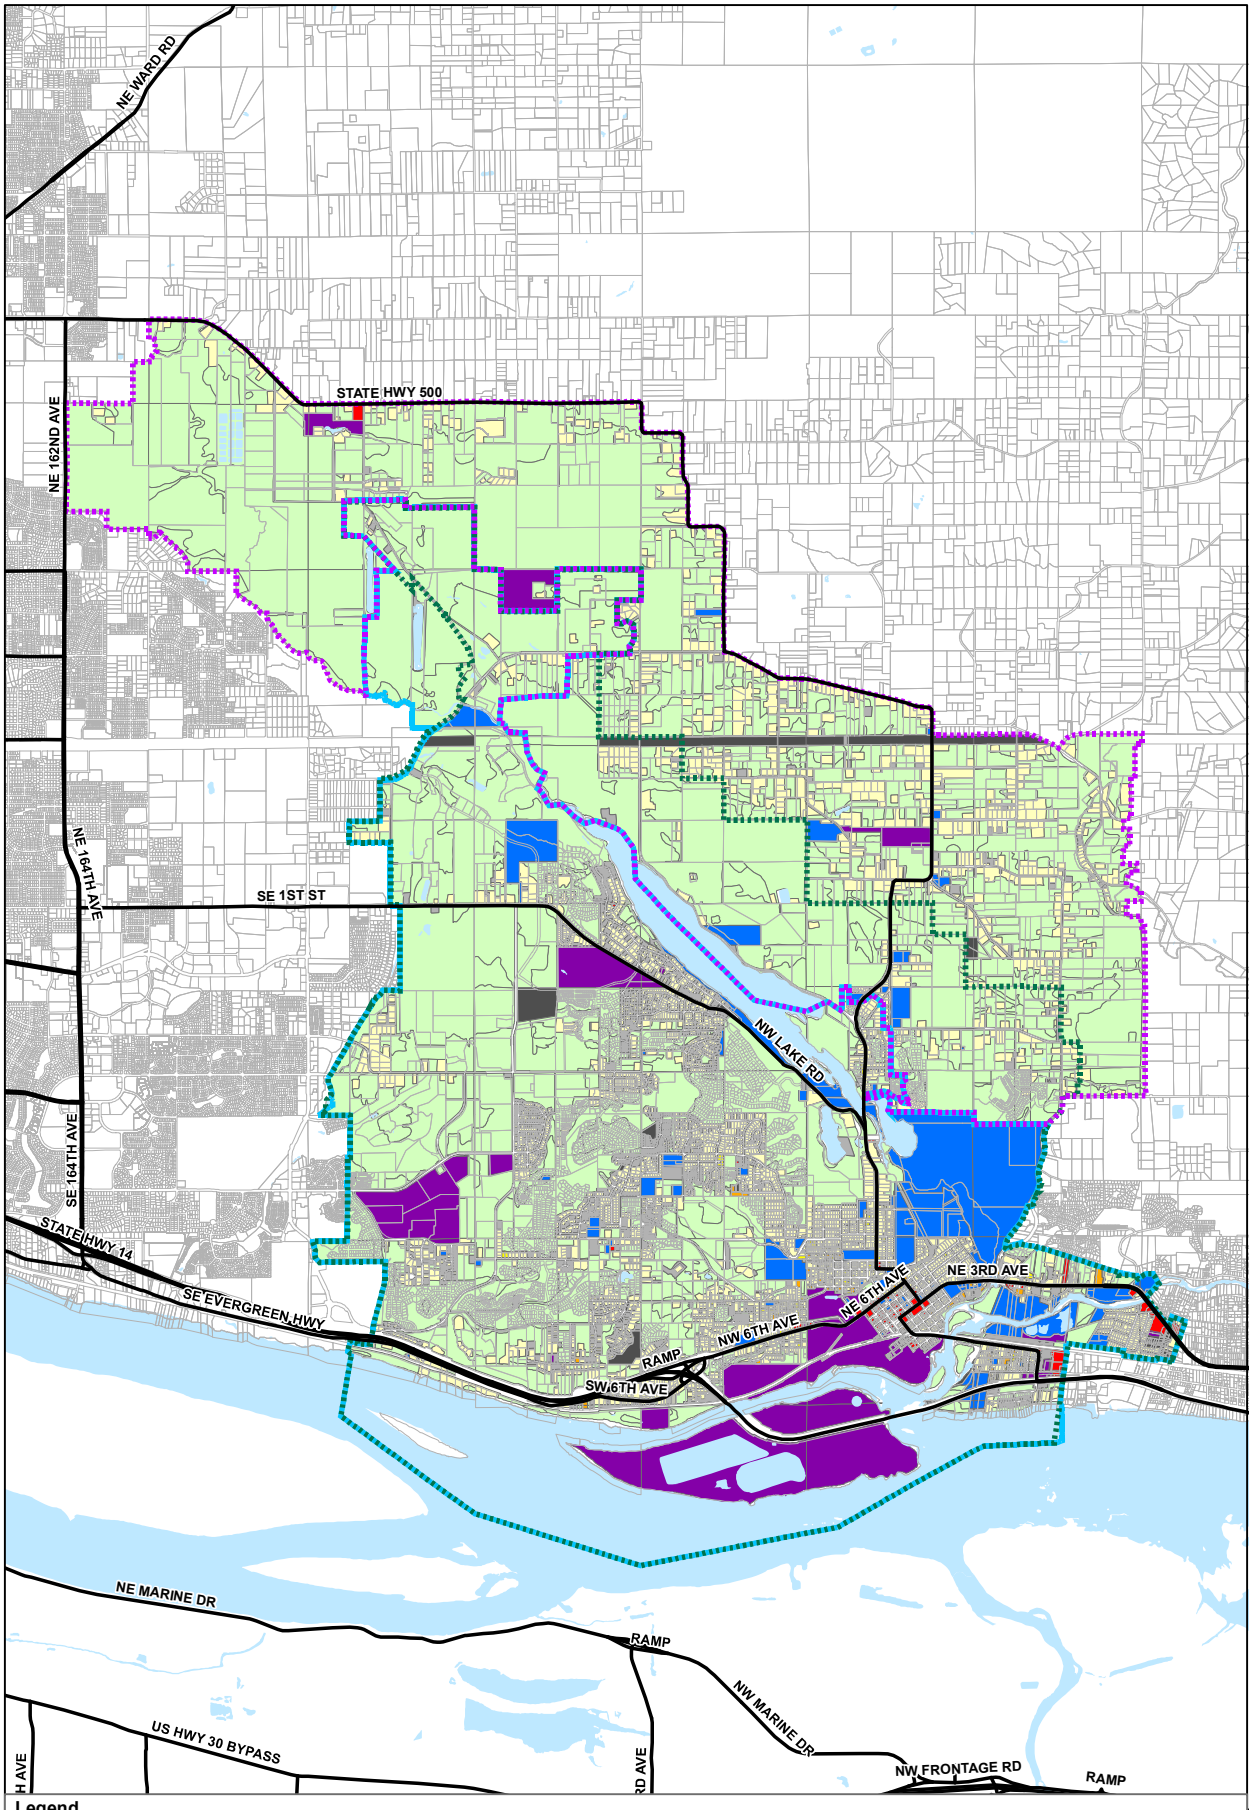
CITY OF CAMAS
WATER SYSTEM PLANT UPDATE

5.4 DEMOGRAPHIC FORECAST

Demand projections depend on the future number of customers to be served by the City's water system. Thus, demographic forecasts of future population and employment must be made to establish an estimate of the future number of customers. A demographic analysis consistent with regional growth planning was performed to estimate the number and type of the future customer accounts served by the City's water system. Converting the number of accounts into demand projections is discussed in Section 5.6.

5.4.1 Land Use

Land use designations and regulations provide important information in determining future water requirements. Land use determines the area available for various types of development including both SFR and MFR development, as well as commercial and other types of land use that provide the economic base necessary to support residential development.

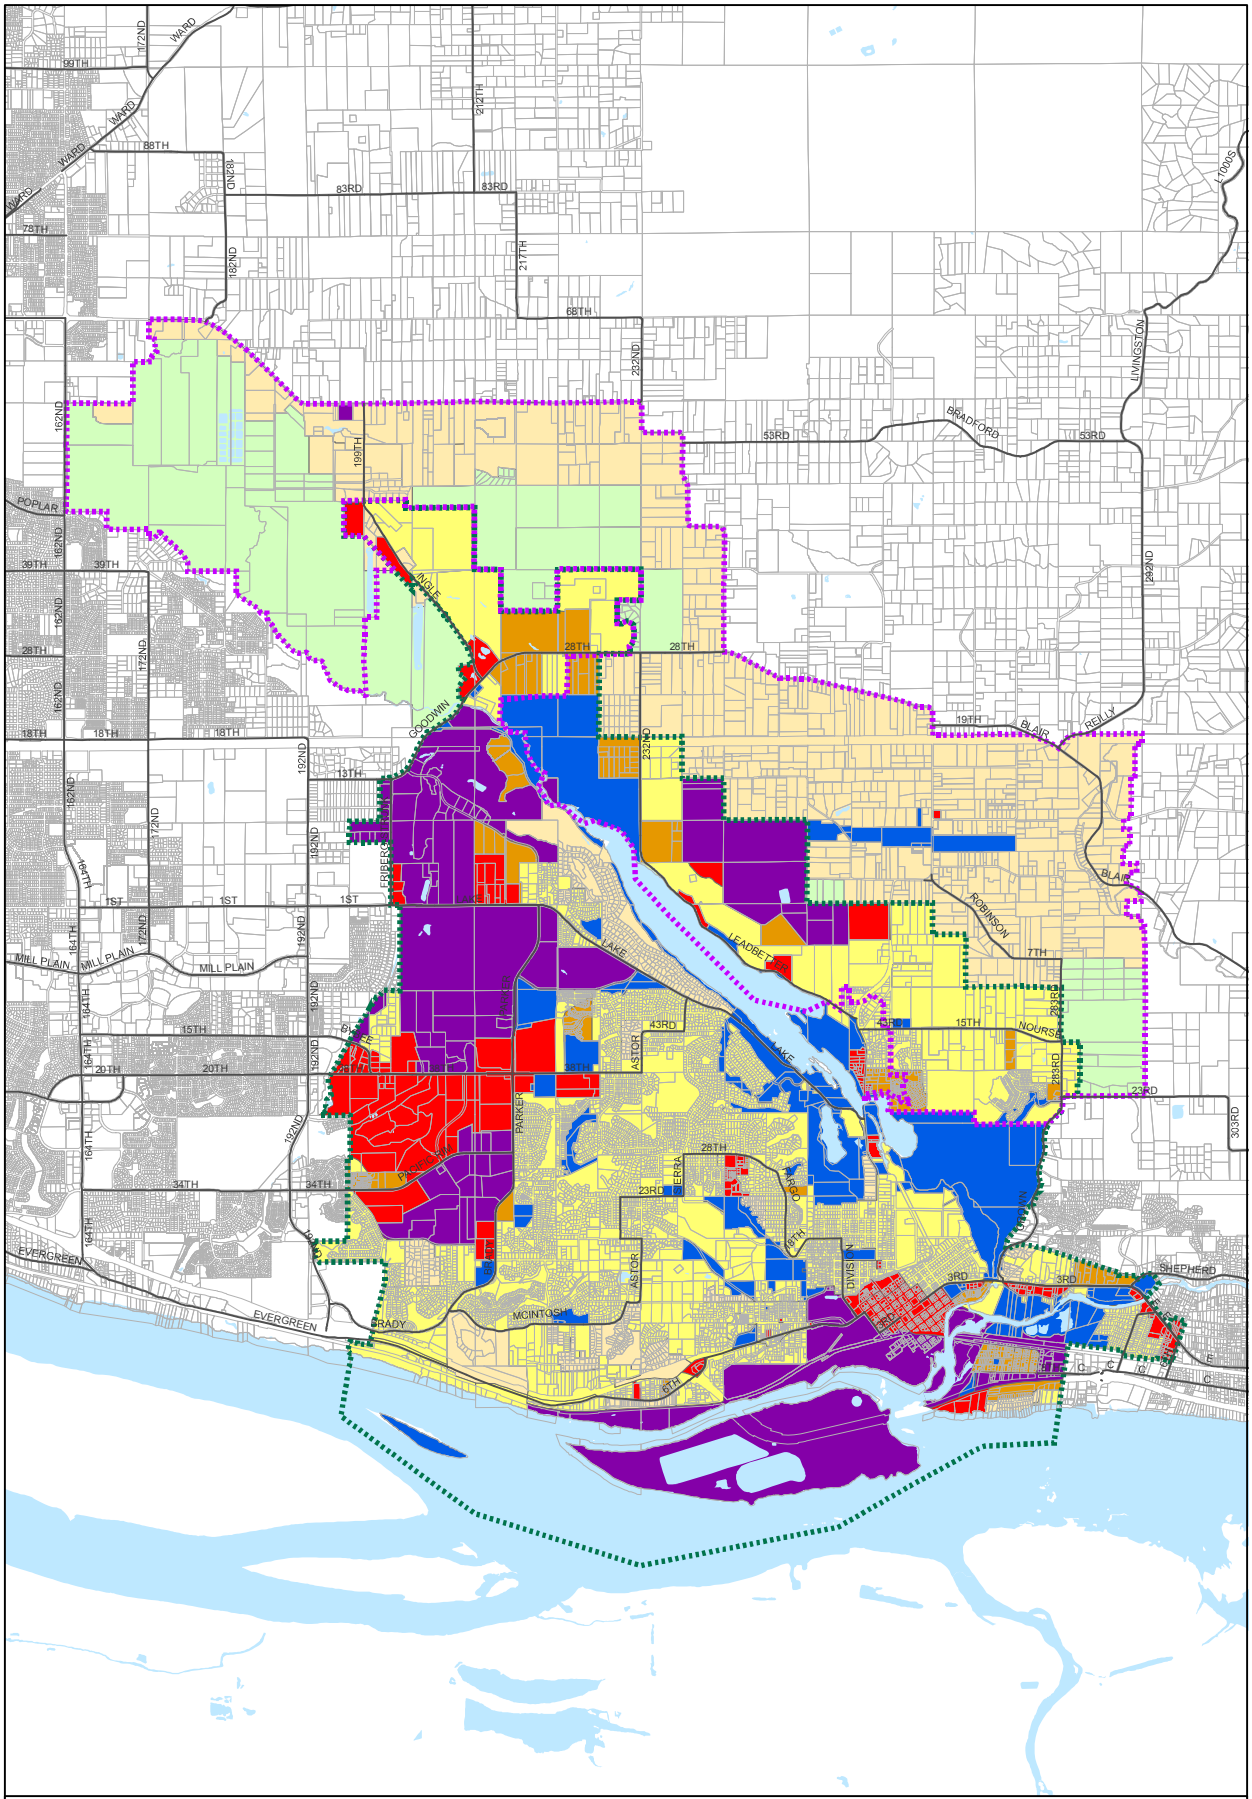


5.4.1.1 Existing Land Use

Figure 5.5 depicts the best available data on existing land use from Clark County GIS data developed for the 1994 Growth Management Act. Because these GIS data are not up-to-date, existing water customers were derived using the City's up-to-date meter data. Each metered account was assigned an address and one of the six customer classes. Using GIS, these metered accounts were geocoded to correspond to a geographic location within a Service Area.

Note that in Figures 5.5, 5.6, and 5.7, the North Shore Urban Growth Area (UGA), or North Shore UGA, refers to the entirety of Service Area 542, but only the portion of this area within the RWSA is incorporated into the demand projections. Note that in Figures 5.5, 5.6, and 5.7, City services in Vancouver, Washington were not included in the demographic forecast.

5.4.1.2 Future Land Use



Future land use designations were obtained from the City's 2035 Comprehensive Plan (Camas 2016). These future land use designations are depicted in Figure 5.6. The future land use designations are used to evaluate the 20-year development conditions as described below.

EXISTING LAND USE

FIGURE 5.5

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

FUTURE LAND USE PER COMPREHENSIVE PLAN

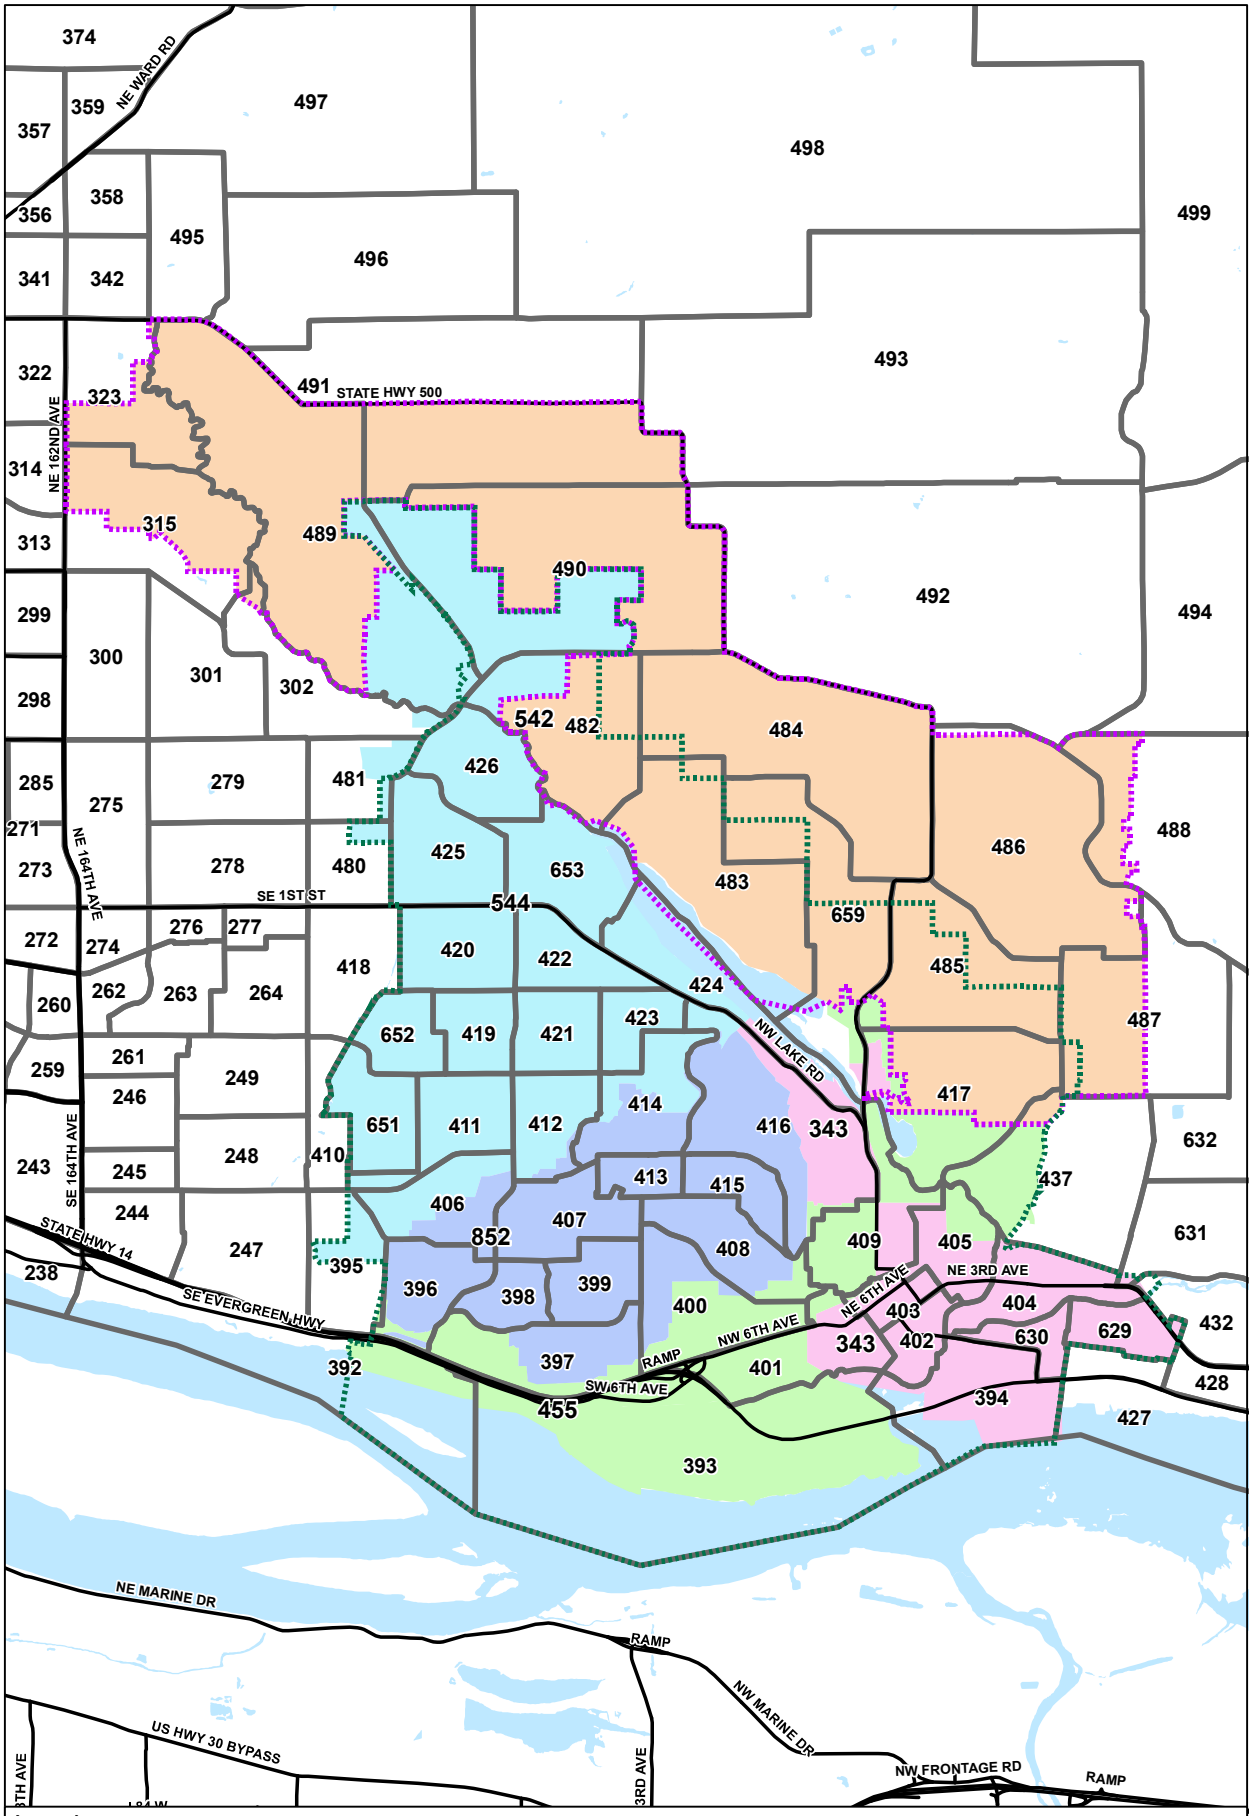
FIGURE 5.6

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

5.4.2 Demographic Growth Rates

The demographic forecasts include an estimated rate of growth and a low and high development cap in each Service Area. In 2035, The City is expected to have a population of 34,098 people, and 11,255-person increase from the 2015 population of 22,843 (Camas 2035, 2016). Rates of growth were based on housing and employment estimates per Transportation Analysis Zones (TAZs) for the City. Camas's water system has five Service Areas encompassing 65 different TAZs. Each Service Area contains multiple TAZs and the boundaries do not coincide. The percentage of each TAZ within each Service Area was estimated using GIS. To estimate the rates of growth in each Service Area, the existing and projected households and employees for each TAZ were allocated to the Service Area in which they lie according to the percentage of their area in that Service Area. A map of the TAZs and Service Areas is shown in Figure 5.7.

Two scenarios were considered for build-out capacity:



- High Growth Scenario: this scenario assumes full development of the City according to the City's Comprehensive Plan representing maximum allowable buildout in 2035.
- Low Growth Scenario: this scenario assumes development of all currently vacant and underutilized lots according to the Comprehensive Plan; however, currently developed properties do not redevelop according to the Comprehensive Plan.

These growth scenarios establish a limit on demographic growth within each Service Area. To estimate households and employees from land use data, the following employee and household density assumptions were used based on the 2015 Clark County Buildable Lands Report:

- SFR: 6 households per acre.
- MFR: 18 households per acre.
- Commercial/City: 20 employees per acre.
- Industrial: 9 employees per acre.

When the projected number of households or employees within a Service Area reached these density limits, no more households or employees were added and household or employee growth within that Service Area was considered "capped."

The final household and employee growth rates were calculated for each Service Area based on the low and high growth scenarios. Medium growth scenario growth rates were calculated as the average between the low and high growth scenarios. Table 5.6 summarizes overall growth within the Service Area for each of the planning years from 2015 to 2035. The table presents total growth compared to 2015 for each of the planning years, and the average annual growth rate.

	Employees (average annual growth since 2015)	1.2%	1.2%	1.2%	1.2%	1.2%	1.3%	1.1%	1.2%	1.2%

Notes:

(1) Demographic growth projections were not developed for the 542 Sewer section of Service Area 542, since the 542 Sewer ERU projections were obtained from the City's Sewer Master Plan, as described in Section 5.4.3. See Table 5.10 for ERU projections in the entire Service Area 542.

(2) The overall demographic growth rates presented in this table include only the Service Areas listed, and do not include households nor employees located in the 542 Sewer section of Service Area 542.

The City currently serves several accounts located outside the RWSA based on agreements with adjacent purveyors. These accounts were not grown as expansion of water service in this area is not expected, per the definition of the RWSA. Instead, their 2015 demands were held constant over the entire 20-year planning period.

5.4.3 Service Area 542 Projections

Some exceptions to the methods for projecting growth described in the previous sections were made in Service Area 542. Previous growth projections were developed for this area as part of the City's sanitary sewer planning. Much of Service Area 542 lies within the North Shore UGA Sewer Basins I-IV, as delineated in the City's Sewer Master Plan. For the region of Service Area 542 inside these basins, the ERU projections developed in the Sewer Master Plan were used. The methods used to project growth and development for all other Service Areas were applied exclusively to properties within the RWSA but outside these sewer basins. These two sections of Service Area 542 are referred to as 542 Sewer and 542 Non-Sewer, respectively, to reflect their distinct methods for projecting growth. Additionally, Camas Meadows Golf Course in Service Area 544 was identified as being contained within the North Shore UGA Sewer Basins I-IV. Meters and land corresponding to this property were consequently excluded from Service Area 544 growth and buildout projections.

5.5 PROJECTED NUMBER OF CONNECTIONS

Once growth rates were established, the number of existing accounts was grown by the low, average, and high Service Area growth rates for each Service Area. Existing residential accounts were grown by the estimated household growth rates for each Service Area; existing non-residential accounts were grown by the estimated employment growth rates for each Service Area.

Table 5.7 summarizes the projected number of accounts for each Service Area, excluding Large Users. The projected number of future accounts was then used to develop ERUs and demand projections.

Notes:

(1) All City accounts are included in the Large Users class. Large User accounts were not grown - the number of Large User accounts in each service area over the entire planning period was assumed to be equal to the 2015 number of accounts. Instead, independent growth projections were developed for each large user and used to project Large User demands, as described in Section 5.6.2.

(2) Account projections were not developed for the 542 Sewer section of Service Area 542, since the 542 Sewer ERU projections were obtained from the City's Sewer Master Plan. See Table 5.10 for ERU projections in the entire Service Area 542.

5.6 PROJECTED WATER DEMAND

Projecting future water demand is one of the key elements of the water system planning process. Identification of system improvements such as supply, pumping, storage, and piping requirements are all related to demand projections. This section summarizes the ERU, ADD, and MDD projections, as well as the potential range in future demands associated with various factors, such as water use per ERU, DSL, and demographic growth rate.

5.6.1 Potential Range in Future Water Demand

Numerous factors and assumptions affect the accuracy of projected future water demands. Recognizing that certain assumptions built into the demand projections will vary in the future, the projections were developed for low, medium, and high demand scenarios to provide a range in demands that may be experienced in the future.

The variables considered in developing the range of demand projections are summarized in Table 5.8 and are discussed below.

- **Future Water Accounts:** The future water accounts are presented in Table 5.7 and were used for their corresponding demand scenario (low, medium, and high).
- **Water Use per ERU:** Water use per ERU for the low and medium demand projections are based on the average water use per ERU over the last three years (2013 to 2015), 260 gallons per day per equivalent residential unit (gpd/ERU), and reflect the City's conservation goals. The high demand projection was based on 75th percentile of the historical data presented in Table 5.3, which equals 315 gpd/ERU.
- **ERUs per Account:** The historical ERUs per account by customer class presented in Table 5.3 were used to project the future demands. These ERU per Account values were based on the 75th percentile of the historical data and a water use per ERU value of 315 gpd/ERU to be conservative.
- **Distribution System Leakage:** DSL varied between 5.6 and 13.3 percent of the City's total production between 2008 and 2015. For the low and medium demand scenarios, a DSL of 10 percent was selected to represent the City's conservation goals. For the high demand scenario, the average DSL observed from 2008 to 2015 of 10.3 percent was used.
- **Maximum Day/Average Day Peaking Factor:** Due to the high projected demands for the City's largest water users (described in the following section), and the lack of summer peaking of industrial users (which comprise most Large Users), the MDD/ADD peaking factor was not applied to Large Users to avoid overly conservative demand projections. Therefore, MDD/ADD peaking factors were developed for all customers excluding the largest users from the historical data to be used for the

demand projections herein. The MDD/ADD peaking factor for all customers excluding Large Users varied from 2.48 to 3.58 between 2008 and 2015. For the low demand projection, the average peaking factor over the most recent three year period (2013 to 2015) of 2.74 was used. For the medium demand projection, the average peaking factor observed from 2008 to 2015, 2.95, was used. For the high demand projection, the 75th percentile peaking factor from 2008 to 2015, 3.43, was used.

Large Users were based on individual demand projections that are presented in the following sections.

Table 5.8 Demand Projection Parameters Water System Plan Update City of Camas

Demand Scenario	Demographic Growth Scenario	Water Use per ERU (gpd/ERU)	Distribution System Leakage (%)	Maximum Day Peaking Factor
Low	Low	260	10.0%	2.74
Medium	Average of High and Low	260	10.0%	2.95
High	High	315	10.3%	3.43

5.6.2 Large Users Demand Forecast

The City's top 10 water users, or Large Users, were identified by the City as presented in Section 5.1.1. Low, medium, and high demand forecasts were created for each Large User based on historical water use data from 2008 through 2015.

The low demand scenario projections assume that each Large User's annual water demand is held constant over the entire planning period at the maximum demand observed by the user during the 2008 to 2015 period. The Large Users high demand scenario projections assume that each user's demands increased at a constant rate equal to that user's average rate of annual increase in demand over the most recent three year period (2013 to 2015). The medium demand scenario is an average of the low and high demand projections.

Notably, demand projections for some Large Users were developed differently. Wafertech Industries and Linear Technologies are not expected to expand and subsequently increase demand, per City staff. Similarly, recent budget cuts applied to the City of Camas and Camas School District limit the amount of water to be used for irrigation purposes in the future. Consequently, the demand projections for these four Large Users calculated under the low demand scenario were used for all demand scenarios, as significant increases in water demand are not expected over the planning period. Additionally, SE Incorporated did not contribute any water demand until 2013, so limited data is available for establishing demand projections. In this case, annual increases in water demand were assumed to match the annual rate of increase in demand over the most recent three year period (2013

to 2015) for all Large Users combined: approximately 4 percent. Lastly, both Karcher North America and Georgia Pacific Mill demonstrated a decline in average demand over the 2008 to 2015 period. For these two users, the annual average rate of increase in demand from 2008 to 2015 was used to develop the low demand scenario instead of the maximum observed demand.

The City does not expect any new Large Users to contribute demand in the immediate future. However, the City has requested Large Users projections include a 0.5 mgd "block" for future industrial clients. This 0.5 mgd was added to the Large Users demand projections in 2021 - the end of the short-term planning period - as it is unlikely any new Large Users will contribute to demand within this planning period.

The Large Users demand projections are presented in Table 5.9. For each Large User, Table 5.9 provides the Service Area, 2015 demand, and the projected 2021, 2025, and 2035 demands.

5.6.3 Projected ERUs

Future water system demands are based on projected ERUs, which in turn are based on the projected water consumption by customer classification and the projected number of accounts discussed earlier in this chapter. Table 5.10 shows the projected ERUs for the City's individual Service Areas over the planning period under each growth scenario. The projected number of ERUs for each Service Area was calculated by multiplying the projected number of accounts, provided in Table 5.7, by the number of ERUs per account, as summarized in Table 5.3, for each customer class. The total ERUs in Service Area 542 includes the projected ERUs based on the City's sewer projections for ERUs in this area.

To incorporate the unique demand projections for Large Users, the Large Users projections were also converted to ERUs and incorporated into the total ERUs for each Service Area.

5.6.4 Projected Average Day and Maximum Day Demands

ADD projections were determined by multiplying the total number of projected ERUs per Service Area by the appropriate water use per ERU for each demand scenario, as listed in Table 5.8. Additionally, the ADD projections incorporate the assumptions for DSL and the unique Large Users demand projections. To develop MDD projections, the ADD projections for all customers other than Large Users were multiplied by the peaking factors shown in Table 5.8 for each demand scenario (as Large Users show limited seasonal peaking).

Tables 5.11 and 5.12 show the projected ADD and MDD, respectively, under the low, medium, and high demand scenarios. These projections, as well as historical ADD and MDD, are visually depicted in Figure 5.8.

FIGURE 5.8

CITY OF CAMAS
WATER SYSTEM PLANT UPDATE

Chapter 6

WATER USE EFFICIENCY

The City of Camas (City) promotes efficient water use to conserve and protect their existing water supplies for present and future residents. The City promotes water conservation and efficient use of water through a variety of activities that encompass their Water Use Efficiency (WUE) Program. The program encourages water conservation and utilizes continued improvements to reduce leakages and water loss in the City's system. This chapter details both the City's existing and future WUE programs.

6.1 WUE PROGRAM BACKGROUND

In 2003, the Washington State Legislature passed the Engrossed Second Substitute House Bill 1338, known as the Municipal Water Law or the WUE rule, to address the increasing demand on Washington's water resources. This law established that all municipal water suppliers (MWS) must use water more efficiently in exchange for water right certainty and flexibility to help them meet future demand.

The WUE rule, which became effective on January 22, 2007, emphasizes the importance of measuring water use and evaluating the effectiveness of the water supplier's WUE program. The intent is to minimize water withdrawals and water use by implementing water saving activities and adopting policies, resolutions, ordinances, or bylaws. This chapter follows the guidelines set forth in the Water Use Efficiency Guide Book, Third Edition, (January 2017) as well as the Water System Planning Handbook (April 1997).

6.1.1 Current WUE Program

The City's current WUE Program was established as part of the 2010 Water System Plan (2010 WSP). Per the Washington Administrative Code (WAC) 246-290-830(4)(a), all water purveyors with 1,000 or more connections were required to set efficiency goals through a public process. The established goals promote water use efficiency for internal operations and for water customers. The current WUE Program goals were established in the 2010 WSP and re-established in 2013:

- **Demand-Side Goal:** Reduce customer consumption per equivalent residential units (ERU) by 1 percent or approximately 2 gallons per day (gpd) per year over the next 6 years.
- **Supply-Side Goal:** Continue to reduce distribution loss to at or below 10 percent for the next 5 years.

The following summarizes the current program.

6.1.1.1 Supply-Side Measures

The City implements the following supply-side measures as part of their WUE Program. A number of these measures are mandated by Washington State Department of Health (DOH) per the Water Use Efficiency Guidebook. The following summarizes the City's supply-side measures:

1. Record and monitor supply source production (Mandatory).
2. Record and monitor customer demands through customer water meters (Mandatory).
3. Test and calibrate industrial and commercial meters annually (Mandatory).
4. Replace customer water meters with enhanced advanced meter reading (AMR) meters. Nearly 60 percent of customer meters have been upgraded to the new AMR meters. Once complete, the City will regularly test and repair residential meters per manufacturer recommendations.
5. Perform annual leak detection surveys through a private contractor. Hydrants and valves are checked as part of leak detection surveys (Mandatory).
6. Replace or replace old distribution system piping with defects as budget allows.
7. Reclaimed Water: Treated wastewater is used for wash down and process use and for landscape irrigation at the wastewater treatment plant (WWTP) (Mandatory to evaluate reclaimed water).

6.1.1.2 Demand-Side Measures

The City implements a number of demand-side measures that the meet the DOH requirement for 6 water use efficiency measures. These measures are similar to many of the example water use efficiency measures presented in Appendix B of the Water Use Efficiency Guidebook. The City provides an overview of their water use efficiency activities on their Water Services website (http://www.ci.camas.wa.us/index.php/pwwater). The City's various public outreach activities meet the DOH requirement for educating customers about water use efficiency. The following provides a summary of the City's demand-side measures:

1. Include water consumption history on customer's utility bills.
2. City staff alert and visit customers where customer leaks are identified.
3. Promote installation of smart controllers and irrigation timers for the school district and industrial users

4. Educate the public on conservation and water-saving devices at community events and on the City website (http://www.ci.camas.wa.us/images/DOCS/WATER_SEWER/REPORTS/waterconservation.pdf).

5. Distribute water-saving devices such as shower timers at community events.

6. Require xeriscaping and Low Impact Development (LID) to reduce irrigation requirements for new developments.

7. Work with developers to evaluate their irrigation systems to incorporate drip systems or micro sprayers.

8. Promote odd/even day and late night or early morning irrigation for all customers.

The above supply and demand side WUE measures are effective in encouraging WUE for the water system. Additional measures will be evaluated if new opportunities arise for WUE.

6.1.2 Distribution System Leakage

Distribution system leakage (DSL) is a significant element of supply-side WUE requirements. DSL above 10 percent on a 3-year rolling average is considered excessive and necessitates the creation of a water loss control action plan. DSL is the difference between total water production and documented water use (retail and authorized unmetered). The estimate of DSL is dependent on the accuracy of meter readings for supply and customer meters and the accuracy of tracking authorized unmetered use for activities such as fire hydrant flushing. Table 6.1 presents the City's reported 3-year rolling average DSL from 2014 through 2016. The City has consistently maintained DSL below their WUE program goal and DOH standard of 10 percent.

Table 6.1 Distribution System Leakage (3-year Rolling Average)
Water System Plan Update
City of Camas

Year	3 Year Rolling Average DSL (%)
2014	8.7%
2015	8.7%
2016	9.1%
2017	9.6%

The DSL in Table 6.1 differs from that calculated in Chapter 5 – Water Requirements in 2014 and 2015, where Chapter 5 typically has less authorized consumption and higher DSL. Note, 2016 and 2017 data was not available for use in Chapter 5 at the time of its completion. The City is not able to account for the differences, since the Lead Operator completing the reports has retired; however, it is believed to be related to year end meter

reading. The City will conduct a water audit in 2018 using the American Water Works Association (AWWA) Water Audit methodology. The AWWA mythology will provide the City with a robust framework to understand the components of water loss and document data sources. The 2018 Water Audit can be found in Appendix L. If the AWWA Water Audit finds DSL greater than 10 percent, then the City will develop a Water Loss Control Action Plan.

6.1.3 Historical Effectiveness of Current WUE Program

The City's current WUE Program includes measures for residential, irrigation, commercial, and industrial customers. The effectiveness of the City's program in meeting their WUE goals can be evaluated considering system-wide water use trends.

The 2010 WSP used a planning ERU of 296 gpd based on average residential use from 2004 to 2007. The current planning ERU value of 260 gpd was based on the average of water use from 2013 to 2015. This equates to a decrease of 4.5 gpd, or 1.6 percent annually over the eight year period, above the City's goal of 1 percent, or approximately 2 gpd per year.

Annual water use per account from 2008 to 2015 was detailed previously in Section 5.1.3. Water use across for the City's single-family residential, multi-family residential, commercial, and industrial accounts have all shown decreases since 2008. Single-family residential, commercial and industrial water use per account have all decreased over 20 percent since 2008, or over 2.5 percent per year. The City believes these decreases were in part from the WUE Program. It is acknowledged that other factors may have played a prominent role, such as weather and economic conditions.

The City does not track staff time or project costs associated with WUE. The supply-side WUE measures, such as metering and leak detection, are core activities of the Utility and are funded through Utility Capital Improvement and operations and maintenance (O&M) funds. The City estimate it dedicates approximately 0.5 full-time-equivalents (FTE) of staff time to conduct demand side measures across its Water Utility, Finances department, and development services staff. It is not possible to estimate the impact of demand-side measures on water use; therefore, no cost per gallon can be calculated.

Water consumption in City billing is based on $1.86 per one hundred cubic feet or 0.2 cents per gallon. Based on other Washington State Utilities, costs for WUE activities are similar to the City's production costs.

As shown in Table 6.1, the City's WUE Program efforts have been effective at keeping DSL below the program goal of 10 percent.

6.2 FUTURE WUE PROGRAM

The City plans to continue its efforts to encourage efficient water use. Going forward, the program will continue to focus on measures targeted at residential customers. The WUE Program goals established in 2013, which have been maintained, are:

- **Demand-Side Goal:** Reduce customer consumption per ERU by 1 percent or approximately 2 gpd per year over the next 6 years.
- **Supply-Side Goal:** Continue to reduce distribution loss to at or below 10 percent for the next 5 years.

Public comment on the future WUE program was taken at the October 7, 2019 City Council Meeting. An agenda and minutes for the meeting are provided in Appendix D.

6.2.1 Mandatory Measures

The WUE Program includes supply side measures that the City implements to understand and control leakage including new meters and leak detection surveys. The City's WUE Program will continue to meet the following mandatory measures in the future:

- Install production (source) meters.
- Install consumption (service) meters.
- Perform meter calibration.
- Implement a water loss control action plan to control leakage if the 3-year rolling average exceeds 10 percent.
- Educate customers about water use efficiency practices.
- Evaluate rates that encourage water demand efficiency, as discussed in a subsequent section.
- Evaluate reclamation opportunities, as discussed in a subsequent section.

6.2.1.1 Rate Structure

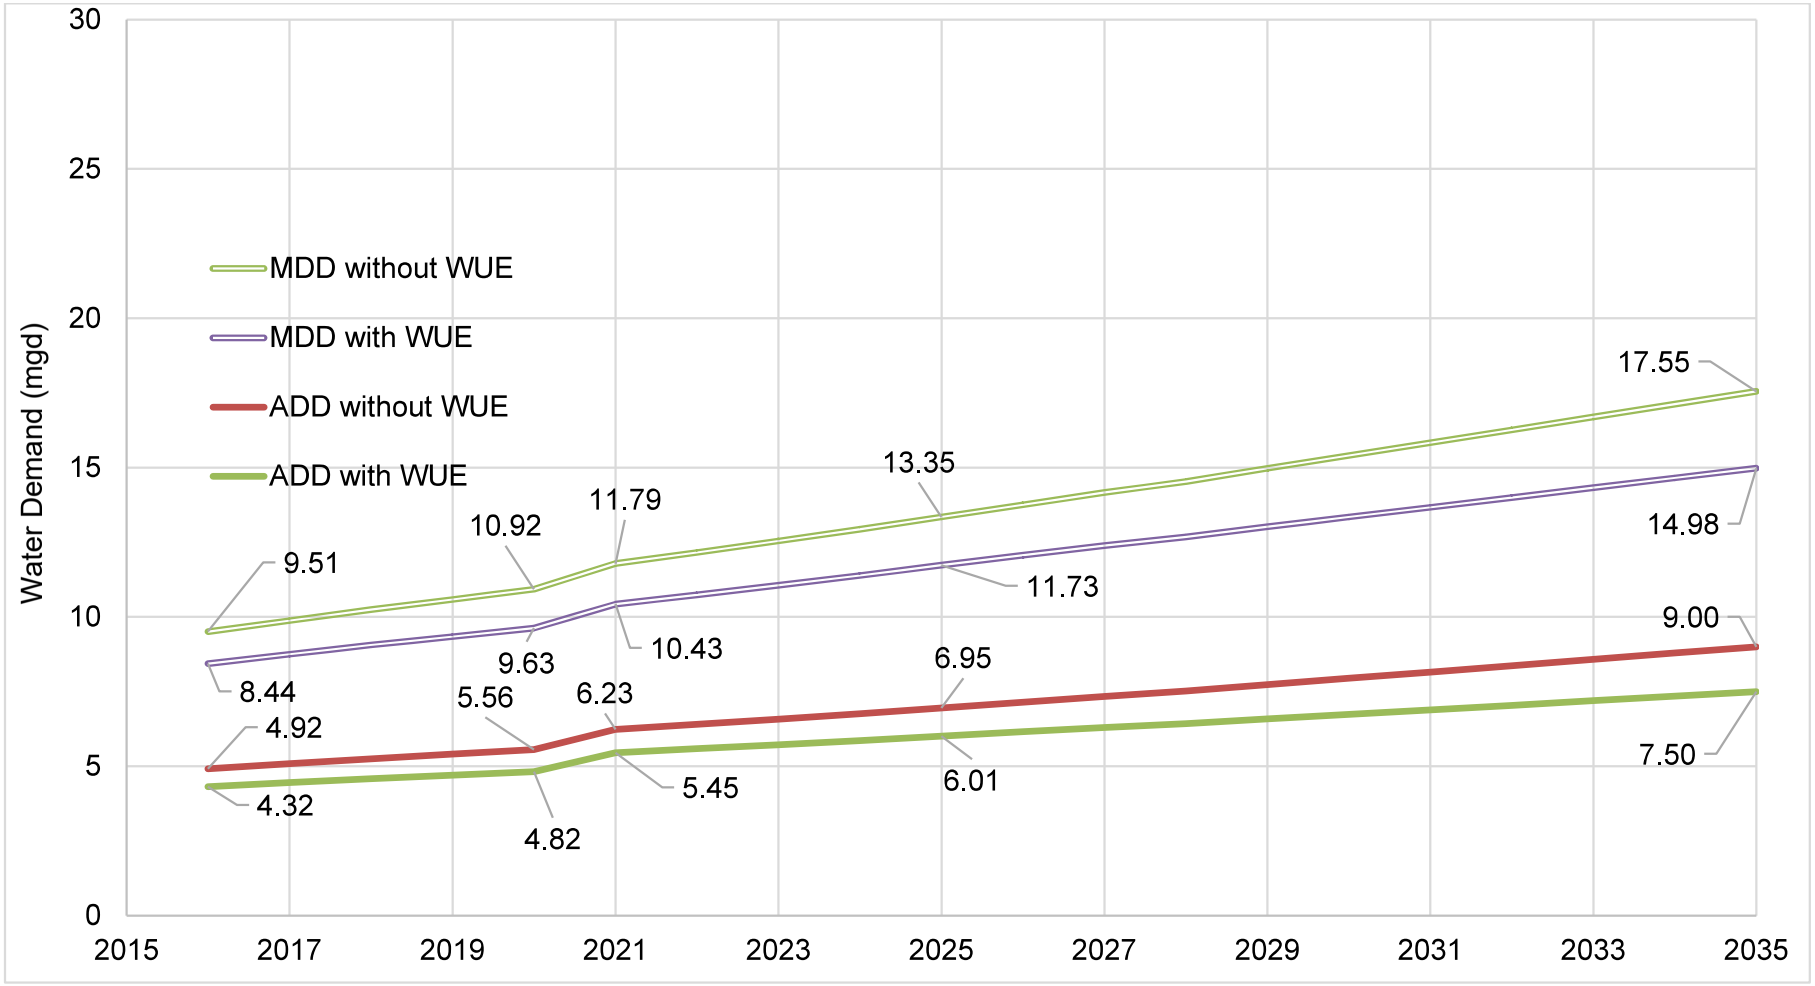
The City's current rate structure bills customers on a uniform volumetric charge. In 2010, the City added a consumption based element to sewer rates based on average winter water consumption, which was thought to encourage water efficiency. The City will reevaluate a more aggressive rate structure, such as inclined block rates, in future rate studies.

6.2.1.2 Reclaimed Water

Per WAC 246-290-100 and WUE requirements, water systems with over 1,000 connections must evaluate reclaimed water opportunities. As mentioned previously, the City currently

uses treated wastewater at the WWTP. In addition, the City is currently (2017) working with one of their large industrial water users to evaluate opportunities for reuse of reclaimed water. If requested, the City is open to extending the reclaimed system to serve private customers.

6.2.2 Future WUE Program Supply-Side Measures



The City will continue their existing program for replacement of customer water meters. The AMR meter provides operational benefits, reduces data error and helps identify customer-side leaks. Continued installation of AMR meters is expected to enhance meter accuracy, leak detection and customer education through the detailed water use data and statistics provided by the AMR system.

6.2.3 Future WUE Program Demand-Side Measures

The City will continue the existing program measures described in Section 6.1. The City exceeds the minimum DOH requirement of 6 WUE measures.

6.2.4 Projected Demands with WUE Goals

The projected water demands considering the water savings from the City's WUE Program were represented with the low demand scenario presented in Chapter 5. Projected demands with WUE savings were compared to the medium demand projection. The low demand projection assumes a 2015 demand of 245 gallons per day per equivalent residential unit (gpd/ERU) while the medium demand projections assumes a 2015 demand of 260 gpd/ERU. The low demand projection also assumes the WUE Program will help to reduce the maximum day demand (MDD) to average day demand (ADD) peaking factor by approximately 8.1 percent. Both demand projections assume the City maintains DSL at 10 percent. Table 6.2 presents the projected ADD and MDD with and without the WUE Program for the 20-year planning period. The projected demands with the WUE Program are also shown in Figure 6.1. For ADD, WUE measures are projected to provide a reduction of 0.78 million gallons per day (mgd), or 9.1 percent, by 2035. For MDD, WUE measures are projected to provide a reduction of 2.57 mgd, or 14.7 percent, by 2035.

PROJECTED DEMANDS WITH WATER USE EFFICIENCY

FIGURE 6.1

Table 6.2 WUE Demand Projections Water System Plan Update City of Camas				
Demand Scenario	**2035 Projection with WUE (mgd)**	**2035 Projection without WUE (mgd)**	**Water Savings (mgd)**	**Percent Savings**
ADD	6.82	7.50	0.78	9.1
MDD	14.98	17.55	2.57	14.7

6.2.5 Future WUE Program Effectiveness

The effectiveness of the existing WUE program was evaluated using system-wide water use data. Measuring the effectiveness of the City's future WUE Program against the established goals could be similarly evaluated using system-wide water use data. Estimating the water savings directly resulting from the City's WUE Program in a single year is difficult. Therefore, long-term trends should be use to more clearly show the impact of the City's WUE Program.

Once AMR is implemented, the City will consider targeted public education programs to customers in a particular area or user profile, such as heavy irrigators. Using AMR, the City can estimate overall usage, irrigation usage and peak water use rates.

The first step would be to establish a baseline from historical information. The second step is to evaluate the resulting water use after promoting WUE through targeted activities and events to customers. It is recommended that water use be tracked for at least a year to identify trends. Some consideration would need to be given to variations in weather and economic conditions. Another method would be to perform the same before/after water use analysis for WUE Program participants who volunteer and provide their address. The resulting information would be valuable for the City to correlate its WUE Program efforts with direct water savings for its customers.

6.2.6 Budget

The City recognizes the importance of continuing their WUE measures and considers it a core function of the Utility. The WUE program provides cost savings through demand reduction and reduction in DSL. Continuing the WUE Program can assist the City in meeting peak demands and avoiding curtailment periods. The City will continue level of effort for demand-side measures; approximately 0.5 FTE of staff time across its Water Utility, finances department, and development services department. Due to AMR capabilities, it is anticipated that the City will further personalize water use communications with customers without increasing staff effort. Future supply-side WUE measures will be funded, as appropriate, through the Capital Improvement and O&M funds. If AMR detects a large numbers of existing and new leaks, the City will evaluate the need for additional personnel in its meter maintenance group to address leaks.

6.3 WATER SHORTAGE PLAN

City ordinances, CMC Chapter 13.14, have been created that allow the City to impose restrictions during a water shortage. They define five stages of water emergencies:

- Stage I – Anticipated Water Shortage.
- Stage II – Serious Water Shortage.
- Stage III - Critical Water Shortage.
- Stage IV – Emergency Water Shortage – Mandatory Outdoor Restrictions and Indoor Conservation.
- Stage V – Regional Disaster - Water Rationing.

The public works director is responsible for declaring and implementing the water shortage plans. Stages I or II implement voluntary reductions in water use for customers and some City watering reductions. Stages III and IV further regulate or prohibit nonessential uses of water. Up-to-date details on the Water Shortage can be found in CMC Chapter 13.14.

Chapter 7

WATER QUALITY

7.1 INTRODUCTION

The City of Camas (City) is defined as a Group A – Community Water System and must comply with the drinking water standards of the federal Safe Drinking Water Act (SDWA) and its amendments, as regulated by the United States Environmental Protection Agency (USEPA). The Washington State Department of Health (DOH) adopted the updated federal standards under Washington Administrative Code (WAC) 246-290, of which the most recent version became effective April 8, 2016.

The quality of the City's drinking water sources is of primary concern to the City. The City's water is supplied by groundwater aquifers and surface water sources (Jones and Boulder Creeks), which are tested regularly for the presence of contaminants at frequencies prescribed by DOH regulations. The City is in compliance with all DOH reporting requirements, including publication and distribution of an annual Water Quality Report that keeps consumers informed as to the quality of the City's water supply and water delivery systems.

This chapter includes the following components:

- Description of current drinking water quality regulations.
- Summary of anticipated future regulations.
- Summary of current monitoring programs.
- Summary of the City's compliance with USEPA and DOH regulations.
- Recommendations.

This chapter utilizes information from the DOH's website for Drinking Water Regulation and Compliance , the USEPA's website for regulations under the SDWA , the City's annual Water Quality Reports (included in Appendix E), and the City's 2012 through 2015 water quality data.

7.2 OVERVIEW OF REGULATORY REQUIREMENTS

The SDWA of 1974, amended in 1986 and 1996, established specific roles for the federal government, state government, and water system purveyors, with respect to water quality monitoring. The USEPA is authorized to develop national drinking water regulations and oversee the implementation of the SDWA. State governments are expected to adopt the federal regulations and accept primary responsibility or "primacy" for administration and enforcement of the Act. States can also regulate contaminants and set advisory levels. Public water system purveyors are assigned the day-to-day responsibility of meeting

regulations by incorporating monitoring, record-keeping, and sampling procedures into their operation and maintenance programs.

Applicable SDWA regulations are summarized in Table 7.1 and are divided into those that address source water quality, surface water treatment, distribution system water quality, and system-wide requirements, respectively. Monitoring requirements under each rule are noted herein.

7.3 SOURCE WATER QUALITY

Historically, the City has relied on groundwater supplies from wells and surface water diversions. All of the City's sources are treated with chlorine and fluoride. Surface water is also treated via a slow sand filtration plant. Regulations that address source water quality for groundwater and surface water systems are described herein.

7.3.1 National Primary and Secondary Drinking Water Standards

National Primary Drinking Water Standards are currently set for 92 contaminants. Maximum contaminant levels (MCLs) and maximum contaminant level goals (MCLGs) have been established for 83 contaminants, while the remaining nine have treatment technique requirements. A constituent's MCL is generally based on its public health goal (PHG), which is the level of a contaminant in drinking water below which there is no known expected health risk. Regulated constituents include microbial contaminants, inorganic chemicals (IOCs), volatile organic compounds (VOCs), synthetic organic chemicals (SOCs), radionuclides, and disinfection by-products (DBPs). Regulations affecting DBPs are discussed below in the distribution system water quality section.

The USEPA regulates most of the chemical contaminants through the rules known as Phases I, II, IIb, and V. The USEPA issued the four rules regulating 69 contaminants over a five-year period as it gathered, updated, and analyzed information on each contaminant's presence in drinking water supplies and its health effects. The Phase I Rule was promulgated July 8, 1987 and included eight VOCs. The Phase II and IIb Rules (published January 30 and July 1, 1991) updated or created new limits for 38 contaminants. The Phase V Rule (published July 17, 1992), set standards for 23 additional contaminants.

These rules form the basis of the DOH regulations, WAC 246-290. Since the Phase V Rule, MCLs for additional contaminants have been established through new regulations and must be adopted by the DOH.

The USEPA has also established secondary standards for 15 contaminants to address the aesthetic quality of drinking water; these secondary standards have also been adopted within the WAC. Because the federal standards primarily address taste and odor, rather than health issues, they are often used only as a guideline. For new community water systems, the DOH requires treatment for secondary MCL exceedances under WAC 246-290-320 (3)(d). For other public water systems, the WAC stipulates that the required follow-up action be determined by the DOH based on the degree of consumer acceptance of the water quality and their willingness to bear the cost of meeting the secondary standard.

Current primary and secondary MCLs for inorganic and organic constituents, respectively, are documented in the following subsections.

7.3.2 Inorganic Chemicals

Regulated IOCs include elemental metals such as mercury, arsenic, and iron. Some non-metallic constituents such as chloride, fluoride, and sulfate are also included in this category. Physical properties of IOCs that affect water quality in this category include turbidity, specific conductivity, total dissolved solids, and color. WAC 246-290-310 specifies primary and secondary MCLs for IOCs, which are summarized in Table 7.2 and Table 7.3 respectively.

Table 7.2 Primary MCLs for Inorganic Chemicals
Water System Plan Update
City of Camas

Chemical	Primary MCL (mg/L)[1]
Antimony (Sb)	0.006
Arsenic (As)	0.01
Asbestos	7 million fibers/liter (length > 10 microns)
Barium (Ba)	2.0
Beryllium (Be)	0.004
Cadmium (Cd)	0.005
Chromium (Cr)	0.1
Copper (Cu)	1.3[2]
Cyanide (HCN)	0.2
Fluoride (F)	4.0
Lead (Pb)	0.015[2]
Mercury (Hg)	0.002
Nickel (Ni)	0.1

Table 7.2 Primary MCLs for Inorganic Chemicals Water System Plan Update City of Camas	
Chemical	**Primary MCL (mg/L)(1)**
Nitrate (as N)	10.0
Nitrite (as N)	1.0
Selenium (Se)	0.05
Sodium (Na)	20(3)
Thallium (Tl)	0.002

Notes:
(1) Source: State DOH Drinking Water Regulations (246-290-310), effective March 2012.
(2) Lead and copper have established ALs, rather than MCLs. These are discussed further in the lead and copper rule (LCR), under the *Distribution System Water Quality* section.
(3) USEPA has established a recommended level of 20 milligrams per liter (mg/L) for individuals that have restrictions on daily sodium intake. This is not an enforceable standard.

Table 7.3 Secondary MCLs for Inorganic Chemicals Water System Plan Update City of Camas	
Chemical	**Primary MCL (mg/L)(1)**
Aluminum	0.05 to 0.2 mg/L
Chloride	250 mg/L
Color	15 (color units)
Copper	1.0 mg/L
Corrosivity	Non-corrosive
Fluoride	2.0 mg/L
Foaming Agents	0.5 mg/L
Iron	0.3 mg/L
Manganese	0.05 mg/L
Odor	3 threshold odor number
pH	6.5-8.5
Silver	0.10 mg/L
Sulfate	250 mg/L
Total Dissolved Solids	500 mg/L
Zinc	5 mg/L

Notes:

7.3.2.1 Monitoring Requirements

The City has a waiver for IOC testing that reduces the frequency to once every nine years for all its wells. The next IOC samples are required in 2020.

7.3.2.2 Compliance

The City complies with the requirements for monitoring IOCs, and has not exceeded any water quality requirements. Water quality data for inorganic chemicals from 2012-2015 is presented in Table 7.4.

Table 7.4 Inorganic Chemicals Monitoring Results
Water System Plan Update
City of Camas

Contaminant	Maximum Contaminant Level Goal	Maximum Contaminant Level	2012	2013	2014	2015
Fluoride (mg/L)	1	4	0.56 - 0.96	0.58 - 1.09	0.62 - 1.1	0.6 - 0.96
Nitrates (mg/L)	10	10	0.44 - 1.56	0.43 - 1.11	0.41 - 1.22	0.57 - 1.6
Other Substances						
Total Hardness (ppm)	0	0.015	34	34	34	34
Turbidity (NTU)	0	1.3	0.32	0.32	0.28	0.28

7.3.3 Volatile Organic and Synthetic Organic Compounds

VOCs are manufactured, carbon-based chemicals that vaporize quickly at normal temperatures and pressures. VOCs include many hydrocarbons associated with fuels, paint thinners, and solvents. This group does not include organic pesticides, which are regulated separately as SOCs. VOCs are divided into the two following groups:

- Regulated VOCs that have been determined to pose a significant risk to human health.
- Unregulated VOCs for which the level of risk to human health has not been established.

There are currently 21 regulated VOCs and 33 regulated SOCs. A list of these compounds and their MCLs is included in Table 7.5.

Table 7.5 Regulated Volatile and Synthetic Organic Chemicals
Water System Plan Update
City of Camas

Organic Chemical	Federal Regulation	Primary MCL (mg/L)[1]	Organic Chemical	Federal Regulation	Primary MCL (mg/L)[1]
Volatile Organic Chemicals (VOCs)					
Vinyl chloride	Phase I	0.002	Monochlorobenzene	Phase II	0.1
Benzene	Phase I	0.005	Ortho-Dichlorobenzene	Phase II	0.6
Carbon Tetrachloride	Phase I	0.005	Styrene	Phase II	0.1
1,2-Dichloroethane	Phase I	0.005	Tetrachloroethylene	Phase II	0.005
Trichloroethylene	Phase I	0.005	Toluene	Phase II	1
Para-Dichlorobenzene	Phase I	0.075	Trans-1,2-Dichloroethylene	Phase II	0.1
1,1-dichloroethylene	Phase I	0.007	Xylenes (total)	Phase II	10
1,1,1-Trichloroethane	Phase I	0.2	Dichloromethane	Phase V	0.005
Cis-1,2-Dichloroethylene	Phase II	0.07	1,2,4-Trichloro-benzene	Phase V	0.07
1,2-Dichloropropane	Phase II	0.005	1,1,2-Trichloroethane	Phase V	0.005
Ethylbenzene	Phase II	0.7	Chlorobenzene		0.07
Synthetic Organic Chemicals (SOCs)					
Arochlor	Phase II	0.002	Benzo(a)pyrene	Phase V	0.0002
Atrazine	Phase II	0.003	Dalapon	Phase V	0.2
Carbofuran	Phase II	0.04	Di(2-ethylhexyl) adipate	Phase V	0.4
Chlordane	Phase II	0.002	Di(2-ethylhexyl) phthalate	Phase V	0.006
Dibromochloro-propane	Phase II	0.0002	Dinoseb	Phase V	0.007
2,4-D	Phase II	0.07	Diquat	Phase V	0.02
Ethylene dibromide	Phase II	0.00005	Endothall	Phase V	0.1
Heptachlor	Phase II	0.0004	Endrin	Phase V	0.002
Heptachlor epoxide	Phase II	0.0002	Glyphosate	Phase V	0.7
Lindane	Phase II	0.0002	Hexachlorobenzene	Phase V	0.001
Methoxychlor	Phase II	0.04	Hexachloro Cyclopentadiene	Phase V	0.05
Polychlorinated biphenyls (PCBs)	Phase II	0.0005	Oxamyl (vydate)	Phase V	0.2
Pentachlorophenol	Phase II	0.001	Picloram	Phase V	0.5
Toxaphene	Phase II	0.003	Simazine	Phase V	0.004
2,4,5-TP	Phase II	0.05	2,3,7,8-TCDD (dioxin)	Phase V	$3x10^{-8}$

Notes:
(1) 40 CFR 141.61(a) and (c); adopted by State DOH, effective April 1999.

7.3.3.1 Monitoring Requirements

Per DOH requirements, VOCs and SOCs must be sampled once every three years, unless a waiver is in place. State waivers requiring no monitoring have been issued for dioxin, endothal, diquat, glyphosate, and insecticides. Additionally, the state grants a waiver if a chemical is not in use or previous monitoring indicates contamination would not occur. The City must apply for waivers through DOH. There are two types of waivers, risk-based or area-wide. The risk-based waiver requires a susceptibility analysis and DOH charges a fee for these waivers (purchased waivers). Area-wide waivers are issued if a chemical is not used within a region, thus DOH does not charge for these waivers. While the state issues both types of waivers, an area-wide waiver is referred to as a "State waiver." A waiver is in place for two years, during which time there are no requirements for monitoring. However, once a waiver expires, monitoring frequency for VOCs and SOCs is one sample every three years.

Quarterly sampling of VOCs is required for the Washoughal wellfield. Well 13 has a six-year waiver ending December, 2019. All other wells have statewide state issued waivers. The City has waivers that reduce required sampling frequencies to once every nine years for pesticides and soil fumigants for all wells Herbicides.

7.3.3.2 Compliance

A review of the City's 2007 to 2013 water quality data shows that all of the City's source wells test below the VOC or SOC MCLs, or are not detected at all.

7.3.4 Radionuclides

In December 2000, the USEPA announced updated standards for radionuclides. This rule became effective December 2003. All community water systems are required to meet the MCLs listed in Table 7.6 and requirements for monitoring and reporting. All systems were required to complete initial monitoring and phase in the monitoring requirements between December 8, 2003 and December 30, 2007. Initially, utilities were required to undergo four consecutive quarters of monitoring for gross alpha, combined radium-226/-228, and uranium. Only systems that were considered "vulnerable" were required to monitor for gross beta (quarterly samples), tritium, and strontium-90 (annual samples). The initial monitoring was used to determine if the system would have to perform reduced or increased monitoring.

Table 7.6 Regulated Radionuclides Water System Plan Update City of Camas	
Radionuclide	**MCL[1]**
Radium – 226	3 pCi/L
Combined Radium – 226 and 228	5 pCi/L
Uranium	30 μg/L
Gross Alpha (excluding Uranium)	15 pCi/L
Beta Particle and Photon Radioactivity	4 millirem/year[2]
Tritium	20,000 pCi/L[2]
Strontium-90	8 pCi/L[2]

Notes:

(1) Environmental Protection Agency, 40 CFR 141.66.
(2) According to USEPA 40 CFR 141.66, "average annual concentration of beta particle and photon radioactivity from man-made radionuclides in drinking water must not produce an annual dose equivalent to the total body or any internal organ greater than 4 millirem/year." The MCLs for tritium and strontium-90 are assumed to produce body organ doses equivalent to 4 millirem/year.

7.3.4.1 Monitoring Requirements

The WAC states "The purveyor may omit analysis for radium-226 and radium-228 if the gross alpha particle is less than five picocurie per liter (pCi /L)." The City is required to sample for radium-228 once every three years at Well 9 and once every six years at all other wells. Gross alpha monitoring is required once every three years at Well 9 and once every six years at all other wells. The USEPA has adopted a new schedule of sampling once every three years that has not yet been adopted by DOH. In Washington State, natural occurrence levels of the regulated radionuclides have generally been quite low.

7.3.4.2 Compliance

The City is in full compliance with the monitoring requirements and has no exceedances to date.

7.3.5 Arsenic Rule

In January 2001, the USEPA promulgated a new standard that requires public water systems to reduce arsenic levels in drinking water. The final rule became effective in 2002 and required compliance by 2006. The rule applies to all community water systems and non-transient, non-community water systems, regardless of size. The rule not only establishes an MCL for arsenic (0.010 mg/L), based on a running annual average (RAA) of quarterly results and an MCLG for arsenic (zero), but also lists feasible and affordable technologies for small systems that can be used to comply with the MCL. However, systems are not required to use the listed technologies in order to meet the MCL.

Initial monitoring of arsenic required groundwater systems to take one sample between 2005 and 2007. Monitoring requirements decreased to one sample every three years (for groundwater systems) if the initial result is less than the MCL. Monitoring requirements increased to quarterly samples if the initial results were greater than the MCL. Each entry point to the distribution system should have been tested, unless otherwise specified by the State.

The arsenic rule has been adopted by the Washington DOH as a revision to the arsenic MCL under WAC 249-290-310.

7.3.5.1 Monitoring Requirements

Monitoring requirements are once every three years, per requirements for IOCs. Arsenic must be monitored at each entry point to the distribution system as part of the IOC monitoring framework. If any sampling point is in violation of an MCL, the system is in violation.

7.3.5.2 Compliance

The City is in full compliance with the monitoring requirements and has no exceedances to date.

7.3.6 Surface Water Treatment Rules

7.3.6.1 Surface Water Treatment Rule

On December 31 1990, USEPA promulgated the Surface Water Treatment Rule (SWTR) to establish filtration and disinfection as a drinking water treatment technique in lieu of MCLs for Giardia lamblia, viruses, HPC bacteria, Legionella, and turbidity. The SWTR is based on the premise that all surface water and groundwater under the influence of surface water (GWI) are at risk of microbiological contamination and the previous requirements were inadequate to prevent waterborne disease outbreaks. The SWTR requires 99.9 percent (3 log) removal and/or inactivation of Giardia cysts, and 99.99 percent (4 log) removal and/or inactivation of viruses. To meet these requirements, surface water systems must disinfect according to strict requirements, must filter water unless certain source water-quality and site-specific conditions are met, and must be operated by qualified personnel. To avoid the filtration requirement, the following criteria must be met:

1. Ninety percent of the samples taken from the source water must have fewer than 100 total coliform bacteria per 100 milliliters (mL) and fewer than 20 fecal coliform bacteria per 100 mL.
2. The turbidity level prior to disinfection must not exceed 5.0 nephelometric turbidity unit (NTU).
3. Giardia and virus inactivation requirements must be met, providing redundant disinfection components and maintaining required disinfection residuals.

4. An approved watershed control program must be implemented with annual onsite inspections.
5. Total Coliform Rule (TCR) requirements in the distribution system and Triahalomethanes (THM) requirements must be met.
6. The water system must be free of waterborne disease outbreaks.
7. The purveyor must have alternative operating plans to address high turbidity levels and other water quality issues.

Utilities that use unfiltered water must maintain a disinfectant residual throughout the water distribution system. At entry points to the distribution system, residual disinfectant concentrations cannot be <0.2 mg/L for more than 4 hours. At distribution system sample locations, residual disinfectant concentrations cannot be undetectable in greater than 5 percent of samples in a month, for any 2 consecutive months. Heterotrophic plate count (HPC) ≤ 500/mL is deemed to have detectable residual disinfectant.

GWI is regulated by the SWTR. The intent is to provide the same level of treatment for groundwater sources that are at risk for contamination by pathogens as surface water supplies. Examples of water sources that may be classified as GWI are shallow wells, springs, infiltration galleries, and Ranney wells.

7.3.6.2 Long Term 2 Enhanced Surface Water Treatment Rule

The Long Term 2 Enhanced Surface Water Treatment Rule (LT2ESWTR) is intended to address a number of deficiencies in the original 1990 SWTR, including the following:

1. Cryptosporidium is not addressed in the SWTR.
2. Pathogen reduction may not be adequate in poorer quality waters.
3. Virus disinfection requirements may be greater than indicated in the SWTR.
4. Disinfectants and Disinfection Byproducts Rule (DBPR) may undermine the SWTR by causing utilities to reduce disinfectant residuals.

USEPA developed the ESWTR in two stages. The proposed Interim Enhanced Surface Water Treatment Rule (Interim ESWTR) was published in the Federal Register on 29 July 1994. USEPA finalized the Interim ESWTR and Stage 1 DBPR in November 1998, as required by the 1996 Amendments to the SDWA, Section 1412(b)(2)(C). The final rules resulted from formal regulatory negotiations with a wide range of stakeholders that took place in 1992-93 and 1997. On 16 January 2001, USEPA published final revisions to the Interim ESWTR and Stage 1 DBPR. The Long Term 1 Enhanced Surface Water Treatment Rule (LT1ESWTR) was promulgated in February 2002 and builds on the requirements of the SWTR. The LT1ESWTR specifies treatment requirements to address Cryptosporidium and other microbial contaminants in public water systems serving less than 10,000 persons.

The LT2ESWTR proposed rule was promulgated in August 2003 and published in the Federal Register on January 5, 2006. The LT2ESWTR requires public water systems (PWSs) that use surface water or groundwater under the direct influence of surface water to monitor their source water (influent water prior to treatment) for *Cryptosporidium, E. coli*, and turbidity for a period of two years starting six months after the rule is finalized. Based on the results of this monitoring, water systems will be classified in one of four risk bins. Systems classified in higher risk bins must provide 90 to 99.7 percent (1.0 to 2.5 log) additional reduction of Cryptosporidium levels. The regulation specifies a range of treatment and management strategies, collectively termed the "microbial toolbox," that systems may select to meet their additional treatment requirements. All unfiltered systems must provide at least 99 or 99.9 percent (2 or 3-log) inactivation of Cryptosporidium, depending on the results of their monitoring.

7.3.6.3 Monitoring requirements

Monitoring requirements are dictated by source water quality and the selected treatment processes. The City has recently completed construction of a new Slow Sand Filtration Treatment Plant for its surface water sources. The City's surface water sources have been listed as Bin 1 sources for cryptosporidium removal and do not require additional treatment beyond slow sand filtration. Specific treatment objectives and monitoring for the slow sand facility include:

- Turbidity reduction as required for slow sand filtration processes, providing finished water turbidity less than one NTU in 95 percent of samples each month and no turbidity samples greater than five NTU.
- Provide 3-log giardia removal and inactivation through a combination of 2-log removal by filtration and 1-log inactivation by chlorine disinfection.
- Provide a total 4-log virus inactivation and removal through filtration and disinfection.
- Provide a continuous free chlorine residual of not less than 1.0 mg/L entering the distribution system at the water quality station and pressure reducing valve (PRV) vault at NE 277th Avenue and NE 14th Street.
- Provide treated water pH of 7.5 plus or minus 0.2 units (if the optional caustic feed system is installed and used for pH adjustment).
- Provide a fluoride residual of 0.7 mg/L.

7.3.6.4 Compliance

The City has constructed a new slow sand filtration treatment plant that is in full compliance with all surface water treatment rules.

7.3.6.5 Filter Backwash Recycling Rule

The Filter Backwash Recycling Rule (FBRR) regulates the recycling of filter backwash water within the treatment process of public water systems. The purpose of the rule is to require systems to review their recycle practices and, where appropriate, work with the DOH to make any necessary changes to recycle practices that may compromise microbial control. The City's slow sand filter backwash water is wasted to a detention pond rather than recycled to the head of the plant and thus the FBRR does not apply.

7.3.7 Groundwater Rule

The USEPA enacted the final Groundwater Rule (GWR) January 8, 2007, for the purpose of providing increased protection against microbial pathogens in public water systems that use untreated groundwater. The GWR will apply to public water systems that serve groundwater as well as to any system that mixes surface and groundwater, if the groundwater is added directly to the distribution system and is provided to customers without providing disinfection contact time.

To implement the GWR, the USEPA is taking a risk-based approach to protect drinking water from groundwater sources that have been identified as being at the greatest risk of fecal contamination. This strategy includes four primary components:

1. **Sanitary Surveys**. Sanitary surveys must be conducted every three years and meet the provisions of the 1998 Interim ESWTR as it relates to populations served. In addition, the sanitary survey shall implement the eight elements of the USEPA/State Joint Guidance on Sanitary Surveys. These elements relate to source protection; identification of the physical components and their condition; and description and implementation of programs for treatment, distribution, storage, pumping, monitoring, operation and maintenance; and operator certification.

2. **Source Water Monitoring**. Source water monitoring is triggered when a system does not sufficiently disinfect drinking water to achieve 4-log (99.99 percent) virus removal and identifies a positive routine sample during its TCR monitoring and hydrogeologic sensitivity assessment monitoring (at the State's discretion) targeted at high-risk systems. Once a total coliform-positive sample is found within a distribution system, the system is required to collect one source water sample per source and monitor for a fecal indicator. Washington State may choose to issue a waiver if the groundwater source has a hydrogeologic barrier.

3. **Corrective Action**. Corrective action is required for any system with a significant deficiency or evidence of source water fecal contamination. Corrective actions must be taken by "groundwater systems that have a significant deficiency or have detected a fecal indicator in their source water." USEPA guidelines recommend that corrective actions take place within 90 days, or longer if approved by the State. The problem should be solved by eliminating the contaminate source, correcting the significant deficiencies, or providing an alternate source of water supply.

4. **Compliance Monitoring**. Compliance monitoring ensures that treatment technology installed to treat drinking water reliably achieves 4-log virus inactivation. Compliance monitoring applies to all groundwater systems that disinfect as a corrective action. Systems serving greater than 3,300 individuals must continuously monitor their disinfection treatment process. If disinfection concentrations are below the required level, the system must restore disinfection concentration within 4 hours.

The compliance date for triggered source water monitoring and the associated corrective actions, as well as compliance monitoring, was December 1, 2009. Initial sanitary surveys should have been completed by December 31, 2012. However, for community water systems that have been identified by the State as outstanding performers (generally those that have treatment that provides 4-log virus inactivation or removal at all sources), the initial sanitary survey must be completed by December 31, 2014.

Many of the requirements of the GWR are determined by the individual state agencies. The requirements of the GWR were adopted by the Washington DOH into WAC 246-290 in November 2010. In addition, the DOH has provided a Fact Sheet for Group A utilities with recommended actions to prepare for the GWR. These actions include the following:

- Correct deficiencies from the last sanitary survey.
- Install a sample tap at each wellhead.
- Know specifically where each well's water goes. Triggered source water monitoring will require monitoring of all sources, unless it can be shown that the area of concern in the distribution system is only served by a limited number of sources.
- Update the emergency response plan, to be ready to provide alternate water, if needed.
- If currently treating groundwater from a well, contact the regional office engineer to confirm whether you currently achieve 4-log virus inactivation. Systems that treat to this level will not be required to conduct triggered source water monitoring, but will instead be required to meet treatment technique monitoring requirements.

7.3.7.1 Monitoring Requirements

The DOH is not requiring all systems to perform assessment monitoring. In addition, DOH has indicated that the sanitary surveys completed under the GWR will not differ significantly from those currently required.

Triggered source water monitoring is required at all sources if a distribution system sample tests positive for total coliform (as collected under the total coliform regulations). The federal GWR includes a provision that positive coliform samples attributed to a distribution system source will not trigger source water monitoring. The DOH has not yet decided on the criteria for determining whether a sample can be attributed to the distribution system but

may not require triggered source monitoring if they document in writing that the coliform positive sample was attributed to a distribution system deficiency. Source water monitoring will be required at fewer sources if systems can demonstrate the sources impacting each TCR sample site. However, such a plan would need to be pre-approved by the DOH.

The federal GWR also allowed for reduced source water monitoring after 12 non-detect samples. The DOH has not yet established a reduced monitoring standard.

7.3.7.2 Compliance

The City completed its sanitary survey in 2014. No reduction in monitoring resulted from the survey. The City is in full compliance at this time.

7.3.8 Unregulated Contaminant Monitoring Rule

The 1986 amendments to the SDWA require public water systems to monitor for unregulated contaminants every five years and submit these data to the states. The intent of this program is to gather scientific information on unregulated contaminants to determine if regulations are required to protect human health. Both the 1993 and 1996 amendments to the act added new lists of contaminants, which led the USEPA to develop a revised program for monitoring. The new program became known as the Unregulated Contaminant Monitoring Regulations (UCMR 1999). The new UCMR program began in 2001, and produces a new list of unregulated contaminants for monitoring every five years.

Under the UCMR program, USEPA asks large systems to take two sets of samples for unregulated contaminants at six-month intervals. There are two tiers of contaminants in UCMR 1; List 1 - Assessment Monitoring, and List 2 - Survey Screening. List 1 contaminants are sampled by all water systems serving over 10,000 people. There are 10 List 1 contaminants, consisting of flame-retardants and other priority contaminants (USEPA Method 527), and some explosives (USEPA Method 529). List 2 contaminants are analyzed using less common analytical techniques, and only a portion of the purveyors required to test for List 1 contaminants are required to test for List 2. List 2 contaminants include Acetanilide pesticides and degraded products (USEPA Methods 525.2 and 535), and Nitrosoamines/NDMA (USEPA Method 521).

The second cycle (UCMR 2) of monitoring was published in the Federal Register on January 4, 2007. The UCMR 2 required monitoring for 25 contaminants using five analytical methods during 2008- 2010. The third cycle (UCMR 3) of monitoring was published on May 2, 2012. UCMR 3 requires monitoring for 30 contaminants: 28 chemicals, and 2 viruses. Monitoring is to occur during 2012 to 2016, and the third cycle UCMR 3 requires laboratories have USEPA approval to analyze public water supply samples.

7.3.8.1 Monitoring Requirements

The City has conducted monitoring of the unregulated contaminants for UCMR 1, 2, and 3. UCMR 3 testing was completed with results published in the 2015 Water Quality Report.

7.3.8.2 Compliance

The City is in compliance with the UCMR testing requirements.

7.4 DISTRIBUTION SYSTEM WATER QUALITY

Regulations that address distribution system water quality are described herein.

7.4.1 Total Coliform Rule

Coliform bacteria describe a broad category of organisms routinely monitored in potable water supplies. Though not all coliform bacteria are pathogenic in nature, they are relatively easy to identify in laboratory analysis. If coliform bacteria are detected, then pathogenic organisms may also be present. Bacterial contamination in a water supply can cause a number of waterborne diseases; therefore, these tests are strictly monitored and regulated by DOH.

The TCR specifies two types of MCL violations, “monthly” and “acute.” A purveyor is required to notify both DOH and system consumers if either a monthly or acute MCL violation occurs. The TCR also requires secondary disinfection in accordance with the following:

- A minimum disinfectant residual of 0.2 mg/L free chlorine or 0.5 mg/L chloramines measured as total chlorine must be continually present at the entrance of the distribution system, with a detectable chlorine residual maintained throughout the distribution system.
- A sample with HPCs less than 500 colony forming units per 100 mL is assumed to carry the required minimum residual.

The original 1989 TCR rule was revised on February 13, 2013. Water systems must comply with the requirements of the Revised Total Coliform Rule (RTCR) by April 1, 2016. The revision requires public water systems that are vulnerable to microbial contamination to identify and fix problems; and establishes criteria for systems to qualify for and stay on reduced monitoring, which could reduce water system burden and provide incentives for better system operation. The rule changes associated with the RTCR are summarized below.

- Monitoring Changes: The RTCR links monitoring frequency to water quality and system performance.
- Public Notification Changes: The RTCR requires public notification when an *E. coli* MCL violation occurs, or when a utility fails to conduct the required assessment and corrective action.

- MCL Changes and Treatment Technique Violation: The RTCR replaces the MCL and MCLG for total coliforms with a MCL and MCLG for *E. coli*, as well as a treatment technique for coliforms.
- New Assessment Requirements: As part of the new treatment technique requirements, all utilities must conduct an assessment to find and fix any vulnerabilities when a treatment technique trigger occurs. Systems must conduct a Level 1 assessment or a more complex Level 2 assessment depending on the level of concern raised by the results of total coliform sampling.
- Corrective Action Requirements: Utilities are responsible for correcting any sanitary defects found through Level 1 or Level 2 assessments within 30 days or on a schedule approved by the DOH if this timeframe is not possible.

7.4.1.1 Monitoring Requirements

Monitoring requirements are described in the City's coliform monitoring plan (CMP). The City currently collects 30 samples per month from 26 locations based on a residential population of 27,111 as provided by the DOH Water Quality Monitoring Schedule as of October, 2016.

7.4.1.2 Compliance

Within the last ten years the City has had two total coliform exceedances; one total coliform exceedances in 2015 and one total coliform exceedance in 2007. All follow-up tests were negative, and no public notification was required. The City is currently in full compliance with the TCR and its RTCR compliant CMP can be found in Appendix E.

7.4.2 Stage 1 Disinfectants and Disinfection Byproducts Rule

The Stage 1 DBPR was promulgated in December 1998 and regulates the concentration of disinfectants such as chlorine, chlorine dioxide, and chloramines, which are oxidants used to control waterborne disease. The DBPR also regulates DBPs such as THMs and Haloacetic acids (HAAs), bromate, and chlorite. DBPs are formed when disinfectants used to control microorganisms react with natural organic matter in water.

The MCLs for THMs and HAAs are 0.080 and 0.060 mg/L, respectively. The four regulated trihalomethanes are chloroform, bromodichloromethane, dibromochloromethane, and bromoform. The five regulated HAAs are monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid. Compliance with the THM and HAA MCLs is based on a system-wide RAA of quarterly samples taken in the distribution system. The Stage 1 DBPR also introduced a maximum residual disinfectant level (MRDL) of 4 mg/L for free chlorine, based on an RAA of samples collected concurrent with TCR monitoring.

7.4.2.1 Monitoring Requirements

Monitoring locations under the Stage 1 DBPR were initially identified in an Initial Distribution System Evaluation (IDSE) prepared by the City in 2004. The City's IDSE explains that the chlorine and chloramines are monitored as part of the CMP, which currently tests at 40 sites system wide. The City monitors quarterly for disinfectant residuals at each of these locations. Additionally, the IDSE identifies nine locations representing the longest detention time corresponding to each water treatment plant. The IDSE notes that because the City does not use ozone or chlorine dioxide, monitoring for bromated or chlorite is not necessary. Monitoring for DBPs included a THM and HAA sample from each site quarterly.

7.4.2.2 Compliance

The City meets the requirements of the Stage 1 DBPR.

7.4.3 Stage 2 Disinfectants and Disinfection Byproducts Rule

The Stage 2 DBPR was promulgated by the USEPA on January 4, 2006. The key provisions of the Stage 2 DBPR consist of:

- An IDSE to identify distribution system locations with high DBP concentrations. Further information is provided below.
- Site-specific locational running annual average (LRAAs) instead of system-wide RAAs to calculate compliance data. LRAAs will strengthen public health protection by eliminating the potential for groups of customers to receive elevated levels of DBPs on a consistent basis.

The MCLs for THM4 and HAA5 remain unchanged from the Stage 1 DBPR at 0.080 and 0.060 mg/L, respectively, although they will now be calculated as LRAAs.

The IDSE is the first step in Stage 2 DBPR compliance. Its intent is to identify sampling locations for Stage 2 DBPR compliance monitoring that represents distribution system sites with high THM and HAA levels. For systems serving more than 500 people, three options were available for the IDSE:

- 40/30 Waiver, which allows systems with no samples exceeding THM and HAA concentrations of 40 and 30 micrograms per Liter (µg/L), respectively, during eight consecutive quarters to apply to waive the IDSE requirements.
- Standard Monitoring Program (SMP), which involves a one-year distribution system monitoring effort to determine locations that routinely show high THM4 and HAA5 concentrations.
- System-Specific Study (SSS), based on historical data and a system model.

The Washington DOH adopted the Stage 2 DBPR on January 4, 2010.

7.4.3.1 Monitoring Requirements

The City was approved for a 40/30 waiver in 2006 and is currently required to collect two samples per year for THM and HAA5.

7.4.3.2 Compliance

The City is in compliance with monitoring requirements for the Stage 2 DBPR. Since April 2012, there have been no samples exceeding the MCL for THM or HAA5 as shown in Table 7.7. The results represent the range of samples from all sources sampled in a particular year.

Table 7.7 Disinfection Byproducts Rule Monitoring Results
Water System Plan Update
City of Camas

Contaminant	Maximum Contaminant Level Goal	Maximum Contaminant Level	2012	2013	2014	2015
Haloacetic Acids (µg/L)	48	60	1.2 - 7.4	1.1 - 3.7	1.5 - 4.2	9.6
Total Trihalomethanes (µg/L)	60	80	1.2 - 1.4	1.5 - 9.7	5.7 - 7.2	4.1 - 15

7.4.4 Lead and Copper

In 1991, the USEPA promulgated the Federal Lead and Copper Rule (LCR). Washington State adopted this rule in 1995 with minimal changes. The LCR is intended to reduce the tap water concentrations that can occur when corrosive source water causes lead and copper to leach from water meters and other plumbing fixtures. Possible treatment techniques to reduce lead and copper leaching include addition of soda ash or sodium hydroxide to the source water prior to distribution.

The LCR establishes an action level (AL) of 0.015 mg/L for lead and 1.3 mg/L for copper, based on the 90th percentile level of tap water samples. The most recent revisions (2007) added the following requirements (required as of December 10, 2009):

1. Monitoring. The rule adds a new reduced monitoring requirement, which prevents water systems above the lead AL to remain on a reduced monitoring schedule.
2. Treatment. Water systems must provide advanced notification and gain the approval of the primacy agency for intended changes in treatment or source water that could increase corrosion of lead.
3. Consumer notification. All utilities must now provide a notification of tap water monitoring results for lead to owners and/or occupants of homes and buildings who consume water from the taps that are part of the utility's sampling program.

4. Lead service line replacement. Utilities must reconsider previously "tested-out" lines when resuming lead service line replacement programs. This provision only applies to systems that have:
   a. Initiated a lead service line replacement program.
   b. Complied with the lead AL for two consecutive monitoring periods and discontinued the lead service line replacement program.
   c. Subsequently been re-triggered into lead service line replacement.
   d. All previously "tested-out" lines would then have to be tested again or added back into the sampling pool and considered for replacement.

An AL exceedance is not a violation but can trigger other requirements that include water quality parameter monitoring, corrosion control treatment, source water monitoring/treatment, public education, and lead service line replacement.

Samples must be collected at cold water taps in homes/buildings that are at high risk of lead/copper contamination as identified in 40 CFR 141.86(a). The number of sample sites is based on system size.

7.4.4.1 Monitoring Requirements

The City must collect 30 samples every three years, based on the standard monitoring schedule. The most recent set of customer tap samples were collected during September 2015.

7.4.4.2 Compliance

The City is installing a corrosion control system in the Slow Sand Filtration Plant to comply with the LCR. It is anticipated that corrosion control will require caustic soda and CO2 addition. This system is anticipated to be online in 2019. The City's monitoring results indicate that the City is in compliance with the requirements of the LCR. The City's LCR monitoring results for 2012 and 2015 are presented in Table 7.8. Results represent the 90th percentile of all samples taken within a given period.

Table 7.8 Lead and Copper Rule Monitoring Results
Water System Plan Update
City of Camas

Contaminant	Maximum Contaminant Level Goal (mg/L)	Action Level (mg/L)	2012 Result (mg/L)	2015 Result (mg/L)
Lead	0	0.015	0.0033	0.0026
Copper	0	1.3	0.56	0.61

7.5 WATER QUALITY MONITORING PROGRAM

Federal regulations related to system-wide requirements are discussed herein.

7.5.1 Consumer Confidence Report

The Consumer Confidence Report (CCR) Rule was finalized on September 19, 1998. Each July, community water systems must provide an annual report to customers providing information as to the quality of their drinking water supply. These reports are referred to as "Consumer Confidence Reports" or CCRs. These reports let customers know whether their water meets state and federal drinking water standards. The CCR includes information on the water source, the regulated and unregulated contaminants that have been detected during the year, and their concentrations. The report also provides information on DBPs or microbial contaminants and the potential health effects of the contaminants at concentrations greater than the MCL. The likely source of the contaminants is identified, and a summary of any violations in monitoring, reporting, or record-keeping is included. The reports can assist customers with special health needs to make informed decisions regarding their drinking water. CCRs provide references and telephone numbers as to health effects data and available information about the water system in general.

7.5.1.1 Compliance

The City issues an annual *Water Quality Report*, which includes a basic description of drinking water contaminants, source description, and annual water quality results. The 2016 *Water Quality Report* is included in Appendix E.

7.5.2 Public Notification Rule

The Public Notification Rule (PNR) requires that public water systems notify their customers when they violate USEPA or State regulations (including monitoring requirements) or otherwise provide drinking water that may pose a risk to consumers' health. The original public notification requirements were established in the SDWA; the revised PNR was promulgated in 2000 as required by the 1996 SDWA amendments.

The PNR establishes three notification levels:

- Immediate Notice (Tier 1): In a situation where there is the potential for human health to be immediately impacted, notification is required within 24 hours.
- Notice as Soon as Possible (Tier 2). In a situation where an MCL is exceeded or water has not been treated properly, but there is no threat to human health, notification is required as soon as possible and within 30 days.
- Annual Notice (Tier 3). In a situation where a standard is violated that does not directly impact human health, notice must be provided within one year, likely within the system's CCR.

Notification requirements are described in the City's Emergency Response Plan (ERP), available through City Staff. The ERP includes protocol for notifying the DOH and the public when a positive detection of VOCs/SOCs, IOCs, physical characteristics, or bacteriological presence is determined. The ERP maintains current phone numbers and contact information to all relevant utilities, contractors, government agencies, and local cable and radio stations.

7.5.2.1 Compliance

Because the City has never had a Tier 1, 2, or 3 violation, no notifications under the PNR have been required.

7.5.3 Operator Certification

The 1996 SDWA amendments require that states develop and implement an operator certification program. Final guidelines were published in February 1999. The regulations set out minimum guidelines for such a certification program including operator classification and qualifications. These sections of the regulation require that:

- Each treatment facility and/or distribution system is placed under the direct supervision of a certified operator.
- Operator certification must be equal to or greater than the system classification being operated.
- At least one certified operator is available on every shift.
- Operators must sit for, and pass, a validated exam demonstrating skills, knowledge, ability, and judgment necessary for the system classification.
- Each operator must have a high school diploma, GED, or state-approved experience and training.

While the responsibility for developing the program lies with DOH, individual systems must bring all operators up to the level of certification as required. The "grandparenting" clause of the regulation will address existing operators; however, new operators will be required to meet the guidelines of the legislation. Washington State issued revised operator certification guidelines in December 2000 (WAC 246-292). A grandparenting clause is also present in this regulation. However, because this clause expired in 2002, full compliance was required by that date.

On December 4, 2013, the DOH adopted the proposed rule changes for the Waterworks Operator Certification rule. The changes of the rule include strengthening the state's authority to enforce regulations, clarify authority to certify Backflow Assembly Testers (BATs) and Cross Connection Control Specialists (CCSs), and other updates to reflect current program practices, move requirements from guidelines into rules, and improve language and readability. Adopted changes pertinent to PWSs include the following:

- Requires purveyors to designate an operator in responsible charge for each operating shift and each major segment of the system, if applicable.
- Requires purveyors to designate and report all mandatory positions to the department within 30 days of starting operations or when a position is vacated.
- Purveyors shall not require operators to perform work that is beyond their skills, abilities, or level of certification.
- Additional requirements for operators, CCSs, and BATs are included.

7.5.3.1 Compliance

Operation, maintenance, cross-connection control, and water quality monitoring functions for the City are accomplished under the direction of the Water/Sewer Superintendent. As a Group A water system, the City presently meets minimum staff certification requirements. To ensure compliance in the future, all certified staff is provided the necessary expenses and leave time to attend classes and seminars in order to meet requirements for certification renewal. Further details on operator certifications are described in Chapter 4.

7.6 FUTURE REGULATORY REQUIREMENTS

Anticipated future regulatory requirements are summarized in Table 7.9. This table includes ongoing programs to introduce new regulatory requirements, under the UCMR and the Contaminant Candidate List (CCL), as well as specific rules and regulations currently under consideration. The City does not anticipate issues with meeting future regulatory requirements based on the limited available information. The City will revisit each proposed rule when specific requirements are published. A brief description of anticipated requirements under each rule is provided herein.

**Table 7.9 Future Regulatory Requirements
Water Quality Analysis
City of Vancouver**

Proposed Rule	Affected Contaminants	Proposed Publication Date(1)
Unregulated Contaminant Monitoring Regulations	Unregulated Contaminants	UCMR 4 - unknown
Contaminant Candidate List	Unregulated Contaminants	CCL4 - unknown
Radon Rule	Radon	Unknown
Perchlorate	Perchlorate	Unknown
Lead and Copper Rule Revisions	Lead Copper	Unknown
Carcinogenic VOC Rule	cVOCs	Unknown

Notes:

(1) Effective and compliance dates were obtained from the Federal Register and USEPA's Drinking Water Hotline and represent the best information available as of the date of this report.

7.6.1 Unregulated Contaminant Monitoring Rule

The USEPA UCMR is used to collect occurrence data for contaminants suspected to be present in drinking water, but do not yet have health-based standards. The current UCMR was discussed in Section 7.3.8. The UCMR is updated every five years; however, no issue date for UCMR 4 has been published by the USEPA at this time.

7.6.2 Contaminant Candidate List

The CCL aids in priority setting for the drinking water program. The USEPA conducts research on the following for CCL contaminants: health effects; analytical methods; treatment technologies, effectiveness, and costs; and occurrence. The third CCL (CCL3) was published in October 2009 and includes 104 chemicals or chemical groups and 12 microbiological contaminants that are known or anticipated to occur in public water systems. The list includes chemicals used in industry, pesticides, waterborne pathogens, DBPs, and biological toxins. The USEPA is currently requesting nominations for chemical and microbial contaminants for possible inclusion in the fourth CCL.

7.6.3 Radon Rule

Radon is a naturally occurring radioactive gas that may cause cancer and may be found in drinking water and indoor air. The first proposed radon MCL of 300 pCi/L was proposed in August 2000. An alternative MCL of 4,000 pCi/L with implementation of a Multimedia Mitigation Program targeted at reducing indoor-air risks has also been proposed. Final determination on a regulatory requirement for radon is still underway.

7.6.4 Perchlorate

The USEPA made a preliminary determination in late 2008 to not set an MCL for perchlorate. In the USEPA's *Interim Drinking Water Health Advisory for Perchlorate* released in December 2008, it is stated that a perchlorate concentration below 15 parts per billion (ppb) would be sufficient to protect subpopulations. The contaminant was slated to be part of UCMR 2, however, public comments asserting that no new information would be gained from additional monitoring were heeded, and the contaminant was removed from consideration. In early 2011, USEPA reversed course and decided to initiate the process for developing a national primary drinking water regulation for perchlorate. The USEPA is still in the process of publishing a proposed regulation; no confirmed date is available from the USEPA at this time.

7.6.5 Revisions to the Lead and Copper Rule

Stakeholder meetings were held twice in 2014 to discuss the long-term revisions that will replace the short-term revisions promulgated in 1999. Items subject to revision will be tiering criteria, service line replacement, corrosion controls, and water quality parameters. It is unknown when these revisions will be finalized.

7.6.6 Carcinogenic Volatile Organic Compounds (cVOC) Rule

The USEPA announced in February 2011 that it plans to develop one national primary drinking water regulation covering up to 16 carcinogenic volatile organic compounds. The following eight compounds are already regulated: benzene, carbon tetrachloride, trichloroethylene (TCE), vinyl chloride, 1,2-dichloroethane, tetrachloroethylene (PCE), 1,2-dichloropropane, and dichloromethane. The following eight potential contaminants are on the CCL3: 1,1-dichloroethane, 1,2-butadiene, aniline, benzyl chloride, nitrobenzene, oxirane methyl, 1,2,3-trichloropropane, and urethane. The USEPA may add, drop, or substitute other contaminants into the rule as additional information becomes available. The USEPA website provides little information on this rule, but does project publication of the rule in February 2018.

7.7 SUMMARY AND RECOMMENDATIONS

The City seeks to maintain high water quality for its customers from the source to the tap. In addition, the City complies with all DOH monitoring and reporting requirements. Therefore, no recommendations were identified in evaluating the City's water quality program.

Chapter 8

WATER RESOURCES

The City of Camas (City) has diverse water supply sources, including wells and surface water supplies. To meet future demands, the City will be required to fully use its water resources and develop new sources to continue to provide a high level of service. The City currently receives its water from 10 wells and two surface water diversions. This chapter presents an evaluation of these supplies to identify any future deficiencies in the City's water rights or in the ability of its supplies to produce reliable water at the levels needed to meet future demands. These deficiencies are addressed by the City's water supply strategy summarized in this chapter.

8.1 WATER RIGHT ANALYSIS

The City relies upon its groundwater wells and surface water sources to meet its current supply needs. Water rights for these sources are administered by the Washington State Department of Ecology (DOE). Source water protection is regulated by the Washington State Department of Health (DOH). This section summarizes the City's existing water rights and analyzes the ability of the rights to meet the City's projected demand.

The City obtains its water from two surface water sources and ten wells. Eight of the nine groundwater sources are located in the City's "Lower Washougal Wellfield", commonly referred to as the Washougal Wellfield, in the lower Washougal floodplain near downtown Camas. The remaining well (Well 9) is located in the uplands about 2 miles north of the Columbia River and 1.5 miles west of Lacamas Lake. The City's Boulder and Jones Creek surface water diversions are located in the headwaters of the Washougal River drainage.

The City has diverted water from Jones Creek since 1913 and from Boulder Creek since 1931. Traditionally, the surface water sources were the City's primary water sources and operated continuously for 24 hours per day with the wellfield being used to meet higher summer peaks. In looking at ways to meet its future demands, the City realizes the importance of protecting the streams and rivers of the region, and understands that there is no opportunity for expansion of the surface water diversions. The City decided to meet future water supply needs with ground water, and the most promising area for future supply has been identified as the productive Pleistocene Alluvial Aquifer (PAA) system in the lower Washougal floodplain.

With the issuance of 4 new groundwater permits in 2008 came the requirement that the City cease their surface water operations between May 15 and October 31 of each year. The requirement further stated that "At the State's discretion, the water rights associated with these diversions will be placed into the State's Trust Water Program as permanent, seasonal donations". In 2015 the City attempted to place the rights into the Trust Program but was advised by DOE that the action was not strictly necessary provided they agreed to operate the surface water system consistent with the intent of the agreement.

Today, the City's focus is on developing new groundwater sources under its existing and applied for water right permits.

8.1.1 Water Rights Summary

The City's water system (DOH ID 108002) currently has two water right claims which have been modified by Certificates of Change, eight certificated water rights, and four water right permits. A summary of the City's water rights is provided in Table 8.1. Copies of the water right certificates for each well are included in Appendix G. The City's 2015 Water Facility Inventory (WFI) is provided in Appendix F. Note, Ecology extended the development schedule on the Parkers Landing and Wastewater Treatment Plant site water right permits to 2020 upon the City's request in November of 2015. The City's current plan for developing the wells is presented in Section 8.4.

The City has limitations on its water rights that are poorly documented and complicate the calculation of total instantaneous water right (Qi) and annual water right (Qa).

- Jones and Boulder Creek surface water sources may only be operated seasonally from May 15 through October 31. The Qa for periods outside of the operating time window are used to maintain instream flow in the Creeks (not for City use). The original water rights have not been modified to reflect the change in operation.
- Water Right permits and certificates with priority dates before 1979 were limited by DOE to a "total Qa of 5,750 acre-feet per year (AFY)". Those rights are shaded green in Table 8.1.
- The modifications of the City's water right claims resulted in the recognition of an additional 550 AFY which increased the total Qa to 6,300 acre-feet/year with priority dates before 1979.
- Well 9 is considered an alternative water right with a non-additive Qa. The permit does not increase the cumulative annual total of all rights but does increase the Qi.

The City's resulting water rights equate to Qi of 14,045 gallons per minute (gpm) (20.2 million gallons per day [mgd]), primary Qa of 11,090 AFY (9.89 mgd), and alternative Qa of 210 AFY (0.3 mgd).

Table 8.1 Water Right Summary

Source	ID Number	Priority Date	Instantaneous Qi (gpm)	Annual Qa (AFY)
Claims

Table 8.1 Water Right Summary

Notes:

(1) Claims are considered valid until proven otherwise through an adjudication process.
(2) This source was formerly known as the Little Washougal River. The certificate refers to an instantaneous quantity (Qi) and does not specify an annual withdrawal. A DOE Report of Examination for Well No. 7 (G2-00501) summarizes existing water rights, including 1,820 AFY for Boulder Creek (S 712), based on continuous withdrawal at the instantaneous right specified.
(3) The certificate refers to an instantaneous quantity (Qi) and does not specify an annual withdrawal. A DOE Report of Examination for Well No. 7 (G2-00501) summarizes existing water rights, including 730 AFY for Jones Creek (S 711), based on continuous withdrawal at the instantaneous right specified.
(4) The Permit and Report of Examination preceding this certificate limited water rights to "the total quantity withdrawn or diverted from all sources is not to exceed 3,300 AFY."
(5) The Permit and Report of Examination preceding this certificate limited water rights to "the total quantity withdrawn or diverted from all sources is not to exceed 5,750 AFY."
(6) Well 10, 11, and 12 were installed to replace Well 1, 2 and 3, which have failed due to collapsed well casings; see Pacific Groundwater Group report dated June 9, 2003. Well 13 replaced Well 4 after Well 4 was determined to be groundwater under the influence of surface water; see Pacific Groundwater Group report dated August 14, 2006. G2-CV1-2P160 which is now associated with Well 10 allowed for seasonal between May 1st and August 31st. Year-round operation of Well 10 is authorized under Permit G2-30144 for the Washougal Wellfield.
(7) See DOE agreement that limits withdrawal from the surface water sources from May 15 through October 31.
(8) Joint application with City of Camas and City of Washougal
(9) (P) = Primary water right, additive to other rights.
(10) (A) = Alternative water right, not additive or considered when summing a cumulative total of all rights.

8.1.2 Water Rights Analysis

The City's water rights were compared to current (2015), 10-year (medium-term, 2025) and 20-year (long-term, 2035) production to establish water right excess or deficiency. Both Qi and Qa were considered and are summarized in Table 8.2 and Table 8.3, respectively. Note, the Plan was started in late 2016, where 2015 was the last full year of record and used in the analyses. The City's Water Rights Self-Assessment is provided in Appendix H and includes the latest 2018 information.

The City currently has surplus water rights based on the actual well pumping in 2015, which was considered to be the existing condition. Note, the reported values reflect the pumping over the entire year, where not all wells were pumped at the same time.

Table 8.2 Instantaneous Water Rights (Qi) Summary

Year	Future Forecasted Source Production (gpm)(1)	Instantaneous Water Right (Qi) (gpm)	Surplus/Deficiency (gpm)
2015	11,395 [2]	14,045	2,650
2025	13,300	14,045	745
2035	17,770	14,045	-3,725

Table 8.2 Instantaneous Water Rights (Qi) Summary			
Year	**Future Forecasted Source Production (gpm)(1)**	**Instantaneous Water Right (Qi) (gpm)**	**Surplus/Deficiency (gpm)**

Notes:
(1) Future values based on the high maximum day demand (MDD) demand projection scenario.
(2) Summation of maximum instantaneous yield from each water right in 2015.

Table 8.3 Instantaneous Water Rights (Qa) Summary			
Year	**ADD - High Scenario (AFY)**	**Annual Water Right (Qa) (AFY)**	**Surplus/Deficiency (AFY)**
2015	4,723 [2]	11,090	6,367
2025	7,780	11,090	3,310
2035	10,080	11,090	1,010

Notes:
(1) Future values based on high average day demand (ADD) demand projection scenario.
(2) Based on actual 2015 annual production data.

For the future water rights evaluation, the forecasted source production was based on the high demand projection scenario. The high demand scenario generally reflects the water use rates from the period of highest demands in the last eight years, as presented in Chapter 4. Use of the highest projected demands is intended to ensure the City has sufficient physical supplies to meet demands and provide sufficient time for in phasing in new supplies, which is typically a multi-year process.

The City is expected to have a sufficient Qi through the next 10 years. The City is expected to have a Qi deficiency starting in 2027 and increasing to -3,725 gpm (-3.3 mgd) in 2035, which equates to approximately 27 percent of the existing Qi. As described in the water supply strategy later in this chapter, the City plans to meet this deficiency by a combination of developing all of its existing water rights, developing pending city groundwater rights (the Fire Station water right), and using the Steigerwald Regional Supply Source with the City of Washougal (pending water right). Additionally, the City will continue to encourage water use efficiency including the reduction of irrigation use, which is a major driver for the relatively high projected maximum day demand (MDD).

8.2 ABILITY TO PUMP

The City will have sufficient Qa for the next 20 years. However, a relatively small percentage of Qa is remaining in 2035. Therefore, it is recommended the City begin to pursue new Qa sources before the end of the study period. Ability to pump

In addition to water rights, the City further evaluated each source's actual supply capacity or "Ability to Pump". The Ability to Pump comprehensively considers physical, water quality, and

regulatory limitations. The resulting total Ability to Pump was compared to demands to determine supply excess or deficiency. Supply improvements are proposed to eliminate all deficiencies. As with the water right evaluation, the supply evaluation considered both MDD and average day demand (ADD) conditions. Further, the Ability to Pump was evaluated for three supply scenarios:

- Standard (all supplies).
- Reliability (only supplies with backup power).
- Redundancy (largest source out-of-service).

8.2.1 MDD Ability to Pump

The MDD Ability to Pump represents the City's Ability to Pump during the peak water use period, typically late-July through mid-August. The standard scenario represents the City's ability to meet MDD with all sources pumping continuously (24 hours per day). This represents the maximum quantity of water that can be produced. The redundancy scenario represents the City's ability to meet MDD with the single largest source offline. The reliability scenario represents the City's ability to meet MDD during a widespread power outage where only supplies with auxiliary power are considered. Demands above the MDD (such as peak hour demands or fire flow) are met from storage and are evaluated in Chapter 9.

The City's existing MDD Ability to Pump is tabulated in Table 8.4. The table quantifies the following components:

- Instantaneous Water Right (Qi): The sum of instantaneous water rights or contractual maximum at each source.
- Pumping Capacity: The pump or physical capacities at each source.
- Treatment Capacity: The available treatment capacity for each applicable source.
- Operational Limitations: Limitations due to water quality in sources without treatment, well field water right limitations (rather than a well specific Qi), and aquifer limitations.
- Auxiliary Power: Source is considered to be reliability if backup power (onsite generator or quick connects).

The City's existing Ability to Pump is approximately 9,300 gpm (13.4 mgd) in the standard scenario and approximately 7,900 gpm (161.4 mgd) in the redundancy scenario. Improvements to existing well capacity may increase supply by 1,145 gpm to approximately 10,475 gpm by resolving operational challenges with Well 5, physical capacity issues in Well 6, and minor changes in Wells 7 and 8. The future construction of the Parkers Landing and Treatment Plant wells add an additional 2,000 gpm of MDD Ability to Pump and resolve the majority of differences between the instantaneous water right and rated source capacity. Additional Auxiliary power is needed for Washougal Wellfield (Wells 5, 6, 7, 9, and 10) to increase the reliable Ability to Pump. Note, the City's surface water sources, Jones and Boulder Creek, cannot be used in the summer per water right; therefore, they were not included in the MDD Ability to Pump analysis.

8.2.1.1 MDD Supply Analysis

The MDD Ability to Pump was compared with the projected MDD for the planning period to evaluate if the City has sufficient supply, as shown in Figure 8.1 and Table 8.5. The top green line represents the maximum instantaneous supply allowed by the City's existing water rights. The solid and dashed red lines represent the existing MDD ability to pump for the standard and redundancy scenarios, respectively. The solid orange line represents the reliability scenario. The demand projections are shown for the high, medium (thicker dashed purple line in Figure 8.1), and low scenarios. Although the high demand projection scenario was used to determine water rights deficiencies, the combination of the high demand scenario and the redundancy supply scenario was considered to be overly conservative. Therefore the medium demand projection scenario is used to determine supply Ability to Pump deficiencies and is presented in Table 8.5. The demands shown in column 2 of Table 8.5 include not only retail demands (medium scenario), but also 830 gpm to replenish fire storage, per DOH recommendations.

The City currently has sufficient supplies to meet the projected demands through 2022 for the standard scenario (solid red line in Figure 8.1). However, the City is anticipated to exceed the MDD Ability to Pump by 2018 for the redundancy scenario (dashed red line in Figure 8.1)). The City will need an additional approximately 3,690 gpm of supplies to meet the standard scenario by the end of the planning period. Considering redundancy (largest source out of service), the City will need an additional 5,040 gpm of redundant supplies by the end of the planning period to avoid a deficiency. To meet the City's reliability goals, all source would require backup power by the end of the planning period.

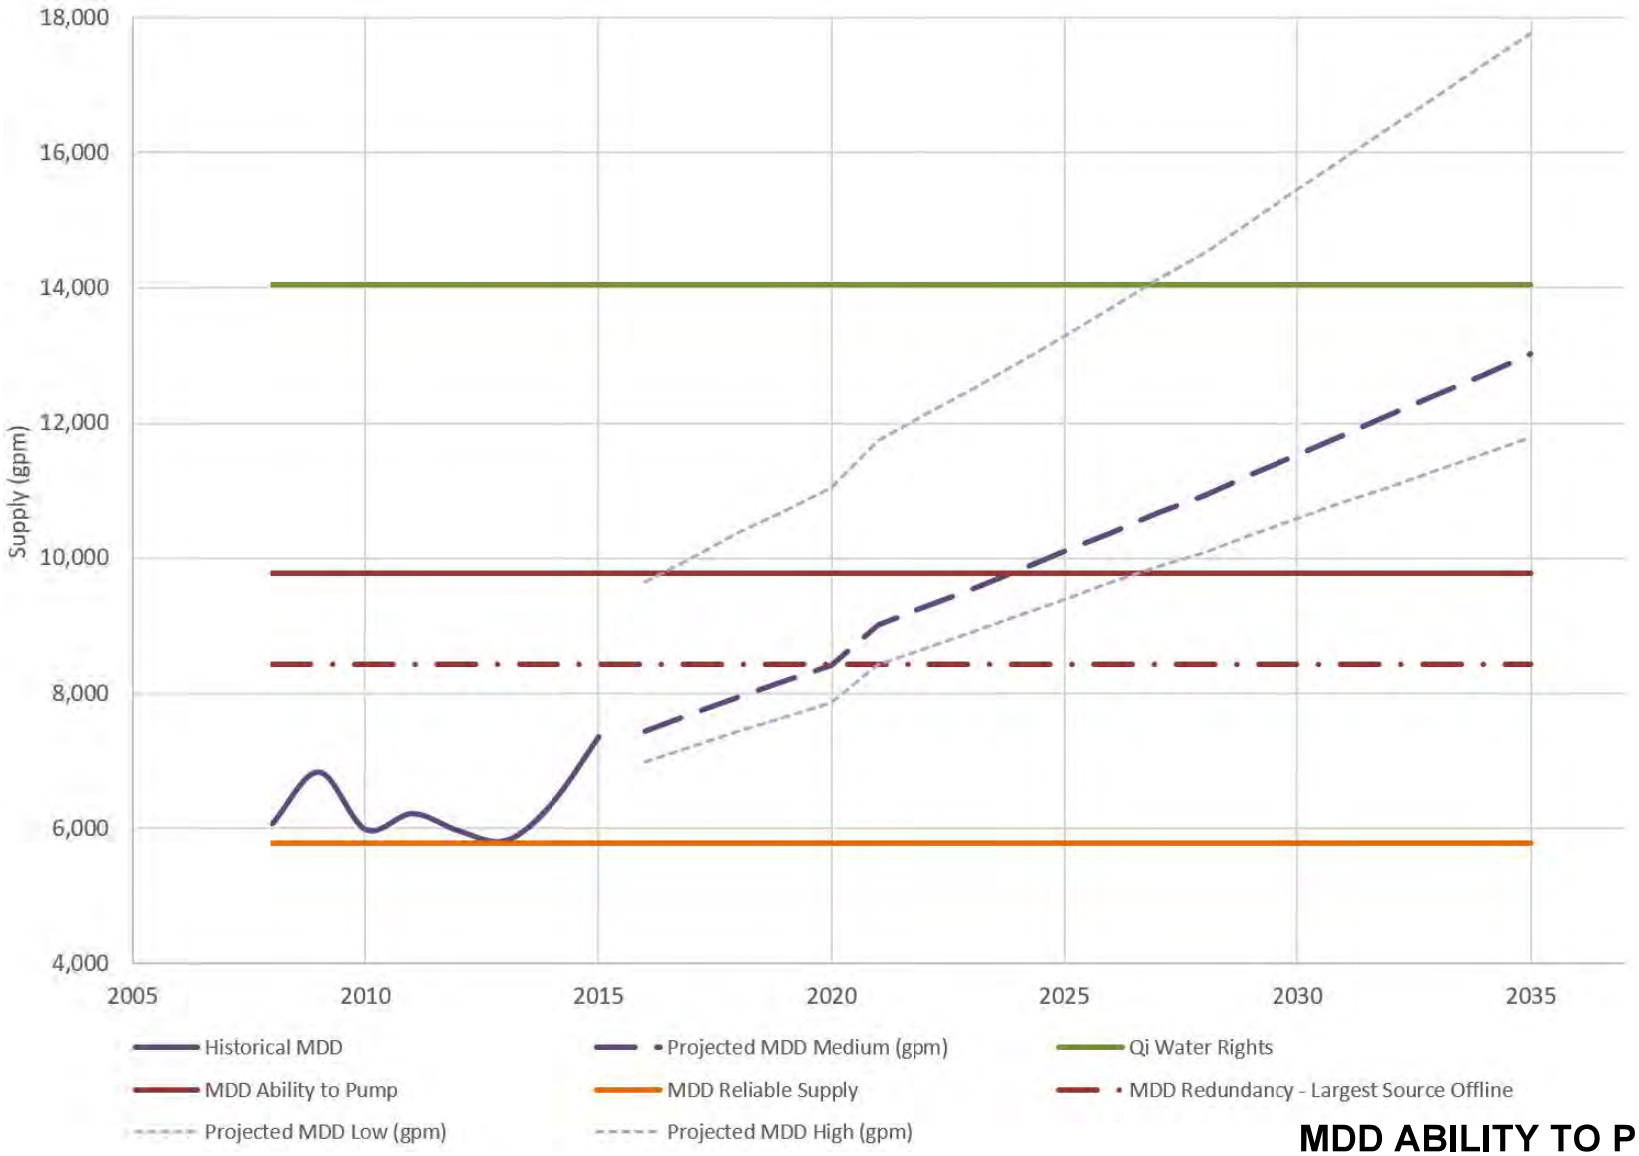
8.2.2 ADD Ability to Pump

The ADD Ability to Pump evaluation confirms the ability of the City to supply its demand throughout the year. The ADD was used to represent the average conditions expected to occur. Similar to the MDD Ability to Pump evaluation, standard, redundancy, and reliability scenarios were considered for ADD.

The City's existing Ability to Pump is tabulated for the standard scenario in Table 8.6 that consists of the following components:

- Annual Water Right (Qa): The sum of Primary annual water rights or contractual limitations at each source.
- Rated Source Capacity: The pump or physical capacities at each source.
- Treatment Capacity: The available treatment capacity for each applicable source.
- Operational Capacity: Limitations due to water quality in sources without treatment, well field water right limitations, and aquifer limitations.
- Auxiliary Power: Source is considered to be reliability if backup power (onsite generator or quick connects).

Table 8.4 Maximum Day Demand Ability to Pump Summary



Source	Instantaneous Water Right (gpm)	Rated Source Capacity (gpm)	Treatment Capacity Limitations (gpm)	Operational Capacity (gpm)	Auxiliary Power (Reliability)	Ability to Pump (gpm)	Reliable Ability to Pump (gpm)	Redundancy - Largest Source Out-of-Service
Boulder Creek	0(1)	0(1)		0(1)	Yes	0	0	0
Jones Creek	0(1)	0(1)		0(1)	Yes	0	0	0
Well 5	600	500		0(2)	No	500	0	500
Well 6	1,500	1,000			No	1,000	0	1,000
Well 7	1,000	950			No	950	0	950

Well 13	1,325	1,325			Yes	1,325	1,325	1,325
Well 14	1,000	1,000			Yes	1,000	1,000	1,000
Washugal Wellfield Right	500	Used at Well 8				NA	NA	NA
Parkers Landing	1,000	0 5						
Treatment Plant Well	1,000	0 5						
Total	**12,975**	**9,775**				**9,775**	**5,775**	**8,430**

Notes:

(1) Water rights do not allow use of the surface water sources during the summer; therefore, it is not considered for the MDD evaluation.
(2) Forest Home booster pump station (BPS) must be on to prevent over pressurization of 343 Downtown Zone during Well 5 operation.
(3) The Washougal Wellfield instantaneous water right of 500 gpm is currently exercised at Well 8.
(4) High Silica content requires valving in distribution system.
(5) City has water right permit, but has delayed well construction until required to meet customer demand.

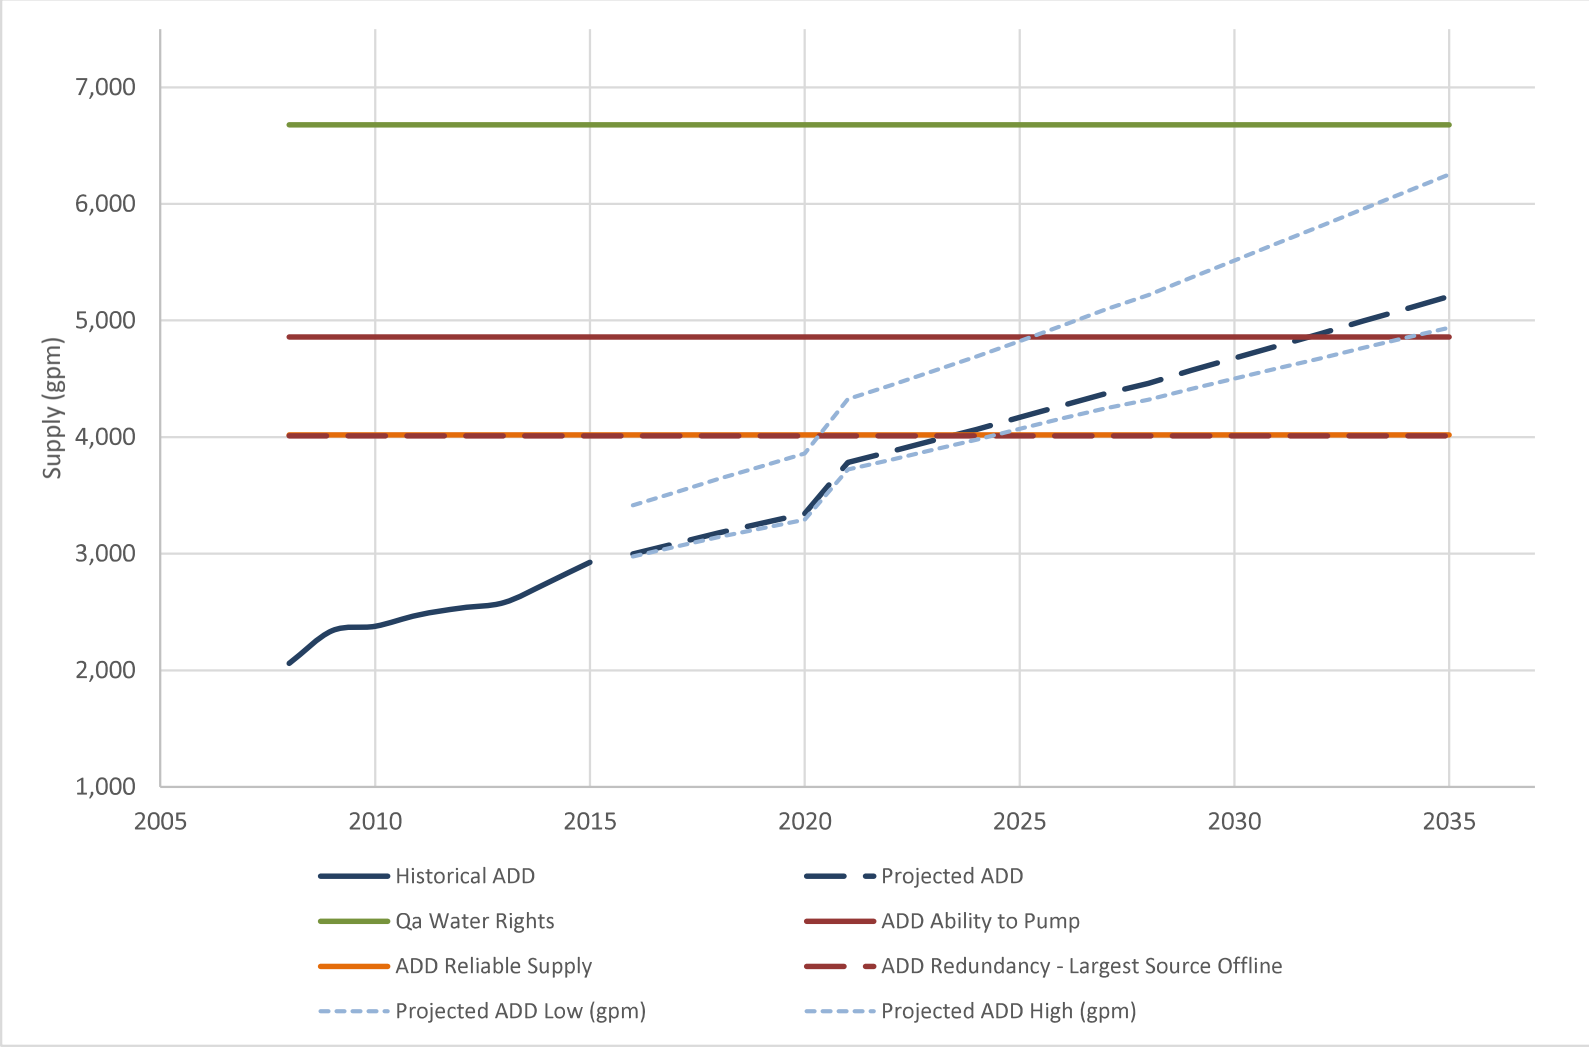
Item 2.

Table 8.6 Annual Ability to Pump Summary

Source	Annual Water Right (gpm)	Rated Source Capacity (gpm)	Treatment Capacity Limitations (gpm)	Operational Capacity (gpm)	Auxiliary Power (Reliability)	Ability to Pump (gpm)	Reliable Ability to Pump (gpm)	Redundancy - Largest Source Out-of-Service (gpm)
Treatment Plant Well	546	0				0		
Total	**8,432**	**11,400**				**4,860**	**4,020**	**4,010**

Notes:

(1) Forest Home BPS must be on to prevent over pressurization of 343 Downtown Zone when Well 5 is run. Well 5 is used as a seasonal source due to this operational complexity.
(2) The Washougal Wellfield annual water right of 1,333 gpm is anticipated to be exercised at Well 8, 12, and 14; however, actual well use will vary due to operational & maintenance needs.
(3) Well 9 is typically used to meet summer demands. Alternative annual water right (210 AFY) typically does not allow for winter pumping. High Silica content requires valving in distribution system.
(4) Well 10 may only be used between May 1st and August 31st per its water right.
(5) The Washougal Wellfield annual water right has been allocated to individual wells.



Similar to the MDD Ability to Pump evaluation, the City's wells have the pumping or physical capacity to use their entire water rights. Seasonal water right limitations the ADD Ability to Pump to approximately 4,855 gpm. Considering the largest source out-of-service (Well 14), the ADD Ability to Pump drops to 4,005 gpm. The City's annual restrictions for water rights with priority dates before 1979 account for the majority of differences between the Qa and rated source capacity (see above water right analysis for additional detail). The City's existing sources have sufficient capacity to produce their full annual water right. Additional annual supplies may come from the undeveloped Well 17, Parkers Landing Well, and Treatment Plant Well, and Steigerwald supply. Note, the City's surface water sources, Jones and Boulder Creek, are included in the ADD Ability to Pump analysis.

8.2.2.1 ADD Supply Analysis

Similar to the MDD, the ADD Ability to Pump was compared with the projected medium ADD scenario for the planning period to evaluate if the City has sufficient supply, as shown in Figure 8.2 and Table 8.7. This Figure uses the same coloring as Figure 8.1, where the green line represents the Primary Qa, rather than the Qi. Consistent with the MDD ability to pump, the medium demand scenario was used to determine deficiencies and is presented in Table 8.7. The City currently has sufficient supplies to meet the projected demands throughout 2032 for the standard scenario (solid red line) and 2024 for the redundancy scenario (dashed red line). The City will need an additional approximately 350 gpm of supplies to meet the standard scenario and 1,200 gpm for the redundancy scenario. It is anticipated that projects to address the MDD Ability to Pump deficiencies, which occur earlier in the planning period, will also address the ADD Ability to Pump deficiencies. To meet the City's reliability goals, all sources will require backup power by the end of the planning period.

Table 8.7 ADD Ability to Pump Analysis

Year	ADD (gpm)	Existing ADD Ability to Pump (gpm)	Surplus/ Deficiency (gpm)	Redundancy	Surplus/ Deficiency (gpm)	Reliability	Surplus/ Deficiency (gpm)
2021	3,790	4,860	1,070	4,010	220	4,020	230
2025	4,170	4,860	690	4,010	-160	4,020	-150
2035	5,210	4,860	-350	4,010	-1,200	4,020	-1,190

ADD ABILITY TO PUMP

FIGURE 8.2

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

8.3 INTERTIES

Interties provide a tool that water utilities use to move water between systems to meet supply needs, increase reliability, and respond to emergencies. The City has interties with the City of Vancouver and the City of Washougal. The City of Vancouver Intertie, located at SE 192nd Ave and 41st Drive, provides service to the River Gateway development. The Washougal Interties provide emergency supply to the City.

In the future, the City plans to develop the Steigerwald Regional Supply Source jointly with the City of Washougal. The City anticipates there will be opportunities for future wholesale and/or emergency interties with the City of Washougal as part of the project.

8.4 WATER SUPPLY STRATEGY

The City requires additional supplies to provide the sought level of service during the planning period, where deficiencies occur starting in 2018 for the redundancy MDD scenario. The City will need to provide a minimum additional supply of 5,040 gpm MDD Ability to Pump by the end of the planning period. The City's water supply strategy has four parts:

- Washougal Wellfield Renewal.
- Construct Wells for Existing Water Rights.
- Secure Additional Water Sources.
- Continue a Water Use Efficiency (WUE) Program.

The improvements are grouped by planning horizons: short-term (2017-2021), medium-term (2022-2025), and long-term (2026-2035).

8.4.1 Washougal Wellfield Renewal

Improved pumping from existing well facilities to achieve their full water right can provide additional future supply. The Ability to Pump Analysis identified that 1,175 gpm (1.7 mgd) of MDD supply can be obtained through improved pumping from Well 6, as well as minor increases from Well 7 and Well 8. While the pumping capacity will increase, the improved wells will not increase the ADD Ability to Pump due to water right restrictions. The Washougal Wellfield Renewal effectively delays the need for Steigerwald Regional Supply Source.

Potential improvements to these existing supply faculties may include the following.

- The City is currently upsizing the pipeline between Well 6 and Well 14, which resolves an existing transmission deficiency that restricts Well 6 pumping. This project was assumed to be complete in all analyses.
- Increase the yield of Well 6 to 1,500 gpm (an additional 500 gpm) to make full use of its instantaneous water right. This may require a hydrogeological study to determine the most cost-effective approach to well redevelopment.

- The City may improve pumping capacity of Well 7 and Well 8 as part of future regular pump maintenance/replacement. This will provide an additional 75 gpm of MDD Ability to Pump.
- Install backup power for Wells 5, 6, 7, 9, and 10 to increase reliability of the wellfield.

It is anticipated that all new supplies will have backup power available. Installation of backup power at the Washougal Wellfield will make the City's supplies fully reliable.

The City's supply sources are in good condition. To maintain the supply facilities, the City has an ongoing operation and maintenance (O&M) program. Repair and replacement (R&R) activities will be triggered by components reaching the end of their usable life. Additional information on the City's O&M and R&R programs is presented in Chapter 4.

8.4.2 Construct Wells for Existing Water Rights

City has existing water right permits for wells at Parkers Landing and Treatment Plant. Construction of these wells is anticipated in the 2020 and the medium-term planning horizon, respectively, to meet customer demand. The completion of these water rights will increase the Ability to Pump buy 2,000 gpm during the MDD and 1,092 gpm during the ADD. The hydraulic analysis, presented in Chapter 9, indicates that distribution system improvements will be needed to convey the new supplies to the wider system.

8.4.3 Secure Additional Water Sources

The City is actively pursuing new water sources to meet future deficiencies and to improve supply redundancy. During the planning period, the City plans to develop its existing water rights (Treatment Plant Well and Parkers Landing Well) and is designing Well 17 (Water Right Application G2-30019) near the North Shore area to better serve this area of future growth. Well 17 is expected to yield 500 gpm. The City has recently purchased the Owahou Water Rights to help offset in-stream impacts from this future water right. Additionally, the City has applied for a new well near Fire Station # 42 - 4321 NW Parker St - (Water Right Application G2-30018, Well 18) in the 544 Pressure Zone. The Fire Station Well water right application provides for 350 gpm of instantaneous supply and 300 AFY of annual supply from an 12-inch well. Hydrogeological investigations indicate that Well 18 is not viable; therefore, he City is exploring alternate locations for this well.

In the long-term, the City anticipates obtaining supply from the future Steigerwald Regional Supply Source (Water Right Application G2-30528), as discussed in the Detailed Implementation Plan (Lower Columbia Fish Recovery Board 2008) for the Salmon-Washougal and Lewis Watershed Water Resource Inventory Areas (WRIAs). Under Washington Administrative Code (WAC) 173-500-040, WRIAs were formalized and the DOE was given responsibility for the development and management of these planning boundaries. The Salmon-Washougal and Lewis Watershed Management Plan WRIAs 27 and 28 (Lower Columbia Fish Recovery Board 2006) and subsequent Detailed Implementation Plan were created to address a range of issues related to water resources, including water supply, stream flow management, water quality, and fish habitat. The City of Camas and the Jones and Boulder Creek surface water supply watersheds reside within WRIA 28.

The completion of WRIA 27 and 28 watershed plans in 2008 eliminated the water rights reservation established by WAC 173-592 and replaced them with regional water supply areas and some stream allocations in WAC 173-527 for the Lewis River Basin (WRIA 27) and WAC 173-528 for the Salmon Creek-Washougal River Basin (WRIA 28).

The Watershed Management Plan discusses the regional water supply areas for Camas, which was designated as the Steigerwald area near Washougal. DOE has designated water supplies near the City as "Instream Flow with Closures and Reserves." This designation limits the ability of the City to obtain new water rights outside of the regional water source.

The Steigerwald Regional Supply Source will be jointly developed with the City of Washougal. The Cities have applied for a joint water right (Water Right Application G2-30528) for 17,213 gpm of instantaneous water rights and 13,555 AFY of annual water right. The Place of Use has been designated as both the City's and Washougal's water service area. It is anticipated that the supply source will include ten 20-inch diameter wells with individual well yields of 2,000 gpm or more. As an entirely new supply source, the City's will need to permit, design, and construction the proposed wells and related facilities, such as disinfection, auxiliary power, and potentially treatment. To convey the water, the City will need several miles of transmission main.

Additionally, the City may consider purchasing water rights from Georgia Pacific, if available, to develop an additional future water source closer to the City's water system.

8.4.4 Continue a Water Use Efficiency Program

The final element of the City's supply strategy is to continue to reduce demand through its water use efficiency program. The City has observed declining per account water use for over a decade. The observed drop in the water use and MDD peaking factor can be attributed in part to the City's water use efficiency program, which is summarized in Chapter 6. WUE gains, including reductions in distribution system leakage, may delay the need for new supplies presented below.

8.4.5 Summary of Improvements

The City water supply strategy largely continues previously planned water supply projects. These new water sources will be required in the planning period to provide redundant supply to its customers. In addition to previously planned projects, the City anticipates completing the Washougal Wellfield Renewal Project to increase the ability to pump and reliability of the wellfield. These projects include:

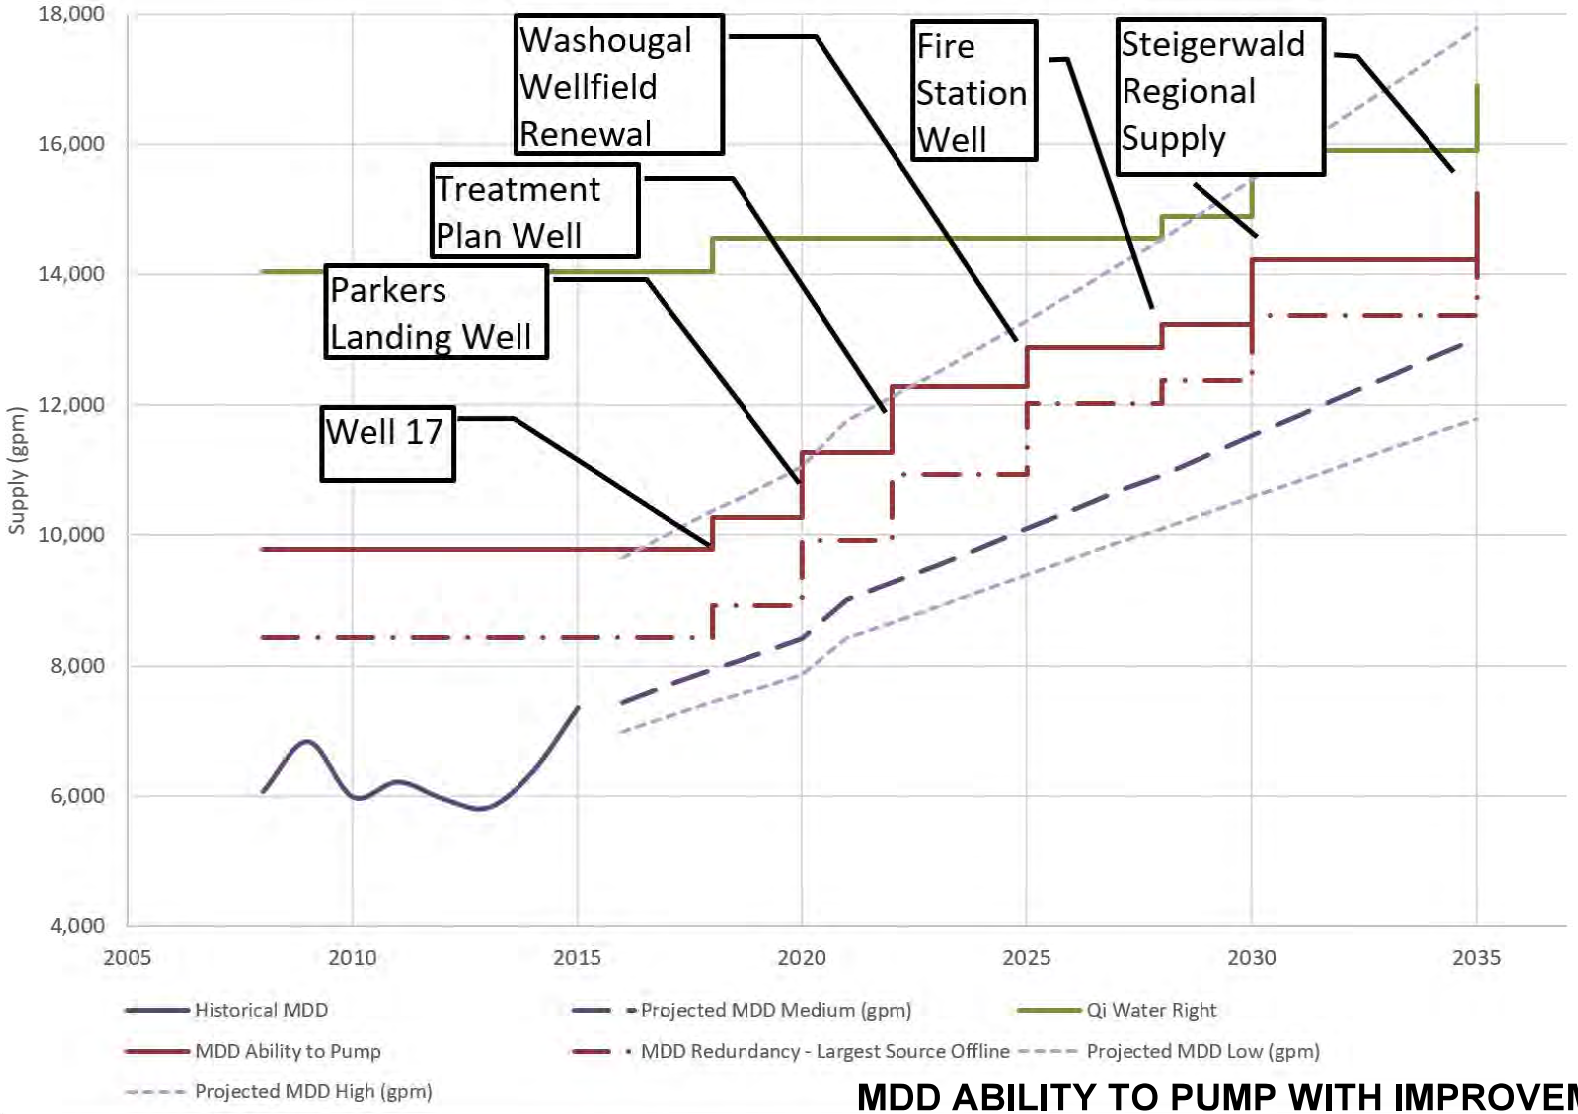
1. Well 17 (CIP Project SR-6).
2. Well 15 - Parkers Landing Site (CIP Project SR-7).
3. Well 16 - Treatment Plant Site (CIP Project SR-9).
4. Well 18 - Fire Station Site at a new location (CIP Project SR-9).

5. Washougal Wellfield Renewal Project: Full use of Well 6. Backup power will be added to Wells 5, 6, 7, 9, and 10.

6. Steigerweld Regional Supply (CIP Project SR-11).

Tables 8.2 and 8.3 describe each improvement, timing, increase in supply, and resulting Ability to Pump after project completion. By the end of the planning period, the proposed new wells and Washougal Wellfield Renewal Project are expected to effectively make full use of the City's existing and proposed water rights. The addition of the Washougal Wellfield Renewal Project delays the City's need for new regional supplies from the Steigerweld Regional Supply until approximately 2030. It is anticipated the supplies will be constructed in phases to meet expected demand growth and spread out the significant capital costs. For planning purposes, it was assumed that Steigerwald supplies would be developed one well at a time, where the City’s portion of each well would be 1,000 gpm (half of the proposed 2,000 gpm well). Water rights were assumed to be proportional to the pending water right.

The increase in ability to pump for these improvements are shown in Figure 8.3 and 8.4 for MDD and ADD, respectively. To maintain redundant MDD Ability to Pump, the City will need to develop up to 5 new wells (Wells 6, 15, 16, 17, and 18) in the next decade. Therefore well development is anticipated to be a major element of the City's CIP. Note, the ADD Ability to Pump does not increase from the Washougal Wellfield Renewal project due to water right restrictions.



The supply improvements allow the City to meet the high ADD projection; however, the City cannot reasonably meet the high MDD projections, which conservatively reflects both unusually high base and peak water use. Therefore, it is recommended that they continue its water use efficiency program efforts to reduce the risk of very high peak demands.

Table 8.8 Supply Improvements - ADD Ability to Pump

Improvement	Timing	Additional Supply (gpm)	ADD Ability to Pump (gpm)	Reliable ADD Ability to Pump (gpm)	Redundant ADD Ability to Pump (gpm)
	Existing		4,860	4,020	4,010
Construct Well 17	2018	275	5,135	4,295	4,285
Construct Parkers Landing Well	2020	546	5,681	4,841	4,831
Construct Treatment Plant Well	Medium-term	546	6,227	5,387	5,377
Washougal Wellfield Renewal	Medium-term	-	6,227	6,227	6,209
Construct Fire Station Well	Long-term	186	6,413	6,413	6,395
Steigerwald Phase 1	Long-term	489	6,903	6,903	6,885
Steigerwald Phase 2	Long-term	489	7,392	7,392	7,374

Table 8.9 Supply Improvements - MDD Ability to Pump

Improvement	Timing	Additional Supply (gpm)	MDD Ability to Pump (gpm)	Reliable MDD Ability to Pump (gpm)	Redundant MDD Ability to Pump (gpm)
	Existing		9,775	5,775	8,425
Construct Well 17	2018	500	10,275	6,275	8,925

FIGURE 8.4

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

8.5 GROUNDWATER MANAGEMENT

The City's wellhead protection plan was updated as part of the Plan. Section 1428 of the 1986 Amendments to the Federal Safe Drinking Water Act (SDWA) mandates that each state develop a wellhead protection program and that all federally defined public water systems (in Washington, Group A systems) using groundwater as its source implement a wellhead protection plan. In July 1994, the WAC addressed requirements for Group A public water systems (WAC 246-290) and was modified to include mandatory wellhead protection measures. The legislative authority to require wellhead protection (WHP) planning can be found in the Revised Code of Washington (RCW) Chapters 43.20.050, 70.119A.060, and 70.119A.080.

8.5.1 Wellhead Protection Program

The overall goal of the state WHP program is to prevent the contamination of groundwater used by Group A public water systems. This is to be accomplished by providing management zones around public wells, identifying existing groundwater contamination sources, and managing potential sources of groundwater contamination prior to their entry into the drinking water system. Under the WAC, local public water systems have the primary responsibility for developing and implementing local wellhead protection plans (WHPP). However, due to the limited jurisdictional and regulatory authority afforded most purveyors, coordination with other local, State, and Federal agencies is essential to the successful implementation of a WHPP.

The DOH has developed regulations that require Group A water systems using groundwater sources to develop and implement the WHPP (WAC 246-290-135). The objective is to prevent releases of contaminants to groundwater in areas that contribute water to the public supply systems. The City's Well Head Protection Report is included in Appendix I.

The basic elements of a WHPP include:

- Assessment of initial groundwater susceptibility for each water supply source.
- Delineation of the WHP area that directly contributes groundwater to each water supply well.
- Inventory of land uses and identification of potential sources of contamination within each wellhead protection area (WHPA).
- Documentation of notification to owner/operators of known or potential hazards.
- Development of spill prevention plans and water contingency plans that minimize or eliminate the possibility of contamination to the groundwater supply and also development of options for maintaining water supply in the event the aquifer contributing to a source is contaminated.

The State of Washington WHPP applies to the City's wells.

8.5.2 Wellhead Protection Area

The updated WHPP developed WHPA using the City's wells, including the recent Well #14 and future Parkers Landing and Treatment Plant wells. Capture zones for the Lower Washugal Wellfield

were estimated using a calibrated groundwater flow model, MODFLOW. The model simulations assumed that the City would exercise all of their existing and two future wells. This assumption provides for a fairly conservative assessment of the capture zone extent. In addition, a high-end pumping was assumed for the nearby Georgia Pacific Wellfield.

8.5.3 Existing and Potential Contamination Hazard Identification

The City performed a risk assessment within the modeled capture zones. The inventory of potential contamination sources within the WHPA was performed according to the DOH publication: "*Inventory of Potential Contaminant Sources in Washington's Wellhead Protection Areas (1993)*." Potential contaminant risks that lie within the vicinity of Camas' Lower Washougal Well-field were investigated and mapped using data from two sources. The first, a parcel data-base that contains information on land use and zoning, was provided by Clark County 2016. The second contains data from the DOE's Facility / Site database, including state cleanup sites, federal superfund sites, hazardous waste generators, solid waste facilities and underground storage tanks. The information from these sources were classified and plotted on GIS coverages to assess whether existing and potential contaminant sources were located within the vicinity of Camas' production wells and WHPA delineations2.

Table 3 in Appendix A of the Wellhead Protection Plan summarizes known environmental sites of potential concern within the Lower Washougal Wellfield wellhead protection capture zones. Thirty-six contaminant sources of potential concern to the water supply were identified within the Lower Washougal wellfield capture zone.

8.5.4 Protection Strategies and Implementation Tasks

As described in the WHPP, the nine shallow wells within the Lower Washougal wellfield are most susceptible to contaminant risks given the hydrogeology and land surface activities. The capacity of the most productive wells in the Lower Washougal wellfield is about 1,300 gpm. If the supply from one of these wells was lost or compromised, the City would have to rely on a combination of the other sources to meet summer time peak demands (other wells, interties, and emergency use of surface water sources).

Additional risks to the City's supply arises from the fact that five of the City's wells (Wells 7, 8, 10, 11, and 12) are clustered in close proximity to each other (Figure 5). Several, if not all, of these wells could be impacted by a single contaminant release, such as a major railroad spill. Depending on the nature of impact to the wells, the City could perform immediate mitigation with changes in well pumping, treatment, blending of waters between wells, and other operational changes to meet demands; however, should multiple wells become impacted, the City may not be able to support the City's entire water demand on a sustainable basis, particularly during the high demand summer months. If multiple wells are impacted, the City may need to institute short-term rationing and pursue expedited drilling of additional wells.

Chapter 9

SYSTEM ANALYSIS

9.1 INTRODUCTION

The City of Camas' (City) water distribution system was evaluated for its ability to meet the City's performance criteria under 2021, 2025, and 2035 future conditions using the medium demand projection scenario described in Chapter 5. The distribution system was evaluated for its pumping reliability and redundancy and the availability of storage using a desktop system analysis. Service pressures and available fire flows for both maximum day demand (MDD) and average day demand (ADD) conditions were evaluated using the City's updated hydraulic model.

This chapter presents the results of the system analysis and discusses in detail recommended improvements to meet the City's level of service goals. These recommendations form the basis of the City's capital improvement program (CIP) outlined in Chapter 10. Many supply, pumping, storage, and pipeline improvements will be necessary during the planning horizon to meet the City's projected substantial growth in water demand. The recommended supply, pumping, and storage improvements are summarized graphically on Figure 9.7. Pipe improvements as well as the location of supply, pumping, and storage improvements are shown on Figure 9.12 through Figure 9.13. All recommended improvements are summarized in Table 9.11 through Table 9.15.

9.2 SERVICE AREAS

For the pumping and storage analyses, the City's distribution system was divided into five sections referred to as "service areas". Each service area has its own supply and storage facilities and was evaluated against the City's pumping and storage criteria independently. The five service areas, which are shown on Figure 9.1 are:

1. 343 Service Area. Consists of the Butler, Cemetery, and Downtown 343 pressure zones.

2. 455 Service Area. Consists of the 455 Pressure Zone.

3. 542 Service Area. Consists of the 542 Pressure Zone. By 2025 the City intends to connect the 542 Pressure Zone and 544 Pressure Zone with a new transmission main around the north end of Lacamas Lake. Therefore, starting in 2025, the 542 Service Area will become part of the 544 Service Area. This combined service area is referred to as the 542/544 Service Area in this chapter.

4. 544 Service Area. Consists of the 544 Pressure Zone and its pressure reducing valve (PRV)-fed 440 subzone. Starting in year 2025 it will become part of the 542/544 Service Area.

5. 852 Service Area. Consists of the 852 Zone and its many PRV-fed subzones.

The existing supply, pumping, and storage infrastructure and their capacities are shown for each service area in Figure 9.2. This figure also indicates the total well capacity (Q_{IN}) and booster pump station (BPS) capacity (BPS_{IN}) for each service area.

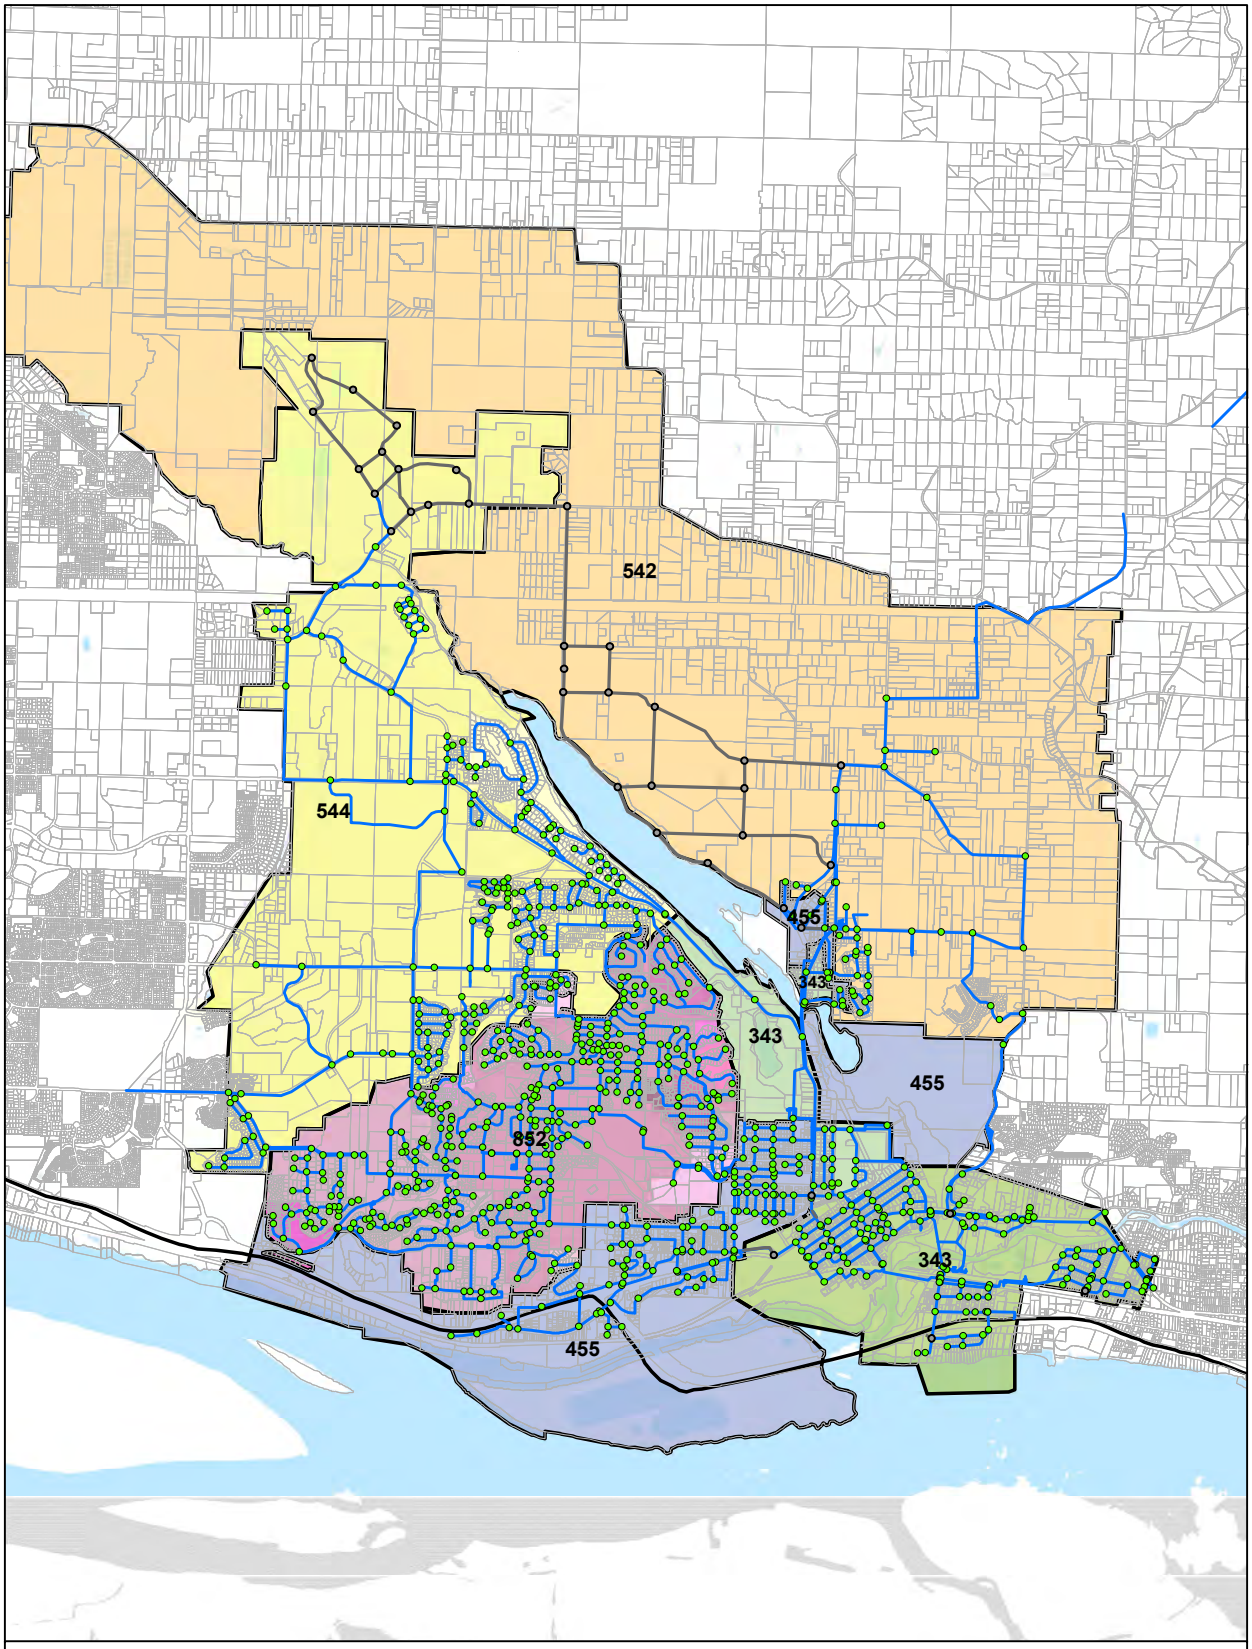
9.3 PUMPING ANALYSIS

9.3.1 Pumping Criteria

For this water system plan update, the City updated its pumping reliability and redundancy criteria as described below. The capacity of pumping into each of the City's service areas was evaluated against the following criteria.

1. Pumping Reliability. Wells and booster pumps with back-up power should be capable of supplying MDD for the water system while concurrently replenishing fire suppression storage within 72 hours.

2. Pumping Redundancy. With the largest pump in each booster pump station out of service, the remaining pumps should provide MDD whole concurrently replenishing fire suppression storage within 72 hours.



The City’s pumping criteria only address MDD conditions. During the winter and average day demand (ADD) conditions, the City operates their slow sand filter that supplies the 542 Zone, offering increased supply redundancy. If the City meets their MDD pumping reliability and redundancy goals, they will by default also be able to supply ADD reliably and redundantly.

9.3.2 Pumping Reliability

The City's water system was evaluated against its pumping reliability criterion for each of the service areas and each planning year. The results of this analysis are presented in Table 9.1 where the surplus/(deficit) reliable supply is the difference between the total pumping requirement, and the net service area supply. Results for year 2035 are shown graphically in Figure 9.3. Four of the City's wells (6, 7, 9, and 10), and two of its booster pump stations (Forest Home and Butler) do not have backup power. These pumps are shown as red in Figure 9.3. As indicated by orange in Figure 9.3, the Angelo BPS has backup power, but not enough to run at full capacity. The capacities shown next to each well or BPS in Figure 9.3 are their reliable capacities.

With only its reliable pumps in operation, the City can only meet 2021 MDD in the 542 and 852 service areas. Demands in the other three service areas cannot be met. By 2035, all service areas are deficient.

In order to meet the pumping reliability criteria, back-up power sources able to provide full capacity are needed at all existing wells and BPSs as well as all future wells and BPSs.

1889
Item 2.

Figure 9.3 2035 Pumping Reliability Deficits

9.3.3 Pumping Redundancy

The City's water system was also evaluated against its pumping redundancy criterion for each of the service areas and each planning year. The City's policy is to supply MDD and replenish fire suppression storage within 72 hours with its firm BPS capacity (largest pump in each booster station out of service). The results of this analysis are presented in Table 9.2, where the surplus (deficit) supply is the net service area firm supply minus the total pumping requirement. Figure 9.4 shows the 2035 results graphically, and the firm capacity of each BPS.

As shown in Table 9.2, by 2021 none of the service areas have adequate firm BPS capacity to meet MDD. The City will need to increase its BPS capacity to all service areas in order to meet its pumping redundancy criteria.

9.3.4 Pumping Recommendations

In addition to the supply improvements described in Chapter 8, to meet its pumping reliability and redundancy goals, the City needs to increase its reliable and redundant pumping capacities to each service area.

Figure 9.4 shows that the 852 and 455 service areas each have a deficit of approximately 1,000 gallons per minute (gpm) by 2035. As shown in Figure 9.5 1,000 gpm of additional firm pump capacity is needed for the 852 Service Area, but a total of 2,000 gpm of additional firm pump capacity is required for the 455 Service Area because in addition to the 1,000 gpm of unmet demand in the 455 Service Area, the 1,000 gpm deficit for the 852 Service Area must be pumped up from the 343 Zone to the 455 Zone before being pumped into the 852 Zone.

Due to its condition, the City intends to replace the existing Forest Home BPS with a new pump station. This new pump station should have a firm capacity of approximately 2,000 gpm. The additional 1,000 gpm flow of the new Forest Home BPS will wheel the 1,000 gpm of additional flow needed for the 852 Zone through the 455 Zone. Approximately 1,000 gpm of additional firm booster pumping capacity will need to be built at Angelo BPS or a new BPS to the 455 Zone. Additionally, as shown in Figure 9.5, the City intends to construct the 500-gpm Well 17 in the 544 Zone by 2021.

In 2021 the 542 Zone is less than 100 gpm deficient, therefore it is recommended that improvements to this zone can be pushed out until 2025 when the combined 542/544 Service Area will require an additional 1,200 gpm of booster pumping capacity after the installation of Well 17 to meet MDD. The Crown Road Pump Station was designed to accommodate two future pumps. It is recommended that the Crown Road Pump Station's capacity is expanded by 1,600 gpm before 2025. Further expansions of approximately 2,000 gpm will be necessary at Crown Road or at a new BPS supplying the 542/544 Service Area by 2035. It is recommended that this BPS be located in a place like Crown Road where it can pump directly from the Butler 343 Zone to the 542 Zone to avoid having to construct multiple pump stations to pump to the 455 Zone and then to the 542/544 Zone.

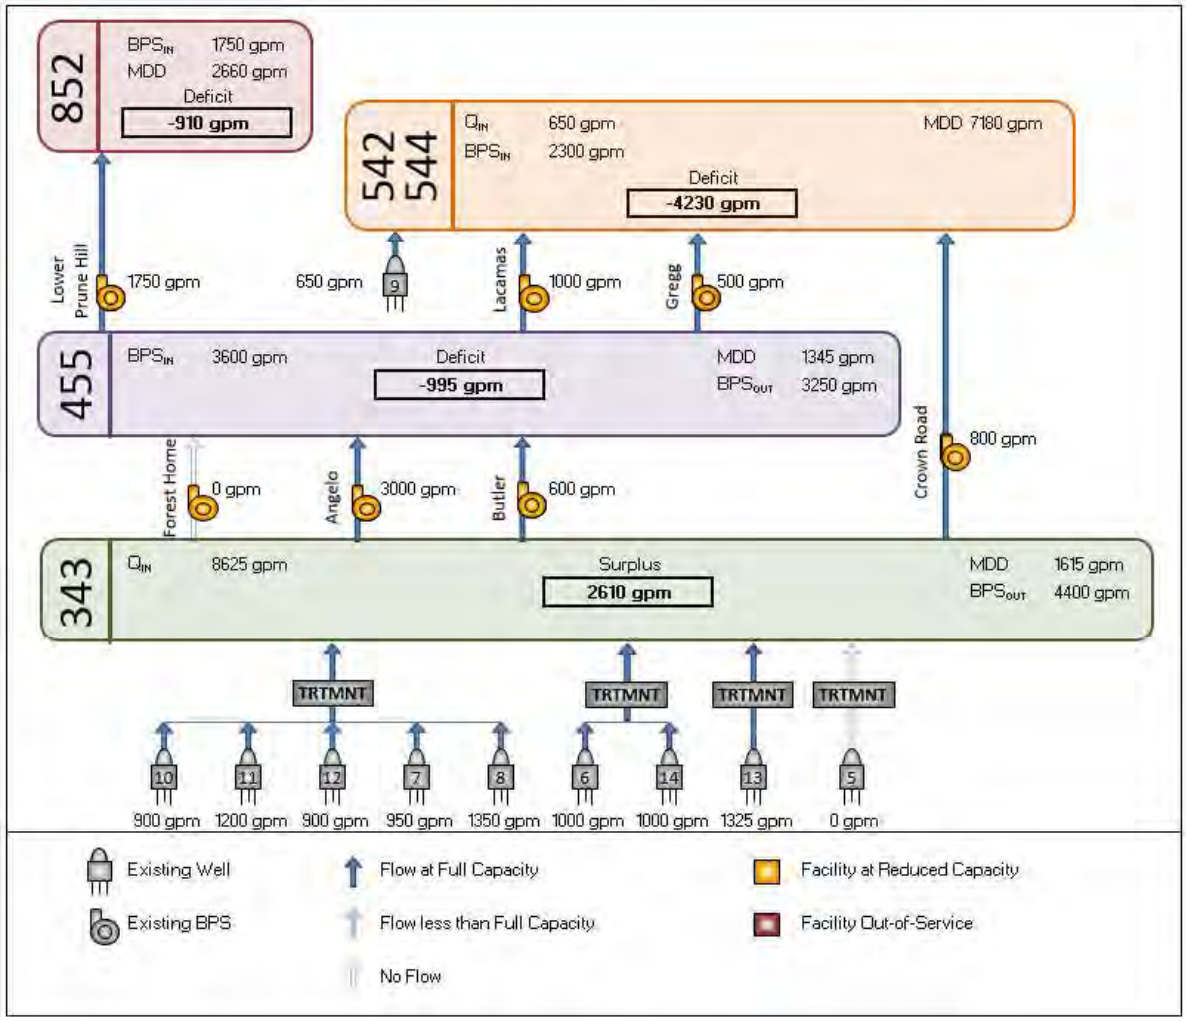
Figure 9.4 2035 Pumping Redundancy Deficits



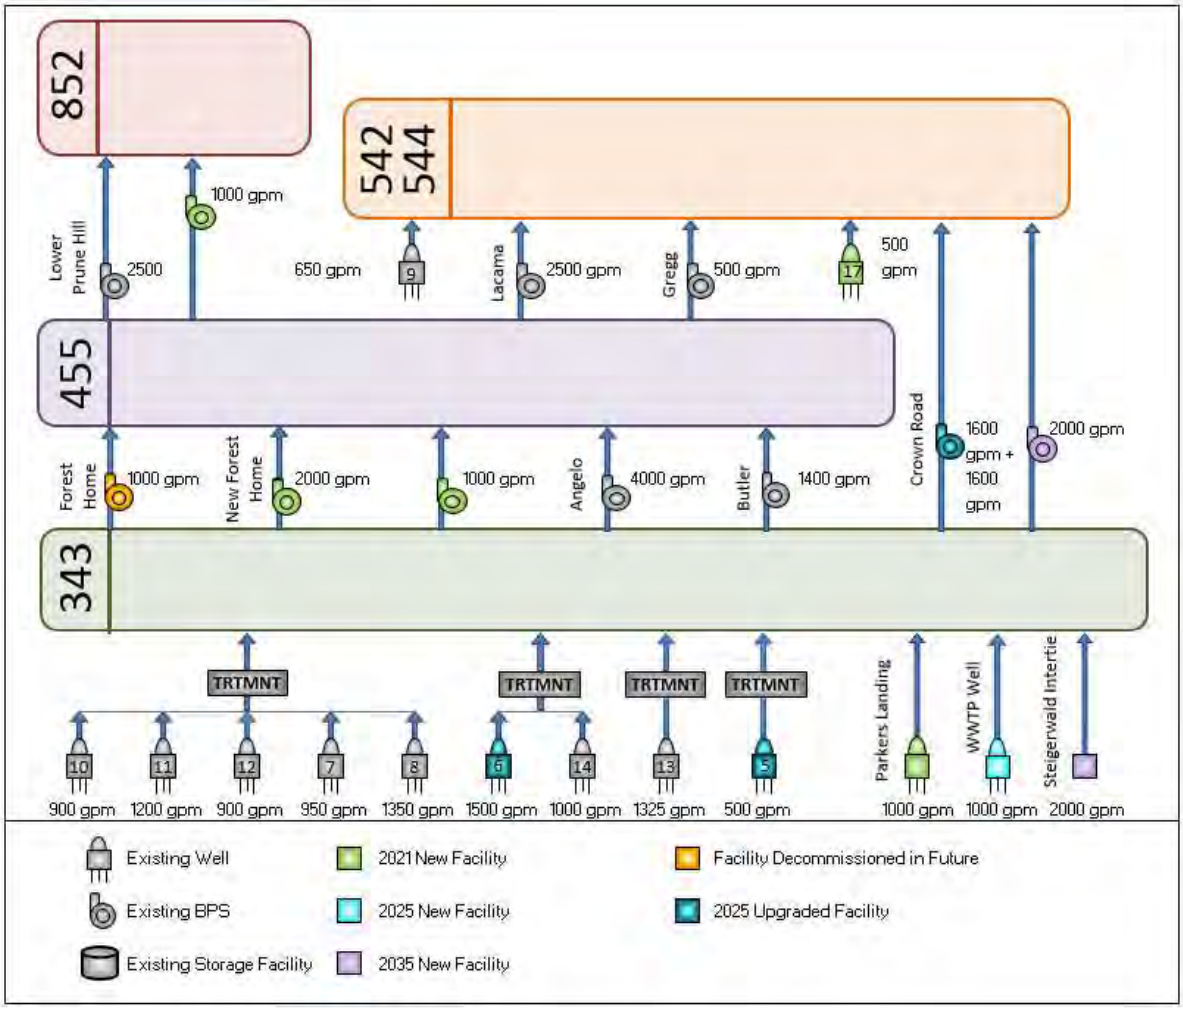


Figure 9.5 BPS Improvement Recommendations

9.4 STORAGE ANALYSIS

The City's storage system was evaluated based on their criteria. The City's storage requirements are dependent on the City's supply capacity, booster pump operation, water demands, fire flow requirements, and pressure requirements. The following sections summarize the available storage of the water system, describe the required storage components, and present recommendations to address identified storage deficits.

9.4.1 Storage Components and Governing Criteria

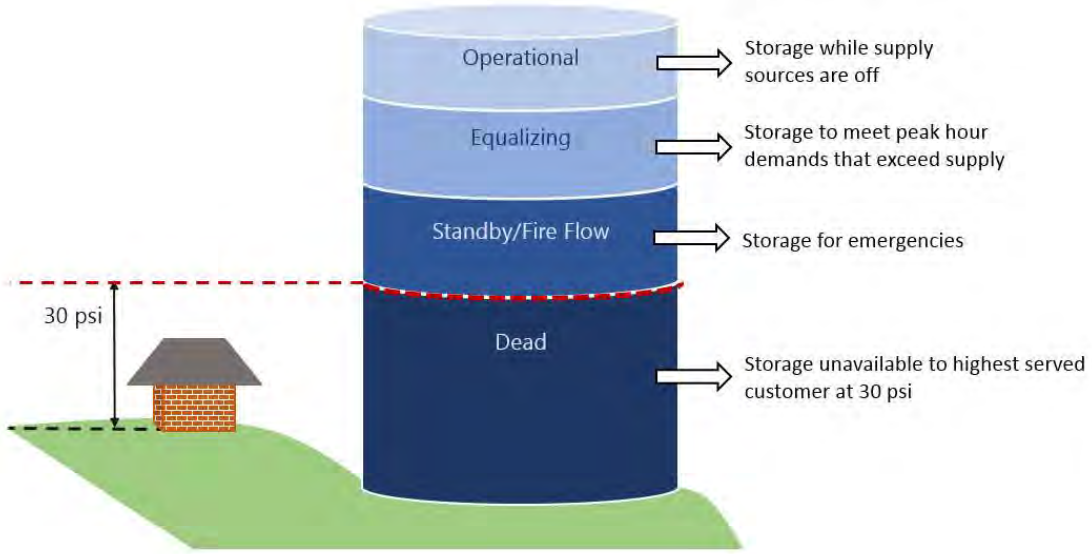
Following the Washington State Department of Health (DOH) storage volume requirements (WAC 246-290-235(3)) and the Water System Design Manual, Chapter 9, the five components of storage listed below and illustrated in Figure 9.6 must be considered for any water system:

1) Operational storage.

2) Equalizing storage.

3) Standby storage.

4) Fire Suppression storage.



5) Dead storage.

DOH requires that operational and equalizing storage are available to all customers at a residual pressure of at least 30 pounds per square inch (psi) under peak hour demand (PHD) flow conditions. The City has an increased level of service goal to provide standby and fire suppression storage to all customers at a residual pressure of at least 30 psi under MDD, which is above the DOH requirement of 20 psi. Therefore, all tank volumes above the 30 psi hydraulic grade line (HGL) are considered available storage. Dead storage is the volume in the tank that cannot be used to serve the highest customer in the water system with a pressure of at least 30 psi.

9.4.1.1 Operational Storage

Operational storage is the band of storage within each reservoir that is utilized during periods of average demand. It is typically estimated based on the volume of water each reservoir drops prior to calling on the supply sources, and is measured as the volume of water stored between the pump call-off and pump call-on levels.

Figure 9.6 Storage Components

9.4.1.2 Equalizing Storage

Equalizing storage is the volume needed to satisfy PHD. It should be available at 30 psi to all service connections. Equalizing storage volume requirements can be calculated using the following equation from the DOH Water System Design Manual:

$$ES = (PHD - MDD)*150 \text{ minutes, but in no case less than zero}$$

Where: *ES* = Equalizing Storage component, in gallons

PHD = Peak hourly demand, in gpm

MDD = Sum of all installed and active source of supply capacities, except emergency sources of supply, in gpm

9.4.1.3 Fire Suppression Storage

Storage for emergencies is comprised of fire suppression storage and standby storage. For the City's water system, these two components of storage are nested, which means that the volume of storage reserved for emergencies consists of whichever requirement is greater between fire suppression storage or standby storage.

Fire suppression storage is the volume of storage required to deliver fire flows as prescribed by local fire protection authorities. Since a fire can occur at any time during the day, the fire suppression storage must be in addition to the equalizing and operational storage. City policy states that fire suppression storage should be available at 30 psi.

The maximum fire flow requirements and durations for each service area are provided in Table 9.3.

Table 9.3 Fire Suppression Storage Requirements Water System Plan City of Camas

Service Area	Largest Fire Flow Requirement (gpm)	Fire Flow Duration (minutes)	Fire Suppression Storage Required (MG)
343	4,000	240	0.96
455	2,000	120	0.24
542	4,000	240	0.96
544	5,000	240	1.2
852	2,500	120	0.3

9.4.1.4 Standby Storage

Standby storage is the volume of storage required to supply reasonable system demands during a system emergency, such as disruption of the water supply. Disruptions could be caused by transmission pipeline or equipment failure, power outage, valve failure, or other system interruptions. The computation of emergency/standby storage requirements

includes consideration of reasonable system disruptions that can be expected to occur within normal planning contingencies, and does not consider major system emergencies, such as earthquakes, that result in shutdown of water supplies and multiple distribution system breaks. These types of emergencies should be covered under emergency system operation planning.

The City's standby storage policy is that the reservoirs in the water system should have enough standby storage to supply 200 gallons per equivalent residential units (ERU). City policy states that this storage should be available to the highest customer in the service area at 30 psi.

9.4.2 Available Storage

The Camas Water System has seven storage tanks with a total capacity of 8.45 MG. However, the available storage excluding dead storage is 6.64 MG as shown in Table 9.4 and described below.

The dead storage corresponds to the volume of the tank that is effectively unusable. The storage volume is considered dead if it is located below the outlet pipe and cannot be withdrawn, due to dynamic losses in the distribution system, or if it is located below the lowest water surface elevation that meets the minimum design pressure of 30 psi.

The available storage in each service area is controlled by the elevation of the highest customer in the system and the HGL required to serve that customer with a pressure of at least 30 psi. Table 9.4 shows the highest service elevation and the amount of available storage in each service area.

9.4.3 Required Storage

The operational, equalizing, fire suppression, and standby storage requirements are summarized in Table 9.4 for each service area and each planning year. The total required storage is the sum of operational, equalizing and the maximum between fire suppression and standby storage.

The 343 Service Area has a small (0.1 MG) storage deficit in all planning years. The 455 and 852 service areas both have storage surpluses throughout the planning period. The 542 and 544 service areas have storage deficits in all planning years with a storage deficit of approximately 3 MG for the combined 542/544 service area in 2035.

Table 9.5, Table 9.6, and Table 9.7 list the parameters used in the calculations of operational, equalizing, and standby storage, respectively.

9.4.4 Storage Recommendations

The most immediate storage need is in the 544 Service Area. The City is in the process of siting and designing a new 2.0 MG tank. An ideal location for this tank is near the corner of NW 18th Ave and Tidland St.

The City's next storage priority will be to replace the Butler Reservoir. Although the 343 Service Area has only a small storage deficit, the City plans to decommission the Butler Reservoir within the 20-year planning period due to its condition. It is recommended that a slightly larger tank with a capacity of 1.5 MG be constructed on Cemetery Hill. This is a hydraulically advantageous location due to its proximity to the Washougal Well Field wells. If the City cannot locate the tank at the cemetery, installing a new tank at the Crown Road BPS site or at the Butler site should be considered.

Finally, by 2035 additional storage will be required for the North Shore Area. We recommend a 1.0 MG storage facility be constructed at the site of the existing Gregg Standpipe. This location is hydraulically ideal due to its proximity to the Crown Road and Gregg BPSs.

9.4.5 Summary of Recommended Supply, Pumping and Storage Improvements

All of the recommended supply, pumping, and storage improvement projects are summarized in Figure 9.7.

9.5 HYDRAULIC MODEL UPDATE

The City's hydraulic model is the primary tool for evaluating the City's distribution system. The model evaluates how the City's water infrastructure handles future demands and verifies that recommended improvements will eliminate system deficiencies.

The City maintains the hydraulic model of their distribution system in InfoWater by Innovyze. For the purpose of the system analysis, the City's model was updated using data provided by the City.

9.5.1 Physical Features Update

City staff to verified pressure zone boundaries. The pressure zone boundaries were updated in the model by permanently closing or opening pipes to match the correct pressure zone configuration of the water system. Also, corrections were made to pressure zone assignments for all pipes and junctions.

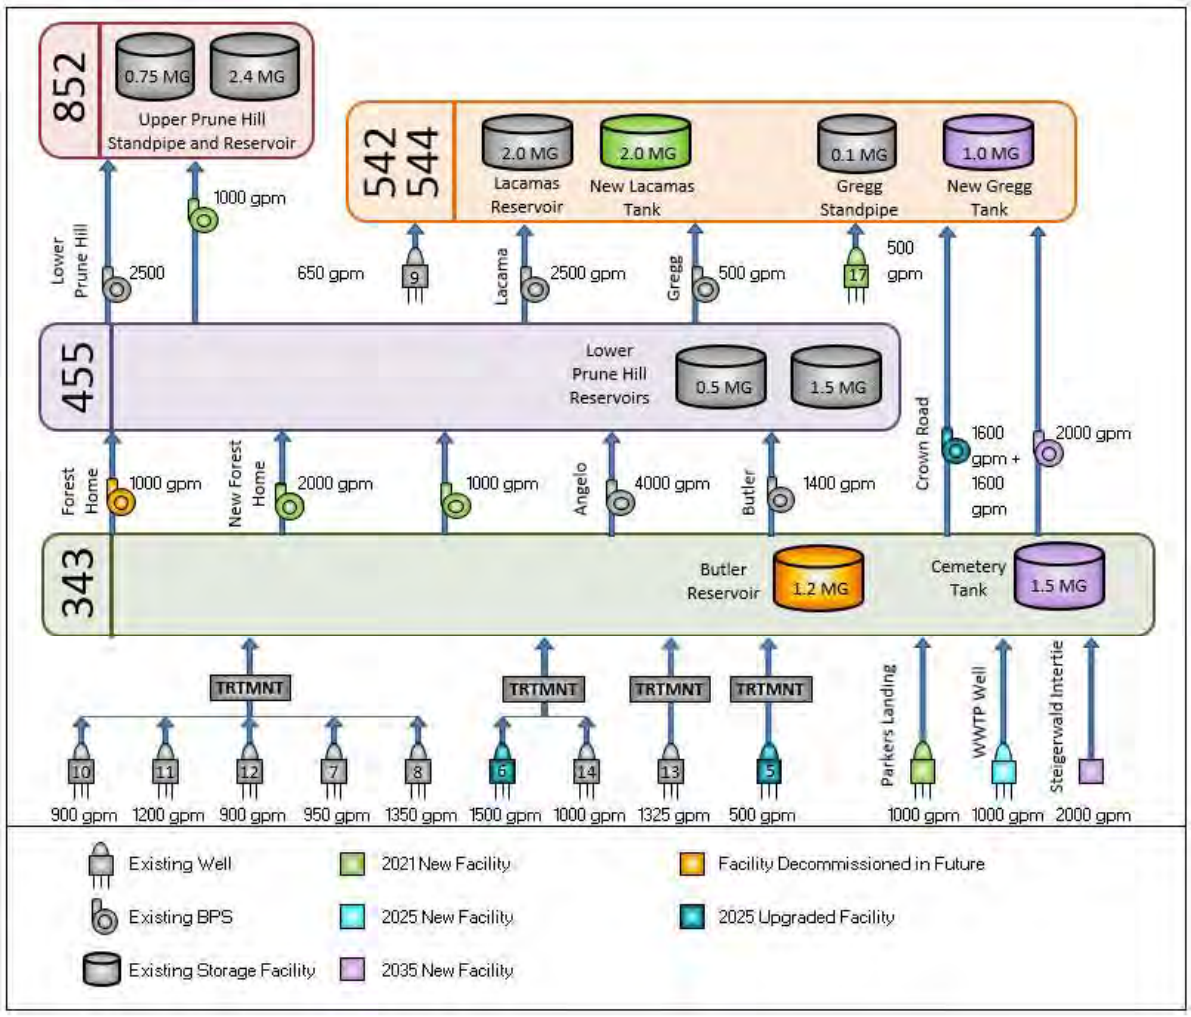
Pipe diameters and PRV settings were verified and corrected in the model to match a map provided by the City. The piping configuration at Well 6 and 14 was updated to match drawings of system improvements that the City is currently undertaking.

9.5.1.1 Butler/Gregg Booster Pump Station Site Updates

The model configuration at the site of the Butler and Gregg BPSs was updated to match record drawings of the pipe and valve configuration. A valve was added to the model to represent the PRV within the Old Gregg BPS building that supplies water to the 455 Zone from the 542 Zone. This PRV will be in operation when the City's slow sand filter that supplies the 542 Zone is online during the winter.

9.5.1.2 Upper Prune Hill Reservoir Site Updates

The original model was not configured to run in extended period simulation at the Upper Prune Hill Reservoir site. The Upper Prune Hill Reservoir altitude valve and pipes were added to the model to match the site's configuration as shown on the City's SCADA system.



9.5.1.3 Reservoir Levels

For the fire flow scenarios, reservoir levels in the model were set to match the bottom of the fire suppression storage component as determined by the storage analysis.

9.5.1.4 Operational Settings

Summer and winter operational settings for wells, pump stations, and valves were updated to reflect the latest information provided by the City.

Figure 9.7 Recommended Supply, Pumping, and Storage Improvements

9.5.2 Future Expansion

Within the planning period the City expects significant expansion of the water system in the North Shore area. Future pipelines were added to the model in the North Shore area to match the transportation corridors delineated on a map provided by the City. The future Green Mountain development was already included in the model before this update began.

In the future the City wants to connect the 542 and 544 zones and combine them as one pressure zone. In past planning documents two methods were identified for connecting the two zones.

1. The first method is to construct a transmission main along the north side of Lacamas Lake that connects the two zones.

2. The alternative method consisted of connecting the two zones hydraulically by converting the existing 455 Zone transmission mains along NE Everett St and NW Lake Rd to 544 Zone mains and bypassing the Gregg and Lacamas BPSs.

The second method would require the NE Everett St and NW Lake Rd transmission mains to be operated as a 544 Zone main in the winter when supply comes from the City's slow sand filter in the 542 Zone, and as a 455 Zone main in the summer when supplies come predominantly from the 343 Zone wells. For the sake of operational simplicity, the City has decided to move forward with the first method of connecting the 542 and 544 zones through a transmission main around the north side of Lacamas Lake. The City plans to construct the transmission mains needed to connect these two zones by 2025.

Despite a wide range of elevations in the North Shore area, the City plans to serve all North Shore customers through the 542/544 Pressure Zone. As a result, many customers will require individual or community PRV stations to provide adequate service pressures.

9.5.3 Demand Allocation

The medium scenario future demand requirements for years 2021, 2025, and 2035, as presented in Chapter 5, were allocated to the model. First, large user demands for each planning year were allocated to the model nodes located closest to the large users. City of Camas and Camas School District demands were divided up and allocated to model nodes representing City facilities and City schools. The proportion of the demand assigned to each node was based on 2015 metered billing data.

To assign demands representing the remainder of the City's customers, demand factors were developed for each customer class based on 2015 billing data. The demand factors are shown in Table 9.8. Using GIS, each meter was assigned a demand based on its customer class and then this demand was assigned to the closest node in the model using GIS geocoding software.

All non-large user 2015 demands in the model were grown by a multiplication factor unique to each pressure zone to represent the demand for future planning years. The only exception to this method was the 542/544 Zone where growth is expected to occur by water system expansion in the North Shore area, rather than development infill. For the North Shore area, demand projections were allocated to model nodes based on land use.

Table 9.8 Customer Class Demand Factors
Water System Plan
City of Camas

Customer Class	Demand per Meter (gpd)	Demand per Meter (gpm)
Single-family	260	0.181
Multi-family	350	0.243
Commercial	502	0.349
Industrial	3,112	2.161
Irrigation	767	0.532

9.5.4 Calibration Verification

The City's hydraulic model was most recently updated and calibrated in 2013. A full recalibration of the model was not included in the water system plan development scope, however, hydrant flow tests were performed at six locations throughout the City's distribution system and model calibration was verified using this data. Details on the model calibration verification can be found in Appendix J.

9.5.5 Fire Flows

The City has three general levels of fire flow requirements that are listed in Table 9.9. All new residential buildings within the City are required to have sprinklers. Residential buildings with sprinklers require a fire flow of 500 gpm. Residential buildings without sprinklers must have fire flows of at least 1,000 gpm. Non-residential buildings require 1,500 gpm of fire flow.

Note: City utility is responsible for dictating the general fire flows for future land use planning which had been developed in collaboration with the Fire Marshal. The Fire Marshal is responsible for dictating the specific fire flow requirements at the time of development. The City evaluates the ability to serve each new connect before utility permit is issued, where the developer is responsible for making improvements to meet site specific fire flows, as necessary.

Table 9.9 Fire Flow Requirements Water System Plan City of Camas	
Customer Class	**Fire Flow Demand (gpm)**
Residential with Sprinklers	500
Residential without Sprinklers	1,000
Non-residential	1,500

The City does not have a record of which houses have sprinklers and which do not. Therefore, for the purpose of the system analysis all existing residential areas were assumed to require 1,000 gpm of fire flow. Future residential neighborhoods such as Green Mountain were assigned a fire flow of 500 gpm, because all of those homes will have sprinklers. Two neighborhoods that were identified as receiving less than 1,000 gpm of fire flow were confirmed by City staff as having sprinklers and requiring 500 gpm of fire flow.

Fire flow requirements above 1,500 gpm for specific facilities such as schools, industrial facilities, and churches were identified and assigned fire flow requirements by City staff. The City's fire flow requirements as they were assigned to each node in the model are shown in Figure 9.8.

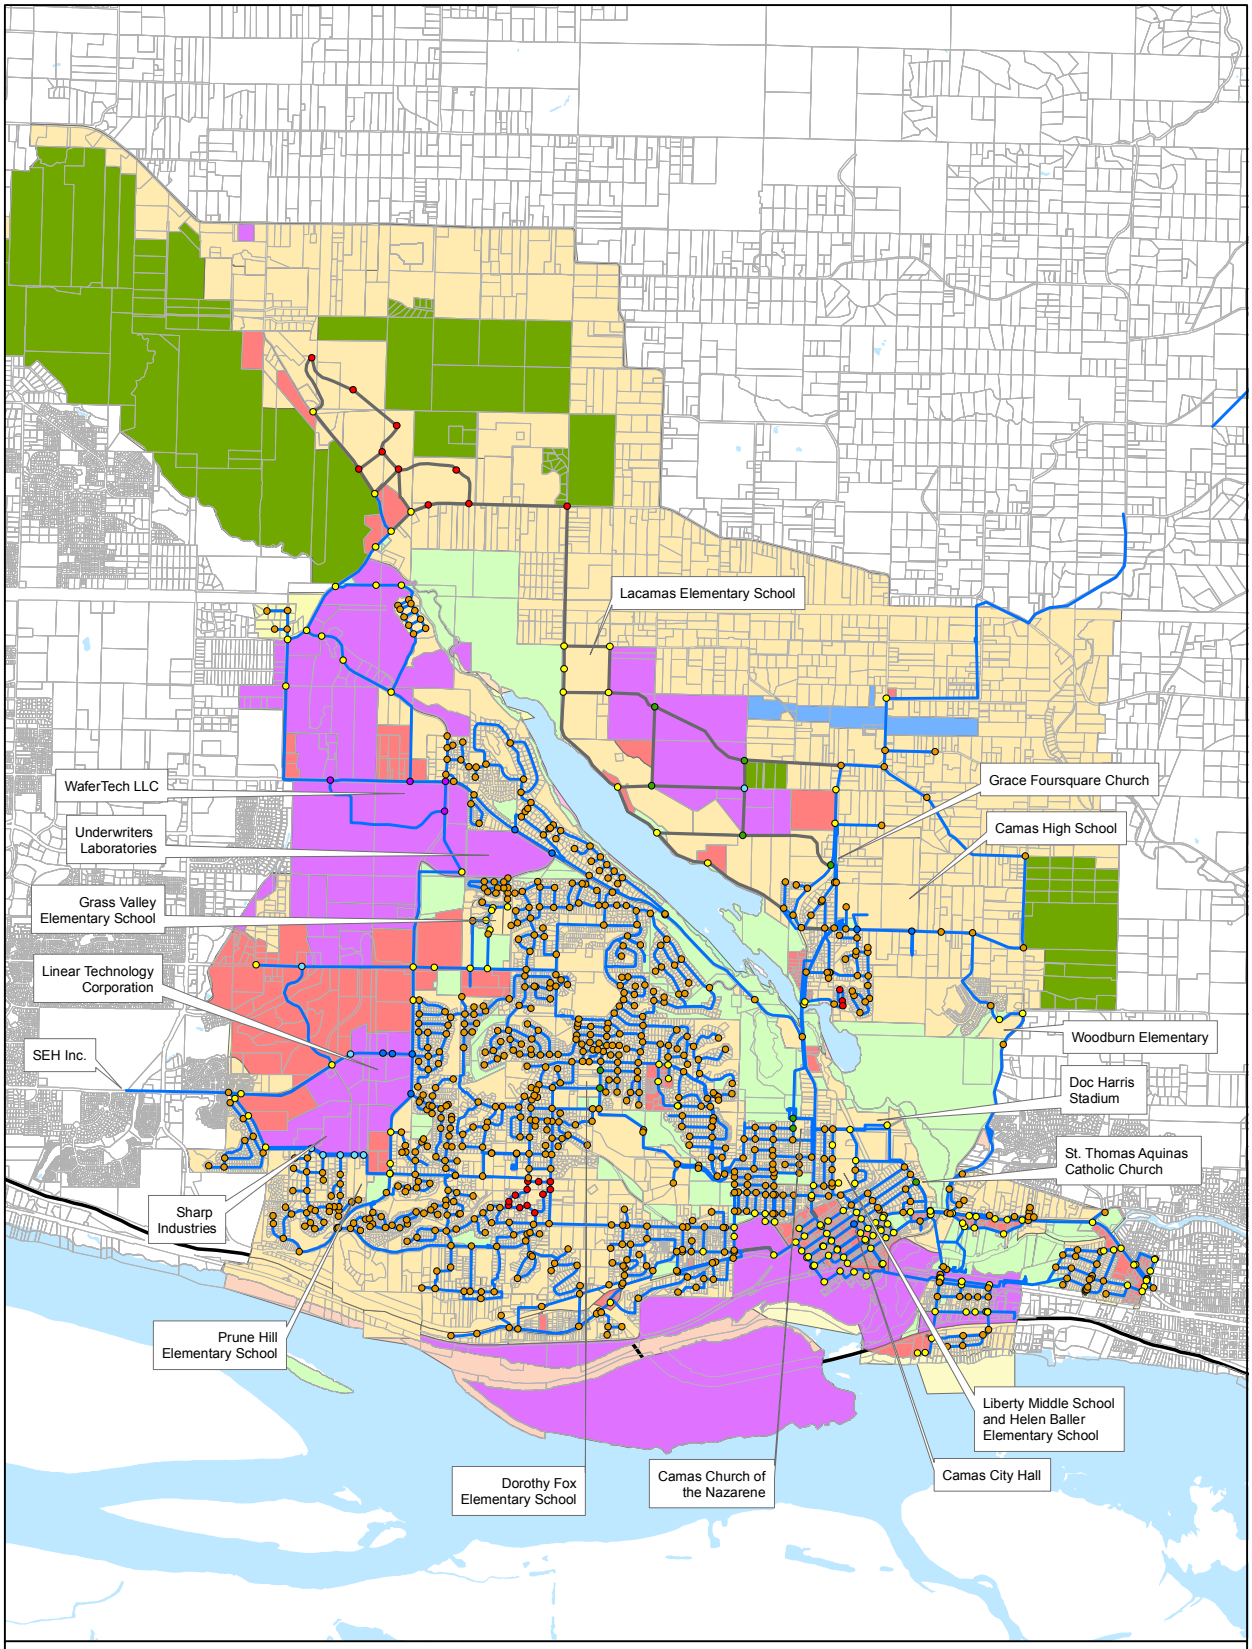
9.6 DISTRIBUTION SYSTEM ANALYSIS

The updated model was used to evaluate the distribution system under future demand conditions. The distribution system was evaluated against two performance criteria: minimum pressure and minimum fire flow. Areas not meeting the criteria are considered deficient and system improvements are identified to achieve the required level of service.

9.6.1 Evaluation Criteria

The distribution system was evaluated for the following criteria, which match the requirements of the DOH Design Manual and WAC 246-290.

1. PHD Pressure. Minimum allowed pressure is 30 psi during PHD.
2. Available Fire Flow. While delivering the required fire flow during MDD conditions, system pressures must remain above 20 psi.



9.6.2 Supply Improvements

Because the City expects significant growth, the City's existing supplies do not have enough capacity to meet projected future demands. The hydraulic model will not run in a condition where demands exceed supply. Therefore, it was necessary to add future supply improvements to the model before the model could be run to identify pressure and fire flow deficiencies. All of the supply and booster pumping improvement projects identified by the water resource analysis in Chapter 8 and pumping analysis in Section 9.3 of this chapter as

well as required transmission main improvements associated with these supply projects were added to the model before identifying pressure and fire flow deficiencies. These supply projects were included in the model with their capacity and timing dictated by what was recommended in the supply and pumping analyses. However, the City may choose to implement other projects recommended in Section 9.6.4 to reach the same level of service.

9.6.2.1 2021 Supply Improvements

The supply improvements recommended to be implemented before the year 2021 include development of Well 17 (S-1 on Figure 9.9) with a capacity of 500 gpm in the 544 Zone near NW Lake Road and development of Parkers Landing Well (S-2 on Figure 9.9) with a capacity of 1,000 gpm near SE 11th Ave and Front Street. Additional supply from Parkers Landing Well requires transmission main upsize projects S-2 and D-2.

FIRE FLOW REQUIREMENTS

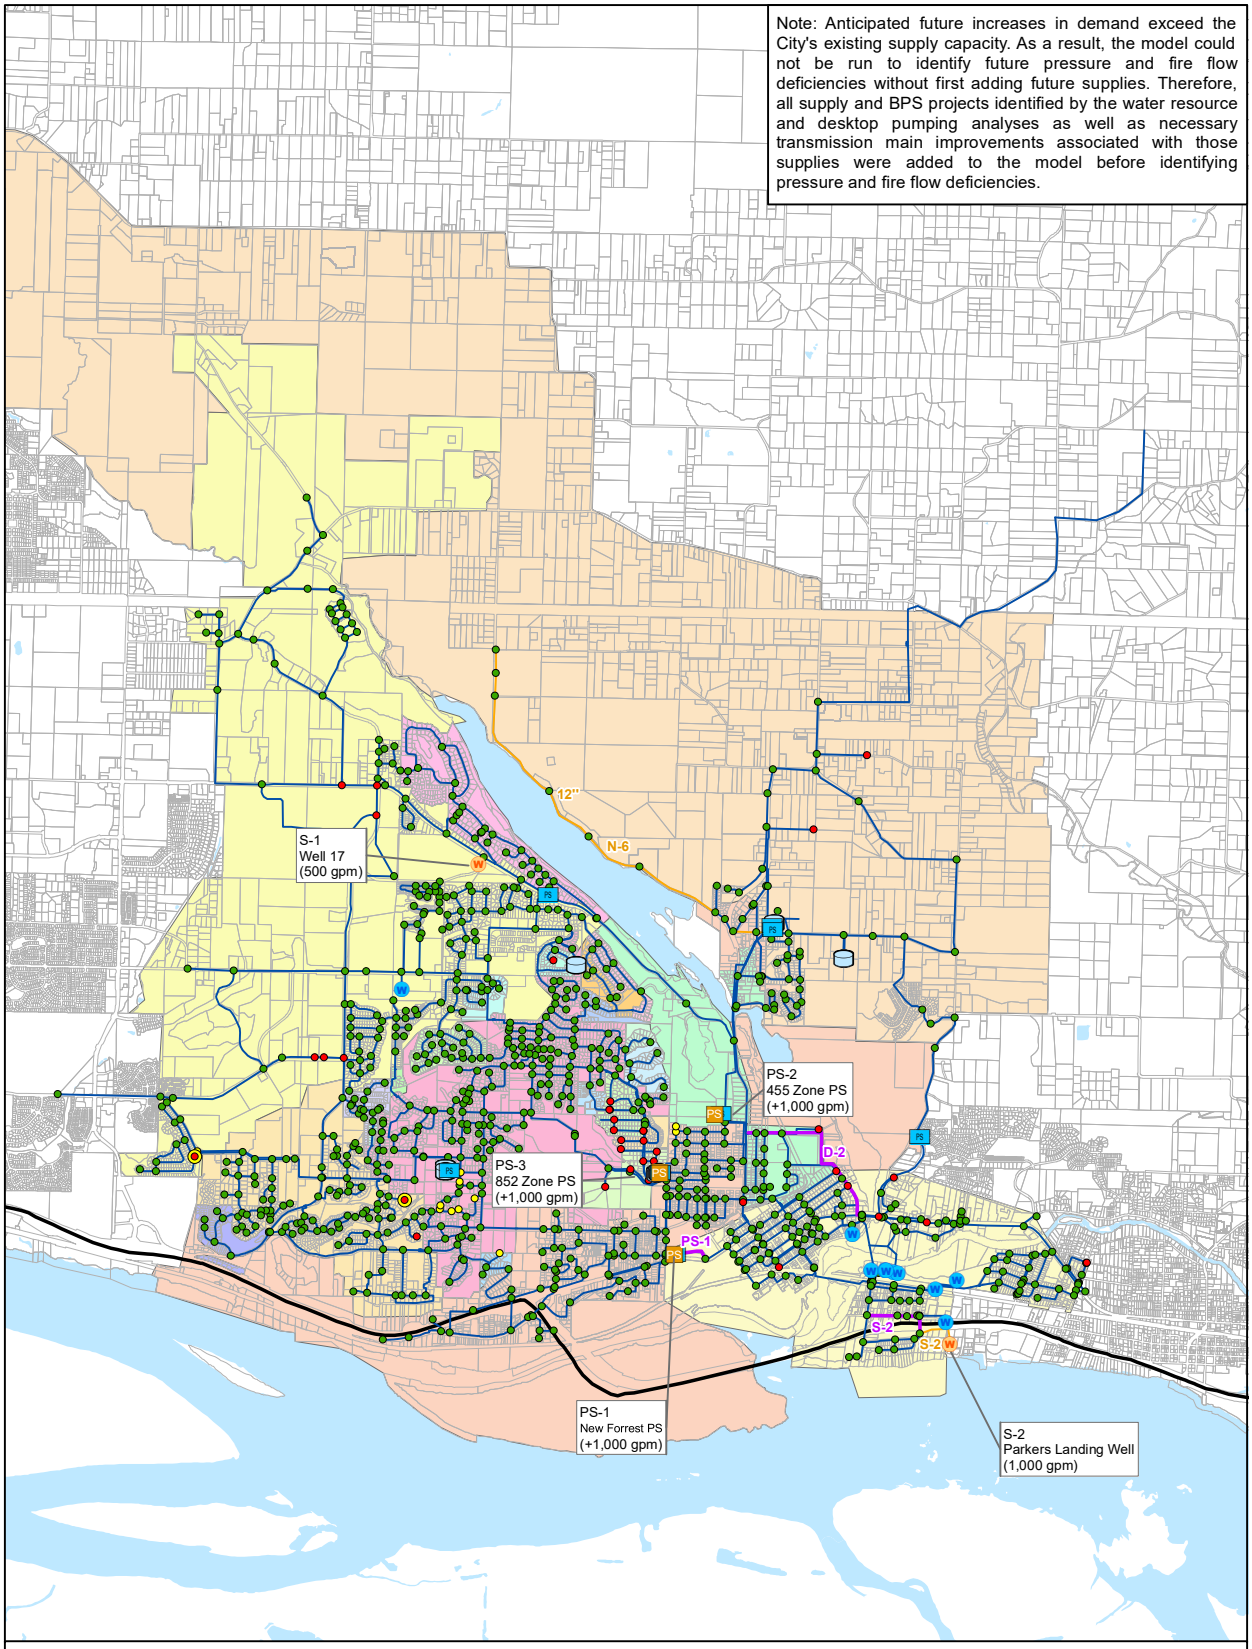


FIGURE 9.8

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

carollo

Document Path: E:\KRC D DRIVE\CAMAS\Fire Flow Analysis\FireFlow_20170414.mxd

Note: Anticipated future increases in demand exceed the City's existing supply capacity. As a result, the model could not be run to identify future pressure and fire flow deficiencies without first adding future supplies. Therefore, all supply and BPS projects identified by the water resource and desktop pumping analyses as well as necessary transmission main improvements associated with those supplies were added to the model before identifying pressure and fire flow deficiencies.

FIGURE 9.9

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

carollo

Document Path: E:\KRC D DRIVE\CAMAS\Fire Flow Analysis\FireFlow_20170414.mxd

The pumping analysis identified the need for additional pumping capacity to the 455 and 852 zones by 2021 to meet redundancy criteria. PS-1 is a project to replace the 1,000 gpm Forest Home Pump Station with a new 2,000 gpm pump station. This improvement should coincide with upsizing the pipe feeding the pump station. Additional pumping to the 455 Zone was modeled as a 1,000-gpm expansion to the Angelo BPS. For 2021, the model includes an additional pump in the Lower Prune Hill BPS with a 1,000-gpm capacity.

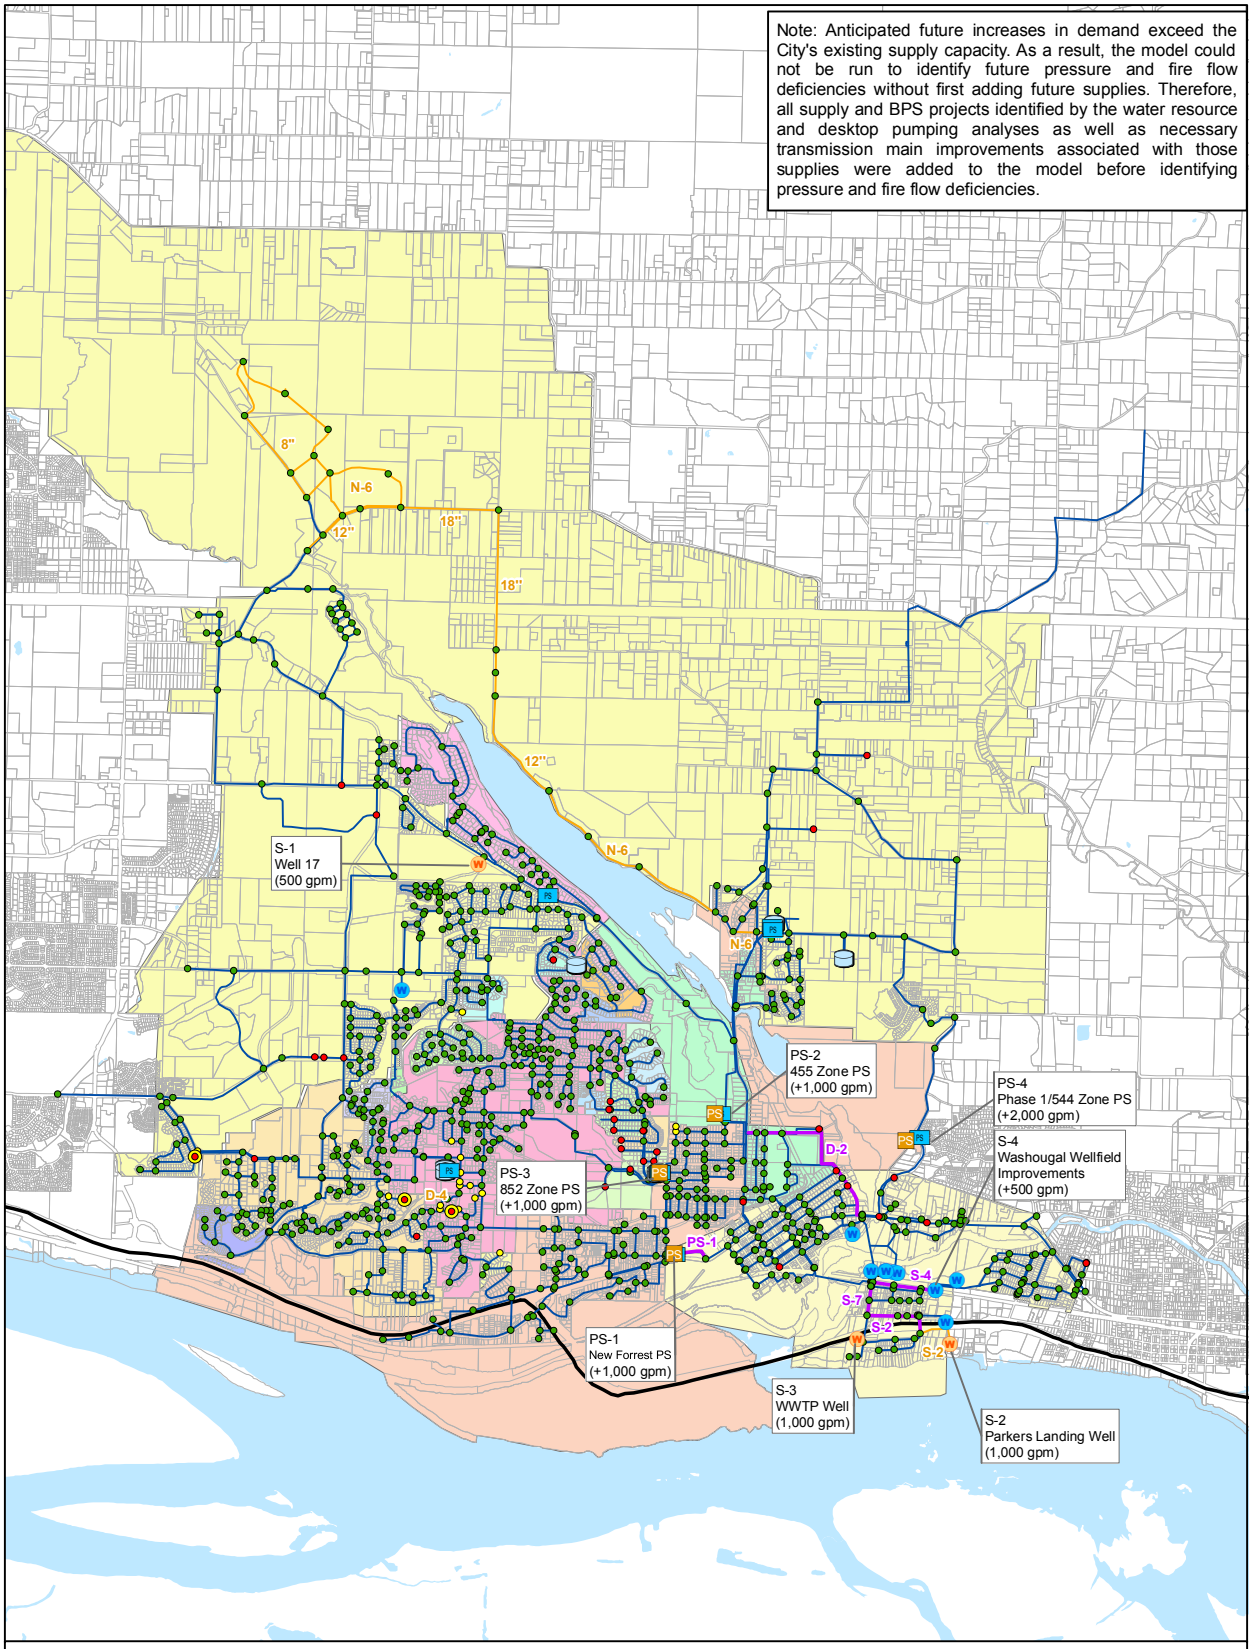
9.6.2.2 2025 Supply Improvements

Additional supply improvements required by 2025 according to the redundancy criteria of the water resources and pumping analyses include the 1,000-gpm Wastewater Treatment Plant (WWTP) Well (S-3 on Figure 9.10) and associated transmission main improvements, and the project to increase the yield of Well 6 from 1,000 gpm to 1,500 gpm (S-4 on Figure 9.10).

By 2025 an additional 2,000 gpm of pumping capacity is required for the 542/544 Zone. This can be accomplished by expanding the capacity of the Crown Road Booster Pump Station (PS-4 on Figure 9.10).

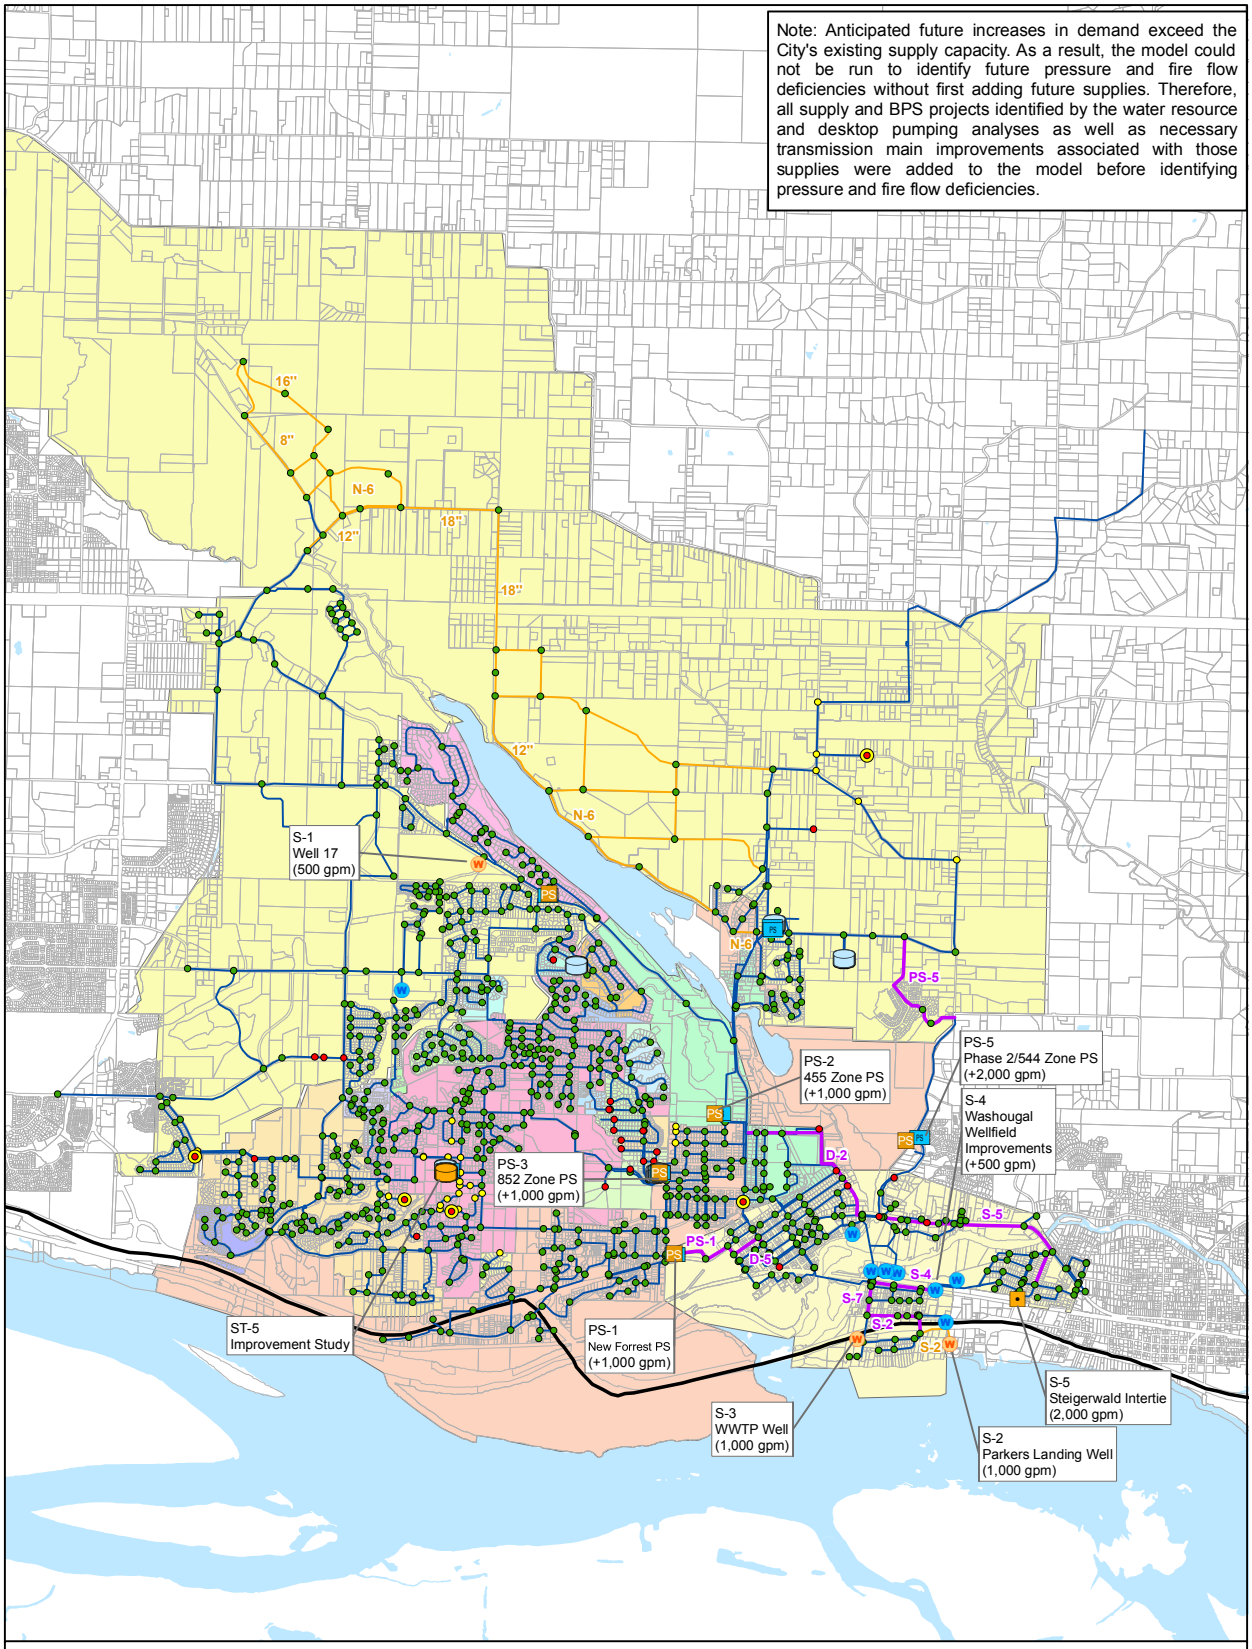
9.6.2.3 2035 Supply Improvements

Between 2025 and 2035 the Steigerwald Regional Water Source that will be supplied through an intertie in the southwest corner of the City's water system is planned to be brought online to supply an additional 2,000 gpm. The intertie and corresponding transmission main improvements are labelled on Figure 9.11 as S-5.



The 542/544 Zone requires an additional 2,000 gpm of pumping into the zone over 2025 levels. It is recommended that a new BPS be constructed at the Crown Road site. In order to convey the additional supply, the transmission main along Woodburn Drive and SE 277th Ave will need to be upsized from 12 inches to 24 inches in diameter.

9.6.3 Identified Deficiencies



Peak hour pressure and max day fire flow deficiencies are displayed on Figure 9.9 through Figure 9.11 organized by planning year. Pressure deficiencies are identified by yellow nodes and fire flow deficiencies are identified by red nodes.

9.6.3.1 2021 Deficiencies

For the 2021 peak hour demand scenario, the model identifies four areas with low pressures. Going from east to west in Figure 9.9, the first area consists of residential customers on the north end of Couch St that experience low pressures due to their elevation. Next, several high elevation nodes near the Upper Prune Hill Standpipe experience pressures below 30 psi during peak demand periods. Additionally, a single high elevation node in the 697 Zone and two nodes directly downstream of a PRV from the 697 Zone to the 544 Zone stand out for low pressure.

Document Path: E:\KRC D DRIVE\CAMAS\Fire Flow Analysis\FireFlow_20170414.mxd

2035 PHD PRESSURE AND FIRE FLOW DEFICIENCIES

FIGURE 9.11

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

carollo

Document Path: E:\KRC D DRIVE\CAMAS\Fire Flow Analysis\FireFlow_20170414.mxd

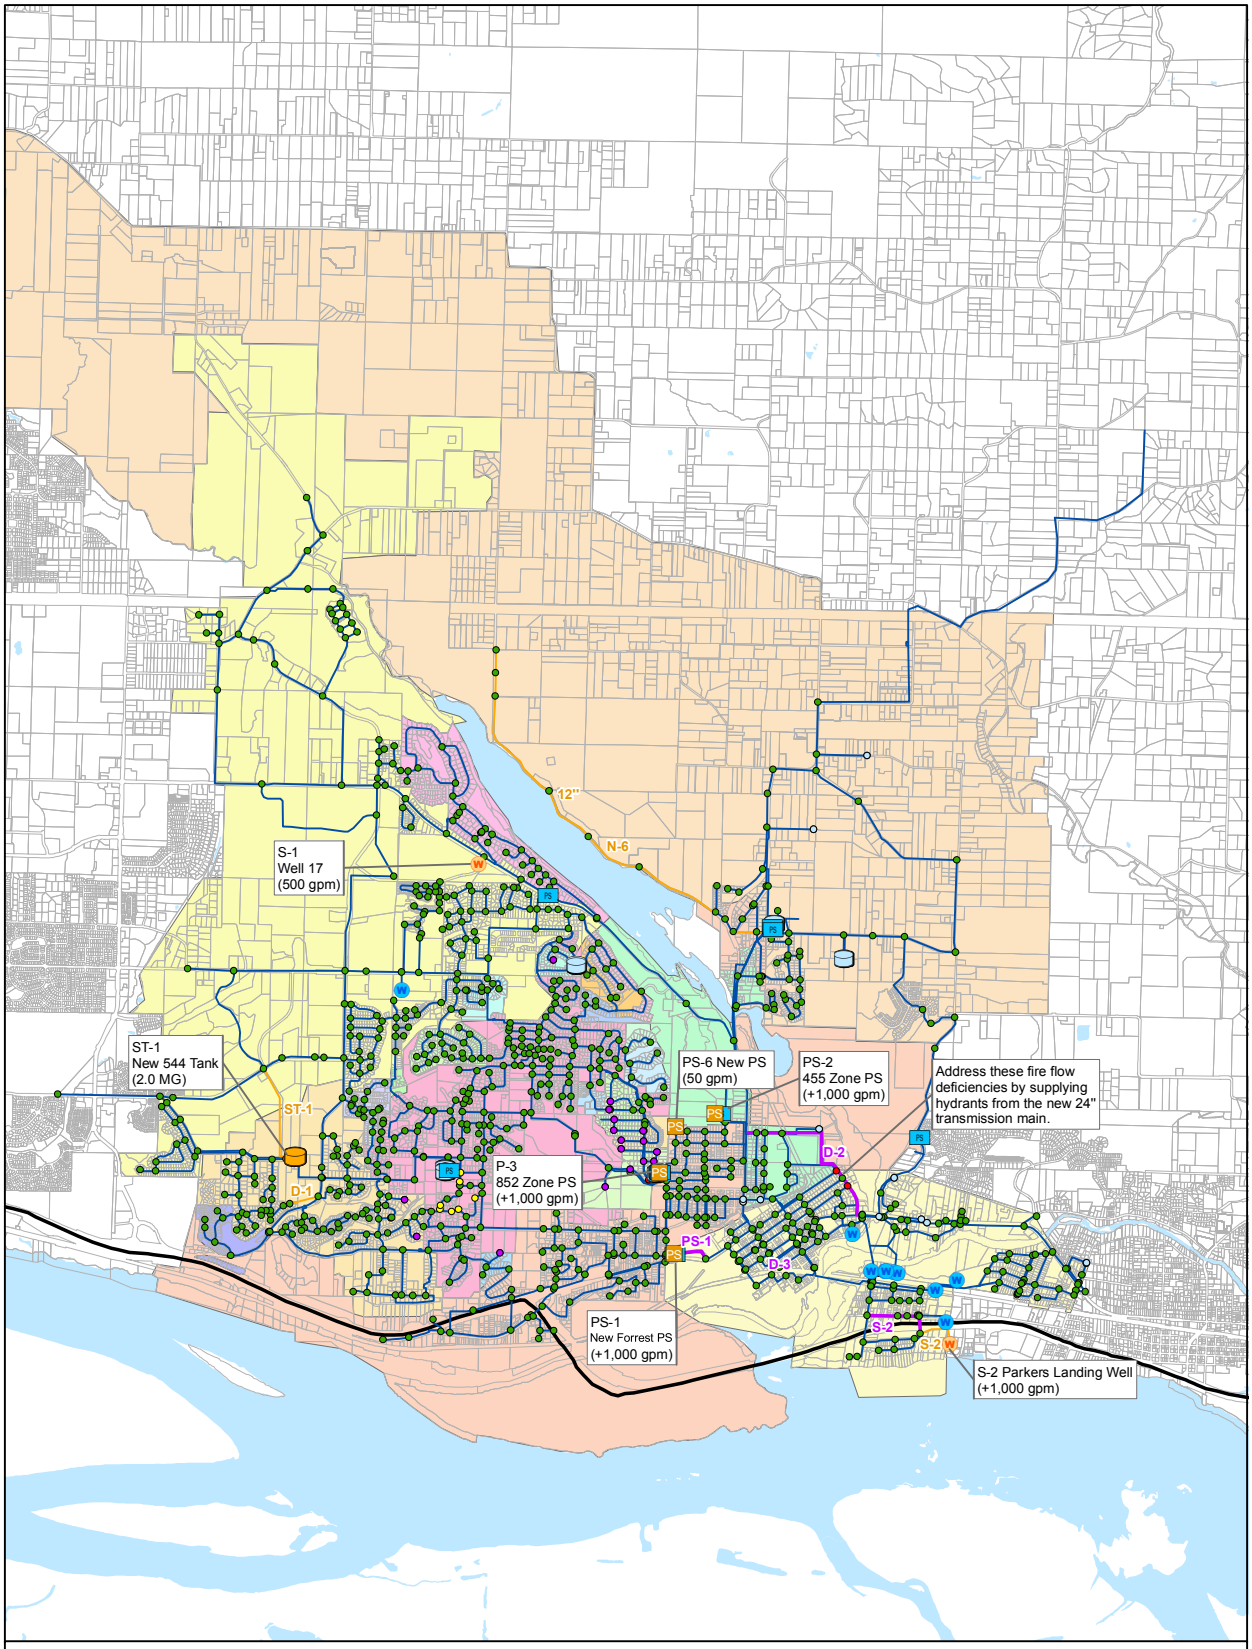
Figure 9.9 also shows fire flow deficiencies where the required fire flows cannot be met while maintaining system pressures above 20 psi. Some of the fire flow deficiencies occur where industrial customers require elevated fire flows. Many fire flow deficiencies are also shown occurring in small zones that are fed by PRVs. These can likely be resolved by adjusting the settings of the PRVs that feed the zones. Many other fire flow deficiencies that appear on Figure 9.9 occur at the end of dead-end mains where looping can improve fire flow availability.

9.6.3.2 2025 Deficiencies

Model results for the 2025 scenario are presented on Figure 9.10. Compared to the 2021 scenario, very few new deficiencies emerge as a result of increasing demands. A few more Upper Prune Hill nodes appear as having low pressure and one node in this area experiences low fire flow. The only other fire flow deficiency that appears in 2025 is along NW 18th Ave.

Connecting the 542 and 544 pressure zones with a new 18-inch transmission main around the north side of Lacamas Lake improves available fire flow at the intersection of NW Lake Rd and NW Parker St.

9.6.3.3 2035 Deficiencies



For the 2035 scenario, on Figure 9.11 we see an expansion of the Prune Hill area experiencing low pressure. Also customers in the NE part of the system along SE Robinson Rd begin experiencing low pressures due to increasing demands in the North Shore.

9.6.4 Recommended Distribution System Capacity Improvements

This section describes the capacity improvements recommended to address pressure and fire flow deficiencies. Programmatic improvements are described first, followed by a description of the individual projects required for each of the planning years. The recommended improvements are shown on Figure 9.12 through Figure 9.14. These figures also show the pressure and fire flow results after implementation of the improvement projects. Each recommended improvement is also listed in Table 9.11 through Table 9.14.

9.6.4.1 Upper Prune Hill Pressure Improvements Study

The area surrounding the Upper Prune Hill Standpipe experiences pressure deficiencies due to high elevation. According to the model, with the current operational settings of the Lower and Upper Prune Hill Pump Stations, the Upper Prune Hill Standpipe does not provide sufficient pressure to the surrounding customers. These junctions will not meet the 30 psi minimum pressure criteria regardless of what kind of pipeline improvements are added. It is recommended that a study be performed to evaluate solutions to these pressure deficiencies.

2035 PHD PRESSURE AND FIRE FLOW RESULTS WITH RECOMMENDED IMPROVEMENTS

FIGURE 9.14

CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

carollo

Document Path: E:\KRC D DRIVE\CAMAS\Fire Flow Analysis\FireFlow_20170414.mxd

There are several feasible options to address this issue:

1. Optimize pump and valve controls so that the Upper Prune Hill Standpipe level does not fall below that required by the surrounding area to provide 30 psi of pressure. This will likely require having the pumps operate within a smaller and higher operating band.
2. Create a small pressure zone with a booster pump station (with appropriate surge controls) to serve the few streets with low pressures. Possibly include a check valve to deliver fire flow into the region (so the booster pump doesn't need to be sized to handle fire demands).
3. Install individual pumps for each service connection. The individual booster pump will be owned and operated by the City allowing for close management and control. The City has extensive experience in operating and maintaining facilities on customer properties from its over 5,000 wastewater septic tank effluent pump stations.

9.6.4.2 PRV Zone Study Program

Many of the nodes experiencing fire flow deficiencies are in sub-zones served by PRV. To address these deficiencies, it is recommended that the City conduct a PRV zone study to optimize their PRV settings to allow fire flows to enter the zones at adequate pressure. Areas that should be included in the PRF zone study are marked by purple nodes.

9.6.4.3 Dead-end Looping Program

Many other fire flow deficiencies occur on dead-end mains. Additional flows can be supplied to these nodes by looping or by upsizing the single pipe feeding the node. These nodes are identified on Figure 9.12 by their light blue color. It is recommended that the City investigate each of these areas individually to determine if looping or pipe upsizing is the best alternative to address the deficiency.

9.6.4.4 2021 Improvements

As recommended by the storage analysis, a new 544 Zone tank was added to the model for the 2021 scenario. The City is looking into locating this tank near the corner of NW 18th Ave and NW Tidland St. Installing a new storage tank at this location with its supply main routed through the Sharp Industries utility corridor and connecting to the distribution system at NW Pacific Rim Blvd as shown on Figure 9.12, eliminates all fire flow and pressure deficiencies in the existing 544 Zone.

The City also considered locating the new 544 Zone tank near Green Mountain. However, modeling results showed that the system would not be able to keep a Green Mountain tank full due to headlosses between the 544 Zone supplies and the tank. The model showed that there would be approximately 10 feet of difference in water level between the existing Lacamas Reservoir and the Green Mountain Tank during MDD.

Projects D-1, PS-6, and D-3 as shown on Figure 9.12 eliminate 2021 pressure and fire flow deficiencies. Installing D-1 increases looping to provide additional fire flow along NW 18th Ave. Project PS-6, which was also listed in the City's 2010 Plan, involves installing a 50-gpm pump to supply high elevation customers along Couch St. D-3 consists of upsizing 200 feet of pipe from 2-inch diameter to 8-inch diameter to eliminate the downtown fire flow deficiency.

The hydrants serving customers with large fire flow requirements along NE Oak St in the 343 Zone should be supplied by the new 24" transmission main that passes through that area to better meet the City's criteria.

9.6.4.5 2025 Improvements

Improvement D-4 consists of a new pipe along NW 16th Ave to resolve the fire flow deficiency in upper prune hill. This project should be reviewed in conjunction with the Upper Prune Hill pressure improvements study.

N-5 improves transmission between the 544 Zone and the North Shore area. This project contributes to increased fire flow at NW Lake Rd and NW Parker St.

9.6.4.6 2035 Improvements

By 2035 two storage facility projects are recommended. The first is a new tank for the 343 Zone to replace the Butler Reservoir (ST-3 on Figure 9.13). The City has discussed locating this tank near the cemetery. The cemetery is an ideal location for this tank because it would not require any additional transmission main improvements. If the City cannot locate the tank at the cemetery, installing a new tank at the Crown Road BPS site or at the Butler site should be considered. Installing a new tank at the Butler site will likely require over 6,000 feet of transmission main improvements along NE Everett St.

An additional 1 MG of storage is required for the 544/542 Zone in 2035 beyond what the New Lacamas Tank provides Constructing a new 1.0 MG reservoir next to the 0.1 MG Gregg Standpipe (ST-2 on Figure 9.13) is recommended due to its location near the Crown Road BPS, which will supply the majority of the summer 542/544 Zone demands.

Project D-5 is recommended to improve transmission of supply from the SE portion of the system to the 455 Zone and help to avoid over-pressurizing the downtown area.

Projects N-1 through N-4 in the NE corner of the water system are required to address low pressures along SE Robinson Rd and convey flows from the expanded Crown Road PS to the North Shore expansion area.

9.6.5 Average Day Demand Simulation

The City's supply strategy varies seasonally. Surface water rights for their Boulder and Jones intakes can only be used during the winter months. These supplies are treated at the

City's slow sand filtration plant and conveyed to the 542 Zone. However, during the summer most of the City's supply comes from wells in the 343 Zone.

Model scenarios for both MDD and ADD were built to simulate both summer and winter supply strategies. During the winter, the Old Gregg BPS PRV conveys excess supply from the 542 Zone to the 455 Zone and the Butler PRV conveys excess supply in the 455 Zone to the 343 Zone. The model parameters for these valves are list in Table 9.10.

Table 9.10 Butler Site PRV Settings
Water System Plan
City of Camas

Valve	Control Reservoir	Reservoir Condition	Valve Setting
Old Gregg PRV	Gregg Standpipe	Above 65 ft	66 psi
Old Gregg PRV	Gregg Standpipe	Below 62 ft	40 psi
Butler PRV	Lower Prune Hill Reservoir 1	Above 22 ft	106 psi
Butler PRV	Lower Prune Hill Reservoir 1	Below 19.5 ft	80 psi

With implementation of the recommended improvements described previously in this chapter, no deficiencies were identified for the ADD scenario.

ST-5	2021	Upper Prune Hill Pressure Improvements Study	N/A	Near Upper Prune Hill Standpipe	Address 852 Zone pressure deficiencies

9.7 LIMITING CAPACITY ANALYSIS

As described in above sections, to meet 2021 demands the City requires additional supply (S-1 and S-2), transmission capacity (D-2), and additional storage (ST-1). Further supply, booster pump station, and piping projects will be needed to meet projected growth beyond 2021. With these improvements, the limiting capacity of the physical water system was determined for 2035. The limiting capacity analysis used the mythology described in DOH Water System Design Manual (2009) Worksheet 6-1 and Table 6-1.

The limiting capacity considers ERUs for both MDD and ADD, which are shown in Table 9.16. The ERUs were calculated based on the projected residential customer class 2035 MDD and ADD in Chapter 5 – Water Requirements.

The physical capacity of each of the systems components were calculated: storage, sources, and pumping. The “Capacity-Related Storage” was calculated based on Equation 6-8 for each storage operating area and is shown in Table 9.17. The 542/544 will have little remaining storage capacity by 2035. Source capacity was evaluated for system overall for both the ADD and MDD per Equation 6-3 and Equation 6-4, respectively. The system will have sufficient supply through 2035, as shown in Table 9.18; however, the City will likely need to develop supplies shortly after the end of the planning period. As previously stated, these supplies are anticipated to come from the Steigerwald Regional Supply. The majority of supplies will be pumped from the 343 PZ to higher PZ; therefore, limiting booster pump station capacity was analyzed. Shortly after 2035, the City will likely need to provide additional pumping capacity for all pressure zones, as shown in Table 9.19. Transmission capacity was assumed to be addressed as part of source and pumping capacity. Note, distribution was not considering capacity limited, as the City has planned projects to address all identified deficiencies and design standards ensure all new development meets City standards.

The limiting capacity for the system is summarized in Table 9.20. In 2035, the City will be limited by booster pump station capacity and storage in the 542/544. While not limiting, the City will likely need to be actively pursuing additional ADD source capacity by 2035 due to the potentially lengthy process of developing new supplies.

Chapter 10

CAPITAL IMPROVEMENTS PLAN

10.1 INTRODUCTION

This chapter summarizes the City of Camas's (City's) comprehensive capital improvements program (CIP) for the water system that is based on the analyses presented in previous Chapters. The purpose of the CIP is to provide the City with a guideline for planning and budgeting of its water system. The CIP consists of schedule and cost estimates in present dollars (December 2016) for each project.

This Plan contains time fames that are the intended framework for future funding decisions. However, these timeframes are estimates and may change depending on factors involved in the growth, project implementation, and availability of funding. The framework does not represent actual commitments by the City. The City has prepared design standards for the replacement and installation of new water infrastructure, which are provided in Appendix K.

10.1.1 Capital Project Categories

Capital projects can be categorized by the nature of infrastructure. These included:

- Supply (S)
- Distribution System Improvements (DS)
- Pump Station (PS)
- Storage (ST)
- General (G)
- Repair and Replacement (R)
- North Shore Expansion (NS)

The above abbreviations were used as the initial letter in the Project ID and aid in delineating the project category. Repair and Replacement (R&R) includes projects for the existing supply, storage, pumping, and distribution system. North Shore Expansion (NS) category includes the distribution piping for the North Shore Area. Supply, pumping, and storage to serve these customers are included in the respective category.

10.1.2 Capital Project Types

Projects can be allocated into three types to support development of rates and standard development charge (SDC) charges:

1. Capacity – Provides additional system capacity to meet future demand growth.

2. Upgrade – Increases level-of-service (i.e., redundant pumping, backup power, seismic retrofits, upgraded Supervisory Control and Data Acquisition [SCADA] controls, etc.) of existing infrastructure.
3. Non-Capacity – Repair and Replacement of system.

Project types were defined as a percent of the total costs. Projects may include elements of multiple types. The allocation between multiple types were made based on professional judgement.

10.1.3 Capital Planning Periods

CIP projects were allocated into one of three planning periods referenced in previous chapters:

1. Short-term (2017-2022).
2. Medium-term (2023-2026).
3. Long-term (2027-2036).

The short-term planning horizon is allocated to individual years to be consistent with the City's CIP planning. Projects in medium- and long-term planning horizons do not provide the same level of specificity, reflecting the uncertainty in future needs and City resources. The project timing in this Chapter is subject to change, as the City regularly reviews and updates its CIP based on changing conditions and priorities.

10.1.4 Standard Development Charges

SDC, also known as connection charges, are differentiated by South and North Shore areas. The City charges different SDCs rates for the areas. SDCs are calculated for each area based on the Capacity CIP costs that contribute to the respective area. Costs for common CIP projects, shared by both areas, are identified as "common".

10.1.5 Developer Share

Projects costs anticipated to be funded in whole or in part by developers are indicated for each CIP project.

10.2 COST ESTIMATING ASSUMPTIONS

10.2.1 Cost Estimate Level

The CIP cost estimates presented in this chapter are American Academy of Cost Engineers (AACE) Class 4 estimates. Class 4 estimates are budget level estimates. Actual costs may vary from these estimates by -30 percent to +50 percent. These costs were determined based on the City's and Consultant's perception of current conditions at the project locations.

All costs are in December 2016 dollars. The Engineering New Report (ENR) U.S. 20-City Construction Cost Index for December 2013 is 10,530. The estimates are subject to change as the project design matures. Cost of labor, materials, and equipment may vary in the future.

10.2.2 Cost Estimates Elements

The total CIP cost estimates were based on construction costs that are inflated using cost factors to account for non-construction project elements. The cost factors for the Plan are shown in Table 10.1. For a typical project, the cost factors would increase the construction costs by 85 percent to represent the total project cost.

Table 10.1 Cost Factors
Water System Plan Update
City of Camas

Adjustment Factors	Description	Factor
Contingency	Costs that may occur due to uncertainty in project scope and conditions.	30%
General Conditions & Overhead	Contractor costs indirectly related to construction.	25%
Engineering/Planning	Cost for planning and design of project.	20%
City Admin	Cost to administer the project.	10%

10.2.3 Pipeline Unit Costs

Pipeline unit cost assumptions are shown in Table 10.2. These costs were developed from recent construction costs from the City and typical cost adjustments for various diameter sizes. To be conservative, these unit costs assume open-trench construction in improved areas. If trenchless construction is possible for some projects, the cost estimates may need to be modified. Costs include pavement cutting, excavation, hauling, shoring, pipe materials and installation, backfill material and installation, and pavement replacement. The unit costs are for construction in stable soil at a depth ranging between 3 to 5 feet. Costs reflect increased effort to construct on shallow bedrock that overlays large areas of the City and its Urban Growth Area (UGA). Steep slopes, extensive permitting, or acquisition of right of way may result in additional costs. These costs are construction costs only and do not reflect the Contingency, General Conditions & Overhead, Engineering/Planning, and City Admin.

10.2.4 Pump Station Costs

Pump station project costs were developed based on typical pump station costs. Pump station costs were estimated based on pump station horsepower (hp), rather than flow, which allowed consistent costs to be calculated for both new pump stations and expansion

of existing stations. Unit costs are per hp, as shown in Table 10.3, and should be applied to all new pumps in the station, including backup (redundant) pumps.

Table 10.2 Pipeline Unit Costs
Water System Plan Update
City of Camas

Pipe Size (Inches)	Pipeline Unit Cost ($/Linear Foot)(1)
8	$175
10	$186
12	$216
16	$236
18	$243
24	$265
48	$417

Note:
(1) Pipeline unit costs are for construction only.

Table 10.3 Pump Station Unit Costs
Water System Plan Update
City of Camas

Pump Size	Cost per hp per Pump ($/hp)
0 to 199 hp	$4,000
200 to 349 hp	$3,200
350 to 649 hp	$2,400
> 650 hp	$1,600

Note:
(1) Pump station unit costs are for construction only.

10.2.5 Well Costs

New well project costs were developed based on the City's Well 17 project and general costs from past projects. Well costs were estimated based on capacity in gallons per minute (gpm), as presented in Table 10.4.

Table 10.4 Well Unit Costs Water System Plan Update City of Camas	
Well Capacity (gpm)	**Cost per gpm ($/gpm)**
0 to 500 gpm	$1,800
Greater than 500 gpm	$1,500
Note: (1) Well unit costs are for construction only.	

10.2.6 Reservoir Costs

New reservoir project costs were developed based typical costs from past projects. Conceptual costs for reservoirs vary by type: ground, standpipe, and elevated. Costs are estimates based on reservoir volume in gallons, as presented in Table 10.5. Reservoir costs are sensitive to site-specific geotechnical and seismic considerations; therefore, it is recommended that a reservoir siting study that addresses these issues be conducted at the initiation of a new reservoir project.

Table 10.5 Reservoir Unit Costs Water System Plan Update City of Camas	
Reservoir Type	**Cost per gallon ($/gal)**
Ground	$1
Standpipe	$2
Elevated	$4
Note: (1) Reservoir unit costs are for construction only.	

10.2.7 Additional Costs

Other common costs for the CIP included: onsite generators, pressure reducing valve (PRV) stations, and land. Conceptual costs were estimates based past projects, as presented in Table 10.6.

Table 10.6 Additional Reservoir Costs Water System Plan Update City of Camas	
Reservoir Type	**Cost ($)**
Onsite Generator	$200,000 per generator installation
PRV Station	$150,000 per station
Land	$500,000 per 0.5 acres
Note: (1) Other costs are for construction only.	

10.3 CIP PROJECT SHEETS AND COST SUMMARY

CIP projects are based on analyses in previous chapters. The CIP Projects summarized in Table 10.7 are in December 2016 dollars and have not been escalated. The table presents the costs for the short-, medium-, and long-term planning horizons. Additionally, it allocates projects between areas (South, North Shore, Common) used in SDC evaluations and project type (i.e., Capacity, Upgrade, and R&R). Where developer contributions to the project are anticipated, the developer's share is noted as a percentage. The table provides a total cost and average annual cost for all CIP items.

An individual Project Sheet was generated for each CIP project and includes project identifiers, description, costs, project type, and comments to aid in future implementation. To aid in finding individual projects, Project Sheets have been separated by sections, by project category. A summary of costs by project category and type is presented at the end of the Chapter.

10.3.1 Supply Project Sheets

Supply projects were identified in Chapter 8 – Water Resources and Chapter 9 – System Analysis. To meet future demand, the City will need to rehabilitate existing wells, develop new City owned wells, and participate in the development of the Steigerwald Regional Well Field. The majority of supply projects will be in the 343 Pressure Zone:

- S-1 Well 17.
- S-2 Parkers Landing Well.
- S-3 Wastewater Treatment Plant (WWTP) Well.
- S-4 Washougal Wellfield Improvements.
- S-5 Steigerwald Regional Source.
- S-6 Watershed Forest Management.
- S-7 544 Zone Watershed Source Improvements.

General notes on the supply projects include:

- Supply projects do not include costs for property, right-of-way, or easements.
- S-1 Well 17 was based on the City's existing project budget that has been established from independent efforts.
- S-5 Steigerwald Regional Source costs reflect anticipated costs for the City's portion of the supply. A cost allowance for transmission main development/ improvements, was included and should be revisited when more information is available.
- S-6 Watershed Forest Management and S-7 544 Zone Watershed Source Improvements were estimated by the City based on prior studies.

Project Description:

Design and construct Parkers Landing Well at Front St and SE 11th Ave, which is currently permitted (G2-30146) for 1,000 gpm peak production and an annual withdrawal of 880 acre-feet per year. As part of design, conduct a hydrogeological investigation to size the well and pump. Approximately 3,240 feet of 16-inch water main will be required to convey the new supply. From the well site, the main will travel north on Front St, turning west on Frontage Rd. Upsize the existing 8-inch main on SE Union St to 16-inch, between Frontage Rd and SE 8th Ave. Upsize the 16-inch main along SE 8th Ave to 16-inch, from Union St to SE Polk St.

Project Description:

Maximize use of existing water rights in the Washougal Wellfield. Increase yield of Well 6 from 1,000 gpm to 1,500 gpm and address issues with Well 5. As part of design, conduct a hydrogeological investigation to determine the preferred improvements. Approximately 1,940 feet of 18-inch water main will be required to convey the new supply from Well 6. Upsize approximately 1,160 ft of 12-inch main, along SE 6th Ave, to 18-inch, from SE 8th Ave to SE 6th Ave.

Project Identification: S-5 **SDC Area** Common
Project Name: Steigerwald Regional Source
Facility Type: Supply

Cost Allocation	Percent	Cost	Total Cost
Capacity:	100%	$ 10,822,554	
Upgrade:	0%	$ -	$ 10,822,554
Non-capacity:	0%	$ -	

Project Description:

In the long-term, the City anticipates obtaining supply from the future Steigerwald Regional Wellfield (Water Right Application G2-30528), which will be developed jointly with the City of Washougal. As an entirely new supply source, the Cities will need to permit, design, and construct the proposed wells and related facilities, such as disinfection, auxiliary power, and, potentially, treatment. The conveyance from the regional wellfield, near Steigerwald Wildlife Refuge, to the City has not been determined. A $2M transmission cost allowance is provided and should be revised when additional information is available. To convey the new supplies: upsize the 8-inch water main on SE James St to 16-inch, from the Intertie to NE 2nd Ave; upsize the 8-inch water main on NE 2nd Ave to 16-inch, from SE James St to NE 3rd Ave; and upsize the 8-inch water main on NE 3rd Ave to 16-inch, from NE 2nd Ave to SE Crown Rd.

10.3.2 Distribution System Improvements Project Sheets

Distribution system improvements to resolve system deficiencies were identified in Chapter 9 – System Analysis. Projects are spread throughout the system:

- D-1 Transmission main from NW 11 Cir to NW Brady Rd.
- D-2 343 Zone Supply Transmission Upsizing.
- D-3 NE Birch St upsized transmission main.
- D-4 New transmission main along NW 16th Ave.
- D-5 New Distribution along NW 6th Ave/ NE Adams St.
- D-6 Dead-end Looping Program.
- D-7 PRV Adjustment Study.
- D-8 Well 6/14 Transmission Line.
- D-9 Parallel Boulder Creek Intake.

General notes on the distribution system projects include:

- Distribution system improvement projects do not include costs for property, right-of-way, or easements.
- D-6 Dead-end Looping Program provides funding for an annual program, where the City will typically address one to two dead-end mains per year. Actual Individual dead-end main project costs vary widely based on site specific conditions.
- D-7 PRV Adjustment Study includes a cost allowance for PRV improvements that should be revisited when the initial PRV study is complete.
- D-8 Well 6/14 Transmission Line costs are based on the City's existing budget.
- D-9 Parallel Boulder Creek Intake costs were provided by the City.

10.3.3 Pump Station Project Sheets

Pump Station projects to resolve system deficiencies and meet future growth were identified in Chapter 9 – System Analysis. Projects are anticipated in conjunction with, or occur near, existing infrastructure:

- PS-1 New Forest Home PS.
- PS-2 New 455 Zone PS Capacity.
- PS-3 Lower Prune Hill PS Expansion.
- PS-4 North Shore PS Capacity Phase I.
- PS-5 North Shore PS Capacity Phase II.
- PS-6 NW Couch St PS.
- PS-7 NW 10th Ave Study.

General notes on the pump station projects include:

- Pump Station costs are estimated using the anticipated hp of the existing City pump stations performing to/from the same pressure zone. Relocation of pumps stations may require additional hp or transmission and distribution improvements.
- Where a new pump station is anticipated a land allowance has been provided.
- PS-7 NW 10th Ave Study is intended to provide an alternative analysis and does not include construction costs.

City of Camas
Water System Plan
Capital Improvement Program

Project Identification: PS-1 **SDC Area** South
Project Name: New Forest Home PS
Facility Type: Pump Station

Cost Allocation	Percent	Cost	Total Cost
Capacity:	0%	$ -	
Upgrade:	50%	$ 892,292	$ 3,116,584
Non-capacity:	50%	$ 1,558,292	

Project Description:

Replace the existing Forest Home BPS with a 2,000 gpm station to provide redundant supply from the 343 Pressure Zone to the 455 Pressure Zone. The new BPS is anticipated to include three (3) 75 hp variable speed pumps that will produce 1,000 gpm each, where one pump is redundant. On-site backup power is included for station reliability. Upsize the 6-inch water main on NW 7th Ave to 16-inch, from NW 6th Ave to the new BPS. BPS is required to transfer supply from the 455 Pressure Zone to higher Pressure Zones (544, 852, etc.).

Project Element		Quantity	Unit	Unit Cost ($/Unit)	Contingency 30%	GC & Overhead 25%	Engineering/ Planning 20%	City Admin 10%	Total Project Cost	Developer Share
New Forest Home BPS		225	hp	$ 3,200	$ 216,000	$ 180,000	$ 144,000	$ 72,000	$ 1,332,000

10.3.4 Storage Project Sheets

Storage projects to maintain adequate equalizing and emergency storage were identified in Chapter 9 – System Analysis. Projects include the ongoing New 544 Zone Reservoir and new reservoirs near Greg Reservoir and for the 343 Pressure Zone in the long-term. Lower Prune Hill Rehabilitation costs were based on a prior study conducted by the City:

- ST-1 New 544 Zone Reservoir.
- ST-2 New Gregg Tank.
- ST-3 343 Zone Reservoir.
- ST-4 Lower Prune Hill Reservoir Rehabilitation.
- ST-5 Upper Prune Hill Pressure Improvements Study.

General notes on the storage projects include:

- ST-1 New 544 Zone Reservoir land acquisition costs were provided by the City based on prior work efforts.
- ST-2 Gregg Reservoir is assumed to be constructed on the existing site.
- ST-4 Lower Prune Hill Improvements costs were developed by the City based on prior work efforts.
- ST-6 Upper Prune Hill Improvements includes a construction cost allowance that should be updated based on the findings of the project's study.

10.3.6 Repair and Replacement Project Sheets

R&R projects were identified for supply, pumping, and piping in Chapter 4 – Operations and Maintenance. Supply and pumping projects are based on the 2016 Condition Assessment:

- R-1 Supply R&R Projects.
- R-2 Pump R&R Projects.
- R-3 Pipeline R&R Projects.
- R-4 Meter Replacement Program.

General notes on the R&R projects include:

- R-1, R-2, and R-3 R&R projects are based on the 2016 Condition Assessment summarized previously.
- R-4 Meter Replacement Program costs were provided by the City based on prior efforts.

Project Description:

During the short and medium-term, maintain a small annual R&R program to address localized issues or to participate in joint projects that cost-effectively replace aging piping. Expand the program, in long-term planning, to address aging infrastructure near downtown that is anticipated to reach the end of its usable life in the 2030s. Small diameter mains (2-inch to 6-inch) should be upsized to 8-inch to meet current City standards. A CIP project will be conducted to repair and replace the surface water raw water line from the sources to the treatment plant.

10.3.7 North Shore Expansion Project Sheets

North Shore Expansion project develops the distribution piping for the North Shore Area:

- NS-1 Annual North Shore Distribution Program.
- NS-2 Leadbetter Road Transmission Main.

A pump station and reservoir will be also developed within the North Shore area that is presented in prior sections:

- PS-4 North Shore PS Capacity Phase I.
- PS-5 North Shore PS Capacity Phase II.
- ST-2 New Gregg Tank.

General notes on the North Shore Expansion projects include:

- The North Shore Area is heavily reliant on the existing system. In particular, it will use storage and pumping in the existing 544 and 542 Pressure Zones. Supply to the North Shore will largely occur from the 343 Pressure Zone.
- NS-1 Annual North Shore Distribution Program letter designations correspond to map on the second page. Where no road currently exists, no road name was provided.
- NS-2 Leadbetter Road Transmission Main is complete. No CIP sheet has been included.

10.3.8 Cost Summary

CIP projects were summarized by project category and type in Table 10.8 and Table 10.9 respectively. When considering CIP costs by project category, as shown in Table 10.8, the majority of CIP costs occur from supply, storage, and the North Shore Expansion. Major supply CIP projects and the construction of the North Shore Expansion are anticipated to occur throughout the planning period. Storage CIP projects are anticipated to occur in the short-term and long-term planning periods. A majority of pumping CIP projects are anticipated in the medium-term planning period. Consistent with the non-capacity costs, repair and replacement project are largely anticipated in the long-term planning horizon.

CIP costs by project type are largely split between capacity and non-capacity. Capacity costs, as shown in Table 10.9, are anticipated to be relatively constant throughout the planning horizon, while non-capacity costs are largely anticipated to occur in the long-term planning horizon.

Chapter 11

FINANCIAL PLAN

11.1 INTRODUCTION

This chapter was prepared by FCS GROUP to provide a financial program that allows the City of Camas (City) water utility to remain financially viable during the planning period. This financial viability analysis considers the historical financial condition, current and identified future financial and policy obligations, operation and maintenance (O&M) needs, and the ability to support the financial impacts related to the completion of the capital projects identified in this Water System Plan Update (Plan). Furthermore, this chapter provides a review of the water utility's current rate structure with respect to rate adequacy and customer affordability.

11.1.1 Past Financial Performance

This section includes a historical summary of financial performance as reported by the City on fund resources and uses arising from cash transactions, as well as a historical summary of comparative statements of net position, which are useful indicators of the City's financial position.

11.1.2 Comparative Financial Statements

The City legally owns and operates both a water and sewer utility. Operations and financial reporting occur on a combined utility fund basis. The City combined utility fund reflects historical integrations that are difficult to separate from an accounting perspective (bond issues, combined asset projects, etc.). The City's long-term goal is to separate the accounting of its Utilities. Currently, all new assets are tracked separately and the Utilities are operated separately.

Table 11.1 shows a summary of the utility fund resources and uses arising from cash transactions for the previous six years (2011 through 2016) for the water and sewer utilities combined. Table 11.2 shows a summary of assets and liabilities, with the difference between the two reported as "net position." Increases or decreases in net position are useful indicators of the financial position of the City's utility fund. Noteworthy findings and trends are discussed following each table to demonstrate the historical performance and condition of the City's combined utility fund.

11.2 FINDINGS AND TRENDS

The City's combined water and sewer charges for services increased from $8.8 million (M) in 2011 to $11.4M in 2016. The average annual increase is 4.9 percent per year, with a total increase of 29.2 percent from 2011 to 2016. Expenses range from $7.2M in 2011 to $10.1M in 2016, showing increases every year. With an average increase of 6.7 percent, expenses have grown faster than revenues over the past six years and have increased 40.2 percent overall. While maintenance and operations expenses have increased 37.1 percent, the largest contributor to increases in expenses is depreciation and amortization, growing by 53.6 percent since 2011.

The O&M Coverage Ratio (total operating revenues divided by total operating expenses) was 123.0 percent in 2011. After a high of 132.4 percent in 2012, this ratio has trended downward ending at 113.4 percent in 2016. A ratio of 100 percent or greater shows that revenue will successfully cover expenses, and the City has remained above this ratio for the past six years.

Net Operating Income as a percent of Operating Revenue was 18.7 percent in 2011. This metric has varied over the past 6 years with a high of 24.5 percent in 2012 and ending 2016 at its low point of 11.8 percent. Similar to the O&M Coverage Ratio, these trends help to show how successfully operating revenue actually covered operating expenses, with higher positive numbers being the best and negative numbers showing need for improvement.

The Debt Service Coverage Ratio measures the amount of cash flow available to meet interest and principal payments. Typically, bond debt service coverage requires a minimum factor of 1.25 during the life of the loans. This ratio is calculated by dividing cash operating income (revenues less expenses before depreciation) by annual revenue bond expenses. The Debt Service Coverage Ratio for all outstanding debt ends 2011 at its high of 2.91 and trends downward to end 2016 at a low of 1.51. The ability of this ratio to remain at levels significantly higher than the bond covenant minimum of 1.25 indicates a stable capacity for new debt and will likely result in favorable terms when entering the bond market.

The Current Ratio is calculated by dividing the unrestricted current assets by current liabilities and measures a city's ability to pay short-term obligations. This ratio begins in 2011 at 1.8, drops to a low of 1.6 in 2013, and then rebounds to 4.5 by 2016. Anything above a 2.0 for this liquidity ratio is good.

The Debt to Net Position Ratio compares total debt to total net position, which is the difference between current assets and liabilities. This ratio ends 2011 at 0.48, dips to a low of 0.43 in 2014 before bouncing back to 0.68 by 2016. For city utilities, a ratio of 50 to 60 percent is within an industry target range. The variance of the Debt to Net Position Ratio over the past 6 years puts the City's ratio close but slightly above this target range.

The Debt to Noncurrent Capital Asset Ratio compares total debt to noncurrent assets, which are also known as property, plant, and equipment. This ratio begins at 0.3, or

30 percent debt to 70 -percent noncurrent assets, in 2011. Noncurrent capital assets increase $19.2M throughout the 6-year history, while total liabilities increase by $25.3M; therefore, the ratio increases to 0.5 by 2016. A ratio of 60-percent debt to 40-percent equity is a general industry target. The City's Debt to Noncurrent Capital Asset Ratio is on the low end of the industry target, signifying capacity for new debt in the future.

11.3 CURRENT FINANCIAL STRUCTURE

This section summarizes the current financial structure used as the baseline for the capital financing strategy and financial forecast developed for this Plan.

11.3.1 Financial Plan

The water utility is responsible for generating sufficient revenue to meet all of its costs. The primary source of funding is derived from ongoing monthly charges for service, with additional revenue coming from hook-up fees, penalties, timber sales and other miscellaneous revenue. Late fees or penalties are assessed on customers that are delinquent on water bill payments. The City controls the level of user charges and, subject to the City Council, can adjust user charges as needed to meet financial objectives.

The financial plan can only confirm financial feasibility if it considers the total system costs of providing water services, both operating and capital. To meet these objectives, the following elements have been completed.

Capital Funding Plan. Identifies the total capital improvement program (CIP) obligations of the planning period. The plan defines a strategy for funding the CIP, including an analysis of available resources from rate revenues, existing reserves, connection charges, debt financing, and any special resources that may be readily available (e.g., grants, developer contributions, etc.). The capital funding plan impacts the financial plan through the use of debt financing (resulting in annual debt service) and the assumed rate revenue available for capital funding.

Financial Forecast. Identifies future annual non-capital costs associated with the operation, maintenance, and administration of the water system. Included in the financial plan is a reserve analysis that forecasts cash flow and fund balance activity, along with testing for satisfaction of actual or recommended minimum fund balance policies. The financial plan ultimately evaluates the sufficiency of utility revenues in meeting all obligations, including cash uses such as operating expenses, debt service, capital outlays, and reserve contributions, as well as any coverage requirements associated with long-term debt. The plan also identifies the future adjustments required to fully fund all utility obligations in the planning period.

11.3.1.1 Capital Funding Plan

To properly evaluate future annual capital funding needs, capital costs were escalated by 3.50 percent annually to the year of planned spending. The CIP developed for this Plan

identifies $84.7M in project costs over the 10-year planning horizon. The 20-year period totals $195M in total project costs.

A summary of the 10-year and 20-year CIP is shown in Table 11.3. As shown, each year has varied capital cost obligations depending on construction schedules and infrastructure planning needs. Approximately 43 percent of the capital costs are included in the 10-year planning period. Table 11.4 provides more detail for the 10-year CIP.

11.4 CAPITAL FINANCIAL STRATEGY

An ideal capital financing strategy would include the use of grants and low-cost loans when debt issuance is required. However, these resources are very limited and competitive in nature and do not provide a reliable source of funding for planning purposes. It is recommended that the City pursue these funding avenues but assume bond financing to meet the needs for which the City's available cash resources are insufficient. Revenue bonds have been used as the debt funding instrument in this analysis. The capital financing strategy developed to fund the CIP identified in this Plan assumes the following funding resources:

- Accumulated cash reserves.
- Transfers of excess cash (over minimum balance targets) from the Operating Fund.
- Connection fee revenues.
- Developer contributions.
- Interest earned on Construction Fund balances and other miscellaneous capital resources.
- Revenue bond financing.

Based on information provided by the City, the water utility began 2017 with $309,000 in the Operating Fund and $7.46M in the Capital Fund. Additional funds beyond the Operating Fund target of 90 days of O&M expenses are transferred to the Capital Fund.

The cash resources described above are anticipated to fund 84 percent of the 10-year CIP and 67 percent of the 20-year CIP. The remaining funding is assumed to be from new debt obligations. Table 11.5 presents the corresponding 20-year capital financing strategy.

Table 11.5 20-year Capital Funding Strategy

Year	Capital Expenditures Escalated	Revenue Bond Financing	Cash Funding	Total Financial Resources

11.5 AVAILABLE FUNDING ASSISTANCE AND FINANCING RESOURCES

Feasible long-term capital funding strategies must be defined to ensure that adequate resources are available to fund the CIP identified in this Plan. In addition to the City's resources, such as accumulated cash reserves, capital revenues, and rate revenues designated for capital purposes, capital needs can be met from outside sources, such as grants, low-interest loans, and bond financing. The following is a summary of the City's internal and external resources.

11.6 CITY RESOURCES

Resources appropriate for funding capital needs include accumulated cash in the capital fund, rate revenues designated for capital spending purposes, developer contributions and capital-related charges such as connection fee revenue. The first two resources will be discussed in the Fiscal Policies section of the Financial Forecast. Capital-related charges are discussed below.

11.6.1 Capital Connection Charges

A connection charge such as the connection fee refers to a one-time charge imposed on new customers as a condition of connecting to the water system. The purpose of the connection charge is two-fold: 1) to promote equity between new and existing customers; and 2) to provide a source of revenue to fund capital projects. Revenue can only be used to fund utility capital projects or to pay debt service incurred to finance those projects. In 2017, the City charged all new customers a connection fee dependent upon the location of the property. A charge of $4,778 per meter capacity equivalent (MCE) was charged to for the South Area while a charge of $7,310 per MCE was charged for the North Shore Area.

11.6.2 Local Facilities Charges

While a connection charge is the manner in which new customers pay their share of plant investment costs, local facilities funding is used to pay the costs of local facilities that connect each property to the system's infrastructure. Local facilities funding is often overlooked in rate forecasting because it is funded upfront by either connecting customers and developers, or through an assessment to properties, but never from rates.

A number of mechanisms can be considered toward funding local facilities. One of the following scenarios typically occurs: (a) the utility charges a connection fee based on the cost of the local facilities (under the same authority as the facilities assessment fee); (b) a developer funds an extension of the system to its development and turns those facilities over to the utility (contributed capital); or (c) a local assessment is set up called a Utility Local Improvement District (ULID/LID) or a Local Utility District (LUD), which collects tax revenue from benefited properties.

A local facilities charge (LFC) is a variation of the connection charge. It is a city-imposed charge to recover the cost related to service extension to local properties. Often called a front-footage charge and imposed on the basis of footage of the main “fronting” a particular property, it is usually implemented as a reimbursement mechanism to a city for the cost of a local facility that directly serves a property. It is a form of connection charge and thus can accumulate up to 10 years of interest. It typically applies in instances when no developer-installed facilities are needed through developer extension due to the prior existence of available mains already serving the developing property.

The developer extension is a requirement that a developer install on-site and sometimes off-site improvements as a condition of extending service. These are in addition to the connection charge required and must be built to City standards. Part of the agreement between the City and the developer planning to extend service might include a latecomer agreement, resulting in a latecomer charge to new connections for the developer extension.

Latecomer charges are a variation of developer extensions, whereby new customers connecting to a developer-installed improvement make a payment to the City based on their share of the developer’s cost. The City passes this charge on to the developer who installed the facilities. As part of the developer extension process, this defines the allocation of costs and records latecomer obligations on the title of affected properties. No interest is allowed, and the reimbursement agreement cannot exceed 20 years in duration.

ULID/LID is another mechanism for funding infrastructure that assesses benefited properties based on the special benefit received by the construction of specific facilities. Most often used for local facilities, some ULIDs also recover related general facilities costs. Substantial legal and procedural requirements can make this a relatively expensive process, and there are mechanisms by which a ULID can be rejected.

11.7 OUTSIDE RESOURCES

This section outlines various grant, loan, and bond opportunities available to the City through federal and state agencies to fund the CIP identified in the Plan.

11.7.1 Grants and Low Cost Loans

Historically, federal and state grant programs were available to local utilities for capital funding assistance. However, these assistance programs have been mostly eliminated, substantially reduced in scope and amount, or replaced by loan programs. Remaining miscellaneous grant programs are generally lightly funded and heavily subscribed. Nonetheless, even the benefit of low-interest loans makes the effort of applying worthwhile. Grants and low-cost loans for Washington State utilities are available from the Department of Commerce, including two assistance programs for which the City may be eligible.

Public Works Trust Fund (PWTF) – Cities, counties, special purpose districts, public utility districts, and quasi-municipal governments are eligible to receive loans from the PWTF.

Eligible projects include repair, replacement, and construction of infrastructure for domestic water, sanitary wastewater, stormwater, solid waste, road, and bridge projects that improve public health and safety, respond to environmental issues, promote economic development, or upgrade system performance.

PWTF loans are typically available at interest rates ranging from 1.28 percent to 2.55 percent depending on the repayment term, with reduced interest rates available for all projects located in communities that have been declared a natural disaster. The standard loan offer is 1.66 percent interest repaid over a 20-year term. All loan terms are subject to negotiation and Board approval.

Currently there is no funding available for construction loans. Funding may become available during the 2019-2021 biennium if the capital budget is approved. Funding cycles typically begin during the summer months.

Information regarding the application process, as well as rates and terms, are posted on the PWTF website in early spring. Further detail is available at http://www.pwb.wa.gov.

Drinking Water State Revolving Fund (DWSRF) Loan Program – DWSRF funding historically targets protection of public health, compliance with drinking water regulations and assistance for small and disadvantaged communities. Terms are up to 20 years to pay back, and in some cases, provide partial loan forgiveness. Interest rates are 1.0 to 1.5 percent and no local match is required.

Applicants need an approved water system plan, or plan amendment, containing the DWSRF project prior to submitting an application. All public water systems that receive a DWSRF loan must undergo an environmental review, a cultural review, and an Investment Grade Efficiency Audit (IGEA). The IGEA is an effort to apply energy efficiency to water systems and may be financed as part of the DWSRF loan.

The fall 2018 application cycle will begin October 1st, 2018 and conclude November 30th, 2018. DWSRF takes applications annually in the fall. Further detail is available at http://www.doh.wa.gov/DWSRF.

11.7.2 Bond Financing

General Obligation Bonds – General obligation (G.O.) bonds are bonds secured by the full faith and credit of the issuing agency, committing all available tax and revenue resources to debt repayment. With this high level of commitment, G.O. bonds have relatively low interest rates and few financial restrictions. However, the authority to issue G.O. bonds is restricted in terms of the amount and use of the funds, as defined by the Washington constitution and statute. Specifically, the amount of debt that can be issued is linked to assessed valuation.

Revised Code of Washington (RCW) 39.36.020 states:

(2)(a)(ii) Counties, cities, and towns are limited to an indebtedness amount not exceeding one and one-half percent of the value of the taxable property in such counties, cities, or towns without the assent of three-fifths of the voters therein voting at an election held for that purpose.

(b) In cases requiring such assent counties, cities, towns, and public hospital districts are limited to a total indebtedness of two and one-half percent of the value of the taxable property therein.

While bonding capacity can limit the availability of G.O. bonds for utility purposes, these can sometimes play a valuable role in project financing. A rate savings may be realized through two avenues: the lower interest rate and related bond costs; and the extension of repayment obligation to all tax-paying properties (not just developed properties) through the authorization of an ad valorem property tax levy.

Revenue Bonds – Revenue bonds are commonly used to fund utility capital improvements. The debt is secured by the revenues of the issuing utility. With this limited commitment, revenue bonds typically bear higher interest rates than G.O. bonds and also require security conditions related to the maintenance of dedicated reserves (a bond reserve) and financial performance (added bond debt service coverage). The City agrees to satisfy these requirements by resolution as a condition of bond sale.

Revenue bonds can be issued in Washington without a public vote. There is no bonding limit, except perhaps the practical limit of the utility's ability to generate sufficient revenue to repay the debt and provide coverage. In some cases, poor credit might make issuing bonds problematic.

11.8 FINANCIAL FORECAST

The financial forecast, or revenue requirement analysis, forecasts the amount of annual revenue that needs to be generated by user rates. The analysis incorporates operating revenues, O&M expenses, debt service payments, rate-funded capital needs, and any other identified revenues or expenses related to operations. The objective of the financial forecast is to evaluate the sufficiency of the current level of rates. In addition to annual operating costs, the revenue needs also include debt covenant requirements and specific fiscal policies and financial goals of the City.

The analysis determines the amount of revenue needed in a given year to meet that year's expected financial obligations. For this analysis, two revenue sufficiency tests have been developed to reflect the financial goals and constraints of the City: cash needs must be met; and debt coverage requirements must be realized. In order to operate successfully with respect to these goals, both tests of revenue sufficiency must be met.

Cash Test – The cash flow test identifies all known cash requirements for the City in each year of the planning period. Typically these include O&M expenses, debt service payments, rate-funded system reinvestment funding or directly funded capital outlays, and any additions to specified reserve balances. The total annual cash needs of the City are then compared to projected cash revenues using the current rate structure. Any projected revenue shortfalls are identified and the rate increases necessary to make up the shortfalls are established.

Coverage Test – The coverage test is based on a commitment made by the City when issuing revenue bonds and some other forms of long-term debt. For the purposes of this analysis, revenue bond debt is assumed for any needed debt issuance. As a security condition of issuance, the City would be required per covenant to agree that the revenue bond debt would have a higher priority for payment (a senior lien) compared to most other expenditures; the only outlays with a higher lien are O&M expenses. Debt service coverage is expressed as a multiplier of the annual revenue bond debt service payment. For example, a 1.0 coverage factor would imply that no additional cushion is required. A 1.25 coverage factor means revenue must be sufficient to pay O&M expenses, annual revenue bond debt service payments, and an additional 25 percent of annual revenue bond debt service payments. The excess cash flow derived from the added coverage, if any, can be used for any purpose, including funding capital projects. Targeting a higher coverage factor can help the City achieve a better credit rating and provide lower interest rates for future debt issues.

In determining the annual revenue requirement, both the cash and coverage sufficiency test must be met, and the test with the greatest deficiency drives the level of needed rate increase in any given year.

11.9 CURRENT FINANCIAL STRUCTURE

The City maintains a fund structure and implements financial policies that target management of a financially viable and fiscally responsible water system.

11.9.1 Fiscal Policies

A brief summary of the key financial policies employed by the City, as well as those recommended and incorporated in the financial program, are discussed below.

Operating Fund – Operating reserves are designed to provide a liquidity cushion to ensure that adequate cash working capital will be maintained to deal with significant cash balance fluctuations, such as seasonal fluctuations in billings and receipts, unanticipated cash expenses, or lower than expected revenue collections. Like other types of reserves, operating reserves also serve another purpose: they help smooth rate increases over time. Target funding levels for an operating reserve are generally expressed as a certain number of days of O&M expenses, with the minimum requirement varying with the expected revenue volatility. Industry practice for utility operating reserves ranges from 30 days

(8 percent) to 120 days (33 percent) of O&M expenses, with the lower end more appropriate for utilities with stable revenue streams and the higher end more appropriate for utilities with significant seasonal or consumption-based fluctuations. The City's current goal is to maintain a minimum balance in the Operating Fund equal to 90 days of O&M expenses for working capital.

Capital Fund – A capital contingency reserve is an amount of cash set aside in case of an emergency should a piece of equipment or a portion of the utility's infrastructure fail unexpectedly. The reserve also could be used for other unanticipated capital needs, including capital project cost overruns. Industry practices range from maintaining a balance equal to 1 to 2 percent of fixed assets, an amount equal to a 5-year rolling average of CIP costs, or an amount determined sufficient to fund equipment failure (other than catastrophic failure). The final target level should balance industry standards with the risk level of the City. The City currently aims to maintain a capital fund balance target of $250,000. The capital fund target balance is meant to represent the need for an emergency repair of the system infrastructure.

System Reinvestment – System reinvestment funding promotes system integrity through ongoing repair and replacement of system infrastructure. Ideally, a detailed asset management plan would guide the level of rate funded system reinvestment, however, in absence of this level of effort, a good benchmark is annual depreciation expense used as a measure of the decline in asset value associated with routine use of the system. Particularly for utilities that do not already have an explicit system reinvestment policy in place, implementing a funding level based on full depreciation expense could significantly impact rates. An alternative benchmark is annual depreciation expense net of debt principal payments on outstanding debt. This approach recognizes that customers are still paying for certain assets through the debt component of their rate, and intends to avoid simultaneously charging customers for an asset and its future replacement. The specific benchmark used to set system reinvestment funding targets is a matter of policy that must balance various objectives, including managing rate impacts, keeping long-term costs down, and promoting "generational equity" (i.e., not excessively burdening current customers with paying for facilities that will serve a larger group of customers in the future).

The City does not currently have a policy in place for system reinvestment funding. No dedicated funding is assumed in the financial model, however, on average, the City is able to fund approximately $870,000 annually through rates. System reinvestment is recommended for consideration during future policy review and rate planning.

Debt Management – It is prudent to consider policies related to debt management as part of a broader utility financial policy structure. Debt management policies should be evaluated and formalized, including the level of acceptable outstanding debt, debt repayment, bond coverage, and total debt coverage targets. The City has one outstanding water revenue bond, which will be fully repaid in 2017. Coverage on this bond is tested at 1.25.

11.9.2 Financial Forecast

The financial forecast is established from 2018 budget documents along with other key factors and assumptions to develop a complete portrayal of the City's annual financial obligations for the water utility. The following is a list of the key revenue and expense factors and assumptions used to develop the financial forecast.

Growth – Rate revenue escalation varies from 2.05 to 2.90 percent for all years of the forecast period with the exception of 2021 where the growth rate jumps to 13.1 percent for one year. The City is expecting the addition of a large industrial customer during this timeframe. Growth rates are provided in Chapter X of this Plan.

Revenue – The City has two general revenue sources: 1) water service charges (rate revenue); and 2) miscellaneous (non-rate) revenue. In the event of a forecasted annual shortfall, rate revenue can be increased to meet the annual revenue requirement. For the purpose of this financial forecast, rate revenues are forecast to increase with customer growth. Non-rate revenues are forecast to increase with customer growth or general cost inflation depending on the nature of the revenue.

System Development Charge Revenue – The current standard development charge (SDC) is forecast to generate revenue between $1.4M in 2017 and $3.3M in 2035 collected from an average of 470 new connections per year. 2021 is forecast to be a large growth year for the City with 1,840 new connections forecast, resulting in $9.8M in SDC revenue. This jump in growth is related to the connection of a large industrial customer. The resources received are used to fund growth related capital projects.

Expenses – O&M expense projections are based on the 2018 budget and forecasted to increase with general cost inflation of 1.77 percent, labor cost inflation of 3.00 percent and benefit cost inflation of 3.00 percent. Budget 2018 figures were used for 2018 taxes; future taxes are calculated based on forecasted revenues and prevailing tax rates.

Existing Debt – The City currently has ten outstanding debt issues, including one revenue bond, two PWTF loans, five DWSRF loans, one Department of Ecology loan and one contractual water rights loan. The final 2007 revenue bond payment was for $223k in 2017; PWTF payments range from $4,437 to $108,000; DWSRF loan payments range from $256,000 to $726,000 and the contractual water rights loan is $53,898 annually over the 20-year study period. The total annual existing debt service obligations begin 2017 at $970,000 and are reduced to $360,000 by 2037.

Future Debt – The capital financial strategy developed for this Plan forecasts the need for $64.8M in new debt proceeds in eight separate instances throughout the twenty year forecast. The analysis performed assumes all revenue bond financing. Annual new debt service obligations begin in 2020 at $450,000, increasing to $5.6M by 2035.

Transfer to Capital –Operating Fund balance above the minimum requirement is assumed to be available to fund capital projects and projected to be transferred to the Capital Fund

each year. On average, the utility funds approximately $870,000 of capital improvements with cash.

Although the financial plan is completed for the 20-year time horizon of this Plan, the rate strategy focuses on the shorter term planning period of 2017 through 2026. It is recommended that the City revisit the proposed rates every 2 to 3 years to ensure that the rate projections developed remain adequate. Any significant changes should be incorporated into the financial plan and future rates should be adjusted as needed.

Table 11.6 summarizes the annual revenue requirements based on the forecast of revenues, expenditures, fund balances, and fiscal policies.

Table 11.6 10-year Financial Forecast

Revenue Requirement	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026
Revenues										
Rate Revenues Under Existing Rates	$ 4,250,897	$ 4,409,345	$ 4,524,720	$ 4,640,950	$ 5,249,906	$ 5,377,758	$ 5,509,467	$ 5,641,678	$ 5,785,010	$ 5,924,993

Total Surplus (Deficiency)	**$ 409,345**	**$ 770,117**	**$ 92,066**	**$ (371,234)**	**$ 72,353**	**$ 478,601**	**$ (38,789)**	**$ 259,577**	**$ (379,154)**	**$ (21,677)**
Annual Rate Adjustment	**0.00%**	**5.00%**	**2.50%**	**2.50%**	**2.50%**	**2.50%**	**2.50%**	**2.50%**	**2.50%**	**2.50%**
Cumulative Annual Rate Adjustment	**0.00%**	**5.00%**	**7.62%**	**10.32%**	**13.07%**	**15.90%**	**18.80%**	**21.77%**	**24.81%**	**27.93%**
Rate Revenues After Rate Increase	$ 4,250,897	$ 4,629,812	$ 4,869,730	$ 5,119,693	$ 5,936,253	$ 6,232,840	$ 6,545,129	$ 6,869,748	$ 7,220,387	$ 7,579,980
Additional Taxes from Rate Increase	-	11,087	17,351	24,076	34,516	43,002	52,083	61,760	72,185	83,229
Net Cash Flow After Rate Increase	**$ 409,345**	**$ 979,497**	**$ 419,726**	**$ 83,433**	**$ 724,184**	**$ 1,290,682**	**$ 944,790**	**$ 1,425,887**	**$ 984,038**	**$ 1,550,081**
Coverage After Rate Increases	12.9	n/a	n/a	9.8	26.3	13.2	7.5	8.2	5.2	5.6

The financial forecast indicates that the utility becomes deficient in 2020 as new debt is added to fund the capital program. This financial analysis recognizes the 2018 adopted rate increase of 5.0 percent. In addition to the 2018 rate increase, annual inflationary level rate increases of 2.50 percent are implemented to cover the forecast deficiency.

11.10 CITY FUNDS AND RESERVES

Table 11.7 shows a summary of the projected Operating Fund and Capital Fund ending balances through 2026 based on the rate forecasts presented above. The operating fund is maintained at a minimum of 90 days of O&M expenses from 2018 forward, and the capital fund balance fluctuates annually depending on the addition of debt proceeds and the capital projects scheduled.

Table 11.7 Ending Cash Balance Summary

Ending Fund Balances	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026
Operating Fund	$ 718,750	$ 907,371	$ 971,269	$ 1,010,570	$ 1,064,722	$ 1,063,508	$ 1,087,674	$ 1,112,179	$ 1,137,976	$ 1,163,017
Capital Fund	1,559,669	394,138	382,316	272,677	5,975,900	2,211,942	3,492,386	280,998	4,025,353	345,581
Total	**$ 2,278,419**	**$ 1,301,509**	**$ 1,353,585**	**$ 1,283,247**	**$ 7,040,622**	**$ 3,275,449**	**$ 4,580,060**	**$ 1,393,176**	**$ 5,163,328**	**$ 1,508,598**

11.11 CURRENT AND PROJECTED RATES

11.11.1 Current Rates

The City's current rate structure consists of a fixed monthly charge based on meter size and a variable monthly charge per hundred cubic feet (ccf) for all use. The fixed monthly charge is the same for all classes while the variable charge differs depending on rate class. Table 11.8 shows the existing rate schedule.

Table 11.8 Existing Schedule of Rates

2017 Monthly Rates	
Base Rate	**per account**
5/8"	$ 9.24
3/4"	10.01
1"	12.35
1.25"	13.90
1.5"	15.48
2"	24.05
3"	87.11
4"	110.50
6"	165.02
8"	227.34
10"	297.44
Volume Charge	**per ccf**
Residential	$ 1.77
Commercial	2.16
Industrial	1.79
Cemetery	0.80
Irrigation	2.01

11.12 PROJECTED RATES

The financial forecast discussed above indicates that while the water utility is covering all financial obligations in the near term, with the addition of new debt in 2020, rate increases are needed to satisfy all future financial responsibilities. In addition to the adopted 5.0 percent rate increase in 2018, a rate strategy of 2.50 percent annually for the remainder of the study period is recommended to satisfy this forecast deficiency. Table 11.9 shows the projected rates with increases applied uniformly to all rate components in all classes.

Table 11.9 Proposed Schedule of Rates

Monthly Rates	Existing	Adopted	Proposed							
	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026
Base Rate	per account	per account	per account	per account	per account	per account	per account	per account	per account	per account
5/8"	$ 9.24	$ 9.70	$ 9.94	$ 10.19	$ 10.45	$ 10.71	$ 10.98	$ 11.25	$ 11.53	$ 11.82

11.12.1 Conservation Based Rates

In 2003 the Washington State Legislature passed the Municipal Water Supply Efficiency Requirements Act. The Water Use Efficiency rules went into effect on January 22, 2007 and typically apply to Water System Plans that each jurisdiction is required to develop every six to ten years. The RCW outlines the rules of this act, under RCW 70.119.180. In section 4(B), the RCW states that jurisdictions must perform an "evaluation of the feasibility of adopting and implementing water delivery rate structures that encourage water conservation." A city does not need to actually adopt such a rate structure, but is required to consider it, which is what the following analysis represents.

Block rate structures (also known as inclining, inverted and tiered block rates) charge a higher rate for increasing consumption. Block rates are designed to send a more conservation oriented price signal to customers – the more you use the more you pay. Water system infrastructure must be built to handle peak demand. Those who peak more, cost the system more since system facilities must be oversized to accommodate system peak requirements. The higher volume charge is intended to helps recover the higher cost of providing peaking capacity. Increasing block rates are not a one size fits all solution. The ideal customer class is one that has relatively homogenous usage patterns and peaking characteristics. As such, a block rate structure is most effective for the residential class. A block rate structure for other classes that may have highly varied usage patterns and demand characteristics is not as effective and runs the risk of presenting inequities since larger customers may pay more simply for being a large user and not necessarily for being an inefficient water user. The focus of the conservation based rate structure evaluation for the City of Camas is for the residential class as it represents 93 percent of the total City accounts.

It is important to remember that any rate structure that may decrease water consumption may also decrease water sales revenue, creating a level of revenue volatility that may require higher reserve levels or establishment of a rate stabilization reserve to shelter

against unexpected revenue shortfalls. A block rate structure can also be more costly to administer (initial billing system set-up) and more difficult to communicate to customers that are accustomed to a uniform consumption rate. The following explanation discusses the development of an increasing block rate structure for the residential class.

11.13 METHODOLOGY

There are many ways to design a block rate structure. The most basic structure needs the following items:

How many blocks?

A three-block structure is very common. This structure allows for a meaningful price signal without being too aggressive in the upper block rates.

What are the thresholds for each block?

Block 1: Set at the average monthly winter consumption. This allows a unit rate that reflects average indoor water usage.

Block 2: Set at twice the summer monthly average.

Block 3: Set to encourage usage reduction at the higher end of the demand curve.

In order to design a block rate structure, a bill frequency analysis was performed to show the distribution of residential customer bills throughout the year. This analysis helps to ensure that the appropriate amount of revenue is recovered based on the block sizes and rates set for each block size.

11.14 RESULTS

The current residential rate for the City is composed of a fixed meter charge differentiated by meter size and a uniform rate for all usage. Table 11.10 demonstrates that in order to satisfy the 2019 revenue requirement as proposed in the existing financial model, an increasing block rate structure would result in a Block 1 rate of $1.55 per ccf for usage up to 14 ccf, a Block 2 rate of $2.05 per ccf for usage between 14.01 and 26 ccf and a Block 3 rate of $2.58 per ccf for all usage over 26 ccf bi-monthly.

Table 11.10 Residential Conservation Rates

Block Rate Calculation	Block 1	Block 2	Block 3	Total
Block Ranges				
Bi-Monthly Block Thresholds (ccf)	14	26	26+	
Bi-Monthly Block Ranges (ccf)	(0-14)	(14.01-26)	(>26)	
Total Residential Usage (ccf)				988,896
Distribution of Bills (%)	51.90%	27.23%	20.87%	
Distribution of Usage (%)	55.43%	19.52%	25.04%	
Distribution of Usage (ccf)	548,186	193,079	247,631	
Calculating Block Rates				
Total 2019 Variable Revenue Target ($)				**$ 1,883,811**
$ Rate per 100 Cubic Foot	**$ 1.55**	**$ 2.05**	**$ 2.58**	

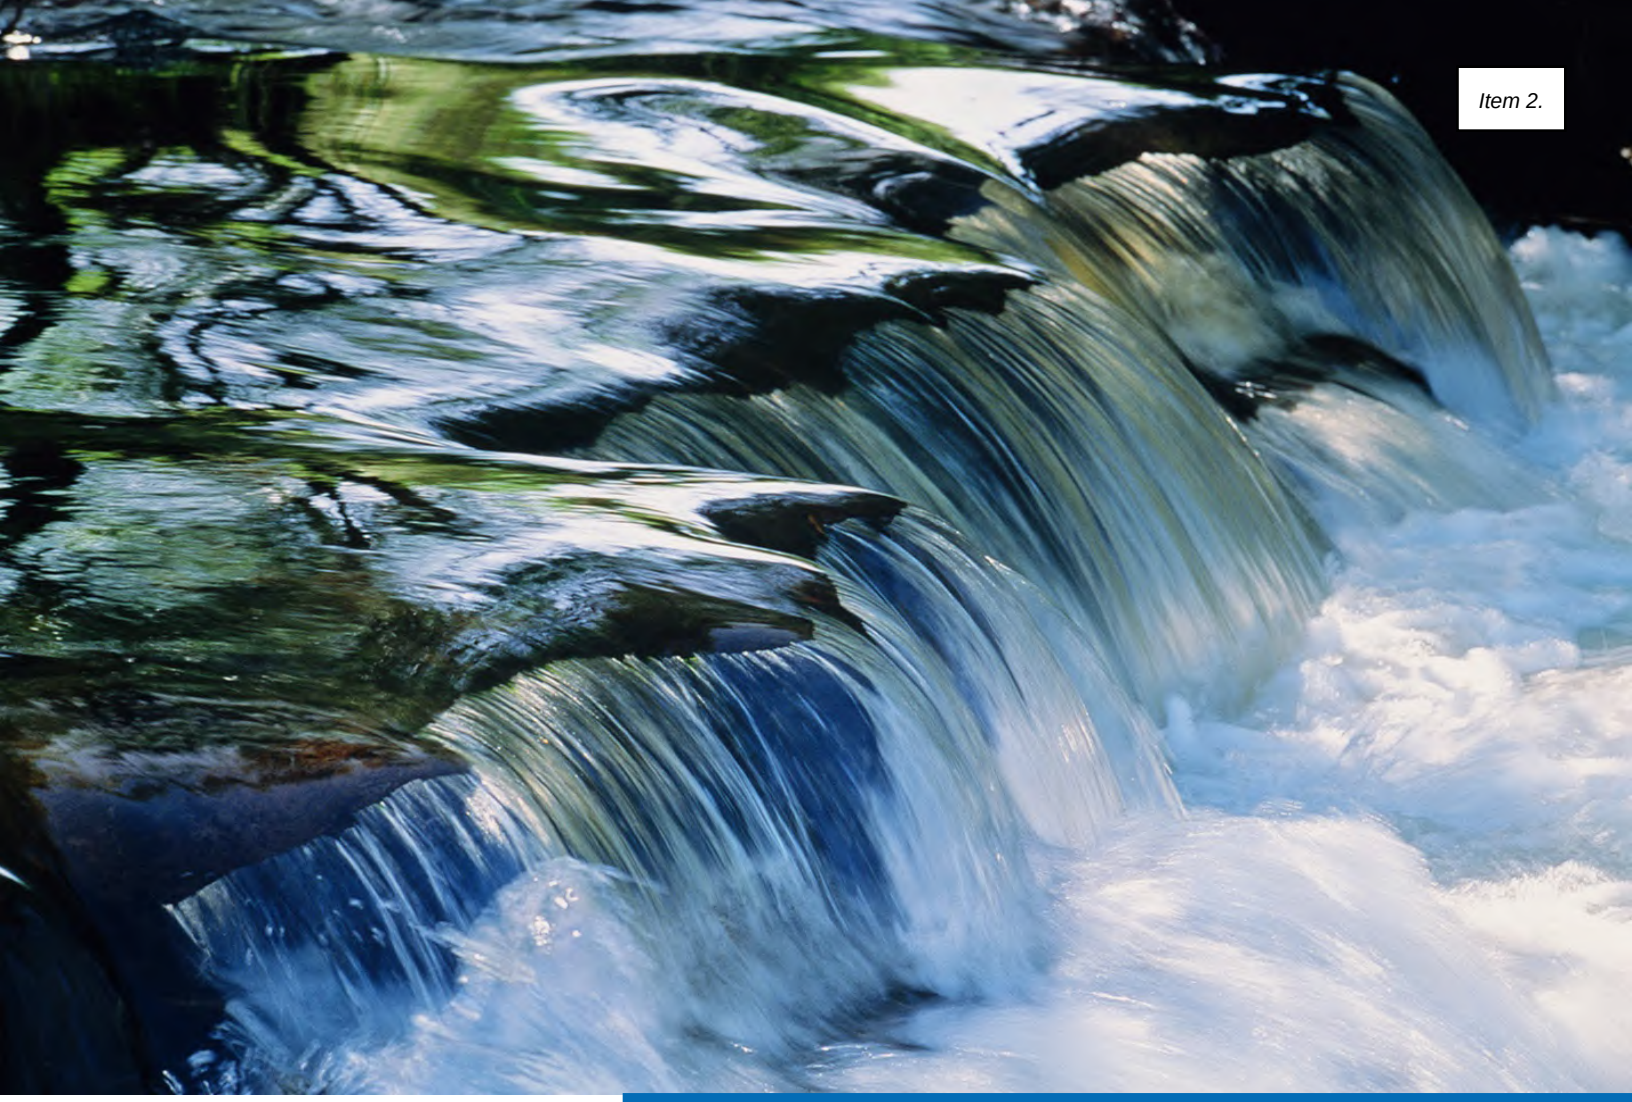
Under the proposed rate structure a residential customer with a use of 14 ccf bi-monthly would have a bill reduction of $3.81, water use of 26 ccf bi-monthly would see a $1.53 reduction and a user with 50 ccf bi-monthly would see an increase of $15.69. The initial block rate structure is intended to get the conservation rate concept in place. As the rate structure matures the block thresholds can be adjusted to increase the conservation price signal. The rate design discussed above was evaluated as part of the water system planning effort that is currently underway and provides a conservation based rate structure alternative for the City. As previously discussed, the City is not required to adopt such a rate structure, but is required to consider a conservation rate structure as part of this Plan. The City Council discussed implementing a conservation rate structure and decided to maintain the existing rate structure at this time.

11.15 AFFORDABILITY

The Washington State Department of Health and the Department of Commerce Public Works Board use an affordability index to prioritize low-cost loan awards depending on whether rates exceed 2.0 percent of the median household income for the service area. The average median household income for the City was $94,350 between 2012 and 2016 according to the U.S. Census Bureau. The 2016 value is escalated based on the assumed 1.77 percent general cost inflation to show the median household income in future years. Table 11.11 presents the City's rates projected to 2026, tested against the 2.0 percent monthly affordability threshold.

Table 11.11 Affordability Test

Year	Inflation	Median HH Income	2% Monthly Threshold	Projected Monthly Bill	% of Median HH Income
2016		$ 94,350	$ 157.25	$ 25.70	0.33%
2017	1.77%	96,020	160.03	26.94	0.34%
2018	1.77%	97,720	162.87	28.29	0.35%
2019	1.77%	99,449	165.75	28.99	0.35%
2020	1.77%	101,209	168.68	29.72	0.35%
2021	1.77%	103,001	171.67	30.46	0.35%
2022	1.77%	104,824	174.71	31.22	0.36%
2023	1.77%	106,679	177.80	32.00	0.36%
2024	1.77%	108,568	180.95	32.80	0.36%
2025	1.77%	110,489	184.15	33.62	0.37%
2026	1.77%	112,445	187.41	34.46	0.37%



Applying the 2.0 percent test, the City's rates are forecasted to remain within the indicated affordability range through 2026.

11.16 CONCLUSION

The results of this analysis indicate that rates must increase to provide revenue sufficient to cover all utility financial obligations, including the addition of new debt and partial cash funding of the capital program through 2026. A rate increase of 5.0 percent in 2018, followed by annual rate increases of 2.5 percent through 2026 should provide for continued financial viability while maintaining generally affordable rates.

It is important to remember that the analysis performed in this chapter assumes growth rates from Chapter 4 of this Plan. If the future growth rates change, the existing rate strategy may need to be updated and revised.

It is recommended that the City regularly review and update the key underlying assumptions that compose the multi-year financial plan to ensure that adequate revenues are collected to meet the City's total financial obligations.

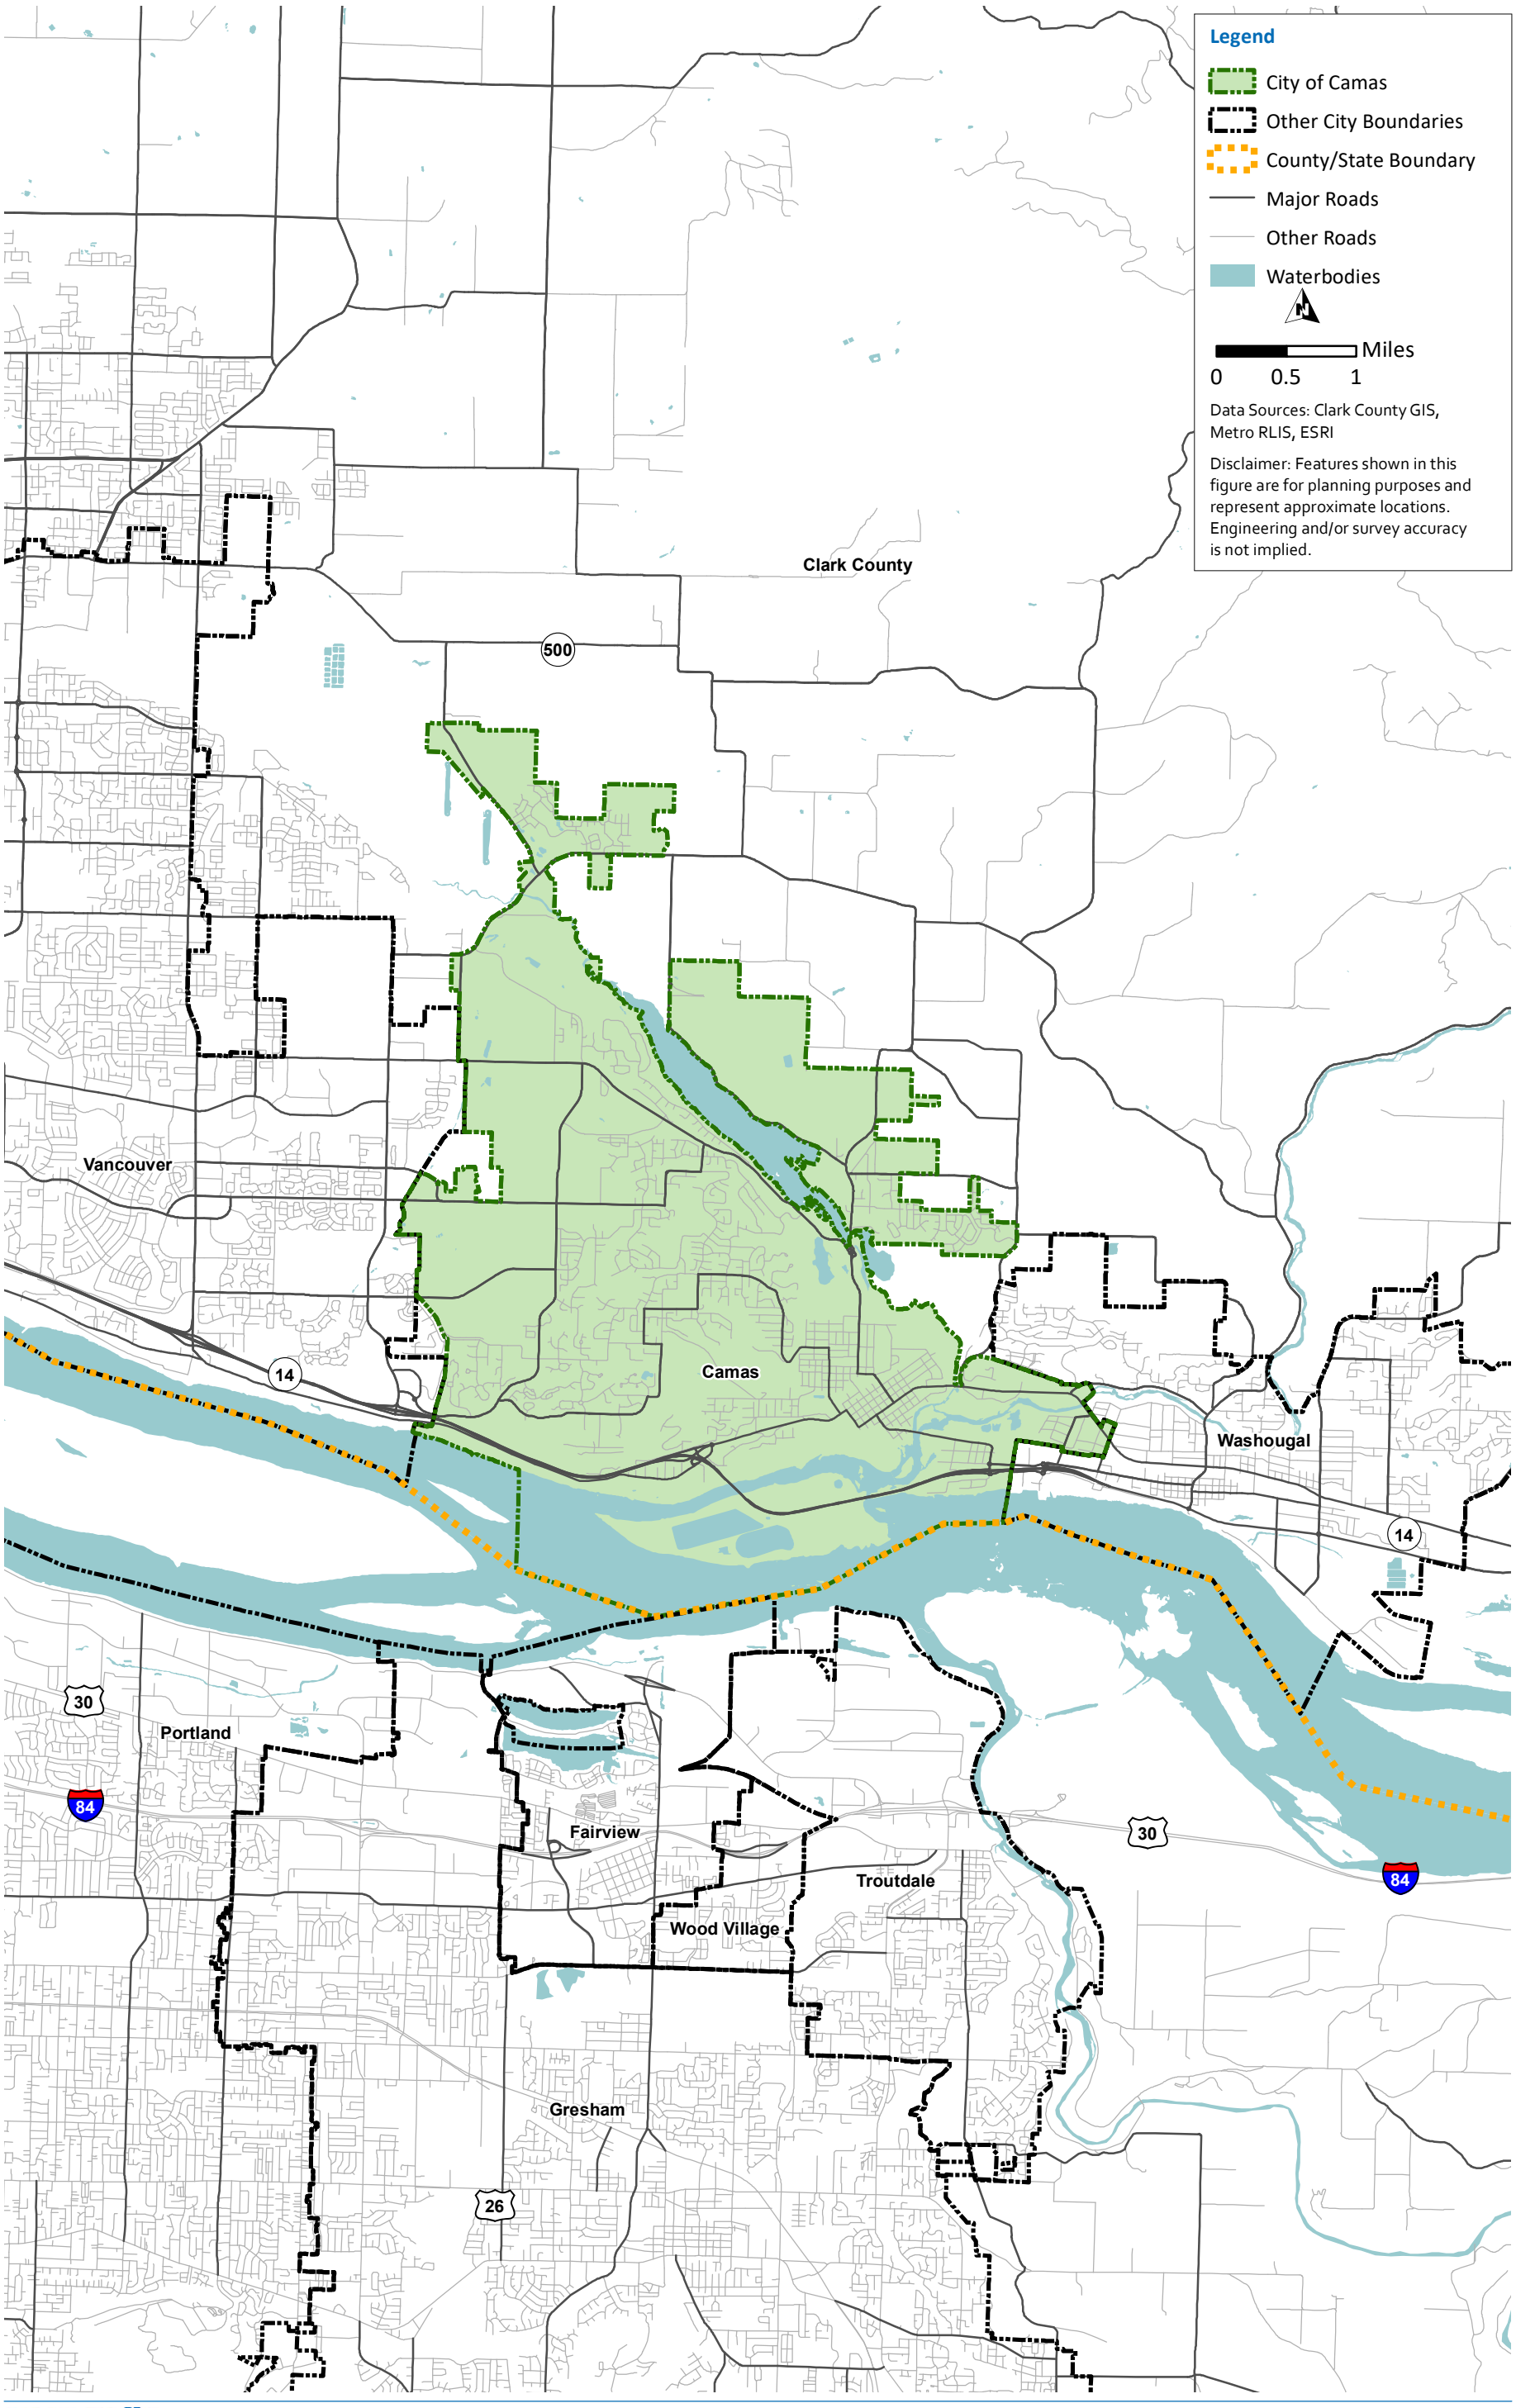
EXECUTIVE SUMMARY

ES.1 Introduction

The City of Camas (City) is located in Clark County, Washington near the border of Washington and Oregon along the Columbia River near Vancouver, Washington. The City owns and operates most of the sewer collection system within the City limits and its urban growth boundary (UGB). The collection system is a combination of gravity sewers, pump stations, force mains, and septic tank effluent pump (STEP) systems. Wastewater is collected and treated by the City at the Camas Wastewater Treatment Plant and then discharged to the Columbia River.

The purpose of the City's General Sewer Plan (Plan) is to develop a clear and logical path to manage the collection system over the next 20 years. The Plan results from an evaluation of the sanitary sewer system which identified deficiencies and concerns that must be addressed to provide service to existing users, as well as improvements needed to accommodate growth. Key elements addressed in the Plan include:

- The need and timing of the replacement of older, deteriorating sanitary sewer facilities within large, neighborhood-size areas within the City.
- The evaluation of system capacity to address both existing deficiencies and potential development.
- The identification of sanitary sewer lift stations and force mains requiring removal, rehabilitation, and replacement.
- The City's Infiltration and Inflow (I/I) program to evaluate options and needs for I/I reduction.
- Implementation of recommended improvements by priority which maintains affordable rates for the system users.



ES.1.1 Sewer Service Area

A map of the sewer service area is presented in Figure ES.1.

ES.2 Policies

The City is responsible for managing and operating its wastewater system in accordance with all local, state, and federal regulations. To best manage the wastewater system and comply with regulations, the City has adopted wastewater system policies and criteria. These policies guide the development and financing of the infrastructure required to provide wastewater service and document the City's commitments to current wastewater system customers as well as those considering service from the City. The following policies and criteria are summarized in Chapter 2 - Policies:

- Environmental Stewardship.
- Design Criteria and Standards.
- Financial Policies.
- Regulatory Requirements.

Figure ES.1 Vicinity Map

ES.3 Basis of Planning

Chapter 3 of the Plan presents flow projections for the collection system and wastewater treatment facility (WWTF) based on demographic growth projections from the *2035 Comprehensive Plan*. Slightly different methodologies are used to project wastewater flows in the collection system and WWTF due to the requirements of the analyses and availability of data. Two major factors drive these differences. First, the collection system analysis considered flow monitoring data collected during a four-month period in the winter of 2018 and 2019, while the WWTF analysis uses historical influent data from 2015 through 2018. Second, the WWTF was assessed using flows projected for 2035, while collection system flows consider both 2035 and buildout of the service area. Collection system piping is typically sized using the buildout period projections since these pipes have a 75-year service life.

ES.3.1 Collection System Flow Projections

The collection system flow projections were developed for use in the City's calibrated hydraulic model of the sewer system. The modeled system corresponds with the study area of the 2019 flow monitoring program, which focused on the lower basins in the collection system closest to the WWTF. The data collected during the flow monitoring program was used along with population growth projections, land use development projections, and wastewater flow factors to develop the flow projections presented in Table ES.1.

Table ES.1 Hydraulic Model Flow Projections Summary

Planning Horizon	ADWF (mgd)	PWWF (mgd)	Peaking Factor (PWWF : ADWF)
2018	0.80	5.45	6.8
2035	1.63	13.33	8.2
Buildout	2.63	14.86	5.7

Notes:
Abbreviations: ADWF - average dry-weather flow; mgd - million gallons per day; PWWF - peak wet weather flow.

ES.3.2 WWTF Flow and Load Projections

The City's WWTF receives flows from the gravity collection system, septic tank effluent, and the septage receiving station. The sum of these flows is greater than the collection system flow projections because the analysis performed for this Plan only focused on the portion of the system included in the hydraulic model and did not include septic tank flows, which constitute up to 50 percent of the total influent flow. Thus, load and peak hour flow projections were developed independently for the WWTF based on measured influent flows and wastewater characteristics, typical septage and STEP system characteristics, and population growth projections. The City expects that half of additional plant flow from population growth within the service area will come from the gravity sewer system, while the other half of the additional flow will come from the STEP system. The influent flow projections developed for the WWTF are summarized in Table ES.2.

Table ES.2 Current and Projected WWTF Flows

Flow Parameter	2021 Flow (mgd)	2035 Flow (mgd)
ADWF	2.2	3.4
AAF	2.8	4.0
MMF	4.8	6.2
PDF	8.4	10.8
PHF	10.0	13.5

Notes:
Abbreviations: AAF - average annual flow; MMF - maximum monthly flow; PDF - peak day flow/load; PHF - peak hour flow.

Wastewater loading data which are related to effluent limitations contained in the City's WWTF National Pollution Discharge Elimination System (NPDES) permit were also projected to evaluate treatment capacity for future conditions. Historical values for 5-day biochemical oxygen demand (BOD_5), total suspended solids (TSS), and ammonia (NH_3) and projections to 2035 are detailed in Table ES.3.

Table ES.3 Current and Projected WWTF Loads

Load Parameter	2021 Load (ppd)	2035 Load (ppd)
Sewered Population[(1)]	18,900	36,000
BOD_5 (ppd)		
Average Annual	2,400	6,000
Max Month	3,300	8,200
Max Week	4,300	10,600
Peak Day	5,300	13,000
TSS (ppd)		
Average Annual	2,400	6,300
Max Month	3,300	10,500
Max Week	4,300	17,000
Peak Day	5,300	19,300
Ammonia (ppd)		
Average Annual	900	1,400
Max Month	1,100	2,000
Peak Day	1,800	4,300

Notes:
(1) Current sewered population is based on 2035 Comprehensive Plan.

ES.4 Existing System

Chapter 4 describes the sewer system within the City's service area, which is owned, maintained, and operated by the City. A map of the existing system is shown in Figure ES.2. The City's conventional system (modeled for this Plan) includes 236,200 linear feet of gravity mains, 29 lift stations, and 38,260 linear feet of force main, which convey nearly half of the total influent flow to the City's WWTF. The septic tank effluent systems convey the remainder of the total flow treated by the City's WWTF through 263,110 linear feet of dedicated sewer mains. The septic tanks provide preliminary wastewater treatment, solids settling, and some digestion such that the effluent is not as strong as raw sewage collected in the conventional system. Each septic tank in the City's service area is pumped out on a five-year cycle and the solids are trucked to the WWTF for treatment.

The City's WWTF is located along the Columbia River in the southeastern portion of its sewer service area. The WWTF was originally constructed in 1972 and has had several modifications since that time to increase capacity and improve treatment capabilities to continue to meet all effluent permit requirements. The City's NPDES effluent discharge limitations, prohibitions, and requirements are similar to other municipal facilities with standard 30/30 monthly TSS and BOD concentration limits with a mandatory 85 percent reduction in each. However, the WWTF has ammonia limits of 20 milligrams per liter (mg/L) (NH_3 as N) in the summer and 7 mg/L (NH_3 as N) in the winter. An aerial view of the WWTF with each unit process and building identified is shown in Figure ES.3.

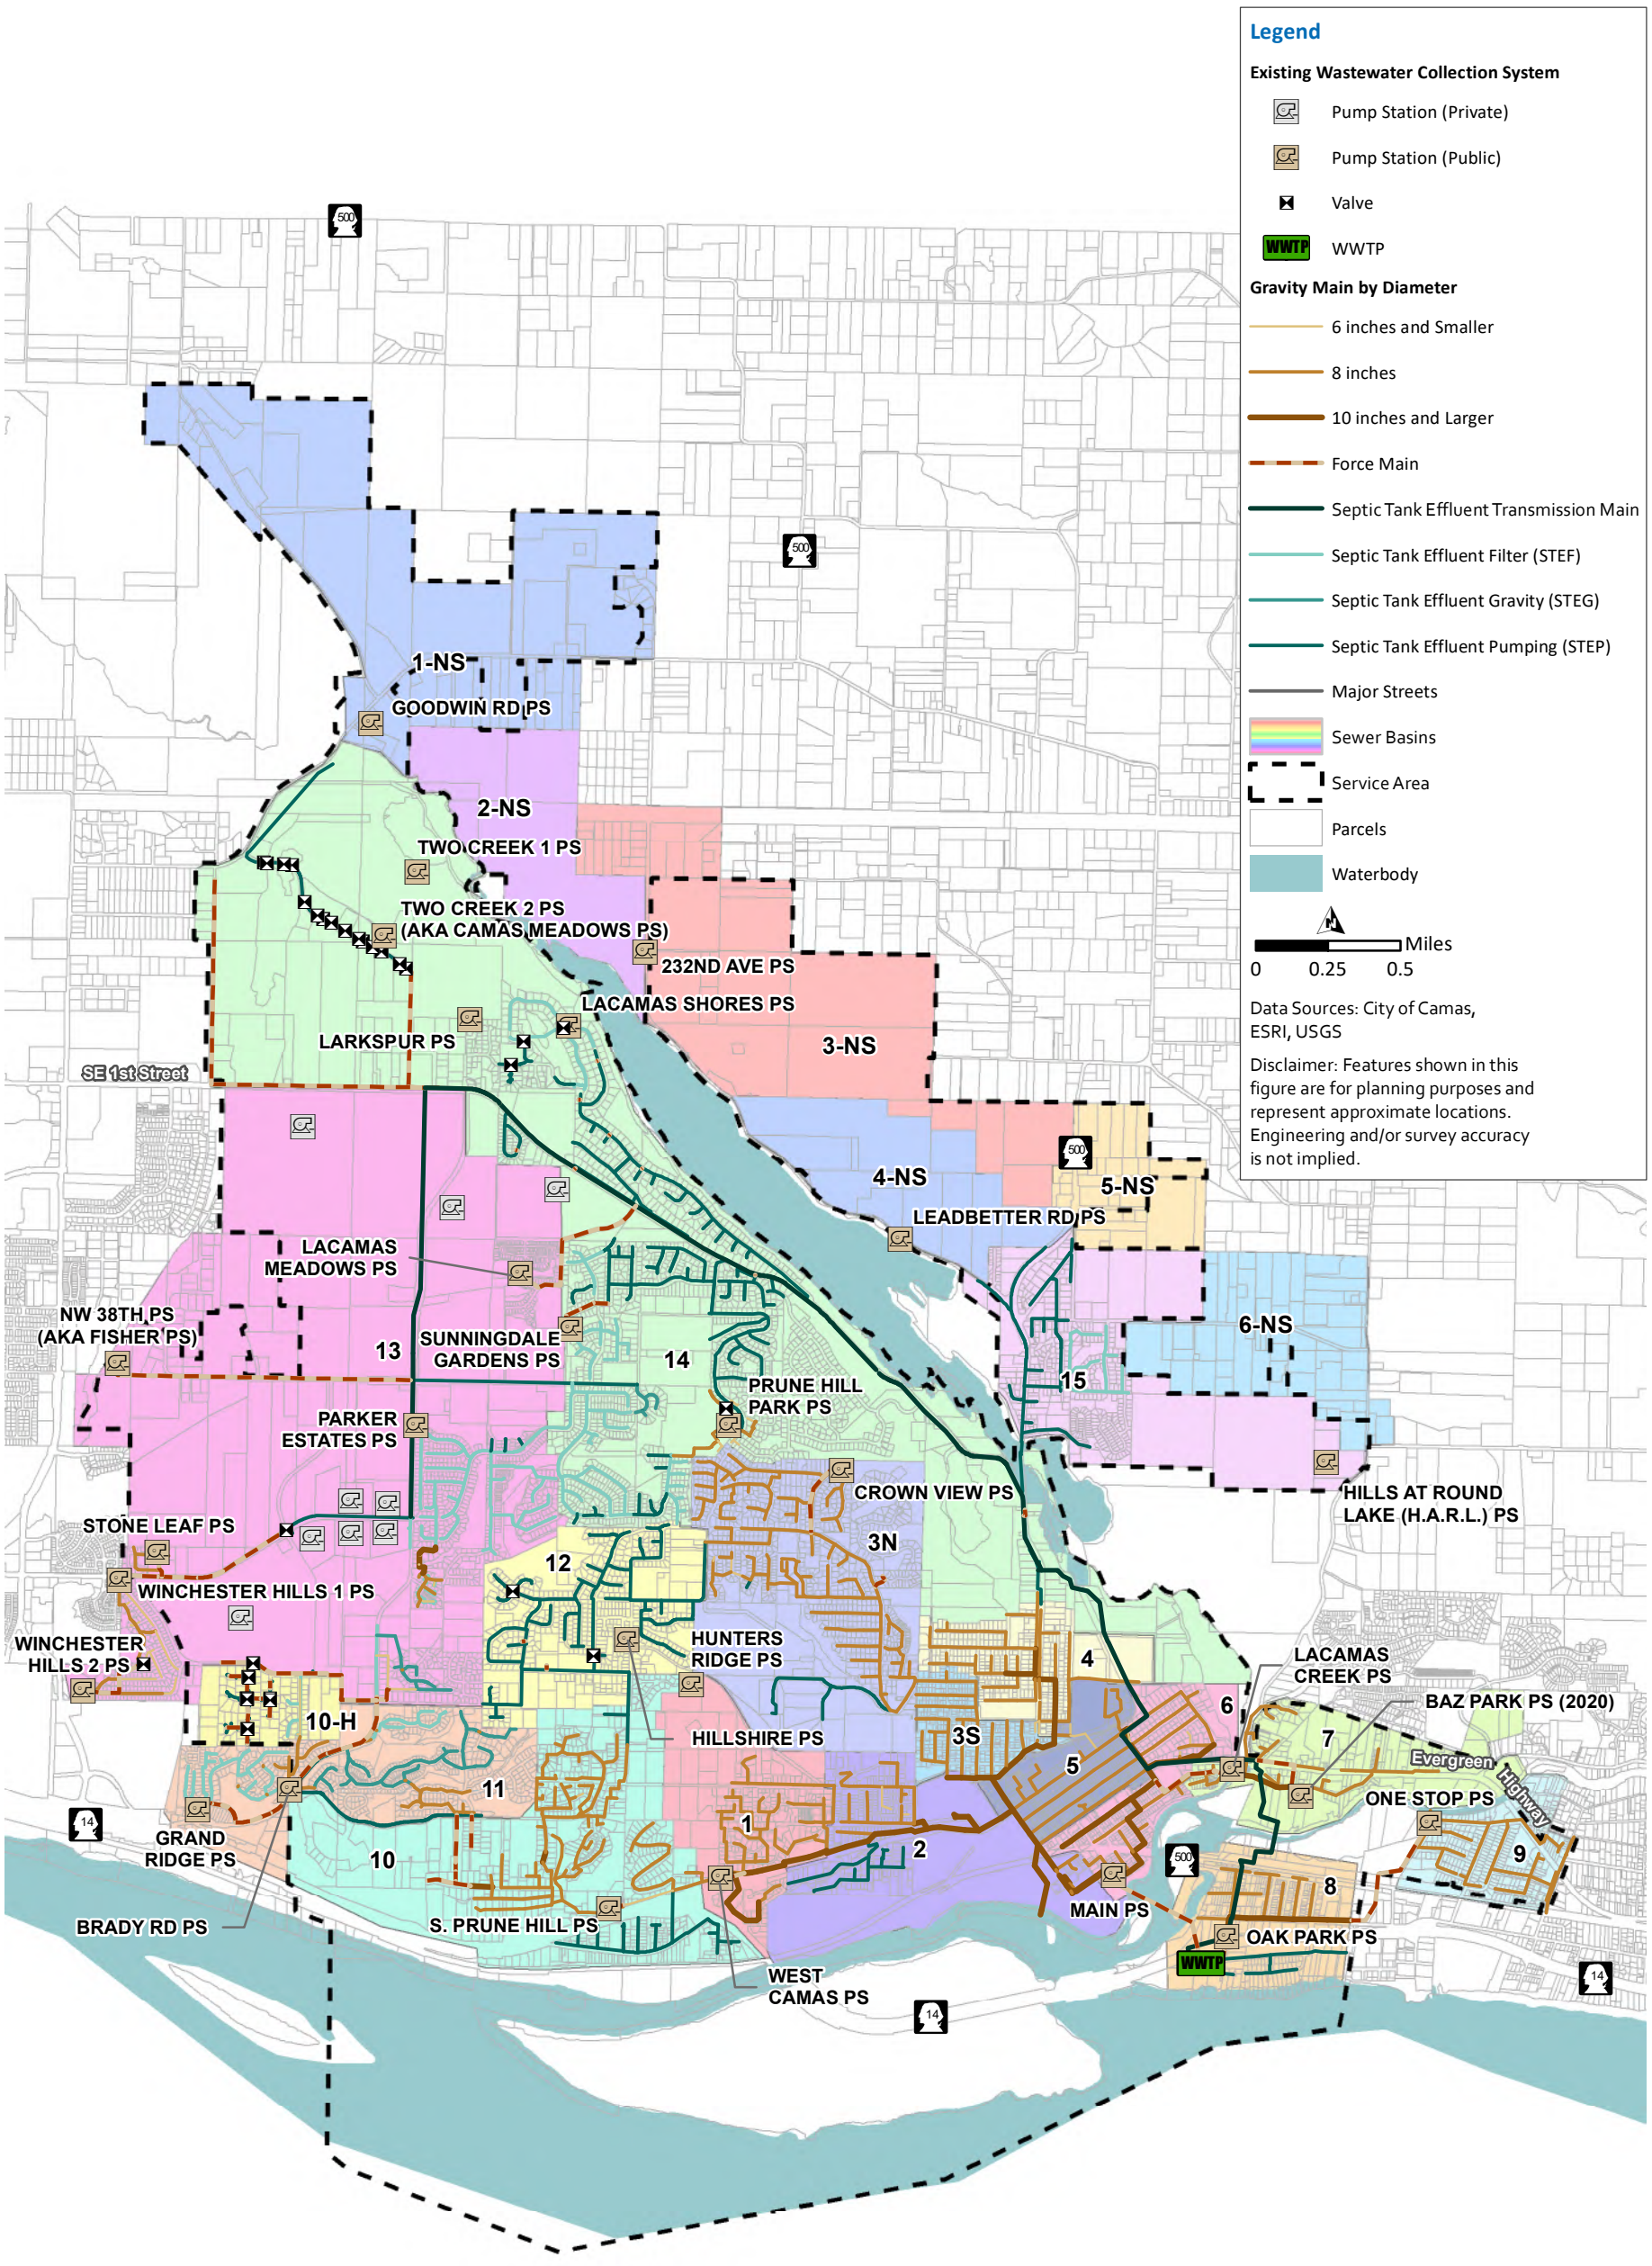

Figure ES.2 Existing Wastewater Collection System

Last Revised: June 17, 2022 pw:\\IO-PW-INT.Carollo.local:Carollo\Documents\Client\WA\Camas\11418A00\GIS\MXD\Existing_Wastewater_System.mxd

Figure ES.3 WWTF Aerial Image with Site Plan

ES.5 Infiltration and Inflow Program

Chapter 5 of this plan summarizes the City's efforts to reduce I/I from 2016 through 2020 and the quantifiable, positive improvement that has been accomplished in reducing I/I. Infiltration and inflow consist of two components which may combine or act independently to increase flow volume and peak flows in the sewer system. If too much I/I enters the sewer system such that the sewer system is operating at or above its capacity, sanitary sewer overflows (SSO) could occur. More dilute wastewater can also be more difficult to treat under percent removal NPDES permits such as those held by the City.

In 2016, the City commissioned an evaluation of the collection system to document existing infiltration and inflow as a condition of their new stormwater permit. The results of this study showed that there was excessive inflow compared to the EPA's guidelines. Since 2016, the City initiated an I/I reduction program and has completed improvement projects each year, totaling well over $1 million. A follow up study completed in 2020 showed significant improvements in I/I and improved WWTF performance. Table ES.4 summarizes the improvements in per capita I/I observed in the City's collection system. The City is continuing to invest in the collection system to further reduce I/I through a pipeline repair and replacement program along with improvements to two key lift stations: Crown View pump station and Lacamas Creek pump station.

Table ES.4 Per Capita I/I Compared to EPA Criteria

Parameter	EPA Criteria for Excessive I/I (gpcd)	I/I Value for Camas in 2014 (gpcd)	Current I/I Value for Camas (gpcd)
EPA Excessive Infiltration Criteria	120	80	46
EPA Excessive Inflow Criteria	275	348	176

Notes:
Abbreviations: gpcd - gallons per capita day.

ES.6 System Analysis

Chapter 6 describes the hydraulic modeling analysis conducted for gravity pipes and pump stations in the modeled portion of the City's collection system. The modeled collection system is primarily large gravity sewers which represent a skeletonized version of the system that does not include the septic tank effluent infrastructure. The analysis identified capacity deficiencies associated with current and projected future use and recommends improvements to alleviate any identified concerns. The collection system was evaluated applying three planning scenarios:

- **Existing:** Matching existing conditions.
- **2035:** Incorporating flows related to growth through 2035 as identified in the City's comprehensive plan.
- **Build-Out:** Development of the full service area including urban growth boundary.

Performance and design criteria for the conveyance system are outlined below:

- **Performance Criteria:** During PWWF for the design storm, water levels should not exceed a maximum depth to diameter flow ratio (d/D) of 1.2 for build-out conditions, and a d/D of 1.0 for existing conditions. No surcharging (d/D>1.0) is allowed at manholes where the distance between crown of pipe and manhole rim is less than three feet.
- **Design Criteria:** New sewers shall be designed to flow at a maximum d/D of 1.0 at peak flow rates for both existing and build-out conditions.

The City's lift stations should have sufficient firm capacity to pump the PWWF during the design storm with the largest pump out of service. Other pump station and force main design criteria are presented in Chapter 2 of the Plan.

ES.6.1 Gravity Collection System Evaluation

For each planning scenario, the associated PWWF was routed through the hydraulic model. The peak hydraulic grade line in manholes and gravity pipelines was compared to the established performance criteria. Under existing conditions there are seven potential problem areas where the capacity is deficient to convey the PWWF. Two additional deficiency areas were identified in the build-out scenario.

ES.6.2 Lift Station Evaluation

The City's hydraulic model includes five out of the seven lift stations located in the gravity collection system. The estimated current and future PWWFs were compared to the five lift station firm capacities in the hydraulic model. For the two lift stations not in the model, firm capacity was compared to projected influent flows. Four of the seven lift stations did not meet the firm capacity criteria under current conditions and the deficiencies were exacerbated under build-out conditions.

ES.6.3 Recommended Improvements

When an increase in capacity is required, existing sewers can be upsized to a larger diameter pipe, or parallel or relief sewers can be constructed. Table ES.5 summarizes the recommended pipe capacity improvement project details.

It is recommended that the Main, South Prune Hill, West Camas, and Crown View Plaza PSs all be upgraded to provide pump redundancy under existing PWWF conditions. These stations do not meet the required firm capacity, based on the City's performance criteria. Table ES.6 summarizes the recommended lift station improvement project details.

Table ES.5 Recommended Pipe Capacity Improvements Projects

Project ID	Improvement Type	Location	Existing Size (inch)	Proposed Size (inch)	Length (feet)	Phase
P-1	Gravity	NW Fargo Street between NW 23rd and NW 19th Avenue	8	12	1,007	Short-term
P-2	Gravity	Division Street between NW 18th and NW 11th Avenue	8	12	2,043	Short-term
P-3	Gravity	NW 6th Place, just upstream of South Prune Hills PS	8 10	12 12	188 616	Short-term
P-4	Gravity	NW 6th Place between South Prune Hills PS and West Camas PS	10	12	588	Short-term
P-5	Gravity	NW 6th Avenue downstream of West Camas PS and through Forest Home Park	12 12	15 18	311 1,340	Short-term
P-6	Gravity	NW 6th Avenue between NW 7th Avenue and SE Adams Street	12 8	18 21	817 401	Short-term
P-7	Gravity	NE and SE Adams Street between SE 3rd Avenue and NW 6th Avenue	21 24	24 27	773 925	Short-term
P-8	Gravity	NW 18th Loop	8	12	609	Long-term
P-9	Gravity	NE 15th Avenue between NE Garfield Street and NE Franklin Street	8	18	256	Long-term

Table ES.6 Recommended Lift Station Improvement Projects

Project ID	Improvement Type	Location	Description	Phase
PS-1	Gravity	South Prune Hills	Add pump capable of pumping 664 gpm.	Existing
PS-2	Gravity	West Camas	Add pump capable of pumping 723 gpm.	Existing
PS-3	Gravity	Crown View Hill	Add pump capable of pumping 382 gpm.	Existing
PS-4	Gravity	Main	Add pump capable of pumping 1,831 gpm.	Existing
PS-5	Gravity	Lacamas Shores, Sunningdale Gardens, Winchester Hills 2	Add flow monitors and pressure sensors to get a better understanding of what happens during peak flows and their capacity to aid in future capital improvement planning.	Existing

Notes:
Abbreviations: gpm - gallons per minute.

ES.7 Wastewater Treatment Facility

Chapter 7 summarizes efforts to identify shortfalls in WWTF capacity that will prevent the City from reliably treating and disposing of projected flow and loads in compliance with their NPDES permit at the end of the planning period (i.e., year 2035). To address the identified deficiencies, an alternatives analysis of the most viable improvement options was conducted, which resulted in the development of 14 projects to be incorporated into the Plan's capital improvement program (CIP). Table ES. 7 summarizes the recommended WWTF improvement project details.

Table ES.7 Recommended WWTF Improvement Projects

Project ID	Description	Improvement Type	Phase
TP-1	This project will improve the aeration basin's performance and increase treatment capacity.	Capacity	Short-Term
TP-2	This project includes the replacement of an aging secondary clarifier and replacement of RAS pumps for another secondary clarifier.	Capacity/Condition	Short-Term
TP-3	This project replaces two of the existing aeration blowers with larger high-speed turbo blowers to meet projected aeration demands	Capacity	Short-Term
TP-4	This project enhances plant hydraulics in several areas and includes the replacement of obsolete UV disinfection equipment.	Condition/ Capacity	Short-Term
TP-5	This project increases the effluent pump station's capacity, as required, to pump 100% of 2035's projected PHFs to the outfall in the Columbia River by replacing the existing effluent pumps with larger units.	Capacity	Short-Term
TP-6	This project replaces the existing grit-separation equipment, including hydrocyclones and grit classifiers, and increases the capacity of the odor control systems servicing the grit-handling area and dewatering building, which will extend the life and reduce maintenance of new installed equipment.	Condition	Short-Term
TP-7	This replaces the existing thickened primary sudge pumps with new progressive cavity pumps.	Condition	Long-Term
TP-8	This project replaces the existing digested sludge pumps with new double-disc piston-style pumps.	Condition	Long-Term
TP-9	This project rehabilitates the existing dewatering centrifuge and modifies the space to accommodate a standby unit for redundancy.	Condition	Short-Term
TP-10	This project repairs the existing plant drain pump station No. 1's structure and replaces its pumps.	Capacity/ Condition	Short-Term
TP-11	This project prepares a SCADA master plan that will provide the City with a roadmap to prioritize and implement planned system upgrades designed to address system deficiencies and enhance facility operation. This project includes an in-depth investigation of the existing SCADA control system for the City's WWTF and associated remote sites.	Planning	Short-Term

Project ID	Description	Improvement Type	Phase
TP-12	This project upgrades the existing SCADA system to provide redundancy and take advantage of modern features, including advanced data analysis, report generation, and secure remote accessibility	Network	Short-Term
TP-13	This project includes replaces existing Modicon Quantum hardware with new, standardized PLCs and RIO cabinets for all process areas at the WWTF.	Network	Short-Term
TP-14	This project plans for a future secondary treatment expansion to accommodate flows and loads outside the planning windows.	Planning	Long-Term

ES.8 Operations and Maintenance

Chapter 8 provides an overview of the City's wastewater utility organization, staffing, and operations and maintenance (O&M) program. City staff for the drinking water system and sewer system are combined. The staff works to provide effective and efficient service for utility rate payers through regular operation and maintenance activities on these systems as outlined in the program included in this Chapter.

ES.9 Capital Improvement Plan

The CIP presented in Chapter 9 includes projects needed to accommodate growth, repair and replace aged infrastructure, and attain level of service goals. The CIP is organized and prioritized in two separate project categories short-term (2022-2031) and long term (2032-2041) periods. Projects are grouped into pipeline, pump station, STEP, I/I, maintenance, treatment plant, and general types of infrastructure work. The CIP consists of the cost estimates and schedules for the recommended improvements. Table ES.8 summarizes the recommended CIP projects and estimated project costs. Approximately $41,000,000 of capital improvement projects have been identified for the short-term and an additional $21,435,00 in improvement projects have been identified for the long-term.

ES.10 Financial Analysis

Chapter 10 presents the financial analysis performed as part of this Plan to assess program needs that will allow the City's sewer utility to remain financially viable throughout the planning period. This financial viability analysis considered the historical financial conditions, current and identified future financial and policy obligations, O&M needs, and the financial impacts of the capital projects identified in this Plan. The results of this analysis indicate that rates must increase to provide revenue sufficient to cover all utility financial obligations, including the addition of new debt and partial cash funding of the capital program through 2031. In addition to the adopted annual increases of 3.30 percent in 2022 and 2023, annual 1.75 percent adjustments from 2024 through 2026 should provide for continued financial viability while maintaining generally affordable rates.

Notes:
1. CIP Project Subtotal is project cost before contingency costs are added. CIP Project Cost = Estimated Construction Cost. Total CIP Project Cost = Estimated Construction Cost plus merkups for contingency, construction overhead (as applicable), engineering, and administration.
2. Part of existing City CIP Project.

Chapter 1
INTRODUCTION

1.1 Introduction

The purpose of the City of Camas's (City) General Sewer Plan (Plan) is to present policies and an assessment of the system to recommend facility improvements. The Plan is intended to provide a road map for accommodating growth and maintaining a high level of service for existing customers. The existing system is aging and will continue to require investment to maintain a high level of service.

The Plan results from an evaluation of the existing sanitary sewer system which provides the groundwork for recommendations to resolve existing deficiencies and concerns, as well as accommodating growth. This chapter presents the objectives of this Plan, and a brief overview of the City's wastewater collection system. A list of abbreviations is provided in the Table of Contents to assist the reader in understanding the information presented in this Plan.

This Plan and recommended improvements were prepared in accordance with requirements of Washington Administrative Code (WAC) 173-240-050, which is administered by the Washington State Department of Ecology (Ecology) and meets the requirements of the Washington Growth Management Act (GMA).

This Plan addresses the following key issues:

- The need and timing of the replacement of older, deteriorating sanitary sewer facilities within large, neighborhood-size areas within the City.
- The evaluation of the City's system capacity to address both system deficiency and potential development.
- The evaluation of sanitary sewer lift stations and force mains for removal, rehabilitation, and replacement.
- The City's Infiltration and Inflow (I/I) program to evaluate options and needs for I/I reduction.
- Implementation of recommended improvements by priority which maintains affordable rates for the system users.

1.2 Background and Goals

The City is located in Clark County, Washington near the border of Washington and Oregon. It is next to Vancouver, Washington along the Columbia River as shown in Figure 1.1. The City owns and operates most of the sewer collection system within the City limits and its urban growth boundary (UGB). The collection system is a combination of gravity sewers, pump stations, force mains, and septic tank effluent Pump (STEP) systems. Wastewater is collected and treated by the City at the Camas Wastewater Treatment Plant and then discharged to the Columbia River.

The City completed its last General Sewer Plan in 2010. The Plan provides a recognized framework for making decisions about Camas's sanitary sewer service area which includes

properties both inside the City and UGB limits. It is intended to aid decision-makers as well as users, including Wastewater Utility, City Council members, the Mayor, City staff, builders, developers, community groups, and other government agencies.

1.3 Referenced Documents

The following documents were referenced in the preparation of this Plan:

- City of Camas 2010 General Sewer Plan.
- Camas 2035 Comprehensive Plan.
- Camas Code of Ordinances.
- Washington Administrative Code, Title 173. Defines the structure of general sewer plans.
- Criteria for Sewage Works Design (Ecology, 2008). Provides guidance for the design of municipal sewer systems and establishes minimum requirements in the State of Washington.
- Camas 2016 Water System Plan.

1.4 Washington State Requirements

The goals of this Plan, to meet the requirements from the Washington State Criteria for Sewage Works Design, include:

- Prepare the Plan in compliance with WAC Chapter 173-240-050.

Each WAC requirement is detailed in Table 1.1 as well as the location within the plan.

Table 1.1 WAC Plan Requirements

Requirement	Location in Plan
Purpose and need for the proposed plan	Chapter 1
Discussion of who will own, operate, and maintain the system	Chapter 2
Existing and proposed service boundaries	Chapter 4
Layout map including:	
• Proposed sewers and areas proposed to be served by each.	Figures 4.1 and 4.2
• Boundary lines of municipality or district and vicinity.	Figure 1.1
• Existing sewers and areas served by each.	Figure 4.2
• Topography and elevations of existing and proposed ground.	Figure 4.3

1.5 Report Organization

This Plan contains ten chapters, followed by appendices that provide supporting documentation for the information presented in the report. The chapters are briefly described below:

- **Chapter 1 - Introduction:** This chapter presents the need for this Plan and the objectives of the study. Lists of abbreviations and reference materials are also provided to assist the reader in understanding the information presented.
- **Chapter 2 - Regulations, Policies, and Criteria:** This chapter documents applicable regulations, summarizes City policies impacting long-term sewer system planning, and presents the City's design criteria which are relevant to sewer system planning.
- **Chapter 3 - Basis of Planning:** This chapter presents an evaluation of historical wastewater flows and loads through the City's collection system and entering the wastewater treatment facility (WWTF). This chapter also establishes the WWTF's flow and load projections based upon future population growth for a 2035 projection and build out.
- **Chapter 4 - Existing System:** This chapter describes the City's existing sewer collection system, adjacent sewer service areas, and WWTF.
- **Chapter 5 - I/I Program:** This Chapter focuses on summarizing the City's efforts on I/I reduction from 2016 through 2018. It summarizes the amount of I/I for these years and specific projects completed to address I/I.
- **Chapter 6 - Collection System:** This chapter presents an evaluation of the available capacity of the existing system to convey current and future sewer flows. Recommendations are provided for improvement projects to address capacity deficiencies and level of service goals.
- **Chapter 7 - Wastewater Treatment Facility:** This chapter summarizes the WWTF Engineering report including condition of existing processes, capacity of existing processes and recommendations that will allow the City to reliably and cost-effectively serve their customers now and into the future.
- **Chapter 8 - Operations and Maintenance:** This chapter provides an overview of the City's Wastewater Utility organization, staffing, and operation and maintenance (O&M) program. This chapter documents existing practices and identifies changes that may improve system operation and maintenance.
- **Chapter 9 - Capital Improvement Program:** This chapter describes the improvements necessary to resolve existing and future deficiencies and accommodate growth. The proposed improvements are also listed by priority and project type.
- **Chapter 10 - Financial Analysis:** This chapter evaluates the financial status of the City's wastewater utility and the ability to finance CIP projects.

Additionally, Technical Memoranda (TM) are included in the appendices as follows:

- **Appendix E - TM 01: Hydraulic Model Update and Calibration.**

Other appendices are included as follows:

- **Appendix A - Approvals.**
- **Appendix B - Agency Comment Letters and Responses.**
- **Appendix C - Demographic Projections.**
- **Appendix D - Flow Monitoring Report.**

- **Appendix E - TM 01: Hydraulic Model Update and Calibration.**
- **Appendix F - I/I Program Reports.**
- **Appendix G - Local Limits Program Reports.**
- **Appendix H - Wastewater Treatment Plant Permits.**
- **Appendix I - Wastewater Treatment Engineering Report.**
- **Appendix J - Spill Response Plan.**
- **Appendix K - CIP Project Sheet.**
- **Appendix L - Financial Backup.**
- **Appendix M - O&M APE Examples.**

1.6 SEPA and Approval Process

A SEPA Checklist has been prepared for this Plan and is presented in Appendix A. It is anticipated that this proposed Plan will not have a probable significant adverse impact on the environment and that an environmental impact statement (EIS) will not be required. However, many of the projects proposed herein will require SEPA checklists and an engineering determination will be made with each individual project.

This Plan includes review by adjacent utility systems. All comments are included in Appendix B, Agency Comment Letters and Responses.

1.7 Acknowledgements

Carollo Engineers, Inc. (Carollo) and their team members would like to acknowledge and thank the following individuals for their efforts and assistance in completing this Plan. Their cooperation and courtesy in obtaining a variety of necessary information were valuable components in completing and producing this report:

- Bob Busch, City of Camas, Wastewater Treatment Plant Operations Supervisor.
- Sam Adams, City of Camas, Utilities Manager.

Chapter 2

POLICIES AND CRITERIA

2.1 Introduction

The City of Camas (City) is responsible for managing and operating its wastewater system in accordance with all local, state, and federal regulations. To best manage the wastewater system and comply with regulations, the City has adopted wastewater system policies and criteria. These policies guide the development and financing of the infrastructure required to provide wastewater service and document the City's commitments to current wastewater system customers as well as those considering service from the City. The following sections outline the City's policies and design criteria that are relevant to sewer system planning. Existing policies are listed in Table 2.2 through Table 2.5. Proposed new policies are also listed in each table. These policies and criteria will guide the planning process throughout this General Sewer Plan (Plan).

The policies and criteria are organized into the following categories:

- Table 2.1 - Service Policies and Extensions.
- Table 2.2 - Environmental Stewardship.
- Table 2.3 to Table 2.5 - Design Policies and Criteria.
- Table 2.6 - Financial Policies.

2.2 Sewer Service

Table 2.1 summarizes the existing policies regarding the wastewater service area and extension of sewer service to additional customers. The City is committed to serving customers in its sewer service area in accordance with established policies. The current sewer service area includes approximately 7,400 acres within its corporate boundaries. The future service area has been defined as the City's Urban Growth Boundary (UGB).

Table 2.1 Service Policies and Extensions

Subject	Policy	Source
Service Area	Where service is available, require connection to public water for domestic and irrigation needs and connection to sewer systems. The intent is to not wait for the malfunction of a well or septic system if service is available.	Camas 2035 Comprehensive Plan U-1
Service Area	Within UGAs, the City should be the sole provider of urban services.	Camas 2035 Comprehensive Plan U-4
Service Area	Extend public sanitary sewer service, which is required within urban areas, throughout urban areas. Service may be provided outside urban areas to serve areas where imminent health hazards exist.	Camas 2035 Comprehensive Plan SS-1
Utility Extension	Do not extend utilities without annexation or commitments for annexation. Exceptions may be made in cases where human health is threatened. In areas where utilities presently extend beyond City limits, but are within UGAs, the City should plan development jointly with the County. A joint development must be consistent with City standards.	Camas 2035 Comprehensive Plan U-5
System Ownership	The sanitary sewage disposal system of the city, including the treatment plant and all other parts of such system and all additions and improvements thereto and extensions thereof, which may be made hereafter, shall be considered as a part of and belonging to the water works utility of the city. The cost of the construction and installation of the hereinafter provided additions, improvements and extensions and the cost of maintenance and operation of such system as improved shall be charged to the water works utility of the city, and any rates and charges which may be collected hereafter for sewage disposal service shall be paid into the "water and sewer revenue fund" of the city, to be hereafter created.	(CMC) 13.60.010
Ownership of System - Commercial and Industrial	All STEP systems serving commercial, industrial, and other nonresidential properties shall be owned by the owner of the subject property, except for the service box at the point where the STEP system connects to the city sanitary sewer system, which shall be owned by the city. The owner shall be responsible for maintaining all components of the STEP system and its ownership and shall be responsible for pumping the STEP tank as needed and for disposing of the waste in an approved manner. The owner shall further be responsible for paying all electrical costs associated with the operation of the STEP system.	CMC 13.62.060(B)
Ownership of System - Residential	After inspection and acceptance of an installed STEP system on residential property, the city shall be the owner of all components of the STEP system with the exception of the sewer line from the structure to the tank, which shall be owned by the property owner. The city will be responsible for maintaining the components of the STEP system owned by the city, and in addition will be responsible for pumping the STEP tank and disposing of waste material when required. The owner will be responsible for maintaining the sewer line connecting the tank to the structure on the subject property. The owner will further be responsible for paying for all electrical costs associated with the operation of the STEP system.	CMC 13.62.060(A)
Construction	On and after May 1, 1949, it shall be unlawful to construct any means of sewerage or excreta disposal such as septic tanks without having first obtained a permit from the city health officer or his authorized representative.	CMC 13.60.040
Sewer Lien and Ownership	The city shall have a lien against premises to which sewer service is available for delinquent and unpaid charges for sewer services, for penalties levied pursuant to Section 13.60.050(B), for unpaid connection charges, and for unpaid sewer system development charges. All such delinquent charges shall bear interest at the rate of eight percent per annum. Such lien shall be superior to all other liens and encumbrances except general taxes and local and special assessments.	CMC 13.60.055(A)
Connections	All property owners whose property abuts a street or alley in which there is a public sanitary sewer or which is within one hundred fifty feet of a public sanitary sewer may be required to connect their private drains and sewers to the city sanitary sewer system at the direction of the city engineer. Those properties which abut a street or alley in which there is a public sanitary sewer or which are located within one hundred fifty feet of a public sanitary sewer, and which are located within a designated health hazard area or which pose a threat to the general health, shall be connected to the sanitary sewer. Such connection shall be in the most direct manner possible and with a separate connection for each residence or structure.	CMC 13.60.050(A)
Prohibited Connection	Prohibit construction of new private wells and subsurface sewage disposal systems in new developments.	Camas 2035 Comprehensive Plan U-2

Subject	Policy	Source
Application to Connect a STEP System	Any property owner seeking to connect his property to the sanitary sewer system of the city by means of a STEP system shall file an application with the public works department on a form provided by the city. The application shall contain the name and address of the owner, the location of the property to be connected to the sanitary sewer system, the nature of the structure to be constructed on the subject property, the proposed use of the subject property, the proposed location of the STEP system, the design of the STEP system, and such other information as the public works department may require. Upon receipt of any such application, the public works director, or his authorized designee, shall review the application and grant the same if he determines that the subject property is suitable for use of a STEP sanitary sewer system, and if the design, location and other information set forth in the application comply with the standards and specifications adopted by the city for STEP systems and the criteria set forth in this chapter.	CMC 13.62.030
Installation Responsibility of a STEP system	The individual owner shall be responsible for and shall pay for the installation of the STEP/ STE system, including but not limited to, service connection per CMC 13.64.050 if required, the tank, pump apparatus, control box, electrical wiring, conduit, plumbing from the structure to the tank, plumbing from the tank to the service box, excavation and backfill material. The city shall, prior to installation, determine the appropriate size tank.	CMC 13.62.040(A)
Sewer Responsibility	Sanitary sewers shall be provided to each lot at no cost to the city and designed in accordance with city standards: • Detached units shall have their own sewer service and STEP or STEF or conventional gravity system as required. • Duplex units may have up to two sewer services at the discretion of the engineering and public works departments. • Multifamily units shall have one sewer lateral per building. • Commercial or industrial units shall have privately owned and maintained sewer systems acceptable to the city.	CMC 17.19.040(C)
Right-of-Entry Agreement	Any owner seeking to connect his property to the sanitary sewer system of the city by means of a STEP system shall be required to execute a right-of-entry agreement authorizing the city and its employees to have access to the owner's property for the purpose of maintaining and inspecting the STEP system and appurtenances thereto. Such right-of-entry agreement shall be executed upon approval of an application for a STEP system.	CMC 13.62.050
Inspection	The superintendent and other duly authorized employees of the city bearing proper credentials and identification shall be permitted to enter upon all properties for the purpose of inspecting, observing, measuring, sampling, and testing sewer connections, operations, and facilities in accordance and to ensure compliance with the provisions of this chapter. No such entry or inspection shall be made without the consent of the owner or occupant of such building or premises unless the city employee shall have obtained a search warrant, or unless exigent circumstances exist that would justify an inspection and entry without obtaining a warrant.	CMC 13.68.030
Enforcement	It shall be the duty of the city health officer or his authorized agent to enforce the provisions of Sections 13.60.020 through 13.60.110 and in the performance of this duty the health officer or his duly authorized agent is authorized to enter at any reasonable hour any premises as may be necessary in the enforcement of Sections 13.60.020 through 13.60.110.	CMC 13.60.080
FOG and Capacity	Grease, oil and sand interceptors shall be provided, when in the opinion of the superintendent, they are necessary for the proper handling of liquid wastes containing grease in excessive amounts, or any flammable wastes, sand, and other harmful ingredients, except that such interceptors shall not be required for private living quarters. All interceptors shall be of a type and capacity approved by the superintendent and shall be located as to be readily and easily accessible for cleaning and inspection.	CMC 13.68.020(H)
Private System - Flush toilet	Every residence, place of business or other building or place where persons congregate, reside or are employed and which does not abut a street or alley in which there is a public sanitary sewer shall be provided with a private water-flush toilet by the owner or agent of the premises; said water-flush toilet system to be built or rebuilt, constructed and maintained in such a manner as to meet the requirements of construction and maintenance hereinafter described.	CMC 13.60.060

Notes:
Abbreviations: CMC - Camas Code of Ordinances; FOG - fats, oil, and grease; STE - septic tank effluent; STEF - septic tank effluent filter; STEP - septic tank effluent pump; UGA - urban growth area.

2.2.1 Environmental Stewardship

The following section summarizes existing policies regarding environmental stewardship.

Table 2.2 Environmental Stewardship Policies

Subject	Policy	Source
Allowable Discharges	Examples of allowable discharges include the following: • Broken water mains. • Diverted stream flows. • Rising ground waters. • Uncontaminated ground water infiltration, as defined in 40 CFR 35.2005(20). • Uncontaminated pumped ground water. • Foundation drains. • Air conditioning condensation. • Irrigation water from agricultural sources that is commingled with urban stormwater. • Springs. • Water from crawl space pumps. • Footing drains. • Flows from riparian habitats and wetlands. • Discharges from emergency firefighting activities.	CMC 14.04.070
Conditional Discharges	The following types of discharges shall not be considered illegal discharges for the purposes of this chapter if they meet the stated conditions, or unless the Director determines that the type of discharge, whether singly or in combination with others, is causing or is likely to cause pollution of surface water or groundwater: • Potable water, including water from water line flushing, hyperchlorinated water line flushing, fire hydrant system flushing, and pipeline hydrostatic test water. Planned discharges shall be de-chlorinated to a concentration of 0.1 ppm or less, pH-adjusted, if necessary and in volumes and velocities controlled to prevent re-suspension of sediments in the stormwater system. • Lawn watering and other irrigation runoff are permitted but shall be minimized. • De-chlorinated swimming pool discharges. These discharges shall be de-chlorinated to a concentration of 0.1 ppm or less, pH-adjusted, if necessary and in volumes and velocities controlled to prevent re-suspension of sediments in the stormwater system. • Street and sidewalk wash water, water used to control dust, and routine external building wash down that does not use detergents are permitted if the amount of street wash and dust control water used in minimized. At active construction sites street sweeping must be performed prior to washing the street. • Non-stormwater discharges covered by another NPDES permit, provided, that the discharger is in full compliance with all requirements of the permit, waiver, or order and other applicable laws and regulations; and provided, that written approval has been granted for any discharge to the storm drain system. • Other non-stormwater discharges. The discharges shall be in compliance with the requirements of a SWPPP, reviewed and approved by the city, which addresses control of such discharges by applying AKART to prevent contaminants from entering surface or ground water.	CMC 14.04.080
Septic System Elimination	Coordinate with Clark County to eliminate septic systems.	Camas 2035 Comprehensive Plan U-5
Illicit Connections	The following connections, both past, current, and future, to the stormwater system are expressly prohibited: • The construction, use, maintenance, or continued existence of illicit connections to the storm drain system is prohibited. • This prohibition expressly includes, without limitation, illicit connections made in the past, regardless of whether the connection was permissible under law or practices applicable or prevailing at the time of connection. • A person is considered to be in violation of this chapter if the person connects a line conveying sewage to the MS4 or allows such a connection to continue.	CMC 14.04.090
Wastewater Discharges	Except as hereinafter provided, no person shall discharge or cause to be discharged any of the following described water or wastes to any public sewer: • Any liquid or vapor having a temperature higher than 150 °F. • Any water or waste which may contain more than 100 ppm by weight, of FOG. • Any gasoline, benzene, naphtha, fuel oil, motor oil, lubricants or other flammable or explosive liquid, solid or gas. • Any garbage that has not been properly shredded. • Any ashes, cinders, sand, mud, straw, shavings, metal, glass, rags, feathers, tar, plastics, wood, paunch manure, or any other solid or viscous substance capable of causing obstruction to the flow in sewers or other interference with the proper operation of the sewage works. • Any waters or wastes having a pH lower than 5.5 or higher than 9.0 or having any other corrosive property capable of causing damage or hazard to structures, equipment, and personnel of the sewage works. • Any waters or wastes containing a toxic or poisonous substance in sufficient quantity to injure or interfere with any sewage treatment process, constitute a hazard to humans or animals, or create any hazard in the receiving waters of the sewage treatment plant. • Any waters or wastes containing suspended solids of such character and quantity that unusual attention or expense is required to handle such materials at the sewage treatment plant. • Any noxious or malodorous gas or substance capable of creating a public nuisance.	CMC 13.68.020(C)

Notes:
Abbreviations: °F - degrees Fahrenheit; AKART - all known, available and reasonable methods of prevention, control and treatment; CFR - Code of Federal Regulations; MS4 - Municipal Separate Storm Sewer System; NPDES - National Pollutant Discharge Elimination System, ppm - parts per million; SWPP - stormwater pollution prevention plan

2.2.2 Design Criteria and Standards

The City's wastewater system design standards, design details, specifications, and construction standards are documented in the Camas Design Standards Manual (2019) available from this City's Public Works department website. Additional design requirements and recommendations applicable to the City's sewer system are found in the Washington State Department of Ecology's (Ecology) *Criteria for Sewage Works Design* book, also known as the Orange Book. Current design criteria policies are outlined in Table 2.3.

The following section summarizes the existing and proposed policies regarding system design. It is recommended that the proposed new policies listed below be adopted by the City. Within this Plan, the capacity limitations of the collection system are evaluated against the proposed new design criteria policies.

Table 2.3 Design Criteria Policies

Subject	Policy	Source
Design	• Sewer systems shall be designed and constructed to achieve total containment of sanitary wastes and maximum exclusion of I/I. No new combined sewers will be approved.	Orange Book Section C1-1.3
Sewer location	• Siting of public sanitary sewer mains and MHs shall be restricted to the public right-of-way and/or easement dedicated for this utility.	Orange Book SectionC1-1.5
Design Period	• Service laterals shall be designed for the ultimate development of the parcel being served. • Collection sewers (that is, laterals and submains) shall be designed for the ultimate development of the tributary area. • Selection of the design period for trunk and interceptor sewers shall be based on an evaluation of economic, functional, and other considerations.	Orange Book Section C1-3.2
Design Flows	• Sewer systems shall be designed on the basis of per capita flows for the design period in conjunction with a peaking factor or approved alternative methods. • Generally, the sewers shall be designed to carry at least the peak hourly flow when operating at capacity. Peak hourly flow should be the design average daily flow in conjunction with a peaking factor.	Orange Book Section C1-3.3
Lift Station Design Criteria	• The firm capacity of a pumping station shall be equal to or greater than the peak hourly design flow. Because mechanical and electrical equipment is typically designed for a 20-year life, it is recommended that the peak design flow be based on a 20-year forecast or greater. • The number of pumps selected shall allow the station to provide the peak design flow with the largest pump out of order. • The station shall be designed to remain fully operational during the 100- year flood/wave event.	Orange Book Sections C2-1.2.1 C2-1.2.3 C2-1.1
Lift Station Pump	• Pumps should be designed for pumping sewage and capable of passing solids at least three inches in diameter. Pump suction and discharge should be four inches or greater.	Orange Book Section C2-1.2.4
Design Storm	• In accordance with all applicable federal, state, and local regulations, the City should design its wastewater system facilities to adequately and reliably convey peak hour flows associated with a Design Storm event without overflowing or discharging to any water bodies. The Design Storm is defined as a 20-year interval, 24-hour storm recorded at Portland International Airport rain gauge.	Proposed New Policy
Emergency Back-up Power	• All sewage pump stations should be designed with capability for emergency power in case the primary electrical feed is out of service. A portable engine generator unit that is plugged into a pigtail at the pump station commonly provides emergency power for small pump stations. Larger pump stations should have permanent engine generator units with automatic transfer switches to transfer the electrical feed from the primary to the standby unit when a power failure is detected by the instrumentation and control system.	Orange Book Section C2-1.8.3
Surcharging	• The City's design criteria require the depth of flow versus the diameter of the pipe (d/D) ratio to be equal to or less than 1 during the design storm (no surcharging).	Proposed New Policy
Inflow/ Infiltration	• Future development shall be designed for a peak inflow and infiltration rate of 1,100 gpad.	Proposed New Policy

Notes:
Abbreviations: d/D - depth versus diameter; gpad - gallons per acre per day; MH - manhole.

2.2.2.1 Wastewater Treatment Plant Design Criteria

The Ecology maintains requirements for hydraulic and loading capacities as well as the redundancy of treatment processes and equipment. These requirements are presented in the Orange Book, Ecology's guidelines for WWTF design (2008) and are derived from the Federal standards developed by the U.S. Environmental Protection Agency (EPA). Flow requirements are detailed in Table 2.4.

Ecology's criteria for designation of WWTFs are divided into three reliability classes based on the nature of their receiving water. Corresponding redundancy and reliability requirements are presented in Table 2.5 based on Ecology's guidelines and Federal standards. These requirements are the basis of the capacity analysis.

Table 2.4 Flow Requirement

WWTF Component	Flow Requirement	Source
Influent Screens	A backup screen designed for mechanical or manual screening must be provided. Influent screens must accommodate all flows.	(1)
Primary Clarifiers	Units must be sufficient in number and size to allow peak hour design flow including recirculation flow for overflow rate and weir loading rate. Surface overflow rates recommended are 400 to 600 gpd/sq ft at average design flow and 1,200 to 1,500 gpd/sq ft at peak design flow.	(1)
Primary Sludge Pumps	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1)
Degritting Cyclone and Grit Classifier	The system must contain components to remove grit and other heavy inorganic solids.	(1), (2)
Aeration Basins	A backup basin will not be required. At least two equal volume basins must be provided. All units in service for peak flow and loading conditions.	(1)
Internal Recycle Pumps	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1), (2)
Aeration Systems	A sufficient number of aerators to enable the design oxygen transfer to be maintained with the largest unit out of service.	(1), (2)
Secondary Clarifiers	Units must be sufficient in number and size to allow PHDF including recirculation flow for overflow rate and weir loading rate.	(1)
RAS Pumps	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1)
WAS Pumps	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1)
Effluent Filters	Secondary effluent polishing filters must pass all flows requiring tertiary treatment.	(1)
UV Channel	Equipment sized to provide maximum day design flow with to meet disinfection requirements and accommodate peak hour design flow hydraulically.	(1)
Effluent Pump Station	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1)
Gravity Thickener	Redundant units provided for equipment maintenance. Ability to thicken and dewater maximum sludge production with all units in service.	(1) (2)
Rotary Drum Thickener	Redundant units provided for equipment maintenance. Ability to thicken and dewater maximum sludge production with all units in service.	(1) (2)
Primary Anaerobic Digesters	Redundant units provided for equipment maintenance. Ability to thicken and dewater maximum sludge production with all units in service.	(1) (2)
Digested Sludge Pumps	A backup pump must be provided that that matches the largest pump and motor. Pumps must handle peak design flows with the largest units out of service.	(1)
Dewatering Centrifuge	Redundant units provided for equipment maintenance. Ability to thicken and dewater maximum sludge production with all units in service.	(1) (2)
Biosolids Dryer	Redundant units provided for equipment maintenance. Ability to thicken and dewater maximum sludge production with all units in service.	(1) (2)

Notes:
(1) Criteria for Sewage Works Design (Ecology, 2008).
(2) Design Criteria for Mechanical, Electric, and Fluid Systems and Component Reliability (EPA, 1974).
Abbreviations: gpd/sg ft - gallons per day per square foot; PHDF - peak hour demand flow; RAS - return activated sludge; UV - ultraviolet; WAS - waste activated sludge.

Table 2.5 Wastewater Treatment Plant Redundancy and Reliability Requirements

WWTF Component	Flow Criteria	Load Requirement	Redundancy
Influent Screens	Pass all flows	-	1 Unit Out of Service
Primary Clarifiers	PHF + Recirculation	Peak Hour Design Load (1)	All Units in Service
Primary Sludge Pumps	Peak Instantaneous Design Flow	Maximum Daily Design Load	1 Unit Out of Service
Degritting Cyclone	PHF	-	Minimum 2 Units
Grit Classifier	PHF	-	1 Unit Out of Service
Aeration Basins	Maximum Week Design Flow Maximum Daily Design Flow	Maximum Daily Design Load Maximum Daily Design Load	All Units in Service All Units in Service
Internal Recycle Pumps	PHF	-	1 Unit Out of Service
Aeration Systems	-	Peak Hour Design Load (2)	1 Unit Out of Service
Secondary Clarifiers	PHF + Recirculation	Peak Hour Design Load (1)	All Units in Service
RAS Pumps	MMF	-	1 Unit Out of Service
WAS Pumps	Peak Instantaneous Design Flow	Maximum Daily Design Load	1 Unit Out of service
Effluent Filters	All flows requiring tertiary treatment	-	-
UV Channel	PHF	-	1 Unit Out of Service
Effluent Pump Station	Peak Instantaneous Design Flow	-	1 Unit Out of Service
Gravity Thickener	-	Maximum Daily Design Load (2)	1 Unit Out of Service
Rotary Drum Thickener	-	Maximum Daily Design Load (2)	1 Unit Out of Service
Primary Anaerobic Digesters	-	Maximum Daily Design Load (2)	1 Unit Out of Service
Digested Sludge Pumps	-	-	1 Unit Out of Service
Dewatering Centrifuge	-	Maximum Daily Design Load (2)	1 Unit Out of Service
Biosolids Dryer	-	Maximum Daily Design Load (2)	1 Unit Out of Service

Notes:
(1) Total suspended solids (TSS) loading only.
(2) 5-day biochemical oxygen demand (BOD_5) loading only.
Abbreviations: PHF - peak hour flow; MMF - maximum monthly flow

2.2.3 Financial Policies

The City's financial polies support the operation of the wastewater utility. A summary of financial polices applicable to the Plan are outlined in Table 2.6.

Table 2.6 Financial Policies

Subject	Policy	Source
Credits	Those properties that have been disconnected from the city sewer system since January 1, 1972, shall receive a credit for the prior connection. The credit for the prior connection shall be in an amount equal to the sewer system development charge for the use classification of the prior connection. The sewer system development charge imposed under this chapter shall be the difference between the amount due under the present use classification less the amount that would have been assessed under the use classification for the prior connection, provided however, that the city shall not be required to reimburse the property owner in the event the credit exceeds the sewer system development charge for the new connection.	CMC 13.72.040(A)
Credits	Those properties that are not presently connected to the city's sewer system but which have been assessed and paid a monthly penalty pursuant to Section 13.60.050(B) shall receive a credit against the sewer system development charge in an amount equal to the total monthly penalties paid prior to connection, provided however, that the city shall not be required to reimburse the property owner in the event the credit exceeds the sewer system development charge for the new connection.	CMC 13.72.040(B)
Violation	Any person, firm or corporation who violates or refuses or fails to comply with any of the provisions of Sections 13.60.020 through 13.60.110 shall be guilty of a misdemeanor and shall be punished by a fine of not less than twenty-five dollars nor more than one hundred dollars or imprisoned in the city jail for a period of thirty days or by both such fine and prison term.	CMC 13.60.090
Inflow Connection	There is imposed upon those property owners who are within the area served by the sanitary system and who refuse to connect to such sanitary sewer system a penalty in an amount equal to the charge that would have been made for sewer service if such property had been connected to the sanitary sewer system. Such penalties as provided herein shall accrue monthly until such property is connected to the sanitary sewer system. All penalties collected pursuant to this provision shall be considered revenue of the sanitary sewer system.	CMC 13.60.050(B)
Sewer Service Development	Pursuant to the authority conferred upon cities and towns by RCW 35.92.020 and 35.92.025, the city council of the city finds that property owners who seek to connect property to the sewer system of the city should be assessed a charge in order that such property shall bear its equitable share of the cost of the sewer system. The council further finds that the charge should be based upon the property owner's anticipated use of the sewer system as related to the historical cost of the sewer system and the projected cost of additions to the sewer system to meet new demand. That portion of the charge based upon the historical costs of the sewer system shall be measured by the undepreciated value of the sewer system and plant in service at the time the charge is imposed. That portion of the charge based upon the projected cost of future improvements shall be based upon appropriate studies by engineers and/or financial consultants. The charge imposed by this chapter shall be denominated as a "sewer system development charge" and shall be in addition to any sewer connection or permit fees imposed by other ordinances of the city.	CMC 13.72.010
Damage to STEP	The cost of repairing any damage to a STEP system which has resulted from the negligence, gross negligence, or intentional acts of the owner shall be the responsibility of the owner. This responsibility includes any clogging which may result due to improper use of the STEP system by the owner.	CMC 13.62.070
Connection Charges for STEP	Except as hereinafter provided, the connection charge for connecting a STEP/STE sewer system to the Camas municipal sewer system shall be the cost of materials, the costs of labor for city personnel at then prevailing rate for such personnel, and the amount of any fees or charges required to be paid to any third parties in order to make such connection.	CMC 13.64.050(A)
Connection Charges for STEP	The connection charge for connecting a STEP/STE sewer system to the Camas municipal sanitary sewer system with a one-inch service line or less shall be as per the fee schedule established by the city council per resolution, or the actual cost to the city calculated in accordance with subsection A of this section, whichever is greater.	CMC 13.64.050(B)
Connection Charges for STEP	No connection charge will be assessed if a service line has already been installed connecting the subject property to the city sanitary sewer system.	CMC 13.64.050(C)

Notes:
Abbreviations: RWC - Revised Code of Washington.

2.2.4 Regulatory Requirements

The City's criteria is developed based on federal and state statues, regulations, and permits. These laws help to determine the design criteria for the City's collection, treatment, and disposal facilities. These regulatory requirements are outlined in Table 2.7.

Table 2.7 Regulatory Requirements

Subject	Policy
Federal Clean Water Act Condition S1	Condition S.1 of the City's permit requires the treatment plant effluent to meet limits for BOD_5, TSS, fecal coliform bacteria, pH, and total ammonia.
Federal Clean Water Act Condition S2	Condition S.2.lists monitoring requirements including influent and effluent flow, BOD_5, TSS, pH, temperature, total ammonia, fecal coliform, priority pollutant metals, oil and grease and cyanide. A program to address oil and grease is also required. The City must monitor twice per 5 years for effluent whole effluent toxicity and conduct quarterly and yearly priority pollutant monitoring of its influent and effluent in support of its industrial pretreatment program. Additionally, per the terms of the City's coverage under the Statewide Biosolids permit, the City must annually test its biosolids for pollutants and compliance with pathogen reduction and vector attraction reduction criteria.
Federal Clean Water Act Condition S4	Condition S.4.A specifies the WWTF design capacity for maximum month BOD_5 loading is 5,616 lbs/day and 6,405 lbs/day for TSS. The peak hour flow, dry weather monthly average, and maximum month average flow capacities for the WWTF are 11.09, 2.86 and 6.10 mgd, respectively. Condition S.4.B requires the City to prepare a plan to maintain adequate capacity when flows and loadings to the WWTF exceed 85% of design capacity for 3-consecutive months.
National Environmental Policy Act	The NEPA was established in 1969 and requires federal agencies to determine environmental impacts on all projects requiring federal permits or funding. Federally delegated activities such as NPDES permits or Section 401 Certification are considered state actions and do not require NEPA compliance. If a project involves federal action (through, for example, an Army Corps of Engineers Section 404 permit), and is determined to be environmentally insignificant, a (FONSI) is issued, otherwise an Environmental Assessment (EA) or Environmental Impact Statement (EIS) would be required. NEPA is not applicable to projects that do not include a federal component.
Federal Clean Air Act	The Federal Clean Air Act requires all wastewater facilities to plan to meet the air quality limitations of the region. The City falls in the jurisdiction of the Southwest Clean Air Agency (SWCAA). The SWCAA is responsible for enforcing federal, state and local outdoor air quality standards and regulations in Clark, Cowlitz, Lewis, Skamania and Wahkiakum counties of southwest Washington state. The Camas generator is permitted by SWCAA.
State Water Pollution Control Act	The intent of the state Water Pollution Control Act is to "maintain the highest possible control standards to ensure the purity of all waters of the state consistent with public health and the enjoyment…the propagation and protection of wildlife, birds, game, fish and other aquatic life, and the industrial development of the state." Under the RCW 90.48 and the (WAC) 173-240, Ecology issues permits for wastewater treatment facilities and land application of wastewater under WAC 246-271.
Criteria for Sewage Works Design, Ecology	Ecology has published design criteria for collection systems and wastewater treatment plants. While these criteria are not legally binding, their use is strongly encouraged by Ecology since the criteria are used by the agency to review engineering reports for upgrading wastewater treatment systems. Commonly referred to as the "Orange Book," these design criteria primarily emphasize unit processes through secondary treatment, and also includes criteria for planning and design of wastewater collection systems. Any expansion or modification of the City collection system and/or WWTF plant will require continued conformance with Ecology criteria.
Certification of Operators of Wastewater Treatment Plants, WAC 173-230	Wastewater treatment plant operators are certified by the state Water and Wastewater Operators Certification Board. The operator assigned overall responsibility for operation of a wastewater treatment plant is defined by WAC 173-230 as the "operator in responsible charge." This individual must have state certification at or above the classification rating of the plant. The City WWTF is currently assigned a Class 4 rating and the operating staff assigned to the plant have the required certification. (One of the operators has a Class 4 certification; two have Class 3 certification, and one has Class 2 certification).
Surface-Water Quality Standards (WAC 173-201A)	In the State of Washington, WAC 173-201A establishes water quality standards for surface waters based on maintaining public health, recreational use and protection of fish, shellfish, and wildlife. Surface water quality standards include five groups: AA (extraordinary), A (excellent), B (good), C (fair), and Lake Class. Each class has its own characteristic use and measurable criteria. Measurable parameters used to distinguish the different surface water classifications include fecal coliform levels, dissolved oxygen concentration, temperature, pH, and turbidity. The surface water criteria include 29 toxic substances, including ammonia, residual chlorine, several heavy metals, polychlorinated biphenyls (PCBs), and pesticides.
State Environmental Policy Act	WAC 173-240-050 requires a statement in all wastewater comprehensive plans regarding proposed projects in compliance with the SEPA, if applicable. The capital improvements proposed in this plan will fall under SEPA regulations. A SEPA checklist is included in Appendix A of this report for use in the environmental review for the project. In most cases a DNS is issued; however, if a project will have a probable significant adverse environmental impact an EIS will be required.
Accreditation of Environmental Laboratories (WAC 173-050)	The State of Washington established a requirement that all laboratories reporting data to comply with NPDES permits must be generated by an accredited laboratory. This accreditation program establishes specific tasks for QA/QC that are intended to ensure the integrity of laboratory procedures. Accreditation requirements must be met for any on-site laboratory or outside laboratory used to analyze samples. Only accredited laboratories may be used for analyses reported for compliance with NPDES permits. In planning for an on-site laboratory, staffing must be sufficient to allow for QA/QC procedures to be performed. The Camas WWTF lab is currently accredited for determination of the following parameters TSS, BOD_5, ammonia, dissolved oxygen, pH and fecal coliform.
Minimal Standards for Solid Waste Handling (WAC 173-304)	Grit and screenings are not subject to the sludge regulations in WAC 173-308, but their disposal is regulated under the state solid waste regulations, WAC 173-304. Waste placed in a municipal solid waste landfill must not contain free liquids, nor exhibit any of the criteria of a hazardous waste as defined by WAC 173-303. To be placed in a municipal solid waste landfill, grit, screenings, and incinerator ash must pass the paint filter test. This test determines the amount of free liquids associated within the solids, and includes the TCLP test, which determines if the waste has hazardous characteristics.
Shoreline Management Act	The Shoreline Management Act of 1971 (RCW 90.58) establishes a broad policy giving preference to shoreline uses that protect water quality and the natural environment, depend on proximity to the water, and preserve or enhance public access to the water. The Shoreline Management Act jurisdiction extends to lakes or reservoirs of 20 acres or greater, streams with a mean annual flow of 20 cfs or greater, marine waters, and an area inland 200 ft from the ordinary high-water mark. Projects are reviewed by local governments according to state guidelines and a local Shoreline Master Program. The Camas wastewater treatment plant and portions of the collection system are located within shoreline areas.

Notes:
Abbreviations: cfs - cubic feet per second; DNS - determination of non-significance; FONSI - finding of no significant impact; lbs/day - pounds per day; mgd - million gallons per day; NEPA - National Environmental Policy Act; TCLP - toxic characteristic leachate procedure; QA/QC - quality assurance and quality control; WAC - Washington Administrative Code

2.2.4.1 NPDES Permit

Table 2.8 presents a brief overview of relevant design criteria and effluent limitations contained in the City's WWTF NPDES Permit No. WA0020249. The City's current permit was issued September 15, 2015 and effective October 1, 2015. This NPDES permit places limits on various water quality parameters, flow rates, and waste loading pertaining to the discharge of treated effluent from the WWTF.

Table 2.8 NPDES Influent Design Criteria and Effluent Limits

NPDES Influent Design Criteria and Effluent Limits		
NPDES Influent Design Criteria		
Parameter		Value
MMF		6.1 mgd
Monthly Average Dry Weather Flow		2.86 mgd
BOD_5 Max Month Loading		5,616 lbs/day
TSS Max Month Loading		8,011 lbs/day
NH_3-N Max Month Loading		1,956 lbs/day
NPDES Effluent Limits		
Parameter	Average Monthly Limit	Average Weekly Limit
BOD_5	• 20 mg/L • 74% removal of influent • 1,017 lbs/day	• 30 mg/L • 1,525 lbs/day
TSS	• 20 mg/L • 76% removal of influent • 1,017 lbs/day	• 30 mg/L • 1,525 lbs/day
Fecal Coliform Bacteria(1)	• 200 organisms/100 mL	• 400 organisms/100 mL
NH_3-N Summer(2)	• 20 mg/L	• N/A
NH_3-N Winter	• 7 mg/L	• N/A

Notes:
(1) Geometric mean.
(2) Summer ammonia limits apply to the months of June through September.
Abbreviations: mg/L - milligrams per liter; mL - milliliter; NH_3-N - ammonia.

Chapter 3

BASIS OF PLANNING

3.1 Introduction

This chapter presents an evaluation of historical wastewater flows and loads through the City of Camas's (City's) collection system and entering the wastewater treatment facility (WWTF). This chapter establishes the WWTF's flow and load projections based upon future population growth through 2035.

The remainder of this Chapter is divided into four sections:

- Section 3.2 provides definitions for the wastewater flow terminology used in this chapter, as it is not commonly used outside of planning and design evaluations.
- Section 3.3 presents the collection system flow monitoring results, which are used to set a baseline for flow projections and development of the hydraulic model.
- Section 3.4 presents projected flows and loads for the City's collection system, which are used in hydraulic modelling evaluations.
- Section 3.5 presents projected flows and loads for the WWTF, which are used in unit process capacity evaluations.

The collection system and WWTF projections are based on demographic growth projections from the *2035 Comprehensive Plan*. However, slightly different methodologies are used to project wastewater flows in the collection system and WWTF due to the requirements of the analyses and availability of data. Two major factors drive these differences. First, the collection system uses flow monitoring data from four-month period in the winter of 2018 and 2019, while the WWTF analysis uses historical influent data from 2015 through 2018. Second, the WWTF flows ware only projected for 2035, while collection system flows are projected for 2035 and buildout period. Collection system piping is typically sized using the buildout period projections since these pipes have a 75-year service life.

3.2 Definitions

Wastewater flows are analyzed by separating dry weather flow from wet weather flow to establish base flows. These base flows identified during dry weather are then used as the basis to project both wet and dry weather flows. Due to the separate collection system and WWTF projections established, the following terminology was utilized to differentiate the various flow parameters:

- **Influent Dry Weather Flow (IDWF)** is the average daily flow during the two driest months of the year (July and August). The IDWF includes the base flow generated by the City's residential and commercial connections plus the dry weather groundwater infiltration (GWI) component. For the City, the IDWF was estimated throughout the service area based on the historical influent flow data from the WWTF.

- **Average Dry Weather Flow (ADWF)** establishes a similar flow parameter as IDWF; ADWF was differentiated as it was based upon collection system flow monitoring data period of record that differs from the IDWF.
- **Average Annual Flow/Load (AAF/AAL)** is the average flow or load that occurs over a calendar year. AAF and AAL were estimated based on the historical influent flow and load data from the City's WWTF.
- **Maximum Month Flow/Load (MMF/MML)** is the maximum 30-day running average influent flow observed at the WWTF during a calendar year. MMF and MML were estimated based on the historical influent flow and load data from the City's WWTF.
- **Peak Day Flow/Load (PDF/PDL)** is the maximum 24-hour average flow and load observed at the WWTF during a calendar year. PDF and PDL were estimated based on the historical influent flow and load data from the City's WWTF.
- **Peak Hour Flow (PHF)** is the highest observed hourly flow that occurs during the design storm. Wet weather inflow and infiltration (I/I) causes flows in the collection system to increase. PHF is typically used for designing sewers and lift stations. Therefore, the PHF and the collection system "Design Flow" are synonymous and will be used interchangeably throughout this Plan.

3.3 Collection System Flow Monitoring Results

The City contracted with ADS to conduct a temporary flow monitoring program within the City's sanitary sewer collection system. The purposes of the Flow Monitoring Program were to collect data for correlating real collection system flows with the hydraulic model's predicted flows, evaluate the system's capacity, and estimate basin I/I. The temporary flow monitoring data was collected from November 16, 2018, to March 18, 2019. The "Camas Flow Monitoring Report 2019" prepared by ADS summarizes the flow monitoring program and was submitted to the City as a stand-alone report. The report can be found as Appendix D - Temporary Flow Monitoring and RDII Analysis (ADS, 2019).

3.3.1 Average Dry Weather Flow Data

Average dry weather flow projections are derived from land use category data and corresponding wastewater flow factors. This method assumes that areas with similar land uses, such as low-density residential parcels, produce equivalent quantities of wastewater flow on a per area basis. System-wide flows can be compared to recorded flows obtained from temporary collection system flow monitors, or from the treatment plant influent flow meter to verify accuracy. This method of estimating base flows is an industry standard providing sufficiently accurate data for planning purposes.

3.3.1.1 ADWF Development

Existing ADWFs for each basin were estimated using data from the Camas flow monitoring report for each of the flow monitoring basins. ADWF was then developed using the driest days from the flow monitoring period based on the following set of minimum criteria:

- Less than 0.1 inch of rain in the previous day.
- Less than 0.4 inches of rain in the previous 3 days.
- Less than 1.0 inch of rain in the previous 5 days.
- In addition, those dry days that exhibited unusual flow patterns were not used to generate net dry day flow values for a basin.

Characteristic dry weather 24-hour diurnal flow patterns were developed for each basin from hourly data. The hourly flow data were also used to calibrate the hydraulic model for the observed dry weather flows during the flow monitoring period. Hourly patterns for weekday and weekend flows vary and were separated to better define dry weather flow. An example of the dry weather flow diurnal patterns from Flow Meter 5-1-1, are shown in Figure 3.1.

Carollo Engineers, Inc. (Carollo) estimated the average weekday and weekend dry weather levels and velocities at each site from the data provided by ADS for use in the model calibration process.

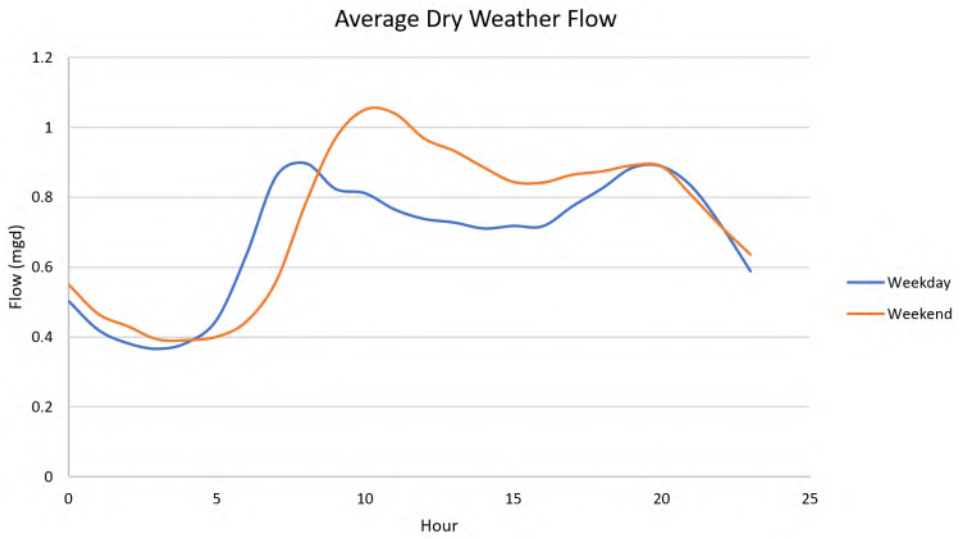

Figure 3.1 Typical Weekday vs Weekend Dry Weather Flow Variation (Meter 5-1-1)

Further detail on dry weather flow (DWF) development can be found in Appendix E - Hydraulic Model Development (Carollo, 2020).

3.3.2 Rainfall Data

An important part of the flow monitoring program is the collection and analysis of rainfall data. Three significant rainfall events occurred during the flow monitoring period, as well as other minor events. The storms recorded during this period caused an I/I response in the collection system, therefore were appropriate for I/I analysis and model calibration purposes. Further detail on the three storms used to calibrate the model can be found in Appendix E - Hydraulic Model Development (Carollo, 2020).

3.3.3 Wet Weather Flow Data

The flow monitoring data were also evaluated to determine how the collection system responds to wet weather events. As mentioned above, the flow monitoring program captured three main rainfall events. The rainfall event that occurred on December 23, 2018, was associated with the largest rainfall dependent infiltration and inflow (RDI/I) response during the flow monitoring period and is the most appropriate to be used for RDI/I analysis.

Figure 3.2 shows an example of the wet weather response at Meter 5-1-1 during the December 23, 2018, rainfall event. This figure also illustrates the volume of RDI/I that entered the system from the collection system upstream of Meter 5-1-1. The light grey line represents the

ADWF, while the green line represents the measured flow during the storm event. As can be seen in the figure, the flow increased by 4 to 8 times ADWF due to RDI/I entering the system during the wet weather events.

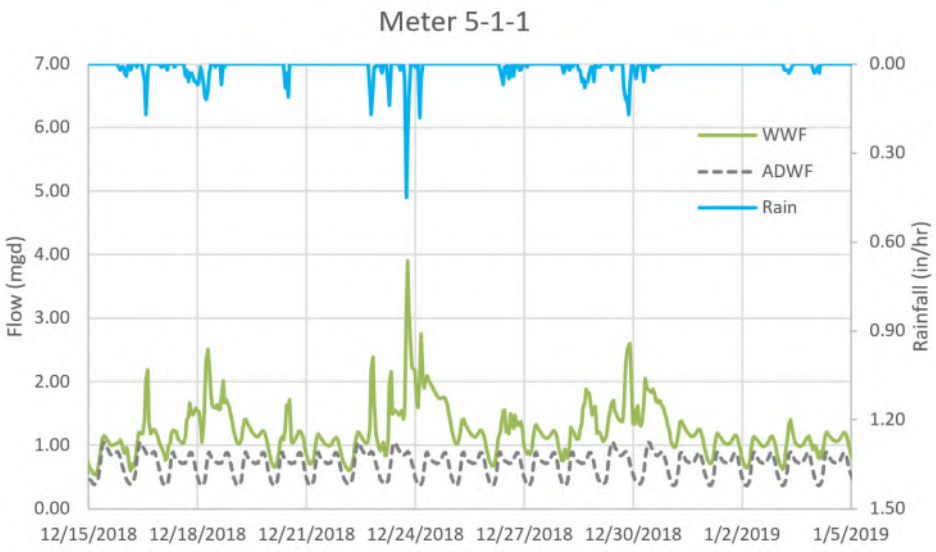

Figure 3.2 Example Wet Weather Response (Meter 5-1-1)

3.4 Collection System Flow Projections

Wastewater collection systems has several distinct flow sources based on the contributors in the service area:

1. Residential flow and base infiltration.
2. Commercial and industrial flow.
3. Wet weather I/I.

The flow from these sources have been grouped into these categories based on typical analytical procedures and the availability of information for each source. Residential flows include contributions from single family homes and multifamily units. The Washington State Department of Ecology (Ecology) issues discharge permits for the City's large industrial customers since the City does not have a pretreatment program in place. Wet weather I/I is caused by rainfall events and includes contributions from connected impervious areas such as roof drains and catch basins (inflow), and groundwater (infiltration) leaking into the collection system. The sum of these components is the complete flow through the collection system into the WWTF.

The flows throughout the collection system were estimated using the calibrated hydraulic model to predict dry and wet weather flows, as presented in Appendix E - Hydraulic Model Development (Carollo, 2021).

3.4.1 Sewered Population

Population projections are determined from the *2035 Comprehensive Plan*, the *Water SystemPlan* (Carollo Engineers, 2016), and the North Urban Growth Area Buildout Memo (BergerABAM, 2014), which are summarized by year in Table 3.1. Additional details on the

methods for population projection are available in Appendix E - Hydraulic Model Development (Carollo, 2021).

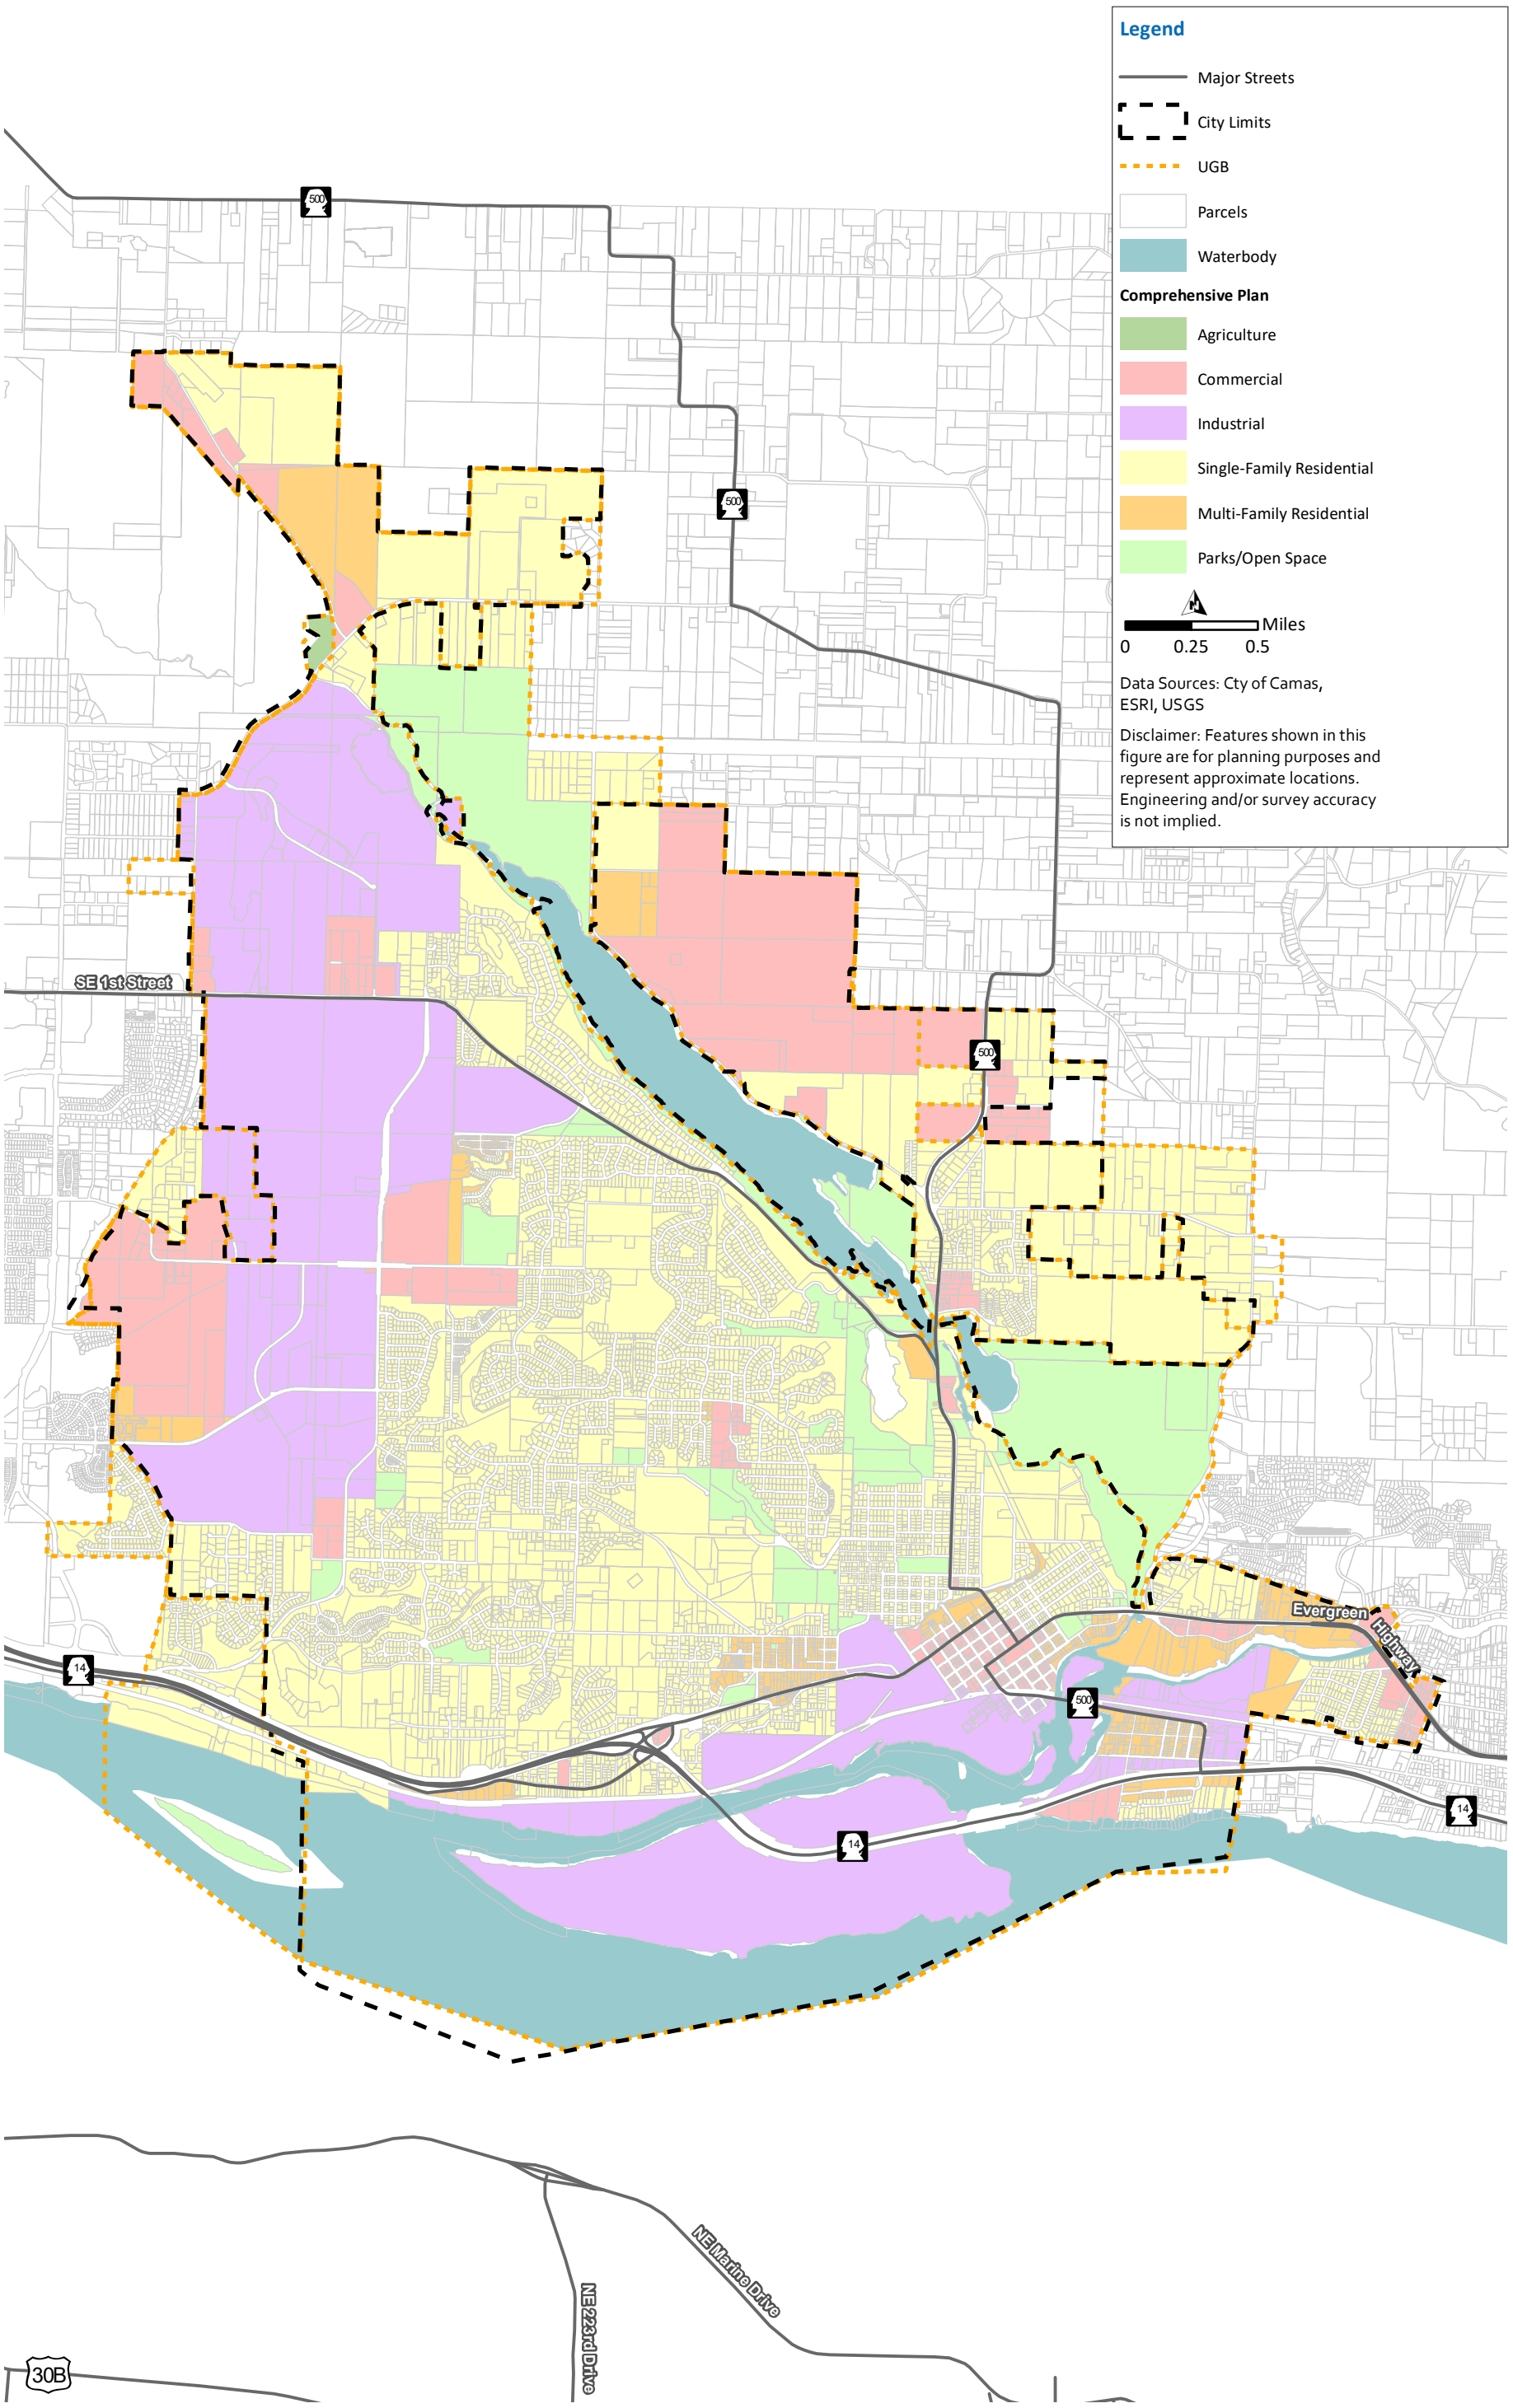
Table 3.1 Population Summary

Year	Population Projections	Source
2020	26,065	(1) (2)
2035	36,000	(3)

Notes:
(1) Population data from the Comprehensive Plan was provided for 2015.
(2) The 2020 population was taken from April 2020 census data. https://www.census.gov/quickfacts/fact/table/camascitywashington/PST045219.
(3) Population data from the Water System Plan and the North Shore Population Estimate Memo was provided for 2035. Half of the North Shore area was assumed to be developed.

3.4.2 Land Use

Land use designations and regulations provide important information for evaluating sewer system capacity. Existing and future land use information is an integral component in projecting wastewater generation within the service area. The type of land use in an area will affect the volume of the wastewater generated. Adequately estimating the generation of wastewater from various land use types is important in sizing collection system facilities.



The City has six major land use categories for parcels within the UGB, as shown in Figure 3.3, which are sub-divided into the nine categories used in the *2035 Comprehensive Plan*. Acreage totals for each land use category are summarized by acreage in Table 3.2.

Table 3.2 Comprehensive Plan Land Use Summary

Comprehensive Plan Designation	Total Acreage[1]
Single Family High	425
Single Family Medium	3,617
Single Family Low	871
Multi Family High	246
Multi Family Low	279
Commercial	992
Industrial	2427
Parks[2]	851
Open Space/Green Space	492
Gross Total	10,200
Rights-of-Way and Stormwater Facilities	-27.7%[3]
Net Total	7,375

Notes:
(1) Total area within each comprehensive plan designation within the urban growth boundary.
(2) Applies only to land held in public trust.
(3) Based on typical County infrastructure deduction used in Clark County Buildable Lands Report.

Maps of the City's existing and future land use within the Service Area were developed with data provided by the City's Planning Department. Existing development information was taken from zoning data. Additional details on developing flows by land use type can be found in Appendix E - Hydraulic Model Development (Carollo, 2020).

Last Revised: February 11, 2022 pw:\\IO-PW-INT.Carollo.local:Carollo\Documents\Client\WA\Camas\11418A00\GIS\MXD\Fig4_CompPlan_LU.mxd

Figure 3.3 Land Use

3.4.3 Wastewater Flow Factors

Relationships between land use and wastewater generation were developed to project wastewater flows and allocate future flows to the collection system. These relationships, called wastewater flow factors, are established based on the average wastewater flow generated for each existing land use type. The land use flow factors were established to project the estimated ADWF through future development of the City's wastewater collection system and project future flows within the Study Area boundary.

Average wastewater flow coefficients are volume rates, usually expressed in gallons per acre per day (gpad), applied to either gross or net acres to calculate average day flow generated from a particular land use. A flow coefficient was developed for each of the land use classifications that were discussed in Section 3.4.2. The flow coefficient provides a means to transform a land use category from acreage into wastewater flow. The resulting flow is then applied to the appropriate sewer area in the sewer system model. Wastewater flow coefficients for residential areas typically range between 500 to 3,000 gpad, and commercial or industrial areas might range from 1,000 to 4,000 gpad, with typical values averaging approximately 1,500 gpad. Land uses designated as open space and parks are assumed to generate negligible amounts of sewage flow, and as a result have a flow coefficient of zero. Additional detail on the development of these flow factors is provided in Appendix E - Hydraulic Model Development (Carollo, 2021). Table 3.3 summarizes the flow factors used to project dry weather flows.

Table 3.3 Wastewater Flow Factor Development Summary

Land Use Type	Developed Area (acres)	Wastewater Flow Factor (gpad)	Existing ADWF (mgd)
Single Family Low	95	450	0.04
Single-Family Medium	693	670	0.46
Single Family High	22	800	0.02
Multi-Family Low	11	1,250	0.01
Multi-Family High	123	1,520	0.19
Commercial	110	1,270	0.14
Industrial	98	1,000	0.10
Agriculture	0	0	0.00
Park/Open Space	117	0	0.00
		Total Estimated Existing ADWF	**0.96**
		Measured Existing ADWF	**0.97**
		Percent Difference	**-0.2%**

3.4.4 Industrial Customer Flows

The City currently has three major industrial customers which must submit industrial discharge monitoring reports to Ecology for various flows, constituents, and characteristics as a condition of their discharge permits. The collective AAF from these contributors is 0.92 million gallons per day (mgd) with a PDF of 1.1 mgd as shown in Table 3.4. These flows can represent a large portion of influent flows for the WWTF. Flow data was taken from available DMR data from 2017 to 2022, as reported to and recorded on the Department of Ecology's Water Quality Permitting and Reporting Information System (PARIS).

Table 3.4 Industrial Customer Flows

Industry	MDF (gpd)	PDF (gpd)	AAF (gpd)
Wafertech Industries	525,000	737,000	629,408
Analog Devices	222,100	381,697	288,812
nLIGHT	156	9,971	3,014
All Flows	747,256	1,128,668	921,234

Notes:
Abbreviations: gpd – gallons per day; MDF - minimum daily flow.

3.4.5 Hydraulic Model Dry Weather Flow Projections

Developing an accurate estimate of the future quantity of wastewater generated at buildout of the collection system is an important step in sizing sewer system facilities for future scenarios. To estimate ADWF for specific areas, such as individual wastewater basins, dry weather flows are typically estimated based on the area contributing to flows and flow factors developed for each land use type. This method is developed based on the assumption that areas with similar land uses, such as low-density residential parcels, produce equivalent quantities of wastewater flow. System-wide flows can be compared to known flows at flow monitors, or at the treatment plant to verify accuracy of planning flow factors based on current development and measured flows. This method of estimating base flows is an industry standard for planning and provides sufficiently accurate data for planning purposes. Table 3.5 outlines the projected ADWFs for each flow monitoring basin for current, 2035, and buildout conditions.

Table 3.5 ADWF Projections for Hydraulic Modelling

Flow Meter Basin	Existing ADWF (mgd)	2035 ADWF (mgd)	Buildout ADWF (mgd)
Basin 5-1-1	0.53	1.25	2.12
Basin 5-1-2	0.15	0.25	0.38
Basin 10-10-12	0.17	0.19	0.22
Basin 8-1-1	0.12	0.13	0.13

3.4.6 Design Storm

Design storms are rainfall events used to analyze the performance of a collection system during peak flows and volumes and have a specific recurrence interval and rainfall duration. The design storm is used for sizing projects. The National Oceanic and Atmospheric Administration (NOAA) publishes isopluvial (rainfall contour) maps[1] that approximate the total rainfall depth for a range of storm size recurrence intervals for standardized storm durations.

The first step in the development or selection of the design storm is to define its recurrence interval and rainfall duration. The recurrence interval is based on the probability that a given rainfall event will occur or be exceeded in any given year. For example, a "100-year storm" means there is a 1 in 100 chance that a storm as large as, or larger, than this event will occur at a specific location in any year. Duration is the length of time in which the rainfall occurs.

[1] Miller, J., R. Frederick, and R, Tracey. Precipitation-Frequency Atlas of the Western United States, Volume IX-Washington. Washington DC, NOAA 1973.

Discrete storm events are established based on the period of time that there is no rainfall between rain events. A 20-year recurrence interval is recommended to match the pump station life cycle sizing in Ecology's Criteria for Sewage Works Design book (Orange Book); therefore the collection system must also be able to convey a 20-year storm.

The NOAA information is based on older data and does not provide a hydrograph corresponding to the accumulated rainfall. To find a suitable storm hydrograph, a statistical analysis on historical rainfall records recorded by the City and other nearby gauges was conducted. 20-year rainfall records from the City's HYDRA Rainfall Network and a 60-year record from the Portland International Airport were used to select a 20-year occurrence rainfall event on December 6, 2015. This storm had 3.37 inches of rainfall in 24 hours, which was consistent with 20-year recurrence intervals from other regional rain gauges. However, we will refer to this event as a 10-year design storm as it aligns with a 10-year recurrence defined by NOAA.

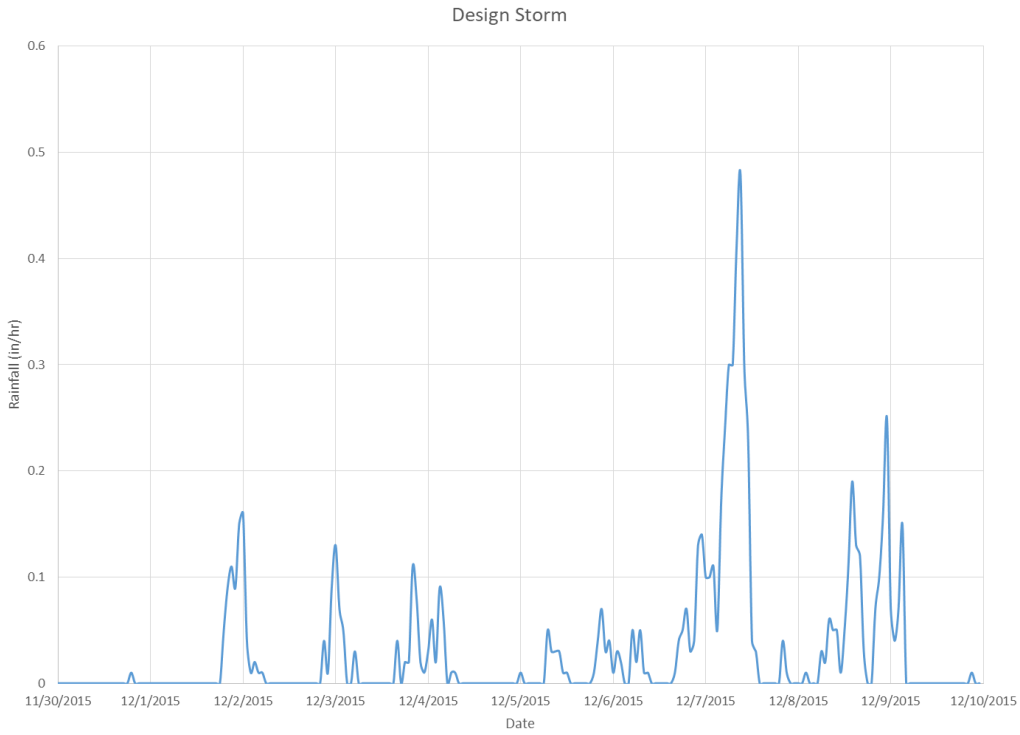


Figure 3.4 Design Storm Hyetograph

3.4.7 Hydraulic Model Wet Weather Flow Projections

To predict future Peak Wet Weather Flow (PWWF), I/I in the future service area must be defined. It is assumed that maintenance will keep up with system degradation, so no net change in I/I was used for future modeling scenarios within the existing service area. Additional area was added to the model for future scenarios in the North Shore that will add additional I/I flows into the system. The North Shore scenarios used the calibrated I/I parameters from Basin 8-1-1, as Basin 8-1-1 has a low I/I response indicative of recent construction. This corresponded to an I/I flow rate of 2000 gpad. Table 3.6 outlines the projected PWWF's for each flow monitoring basin for current, 2035, and buildout conditions. To properly convey the flows throughout the system to find the true peaks, significant upsizing was done on the piping and pump station capacity to eliminate hydraulic restrictions.

Table 3.6 PWWF Flow Projections for Hydraulic Modelling

Flow Meter Basin	Existing PWWF (mgd)	2035 PWWF (mgd)	Buildout PWWF (mgd)
Basin 5-1-1	4.63	11.38	12.76
Basin 5-1-2	0.39	1.51	1.66
Basin 10-10-12	0.54	0.56	0.59
Basin 8-1-1	0.43	0.44	0.44

3.4.8 Hydraulic Model Flow Projections Summary

Table 3.7 presents the total projected ADWF and PWWF for the three planning periods for the modeled portion of the system (gravity and Septic Tank Effluent Pump [STEP] that is upstream of gravity). The table also includes the ratio between PWWF to ADWF, called the Peaking Factor, which ranges from 5.7 to 8.2.

Table 3.7 Flow Projections Summary

Planning Horizon	ADWF (mgd)	PWWF (mgd)	Peaking Factor (PWWF:ADWF)
2018	0.80	5.45	6.8
2035	1.63	13.33	8.2
Buildout	2.63	14.86	5.7

3.5 WWTF Flow and Load Projections

The City's WWTF receives flows from the gravity collection system, septic tank effluent, and the septage receiving station. The sum of these flows is greater than the collection system flow projections because that analysis only focused on the portion of the system included in the hydraulic model and did not include septic tank flows, which make up to 50 percent of the total influent flow. Thus, load and peak hour flow projections were developed independently for the WWTF based on measured influent flows and wastewater characteristics, typical septage and STEP system characteristics, and population growth projections. The City expects that half of additional plant flow from population growth within the service area will come from the gravity sewer system, while the other half of the additional flow will come from the STEP system.

The influent flow projections developed for the WWTF are summarized in Table 3.8. Note that the 2035 PHF projection was developed by multiplying the projected PDF of 10.8 mgd by a diurnal peaking factor of 1.25 recorded during a peak flow event in February 2017. Additionally, it is assumed that no additional flow enters the collection system due to inflow and infiltration (I/I) as the City mitigates existing sources of I/I and installs new sewer and STEP system connections which do not contribute to overall I/I.

Table 3.8 WWTF Influent Flow Projection

Flow Parameter	2021 Flow (mgd)	2035 Flow (mgd)
ADWF	2.2	3.4
AAF	2.8	4.0
MMF	4.8	6.2
PDF	8.4	10.8
PHF	10.0	13.5

Wastewater loading data are important for sizing several critical treatment processes. The wastewater loading components of principal interest are the 5-day biological oxygen demand (BOD_5), the total suspended solids (TSS), and ammonia (NH4). Influent loading was projected using the same method described for influent flow projections. Historical values for BOD_5, TSS, and NH_3 and projections to 2035 are detailed in Table 3.9 and Figure 3.5 below.

Table 3.9 Current and Projected WWTF Loads

Load Parameter	2021 Load (ppd)	2035 Load (ppd)
Sewered Population[(1)]	18,900[(1)]	36,000
BOD_5 (ppd)		
Average Annual	2,400	6,000
Max Month	3,300	8,200
Max Week	4,300	10,600
Peak Day	5,300	13,000
TSS (ppd)		
Average Annual	2,400	6,300
Max Month	3,300	10,500
Max Week	4,300	17,000
Peak Day	5,300	19,300
Ammonia (ppd)		
Average Annual	900	1,400
Max Month	1,100	2,000
Peak Day	1,800	4,300

Notes:
(1) Current sewered population is based on 2035 Comprehensive Plan.

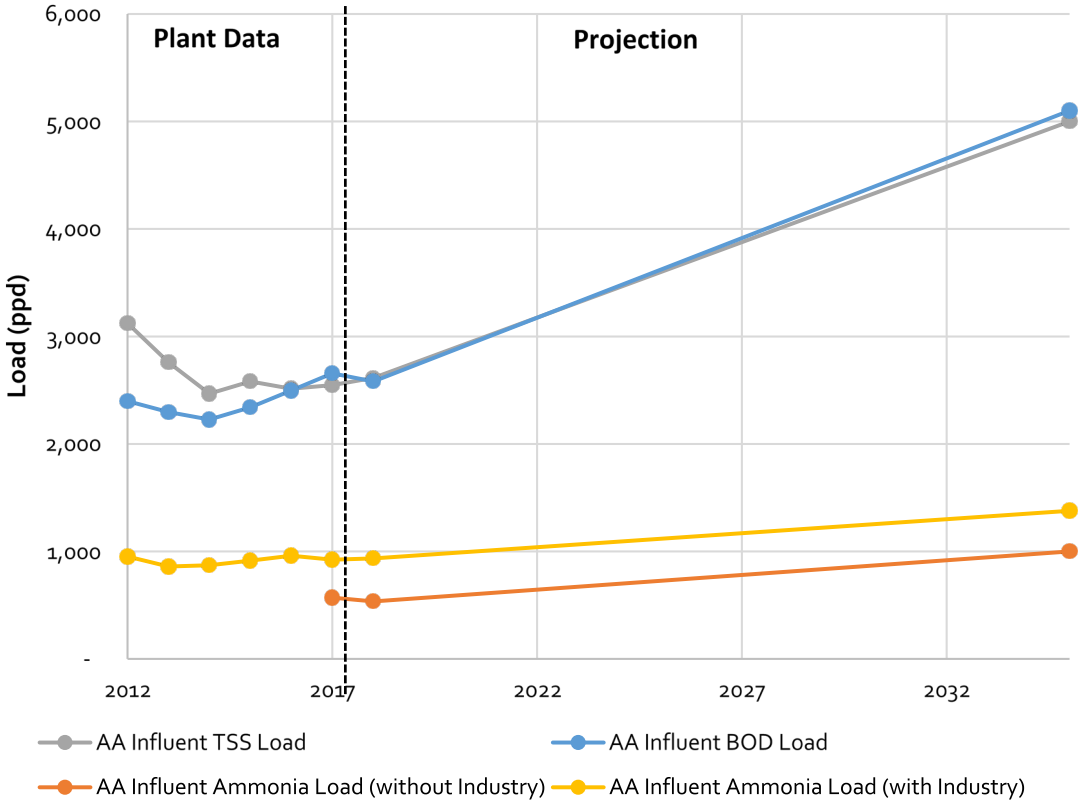

Figure 3.5 Current and Projected WWTF Loads

Chapter 4

EXISTING SYSTEM

4.1 Introduction

The purpose of a sewage collection system is to adequately convey sewage to locations where it can be treated and safely discharged. This chapter describes the City of Camas's (City's) existing sewer collection system, adjacent sewer service areas, and wastewater treatment facility (WWTF). The City's collection system utilizes both conventional gravity sewer with lift stations (LS) as well as Septic Tank Effluent (STE) Pumping Stations (STEP), Septic Tank Effluent Filter Systems (STEF), and Septic Tank Effluent Gravity Systems (STEG) to convey wastewater to the WWTF. These systems are influenced by the natural environment, critical areas, and the service area which are summarized in this Chapter.

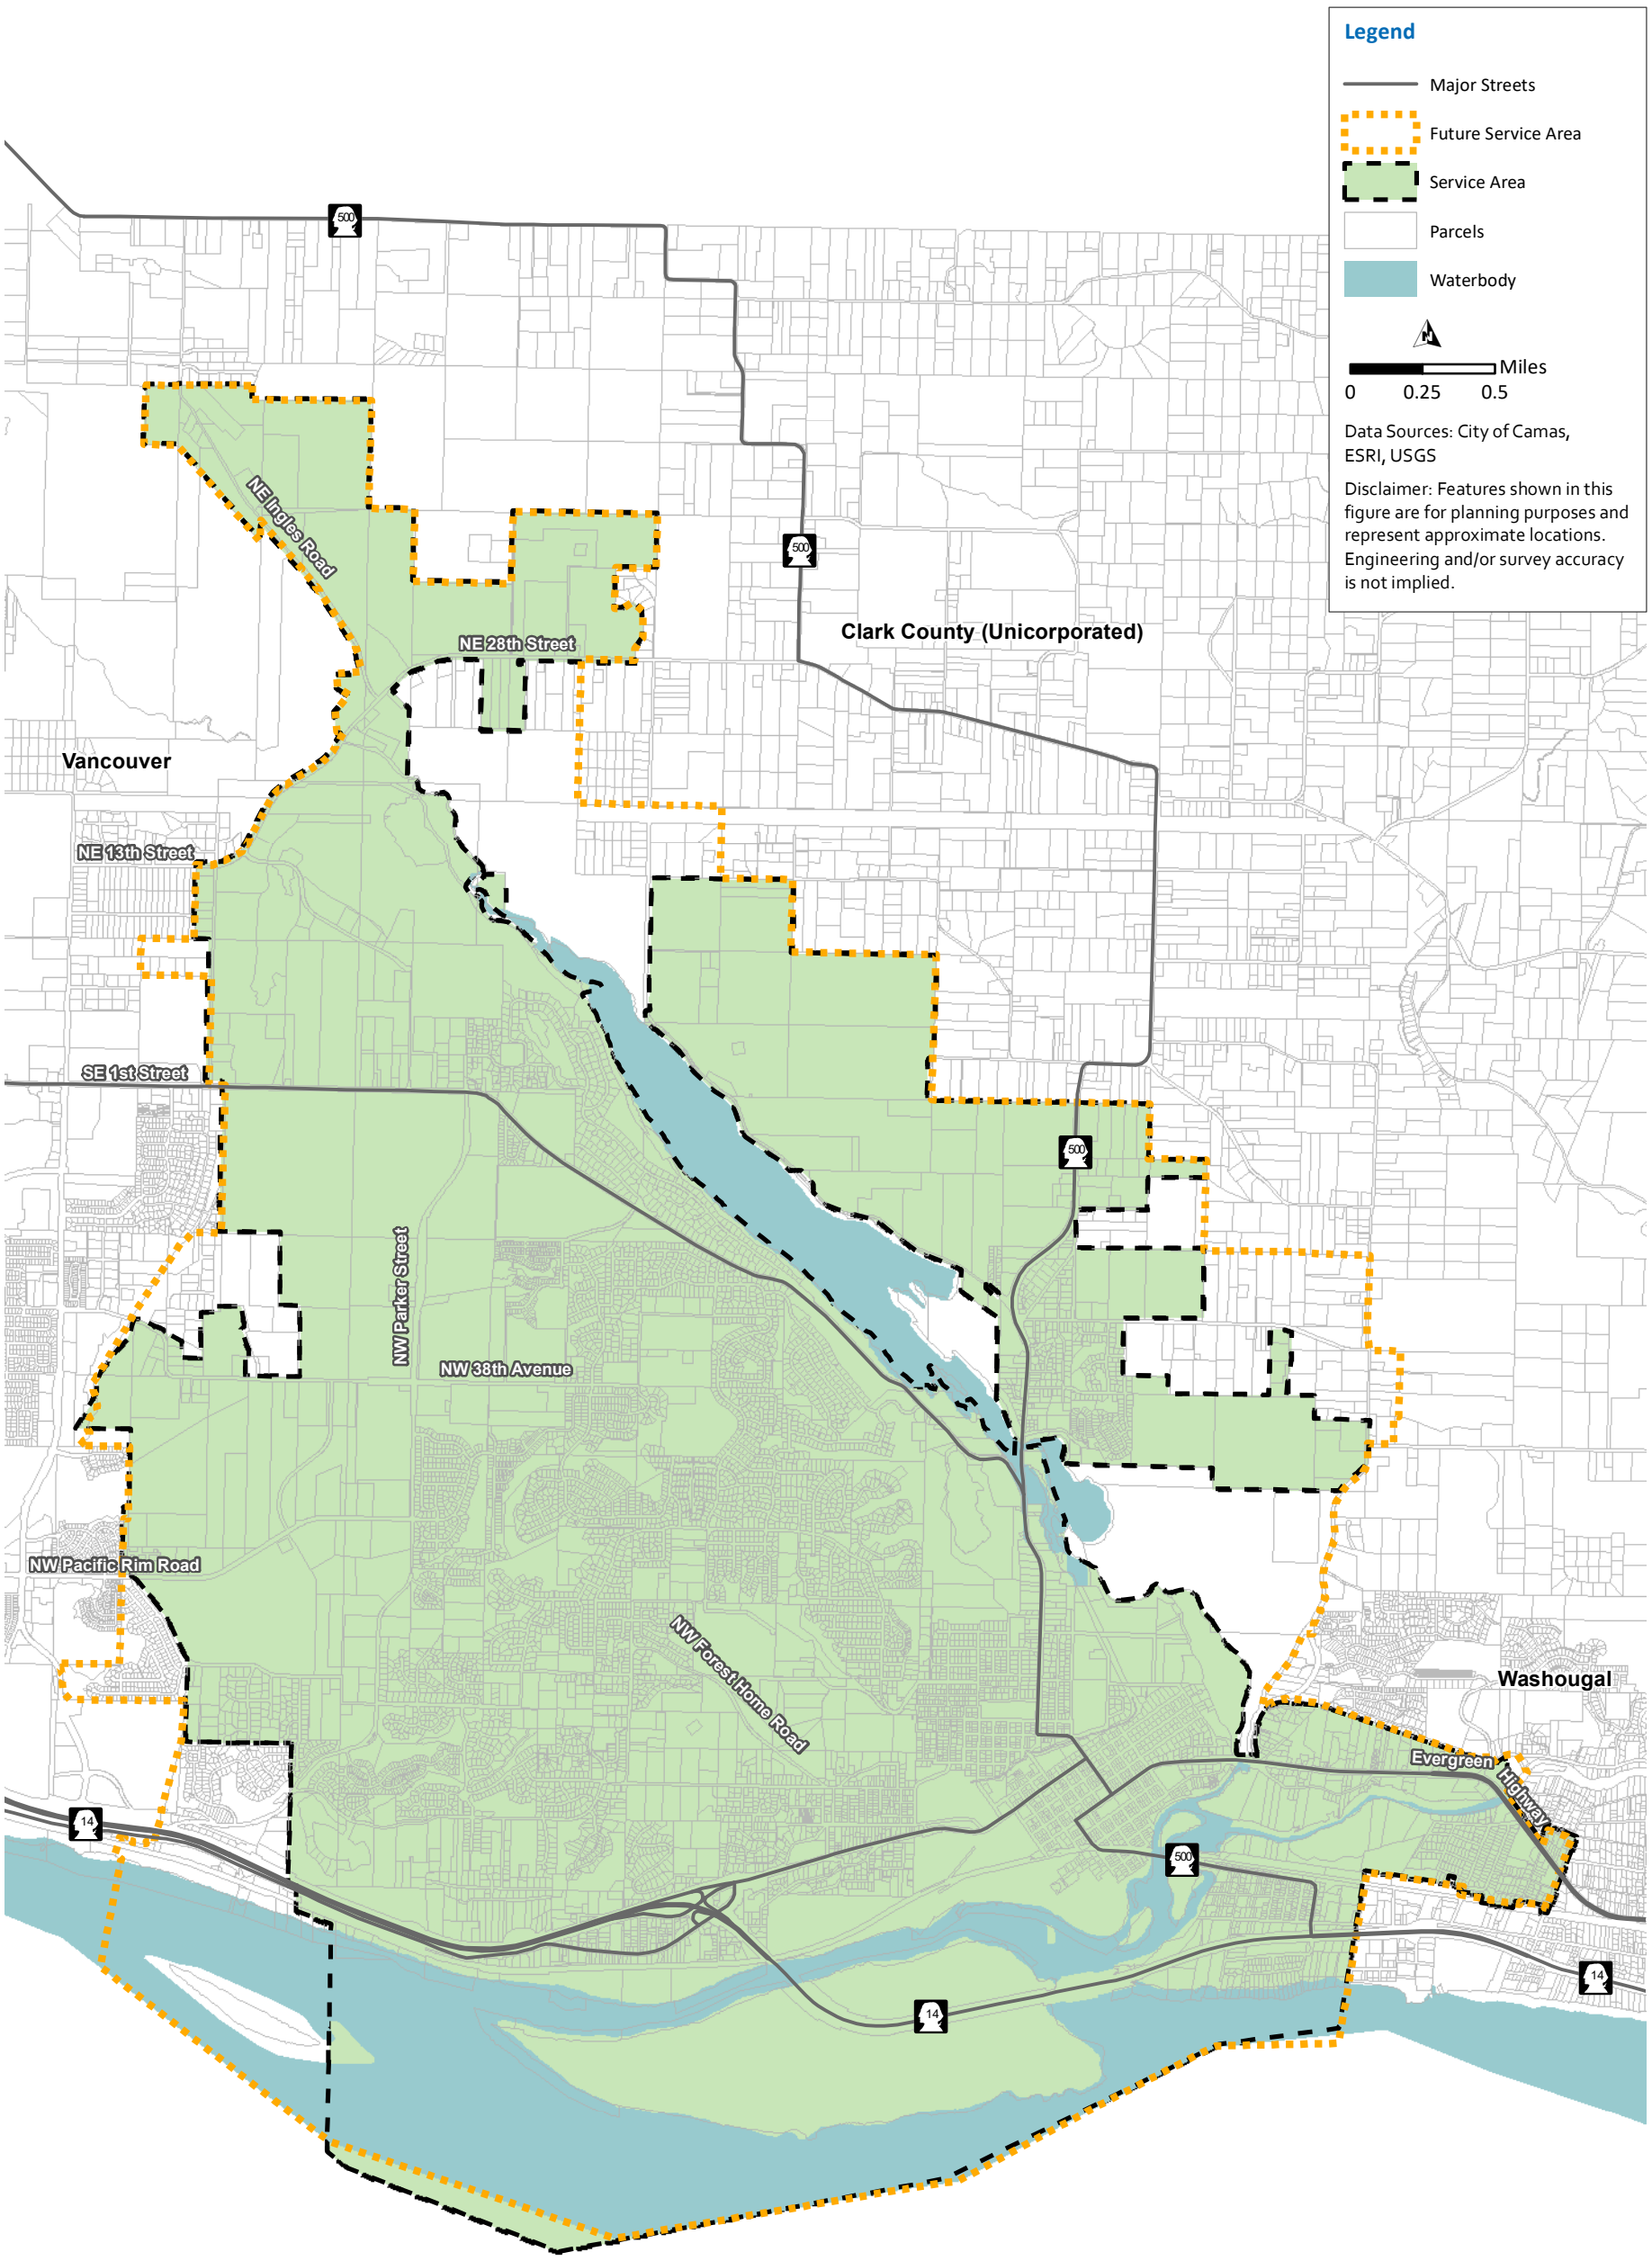
This chapter will serve as the framework on which to base the General Sewer Plan (Plan), which was last updated in 2010. These considerations establish the basis of planning for the demographic and system analysis which will be the framework for identifying potential for development within the established service area. Consideration for the adequacy of the system to serve the anticipated development within the service area study boundaries is also reliant upon existing system characteristics.

4.2 Sewer Service Area

The City's service area is shown in Figure 4.1. The service area contains approximately 7,400 acres. The current service area includes the City limits and the future service area extends to the Urban Growth Area (UGA). Adjacent sewer systems include City of Vancouver, the Discovery Clean Water Alliance (CWA), and City of Washougal. These systems are described in greater detail in Section 4.5.

4.3 Collection System

The City's sewer system is comprised of four major facility types:



1. Conventional Gravity Sewer.
2. STE Systems.
3. STEP Transmission Mains.
4. Lift Stations (LS) with Force Mains.

The conventional gravity sewer system is the most common sewer conveyance method in the region and relies on a downward slope throughout the profile to convey flow to a WWTF or intermediate LS. In addition to the conventional gravity sewer system and LS, three STE systems are utilized in the City's collection system: STEF, STEG, and STEP, which are explained in further detail in Section 4.3.2. Twenty-nine LS are located within the service area which convey sewage and STE for treatment where gravity sewers are not effective. Properties within the sewer service area outside of the gravity sewer portion of the City's collection system use on-site septic tank systems which provide some wastewater treatment, solids settling, and digestion. Similar to LS, STEP systems allow service where gravity systems may not be effective, or which were originally located outside the public boundaries of a public sewer system service area.

Figure 4.2 and Table 4.1 below details the pipe infrastructure in the City's system by sewer type. As previously mentioned, the infrastructure is predominantly gravity sewer and nearly half of the City's pipelines serve STE systems.

Table 4.1 Summary of Pipe Infrastructure by Type

Sewer Type	Pipe Length (feet)	Pipe Length (miles)
Gravity Main	236,200	44.7
Force Main	38,260	7.2
STEP Main	255,070	48.3
STEP Bypass Main	8,040	1.5
Total	**537,570**	**101.8**

carollo

Last Revised: February 11, 2022 pw:\\IO-PW-INT.Carollo.local:Carollo\Documents\Client\WA\Camas\11418A00\GIS\MXD\Sewer_Service_A_11x117

Figure 4.1 Sewer Service Area

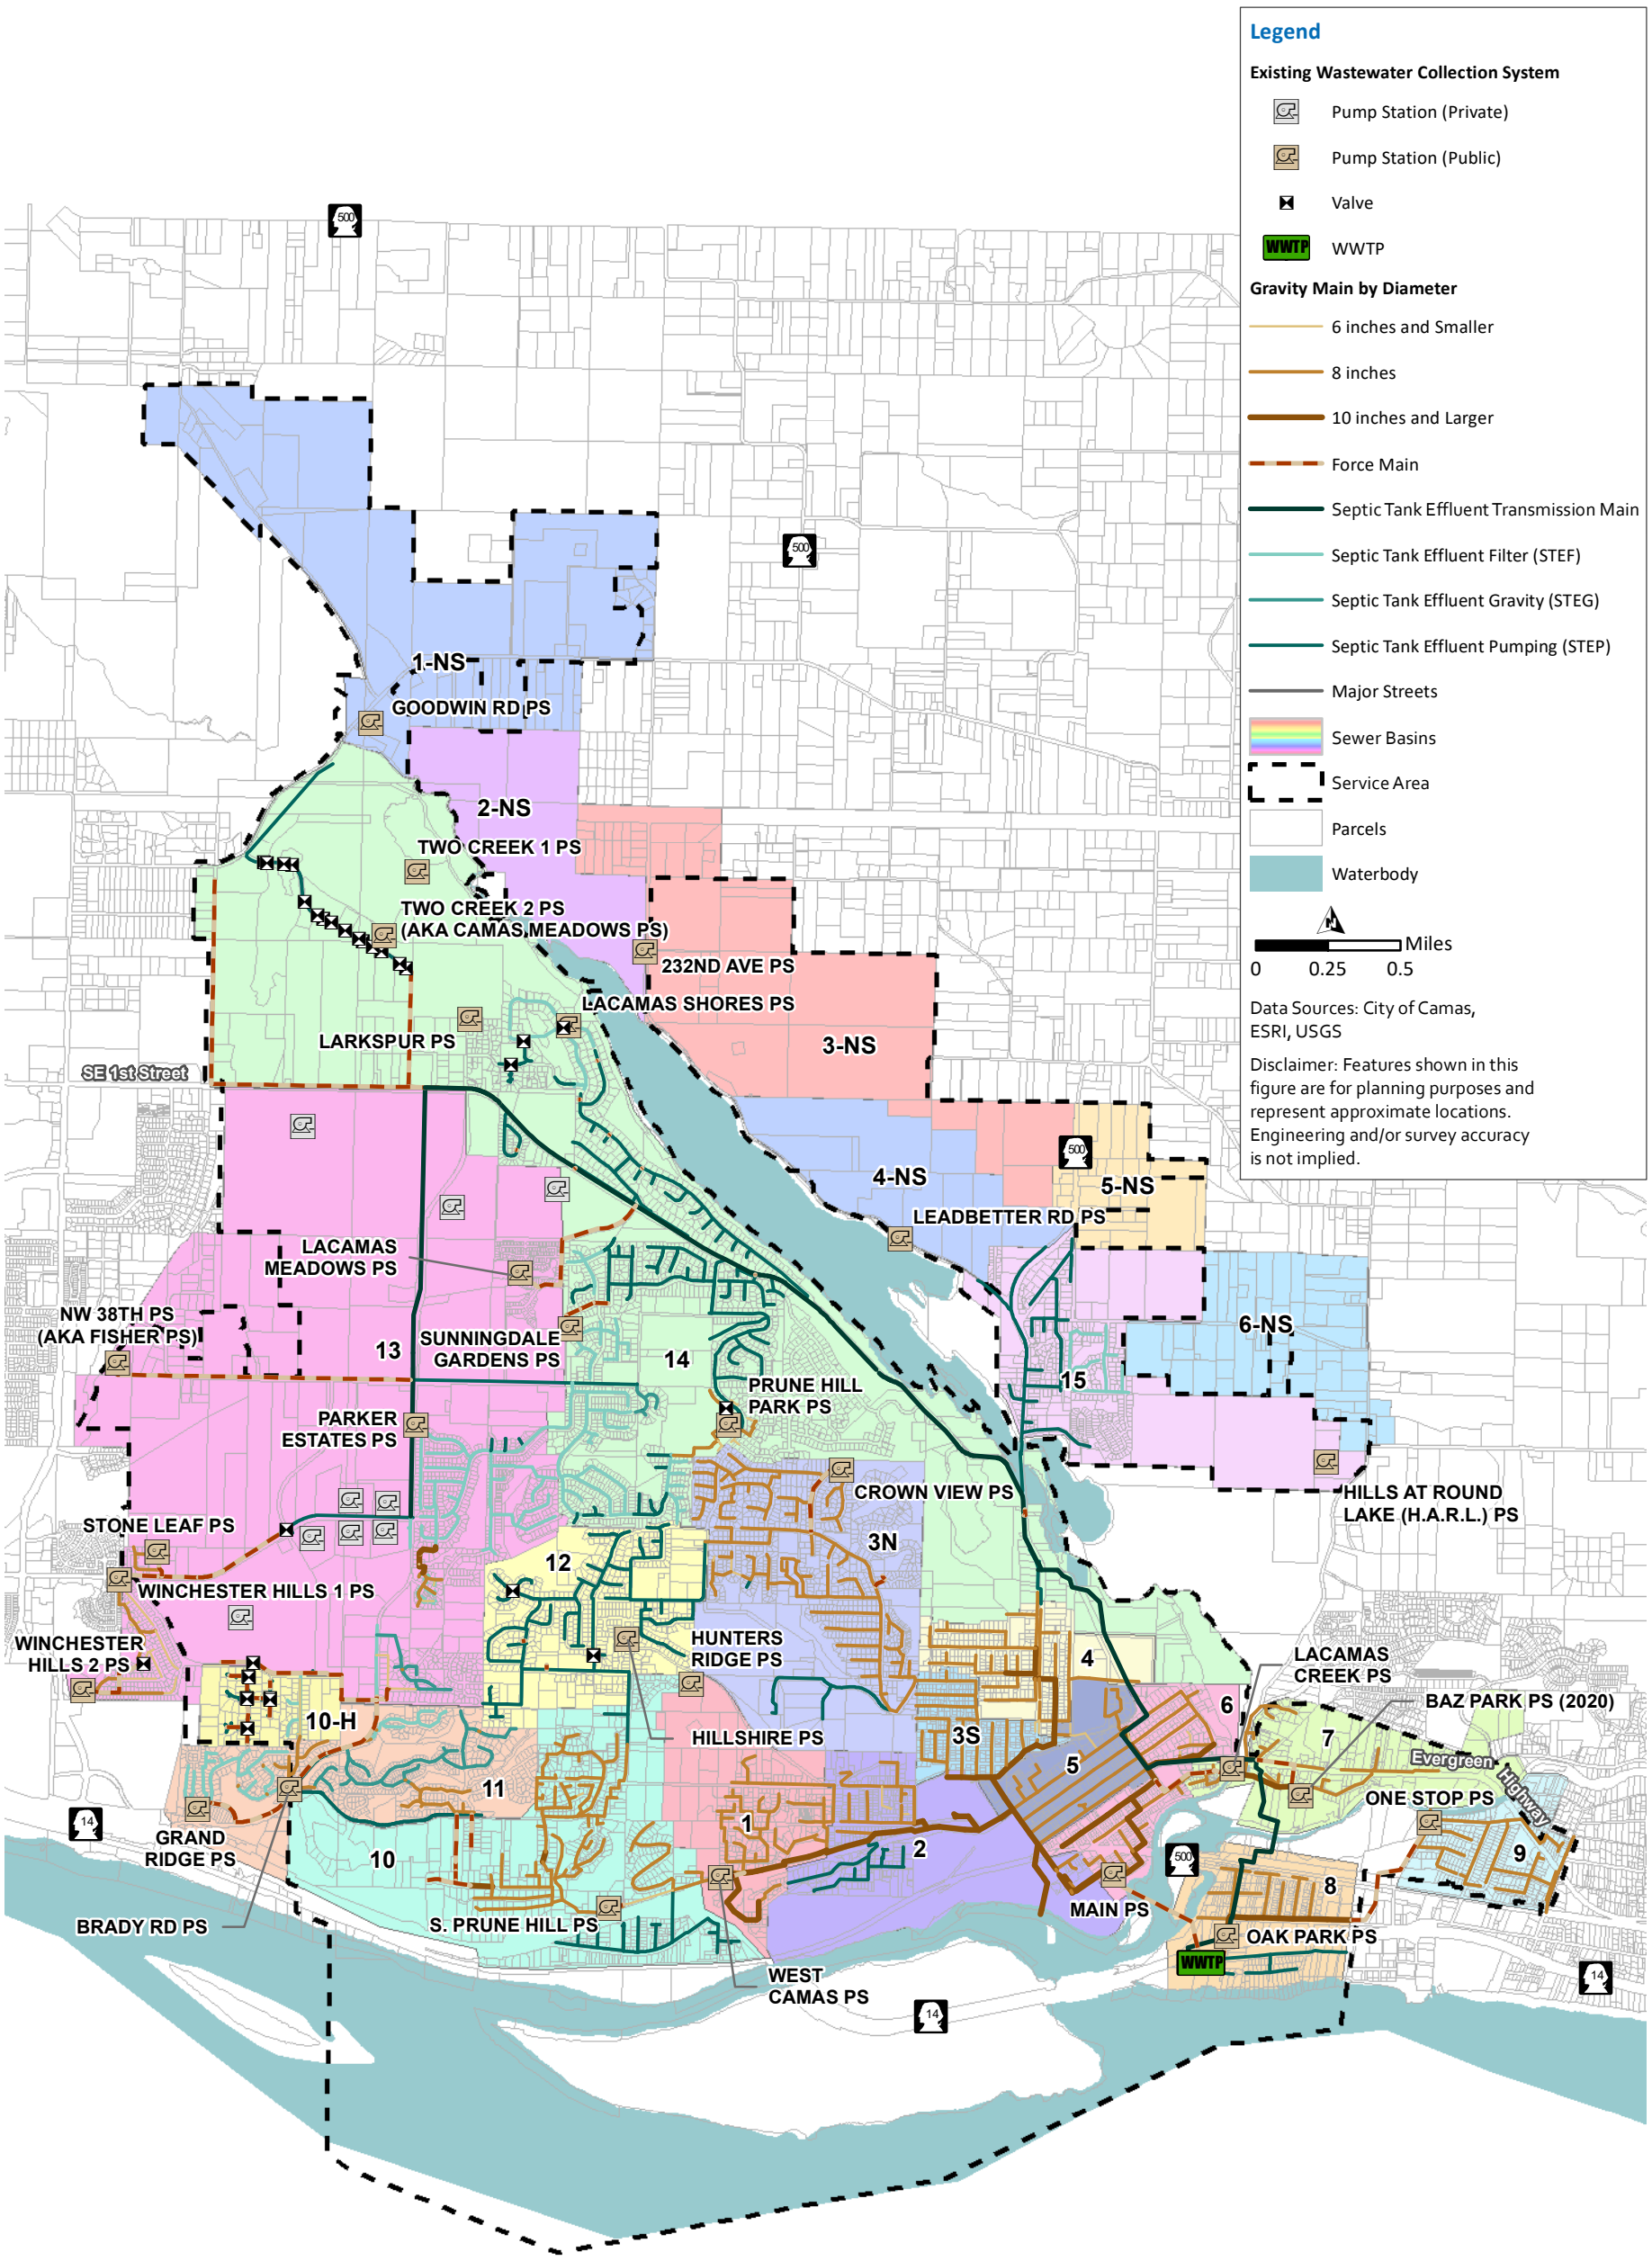


Figure 4.2 Existing Wastewater Collection System

4.3.1 Gravity System

Portions of the system served by conventional gravity sewers date from its beginning in the 1920's and includes the following basins identified in Figure 4.2: Downtown, Oak Park, Parkers Landing, basins along the Columbia River and State Route (SR) 14, and portions of Prune Hill. The North Shore area is and will continue to be served from conventional gravity sewers. Properties served by STE systems are located on the northern and western sides of the City.

The earliest portions of the gravity sewer system was constructed with vitrified clay pipe (VCP). Much of this VCP was later replaced with cast iron, concrete, and eventually polyvinyl chloride (PVC). Therefore, the relative age of sanitary sewer can be identified by the material type. The system utilizes a pipe diameter ranging from four inch to 24-inch segments where the majority of the system is eight inches or less in diameter. A summary of pipe infrastructure by diameter is shown in Table 4.2.

Table 4.2 Summary of Gravity Sewer Infrastructure by Size

Pipe Diameter (inches)	Pipe Length (feet)	Pipe Length (miles)
4	40	0.01
6	13,760	2.6
8	191,920	36.3
10	9,380	1.8
12	9,640	1.8
15	2,610	0.5
18	3,570	0.7
21	3,140	0.6
24	1,150	0.2
27	980	0.2

4.3.2 STE Systems

Starting in the 1985, the City required new customers in the western portion of the service area to be served using the STE system. Due to the City's topography and shallow bedrock, the STE systems allowed the City to serve areas without the costly installation of gravity sewers. The three STE systems address site specific challenges within the City's collection system. STEP systems consist of a septic tank equipped with a pump at the outlet to convey effluent flows to the STEP transmission main, rather than an on-site drain field. STEG systems consist of a septic tank with an outlet that conveys effluent flows by gravity to the STE transmission main. STEF systems utilize a siphon to convey effluent flows to the STE transmission main. Figure 4.2 shows the STEF, STEG, and STEP systems and STE transmission mains within the City's conventional gravity collection system.

The City owns and maintains residential STE systems. The City pumps out the septage from the STE systems on a five-to-seven-year cycle. Commercial and Industrial systems are owned and maintained by the property owner. The City receives and treats septage from both systems at the WWTF.

Table 4.3 Summary of STE Infrastructure by Size

Pipe Diameter (inches)	Pipe Length (feet)	Pipe Length (miles)
Unknown	40	0.01
1	1,880	0.4
2	50,235	9.5
3	9,740	1.9
4	23,680	4.5
6	57,440	10.9
8	40,980	7.8
10	25,950	4.9
12	320	0.06
18	2,450	0.5
21	230	0.04

4.3.3 STEP Transmission Main

The STEP transmission main is a transmission main that conveys STE system flows and major industrial dischargers to the WWTF. The pressurized transmission main is shown in Figure 4.2, The STEP main is approximately 36,970 linear feet in length and is 21-inches to 24-inches in diameter. The transmission main conveys flows directly to the WWTF without receiving flows from the other sewer systems.

4.3.4 Lift Stations

The City currently operates twenty-nine LS, whose characteristics are summarized in Table 4.4. Of these twenty-nine LS, thirteen serve the gravity system and fifteen serve the STE systems. One LS is dedicated to odor control. The LS are identified in Figure 4.2. There are approximately 51,460 ft, or 9.7 miles, of force main associated with the LS ranging from 4-inches to 18-inches in diameter. The majority of LS serve relatively small service areas and have capacities less than 500 gallons per minute (gpm). The Main LS, with a capacity of 7,700 gpm station, conveys the majority of the gravity system to the WWTF through an 18-inch diameter force main under Lacamas Creek.

Table 4.4 Summary of Lift Stations

	Lift Station	Location	Basin Number	STE or RAW	Quantity of Pumps	Pump Motor Size (HP)	Pump Capacity (gpm, ea.)	Total Station Capacity (gpm, 1 standby)	TDH (feet)

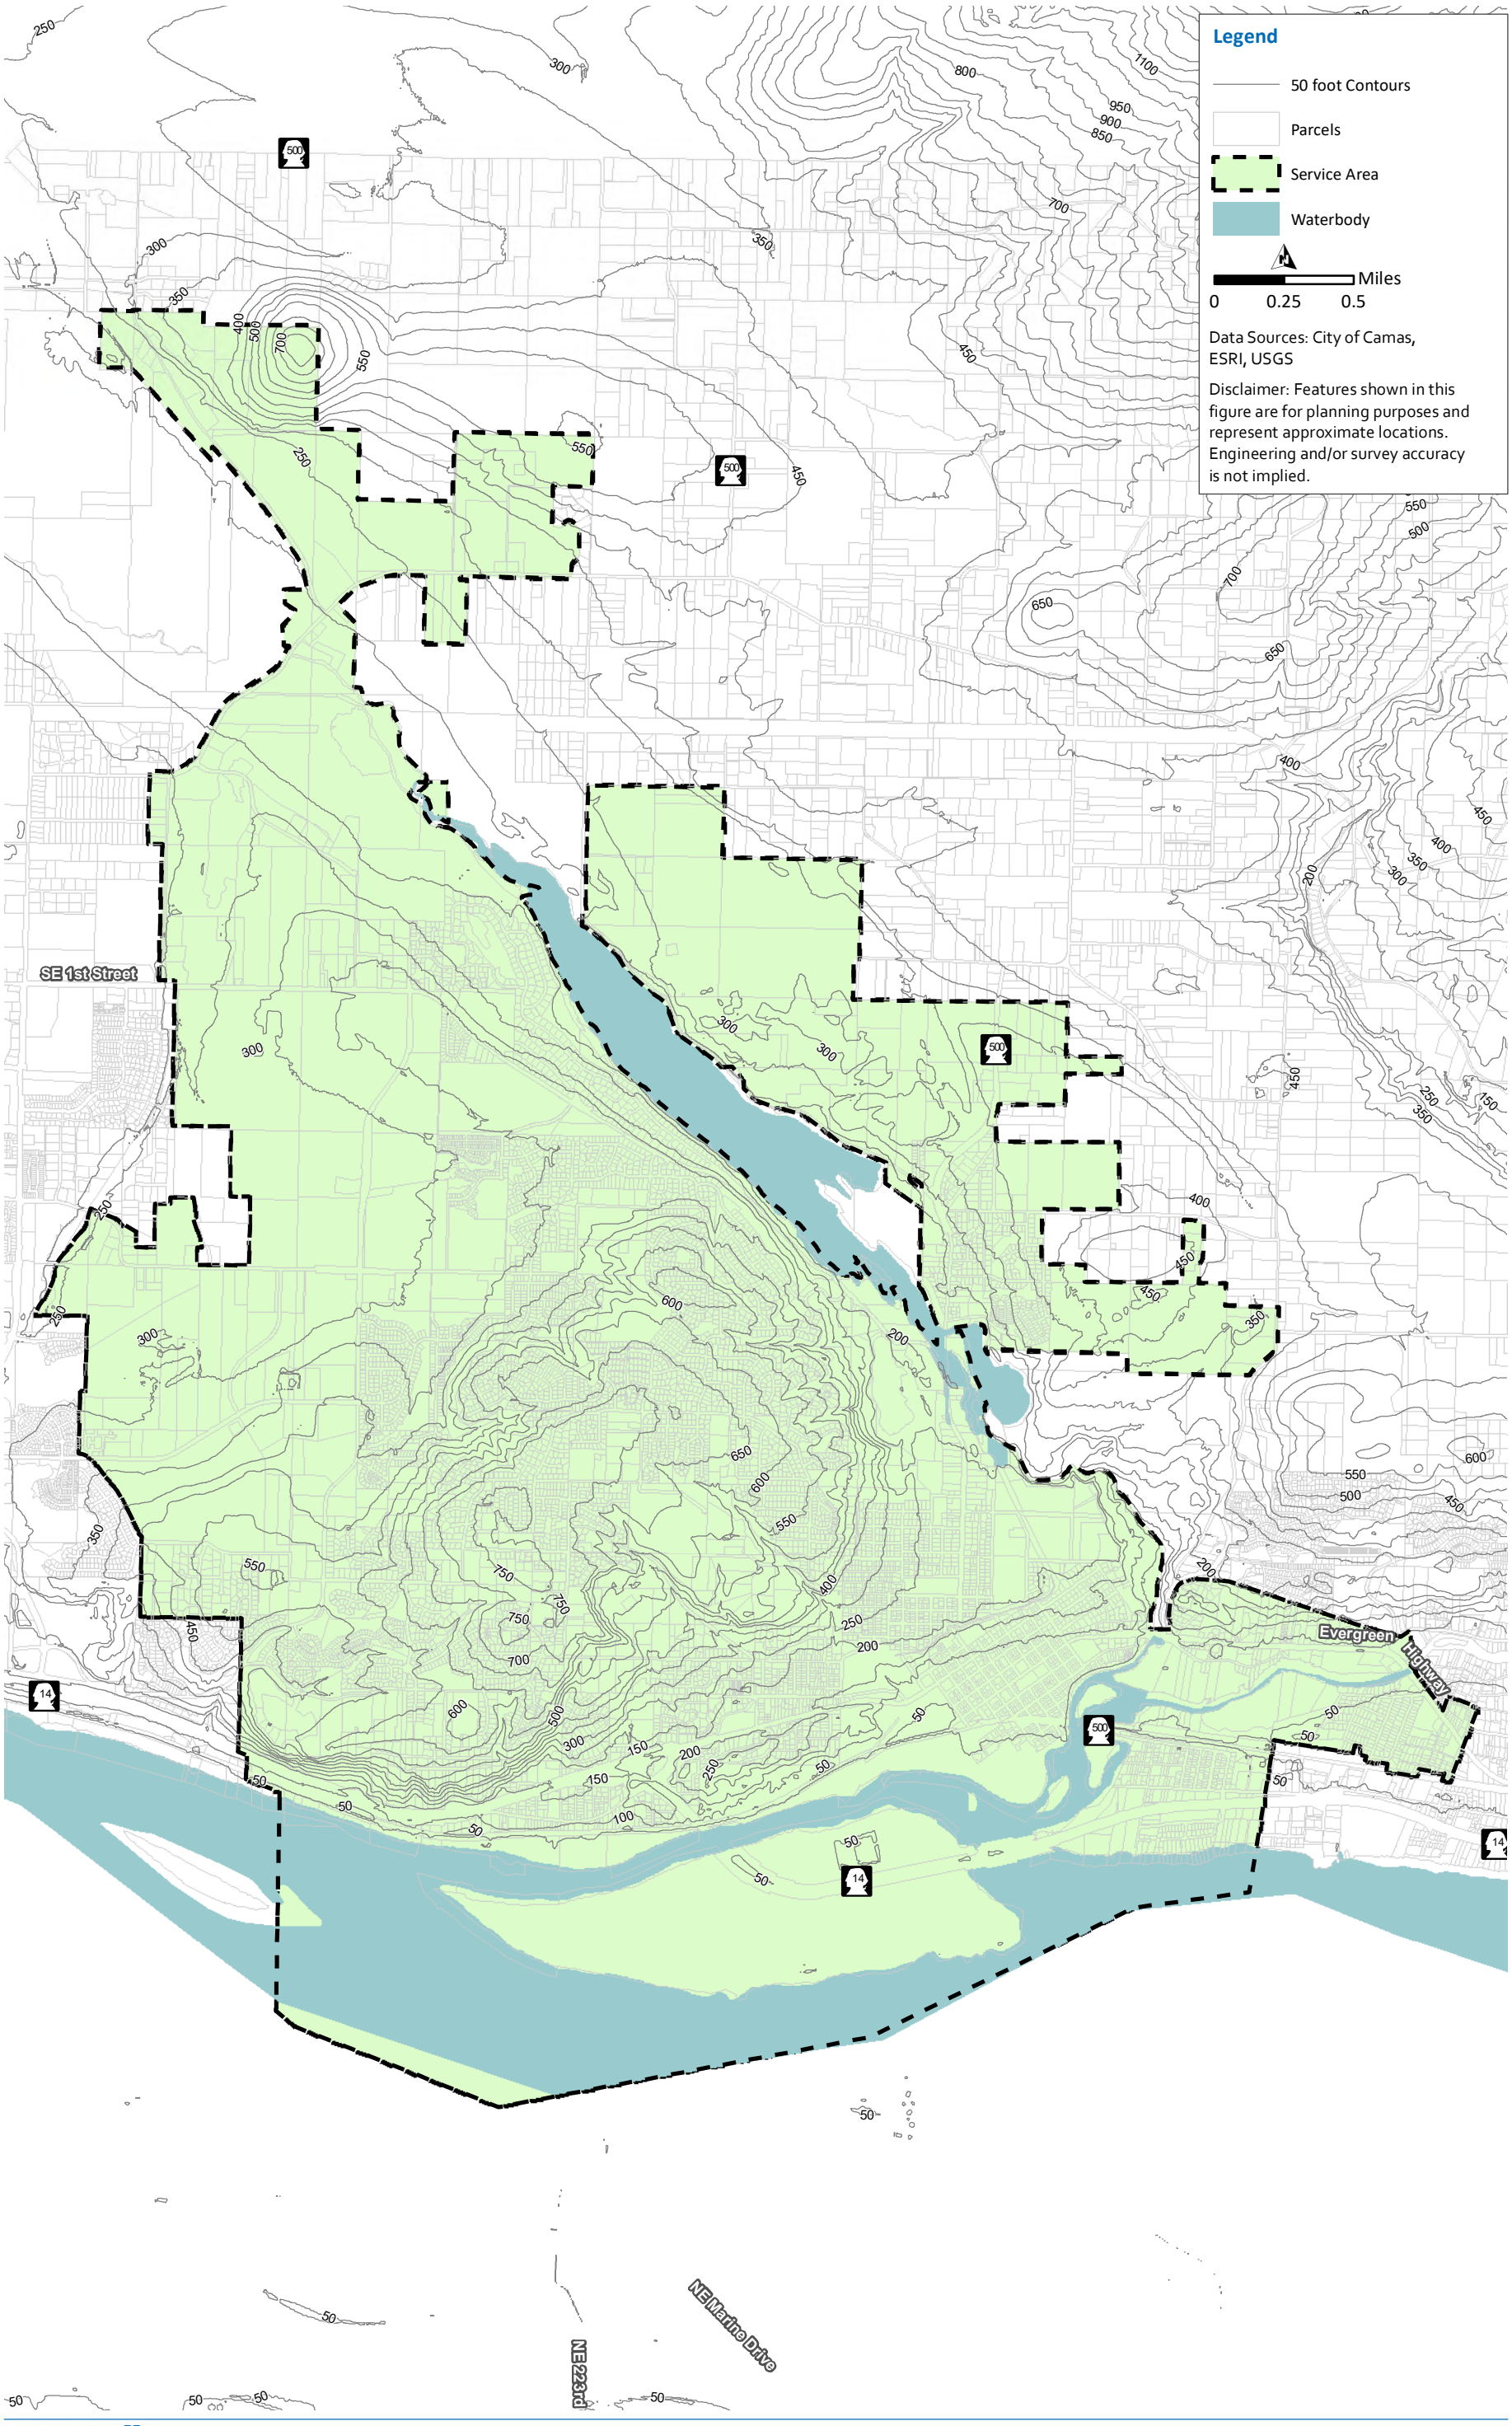

Figure 4.3 Topography

4.4 Wastewater Treatment Facility

The City's WWTF is located along the Columbia River in the southeastern portion of its sewer service area. The WWTF was originally constructed in 1972 and has had several modifications since that time. The first major upgrade and expansion of liquid stream processes was completed in February of 2000. A subsequent Phase 2A upgrade, primarily addressing solids treatment, including anaerobic digesters and sludge drying facilities, was completed in 2012. Phase 2B, completed in 2014 improved blower controls, added a third secondary clarifier, new effluent filters, and digester gas treatment facilities.

The facility process flow diagram is shown in Figure 4.4. An aerial view of the WWTF with each unit process and building identified is shown in Figure 4.5. The liquid stream treatment begins with climbing bar screens at the plant headworks to remove larger material which is washed, compacted, and disposed of at a landfill. Primary solids-liquid separation occurs in two circular primary clarifiers with the primary effluent discharging to a splitter box where it is combined with return activated sludge (RAS) from the secondary clarifiers (SC) and split between three aeration basins (ABs), where biomass is aerated to promote biological oxidation and improve water quality. Secondary treatment in the ABs consists of influent channel selector zones followed by two aerated and three anoxic zones to remove carbonaceous material and reduce ammonia concentrations. Magnesium hydroxide ($Mg(OH)_2$) is added at the SC splitter box to provide supplemental alkalinity.

Mixed liquor from the three ABs is combined and split between three secondary clarifiers. The three clarifiers provide separation of the biomass from the secondary treatment processes (termed activated sludge) and discharge of liquid effluent to two mechanical disc filters. Ultraviolet (UV) disinfection is provided in an open channel system with four banks of UV lamps prior to discharge to the outfall in the Columbia River.

The effluent either flows by gravity or is pumped to the outfall via the three effluent pumps, which are operated with two duty and one standby configuration. Transitions between gravity and pumped effluent flow are performed automatically when the pumps are placed in "auto" mode. When the Columbia River level rises, gravity effluent discharge is stopped by closing the flap gate in the effluent manhole. The existing outfall is a 36-inch corrugated metal pipe (CMP) and extends approximately 850 feet south into the Columbia River channel. The diffuser portion of the outfall is located along the outer 150 feet of the pipe and is equipped with 16 vertical risers, with each oriented vertically with rubber Tideflex check valve-type nozzles. The vertical risers discharge effluent perpendicular to the flow of the Columbia River.

Solids from the primary clarifiers are first conveyed to two hydro-cyclones and a classifier for degritting then thickened in the gravity thickener. Thickened primary sludge (TPS) is then pumped to anaerobic digesters. Solids from the secondary clarifiers are moved by a sludge-scraper mechanism to a wet well and then withdrawn by pumps. The settled solids (RAS) are pumped back to the aeration basin splitter box. Excess activated sludge wasted (WAS) from SC Number 3 is sent to a storage tank and thickened in a rotary drum thickener. Thickened primary and secondary solids are then combined in anaerobic digesters for stabilization, removal of volatile solids, and production of biogas. Dewatering of the digested sludge is accomplished through a centrifuge and then conveyed to a belt dryer, which evaporates most of the remaining water content in the biosolids. The dewatered and dried biosolids are dried to achieve Class A

and are hauled off-site for land application. Odors are controlled at the plant through unit-specific odor control ductwork. The odorous air is then blown through a bark media biofilter.

The unit capacity for each major unit at the WWTF is summarized in Table 4.5.

Table 4.5 Unit Process Capacity

Unit	Number of Units	Design Criteria[1]
Bar Screens		
Climbing Bar Screens	2	• Perforation Size: 1/4 in (6 mm)
Manual Coarse Bar Screen (Bypass)	1	• Bar Spacing: 3/4 in (19 mm)
Primary Clarifiers	2	• Diameter: 60 ft (each) • Depth: 10 feet • Volume: 211,500 gallons
Aeration Basins	3	• Volume: 100,800 ft^3 (each)
Aerobic	3	• Total Volume: 176,400 ft^3
Anoxic	2	• Total Volume: 108,360 ft^3
Selector (SAx)	3	• SAx-1 Volume: 2,700 ft^3 • SAx-2 Volume: 1,600 ft^3 • SAx-3 Volume: 4,500 ft^3 • SAx-4 Volume: 9,000 ft^3
Secondary Clarifiers		
SC Number 1	1	• Diameter: 75 feet • Depth: 13 feet • Volume: 424,000 gallons
SC Number 2	1	• Diameter: 75 feet • Depth: 17 feet • Volume: 461,800 gallons
SC Number 3	1	• Diameter: 75 feet • Depth: 14 feet • Volume: 462,700 gallons
Effluent Disc Filters	2	• Capacity: 3.0 mgd (each)
UV Disinfection[1]	4	• Peak Day Process Flow: 10.04 mgd
Hydrocyclones	2	• Capacity: 220 gpm
Gravity Thickener	1	• Diameter: 30 feet • Depth: 10 feet
Anaerobic Digesters	2	• Volume: 24,500 ft^3 (each)
Centrifuge	1	• Capacity: 130 gpm
Rotary Screen Thickener	1	• Capacity: 100-300 gpm

Notes:
Abbreviations: ft^3 - cubic feet; mm - millimeter.

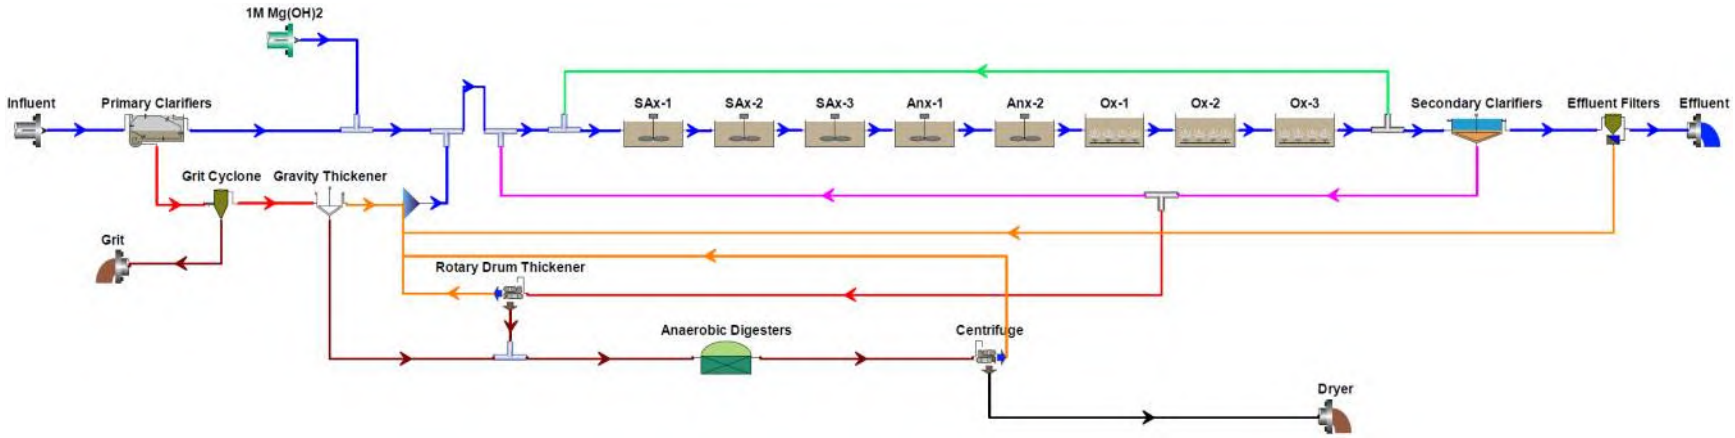

Figure 4.4 BioWin Process Flow Diagram

Figure 4.5 WWTF Aerial Image with Site Plan

4.4.1 Recent Plant Upgrades

As noted, several upgrades have taken place at the WWTF since the previous General Sewer Plan (Gray and Osborne, 2010), which have increased capacity and efficiency:

- **WWTF Improvements Phase 2A (2012):** Several improvements took place with this design to improve the following:
  - The addition of solids handling equipment which includes a rotary screen thickener, two anaerobic digesters, a waste gas burner, and sludge holding tank.
  - Modifications to headworks which includes the addition of Bar Screen No. 2 and Washer/Compactor No. 2.
  - Installation of the Plant Drain Pump Station No. 2, Biofilter No. 2, and the Septage/Centrate/ WAS Storage Tank.
  - Reduction to the height of the aeration basins (AB) and the addition of baffle walls within the selector zone.
- **WWTF Improvements Phase 2B (2014):** This project focused on modifications to the sludge storage area, the addition of Secondary Clarifier No. 3, modification of Secondary Clarifier No. 2, and addition of two effluent disk filters.
- **Installation of a Thermal Dryer (2012):** This allowed the facility to produce Class A Biosolids for land application.

Additionally, two studies have been completed focusing on assessing the condition of equipment. The WWTF and Pump Station Condition Assessment Report (HDR, 2018) recommended several improvements in the immediate term which include an odor control evaluation, polymer usage evaluation, replacement/upgrading grit hydrocyclones and classifiers, modeling of the AB's, blower filter replacement, a cross connection evaluation, supervisory control and data acquisition (SCADA) upgrade, replacement of variable frequency drive (VFDs) in the equipment building and plant effluent building, and replacement of pH and dissolved oxygen (DO) analyzers. An additional condition assessment was completed on the gravity thickener which identified six major components which were severely deteriorated as well as the conduit and wiring within.

4.4.2 Plant Flows

The WWTF receives influent flows from the Main and Oak Park pump stations and a septage truck unloading station. STEP flows in the collection system are conveyed to the plant through the Main and Oak Park pump stations. The combined flow from the pump stations and septage truck unloading station are measured by a Parshall flume. The combined flow measured by the Parshall flume is recorded as the WWTF influent flow.

The WWTF has a five-year average annual flow (AAF) of 2.8 mgd from the collection system with approximately 33 percent of the AAF from industrial users. This relatively high percentage of industrial users increases the influent ammonia concentrations but decreases the total suspended solids (TSS) and biochemical oxygen demand (BOD) concentrations resulting in a high nitrogen and low carbon influent compared to a typical municipal facility. The previously described STEP and STEF system which contributes nearly 60 percent of the average day dry weather influent flows also contributes to unique influent characteristics when brought into the facility due to an estimated 35 percent reduction of BOD in the 5-day test (BOD_5) and a 60 percent reduction of TSS in the septic tank. Although septic tank solids are also returned to the facility through septic delivery, these solids also have reduced BOD_5 and TSS loadings due to

the nearly five-year detention time. National Pollution Discharge Elimination System (NPDES) effluent discharge limitations, prohibitions, and requirements are similar to other municipal facilities with standard 30/30 monthly TSS and BOD concentration limits with a mandatory 85 percent reduction in each. However, the WWTF has ammonia limits of 20 mg/L (NH_3 as N) in the summer and seven mg/L (NH_3 as N) in the winter.

4.4.3 NPDES Violations

The current NPDES permit was effective October 1, 2015, and expired September 30, 2020, but as of February 2022 the City is working with Ecology on an extension request. The plant has had few permit violations since issuance of the latest permit, with the last violation occurring in October 2019. These violations include minimum pH value, average monthly ammonia concentration, average weekly TSS concentration and load, and average weekly BOD_5 concentration and load. A list of permit violations is shown in Table 4.6. The violations in 2017 occurred due to a toxic slug introduced in the influent which reduced the viable mixed liquor population resulting in floating sludge and higher than expected discharge concentrations from the secondary clarifiers which overwhelmed the filters pushing a higher percentage of flow through the filter by-pass.

Table 4.6 Five-Year NPDES Permit Violation Summary

Violation Date	Type / Parameter	Measurement Value(2)	Effluent Limit(2)
October 2019	pH Daily Minimum	5.9	6 (min)
February 2018	Ammonia Winter(1) Monthly Average	13.2 mg/L	7 mg/L
February 2017	TSS Weekly Average	51.5 mg/L 3,532 ppd(2)	30 mg/L 1,525 ppd
February 2017	BOD_5 Weekly Average	41.2 mg/L 2,623 ppd	30 mg/L 1,525 ppd

Notes:
(1) Winter Ammonia limits apply to the months of October through May.
Abbreviations: mg/L - milligrams per liter; ppd - pounds per day.

4.5 Adjacent Sewer Service Areas

Four sewer service areas with their own WWTFs are within a 20-mile radius of the Camas WWTF. All of the facilities listed in Table 4.7 have Columbia River outfalls. Distances vary from the closest, Washougal WWTF, approximately 3.5 miles away, to the farthest, Salmon Creek WWTF, approximately 20 miles away.

Table 4.7 Adjacent Service Areas WWTFs

Facility/Service Area	MMF (mgd)(1)	Biological Treatment Process	Disinfection	Biosolids
Salmon Creek (Clark County)	10.3	Aeration Basins	UV	Land Applied
Marine Park (Vancouver)	16.1	Aeration Basins	UV	Incinerated
Westside (Vancouver)	28.3	Aeration Basins	UV	Incinerated
Washougal	2.2	Oxidation Ditch	UV	Lagoon

Notes:
Abbreviations: MMF - maximum monthly flow.

All of these nearby treatment facilities utilize activated sludge treatment processes and UV disinfection; however, the greatest variation in treatment can be seen in the processing of biosolids. Salmon Creek WWTF operates similarly to Camas through the land application of biosolids. Marine Park and Westside incinerate of solids produced at those City of Vancouver facilities.

4.5.1 City of Vancouver

The City of Vancouver currently uses 716 miles of sanitary sewer and forty-one pump stations to convey sewage to Vancouver's Marine Park and Westside WWTFs. Vancouver's collection system is divided into three basins currently: the Westside Basin, Eastside Basin, and Diversion Basin. Wastewater generated in the Eastside Basin is conveyed to and treated exclusively at the Marine Park facility. Diversion Basin wastewater is conveyed to and treated at either the Marine Park or Westside WWTF. Westside Basin sewage is conveyed to and treated exclusively at the Westside Treatment Facility.

The largest nearby treatment facility is Westside in Vancouver at 28.3 mgd average annual flow. Altogether, Marine Park and Westside WWTFs serve 195,000 residents per2022 census data. Currently, Marine Park does not treat its solids on-site and instead conveys them to Westside through a force main and gravity sewer. Once at Westside, a fluidized bed furnace incinerates scum and solids from the primary and secondary clarifiers at both plants.

4.5.2 City of Washougal

The City of Washougal currently operates fourteen LS throughout the City and conveys sewage through more than 1.5 miles of force mains to the Washougal Treatment Plant. The treatment plant consists of an oxidation ditch followed by a secondary clarifier and UV disinfection. Similar to other pants in the region, effluent is discharged to the Columbia River.

4.5.3 Clark County

Clark County formed the Discovery Clean Water Alliance (CWA) in January 2013 to provide framework for regional wastewater collection. The CWA serves unincorporated Clark County, the City of Battle Ground, the City of Ridgefield, and Clark Regional Wastewater District.

Nearby Salmon Creek WWTF is part of the CWA and serves approximately 100,000 residents. Although the average annual flow is typically between 8-10 mgd, the plant has the capacity to treat up to 15 mgd. Future expansion is underway to improve the Columbia River outfall as well as increase capacity to 17.5 mgd. Odor control will be built as well due to odorous air present particularly during the summer and early fall.

4.6 Natural Environment and Critical Areas

Topics considered to describe the existing system's natural environment include topography, soils and geology, and climate including rainfall. Critical areas within the natural environment highlight the connection between the sewer system and these characteristics. Critical areas include wetlands, critical aquifer recharge areas (CARA), geologically hazardous areas, frequently flooded areas, and fish and wildlife habitat conservation areas.

4.6.1 Natural Environment

Relatively steep topography with slow to moderate infiltration rates comprise a majority of the City's geography. The City enjoys moderate temperatures between the average high of 62 degrees Fahrenheit (°F) and average low of 37°F. Heavy rainfall, characteristic of the Pacific Northwest region, provides an average annual precipitation of 84 inches while snowfall is not typically heavy, annually averaging 9 inches.

4.6.1.1 Topographical Characteristics

As shown in Figure 4.3, elevation ranges from slightly above sea level (20 feet) to greater than 750 feet in the City. Steep slopes comprise a large portion of the landscape which range from 5 to 15 percent. A relatively flat plateau is present at the most central portion of the City near Prune Hill while the older, denser zones lie along the Columbia River. Similarly, the UGA was developed on a steep slope with the plateau at 470 feet elevation residing just outside of the City Limits.

4.6.1.2 Soils and Geology

According to the National Resources Conservation Service (NRCS), Clark County is approximately 5 percent cinebar stony silt loam with 30 to 70 percent slopes. However, the City is a much higher percentage of Lauren gravelly loam from 0 to 8 percent slopes and Hesson Clay loam from 0 to 8 percent slopes. These soil types are categorized as hydrological soil groups B and C, respectively, which indicate slow to moderate infiltration rates when wet with a slow to moderate rate of water transmission. This indicates moderate runoff coefficients for the region. Additional details on the soil groups are available in Figure 4.2.

4.6.1.3 Climate

The City's climate is characterized by a combination of rainfall, wind, and temperature patterns for the nearby region. The average high temperature is 62°F and the average low is 37°F. The temperature is known to vary from 36°F to 84°F throughout the year with a warm season from June to September. Altogether, summers last approximately three months with warm weather and winters are cold with the heaviest rainfall occurring late November or early December.

Historical precipitation data was gathered from Airport Way #2 Rain Gage (Station 111) of the City of Portland HYDRA Rainfall Network. The average five-year rainfall patterns indicate the November through February period averaging five inches per month or more with a peak in January at approximately 6.4 inches. The maximum annual rainfall occurred in 2017 at 53.24 inches total which is 32 percent greater than the average. The driest month of the year is typically July with no rainfall recorded for 2017 and 2018. The average annual rainfall patterns are detailed in Table 4.4. Average annual snowfall is nine inches and average annual precipitation is approximately 84 inches.

Table 4.8 City of Portland Station Precipitation 2017-2022

Year	Jan	Feb	March	April	May	June	July	Aug	Sep	Oct	Nov	Dec	**Annual**

4.6.2 Critical Areas

Critical areas define crucial components for planning in an area including protected lands, e.g., wetlands, CARAs, and conservation areas, as well as areas with greater risk to its inhabitants, e.g., frequently flooded areas and geologically hazardous areas. Identifying these areas allows for the mitigation of unnecessary risk or harm to protected lands; additionally, policies in the *Camas 2035 Comprehensive Plan* (Camas, 2016) outline goals to protect and restore these sites.

4.6.2.1 Wetlands

Ecology currently rates wetlands based upon several key factors including their 'ability to be replaced, sensitivity to disturbances, rarity, functional performance, and importance in biodiversity' (Ecology, 2006). These levels include categories I-IV with a Category I wetland requiring the greatest protection. As defined by the wetland rating system, Category I wetlands have valuable biodiversity and hydrogeomorphic functionality in pollutant removal, stormwater storage, and even buffering natural disasters.

Within the City, there are >1,200 acres of recognized wetland which are protected by several local, state, and federal ordinances and laws including the Growth Management Act, Critical Areas Ordinance, Clean Water Acts, and City municipal code (CMC) 18.31.050. These regulations entail the study of a wetland's functionality and that adverse impacts be avoided or reduced. Figure 4.6 illustrates the City's wetlands delineated using reports filed with the city and published data.

4.6.2.2 Critical Aquifer Recharge Areas

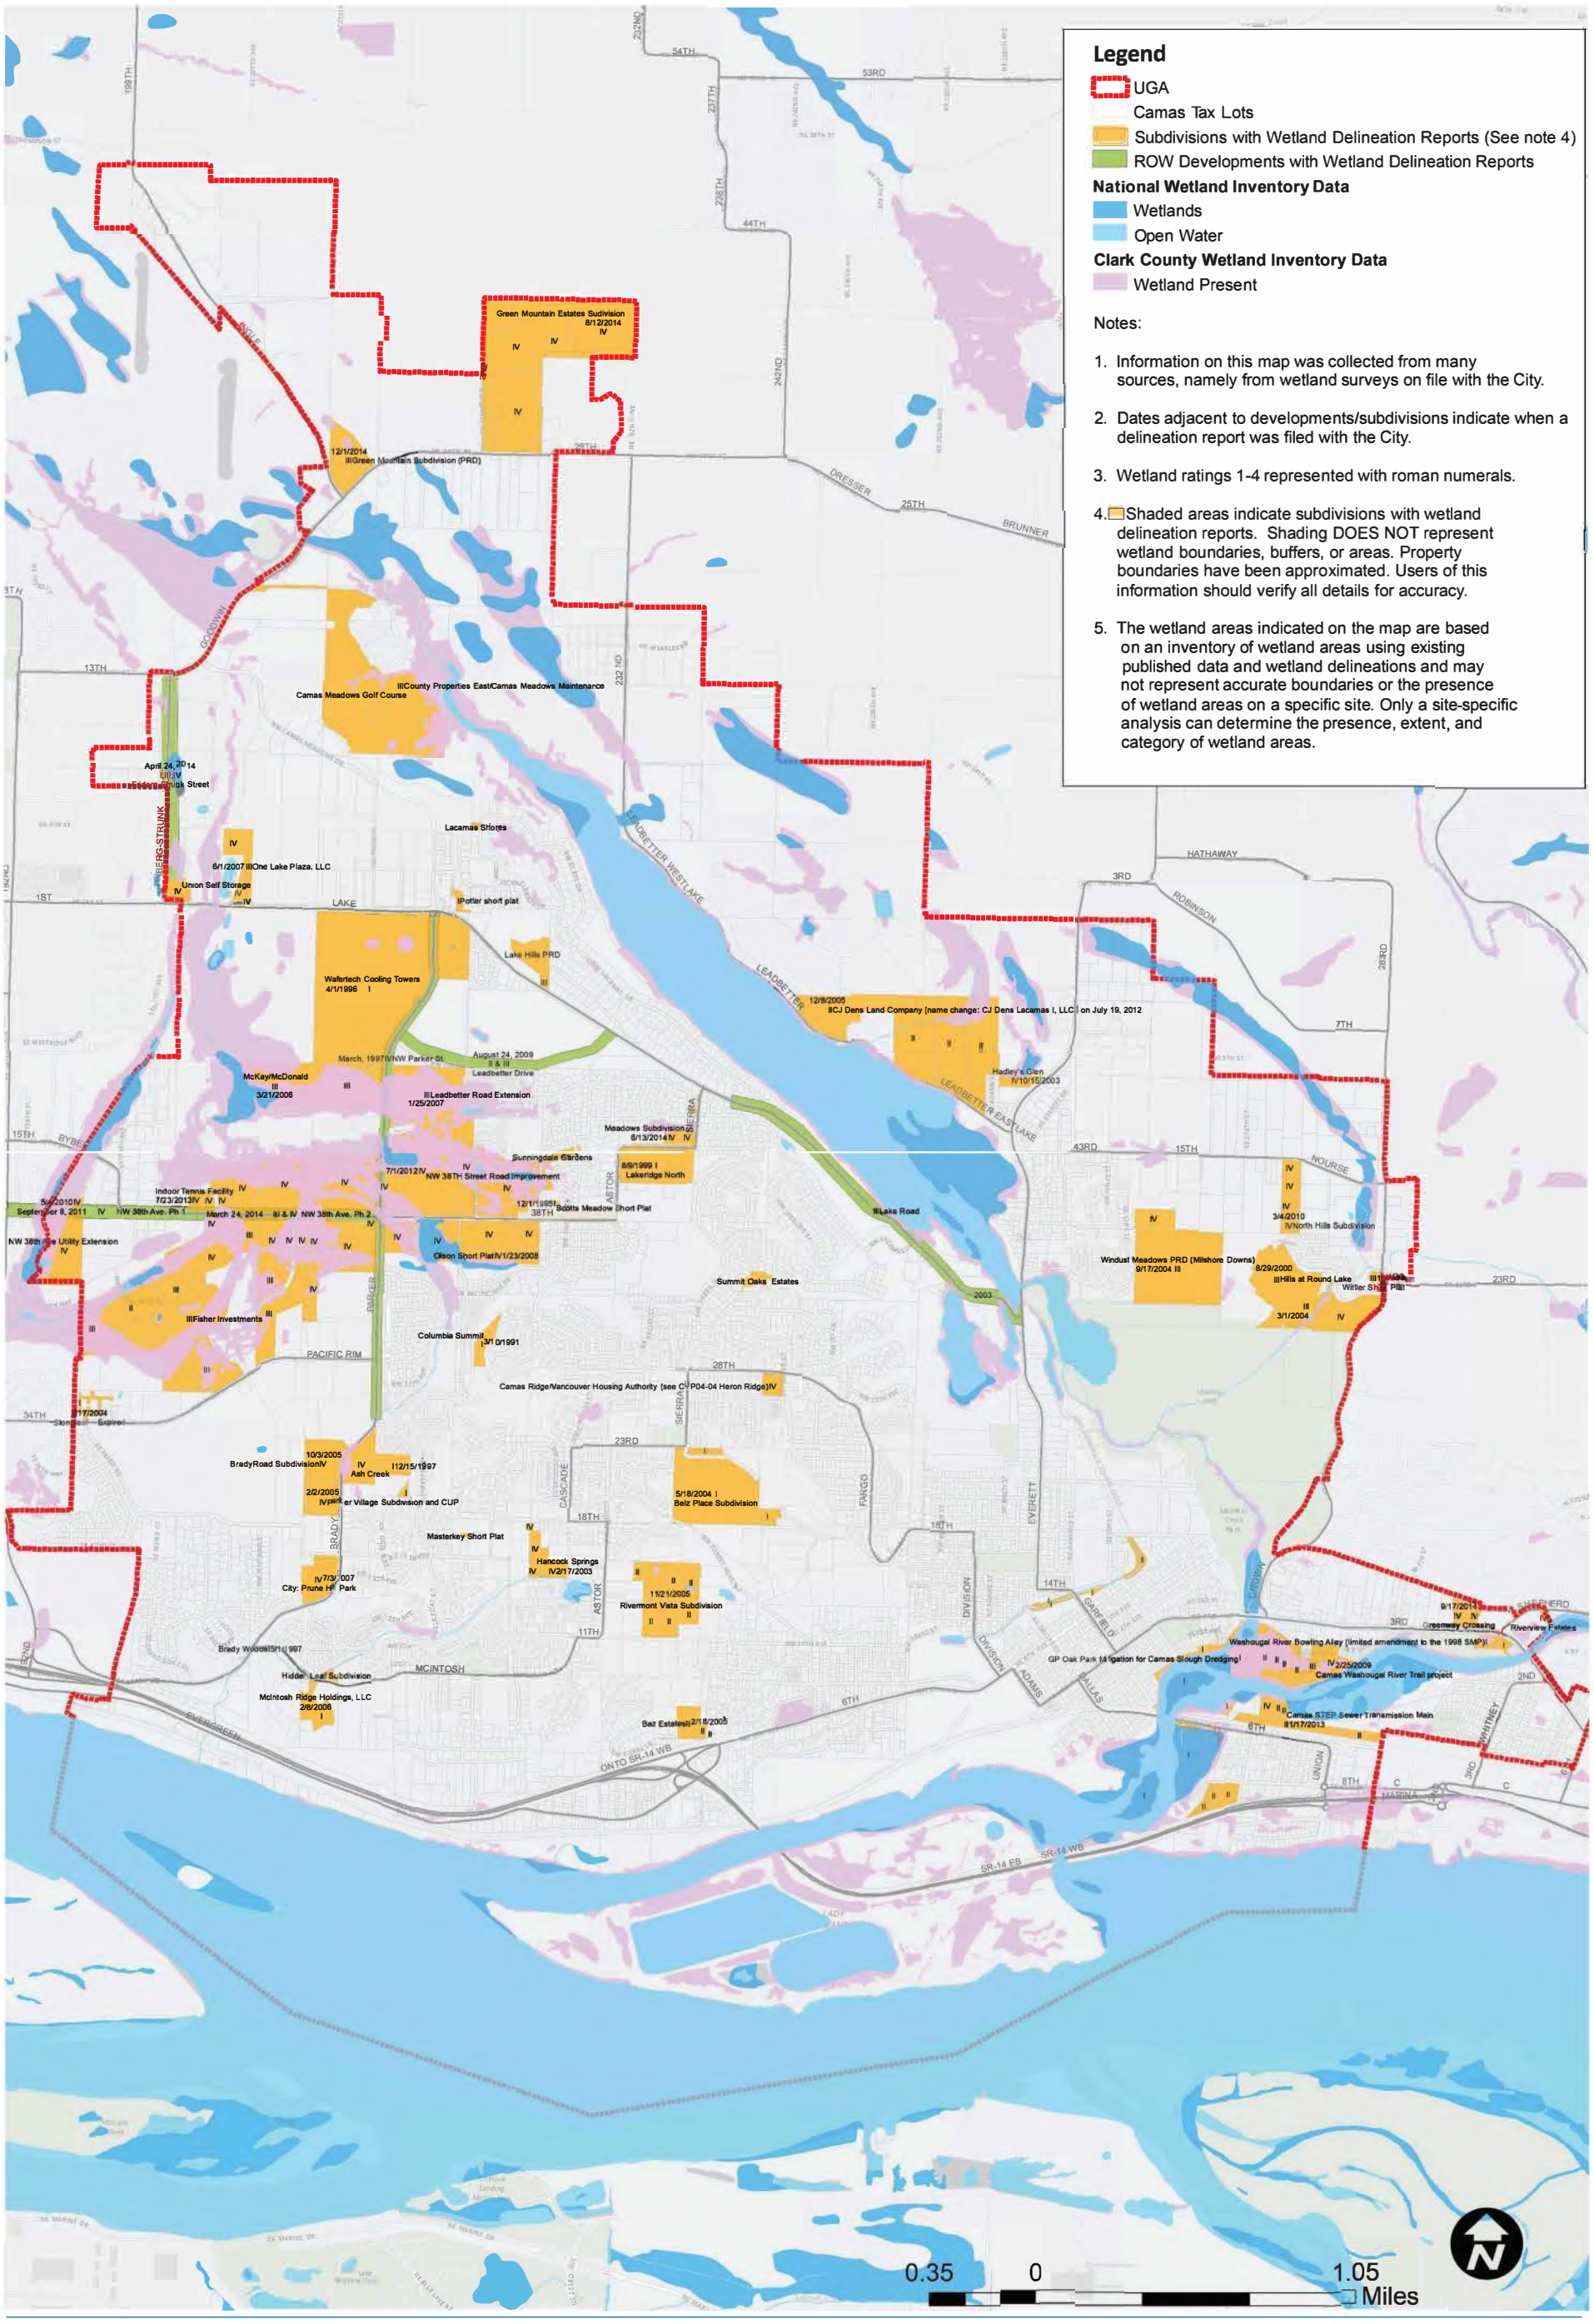
The majority of raw water supply for the City is provided by groundwater resources. This critical resource is protected by the CARA ordinance and the CMC. CMC 16.70.050 focuses on Aquifer Recharge Areas and required reports for proposed activities.

CARAs are located in multiple regions of the City and surrounding areas. Currently, two wellhead protected areas are within the City limits with the southernmost protected area extending beyond the UGA. Figure 4.4 shows these regions in relation to wells which serve more than 20 people.

4.6.2.3 Frequently Flooded Areas

Frequently flooded areas are defined as regions with >1 percent chance of flooding per year. These regions are near surface water bodies which include Lacamas Lake, Columbia River, Washougal River, Jones Creek, Boulder Creek, Round Leaf Lake, and Fallen Leaf Lake. Due to low elevations, portions of the southeastern region of the City are located within the 100-and 500-year Federal Emergency Management Agency (FEMA) floodplain. Construction regulations focus on decreasing flood hazards of the structure which area detailed in a critical area report.

4.6.2.4 Geologically Hazardous Areas



Geologically hazardous areas are typically defined by the possibility of natural disasters including earthquakes and volcanic activity. These hazard potentials are then increased by the presence of steep slopes prone to landslide, particular soil groups prone to liquefaction, and other circumstances which have the potential to compound emergency scenarios. The United State currently operates on a Category 1-4 system to determine building code stringency as it pertains to natural disasters where category 4 is the most stringent. The City is rated as a Category 4 which indicates a high potential for landslides and other events.

In Chapter 40.430, Clark County defines three types of geologic hazard areas which include seismic, landslide, and steep slope. The county's Geologic Hazard regulation requires developers to have a Geologic Hazard Area Study completed on any property which is identified in a hazard area.

4.6.2.5 Fish and Wildlife Habitat Conservation Areas

As defined in the City's 2035 Comprehensive Plan, one of the primary plans for the City is to protect "habitat and safe passage for wildlife from Green Mountain to the Columbia River" (Camas, 2035). Multiple threatened species have been found to inhabit or pass through the region, and regulations are currently in place to prevent harm to any habitat including Washington Administrative Code (WAC) 365-190-130. These regions are defined as Fish and Wildlife Habitat Conservation Areas which are protected.

Regulations include completing a habitat assessment before construction. These regulations impact any proposed sanitary sewer pipelines or pump stations in order to protect the fish and wildlife habitat.

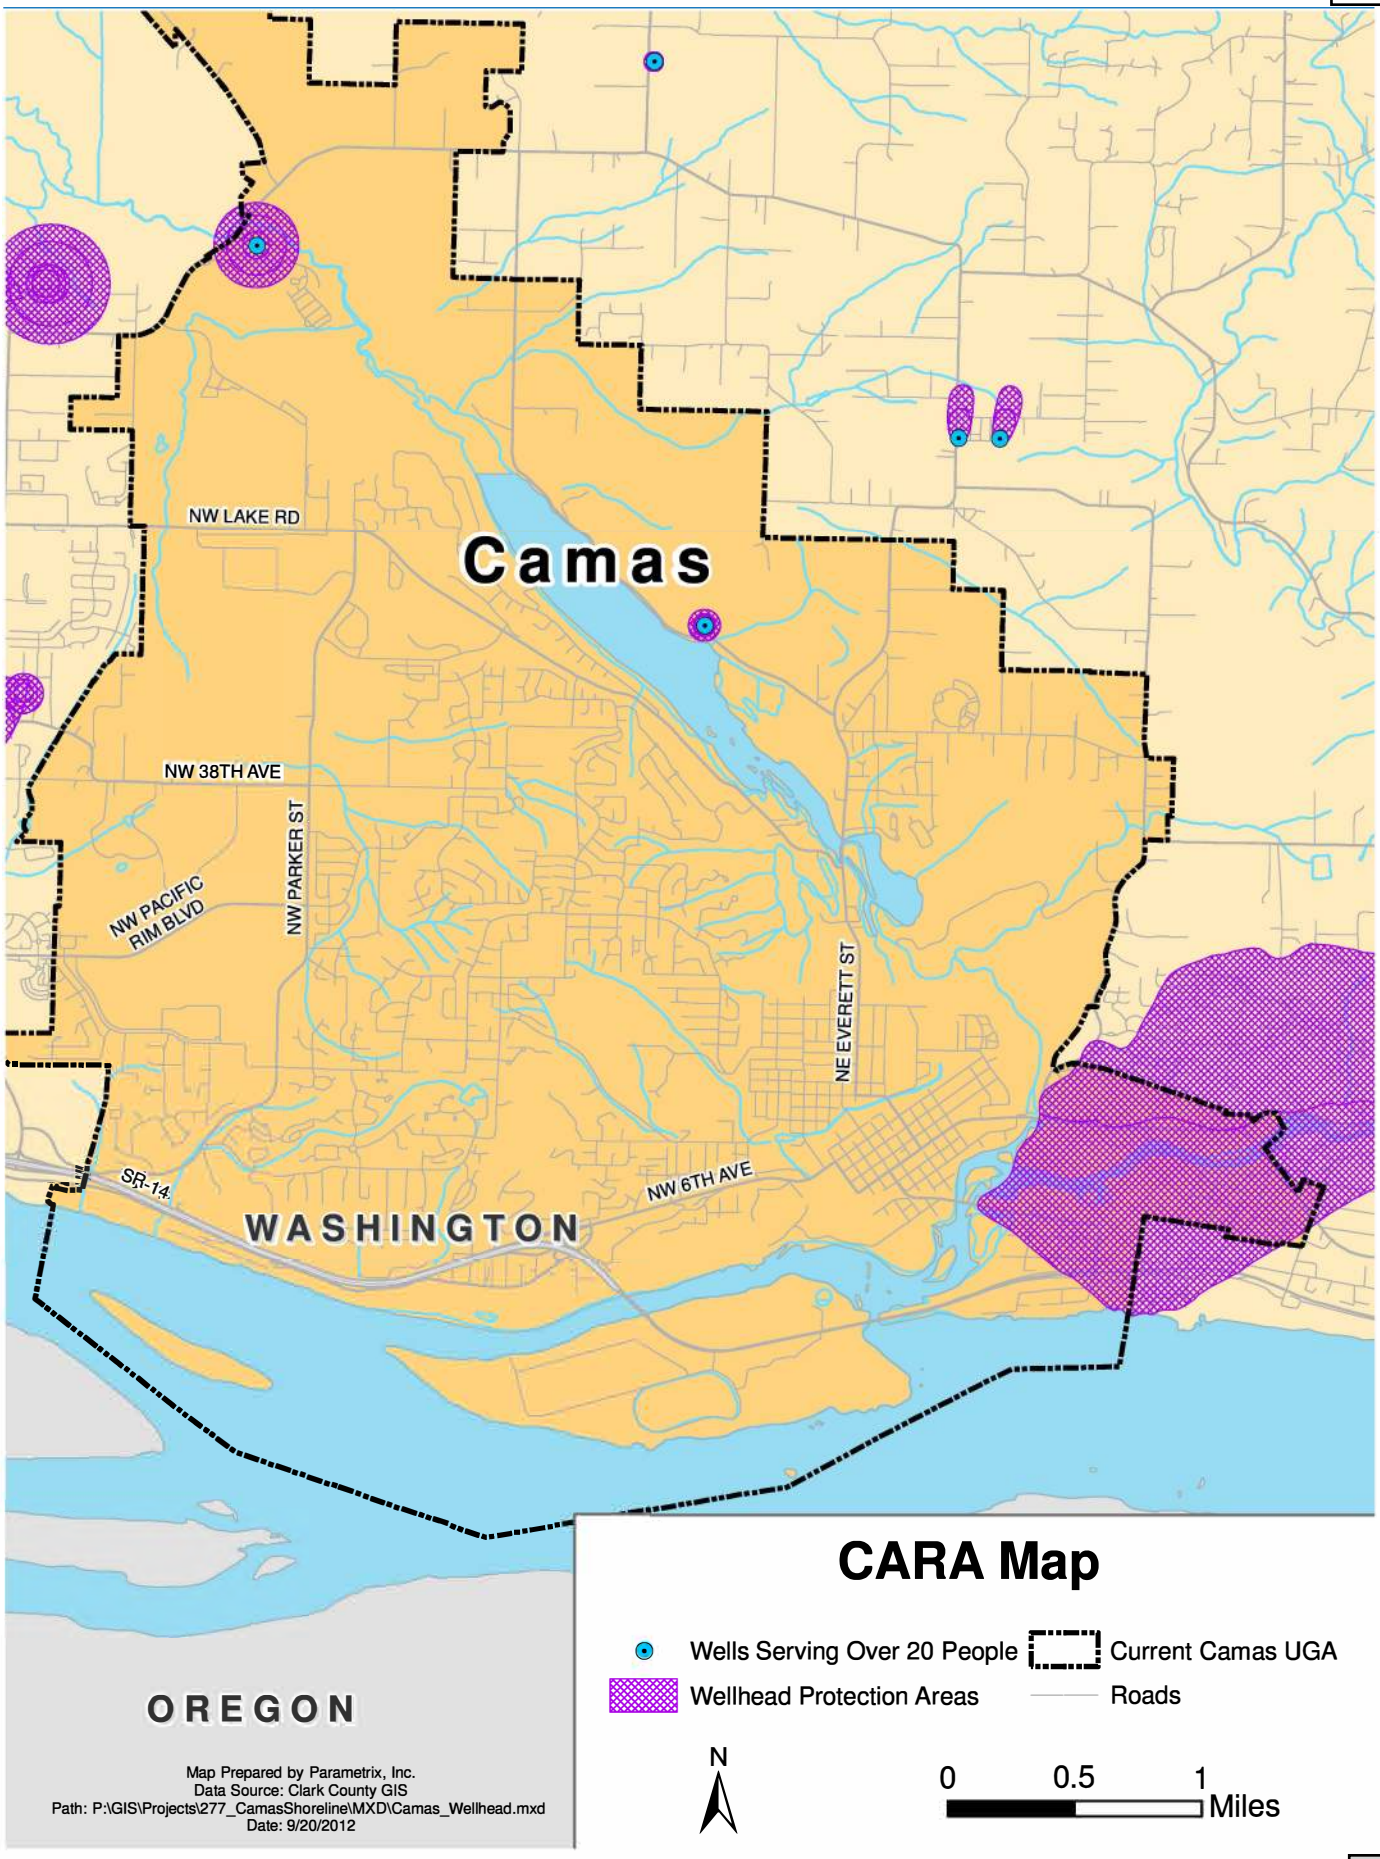

Figure 4.7 CARA Ma

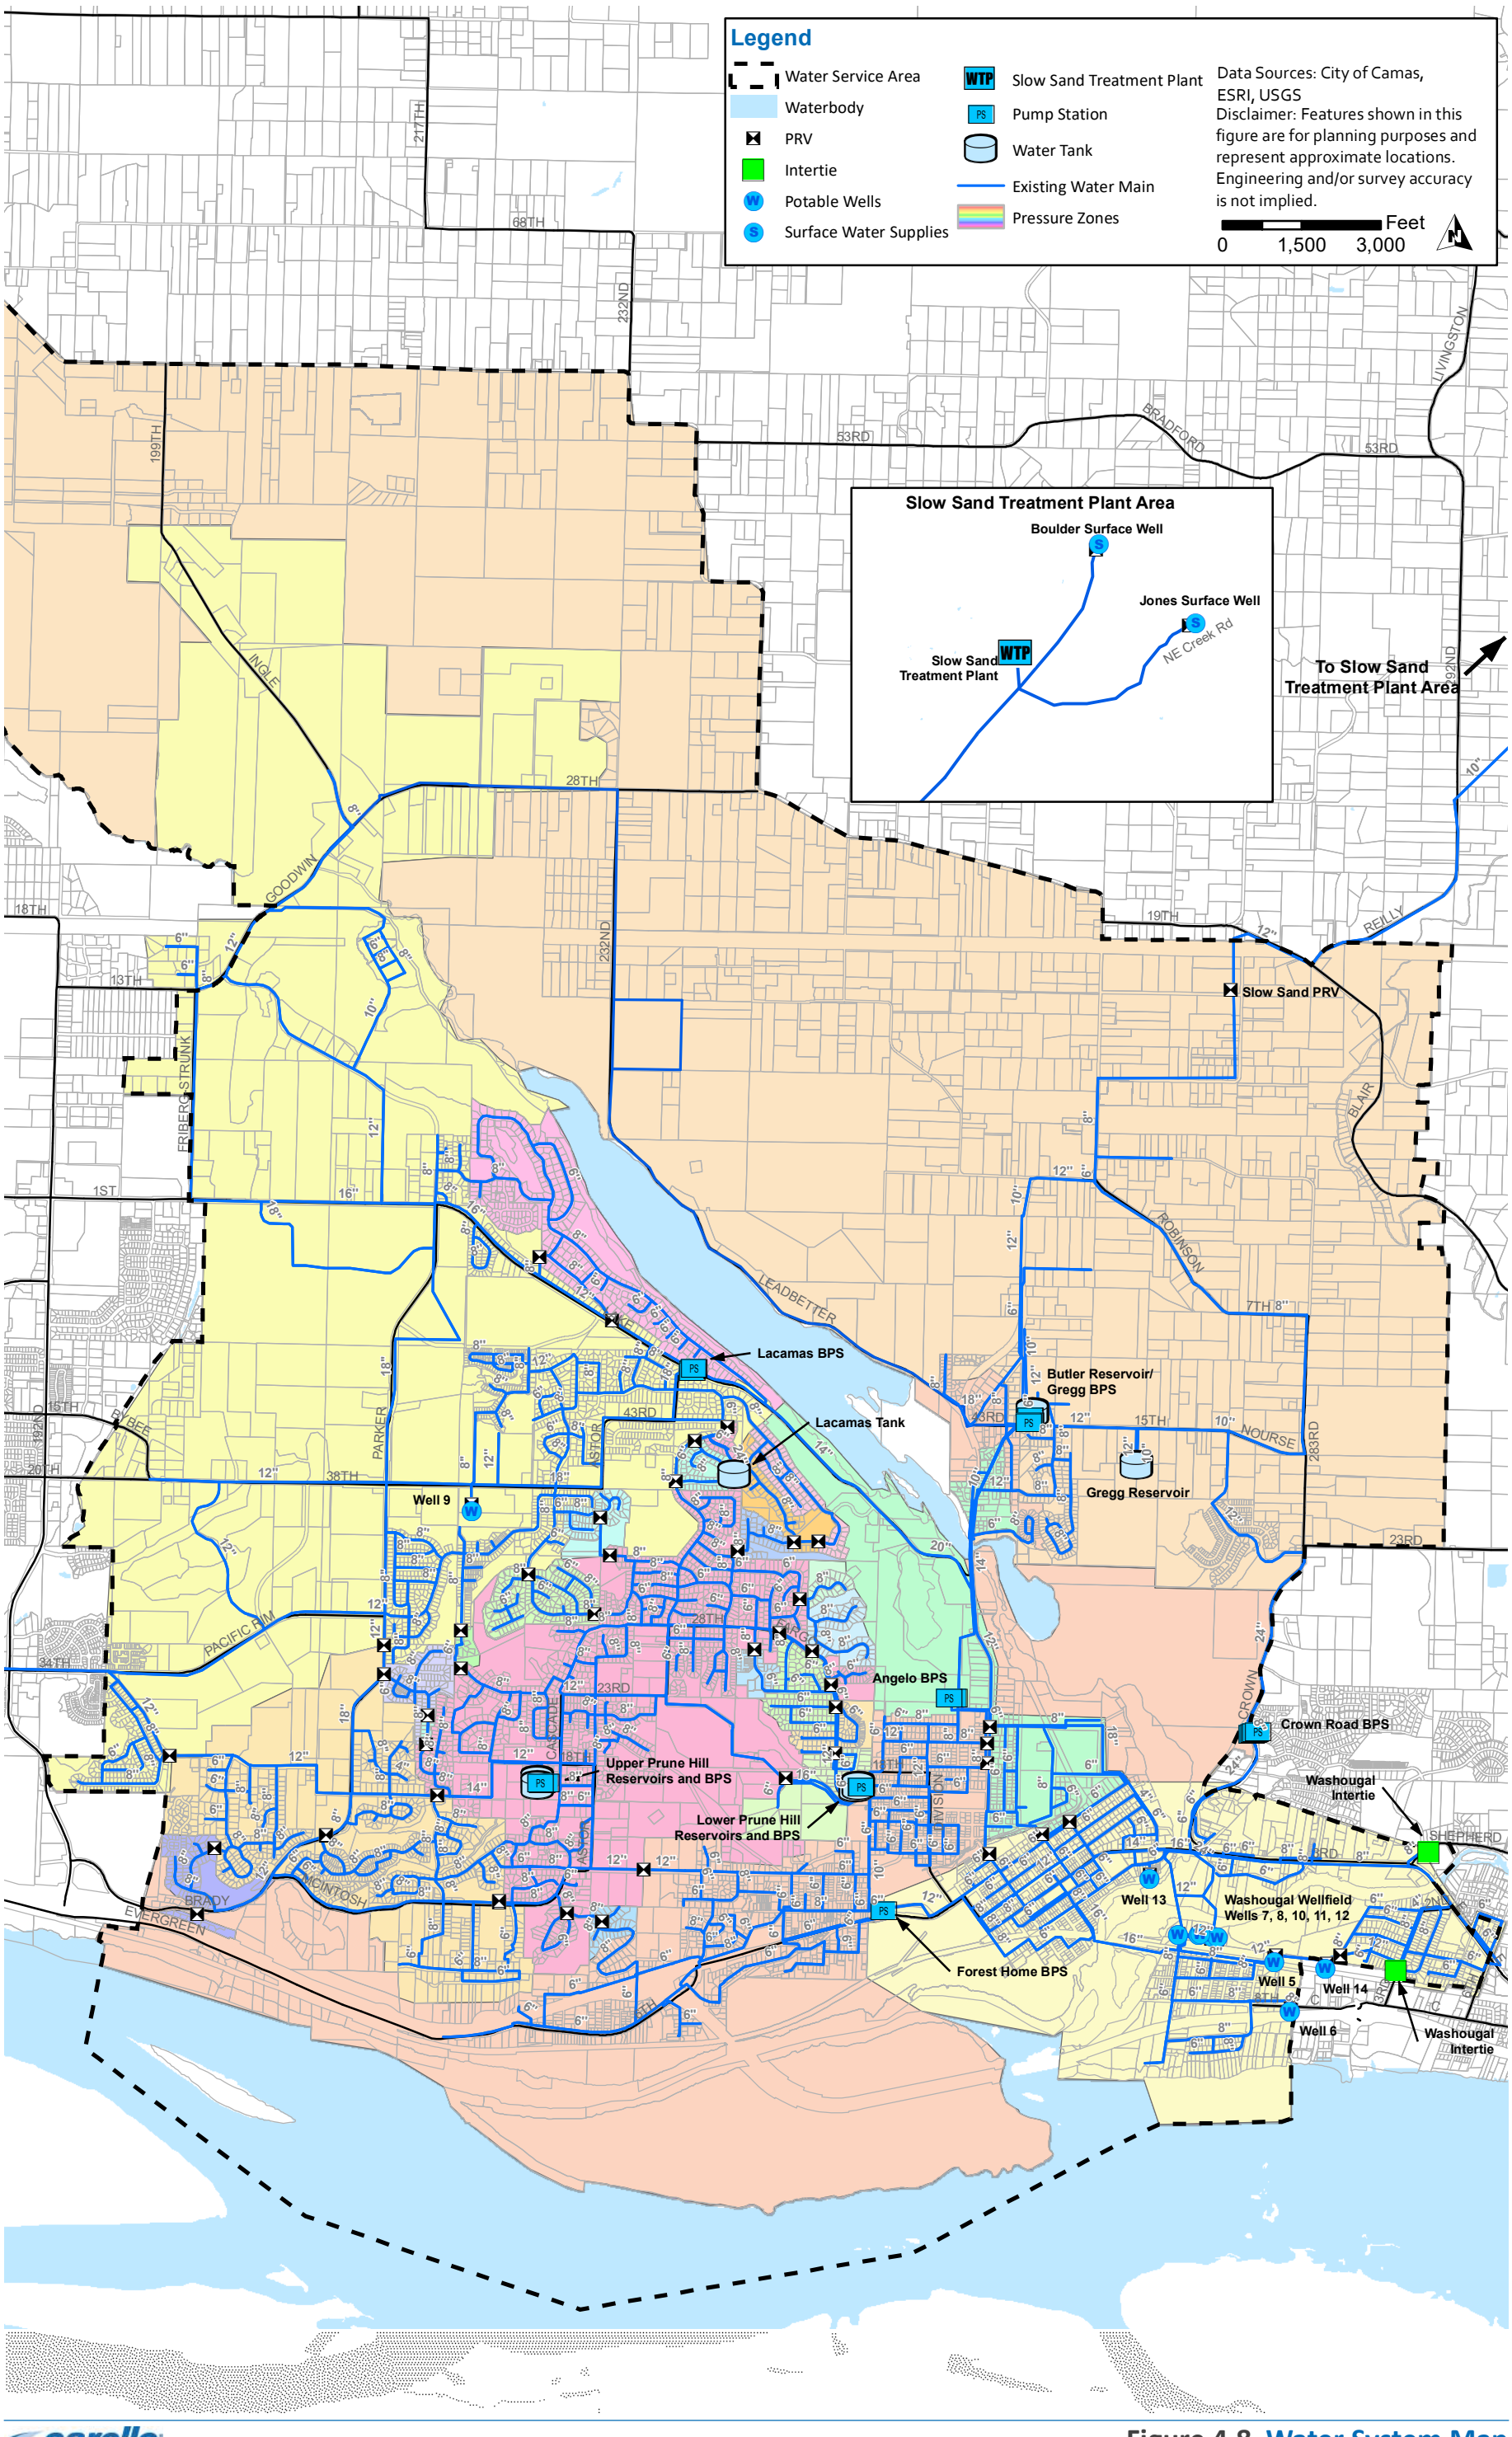
4.7 Water System

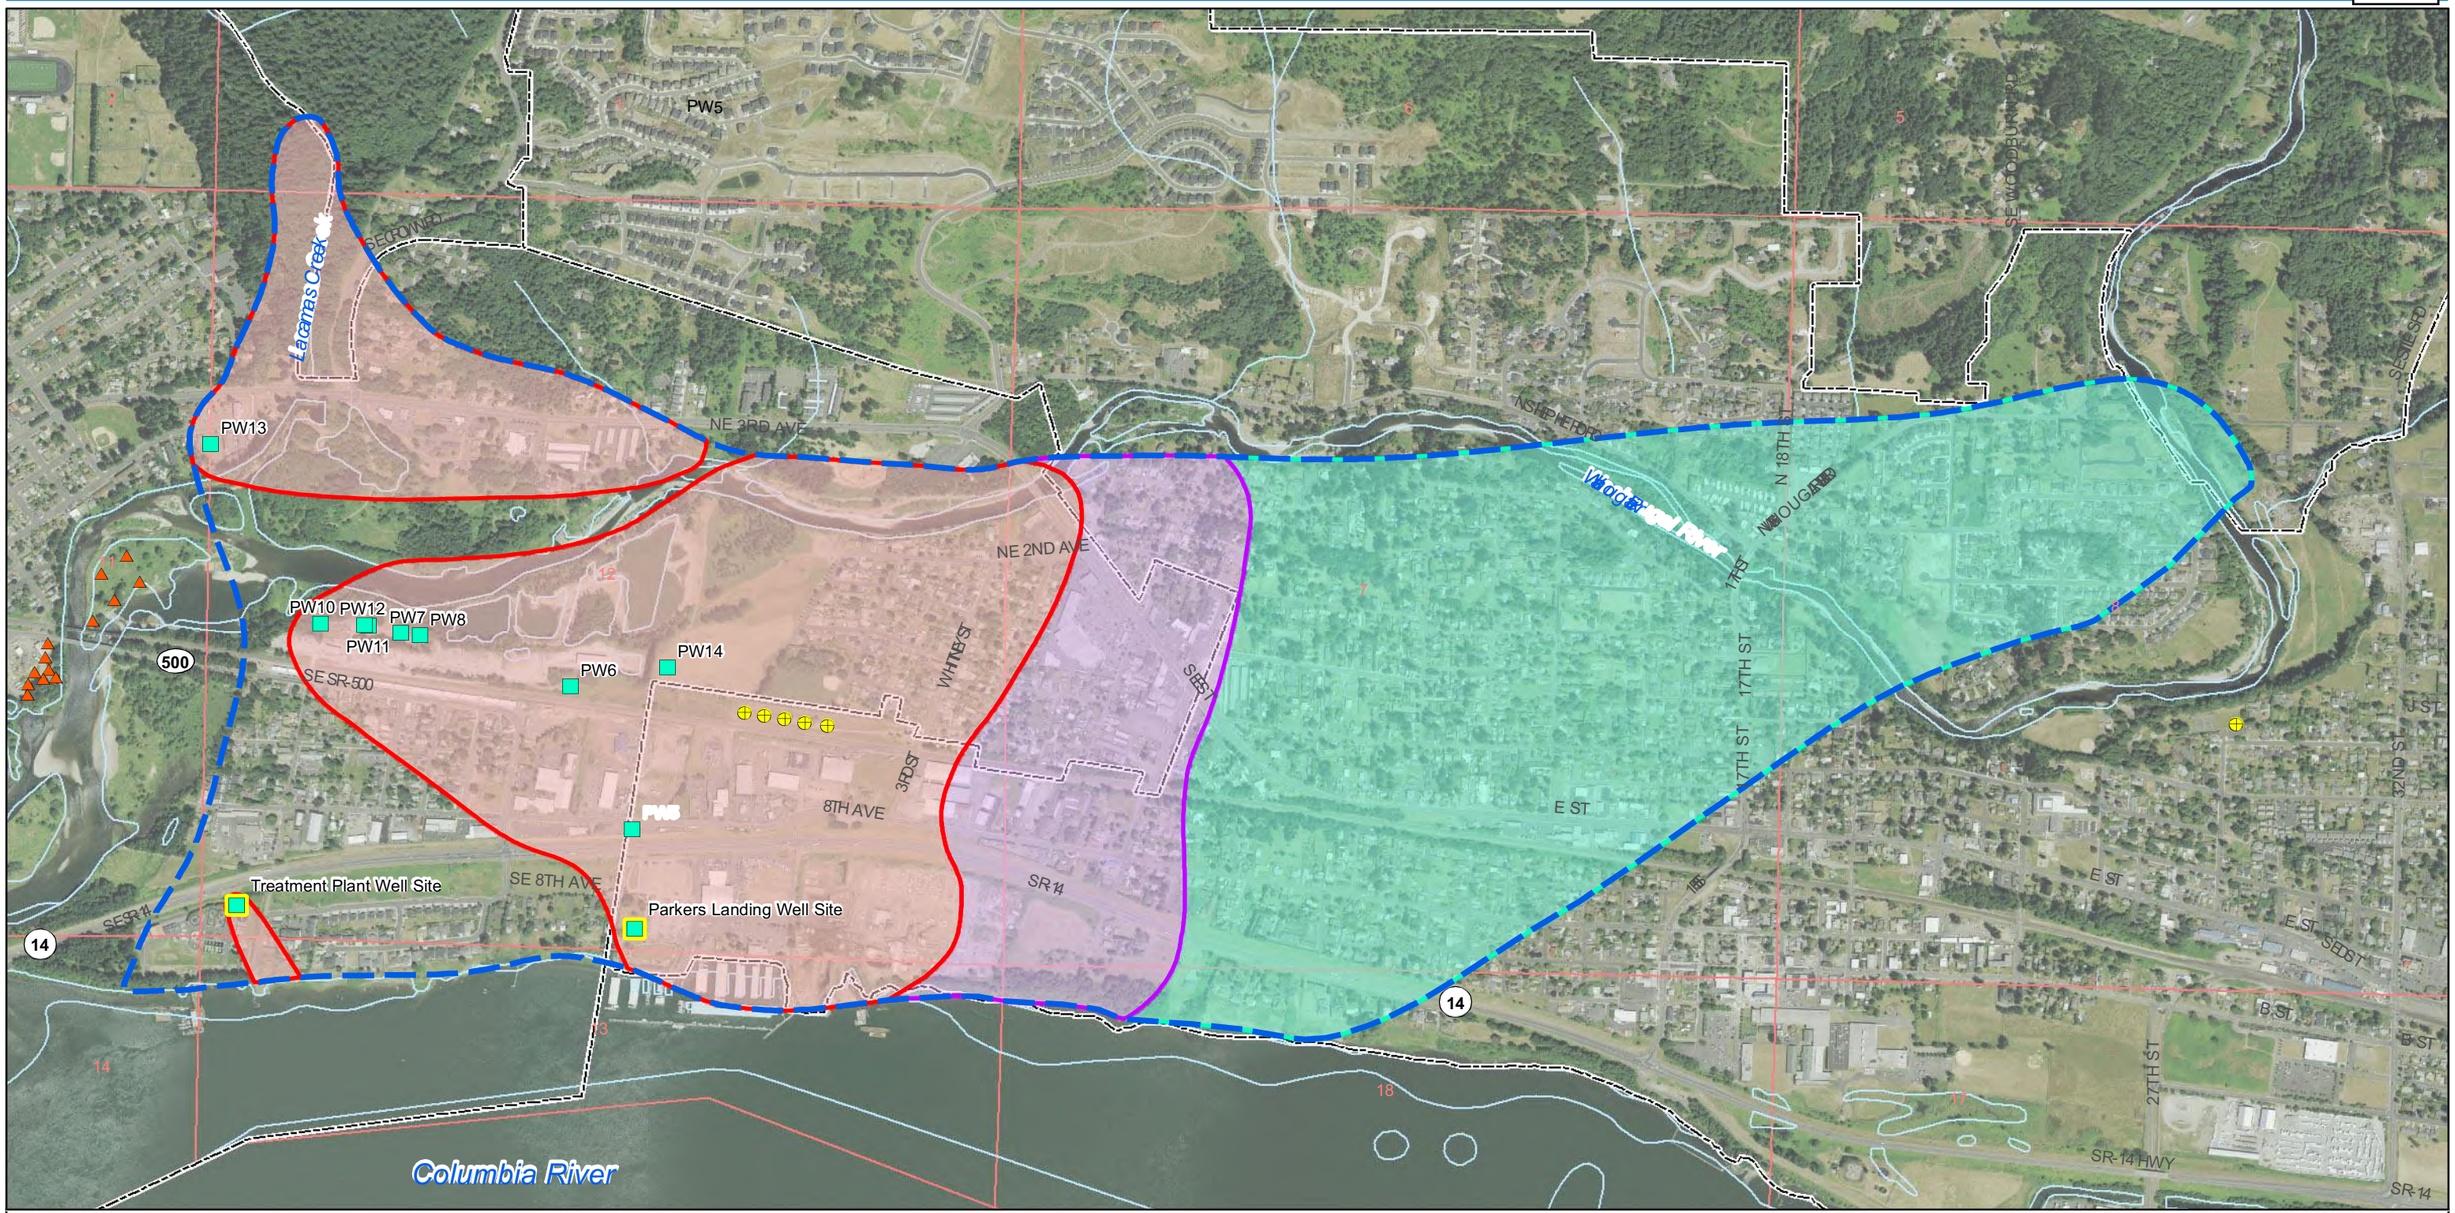


The City owns and operates a multi-source municipal water system, shown in Figure 4.8, which uses ground water and surface water to supply, treat, store, and distribute potable water to residential and commercial customers. The City currently obtains its water from ten groundwater wells and two surface water resources. The wellhead protection areas are regulated to prevent leakage from the sanitary sewer system from infiltrating a well; these areas are shown in Figure 4.9. The surface water resources include the Jones Creek Intake constructed in 1913 and the Boulder Creek Intake constructed in 1931. These intakes are permitted to flow at 1,570 gpm and have lower operating expense than groundwater sources. The ten groundwater wells are located in the 343 Zone excluding Well 9 which is located in the 544 Zone.

The City currently maintains the capacity to store 8.45 million gallons (MG) at multiple facilities including Butler Reservoir (1.2 MG), Gregg Reservoir (0.1 MG), Lacamas Reservoir (2.0 MG), Lower Prune Hill Reservoirs (2.0 MG), and the Upper Prune Hill Reservoirs (3.15 MG). This capacity is available for normal and emergency conditions, such as fire suppression. Service is provided to customers across five major pressure zones and 18 subzones. Eight booster pump stations are used to move water between pressure zones. Table 4.9 below lists the booster pump stations and their capacities.

Table 4.9 Camas Booster Pump Stations

Booster Pump Station	Capacity (gpm)
Butler	1,400
New Gregg	1,000
Forest Home	3,500
Lower Prune Hill	2,500
Lacamas	2,500
Angelo	4,000
Upper Prune Hill	2,900
Crown Road	1,600



The City owns over 143 miles of pipelines in its water transmission and distribution system compared to only 87.5 miles of collection system. Approximately 47 percent of the pipeline is Ductile Iron followed by Cast Iron at 15 percent. Additionally, the distribution system includes numerous meters, isolation valves, and hydrants. An emergency intertie is available with the City of Washougal as well while an agreement with the City of Vancouver includes the use of two fire hydrants located at SE 1st and Friberg.

Chapter 5

INFLOW / INFILTRATION PROGRAM

5.1 Introduction

Special condition S.4.E of the City's 2015 National Pollutant Discharge Elimination System (NPDES) Permit required the City to submit an annual Inflow and Infiltration (I/I) Analysis Report. The City received lower than typical treatment plant process removal efficiencies in their 2015 NPDES permit to account for the dilute Septic Tank Effluent Pump (STEP); Septic Tank Effluent Filter (STEF); and Septic Tank Effluent Gravity (STEG), which contribute approximately half of the plant influent, as well as low strength industrial wastewater. This accounts for the lower biological solids loading expected from septic tank effluent, which makes removal efficiency more difficult to achieve at the WWTF. This lower treatment standard could also potentially mask excessive I/I. Therefore, the City was required to conduct an Annual I/I Analysis report to prove the City is controlling I/I. The City completed the following reports: Infiltration and Inflow Study (Gray & Osborne, 2016); the May 2016-April 2017 Annual Inflow and Infiltration Report; the May 2017-April 2018 Annual Inflow and Infiltration Report; and the May 2018- April 2019 Annual Inflow and Infiltration Report. In 2020 an Infiltration and Inflow Follow-Up Study (Gray & Osborne, 2020) was completed to document improvements within the City's collection system. This section references findings from these reports as well as generally describing the City's I/I program.

Infiltration and inflow consist of two components which may combine or act independently to increase flow volume and peak flows in the sewer system. If too much I/I enters the sewer system such that the sewer system is operating at or above its capacity, sanitary sewer overflows (SSO) could occur. More dilute waste can also be difficult to treat if using percent removal criteria as the basis, as noted above. Proper attention to the lower than typical biological solids loading under these conditions is warranted in design and operation of the WWTF. The definitions of infiltration and inflows are described below:

- **Infiltration:** Infiltration is defined as stormwater or groundwater flows that enter the sewer system by percolating through the soil and then through defects in pipelines, manholes (MH), and joints. Examples of infiltration entry points are cracks in pipelines, misaligned joints, and root penetration. Due to this process, infiltration may be seen hours after a storm has occurred.
- **Inflow:** Inflow may be seen immediately after or during the storm. Inflow occurs when stormwater enters the sewer system via storm drain cross connections, leaky MH covers, or cleanouts. Examples of inflow entry points are roof drains and downspout connections, leaky MH covers, and illegal storm drain connections. Gross pipeline or system structural defects can be severe enough to allow storm or groundwater to enter the system rapidly and exhibit response time characteristics that could be categorized as inflow.

Key adverse effects of I/I on wastewater collection and treatment facilities include:

- Surcharging of sewer MHs.
- Sewage backups in facilities.
- Hydraulic overloading of unit processes at the wastewater treatment facility (WWTF).
- Reduced treatment efficiency at the WWTF due to dilute concentrations.
- Prematurely reaching capacity for collection systems and/or WWTF components.

This Chapter focuses on summarizing the City's efforts on I/I reduction from 2016 through 2020 and the quantifiable, positive improvement that has been accomplished in reducing I/I. It summarizes the amount of I/I for these years and specific projects completed to address I/I.

This Chapter focuses on summarizing the City's efforts on I/I reduction from 2016 through 2020 and the quantifiable, positive improvement that has been accomplished in reducing I/I. It summarizes the amount of I/I for these years and specific projects completed to address I/I.

5.2 Historical I/I Control Efforts

The City has conducted I/I studies since 1977. The City has spent more than $4.55 million in collection system I/I work and $750,000 in wastewater treatment facility improvements to address I/I flows.

The 1977 I/I Report attributed approximately 2.6 million gallons per day (mgd) to infiltration and 2.1 mgd to inflow. Major infiltration sources identified included roof and foundation drains, catch basins and multi-hole MH covers. By 1987, a sealing project was underway for individual sewer services.

In 1994, CH2M Hill wrote a memorandum stating that estimated I/I entering the system was 3.54 mgd and the major source was likely faulty service connections. It was concluded that a more cost-effective alternative to reducing I/I would be to increase treatment capacity.

In 1997, a Facility Plan determined the City had excessive I/I based on U.S. Environmental Protection Agency (EPA) criteria, and an 8-year sewer system rehabilitation program began based upon basins with the highest risk. During this study, a peak I/I flow of 3.4 mgd was determined.

In 2007, excessive inflow was determined at 62 gpcd for infiltration and 383 gpcd for inflow. This is based on the EPA criteria for excessive I/I to be 120 gallons per capita day (gpcd) for infiltration and 275 gpcd for inflow. At total of 26 collection system projects were identified to address capacity and condition issues, 18 of which would reduce I/I.

In 2016, the City commissioned an evaluation of the collection system to document existing infiltration and inflow as a condition of their new stormwater permit. This evaluation utilized pump station run time, WWTF flow, and precipitation records to identify basins that were yielding high I/I values. This provided data to confirm the basins with high I/I, which were 3s, 3n, 4, and 10. Then smoke testing, manhole inspection, and CCTV inspection were used to identify specific locations within basins where improvements could be made to lower I/I. The results of 2016 I/I Study were used to plan and prioritize projects in order to reduce I/I:

1. In 2020, the City commissioned a follow-up study to document the reduction in I/I achieved by implementing the recommendations of the 2016 evaluation. The specific objectives of the 2020 study included: Comparing the I/I with that measured in previous

flow monitoring efforts completed for the 2016 I/I Study to assess the efficacy of rehabilitation efforts
2. Identifying areas of the City where the I/I related peaking factor exceeds 3.4:1
3. Identifying additional areas of high I/I in order to new areas for rehabilitation

The 2020 Study demonstrated that since 2016, the City has observed a reduction in peak WWTF flows and high flow events, even though the population of the City and the extent of the sewer system have both increased over this time. Additionally, the City's WWTF no longer experiences excessive infiltration or inflow as defined by the EPA, which is examined below in Section 5.7.3.

The most recent I/I projects completed are summarized in this report. Future planned projects can be viewed in Appendix F.

5.3 Required I/I Reporting

Special condition S.4.E of the 2015 Camas WWTP NPDES permit required the City to conduct a study of inflow sources and annual analysis of I/I using the Washington State Department of Ecology's (Ecology) Information Manual for Treatment Plant Operators. Special condition S.4.E indicates the Annual I/I Report should include:

1. Average monthly flow and total precipitation for each month for the past year.
2. Maximum monthly and peak hourly hydraulic design capacity for the plant.
3. Design population equivalent for the treatment plant and population served by the facility for the past year.
4. The amount of I/I for each year since the base year and the percent of maximum monthly design capacity each year's I/I represents.
5. Percent increase or reduction in I/I for each year after the base year I/I.
6. Additional lengths of sewer lines added to collection system for the past year.

The Annual I/I reports for 2016, 2017, and 2018 and the City's I/I Program are provided in Appendix F and summarized throughout this chapter. Values in this Chapter are based on numbers that were reported in the Annual Reports. Please note that the City is updating their treatment plant capacity and values may change after completion.

5.4 Calculated I/I

Special condition S4.E.3 of the 2015 NPDES permit states that the annual period for the required I/I reporting is May 1st through April 30th. The 2016 Annual Report selected May 2011-April 2012 to be the base year to compare future I/I against, which is highlighted in Table 5.1. This base year was selected because it represents the 20-year median rainfall very closely. The average 12-month rainfall in Camas from the twenty-year period of 1997 to 2017 was 46.43 in, and from May 2011-April 2012 the rainfall was 47.60 in, which was the 50th percentile of all twenty 12-month totals and only 1.17 inches more than the twenty-year average. Additionally, using 2011-2012 as the selected base year incorporates the City's recent growth. Per permit requirements, the I/I was compared with maximum monthly hydraulic design capacity for the Camas Wastewater Treatment Plant. Additionally, I/I was compared with the previous year. The fluctuations seen in I/I in Table 5.1 are largely due to variations in rainfall. Reductions in I/I from specific projects are presented in further sections.

Table 5.1 Annual Report Calculated I/I

Year	Calculated I/I (mgd)	I/I as Percent of Design Capacity	I/I Percent Increase/Decrease
2011	1.511	25%	N/A
2012	2.340	38%	+55%
2013	0.591	10%	-75%
2014	0.985	16%	+67%
2015	2.277	37%	+131%
2016	1.920	31%	-16%
2017	1.021	17%	-47%
2018	1.052	17%	+3%

5.5 Field Investigation

Several evaluations were conducted to determine areas of excessive I/I. Field investigation methods include flow monitoring and analysis, smoke testing, MH inspection, and video inspection.

5.5.1 Flow Monitoring and Analysis

According to the NPDES permit, the City is required to:

- Quantify the level of inflow from each collection system basin or sub-basin in order to identify areas exceeding a peak day to monthly average peaking factor of 3.4:1 during the design rainfall event.
- Prioritize the list of projects to most cost effectively reduce the level of inflow to a peaking factor of 3.4:1 or less.

The analysis for flow monitoring includes evaluation of WWTF flow data, pump station run-time data, and collection system flow monitoring data. The highest-ranking storm event identified occurred on January 1, 2009 with 3.1 inches rainfall and 7.711 mgd WWTF influent followed by January 19, 2012 at 2.0 inches rainfall and 7.534 mgd WWTF influent. The design storm was estimated with the January 1, 2009, rainfall event. For pump station run-time, Crown View, Lacamas Creek, South Prune Hill, and West Camas were identified to exceed the peaking factor criterion of 3.4:1. Thus, the basins these pump stations are located in were targeted for further flow assessment.

Major storm events and corresponding WWTF influent flow are typically indicative of I/I activity in a collection system. During the 2016 I/I Study, basins of concern were Crown View (Basin 3N), Lacamas Creek (Basin 7), South Prune Hill (Basin 10), and West Camas (Basin 10) with ratio normalized to peak day of 5.904, 5.433, 3.554, and 3.299, respectively.

The highest priority flow monitoring locations are Basins 3 and 4 with the greatest I/I which exceeds the NPDES Peaking Factor criterion. Basins 3 and 4 are shown in Figure 4.2 in Chapter 4.

For the 2020 I/I Follow-up Study, temporary flow meters were installed in October 2019 in the collection system to determine the state of I/I in the City and assess the impact of previous I/I reduction projects. From this evaluation, the City was able to see areas still with peaking factors exceeding the NPDES Peaking Factor Criterion for peak day to average flow of 3.4:1.

5.5.2 Smoke Testing

Smoke testing is a typical means of conducting a physical assessment of a wastewater collection system. Smoke testing locates potential sources of I/I by blowing artificial smoke into a collection system, typically at a MH, and visually observing where the smoke escapes, indicating breaks in the collection system as well as cross connections between the sewer system and storm drain systems and roof drains.

Smoke testing was conducted from August 14 to August 26, 2015 as a part of the 2016 I/I Study. The test identified 92 locations where inflow could potentially occur where a majority was cleanouts that were either broken or without covers or where smoke was observed coming out of the ground. The highest observed sources of smoke occurred in Basin 3N, 3S, 4, and 5, as summarized in Table 5.2. A small number of roof drains and catch basins connected to the sewer system were identified. Defects were also identified near two MHs in Basin 3N through smoke testing.

Table 5.2 2015 Smoke Test Results

Basin	Cleanouts	Catch Basins	MHs	Roof Drains	"Ground Smoke" (Likely Side Sewers)	Total
1	1	0	0	0	1	2
2	3	0	0	0	1	4
3N	12	0	2	1	3	18
3S	2	0	0	1	13	16
4	4	1	0	1	6	12
5	2	1	0	1	10	14
6	0	2	0	2	3	7
7	1	0	0	0	0	1
8	4	0	0	0	1	5
9	3	0	0	0	0	3
10	6	1	0	0	3	10
Total	**38**	**5**	**2**	**6**	**41**	**92**

5.5.3 Manhole Inspection

Wastewater collection system MHs represent a relatively easy means of viewing what is occurring in a collection system because they:

- Allow for a visual inspection of flow.
- Are potential sources of I/I themselves due to deterioration or how they were constructed.
- Are insertion points for flow meters to measure flows within a collection system.

During the investigations in 1997 and 2015, all basins were tested. In the 1997 study, leaking MHs were found in Basins 1, 2, 3N, 4, 5, 6, 7, and 10. In the 2016 study, of the 95 MHs inspected in Basin 3S, 3N, 4, 5, and 7, only 14 were found to have reportable issues. Defects identified in these MHs are summarized in Table 5.3.

Table 5.3 2015 Manhole Inspection Results

Basin	Number of MHs leaking (2015)
3S	3
3N	4
4	2
5	4
7	1
Total	**14**

5.5.4 Video Inspection

The City contracts with specialist firms to perform regular closed-circuit television (CCTV) inspections of its gravity sewer system. The inspections identify structural and operational defects, such as broken pipes, cracks, grease, roots, sag, separated and offset joints, and other problems. Several structural defects identified in CCTV inspections were repaired when identified. Other defects may be addressed through increased preventative maintenance, repair, or monitoring. In 2016 as a result of the flow monitoring work completed for the 2016 I/I Study, the City selected an area of the sewer system that frequently exceeded the 3.4:1 peak to average flow ratio. This area was the section of sewer system that drains to the Crown View Lift Station, and CCTV inspections were evaluated to identify potential I/I sources. The results were used to develop a list of projects which the City incorporated into their ongoing repair and replacement program.

5.6 Identified I/I Projects

From the field investigation, projects were developed and given a level of priority based on their potential to remove I/I. Priority basins for I/I reduction were 3N, 3S, and 4. Future I/I projects are slated for the City's other basins.

High priority projects developed to guide the likely schedule of I/I mitigation projects were described as follows:

- Action explicitly required by NPDES permit.
- Disconnect catch basins from sanitary sewer and connect to storm sewer.
- Repair cleanouts with > 500 gallons per day (gpd) estimated inflow.
- Disconnect downspouts.
- Replace significantly deteriorated MHs.
- Raise MH lids to minimize inflow.
- Repair significantly deteriorated or sagging pipe, with highest priority on problems observed in Basins 3N, 3S and 4, followed by Basins 5 and 6.

With the completion of high priority work only, the sewer system is anticipated to achieve the NPDES permits required ratio of peak day to monthly average flows in all basins. If it is not reduced, then the medium high priority projects will be completed, then the medium and lastly the low. Table 5.4 includes basins targeted and total capital required to complete the projects. The suggested timeline was for high priority projects to be completed in 2016-18, medium high priority in 2019, medium priority in 2020-2025, and low priority from 2026-2029.

Table 5.4 Summary of I/I Projects and Costs Listed in 2016 I/I Study

Year	Basins	Targeted Cost(1)
2016	3N, 3S, 4	$328,000
2017	1, 2, 3N, 3S, 4, 5, 6, 10	$380,000
2018	2, 3N, 3S, 4, 5, 6, 7	$500,000
2019	5, 7, 8, 9, 10	$130,000
2020	3N	$150,000
2021	3N, 3S	$135,000
2022	3S,	$150,000
2023	3S, 4	$150,000
2024	4, 5, 8, 9	$150,000
2025	9, 10	$50,000
2026-2028	1, 2, 5, 6, 7, 8, 9	$325,000

Notes:
(1) All cost values were determined by Gray & Osborne. All values are believed to be in 2016 dollars.

The 2015 I/I report included a project schedule with all planned projects for the next 10 years. The 2016, 2017, and 2018 Annual Reports denote on the project schedule which projects have been completed.

5.7 Completed I/I Projects

As mentioned previously, five high priority projects have been completed, as shown in Table 5.5. These projects have cost the City in excess of $1.5 million dollars. The City conducted pre- and post- construction monitoring for the two largest projects, which are summarized in Section 5.7.1 and 5.7.2.

Table 5.5 Completed I/I Projects

Year	Basin	Project Title	Description	Project Cost(1)
2019	10	View Ridge Court Sewer Replacement	Replacement of sewers	$370,000(3)
2017	4	NE Dallas Street Sewer Replacements	Replacement of several sewer pipes	$129,000(3)
2017	4	NE Adams Street Sewer Replacements	Replacement of several sewer pipes	$100,000(3)
2017	4	Everett and Franklin Sewer Replacement	Replacement of sewer line from 19th and Franklin to Everett and Everett to 21st	$352,000(3)
2016	4	Franklin Street Sewer Improvement	Replace sewer line between MH 4-1-1 and MH 4-1-4	$952,883(2)
2018	3S	Mill Ditch Repair	Replaced section of sewer line between Dallas Street and Birch Street	$417,105(2)
2018	3S	Mill Ditch Repair	Rehabilitate or replace 15-inch CONC from MH 3-2-6 to 3-1-1 (1,370 feet)	

Notes:
(1) Cost values reflect actual construction costs at the time of completion.
(2) Value from the 2017 Annual Report.
(3) Value from the I/I Follow-Up Study.

5.7.1 Franklin Street Sewer Improvement Project

The Franklin Street Sewer Replacement Project was completed in October 2016. The project involved replacing and upsizing approximately 1,600 feet of sewer line that had been video inspected along Franklin Street between NE 19th Avenue and NE 14th Avenue and were found to contain cracks and sag. Table 5.6 summarizes the inflow before the project and changes in flow observed after project completion. The project effectively reduced inflow by approximately half during typical flow conditions. No reduction was seen during the largest storm monitored, which is likely due to upstream inflow sources outside of the scope of the project.

Table 5.6 Franklin Street Sewer Project I/I and Flow

Manhole	Basin Measured	Flow Meter Installed	Flow Meter Removed	Parameter (mgd)	Daily Flows (mgd)			Rainfall/ days(1)
					Min	Ave	Max	(in/day)
MH 3-2-6 Pre-Construction	4	1/5/2016	1/20/2016	Flow Inflow	0.411 0.303	0.749 0.641	1.019 0.911	0.3593
MH 3-2-6 Post-Construction	4	3/4/2017	3/30/2017	Flow Inflow	0.127 0.017	0.447 0.337	1.054 0.944	0.3362

Notes:
(1) This is the total cumulative rainfall over the duration the flow metered.

5.7.2 Mill Ditch Repair Project

The Mill Ditch Sewer Line Replacement was completed in April 2018. The project included replacing approximately 900 feet of deteriorated 15-inch concrete main with 21-inch high-density polyethylene (HDPE) pipe and manholes. Table 5.7 summarizes the inflow before the project and changes in flow observed after project completion. The project effectively reduced inflow by approximately half during typical flow conditions. Due to the timing of the project and dry spring weather, post construction flow monitoring was not completed until 2019. The increase in inflow during the largest storm monitored is likely due to differences in rainfall intensity between the pre- and post-construction periods and upstream inflow sources outside of the scope of the project.

Table 5.7 Mill Ditch Project I/I and Flow

Manhole	Basin Measured	Flow Meter Installed	Flow Meter Removed	Parameter (mgd)	Daily Flows (mgd)			Rainfall(1)
					Min	Ave	Max	(in/day)
MH 5-8-1 Pre-Construction	3N, 3S, 4	2/5/2016	2/23/2016	Flow Inflow	0.352 0.68	0.909 1.114	1.969 1.617	0.1756
MH 5-8-1 Post-Construction	3N, 3S, 4	3/19/2019	6/4/2019	Flow Inflow	0.46 0.245	0.795 0.58	2.496 2.28	0.0906

Notes:
(1) This is the total cumulative rainfall over the duration the flow metered.

5.7.3 I/I Reduction Summary

In 2020, the City commissioned a follow-up study to document the reduction in I/I achieved by implementing the recommendations of the 2016 evaluation. The purpose of this work was to compare estimated per capita I/I from the 2016 study and 2020 against EPA criteria. The EPA's threshold for excessive infiltration is 120 gallons per capita per day (gpcd) is and the threshold for

excessive inflow is 275 gpcd. The per capita infiltration flow accounts for domestic wastewater flow, infiltration, and nominal industrial and commercial flows. Inflow values are based on the maximum daily influent flow at the WWTF between 2019 and 2020.

The initial Infiltration and Inflow Study (Gray & Osborne, 2016) determined that per capita infiltration in the collection system was 80 gpcd, which was below the EPA threshold for excessive infiltration. This study determined that inflow was a much more significant source of I/I in the collection system with an estimated flow 348 gpcd, which is excessive per EPA criteria. As a result of I/I projects completed between 2016 and 2020 the City's per capita infiltration was reduced to 46 gpcd. During this same period the City's per capita inflow was reduced to 176 gpcd and is no longer considered excessive.

Table 5.8 summarizes the improvements in per capita I/I for the City's collection system.

Since 2016, the City has completed I/I reduction projects each year, totaling well over $1 million. According to the 2020 Follow-up I/I Study, along with the reduction of I/I since 2016, the performance of the WWTF has improved as well. The WWTF has not experienced an I/I related effluent violation for over three years (since February 2017). While the I/I reduction is presumably not the only reason the WWTF's efficacy has improved, reductions in I/I due to the City's reduction efforts has certainly played a crucial role.

Table 5.8 Per Capita I/I Compared to EPA Criteria

Parameter	EPA Criteria for Excessive I/I (gpcd)	I/I Value for Camas in 2014 (gpcd)	Current I/I Value for Camas (gpcd)
EPA Excessive Infiltration Criteria	120	80	46
EPA Excessive Inflow Criteria	275	348	176

5.8 Planned I/I Projects

The City has two major pump station improvements projects planned to be constructed within the next five years. These are the Crown View Pump Station Improvements project and the Lacamas Creek Pump Station Replacement project. The design for each of these projects was completed in 2020 but bidding documents have not been issued for construction. In addition, the City will continue to address I/I throughout the collection system through their ongoing repair and replacement program. The 2020 Follow-up I/I Study expects that the Crown View Pump Station Improvement will significantly reduce I/I in Basin 3n, and the Lacamas Creek project will significantly reduce I/I in Basin 7.

Table 5.9 Planned I/I Projects

Year	Basin	Project Title	Description	Project Cost
Ongoing	N/A	Gravity Main Repair and Replacement	Ongoing repair and replacement of gravity mains at end of useful life.	$150,000/year
2020	3N	Crown View Pump Station Improvements	Includes stormwater improvements to reduce I/I entering the pump station	-
2020	7	Lacamas Creek Pump Station	Includes replacing the pump station and sewer pipe	$4.03M

Chapter 6

COLLECTION SYSTEM

6.1 Introduction

The City of Camas's (City) customer base continues to increase through system expansion. With this growth, some of the City's sewer infrastructure may reach conveyance capacity. This chapter presents an evaluation of the available capacity of the existing system to convey current and future sewer flows. The City's collection system is broken up between gravity mains and septic tank effluent pumping (STEP) systems that flow to the Treatment Plant separately.

Using the City's updated sewer model, major pipes and pump stations in the modeled collection system were evaluated for meeting established capacity criteria. The modeled collection system is primarily large gravity sewers which represent a skeletonized version of the system. The City has a limited GIS inventory of the collection system so no updates to the extent of the system that is modeled could be made. The STEP system was not included in the hydraulic model. Thus, capacity evaluation was only performed for the modeled gravity portion of the collection system. An overview of the modeled collection system is shown in Figure 6.1. The current modeled service area, in pink, represents the portion of the model evaluated in the existing scenario based on flow monitoring. The system was calibrated with four flow meters, which delineated the model system into four flow monitoring basins with similar diurnal patterns and wet weather flow parameters, also shown in Figure 6.1. The 2035 year and build-out scenarios expanded the modeled service area to the NUGA in the North of the system, shown in green. Additional details on the model used to evaluate the collection system can be found in Appendix E - TM Hydraulic Model Development. This chapter identifies recommended projects that correct capacity deficiencies and will be required to serve future users.

6.2 Evaluation Criteria

Defining performance criteria is a critical step in the master planning process because it sets metrics by which the collection system infrastructure will be evaluated to meet service goals set by the City. Sewer pipe capacities are dependent on many factors, including roughness of the pipe, the maximum allowable depth of flow, or slope of pipe. The City's application of these factors and established requirements are discussed below.

It is important to differentiate performance and design criteria when judging the performance of collection system infrastructure. Design criteria establish the standards for designing and constructing new sewers. Performance criteria establish the standards that are used to analyze adequacy of existing facilities and to trigger future infrastructure needs. Performance criteria are commonly less stringent than design criteria because existing sewer systems typically have aged significantly and would require extensive reconstruction to meet standards for new design. It is generally inappropriate to use standard design criteria as performance criteria, especially when significant wet weather flows impact an existing collection system (as is the case with an aged sewer system). For instance, new sewers are designed to convey flow under non-surcharged conditions (assuming limited inflow and infiltration [I/I]), while surcharging may be permissible

during the analysis of existing sewers, especially during peak wet weather flows (PWWFs). The following sections describe the City's established design criteria and performance criteria used herein.

6.2.1 Design Criteria

The design criteria are used to size new infrastructure recommended to alleviate system deficiencies for this system evaluation.

6.2.1.1 Conveyance System

It is common practice to use diameter-based flow depth criteria for pipes when designing new gravity sewers. The depth/diameter (d/D) ratio is defined as the depth of flow in a pipe during peak flow conditions divided by the pipe's diameter. The City's Sewer Standards define the acceptable d/D values for design of new sewers under design storm conditions:

- All sewers shall be designed to flow at a d/D no greater than 1.2 at peak flow rates under build-out conditions, and d/D of 1.0 for existing condition.
- No surcharging (d/D>1) is allowed at shallow manholes. Shallow manhole are defined as manholes where the distance between crown of pipe and manhole rim is less than three feet.
- During the PWWF for design storm, water levels were not allowed to rise up to three feet below manhole rim.

6.2.1.2 Pump Stations and Force Mains

Any new pump stations recommended will need to follow the City's Sewer Standards for pump stations and force main construction to meet Department of Ecology (DOE) requirements. These are detailed in Section 2.2.2 of Chapter 2 - Policies.

6.2.2 Performance Criteria

6.2.2.1 Design Storm

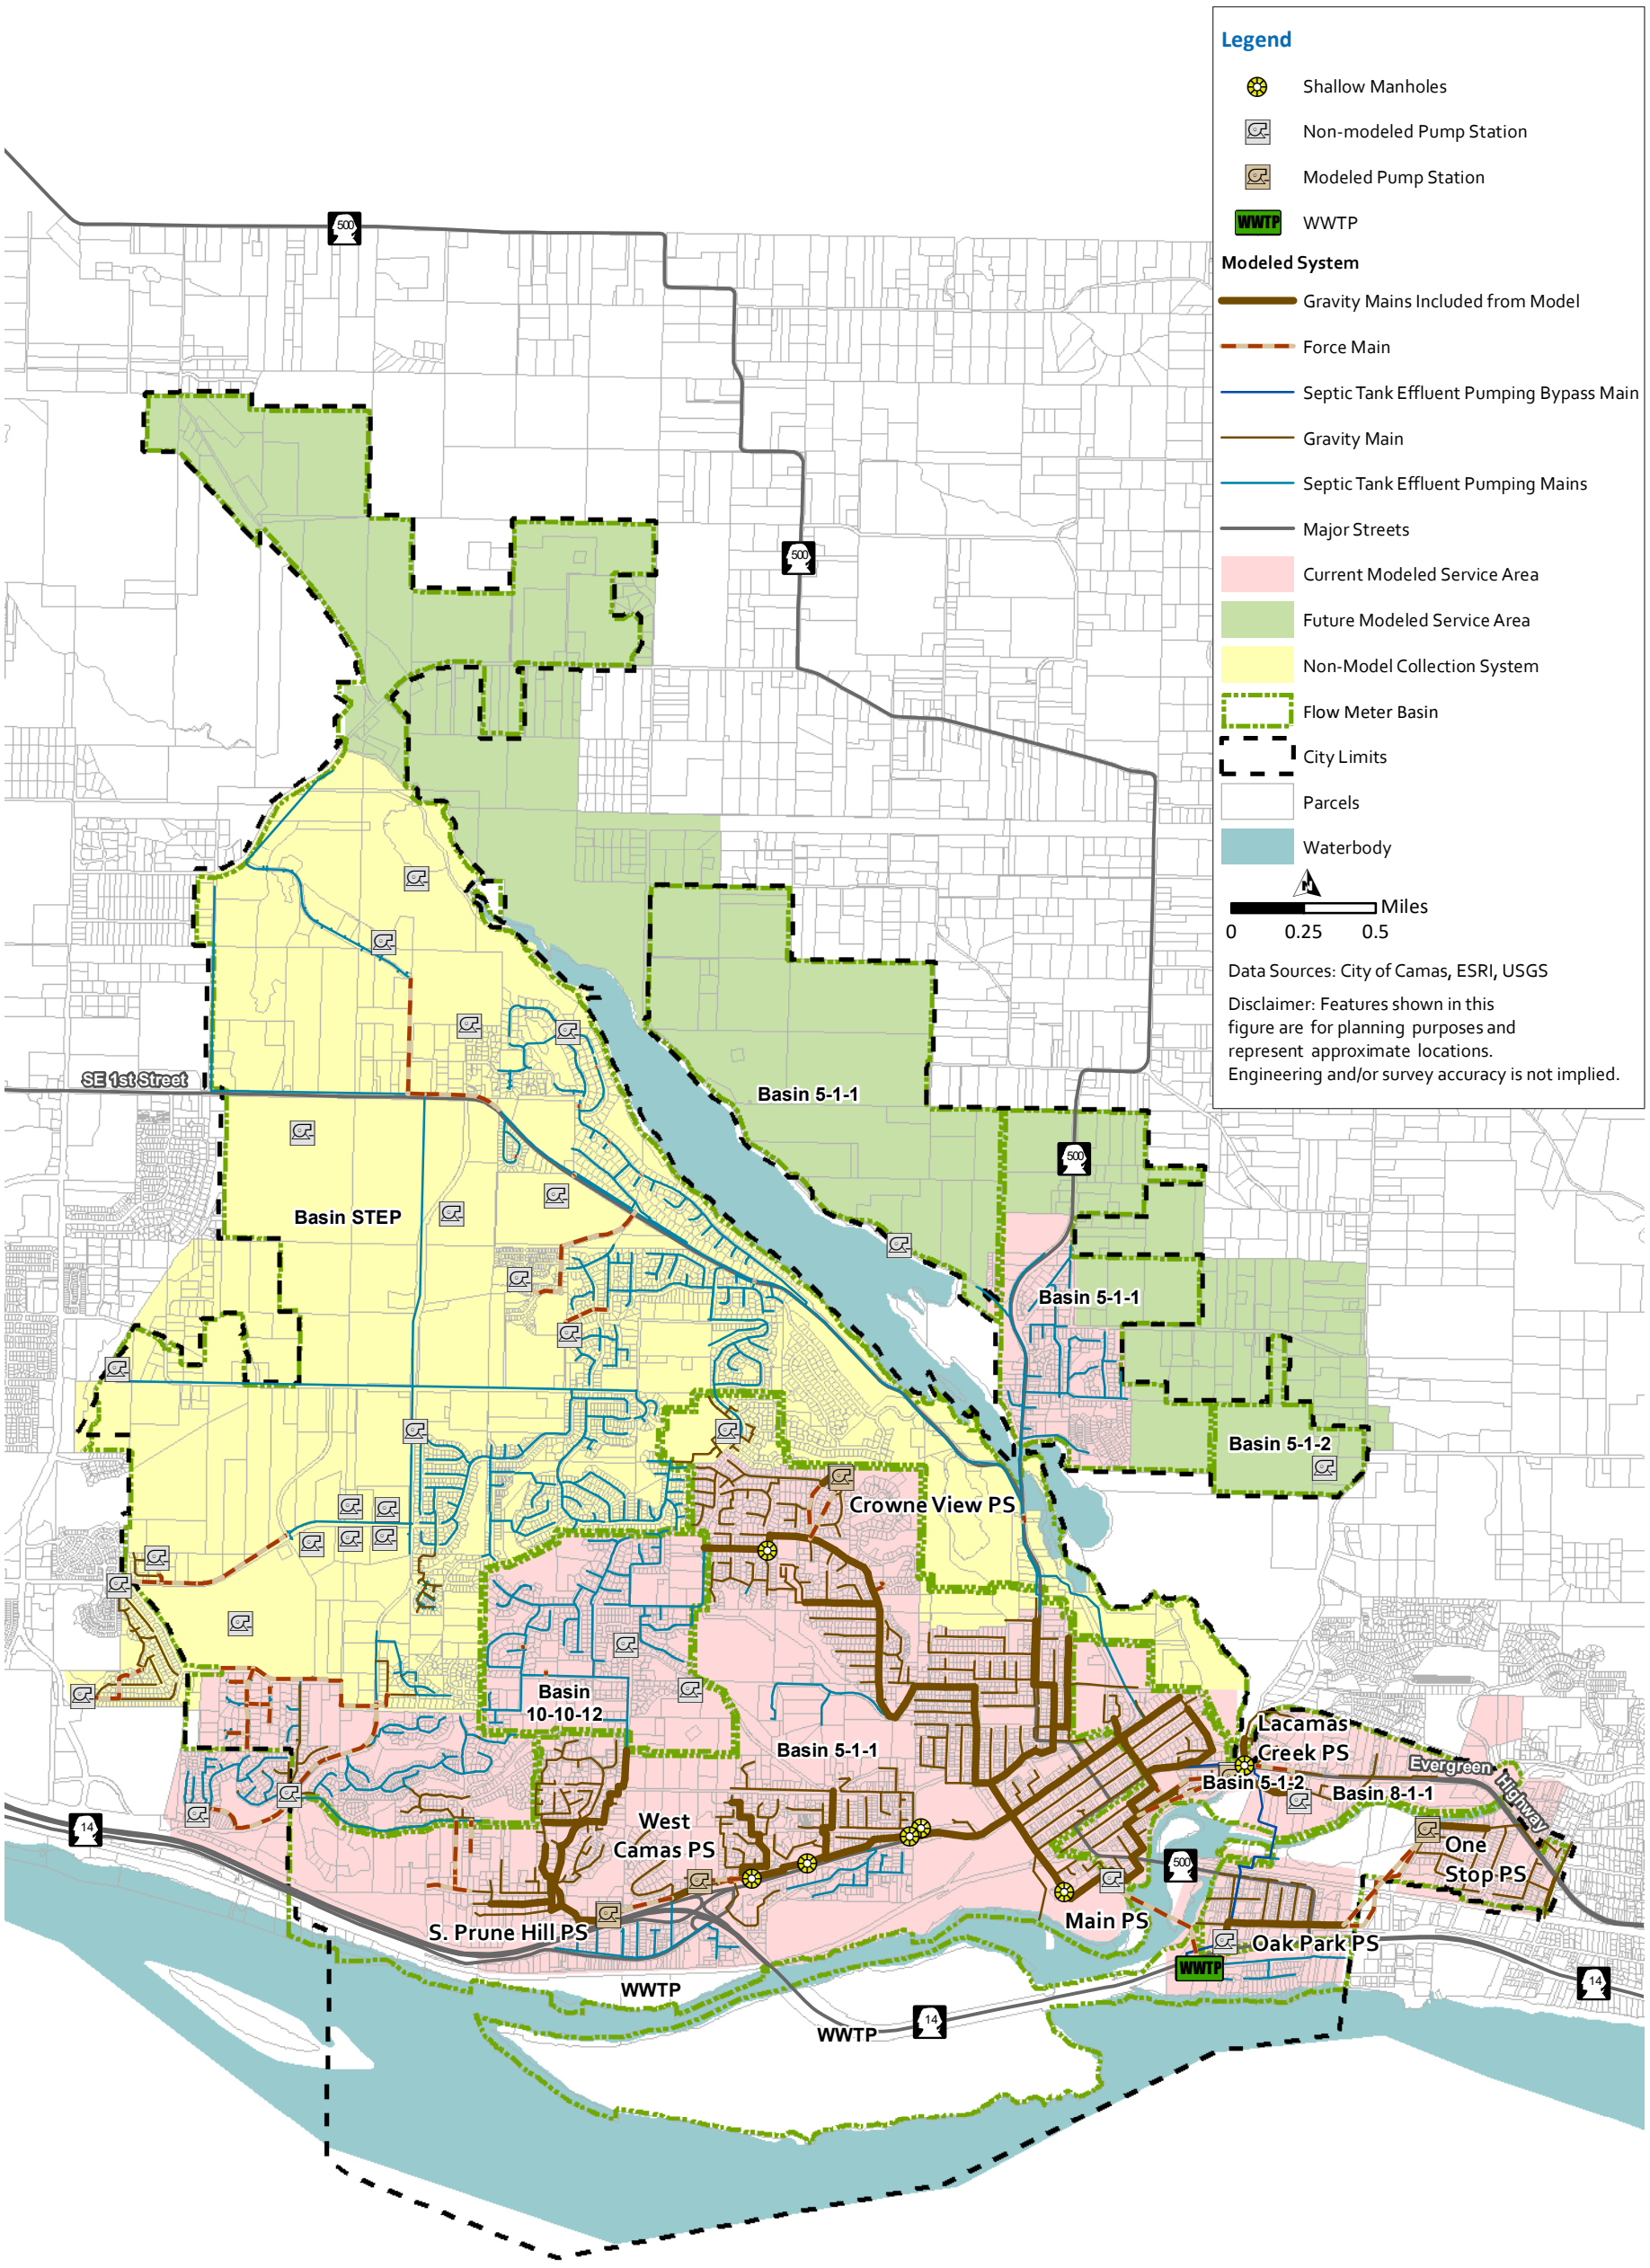
The sewer system hydraulic capacity analysis was performed using a historical 10-year, 24-hour rainfall event (Station Portland Airport (PDX), HYDRA Rain Gauge Network) on December 6, 2015. This design storm is discussed in Section 3.4.6 of Chapter 3 - Basis of Planning.

For this general sewer plan (Plan), the HYDRA historical event referenced above was selected as the design storm for modeling system response and system performance evaluation to realistically represent peak wet weather conditions. The historical HYDRA event was chosen for three reasons:

- The National Oceanic and Atmospheric Administration (NOAA) Precipitation Atlas defines a 10 year, 24-hour event as 3.5 inches per 24 hours based on isopluvial lines through Camas.
- The rain gauge measured 3.37 inches per 24 hours and includes storm hydrograph data. This event had a 20-year recurrence interval based on evaluation of the historical dataset.
- The City 's historical 20-year, 24-hour volume is approximately the same as the NOAA, 10-year.

6.2.2.2 Conveyance System

When evaluating existing sewers, using a conservative d/D ratio may lead to unnecessary replacement of existing pipelines. The PWWF was defined using the standards summarized in Section 6.2.1.1.



Sewer pipes were allowed to surcharge under these PWWF conditions. If the flow depth was greater than the maximum allowable Hydraulic Grade Line (HGL), then the sewer was deemed deficient and mitigation might be proposed to provide greater flow capacity. Shallow manholes locations are shown on Figure 6.1.

6.2.2.3 Pump Stations and Force Mains

The City's performance criteria for existing pump stations include firm capacity, which is capacity with largest pump out of service and force main velocities. According to City Sewer Standards:

- Firm pump capacity shall be provided to handle the PWWF from the pump station's tributary area.
- Firm pump capacity is defined as the largest pump out of service.

The evaluation of existing force mains is based on a maximum pipe velocity of eight feet per second (ft/sec) for the design storm. No such evaluation was performed in this Plan as the hydraulic model was set up with simplified pump station assumptions and did not model force mains directly.

Figure 6.1 Shallow Manholes

6.3 Gravity Collection System Evaluation

A capacity analysis of the modeled collection system was performed using the City's calibrated hydraulic model and using the evaluation criteria identified above in Section 6.2. The capacity analysis entailed identifying areas in the sewer system where the performance criteria for surcharging was exceeded, or where the capacity of pump stations was exceeded. The collection system was evaluated for three development scenarios:

- Existing: Matching existing conditions.
- 2035: Incorporating growth through 2035 as identified in the previous comprehensive plan.
- Build-Out: Development of the full-service area including urban growth boundary (UGB).

For the remainder of the chapter, the system evaluation will focus on the existing and build-out system. The difference between the 2035 year and build-out system were negligible in terms of collection system capacity criteria.

6.3.1 Key Causes of Deficiencies

The calibrated hydraulic model was exercised under design storm conditions and predicted results analyzed using the performance criteria to identify segments of the system not meeting that criteria. The key causes triggering deficiencies in the City's collection system include:

- Adverse slopes and misaligned inverts.
- Shallow manholes.
- Pipe restrictions caused by a single or few smaller diameter pipes between larger diameter pipes.
- Pipe diameter not sufficient to convey the PWWF.
- Pump station firm capacity not sufficient to pump the PWWF.
- Backwater condition.

6.3.2 Existing System Problem Areas

For the existing sewer collection system, the PWWF was routed through the hydraulic model to assess performance. In accordance with the established criteria for existing sewers, where the model predicted potential deficiencies, these were identified. In general, the smaller sewer mains further upstream in the system have sufficient capacity to convey existing flows during the design storm. Existing deficiencies are primarily located in Flow Monitoring Basin 5-1-1, with primary capacity issues in the downstream larger trunk lines receiving flow from smaller tributary areas and delivering sewage to NE Adams. Specific manhole locations of these deficiencies are discussed in Section 6.5. Each portion of the system with localized capacity issues is broken into seven different existing system problem areas, further discussed in Section 6.5. Basin 5-1-1 experiences elevated I/I that appears to be the main cause of observed deficiencies along 6th Avenue, Division Street, and NW Fargo Street. The locations of these predicted deficiency problem areas under existing PWWF conditions are shown on Figure 6.2 in red.

6.3.3 Build-Out System Problem Areas

The Service Area scenario (build-out) system analysis was performed in a similar manner to the existing system analysis. The build-out condition evaluated whether or not the sewers would be adequately sized to convey the future PWWFs, including urban reserve areas. This analysis incorporates the preliminary assumptions made for how/where to connect the growth areas to the existing system.

Two additional deficiency problem areas occur during build-out conditions. The additional projected flows from the North Shore area add significant amounts of flow and are predicted to exceed the criteria and cause additional surcharging in the system. Additional growth upstream of 6th Avenue NW causes existing deficiencies to worsen under build-out conditions. The build-out deficiency problem areas are shown in red on Figure 6.3.

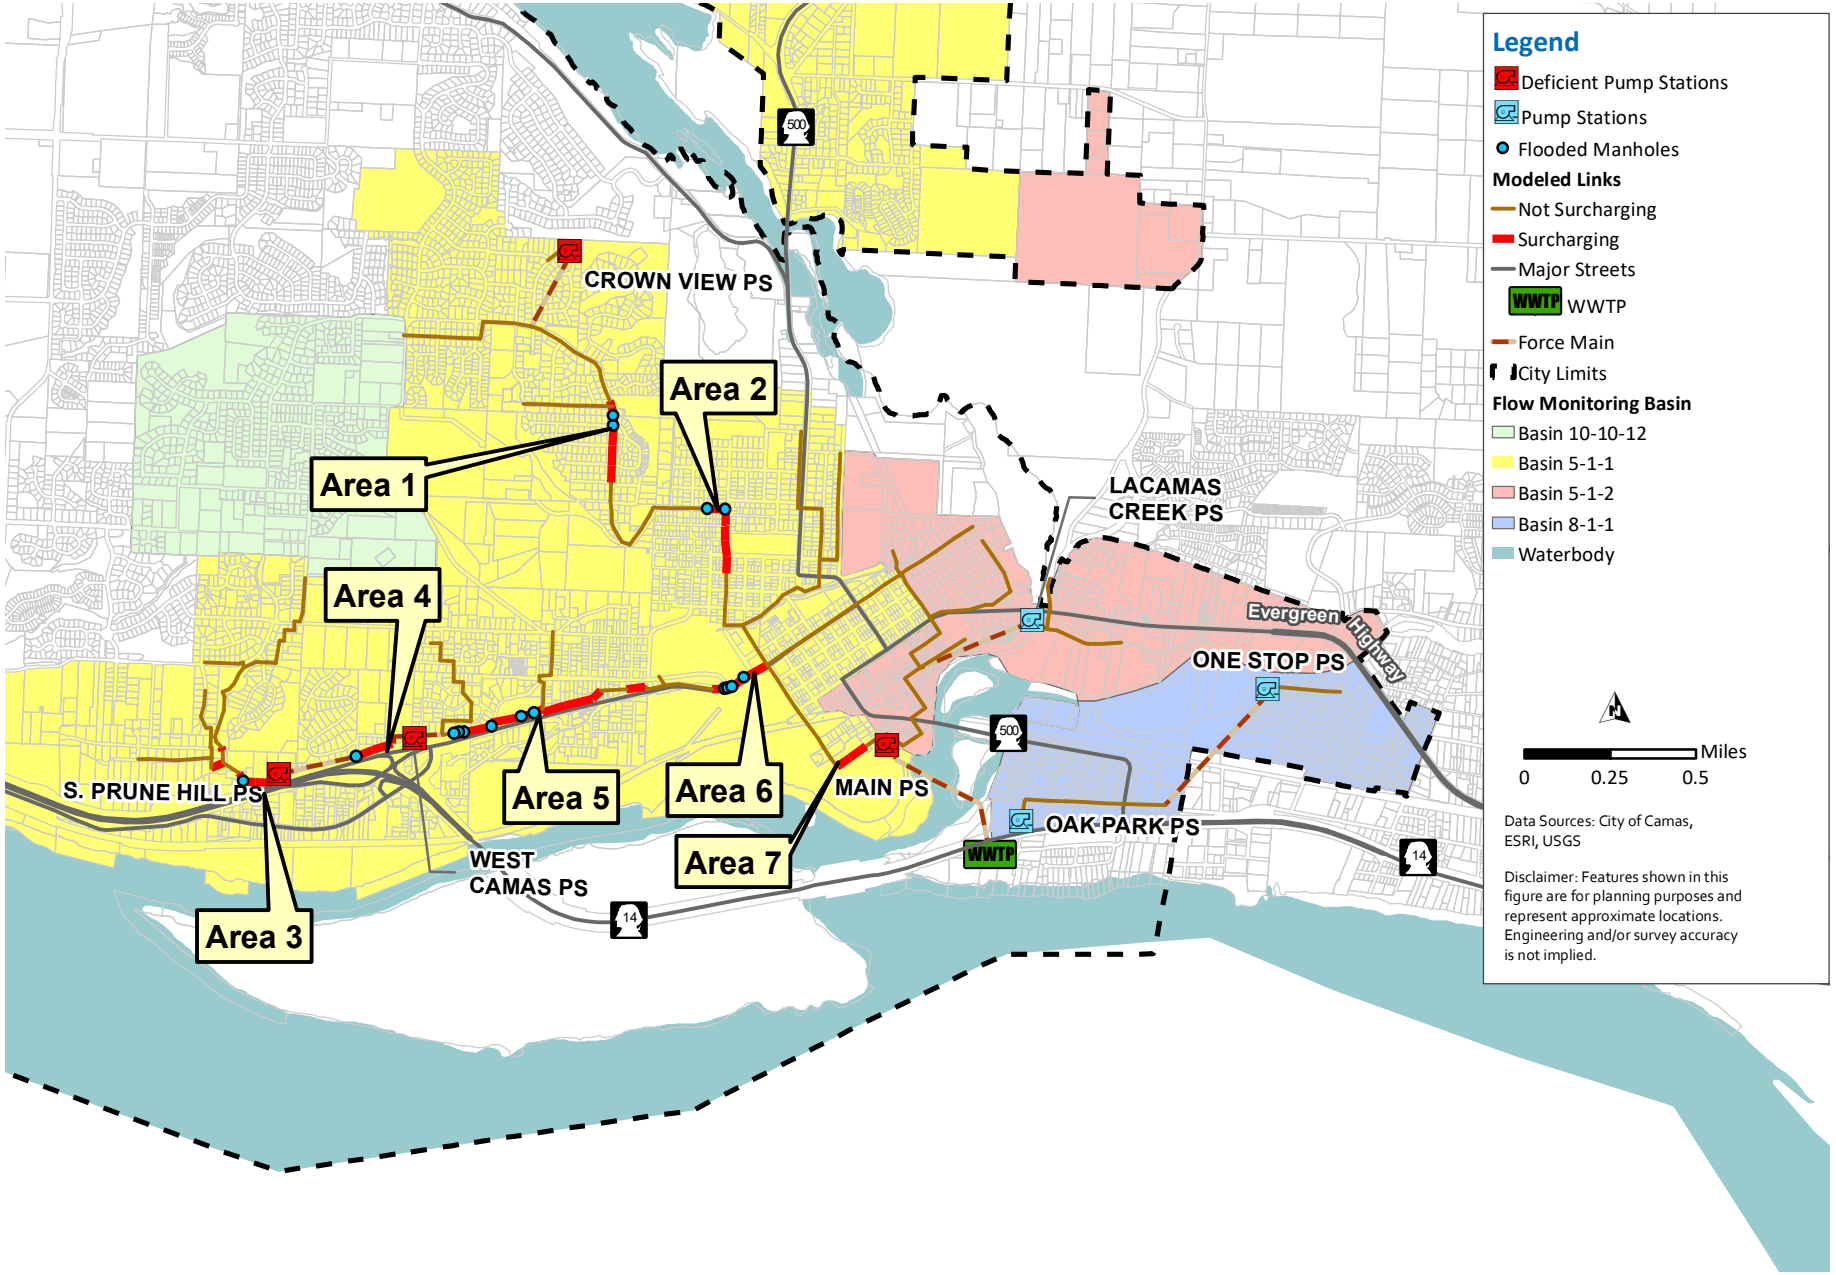

Figure 6.2 Existing Potential Problem Areas and Deficiencie

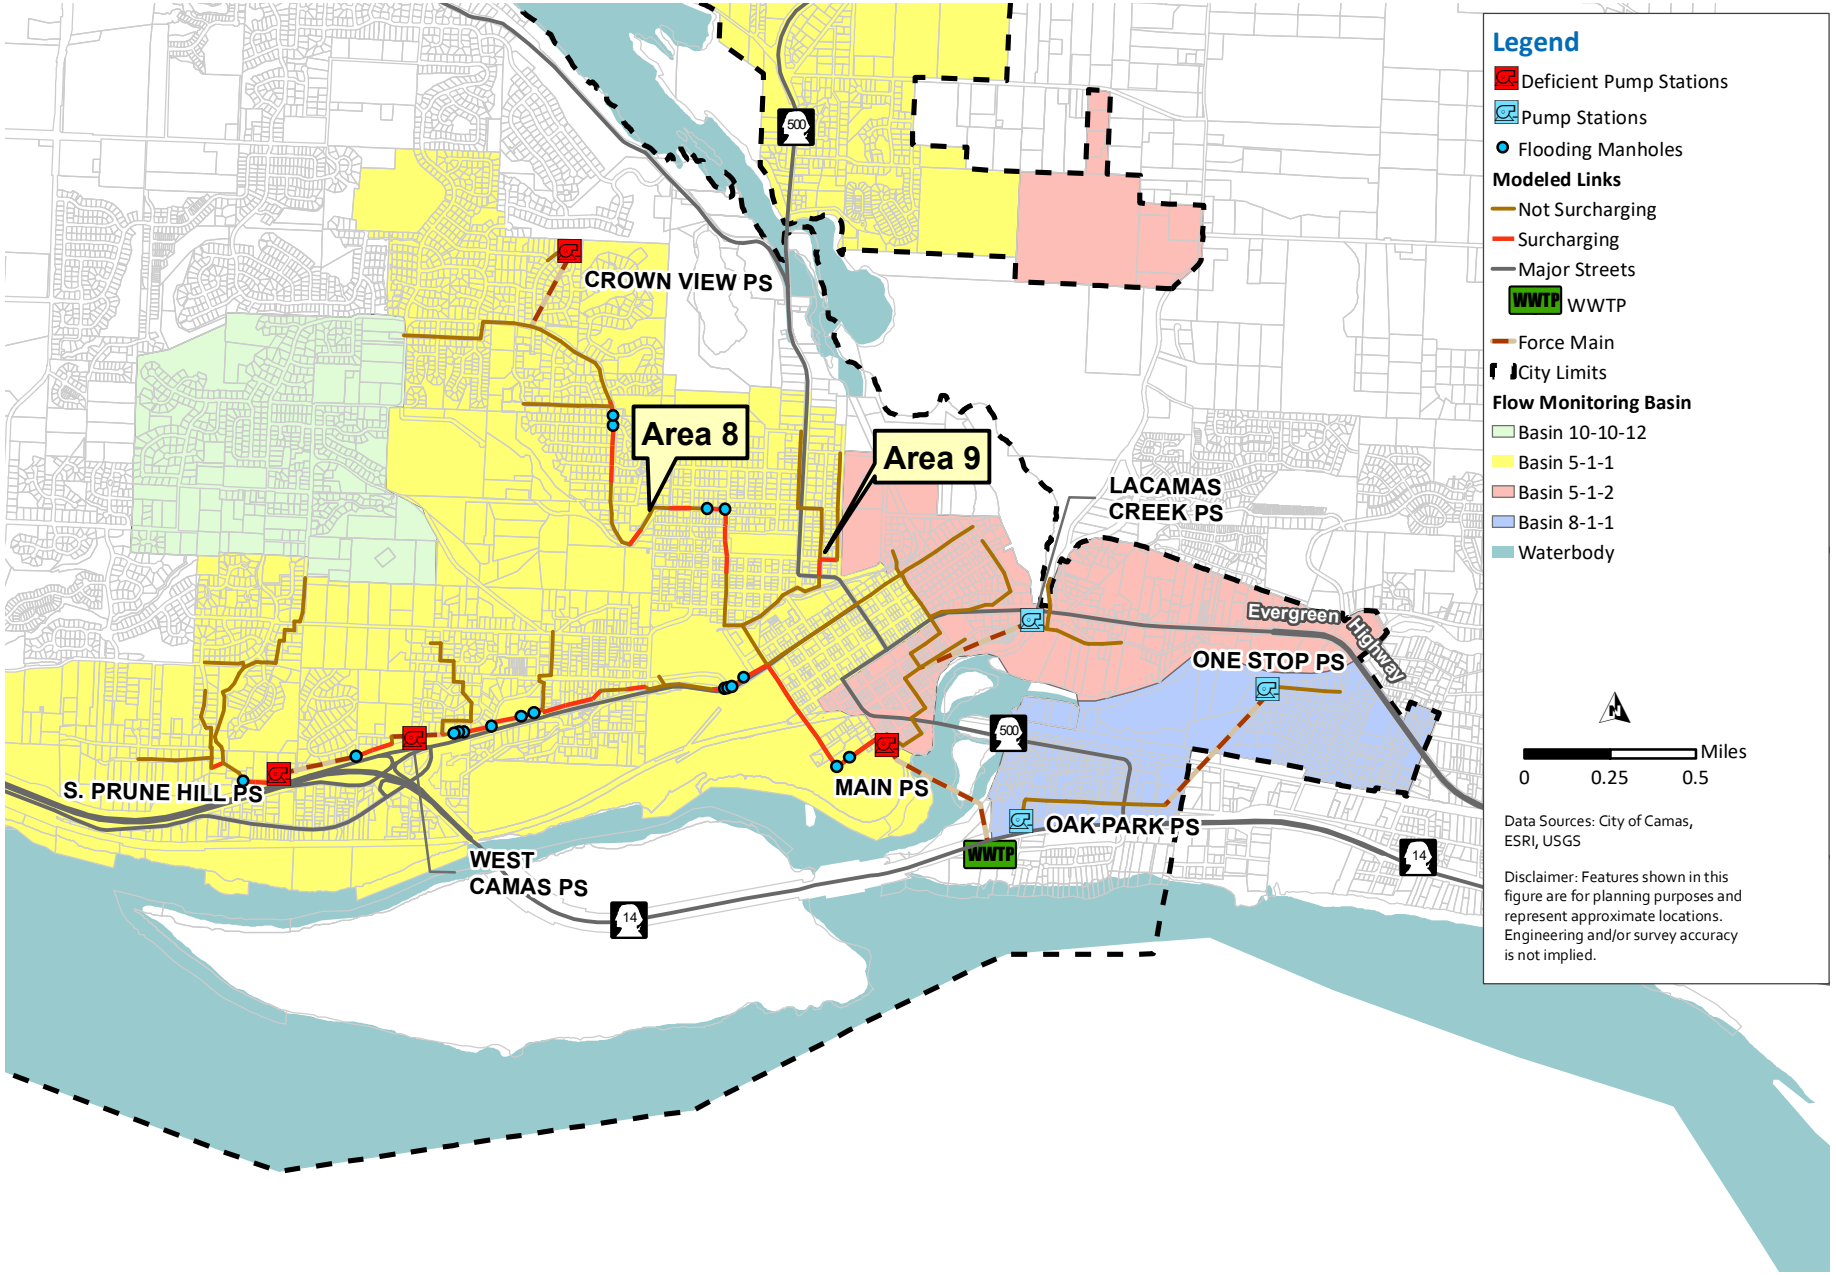

Figure 6.3 Build-Out Potential Problem Areas and Deficiencies

6.4 Pump Station Evaluation

Ensuring that pump stations have adequate capacity to convey peak flows is important to prevent sewage overflows at or near pump stations. In accordance with the established performance criteria, the City's existing pump stations were evaluated using the calibrated system model to determine if each one has available capacity to convey existing and future PWWFs. If a pump station has inadequate capacity to pump the PWWFs, the water level in the wet well may rise to the overflow point, spilling sewage. Pump stations predicted to experience an influent PWWF greater than the existing firm capacity of the station were flagged as deficient. The firm capacity of a pump station is defined as the capacity with the largest pump out of service.

The City's hydraulic model includes five of the seven pump stations located in the City's Gravity Collection System. In addition to the five collection system pump stations included in the model, there are two additional pump stations located just upstream of the WWTF (Oak Park and Main). These two stations were also evaluated utilized existing and projected influent flows, despite not being included in the model. All seven stations are shown in Figure 6.1 in blue. The estimated current and future peak flows were compared the to the pump station firm capacities. Table 6.1 summarizes the results of the pump station evaluation. Figures 6.2 and 6.3 show deficient pump stations in red and pump stations meeting the firm capacity in blue. Firm capacities were based on draw down testing performed by the City. Table 6.1 includes the total capacity at each station, as an additional point of reference for the modeled PWWF's. The total capacity was conservatively assumed to be twice the field measured firm capacity as all stations have two pumps.

Table 6.1 Pump Station Evaluation

Pump Station Name	Firm Capacity (gpm)	Existing Modeled PWWF (gpm)	Build-Out Modeled PWWF (gpm)	Firm Excess Deficiency	Build-Out Excess Deficiency
One Stop	229	67	72	No	No
South Prune Hill	449	1,104	1,113	Yes	Yes
West Camas	579	1,302	1,302	Yes	Yes
Crown View Plaza	148	512	530	Yes	Yes
Lacamas Creek(1)	Current = 346, Build-out = 570	215	525	No	No
Oak Park	426	148	153	No	No
Main	3,851	3,909	5,682	Yes	Yes

Notes:
(1) Lacamas Creek has been design, but not yet constructed. The designed capacity is shown as the 1.27 cfs value for firm capacity. This is used to evaluate the pumps under build-out conditions.
Abbreviations: gpm - gallons per minute; cfs - cubic feet per second.

Based on the analysis and the results presented in Table 6.1, four of the City's pump stations are considered deficient per the City's firm capacity performance criteria. Deficiencies are identified for these four pump stations under existing conditions. These deficiencies are exacerbated under service area build-out conditions.

The collection system model had a simplified set up of the pump stations. Force mains were not included in the model, pumps were setup to discharge into the gravity system at the location of the force main, and associated losses were factored into the pump curves. This setup was consistent with how the model had previously been set up. Future analysis should add force mains to the model, so that force main velocity evaluation can occur. For this plan, no recommendations were made for pump station force mains.

6.4.1 Pump Station Run Times

The gravity collection system model includes only five pump stations and has PWWF information upstream of seven pump stations. The City's STEP system includes 20 pump stations. These stations are not included in the model, therefore no evaluation of performance was available for PWWFs. Historical pump station run times were analyzed for all pump stations to gauge the average capacity of the stations. The station run time data was typically weekly by hour. The number of hours between data points was divided by the number of hours the pump ran to estimate a daily average. This daily average was converted to an annual average for every station. The resulting capacity is displayed in Table 6.2. No conclusions could be made on how pump stations performed during peak wet weather events utilizing the average daily run times. It is difficult to make any determinations from this data, and all stations should undergo additional evaluation to confirm capacity is appropriate to expected wastewater flow conditions.

Table 6.2 STEP Pump Station Percent of Time Running During the Day Based on Pump Hours

Pump Station Name	2014	2015	2016	2017	2018	2019	Potential Capacity Deficiency
Harl	3%	7%	7%	9%	10%	12%	No

Fisher	1%	1%	1%	1%	1%	2%	No

The relation between average pump station capacities to PWWF depends on the peaking factor of the tributary area, and therefore varies for every station. Considering the limitations in the pump station operational data (daily run times), for the stations identified in Table 6.2, where percent capacity is estimated at 40 percent or higher, the City should assume there is a substantial risk of failing to meet capacity during existing PWWF events. Applying the methodology described herein, Lacamas Shores, Sunningdale Gardens, and Winchester Hills 2 all have exhibited average capacity above 40 percent at some point in the last five years. These stations should be prioritized and undergo future evaluation, possibly including focused flow and pressure monitoring to gain a better understanding of what happens during peak flows and their capacity to inform future capital improvement planning. No future projections were performed for these stations. Future projects should prioritize projecting flows and understanding how the upstream tributary areas of these stations will develop.

6.5 Capacity Evaluation Summary

The City's model predicted several locations where the sewer system may have inadequate capacity for existing PWWF conditions. The deficiencies increase with projected additional growth and City expansion.

Four of the City's seven gravity system pump stations included in the model are considered deficient due to lack of pump redundancy. Additionally, three STEP system pump stations evaluated based on run times may be deficient in the future.

Figures 6.2 and 6.3 highlight the location of system piping and pumping capacity deficiencies identified in this analysis based on the established performance criteria.

Following the completion of the existing, 20 year, and build-out system analysis, improvement projects and alternatives were identified to mitigate capacity deficiencies predicted in the existing and build-out pipeline system. The City has nine localized areas of capacity system deficiencies and four pump stations that will need to be upgraded to meet firm capacity criteria. The following sections describe each of the nine problem areas and the suggested pipeline improvements in addition to proposed pump station upgrades. Figure 6.4 identifies the proposed pipeline improvements for each problem area, discussed in the following sections.

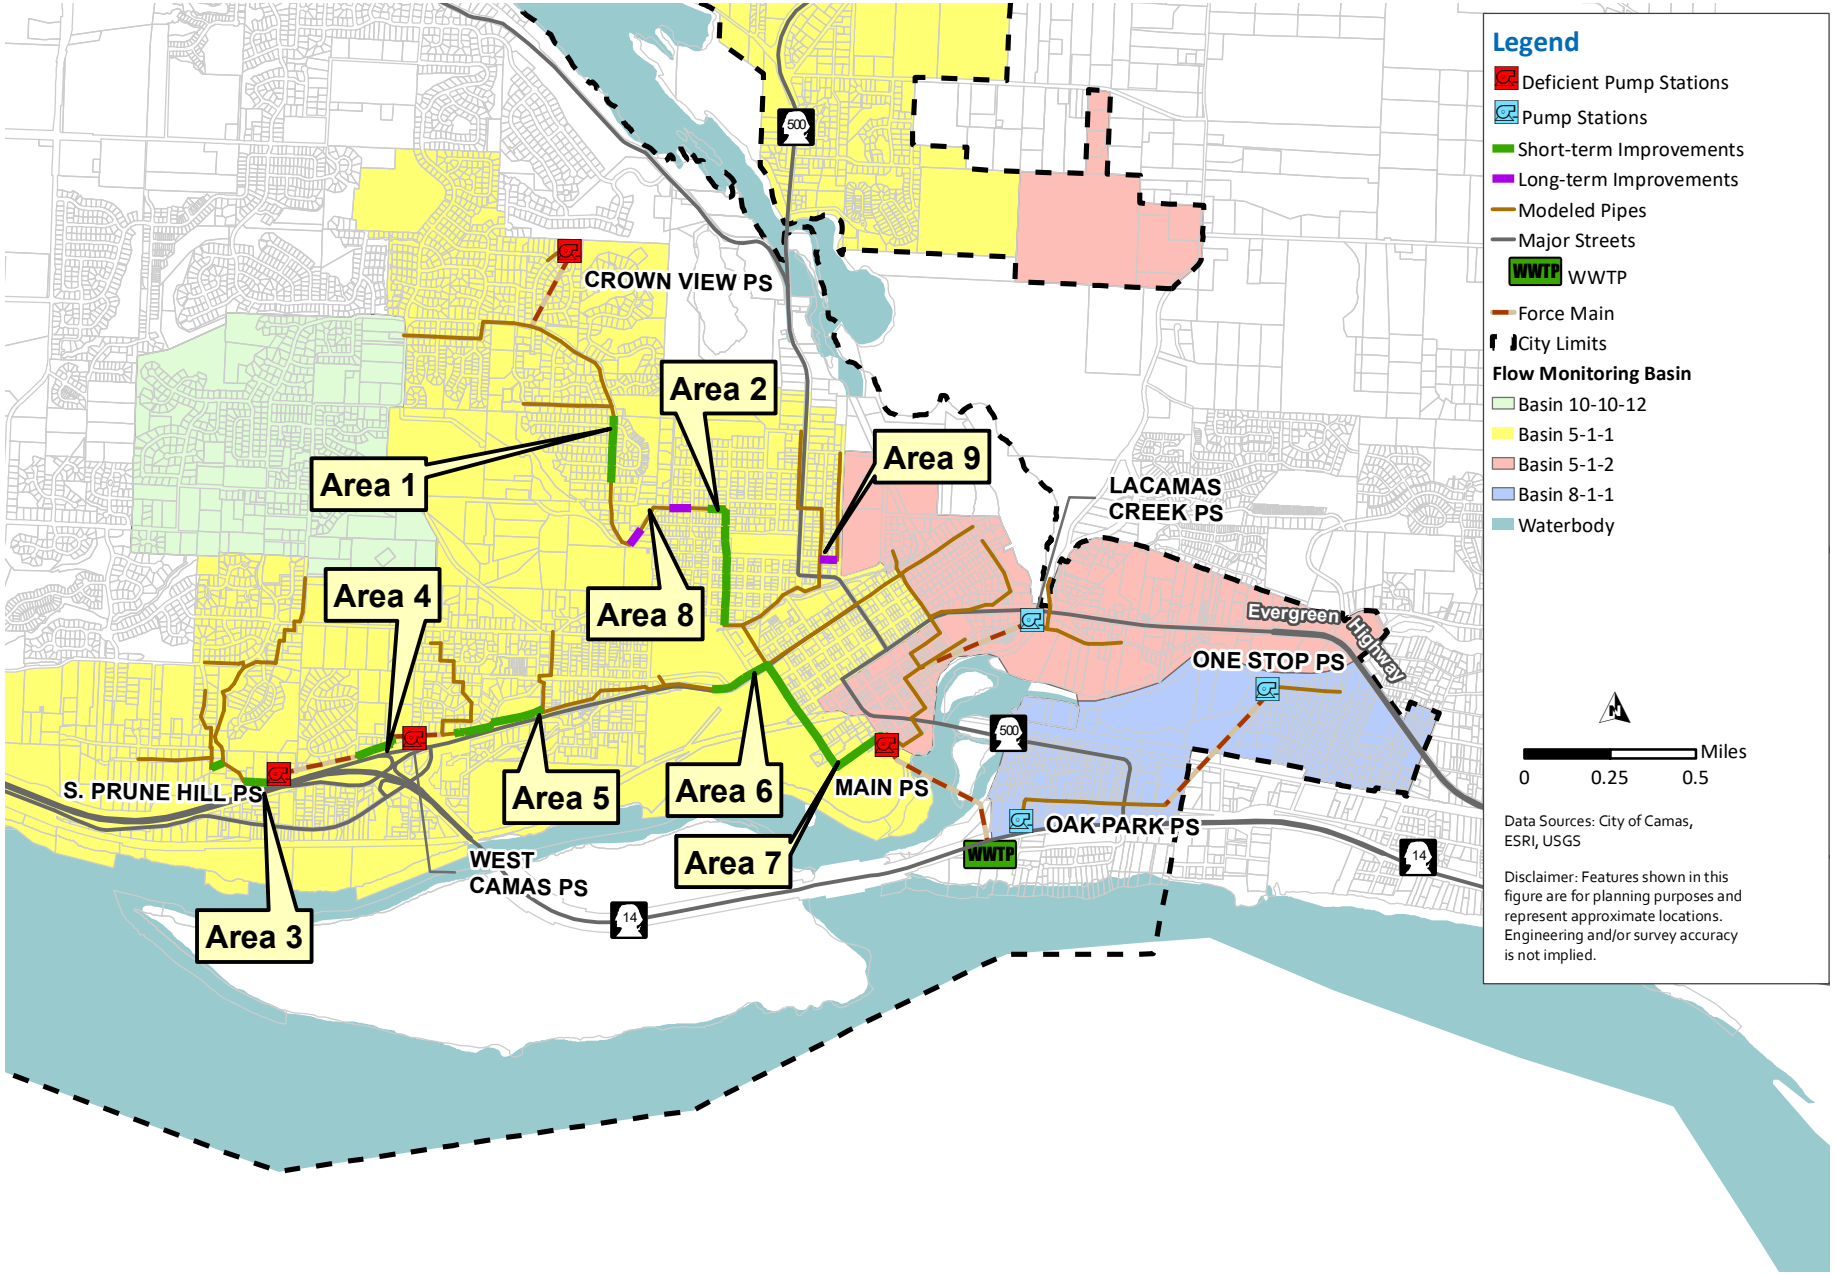

Figure 6.4 Proposed Pipeline Improvements

6.5.1 Area 1

Area 1 experiences surcharging along NW Fargo Street, as illustrated in Figure 6.2, under existing conditions. The model showed potential manhole flooding during the design storm at modeled manholes 3-1-26 and 3-1-25. This deficiency is caused by capacity limitations due to pipe diameter and slope constraints in the reach, as shown in Figure 6.5 of the pipe profile plot with HGL in blue. The proposed improvements to mitigate these deficiencies consist of upsizing pipes between manholes 3-1-26 to 3-1-22 from 8-inch to 12-inch, shown in red on Figure 6.4. This piping upsize effectively alleviates the surcharging and meets the City's design criteria, as illustrated in Figure 6.6.

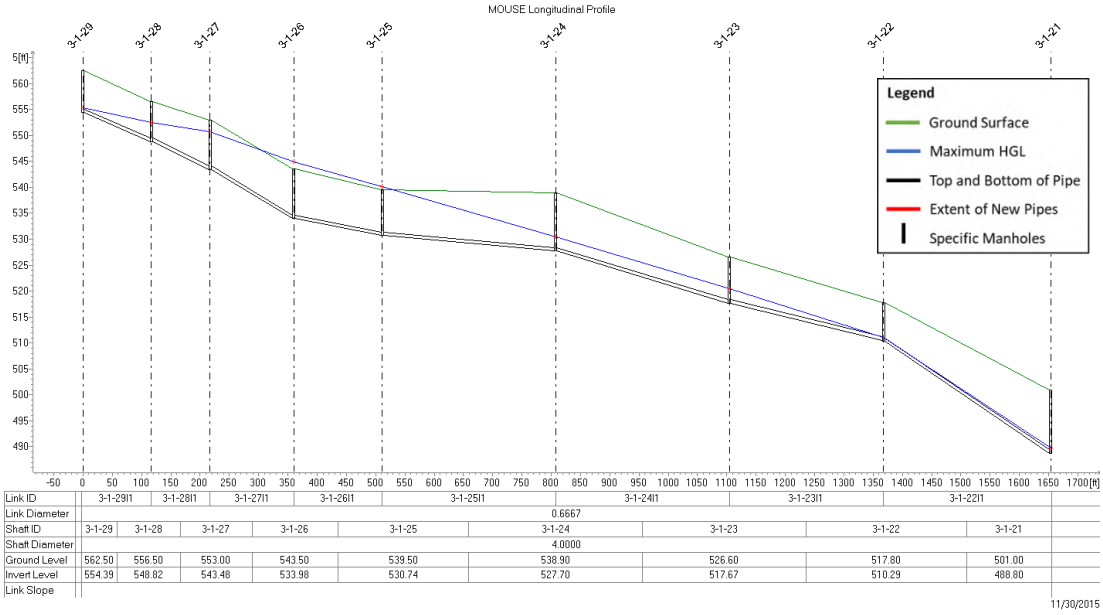

Figure 6.5 Area 1: HGL and Profile Plot

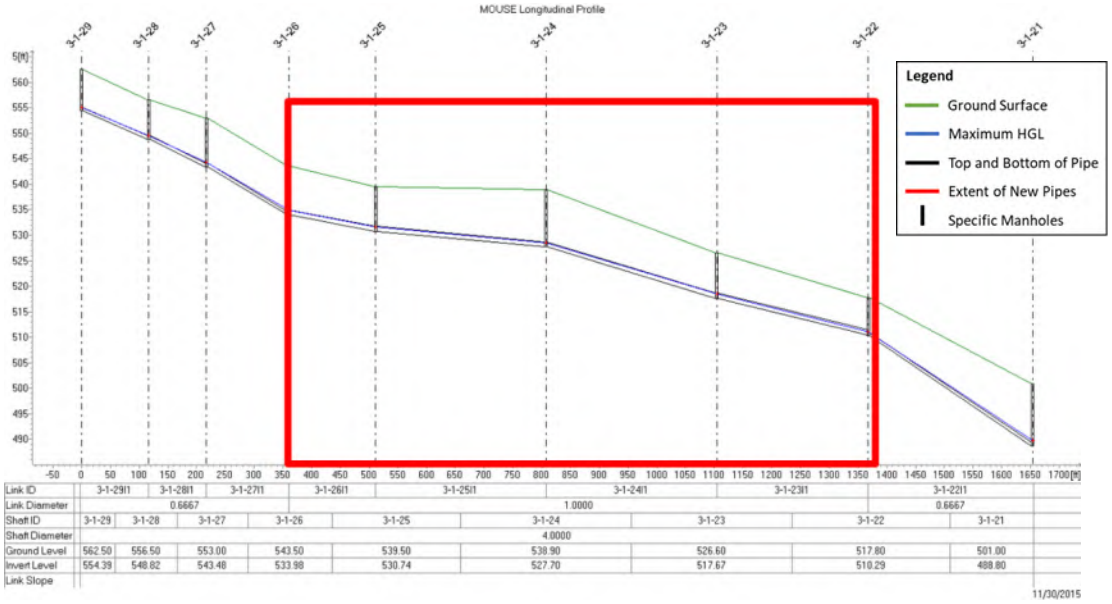

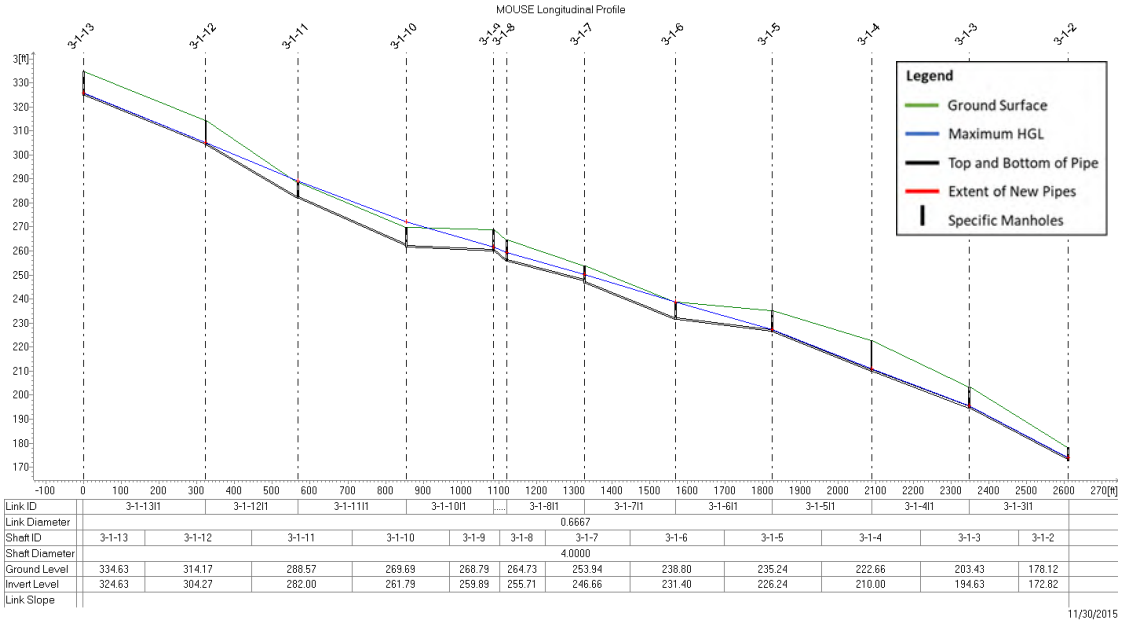

Figure 6.6 Area 1: HGL and Profile Plot after Improvements

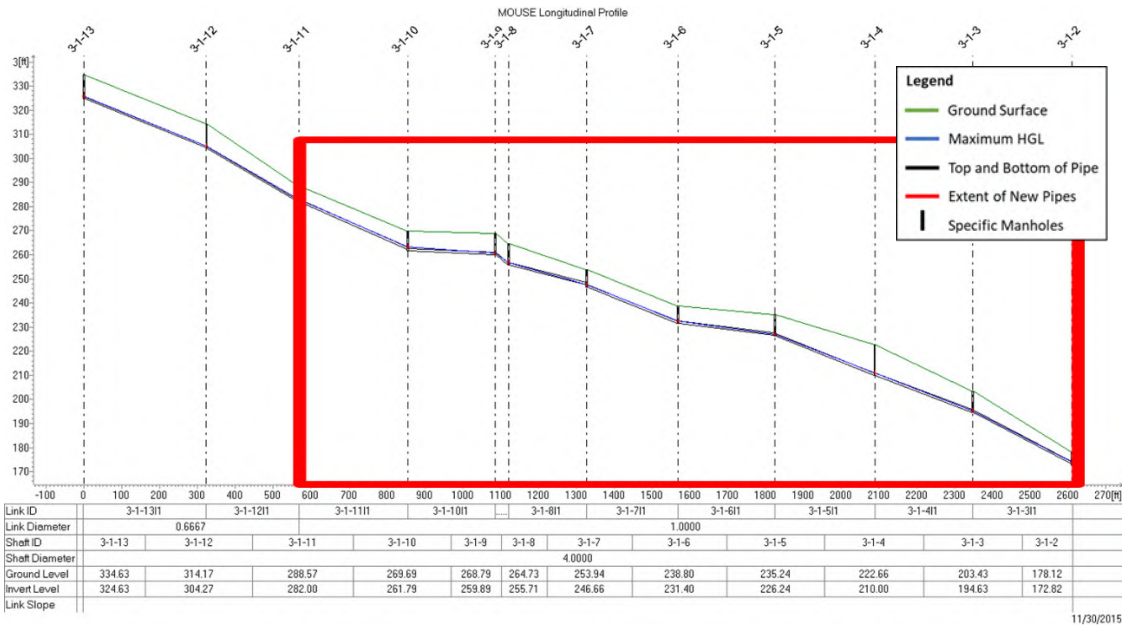

6.5.2 Area 2

Area 2 experiences surcharging along Division St, during existing conditions. The model showed potential manhole flooding during the design storm at model manholes 3-1-11, 3-1-10, and 3-1-6. This deficiency is caused by capacity limitations at the lower sloped pipelines in the reach, as shown through the pipe profile plot and HGL on Figure 6.7. The proposed improvements consist of upsizing pipes between manholes 3-1-11 to 3-1-2 from 8-inch to 12-inch, shown boxed in on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown in Figure 6.8.

Figure 6.8 Area 2: HGL and Profile Plot after Improvements

6.5.3 Area 3

Area 3 experiences surcharging along NW 6th Place just upstream of the South Prune Hills Pump Station (PS), during existing conditions. The model showed potential manhole flooding during the design storm at manhole 10-1-8. This deficiency is caused by the significant change in grade from the steep upstream slopes to the shallow downstream slope near the pump station. An additional capacity restriction occurs further upstream between manholes 10-1-11 and 10-1-10, due to a shallow slope. This deficiency is shown through the profile plot and HGL in blue on Figure 6.9. The proposed improvements consist of upsizing pipes between manholes 10-1-11 to 10-1-10 from 8-inch to 12-inch and 10-1-8 to 10-1-5 from 10-inch to 12-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown in Figure 6.10.

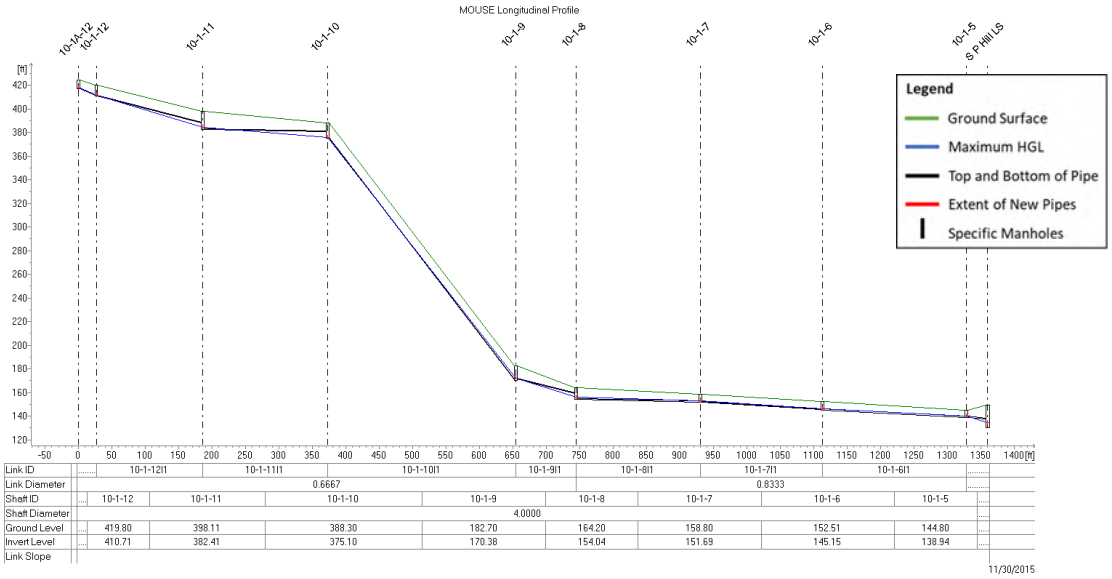

Figure 6.9 Area 3: HGL and Profile Plot

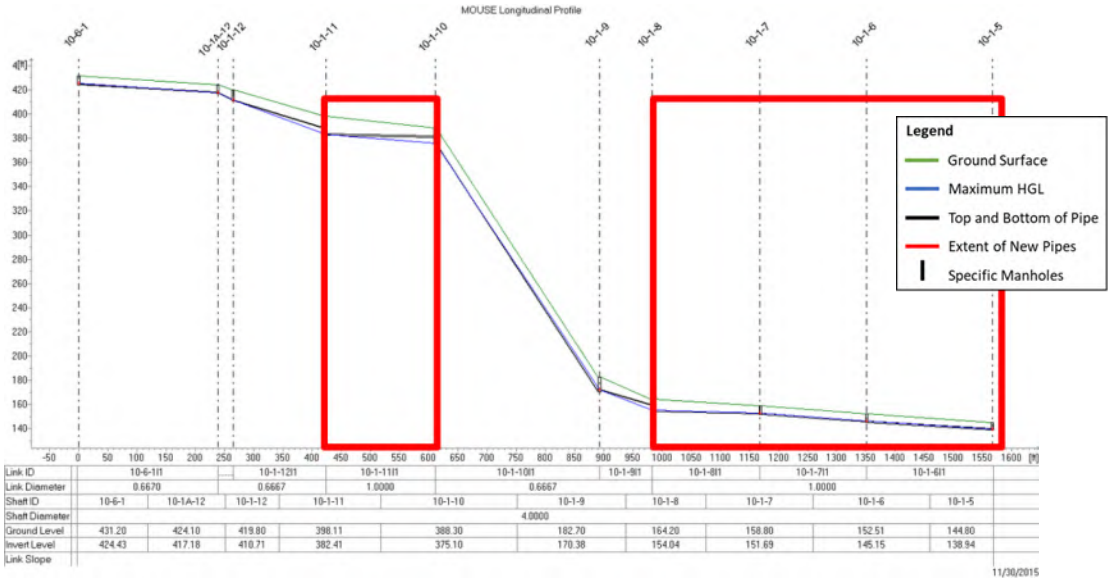

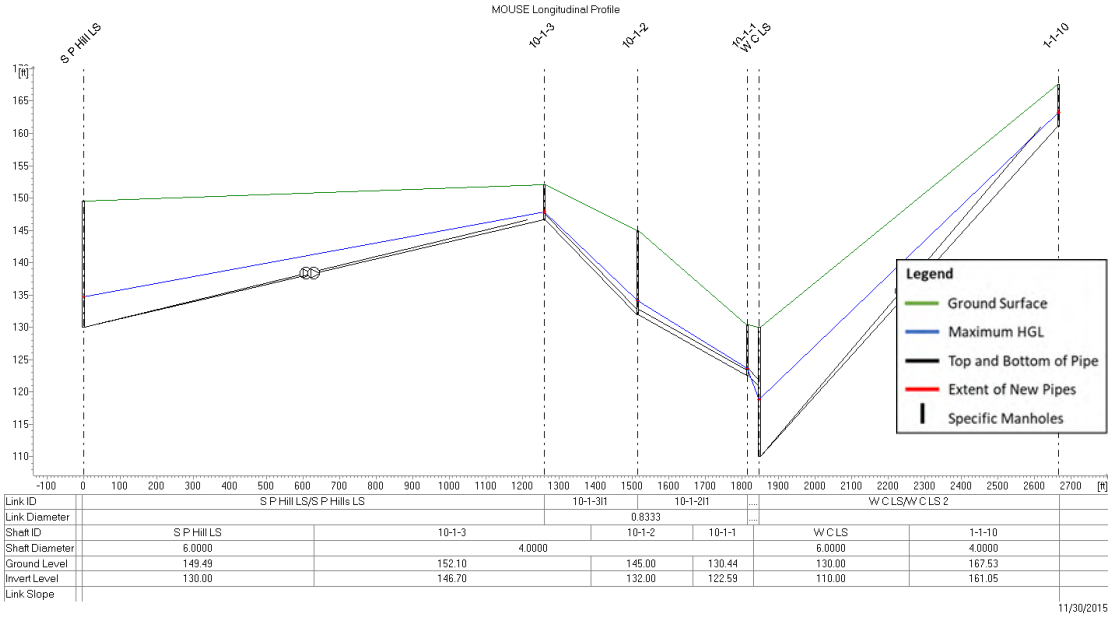

Figure 6.10 Area 3: HGL and Profile Plot after Improvements

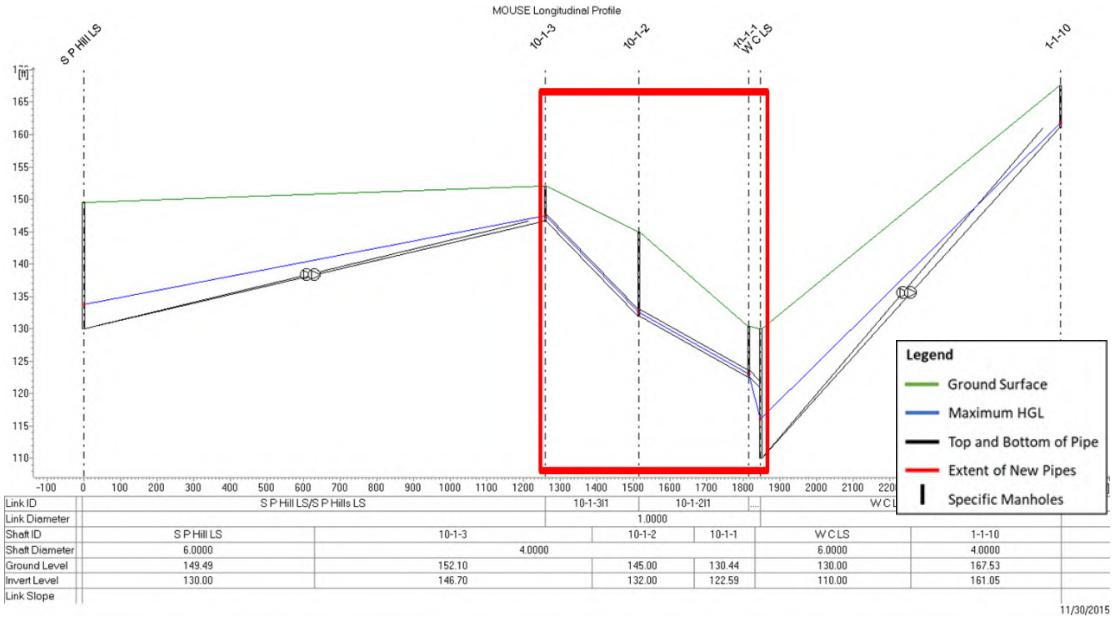

6.5.4 Area 4

Area 4 experiences surcharging and flooding along NW 6th Place, shown in Figure 6.2, during existing conditions. The model showed potential manhole flooding during the design storm at manhole 10-1-3, just downstream of the South Prune Hills PS. This deficiency is caused by capacity limitations between the pump stations coupled with backwatering from the West Camas PS. This is shown through the profile plot and HGL in blue on Figure 6.11. The proposed improvements consist of upsizing pipes between manholes 10-1-3 and the West Camas PS wet well from 10-inch to 18-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown in Figure 6.12. Note this deficiency depends upon the timing and extent of the proposed West Camas PS improvements as well, identified in Section 6.4. The results shown above assume that the lift station is upsized to convey its firm capacity.

6.5.5 Area 5

Area 5 experiences surcharging and flooding downstream of the West Camas PS along NW 6th Place and through Forest Home Park, during existing conditions. The model showed potential manhole flooding during the design storm at manholes 1-1-9, 1-1-8, and 1-1-7. This deficiency is caused by capacity limitations due to both pipe size and slope, as shown in the profile plot and HGL in Figure 6.13. The proposed improvements consist of upsizing pipes between manholes 1-1-9 to 1-1-7 from 12-inch to 15-inch and upsizing pipes between manhole 1-1-7 to 1-1-2 from 12-inch to 18-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown by the HGL in Figure 6.14.

Figure 6.13 Area 5: HGL and Profile Plot

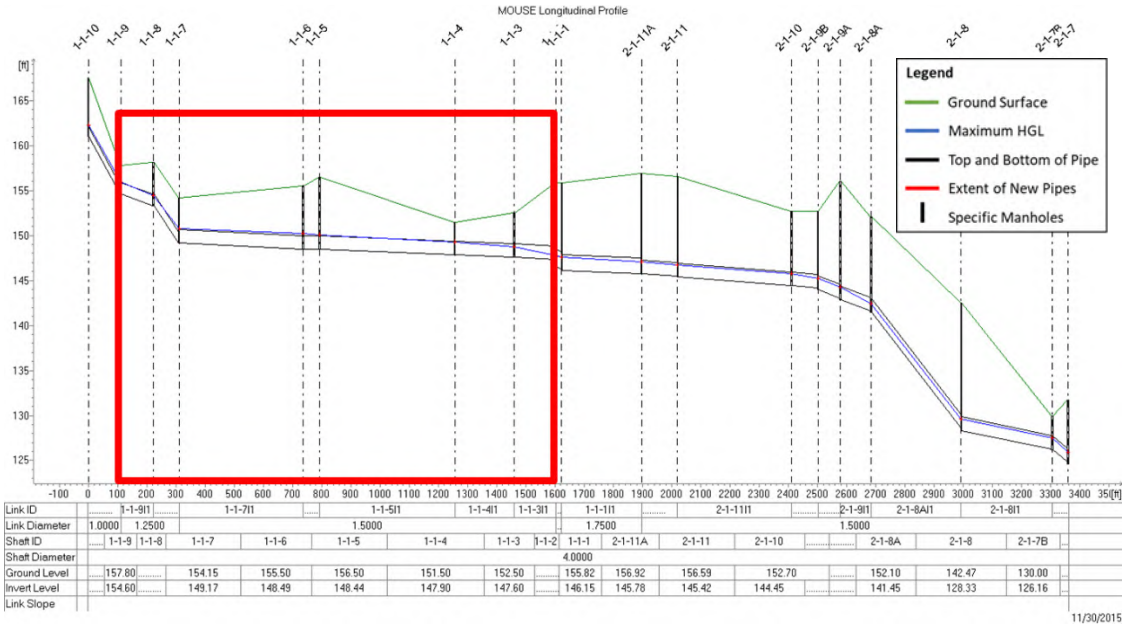

Figure 6.14 Area 5: HGL and Profile Plot after Improvements

6.5.6 Area 6

Area 6 experiences surcharging and flooding along NW Fargo Street, during existing conditions. The model showed no potential manhole flooding during the design storm, however flooding is very close at Manholes 2-1-2. This deficiency is caused by capacity limitations at the lowered sloped pipelines and a drop manhole at 2-1-1. The HGL and pipe profile through the reach is shown in Figure 6.15. The proposed improvements consist of upsizing pipes between manholes 2-1-3 to 2-1-1 from 12-inch to 18-inch, manholes 2-1-1 to 5-1-12 from 12-inch to 21-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown by the HGL in Figure 6.16.

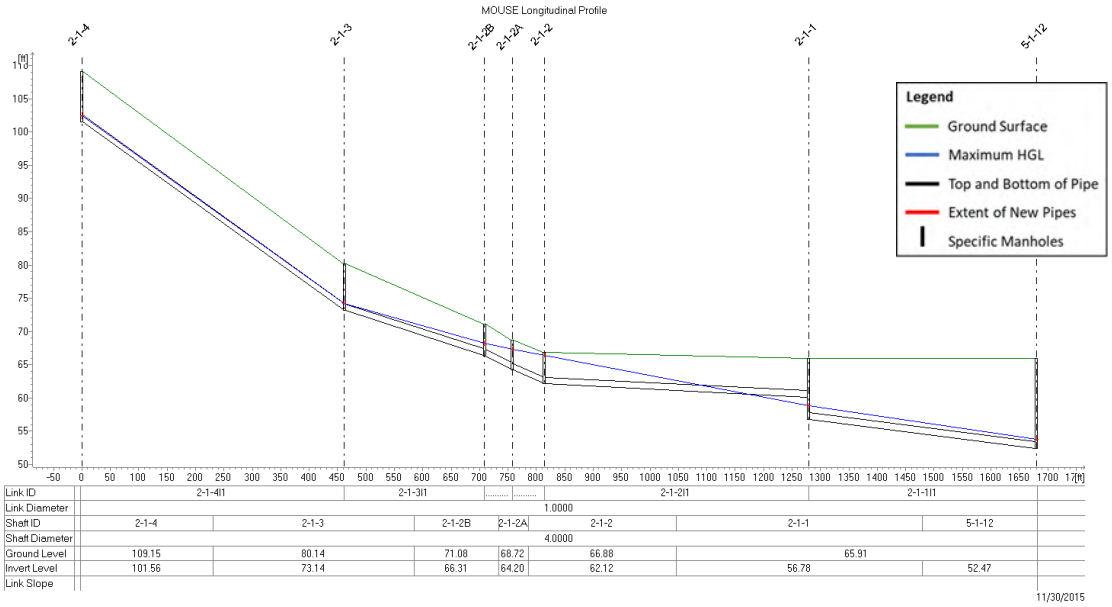

Figure 6.15 Area 6: HGL and Profile Plot

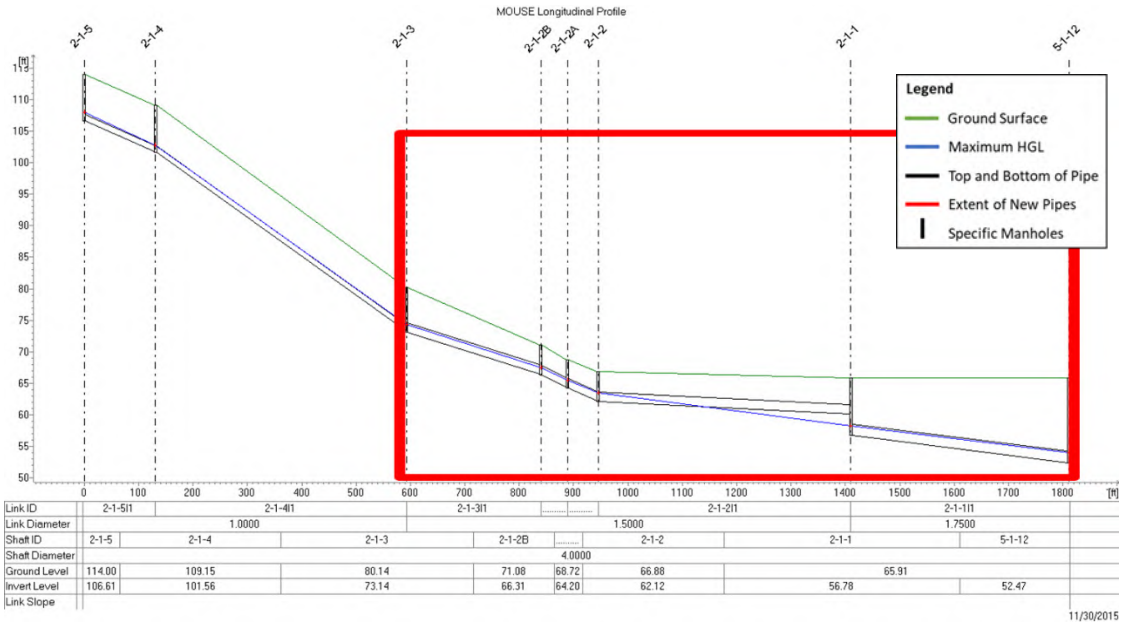

Figure 6.16 Area 6: HGL and Profile Plot after Improvements

6.5.7 Area 7

Area 7 experiences surcharging along SE 3rd Avenue, during existing conditions. Under build-out conditions, additional flows from the North Shore expansion and from 6th Avenue as a result of improvement projects for Areas 3, 4, 5 and 6, the surcharging at Area 7 greatly increases, shown in Figure 6.3. The model showed potential manhole flooding during the design storm for build-out conditions with upstream capacity improvements at manholes 5-1-5 and 5-1-6. This deficiency is caused by capacity limitations due to pipe slope constraints. This is shown through the profile plot and HGL in blue on Figure 6.18. Figure 6.17 shows the profile under existing conditions where the surcharging is less severe. The proposed improvements consist of upsizing pipes between manholes 5-1-10 to 5-1-12 from 21-inch to 24-inch, manholes 5-1-10 to 5-1-8 from 24-inch to 27-inch, manholes 5-1-8 to 5-1-6 from 21-inch to 24-inch, manholes 5-1-6 to 5-1-2 from 24-inch to 27-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown by the HGL in Figure 6.19.

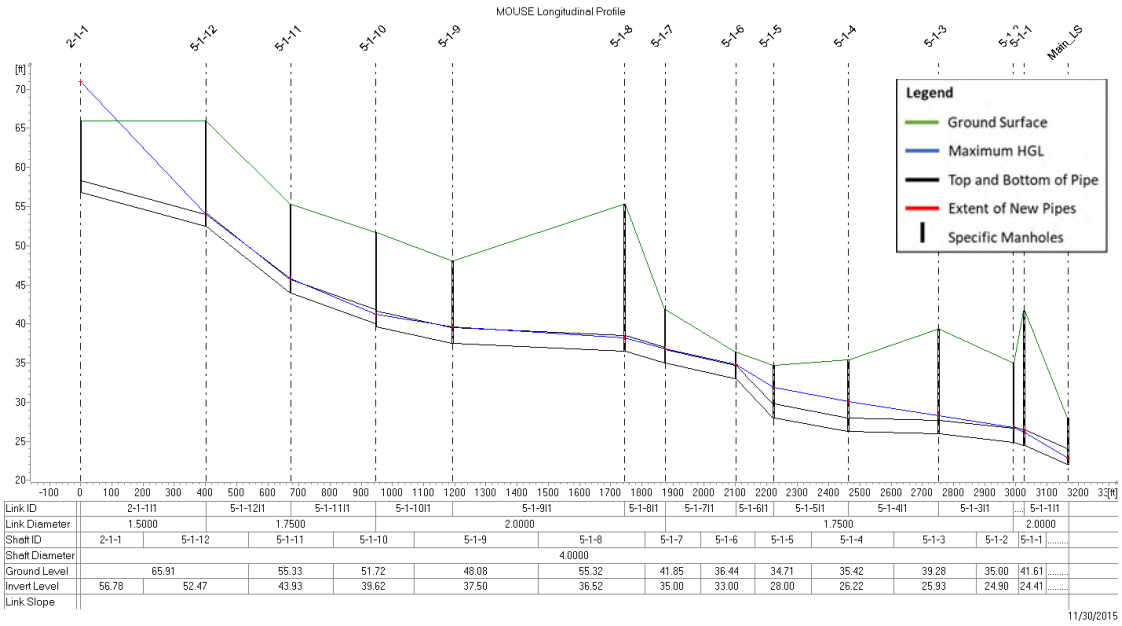

Figure 6.17 Area 7: HGL and Profile Plot Under Existing Conditions

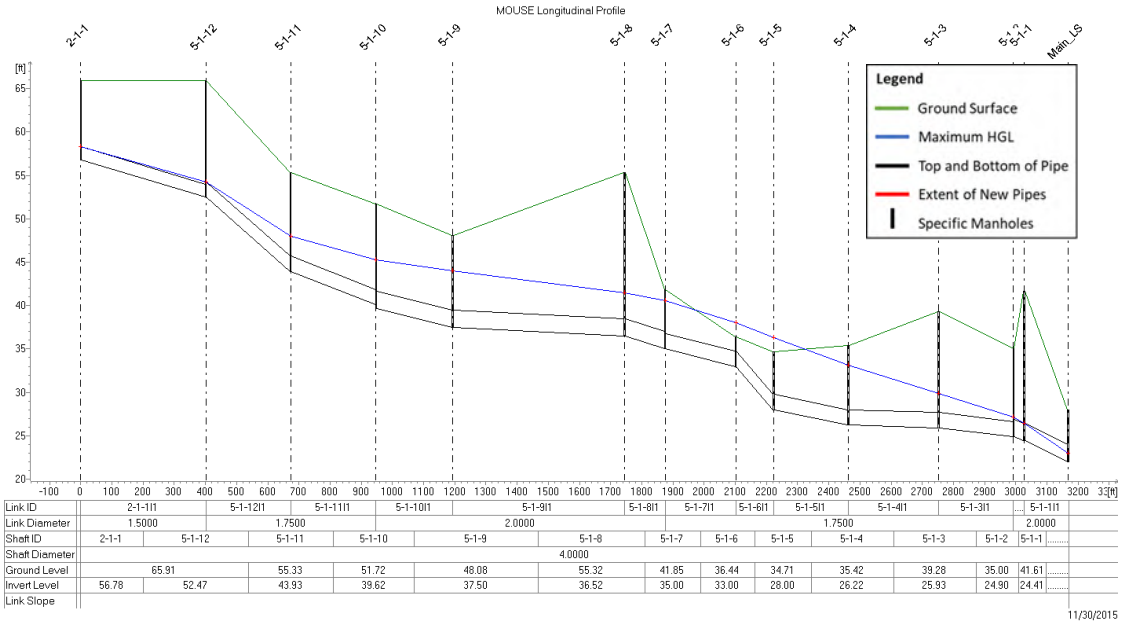

Figure 6.18 Area 7: HGL and Profile Plot under Build-Out Conditions with Upstream Improvement Projects Completed

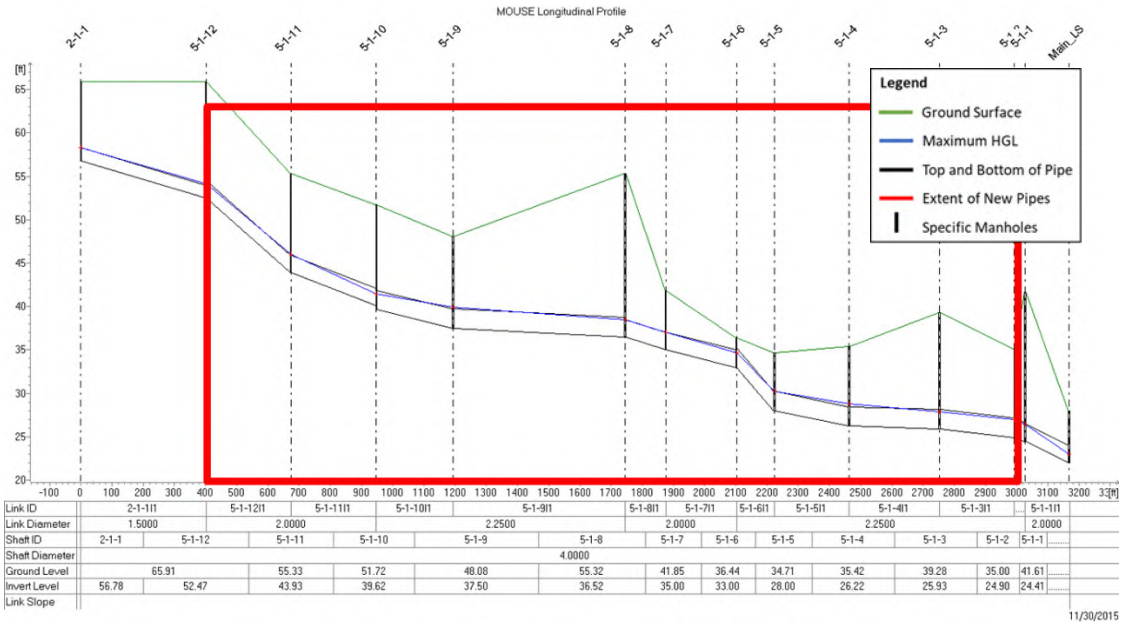

Figure 6.19 Area 7: HGL and Profile Plot under Build-Out Conditions with All Improvement Projects Completed

6.5.8 Area 8

Area 8 experiences surcharging along NW 18th Loop, during build-out conditions. There is no risk of flooding. This deficiency is caused by increased flows under future conditions which cause capacity issues. This is shown through the profile plot and HGL in blue on Figure 6.20. The proposed improvements consist of upsizing pipes between manholes 3-1-1 to 3-1-16 and manhole 3-1-13 to 3-1-12, from 8-inch to 12-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown by the HGL in Figure 6.21.

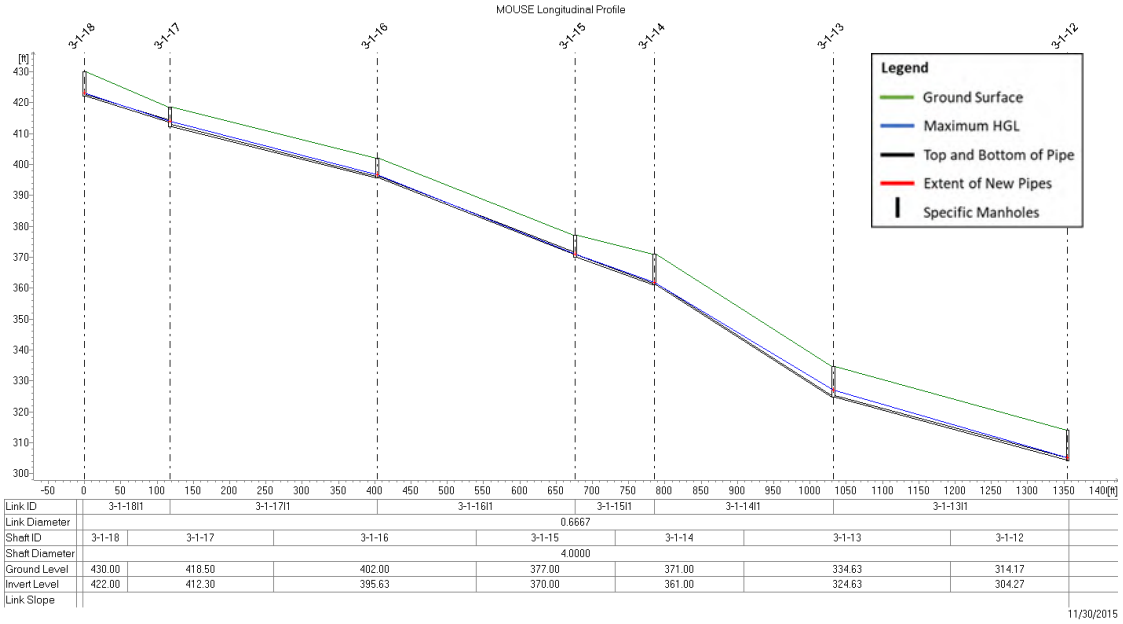

Figure 6.20 Area 8: HGL and Profile Plot under Build-Out Conditions

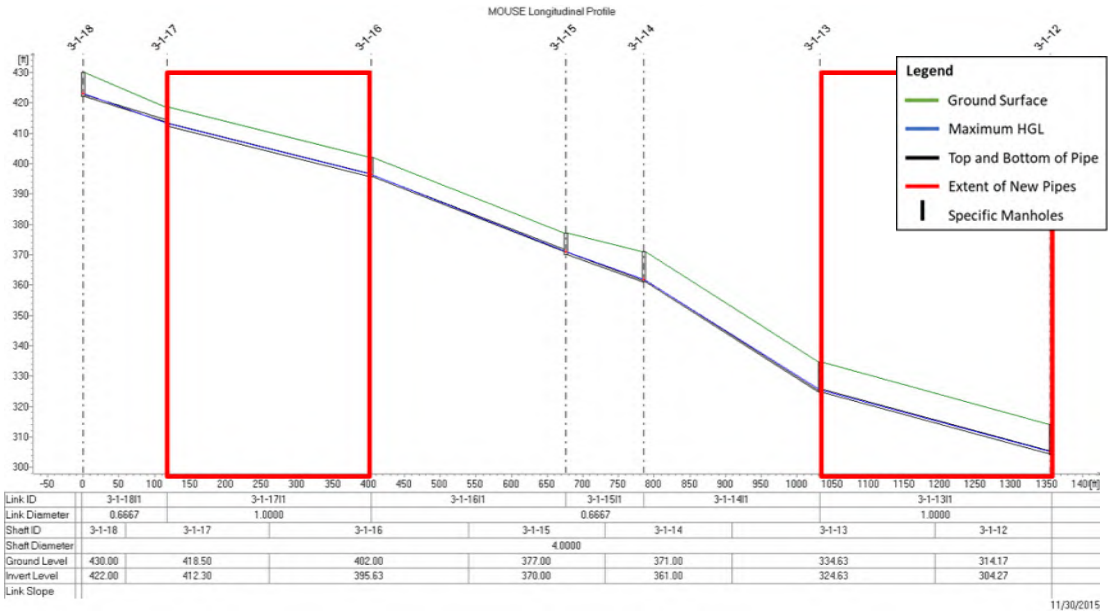

Figure 6.21 Area 8: HGL and Profile Plot under Build-Out Conditions, with Improvement Project

6.5.9 Area 9

Area 9 experiences surcharging along NE 15th Avenue between NE Garfield Street and NE Franklin Street, during build-out conditions. There is no risk of flooding. This deficiency is caused by increased flows under future conditions which cause capacity issues. This is shown through the profile plot and HGL in blue on Figure 6.22. The proposed improvements consist of upsizing pipes between manholes 4-1-2 to 4-2-1, from 8-inch to 18-inch, shown on Figure 6.4. This effectively alleviates the surcharging and meets the City's design criteria, as shown by the HGL in Figure 6.23. There is no threat of surcharging, so fixing this deficiency is a low priority and long-term project.

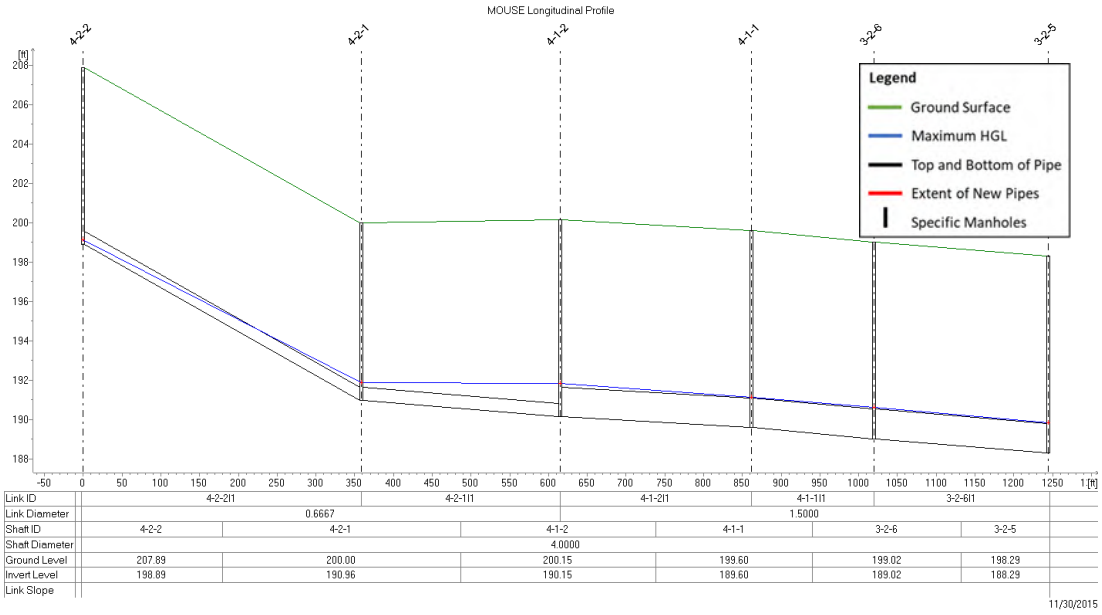

Figure 6.22 Area 9: HGL and Profile Plot under Build-out Conditions

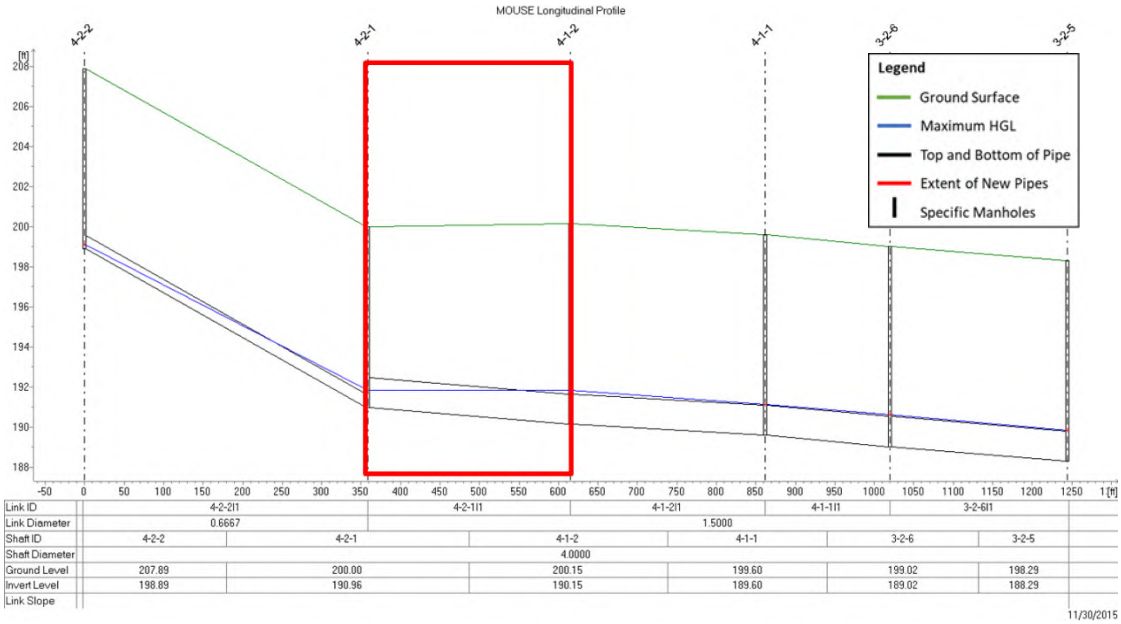

Figure 6.23 Area 9: HGL and Profile Plot under Build-out Conditions, with Improvement Project

6.6 Recommended Collection System Improvements

A number of recommended gravity collection system improvement projects for both pipes and pump stations have been identified to mitigate potential existing, 2035 Year Planning Horizon, and build-out deficiencies and to serve future users. The pipeline improvement projects were described in Section 6.5 and are summarized in Section 6.6.1. Pump Station Improvements are summarized in Section 6.6.2.

Figure 6.4, Table 6.3, and Table 6.4 identify the location and relevant components of the recommended system improvement projects. Table 6.3 and 6.4 referenced details of the improvement (length, diameter, street location, etc.). The improvements summarized in Table 6.3 and 6.4 utilize a numbering system cross-referenced with Figure 6.4. The deficiencies addressed by each project are explained in Section 6.5. The columns used in Table 6.3 and 6.4 refer to the following:

- Project ID: Assigned unique identifier associated with each improvement project. This is an alphanumeric number that starts with one letter indicating the type of improvement P= Pipe, PS = Pump Station, and continues with a number and a letter.
- Improvement Type: Gravity pipelines or pump stations.
- Location: Street in which the improvement is proposed.
- Existing Size: This represents the diameter of the existing pipelines (inches), or the total capacity of existing pump stations (million gallons per day [mgd]).
- Proposed Size: This represents the diameter of the proposed pipelines, or the total capacity of pump stations after proposed improvement, or upon construction if a new facility to serve future growth.

- Length: Estimated length of the proposed improvement in feet. It should be noted that the length estimates do not account for re-routing the alignment to avoid unknown conditions, if more detailed planning and design identifies such constraints.
- Phase: Phase in which the improvement is recommended. Improvements are recommended either for Short-term (Existing) or Long-term (2035 Year Planning Horizon or Build-out).

All proposed improvement projects are allocated to Short-Term (Existing Deficiency) and Long-Term (Build-out deficiency or no risk of flooding) phases based on when the model scenarios predict they are required. Detailed project prioritization based on condition of pipes and funding availability is presented separately in Chapter 9 - CIP and Chapter 10 - Financial Analysis. The two planning phases can be further described as follows:

- Short-term (2022-2031): Proposed facilities that alleviate deficiencies under existing flow conditions.
- Long-term (2032 - 2041): Proposed facilities that alleviate deficiencies for estimated 2035 or UGB flows and proposed facilities to serve service area expansion required under build-out conditions.

The projects were phased based on the best available information for how the City plans to develop moving forward. The actual implementation of the improvements serving future users ultimately depends on growth. The phasing presented below are estimates and will change with the City's planning assumptions or growth projections. Table 6.3 and 6.4 show all collection system projects allocated to the two planning periods.

6.6.1 Recommended Pipeline Improvements

Certain proposed improvements will serve future users, even when an improvement calls for the upgrade of an existing facility. In these cases, an existing sewer or pump station may have sufficient capacity to convey current PWWFs, but as growth continues and more users are added to the system, the increased flow results in capacity deficiencies. These projects, as well as new trunk sewers to extend sewer collection system service to future growth areas, are future improvements.

In most cases, a project is needed to correct an existing capacity deficiency but is sized to accommodate additional flows from future development.

Table 6.3 Recommended Pipe Capacity Projects

Project ID	Improvement Type	Location	Existing Size (inch)	Proposed Size (inch)	Length (feet)	Phase
P-1	Gravity	NW Fargo Street between NW 23rd and NW 19th Avenue	8	12	1,007	Short-term
P-2	Gravity	Division Street between NW 18th and NW 11th Avenue	8	12	2,043	Short-term
P-3	Gravity	NW 6th Place, just upstream of South Prune Hills PS	8 10	12 12	188 616	Short-term
P-4	Gravity	NW 6th Place between South Prune Hills PS and West Camas PS	10	12	588	Short-term
P-5	Gravity	NW 6th Avenue downstream of West Camas PS and through Forest Home Park	12 12	15 18	311 1,340	Short-term
P-6	Gravity	NW 6th Avenue between NW 7th Avenue and SE Adams Street	12 8	18 21	817 401	Short-term
P-7	Gravity	NE and SE Adams Street between SE 3rd Avenue and NW 6th Avenue	21 24	24 27	773 925	Short-term
P-8	Gravity	NW 18th Loop	8	12	609	Long-term
P-9	Gravity	NE 15th Avenue between NE Garfield Street and NE Franklin Street	8	18	256	Long-term

6.6.2 Recommended Pump Station Improvements

It is recommended that the Main, South Prune Hill, West Camas, and Crown View Plaza PSs all be upgraded to provide pump redundancy under existing conditions. These stations do not meet the required firm capacity, based on the City's performance criteria. It is recommended that the City improve these pump stations through addition of redundant pumps. Table 6.4 shows the recommended pump station improvements.

Table 6.4 Recommended Pump Station Improvement Projects

Project ID	Improvement Type	Location	Description	Phase
PS-1	Gravity	South Prune Hills	Add pump capable of pumping 664 gpm	Existing
PS-2	Gravity	West Camas	Add pump capable of pumping 723 gpm	Existing
PS-3	Gravity	Crown View Hill	Add pump capable of pumping 382 gpm.	Existing
PS-4	Gravity	Main	Add pump capable of pumping 1,831 gpm.	Existing
PS-5	Gravity	Lacamas Shores, Sunningdale Gardens, Winchester Hills 2	Add flow monitors and pressure sensors to get a better understanding of what happens during peak flows and their capacity to aid in future capital improvement planning	Existing

6.7 Recommended Collection System Future Projects

Our collection system evaluation was limited to the collection system that was modeled. The collection system includes gravity and STEP elements, but only portions of the gravity system and none of the STEP system were set up for capacity evaluation with the hydraulic model. There was insufficient data to evaluate the STEP system; therefore, specific improvement projects were not developed. Other factors such as limited pump telemetry and a lack of extensive city-wide geographic information system (GIS) limited the scope of the collection system evaluation. The following bullet points explain future projects the City should undergo to allow more effective evaluation of the gravity and STEP system, respectively:

- **Gravity Collection System Model:** The gravity collection system model is skeletonized, only 24 percent of the gravity system pipes and none of the force mains are included. While most of the critical trunks are included, a full pipe or less skeletonized model is needed for a more robust evaluation of the system. In order to expand the model, accurate and updated GIS for the collection system should be developed.
- **Gravity Pump Station Instrumentation:** The lack of pump station instrumentation limited the extent stations could be evaluated. The City conducted draw down testing that resulted in lower capacities than previous modeling concluded. It is recommended that the City improve instrumentation of these stations to better understand the reasons for these revisions.

- **STEP Main Flows:** As discussed in Chapter 7, with the City's combined treatment plant influent monitoring restricted the ability to separate out STEP flows from Gravity System Flows with a high degree of confidence. Recently, this issue was resolved and future monitoring will allow a greater understanding of the STEP Main flows. If Oak and Main PSs are flow metered, the STEP system flow can be determined. A future study is recommended once sufficient historical data is available.
- **STEP Main Modeling:** The STEP system should be added to the collection system model in order to evaluate that portion of the system. Additional metering at pump stations further upstream would allow proper calibration of the STEP portion of the model. While these pump stations would not need to be included in the model. Accurate data on Pump Station inflows to the STEP system would need to be determined. The addition of a manhole with a flow meter near NW Lake Rd and NW Lacamas Drive or NW Parker Street and NW Knapp Lane to aid in calibration should also be considered. Figure 6.24 shows the potential overview of a STEP main model, in dark grey, and proposed monitoring locations to add to the STEP system. Inflows are shown in orange and black triangles. These inflows are based on the Gray and Osborne 2009 General Sewer Plan Appendix F, Figure F-1. These inflows give an overview of where additional monitoring could be implemented in order to further refine the system during STEP model calibration.
- **STEP Main Condition Assessment:** The addition of manholes to the STEP system would help facilitate investigation of the STEP mains condition and allow any partially obstructed portion of the STEP Main to be identified. A future investigation of debris, solids, and other obstruction is recommended in the sags in the system.
- **STEP System Lift Stations:** The STEP System Lift stations could not be evaluated under PWWF events using the system model, due to a lack of data. Supervisory control and data acquisition (SCADA) with historian capabilities would assist with the evaluation of all stations and determining pump run times at these stations. Based on the City's pump station run time tests, a representative peak flow could be determined. This program should start with the most at risk stations defined in Section 6.4, and expand to all city owned pump stations.

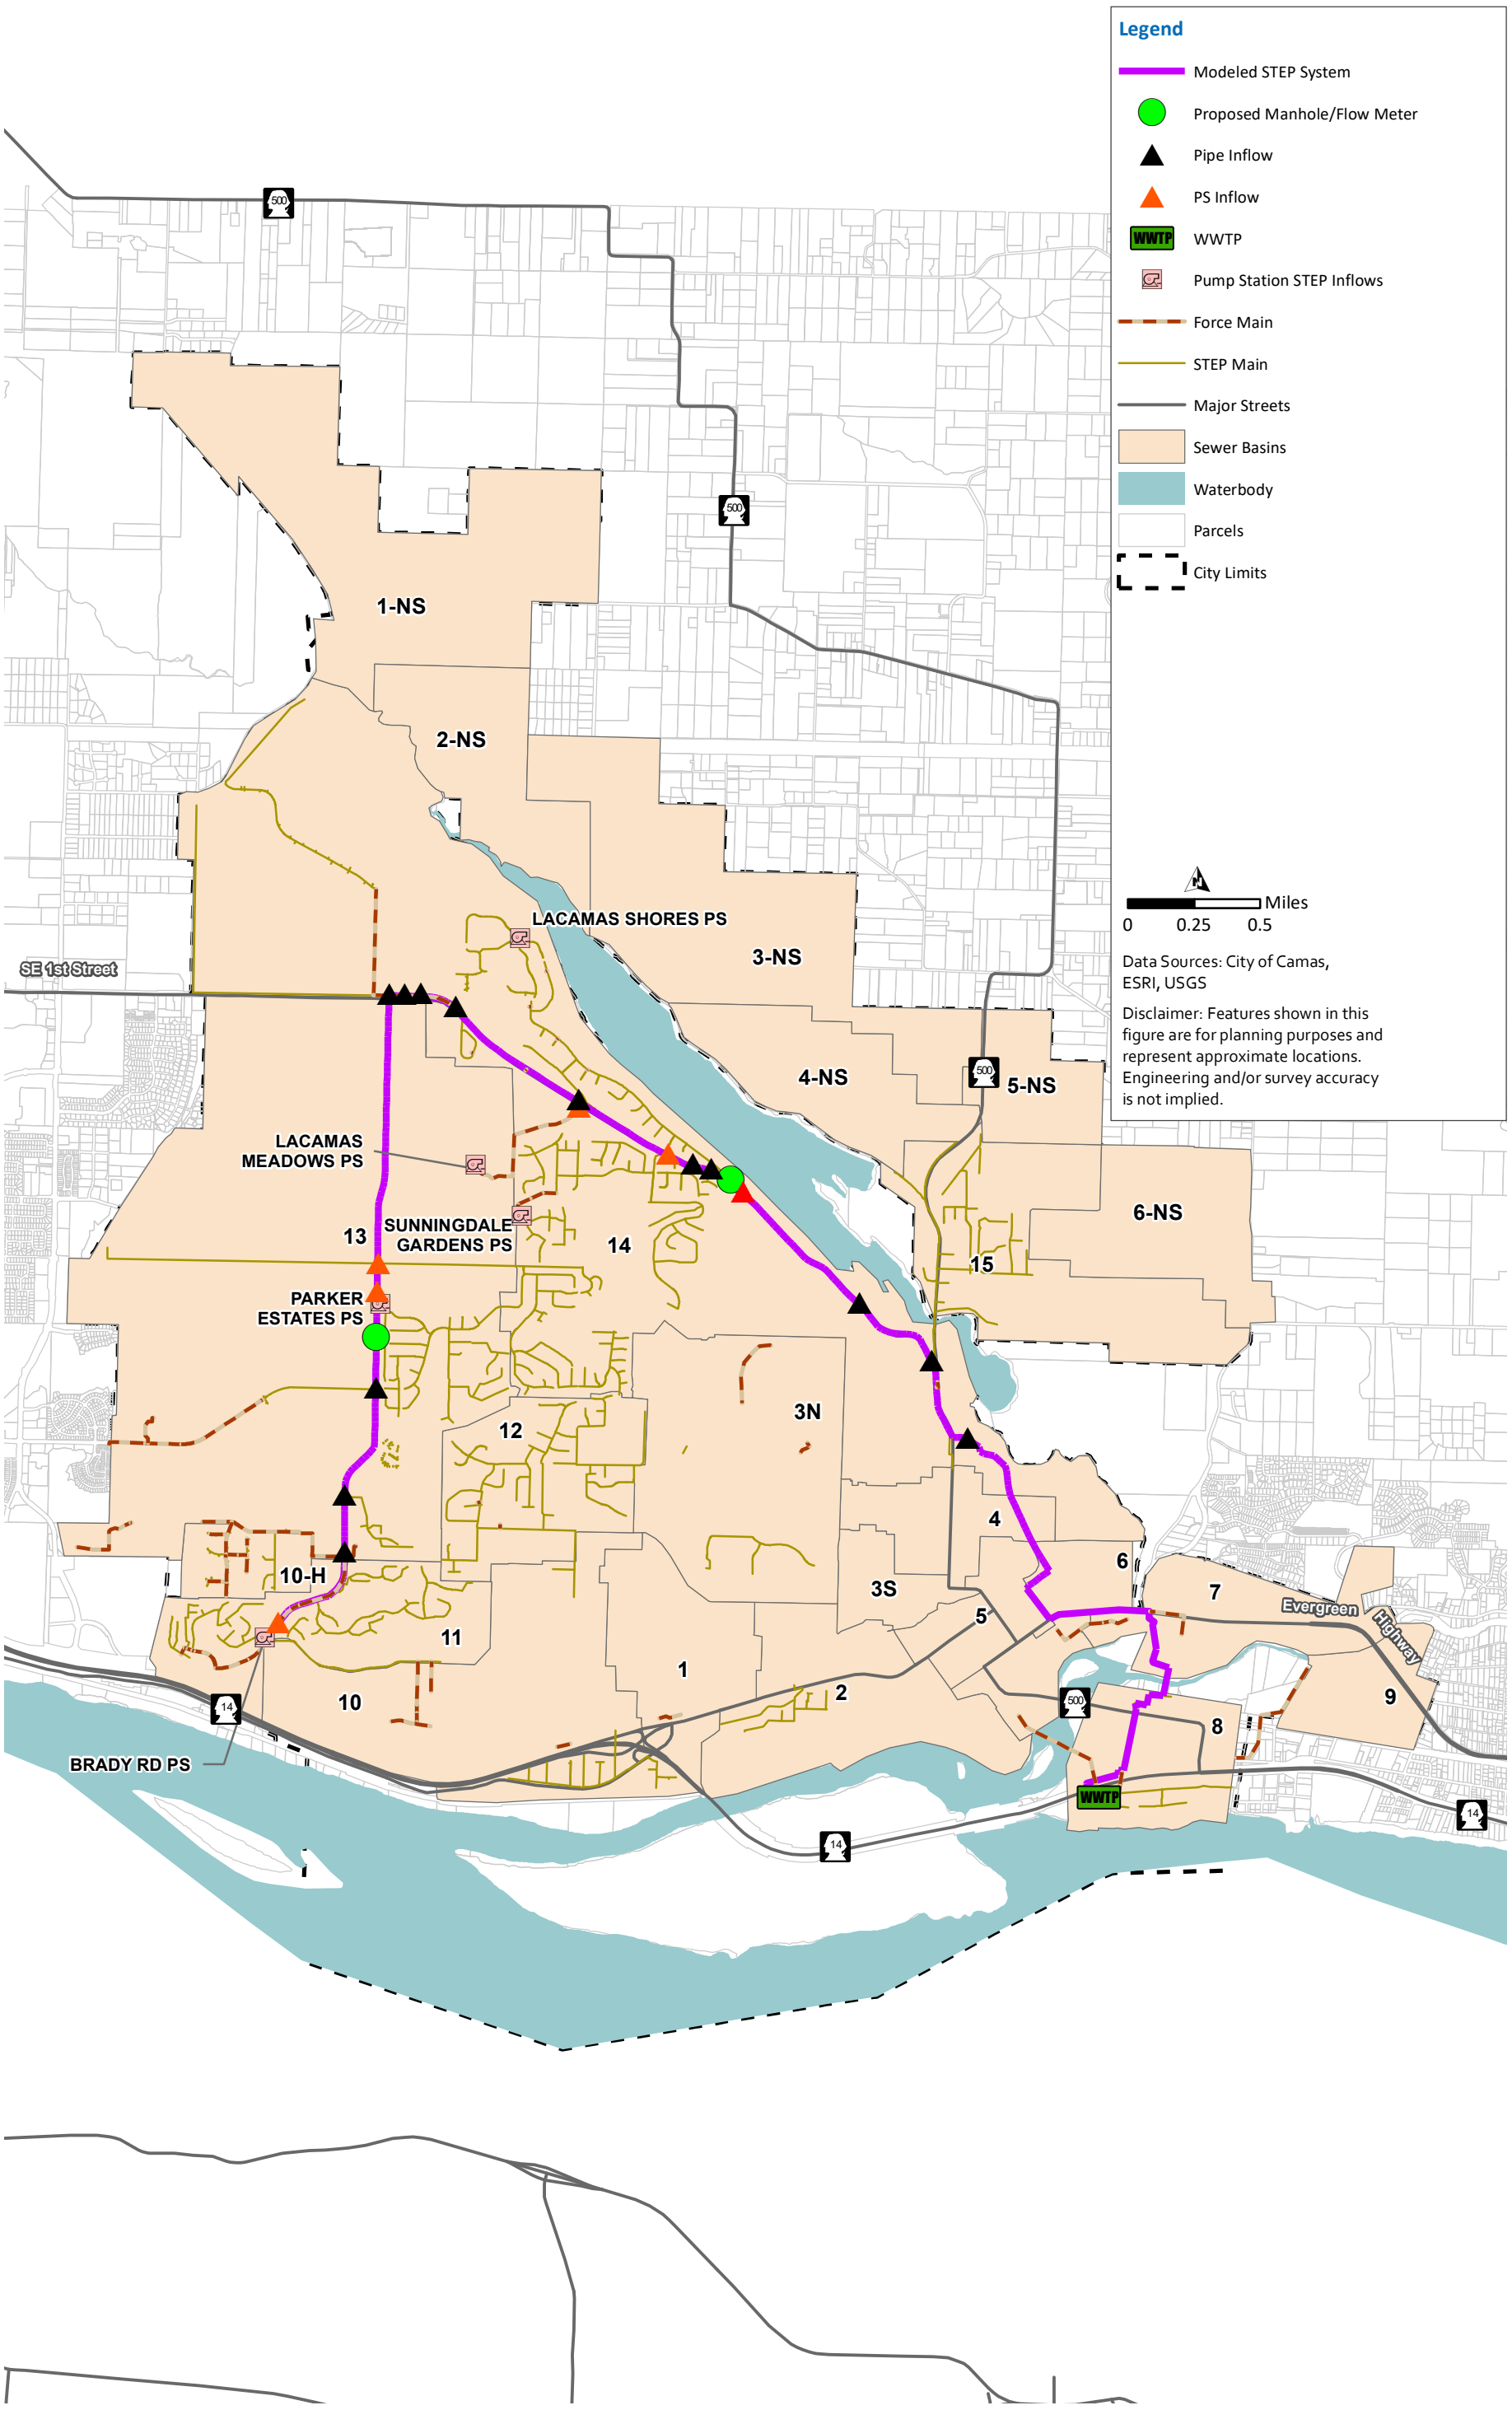

Figure 6.24 Overview of Potential STEP Main Model

Chapter 7

WASTEWATER TREATMENT FACILITY

7.1 Introduction

The City of Camas (City) serves the water quality needs of approximately 8,500 residential, industrial, and commercial accounts by maintaining and operating their wastewater treatment facility (WWTF) which has a maximum month design flow of 6.1 million gallons per day (mgd).

To support development of the City's General Sewer Plan (the Plan), a unit process analysis was completed to identify shortfalls in plant capacity that will prevent the City from reliably treating and disposing of projected flow and loads at the end of the planning period (i.e., year 2035). To address the identified deficiencies, an alternatives analysis of the most viable improvement options was conducted, which resulted in the development of 14 projects to be incorporated into the general sewer plan's capital improvement program (CIP).

This chapter summarizes the methods and results of these tasks, thus defining the condition and capacities of the WWTF's unit processes and presenting sequenced recommendations that will allow the City to reliably and cost-effectively serve their customers now and into the future.

7.1.1 Current National Pollution Discharge Elimination System Permit

The City's WWTF effluent must comply with limits on biological oxygen demand, total suspended solids, ammonia, pH, and fecal coliform bacteria as conditions of their National Pollutant Discharge Elimination System (NPDES) permit. The current permit, Permit Number (No.) WA0020249, was issued in 2015 effective through September 2020. The City began coordinating with the Washington Department of Ecology (Ecology) to request a permit extension in March 2020, but a formal extension or new permit has not been issued as of January 2022. The City will continue to work with Ecology to extend or renew their NPDES permit and will continue to comply with their current discharge limits, which are summarized in Table 7.1.

Table 7.1 NPDES Permit Effluent Limits for Permit No. WA0020249

NPDES Permit Effluent Limits		
Parameter	**Average Monthly**	**Average Weekly**
Biological oxygen demand (BOD_5)	• 20 mg/L • 1,017 ppd • 74% removal	• 30 mg/L • 1,525 ppd
Total suspended solids (TSS)	• 20 mg/L • 1,017 ppd • 76% removal	• 30 mg/L • 1,525 ppd
Ammonia (NH3 as N) during summer(1)	• 20 mg/L	-
Ammonia (NH3 as N) during winter(2)	• 7 mg/L	-
Parameter	**Minimum**	**Maximum**
pH	• 6 SU	• 9 SU
Parameter	**Monthly Geometric Mean**	**7-Day Geometric Mean**
Fecal coliform bacteria	• 200/100 mL	• 400/100 mL

Notes:
(1) Summer months include June through July.
(2) Winter months include October through May (inclusively).
Abbreviations: BOD_5 - five-day biochemical oxygen demand; mg/L - milligrams per liter; mL - milliliter; ppd - pounds per day; SU - standard units.

7.1.2 Past Evaluation of Reuse

In the 2010 iteration of the general sewer plan, the City explored their potential to practice wastewater reclamation, or the production and beneficial use of reclaimed water. As such, an evaluation was completed to understand the feasibility of reusing effluent from the WWTF or constructing a new water reclamation facility (WRF) to treat wastewater for reuse.

The evaluation determined that, though environmental and social benefits are difficult to quantify and assess, the City and their surrounding communities can benefit indirectly from the use of reclaimed water in the following ways:

- Development of additional outdoor recreational sites for the community.
- Irrigation of parks and playfields, which can potentially increase property values.
- Conservation of the quality and quantity of the City's water resources.
- A flexible and reliable alternative water source for industrial water customers.

However, the evaluation also confirmed that the production of reclaimed water is only economically feasible if the cost of producing reclaimed water is less than or equal to the cost of purchasing water or developing additional water rights.

Capital, operation, and maintenance costs for the two alternatives were taken from the 2010 general sewer plan and converted from 2006 dollars to 2021 dollars. A new 20-year present worth analysis was conducted with the updated values. Both the 2010 general sewer plan and the current 20-year present worth analysis found that neither the costs to modify the existing WWTF nor construct a satellite WRF were less than or equal to the cost of developing additional water rights, which are available at notably lower costs. The cost to develop and acquire additional water rights was expected to not exceed 5 million dollars in 2006 which would be 7.9 million dollars in 2021.

Comparisons of the two alternatives are shown in Table 7.2. Alternative 1 has a 20-year present worth of $15.8 million dollars and alternative 2 has a 20-year present worth of $42.6 million dollars. Both alternatives are considerably larger than the 7.9 million dollars to develop and acquire additional water rights. Therefore, water reclamation and reuse were determined to be economically infeasible at this time and not pursued at the City's WWTF.

Chapter 10 of the *2010 General Sewer/Wastewater Facility Plan* (Gray & Osbourne, Inc. 2010) documents the feasibility evaluation of reuse in further detail.

Table 7.2 Reuse Alternative Cost Comparison

	Alternative 1 Modify Existing WWTF	Alternative 2 Construct Satellite WRF
Capital Cost[(1)]	$12,837,000	$35,878,000
Annual O&M Cost[(2)]	$157,700	$350,500
20-year Present Worth[(3)]	$15,841,000	$42,554,000

Notes:
(1) 2010 general sewer plan used 2006 costs. The ENR CCI 20-City Average for June 2006 and June 2021 were used.
(2) 2010 general sewer plan reported 2004 costs. Costs were updated using the ENR CCI 20-City Average for March 2004.
(3) Discount rate assumed 5% bond repayment rate and 4% inflation for a total rate of 1%.
Abbreviations: O&M - operations and maintenance.

7.2 Unit Process Analysis

A unit process analysis comparing the design or rated capacity of each WWTF unit process against its requisite treatment demands under current and projected flows and loads. This comparison identified deficiencies or limitations in the plant's current installed capacity to meet its various regulatory and operational requirements by 2035.

To this end, the unit process analysis was completed in the following six sequential tasks:

- Compile and analyze five years (i.e., January 2014 to December 2018) of WWTF data.
- Develop a hydraulic model of the collection system (collection system model) to estimate future peak hour flow (PHF) at the WWTF under the design storm.
- Estimate future flows and loads from 2019 through 2035 to approximate each unit process's necessary treatment performance.
- Develop and calibrate hydraulic and BioWin models to assess how future flows and loads will affect existing plant facilities and their performances.
- Conduct plant tours to complete condition assessments of the existing facilities and identify operational limitations.
- Determine future treatment capacities for existing unit processes and estimate the ideal timing of future plant improvements.

The following sections highlight key points and findings from these six tasks.

7.2.1 Flows and Loads

Tables 7.3 and 7.4 present the current and projected flows and loads, which must be treated and discharged to the Columbia River. These projections were developed according to measured influent flows and wastewater characteristics, typical septage and septic tank effluent pump (STEP) system characteristics, and population growth projections. Chapter 3 details the method by which these flows and loads were analyzed.

Table 7.3 Current and Projected Flows

Flow Parameter	Current Flow (mgd)	2035 Flow (mgd)
ADWF	2.2	3.4
AAF	2.8	4.0
MMF	4.8	6.2
PDF	8.4	10.8
PHF	10.0	13.5

Notes:
Abbreviations: AAF - average annual flow; ADWF - average dry-weather flow; MMF - maximum monthly flow.

Table 7.4 Current and Projected Loads

Load Parameter	Current Load (ppd)	2035 Load (ppd) 50% STEF/STEP
BOD_5		
Average Annual	2,400	6,000
Max Month	3,300	8,200
Max Week	4,300	10,600
Peak Day	5,300	13,000
TSS		
Average Annual	2,500	6,300
Max Month	4,200	10,500
Max Week	7,000	17,000
Peak Day	7,900	19,300
Ammonia		
Average Annual	900	1,400
Max Month	1,100	2,000
Peak Day	1,800	4,300

Notes:
Abbreviations: STEF - Septic tank effluent filter; Hydraulic Modeling.

Carollo Engineers' Hydraulix® modeling software was used to establish the hydraulic capacities of individual unit processes and water surface elevations (WSE) under current and future flows. More specifically, this software modeled the flow through the WWTF by calculating both energy grade lines and hydraulic grade lines according to headloss and velocity at each hydraulic element under various influent flow conditions identified in Table 7.3.

Each individual unit process was considered "at risk" when the model indicated less than 18 inches of freeboard in a structure or less than six inches of fall from flow over a weir to the downstream water surface. A unit process was considered "overloaded," or as having a true hydraulic limitation, when the model indicated less than 12 inches of freeboard or a weir was submerged. Less than 12 inches of freeboard in an open channel puts the WWTF at risk of flow overtopping a structure and must be avoided at all costs.

7.2.2 BioWin Modeling

BioWin version 6.1 was employed to develop an overall process model of the WWTF. This model was calibrated using existing treatment facility operational data and then confirmed by running the calibrated model as a steady-state simulation using average plant influent and effluent values (BOD, TSS, ammonia) from 2018.

Once the calibration effort was deemed acceptable, parameters were established for future conditions under which the WWTF must operate. Specifically, this effort adopted the flows and load projections presented in Tables 7.3 and 7.4 while assuming that effluent limits on ammonia would be as low as seven mg/L for all scenarios.

Finally, the BioWin model was used to model performance of the secondary treatment unit processes under anticipated future conditions, under the following future scenarios:

- A TSS removal rate of 65 percent under current AAF, current MMF, and 2035 AAF conditions and 52 percent under 2035 MMF conditions.
- A minimum aerobic solids retention times (aSRT) of eight days under average conditions and 6.6 days under maximum month conditions.
- The sludge volume index (SVI), which is aquantification of mixed liquor suspended solids (MLSS) settleability, cannot exceed 150 milliliters per gram (mL/g) if capacity limitations are to be prevented.

In regard to the final point, the highest allowable maximum month MLSS concentration, 3,500 milligrams per liter (mg/L), is limited by the capacity for suspended solids to settle in the SCs under peak day flow (PDF). A state point analysis (SPA) was conducted to determine the maximum allowable MLSS concentration, which was 2,330 mg/L with one SC out of service and all three ABs in service. The loading conditions that will result in this maximum month MLSS concentration at a 6.6-day aSRT is a PDF of 9.0 mgd. Section 7.4.2.1 discusses this topic further.

7.2.3 Condition Assessment

A condition assessment was conducted to identify major facility deficiencies and provide a general priority rating for mechanical equipment, treatment units, structures, and electrical, instrumentation, and control (E&IC) systems. The information compiled was used during the planning process to determine which portions of the facility can be retained, which require major upgrades, and which should be abandoned or replaced.

To begin, the assessment team reviewed each unit process's drawings and design criteria, including the Washington State Department of Ecology's (Ecology) recommended WWTF redundancy criteria for flows and loads as published in *Criteria for Sewage Works Design* (2008).

Table 7.5 summarizes the criteria that each facility component must meet.

Table 7.5 Design Criteria for Each WWTF Component

WWTF Component	Flow Criteria	Load Requirement	Redundancy
Influent Screens	• PHF.	-	• 1 unit out of service.
Primary Clarifiers	• PHF + Recirculation.	• Peak hour design load	• All units in service.
Aeration Basins	• Maximum month design flow. • AAF.	• Maximum month design load. • Average annual load.	• All units in service • 1 unit out of service.
Internal Recycle Pumps	• PDF.	-	• 1 unit out of service.
Aeration Systems	-	• Maximum week design load.	• 1 unit out of service.
Secondary Clarifiers	• PDF + Recirculation.	• Maximum month design load.	• all units in service.
RAS Pumps	• 100% of MMF. • 50% of PHF.	-	• 1 unit out of service.
Effluent Filters	• All flows requiring tertiary treatment.	-	-
UV Channel	• PHF.	-	• 1 unit out of service.
Primary Sludge Pumps	• Peak instantaneous design flow.	• Maximum daily design load.	• 1 unit out of service.
Degritting Cyclone	• PHF.	-	• N/A
Grit Classifier	• PHF.	-	• N/A
Gravity Thickener	-	• Maximum daily design load.	• N/A
WAS Pumps	• Peak instantaneous design flow.	• Maximum daily design load.	• 1 unit out of service.
Rotary Drum Thickener	-	• Maximum daily design load.	• 1 unit out of service.

Notes:
Abbreviations: N/A - not applicable; RAS - return activated sludge; UV - ultraviolet; WAS - waste activated sludge.

Next, the team discussed maintenance history, plant shortcomings, and general operational issues with City staff, who also accompanied the team on walk-through inspections of the WWTF's following processes and associated major equipment:

- Preliminary treatment.
- Primary treatment.
- Secondary treatment.
- Aeration blowers.
- Tertiary filtration.
- UV disinfection.
- Effluent pump station and pumps.
- Primary sludge and degritting.

- WAS system.
- Anaerobic digestion and waste gas flare.
- Dewatering centrifuge.
- Biosolids belt dryer.
- Plant drain and non-potable pump station.
- Biofilters and septage-receiving station.
- Facility control systems, including the programmable logic controller (PLC) and central supervisory control and data acquisition (SCADA).

Note that, although they were a part of the assessment, anaerobic digestion and the waste gas flare, dewatered sludge conveyance, and the biosolids belt dryer were not evaluated in detail since they were recently upgraded. Additionally, the biofilters and septage-receiving station were not analyzed in detail and should be more closely reviewed in a subsequent project.

Table 7.6 summarizes each key WWTF component's condition and capacity findings.

Table 7.6 Conditions and Capacity Findings from the WWTF Conditions Assessment

WWTF Component	Condition	Capacity
Influent Screens	• No significant conditions issues identified.	• 14.0 mgd
Primary Clarifiers	• No condition issues identified.	• 2,380 gpd/sq ft PHF
Aeration Basins (AB)	• Weir walls between zones are uneven.	• 8.37 mgd (2 ABs, 2 SCs per SPA) (max month) • 9.12 mgd (3 ABs, 2 SCs per SPA) • 9.71 mgd (3 ABs, 3SCs per SPA)
Secondary Clarifiers (SC)	• SC No. 1 in poor condition.	
Internal Recycle Pumps	• No condition issues identified.	
Aeration Systems	• Unable to control blowers when operating multiple in parallel.	
RAS Pumps	• No condition issues identified.	
Effluent Filters	• No condition issues identified.	• 6.0 mgd
UV Channel	• No condition issues identified.	• 13.7 mgd at 70% UV Transmittance
Primary Sludge Pumps	• No condition issues identified.	• 220 gpm (each)
Degritting Cyclone	• End of useful life.	• 220 gpm (each)
Grit Classifier	• End of useful life.	• 15 gpm
Gravity Thickener	• End of useful life.	• 400 gpm
WAS Pumps	• No condition issues identified.	• 200 gpm

WWTF Component	Condition	Capacity
Rotary Drum Thickener	• Significant Observed Deterioration.	• 200 gpm.
Centrifuge	• Near end of useful life.	
Plant Drain Pump Stations	• Show signs of concrete corrosion and pumps at the end of useful life.	• Plant Drain Pump Station No. 1: 250 gpm at 35 feet TDH • Plant Drain Pump Station No. 2: 500 gpm at 40 feet TDH
Non-Potable Pumps	• No condition issues identified.	• 200 gpm at 185 feet TDH
Effluent Pump Station	• No condition issues identified.	• 12.4 mgd at 18 feet TDH

Notes:
Abbreviations: gpd/sq ft -gallons per day per square foot; gpm - gallons per minute; TDH - total dynamic head.

7.3 Summary of Key Improvements and Preferred Alternatives

Comprehensive analysis of the WWTF's unit processes identified several current and anticipated condition or capacity issues in the WWTF's hydraulic, liquid treatment, solids treatment, and plant support systems. The following sections highlight key issues with unit processes at the WWTF and also recommend improvements to mitigate them; collectively, this information served as the basis for the subsequent alternatives analysis and project development for inclusion in the general sewer plan's recommended CIP.

Each unit process's complete description; condition findings, hydraulic capacity, and process capacity analyses; and recommendations for improvements and alternatives are available in Appendix I: Wastewater Treatment Facility Engineering Reports.

7.3.1 Basis of Project Costs

Cost estimates for treatment projects include 30 percent for construction contingency, 1.3 percent for builder's risk and insurance, 15 percent for general contractor overhead, risk, and profit, and 1 percent for performance and payment bond for a total overall construction adjustment factor of 53 percent. Planning adjustment mark-ups include 25 percent for engineering, legal, and design and 5 percent for owner's reserve for change orders for a total overall planning adjustment factor of 30 percent.

All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021). Cost estimates were developed using a Class 4 budget estimate, as established by the American Associate of Cost Estimators (AACE). This level of estimate is used for feasibility studies and assumes a one percent to 15 percent level of project definition. The expected accuracy range is of the Class 4 cost estimates are -30 percent to +50 percent.

7.3.1.1 Total Treatment Project Capital Improvement Cost

The costs presented in this Plan are high-level planning costs to help the City in making financial decisions.

As shown in the following sample calculation of the capital improvement cost, the total cost of all project contingencies (construction and planning) and allied costs (engineering services, construction management, and project administration) is 82 percent of the baseline project cost.

Example:

Baseline Project Cost	**$1,000,000**
Overall Construction Adjustment Factor (53%)	$530,000
Construction Cost	**$1,530,000**
Engineering, Legal, Design (25%)	$382,500
Owner's Reserve (5%)	$76,500
Total Capital Improvement Cost	**$1,989,000**

7.3.2 Hydraulics

To ensure that the plant's unit processes have adequate capacity to handle future flows, hydraulic improvements are recommended in the following areas.

7.3.2.1 Inlet to the Headworks Channel

The headworks's hydraulic capacity is currently limited by the inlet pipe's configuration. Flow from the existing inlet pipe enters a shallow influent channel vertically from below, directing flow *upward* instead of *toward* the flume. As a result, flow upstream of the Parshall flume occasionally sprays out over the top of the headworks structure, especially at high influent flow rates.

To prevent flow measurements from being skewed and raw sewage from splashing over the top of the structure, the inlet pipe to the headworks channel is recommended to be modified by installing a rigid plate or slab over the top of the influent channel to the flume. The new tread plate will replace the existing metal cover with a resilient, watertight alternative.

The estimated total project cost of these modifications is $6,000. They may be implemented at any time either by City staff or a general contractor as part of a larger project. Before implementing the project, the tread plate's load rating must be considered, and the anchorage design must be reviewed to resist the thrust caused by peak flows.

7.3.2.2 Tertiary Filter Bypass System

The plant's two tertiary disc filters are hydraulically bottlenecked by a set of serpentine bypass weirs whose current configuration provides minimal freeboard in the filter influent channel. At sufficiently reduced freeboard, flow may flood the SCs' effluent weirs, splash out of the channel, and potentially damage sensitive equipment and electronics, particularly those of the UV system. If left unmodified, the filters' removal efficiency will decrease as future flows increase and require more bypass, which will also decrease the removal rate of TSS.

To prevent the weirs from limiting the plant's overall hydraulic capacity, the tertiary filter bypass system is recommended to be reconfigured in the following manner:

- Remove the original weir wall between the filter influent channel and the existing serpentine weirs.
- Remove the concrete fill in the corners of the bypass channel to increase the depth and decrease the flow velocity.
- Reverse the serpentine weirs so that flow enters up between and through the launders, allowing for a uniform velocity as flow approaches the bypass weir, which, in turn, leads to more uniform weir loading.

As shown in Table 7.7, the total estimated project cost of the recommended modifications is approximately $49,000. These modifications can be implemented as a standalone project or along with other project efforts to reduce overhead costs. Although the timing of this improvement is not constrained, implementation during the dry weather season is recommended since the work will require temporary bulkheads upstream and downstream of each bypass channel.

Table 7.7 Filter Bypass Modification Costs

Description	Cost[1]
Demolition of Existing Structures	$7,000
New Concrete	$5,000
Structural Steel	$10,000
Bypass Weir Removal and Reinstallation	$3,000
Total Direct Cost	**$25,000**
Total Estimated Construction Cost	**$38,000**
Total Estimated Project Cost	**$49,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.3 Liquids Treatment

To address process and condition issues identified in the plant's secondary treatment system, modifications in the following areas are recommended.

7.3.3.1 Secondary Clarifier No. 1

The WWTF's three SCs all have differing effective sidewater depths and configurations, with SC Nos. 2 and 3 performing well. SC No. 1, however, performs poorly and unreliably not only because of the condition of its mechanical equipment but also because it has a center-well sludge-collection mechanism without a sloped floor to its center.

This clarifier is a major existing limitation and, as such, restoring it to its full design capacity is key to also restoring the process and hydraulic capacities associated with the secondary treatment process. As it stands, with all three ABs operating under MMF conditions and using only the two SCs that are currently operable, the secondary system will have insufficient capacity by approximately year 2024.

As such, SC No. 1 is recommended to be replaced with a new 75-foot-diameter, sloped-bottom clarifier similar in design to SC No. 3 since past retro-fit projects have not improved the clarifier's performance. Operating three fully functional SCs will increase the allowable maximum month MLSS concentration from 2,330 mg/L to 2,950 mg/L and slightly increase the allowable PDF from nine mgd to 9.4 mgd.

As shown in Table 7.8, the total estimated project cost to replace SC No. 1 is approximately $5.15 million. To replace SC No. 1, the plant must be operated using only two SCs through at least one wet weather season when peak flow events are likely, placing it at a higher risk of permit violations during construction.

Table 7.8 Replacement Costs for Secondary Clarifier No. 1

Description	Cost[(1)]
Demolition of Existing Equipment and Structure	$333,000
New Concrete Basin (Similar to SC No. 3)	$1,357,000
75-foot-diameter Spiral Scraper Mechanism	$420,000
Two 30-hp Vertical Centrifugal RAS Pumps	$147,000
Piping Modifications	$158,000
Electrical, Instrumentation, and Controls Upgrades	$175,000
Total Direct Cost	**$2,590,000**
Total Estimated Construction Cost	**$3,958,000**
Total Estimated Project Cost	**$5,146,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).
Abbreviations: hp - horsepower.

7.3.3.2 Secondary Treatment System

The plant's existing secondary treatment system has the following notable issues:

- Aerated volume in existing ABs is insufficient to maintain the eight-day aSRT necessary for stable nitrification.
- The baffle walls that divide the ABs' zones were poorly cut to their current top elevation and/or in deficient condition.
- RAS pumps for SC No. 2 are undersized and cannot prevent a sludge blanket failure under peak flow and load conditions.

The following sections detail each of these issues and their recommended improvements.

Aeration Basins

Flow and load projections predict that approaching 2030, the ABs' current capacity will become insufficient in maintaining an MLSS concentration below 3,500 mg/L under average loading conditions with one basin out of service at the 8-day aSRT required for stable nitrification.

To resolve this issue, the City is recommended to convert the existing ABs' anoxic zone volume into usable aerobic zone volume. If aeration diffusers are added to the final anoxic zone, the overall aerated volume can be increased by approximately 31 percent, leading to an approximate 24 percent decrease in the MLSS concentration allowing the system to maintain an eight-day aSRT. At this rate, the year when the firm AB capacity is exceeded might be prolonged from 2030 to 2038, and the overall SC capacity increases.

Supports for the diffusers in the new aerated zone must be designed to withstand forces exerted by the existing mixer so this zone can operate flexibly as a swing zone that provides either anoxic or aerobic conditions. To this end, the conversion of the current final anoxic zone to an aerated swing zone will require the following modifications:

- **Install a new diffuser grid:** The new diffusers are recommended to be the same type as those currently installed in each of the ABs' oxic zones, which are nine-inch Sanitaire membrane diffusers.
- **Connect the diffuser grid to the existing air pipe header:** Each new zone's aeration piping will include a modulated airflow control valve and a thermal mass flow meter accessible from the walkways between the ABs.

As shown in Table 7.9, the total estimated project cost for these modifications is approximately $340,000.

Table 7.9 Aeration Basin Diffuser Modification Costs

Description	Cost[(1)]
Three New Sanitaire Diffuser Grids	$69,000
Air Piping Modifications	$60,000
Electrical, Instrumentation, and controls Upgrades	$42,000
Total Direct Cost	**$171,000**
Total Estimated Construction Cost	**$261,000**
Total Estimated Project Cost	**$340,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

Aeration Basins' Baffle Walls

The marine plywood baffle walls in the ABs' selector zones are in poor condition. In addition, the concrete baffle walls between the ABs' anoxic/oxic zones are uneven and have exposed rebar. These issues not only compromise the structural integrity of the baffle walls but also may cause short-circuiting and backflow between the zones.

To resolve these issues, the marine plywood baffle walls in the selector zones are recommended to be removed, but not replaced. Meanwhile, the concrete baffle walls between the anoxic/oxic zones are recommended to be repaired to cover the exposed rebar and provide an even top of wall elevation. The total estimated project cost for these improvements is approximately $40,000.

Secondary Clarifier No. 2's RAS Pumps

According to the state point analysis introduced in Section 7.2.3, under max month MLSS concentrations and PDF, the current RAS rate is insufficient in preventing the sludge blanket in the SCs from rising. The current rated capacity of the RAS pumps in SC No. 1 is only 1,000 gallons per minute (gpm) and 1,050 gpm in SC No. 2, well below SC No. 3's RAS firm pumping capacity of 1,400 gpm.

Even if SC No. 1 is rehabilitated and additional aerated zones are added to the ABs, PDF will still be limited to 10.6 mgd at a maximum month MLSS concentration of approximately 2,725 mg/L. However, additionally increasing both SC nos. 1 and 2's RAS pumping capacities to 1,400 gpm will increase the allowable maximum month MLSS concentration to 3,000 mg/L at a PDF of 10.9 mgd. This capacity expansion extends the predicted point in time at which the secondary treatment process runs out of capacity to handle PDFs and maximum month MLSS concentrations from 2033 to 2036.

Since SC No. 1 is recommended to be wholly replaced, only SC No. 2's two RAS pumps are recommended to be replaced. The pumps were assumed to be replaced with larger units, although the existing pumps may be sufficient with replacement of impellers.

As detailed in Table 7.10, the total project cost to replace SC No. 2's RAS pumps is approximately $391,000.

Table 7.10 SC No. 2's RAS Pumps Replacement Costs

Description	Cost[(1)]
Removal of Existing Pump	$3,000
Two 30-hp Vertical Centrifugal RAS Pumps	$147,000
Electrical, Instrumentation, and Controls Upgrades	$47,000
Total Direct Cost	**$197,000**
Total Estimated Construction Cost	**$300,000**
Total Estimated Project Cost	**$391,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

Timing of the Recommended Improvements for the Secondary Treatment System

The recommended improvements to SC No. 1, the ABs, and the RAS pumps will provide the WWTF with sufficient secondary treatment capacity through 2036, beyond the planning horizon. However, these projects must be implemented with considerations made for permit requirements and process implications.

To replace SC No. 1, the plant must operate with only two units online during a wet weather season when peak flow events will likely increase the risk of violating permit demands when the new SC is being constructed. However, if the aeration improvements are implemented before the new SC is constructed, the secondary treatment process can be operated at a significantly lower MLSS concentration, reducing the risk of settling failure in SC Nos. 2 and 3. Ideally, aeration improvements and SC reconstruction could occur during the same dry weather period when the plant has sufficient capacity to operate with tanks out of service, allowing the aeration improvements to be completed before wet weather flows occur.

The replacement of SC No. 1 is also a sensible time to replace the existing RAS pumps for both SC Nos. 1 and 2. Since SC No. 2 is required while SC No. 1 is under construction, increasing SC No. 2's RAS rate to match that of SC No. 3 will provide an additional buffer against sludge blanket failure while SC No. 1 is out of service.

Section 7.4.2 discusses potential implementation years for these projects. Note that, even with these efforts complete, the City must still begin preparing even more secondary treatment capacity, either by process expansion or intensification, no later than 2031.

7.3.3.3 Aeration Blowers

The WWTF's four multistage centrifugal aeration blowers have the following notable issues:

- The blowers' firm capacity is insufficient to meet projected 2035 air demands.
- The blowers' current operational configuration risks overloading the blower motors and, thus, the four units cannot be run simultaneously.
- Each blower's variable frequency drives (VFD) cannot effectively modulate airflow by changing blower speeds.
- The control valves are oversized and ineffective in controlling dissolved oxygen (DO).
- Adding a fourth aerated zone to each AB will place additional demand on an already undersized system.

To provide capacity, redundancy, and control over a range of current and projected air demands, as well as to meet NPDES permit limits, two of the existing aeration blowers are recommended to be replaced with high-speed turbo blowers, which are more compact, efficient, with VFD speed control, better suited to the task than the existing multistage centrifugal blowers.

Preliminary analyses indicate that two new 300-hp turbo blower units in a duty/standby configuration alongside the two existing 150-hp multistage centrifugal blowers have enough capacity to fulfill 2035 peak air demands. Under these peak conditions, one of the new turbo blowers can be run in parallel with the existing blowers to supply the airflow rate required for aeration, with the second new turbo blower ready on standby. For conditions with low air demand, the plant may continue to use the two existing multistage centrifugal blowers.

As shown in Table 7.11, the total estimated project cost to replace the WWTF's aeration blowers, along with necessary mechanical and electrical improvements, is $1.86 million.

Table 7.11 Aeration Blower Replacement Costs

Description	Cost[(1)]
Two 300-hp turbo blowers	$691,000
Equipment pads	$3,000
Air piping modifications	$15,000
Electrical, instrumentation, and controls upgrades	$228,000
Total Direct Cost	**$937,000**
Total Estimated Construction Cost	**$1,432,000**
Total Estimated Project Cost	**$1,861,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.3.4 UV Disinfection System

The WWTF's existing UV disinfection system is nearing the end of its useful life and, given this age, many of its replacement components are no longer manufactured. As the current system continues to age, repair and replacement parts will become increasingly difficult to procure even as the frequency of component failure likely increases.

To eliminate the risk of losing the plant's UV capacity permanently upon a non-replaceable component failing, the UV system is recommended to be replaced with more modern equipment designed specifically for wastewater and water reuse applications.

The following modifications to the existing UV channel and ancillary equipment are recommended to install a newer model system:

- Complete computational fluid dynamics (CFD) modeling to ensure appropriate and even velocity distribution for flow entering the first new UV bank.
- Replace the existing level control gate with a new unit to provide the deeper water level required by newer UV equipment.
- Demolish and replace the existing ramp up to the level control gate to suit the design requirements of the replacement equipment.
- Replace the four existing banks of UV lamps with three new banks.
- Replace the existing power distribution centers (PDC) with three new PDCs.
- Remove the four step-down transformers currently installed for the existing UV system.
- Cut a small trench in the channel floor for routing hydraulic hoses if required by the new UV system manufacturer.

As shown in Table 7.12, the estimated project cost to replace the existing UV system, including the temporary disinfection process, is approximately $1.15 million. To minimize the volume of bypass pumping and disinfection required, this work is recommended to be performed during an extended low flow period (e.g., dry weather season). A temporary disinfection process, such as a skid-mounted UV disinfection system, will be required while the UV channel is being modified.

Table 7.12 UV Disinfection System Replacement Costs

Description	Cost[(1)]
New UV Equipment	$340,000
Existing UV Channel Modifications	$65,000
Electrical, Instrumentation, and Controls Upgrades	$65,000
Temporary Disinfection	$110,000
Total Direct Cost	**$580,000**
Total Estimated Construction Cost	**$887,000**
Total Estimated Project Cost	**$1,153,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.3.5 Effluent Pump Station

The effluent pump station is a low-head pump station that is only required under elevated river conditions, which occur infrequently. Although the pump station is in good condition, its current firm capacity is insufficient by at least 1 mgd to handle the projected 2035 PHF. The process implications of exceeding the effluent pumps' capacity are catastrophic since flow cannot be removed from the effluent wet well quickly enough to avoid submerging the upstream processes.

To ensure that treated effluent is effectively conveyed out of the plant under 2035 PHF conditions with one pump out of service, the effluent pump station's capacity is recommended to be expanded by replacing the pumps with units capable of providing sufficient flow capacity for condition projected through 2035.

As shown in Table 7.13, the total project cost to replace the existing effluent pumps is estimated to be $1,275,000. The effluent pump station is recommended to be modified during a low river stage when the pumps are unlikely to be needed.

Table 7.13 Effluent Pump Replacement Costs

Description	Cost[1]
Three Centrifugal Pumps, 4,700 gpm at 21 feet TDH	$485,000
Structural and Mechanical Modifications	$11,000
Electrical, Instrumentation, and Controls Upgrades	$146,000
Total Direct Cost	**$642,000**
Total Estimated Construction Cost	**$981,000**
Total Estimated Project Cost	**$1,275,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.4 Solids Treatment

To resolve redundancy and condition-related deficiencies identified in the solids processes, modifications to the following areas are recommended.

7.3.4.1 Grit-Separation System

The WWTF's degritting room is filled with odorous air that likely contains significant levels of hydrogen sulfide, which corrodes the degritting equipment in the space; as evidence of this, the cyclones, classifier, gravity thickener, and turbo pumping systems (TPS) pumps all exhibit conditions that indicate a corrosive atmosphere and signify the end of their useful life, requiring extensive rehabilitation or replacement.

In addition to increasing the number of air changes in the degritting room and implementing air treatment using biofilters, the entire grit separation system is recommended to be replaced. As shown in Table 7.14 the total project cost to replace the existing grit separation system is estimated to be $954,000. This project is recommended to be implemented within the next five to 10 years, though replacement may be required sooner if the existing equipment's condition continues to deteriorate.

Table 7.14 Grit-Separation Improvement Costs

Description	Cost(1)
Demolition	$20,000
New Degritting Equipment	$294,000
Piping Modifications	$9,000
Electrical, Instrumentation, and Controls Upgrades	$157,000
Total Direct Cost	**$480,000**
Total Estimated Construction Cost	**$734,000**
Total Estimated Project Cost	**$954,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.4.2 Thickened Primary Sludge Pumps

As with the rest of the equipment in the degritting room, the two existing, 130-gpm, progressive cavity TPS pumps have also been corroded by high levels of hydrogen sulfide and are nearing the end of their useful life. Furthermore, these pumps are oversized for the City's sludge flow and concentrations which unnecessarily increases maintenance costs. As such, the existing units are recommended for replacement with new, appropriately sized, 70-gpm progressive cavity units.

As shown in Table 7.15, the projected cost to replace the two existing TPS pumps is $154,000. The priority and timing for this replacement depend on the availability of replacement parts as well as the integrity of the pumps' non-replaceable parts.

Table 7.15 Thickened Primary Sludge Pump Replacement Cost

Description	Cost(1)
Demolition of Existing Pumps	$10,000
Two New 70-gpm Progressing Cavity Pumps	$43,000
Piping Modifications	$6,000
Electrical, Instrumentation, and Controls Upgrades	$19,000
Total Direct Cost	$78,000
Total Estimated Construction Cost	**$119,000**
Total Estimated Project Cost	**$154,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.4.3 Sludge Recirculation Pumps

The plant's rotary-lobe-style sludge recirculation pumps have historically had significant issues with microplastics infiltrating the pump shaft seal and damaging the overall unit. Despite replacements and corrections by the manufacturer, the frequency and severity of the maintenance issues have not improved.

Given that the solids content in the WWTF's digester ranges from 1.9 to 5.6 percent, a heavy-duty piston-style pump is recommended to replace the existing pumps. This new unit's shaft seal is located on top of the disk instead of underneath, which eliminates the leaking issue that piston-style pumps often have. And, because the seal has no gaps like a traditional mechanical seal might, infiltration of round microplastics is not anticipated to be an issue. While the seal must be replaced when it wears, the wear parts on this type of pump are anticipated to last three to four times longer than they might on progressive cavity or rotary-lobe pumps.

As shown in Table 7.16, the projected cost to replace the three existing rotary-lobe pumps with three double-disc piston-style pumps is $509,000. This project may be implemented at any time when the budget becomes available, and, to minimize risk, may be piloted to determine its application suitability.

Table 7.16 Sludge Recirculation Pump Replacement Cost

Description	Cost(1)
Demolition	$20,000
Three Double-Disc Piston Pumps: 200 gpm, 54 feet TDH	$144,000
Piping Modifications	$24,000
Electrical, Instrumentation, and Controls Upgrades	$68,000
Total Direct Cost	**$256,000**
Total Estimated Construction Cost	**$391,000**
Total Estimated Project Cost	**$509,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.4.4 Rotary Drum Thickener

After 10 years of operation, the plant's rotary drum thickener is showing significant signs of wear. Although the City recently added a new manufacturer-designed stabilization wheel that may allow this existing unit to continue operating, it remains a single point of failure without an operational plan in place to accommodate such a failure.

For full redundancy, a new thickening building capable of housing two RDTs and associated support equipment is required; however, the City's budgetary and site constraints do not currently allow for this construction to take place. Therefore, the City is recommended to continue monitoring and carefully implementing their current protocol for when the RDT is unavailable and proceed with other improvements to the WWTF's unit processes.

The City's current RDT protocol relies on use of the WAS storage tank when the RDT must be taken offline for maintenance. Process modeling of the WWTF indicates that the WAS-wasting rate, which has historically averaged approximately 37,000 gallons per day (gpd), may exceed 100,000 gpd under 2035 MM conditions. This means that, with the RDT offline, the current tank's capacity will be exceeded within one and a half days. Given these projections, planned maintenance activities must be scheduled during demand seasons when the WAS-wasting rate is low, and the RDT operation schedule must be extended during high demand periods to keep the WAS storage tank's levels as low as feasible.

Once the storage tank has reached its maximum capacity, excess WAS is directed to the gravity thickener to be co-thickened with primary sludge. However, this temporary operation affects performance in the following ways:

- Percent capture and thickened sludge concentrations are considerably reduced compared to what would be observed under normal operations.
- Hydraulic loading to the digesters is increased, resulting in a reduction of hydraulic residence time below the recommended 15 days when co-thickening.

While co-thickening's effects may be less severe at lower flows and loads, the temporary operation will not provide reliable thickening relief beyond one to two days at peak flows such as those projected under the 2035 MMF scenario.

With this being said, implementing the recommended improvements to the ABs will allow the secondary treatment process to be operated at a significantly lower MLSS, reducing the risk of settling failure in SC Nos. 2 and 3 and allowing SC No. 1 to be used for additional WAS storage during an emergency. In its current configuration, SC No. 1 can provide nearly 430,000 gallons of storage, which is equivalent to four days of continuous wasting under the 2035 MMF scenario. Note that using this SC for emergency storage will require connections and temporary piping routed from the control building No. 1 for SC Nos. 2's and 3's WAS pump.

7.3.4.5 Dewatering Centrifuge

The plant's existing DS-403 Sharple dewatering centrifuge is over 20 years old and, thus, exhibiting signs of being at the end of its useful life. In 2021 the City purchased a second, refurbished DS-403 Sharple centrifuge to provide dewatering redundancy. In the near term the centrifuge will act as a spare unit should an emergency replacement be required. The City is currently developing plans to modify the dewatering room and install the stand-by centrifuge, which will include the following modifications:

- Install a redundant centrifuge.
- Upsize the centrate piping to reduce any hydraulic restrictions.
- Increase the number of air changes per hour in the room.
- Clean out the existing odor-control piping connected to the centrate chute to confirm that nothing is blocking the ventilation of the centrifuge.

Table 7.17 shows costs for the modifications needed to install the redundant centrifuge in the existing building.

Table 7.17 Dewatering Centrifuge Improvement Costs

Description	Cost[(1)]
Existing Centrifuge Overhaul	$106,000
Piping and Mechanical Modifications	$39,000
Electrical, Instrumentation, and Controls Upgrades	$168,000
Total Direct Cost	**$313,000**
Total Estimated Construction Cost	**$479,000**
Total Estimated Project Cost	**$622,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.4.6 Biosolids Belt Dryer

As mentioned earlier, the biosolids belt dryer was not analyzed or assessed in detail, per the City's direction. However, the condition and capacity of the biosolids dryer are recommended for evaluation within the next five years.

7.3.5 Plant Support Systems

To accommodate future flows and provide reliable operation, modifications are recommended in the following plant support systems.

7.3.5.1 PLC, RIO, and SCADA

The City WWTF's control system includes a mixture of owner PLC systems and vendor PLC systems, which communicate to a central SCADA system that monitors and controls the entire plant. The existing PLC hardware utilizes the Modicon Quantum PLC platform, which includes remote input/output (RIO) racks. Meanwhile, data transfer utilizes older Data Highway Plus (DH+) serial communications.

The existing Modicon Quantum PLCs are outdated and no longer commercially available through the manufacturer. Since the failure of an existing module without a spare in stock could suspend automated control of a portion of the facility, the continued use of this PLC platform poses a significant operational risk.

In addition, the plant's existing Wonderware SCADA application is installed on a single computer server without redundancy, meaning this computer represents a single point of failure. If the computer fails for any reason or Wonderware is corrupted, the WWTF can no longer be governed via the control room. In a worst-case scenario, operators will be required to run all equipment manually from the field until the SCADA system is brought back online.

To minimize risks and employ up-to-date technologies, the WWTF's existing PLC network and SCADA system are recommended to be upgraded.

The following PLCs require replacement:

- Control building 1, PLC E, 1 rack.
- Control building 2, PLC E, 1 rack.
- UV building, PLC D1, 1 rack.
- UV building, UV panel, 1 rack.
- Equipment building, PLC C1, 1 rack.
- Digester building, PLC F, 3 rack.
- Main influent pump station, 1 rack.

Additionally, the following remote input/output cabinets require replacement:

- UV building, PLC D1, 2 RIO.
- Equipment building, PLC C1, 4 RIO.

These units are recommended to be replaced by modern equivalents on a standardized communication protocol, which will allow for a sequenced conversion process. Note that any changes made to the PLC programs by other facility equipment upgrades or changes in operational sequences will increase replacement costs since more PLC programming time will be required.

Meanwhile, the SCADA system must be upgraded and expanded to incorporate a level of redundancy. To develop a modern system with desired features, including advanced data analysis, report generation, and secure remote accessibility, the following upgrades are recommended:

- Replace the existing SCADA server with matching redundant SCADA servers.
- Upgrade the SCADA human-machine interface (HMI) application to a redundant configuration.
- Upgrade or add a SCADA historian application.
- Add a SCADA reporting application.
- Harden the system for improved remote access security by upgrading the network switch with a demilitarized zone (DMZ).
- Rebuild HMI graphics to take advantage of increased system functionality, correct existing errors with data collection and display, and provide robust communications with the upgraded PLC hardware.
- Integrate the existing Hach WIMS data with the SCADA historian and reporting applications.

In addition, the City is recommended to develop a comprehensive and living SCADA master plan that identifies and prioritizes system improvements at the WWTF as well as the City's 27 remote sites, including lift stations, pump stations, and tanks. At this time, controls at these sites are a mix of older hard-wired controls and some PLC control, with hard-wired being the norm; as such, all of the City's remote sites are recommended to be converted to PLC-based controls that utilize a standard format control panel design with radio telemetry communications to the WWTF.

Upgrades to improve the telemetry system are recommended for Lacamas Shores, Sunningdale Gardens, and Winchester Hills 2 in the near term, given that these sites' run-time data all showed risks of capacity deficiencies; the addition of flow meters and pressure sensors is recommended to better understand these stations' capacities or lack thereof. Updates to the other 22 sites are recommended in the long term as the City's budget allows.

Table 7. 18 represents a budgetary cost estimate to implement the proposed upgrades to the City's SCADA, PLC, and RIO systems.

Table 7.18 Camas WWTF Control System Upgrade Cost

Description	Total Estimated Project Cost(1)
SCADA Master Plan	$210,000
SCADA System Upgrade	$644,000
PLC Hardware Upgrade (Nine Cabinets)	$1,295,000
RIO Hardware Upgrade (Six Cabinets)	$650,000

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.5.2 Plant Drain Pump Station No. 1

Plant drain pump station No. 1 shows signs of concrete corrosion, and its pumps are nearing the end of their useful life. In addition to these condition-related issues, this station is already required to operate at its total installed hydraulic capacity for extended periods under current conditions and is unlikely to reliably accommodate future recycle flows and loads.

As such, plant drain pump station No. 1 is recommended to be rehabilitated through the following improvements:

- Replace the existing pumps with a new set of submersible pumps, each capable of pumping 500 gpm. The existing motor starter may be reused and connected to the new pumps.
- Install a liner in the existing wet well to extend the life of the existing structure.
- Replace the control panel, pump guide rails, and discharge piping within the wet well.

As shown in Table 7.19, the projected cost to replace plant drain pump station No. 1's pumps and accessories is $517,000.

Table 7.19 Plant Drain Pump Station No. 1 Replacement Cost

Description	Cost[(1)]
Demolition and Temporary Pumping	$42,000
Wet Well Liner	$95,000
Plant Drain Pumps and Piping	$60,000
Electrical, Instrumentation, and Controls Upgrades	$63,000
Total Direct Cost	**$260,000**
Total Estimated Construction Cost	**$398,000**
Total Estimated Project Cost	**$517,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.3.5.3 Non-Potable Pump No. 3

The non-potable water pump station's three pumps are in reasonably good condition. However, non-potable water pump No. 3 is not currently usable since its intake is located below the UV channel's discharge weir due to air entrainment caused by cascading water and prevents the unit from properly priming, which also causes it to fail.

To mitigate this issue, this pump is recommended to be relocated within the wet well but out of the direct flow path of the weir. While modifications to the pump column are not necessary, a new hole must be cut in the elevated slab over the non-potable pump station's wet well. The total estimated project cost to relocate non-potable water pump No. 3 is approximately $43,000.

Because air entrainment is a persistent issue, any future improvements to the UV system must be made with consideration for the location of these pumps. If a second parallel UV channel must be installed at some point, the entire non-potable water pump station must be modified or most likely relocated to sit within the effluent pump station, and the pumps must be relocated close to the existing UV equipment, which may potentially complicate access to the effluent pump station's electrical room and back-up generator.

7.3.5.4 Odor Control and Treatment

Located in the WWTF's equipment building, the centrifuge room and primary sludge degritting room share a combined odor-control system. Because these rooms lack sufficient airflow, both experience persisting odor issues and corrosion of the assets contained within.

The current centrifuge room exhausts air at a rate of 700 cubic feet per minute (cfm), accounting for approximately 3.5 air changes per hour (ACH). The room also has point-source odor control, which pulls 500 cfm of air from various equipment, accounting for approximately 2.5 ACH. Combined, the room exhausts six ACH.

To improve odor control, the ducting is recommended to be balanced to exhaust 1200 cfm from the overall centrifuge room, 400 cfm from the cake conveyor, and 100 cfm from each centrifuge. This solution will provide the room with 6 ACH, in addition to a more robust point-source connection to prevent odorous air from escaping the centrifuge, for a total of 8.5 ACH. To supply the space with the proper amount of intake air, this alternative requires the installation of a second intake louver on the west wall.

Meanwhile, the primary-sludge-degritting room exhausts 700 cfm of air, accounting for approximately 6.3 ACH. Increasing the exhaust airflow to 1350 cfm is recommended. Furthermore, the three duct drops on the west wall must be balanced to pull 250 cfm each, and the drops above the storage containers must be balanced to pull 300 cfm each. Together, these modifications will provide the space with a total of 12.2 ACH. Similar to that of the centrifuge room, this solution requires a second intake louver to be installed on the east or south wall to supply the proper amount of intake air into the space.

The improvements recommended for both rooms require the shared odor-control fan to exhaust 4850 cfm in total. The current fan only exhausts 3600 cfm. If the fan does not have sufficient capacity to provide the required increase in airflow, a new odor-control fan must be installed in the same location as the existing unit.

Table 7.20 shows the estimated costs associated with the odor-control improvements, including a new fan. Note that this improvement plan's increased airflow will reduce contact time with the biofilter, thus reducing some of the filter's effectiveness and the quality of the air passing through and leaving it. Therefore, the frequency at which media should be replaced will be modestly increased.

Table 7.20 Odor Control Improvement Costs

Description	Cost[(1)]
Additional Ducting and Louvers	$6,000
New Exhaust Fan Capable Of Exhausting 4,850 cfm	$21,000
Testing and Balancing	$1,000
Total Direct Cost	**$28,000**
Total Estimated Construction Cost	**$42,000**
Total Estimated Project Cost	**$55,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.4 Recommended WWTF Improvement Projects

The improvements recommended to address WWTF capacity limitations over the next 20 years and address current condition issues that prohibit reliability or performance are summarized in this section. The recommended alternatives presented in Section 7.3 were re-organized and, in some cases, grouped together to suggest construction sequencing and project timing the City should consider when implementing these improvements.

The following 14 distinct projects were developed for incorporation into the City's general sewer system plan CIP:

- **TP-1 Aeration Basin Improvements:** This project improves the ABs' performance by making the following modifications:
  - Install new aeration diffusers and associated zone controls in each AB's final anoxic zone to create a new aerated swing zone.
  - Demolish the marine plywood baffle walls at the upstream end of the ABs.
  - Repair and relevel the concrete baffle walls dividing each zone in each AB.
- **TP-2 Secondary Clarifier Improvements:** This project enhances the SCs' performance and capacity by making the following modifications:
  - Demolish SC No. 1 and replace it with a new clarifier that matches SC No. 3's design including RAS pumping capacity.
  - Replace SC No. 2's RAS pumps to provide a firm capacity that matches those of SC No. 3.
- **TP-3 Aeration Blower Replacement:** This project replaces two of the existing aeration blowers with larger high-speed turbo blowers to meet projected aeration demands.
- **TP-4 Disinfection Building and Hydraulic Improvements:** This project enhances plant hydraulics and modifies the disinfection building with the following improvements:
  - Replace the existing UV disinfection equipment and provide a temporary UV skid to bypass the existing channel.
  - Modify the filter bypass so it does not limit the plant's hydraulic capacity.
  - Reconfigure the non-potable water pump station to prevent air entrainment in the pump suction.
  - Redirect the headworks channel inlet pipe to improve flow measurements and prevent splashing of raw sewage out of the top of the structure.
- **TP-5 Effluent Pump Station Improvements:** This project increases the effluent pump station's capacity, as required, to pump 100 percent of 2035's projected PHFs to the outfall in the Columbia River by replacing the existing effluent pumps with larger units.
- **TP-6 Grit-Separation and Odor-Control Improvements:** This project replaces the existing grit-separation equipment, including hydrocyclones and grit classifiers, and increases the capacity of the odor control systems servicing the grit-handling area and dewatering building, which will extend the life and reduce maintenance of new installed equipment.
- **TP-7 Thickened Primary Sludge Pump Replacement:** This replaces the existing TPS pumps with new progressive cavity pumps.
- **TP-8 Sludge Recirculation Pump Replacement:** This project replaces the existing digested sludge pumps with new double-disc piston-style pumps.

- **TP-9 Mechanical Dewatering Improvements:** This project rehabilitates the existing dewatering centrifuge and modifies the space to accommodate a standby unit for redundancy.
- **TP-10 Plant Drain Pump Station Improvements:** This project repairs the existing plant drain pump station No. 1's structure and replaces its pumps.
- **TP-11 SCADA Master Plan:** This project prepares a SCADA master plan that will provide the City with a roadmap to prioritize and implement planned system upgrades designed to address system deficiencies and enhance facility operation. This project includes an in-depth investigation of the existing SCADA control system for the City's WWTF and associated remote sites.
- **TP-12 SCADA Improvements:** This project upgrades the existing SCADA system to provide redundancy and take advantage of modern features, including advanced data analysis, report generation, and secure remote accessibility.
- **TP-13 PLC and RIO Cabinet Improvements:** This project includes replaces existing Modicon Quantum hardware with new, standardized PLCs and RIO cabinets for all process areas at the WWTF.
- **TP-14 Secondary Treatment Expansion Planning Project:** This project plans for a future secondary treatment expansion to accommodate flows and loads outside the planning windows.

7.4.1 Cost Summary of the Improvement Projects

Table 7.21 summarizes the total project cost for each improvement project. Costs are rendered in 2021 dollars and include all construction, engineering, legal, and administrative markups.

Table 7.21 Recommended WWTF Project Costs

Project ID	Improvement Type	Total Project Cost[(1)]
TP-1 Aeration Basin Improvements	Capacity	$376,000
TP-2 Secondary Clarifier Improvements	Capacity/Condition	$5,539,000
TP-3 Aeration Blower Replacement	Capacity	$1,862,000
TP-4 Disinfection Building and Hydraulic Improvements	Condition/Capacity	$1,252,000
TP-5 Effluent Pump Station Improvements	Capacity	$1,276,000
TP-6 Grit Separation and Odor Control Improvements	Condition	$1,010,000
TP-7 TPS Pump Replacement	Condition	$154,000
TP-8 Sludge Recirculation Pump Replacement	Condition	$509,000
TP-9 Mechanical Dewatering Improvements	Condition	$622,000
TP-10 Plant Drain PS Improvements	Capacity/Condition	$517,000
TP-11 SCADA Master Plan	Planning	$209,000
TP-12 SCADA Improvements	Network	$645,000
TP-13 PLC and RIO Cabinet Improvements	Network	$1,946,000
TP-14 Secondary Treatment Expansion Planning	Planning	$75,000
WWTF Recommended Improvements Total	**–**	**$15,992,000**

Notes:
(1) All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021).

7.4.2 Implementation Timing for the Improvement Projects

Implementation timing for the 14 projects was considered in the context of the following factors:

- **Each project's high or low criticality to the WWTF's operation:** Criticality to the process was higher for processes that are essential for liquid treatment and less so for solid treatment processes.
- **The risk of failure associated with the equipment being addressed by a project:** Risk of failure was high or low depending on the age of the equipment, availability of replacement parts from manufacturers, and installed redundancy.

Table 7.22 lists the projects, possible sequencing, start years for design and planning, possible years of implementation for capacity reasons (if applicable), and brief explanations of project prioritization rationale. It is suggested that the City closely track key factors, including growth within service area, useful life, and condition of plant components, to allow for optimal timing and phasing of improvements. Proper timing and phasing of projects will prevent the City from incurring unnecessary construction, operation, and maintenance costs to increase capacity before it is needed to serve users.

Table 7.22 Recommended WWTF Project Implementation Schedule

Project ID	Recommended Start Year	Year Required Online	Reason for Prioritization
TP-1 Aeration Basin Improvements	2026	2030	Improve capacity before TP-2.
TP-2 Secondary Clarifier Improvements	2027	2030	Meet capacity only.
TP-3 Aeration Blower Replacement	2028	2032	Meet capacity only.
TP-4 Disinfection Building and Hydraulic Improvements	2021	2026	Address aging equipment whose parts are unavailable from manufacturers.
TP-5 Effluent Pump Station Improvements	2026	2029	Meet capacity only.
TP-6 Grit Separation and Odor Control Improvements	2023	2027-2032	Eliminate ongoing corrosion in the building and improve workspaces.
TP-7 TPS Pump Replacement	2032	N/A	Anticipated end of useful life.
TP-8 Sludge Recirculation Pump Replacement	2032	N/A	Anticipated end of useful life.
TP-9 Mechanical Dewatering Improvements	2024	N/A	Create redundancy.
TP-10 Plant Drain Pump Station Improvements	2021	2021	Address immediate capacity needs and corrosion issues.
TP-11 SCADA Master Plan	2022	N/A	Update out-of-date software.
TP-12 SCADA Improvements	2023	N/A	Update out-of-date software.
TP-13 PLC and RIO Cabinet Improvements	2023	N/A	Update out-of-date software.
TP-14 Secondary Treatment Expansion Planning	2031	N/A	Secondary treatment inadequate by 2036.

Chapter 8

OPERATION AND MAINTENANCE

8.1 Introduction

This chapter provides an overview of the City of Camas (City) Wastewater Utility organization, staffing, and operation and maintenance (O&M) program. This chapter documents existing practices and identifies changes that may improve system operation and maintenance.

8.2 Organization Structure

The City Public Works Department is organized as shown in Figure 8.1 and is managed by Steve Wall. The Utility group is managed by Rob Charles. There are various groups relevant to this General Sewer Plan (Plan) including the wastewater treatment facility (WWTF), and a combined group with responsibilities pertaining to sewer and water disciplines. The WWTF is supervised by Bob Busch.

Note, Stormwater and Sewer/Water groups assist each other during abnormal conditions, such as cleanup after a major storm or repairs requiring specialized staff and equipment.

The Capital Engineering group managed by James Carothers leads major wastewater capital projects, such as new lift stations. The Utility group leads lift station retrofits, "repair & replacement" projects, and operations and maintenance projects.

8.3 Staffing

8.3.1 Maintenance and Operations Staff

The City combines staff for water and sewer disciplines. Therefore, staff under this branch will work on both water and sewer mains including the septic tank effluent (STE) systems. They are also in charge of making sewer system repairs. Operational staff work full shifts on weekdays and there is always at least one person on duty during the day on weekends. There is always at least one person on call in the evenings to address emergencies.

No additional positions are sought although as of March 2022, there are three vacant water/sewer staff positions the City is seeking to fill.

8.3.2 Wastewater Utility Engineering Staff

WWTF staff work primarily on the treatment plant and are also in charge of the sewer lift stations in the conveyance system. The City's WWTF National Pollutant Discharge Elimination System (NPDES) permit requires a Washington Wastewater Treatment Facility Operator (WWTFO) Class IV certified operator to be responsible for the plant at all times. Table 8.1 lists WWTF staff certifications. The City has two Class IV operators in the case that one is unavailable. The NPDES permit does not require anyone other than the responsible operator(s) to hold a certification, but the City requires all operators to have a Class I certification or have the ability to acquire one within six months of employment.

Table 8.1 Wastewater Utility Operator Certifications

Name	Position	Certification
Bob Busch	WWTF Supervisor	WWTFO Class IV
William Blake	WWTF Operator Lead	WWTFO Class IV
Ole Helland	WWTF Operator	WWTFO Class II
Ken Murray	WWTF Operator	WWTFO Class I
Steve Carroll	WWTF Operator	WWTFO Class I
Joe Calderone	WWTF Operator	WWTFO Class I
Matt Golphenee	WWTF Operator	WWTFO Class II
Jacob Taylor	WWTF Operator	WWTFO Class II

8.4 Records

For O&M record keeping, the WWTF uses a Computerized Maintenance Management System (CMMS), data-tracking Excel spreadsheets, handwritten logbooks, and an electronic repository of equipment documentation. The WWTF staff have a "WWTF" shared drive at the plant, which is a reference library of construction documents, O&M documentation for individual equipment, training materials, etc.

Septic tank effluent pump (STEP) systems are tracked in a separate management system involving record keeping, both on paper and on a tablet. The City currently uses IAUDIT on iPads to document work and plans to move to the same software as the WWTF in the future to better track current activities. The implementation plan is to add new activities to the software as it comes up.

City staff and third-party customer service representatives receive utility-related calls made by system users, and information is dispatched to the appropriate utility staff.

8.5 Current Operation and Maintenance Program

8.5.1 Maintenance

8.5.1.1 Lift Station Inspection and Maintenance

Lift station inspection and maintenance is completed by City WWTF Operators listed in Table 8.1.

For all lift stations, pump run hours are closely tracked to identify potential issues. Additionally, periodic maintenance is completed. Table 8.2 presents each activity and frequency staff completes for the sewer lift stations.

Table 8.2 Summary of WWTF Sewer Lift Station Maintenance

Frequency	Component	Activity
Daily	SCADA	• Review lift station alarm history. Check pump/level/pressure/flow trend charts.
	Record Keeping	• Update pump runtime tracking spreadsheets. Review updated sheets for anomalies. Submit requests for any necessary maintenance via CMMS.
Weekly	Controller	• Check for active alarms. Verify pumps, level indicator, and other controller-monitored equipment is operating normally in "AUTO". Document pump run hours. Verify no tripped breakers.
	Pumps	• Run pumps in hand to verify proper operation. Inspect for unusual sounds, vibration, or leaks.
	Genset	• Check ATS status and verify there are no faults and system is ready for emergency operation. Check generator fuel. Check generator for leaks or signs of mechanical failure. Check generator control paned for faults. Generator auto-exercises on Thursdays.
	Dry Well	• Verify dry well is dry. Verify sump pump or floor drain is functioning properly. When running pumps, verify check valves open/close. Verify force main pressure (static and pumping). Check for piping leaks.
	Wet Well	• Inspect influent flow, verifying it is not abnormally high or low, color, odor, etc. Inspect for excess debris or grease accumulation. If able, break up FOG and pump out. Verify level sensors are free of debris or obstructions, clean, as necessary.
	Odor Control System	• Verify proper operation and odor level. Inspect for unusual sounds, vibration, odor, and leaks.
	Surge Tank	• Verify proper operation, checking controller for any faults.
	Grounds	• Monitor physical appearance of station. Remove any accumulated trash or debris. Monitor and control vegetation. Monitor for odors emanating from station.
Quarterly	Pumps	• Perform draw down testing for each pump.
	Record Keeping	• Update pump tracking spreadsheet with draw down test results.
	Odor Control System	• Change out carbon media at Lacamas Meadows Lift Station. In depth check of biofilter systems.
Bi-Annually	Gas Sensors	• Calibrate lower explosive limit meters.
	Grounds	• Herbicide application, where necessary.
	Odor Control System	• Change out odor control media on carbon absorber units.
	Isolation Valves	• Exercise isolation valves at all lift stations to maintain operability.
Annually	Generator	• Third-party preventative maintenance.
	Pumps	• Pull pumps for visual inspection.
	Main Pump Station Pumps	• Third-party preventative maintenance.
	Piping	• Winterize any water piping.
	Odor Control System	• Winterize biofilters prior to freezing weather. Turn off odor control units that are not operated during winter months. Turn on odor control units that are operated during summer months.
	Wet Well	• Cleaning of any wet wells that have accumulated excessive FOG/floatables/debris.
Every 3 Years	Pumps	• Third-party pump inspections and testing.

Notes:
Abbreviations: ATS - automatic transfer switch; FOG - fats, oils, and grease; SCADA - Supervisory Control and Data Acquisition.

8.5.1.2 Pipeline Video Inspection

A closed-circuit television (CCTV) inspection of the gravity main by push camera was completed in 2013. For future inspections, the City will contract with CCTV inspection contractors on an as needed basis for their CCTV and manhole inspection programs. Inspections will be performed in accordance with all industry standards and best practices.

8.5.1.3 Manhole Inspection and Maintenance

The City inspects manholes on an as-needed basis and the manhole inspection program will be contracted out to a third party as well. The City may choose to implement their own standards for manhole inspections, rather than rely on the NASSCO standards.

8.5.1.4 Root Cutting

Root maintenance is completed as needed. It is anticipated that additional root cutting tasks may be identified through contracted video inspection on an as needed basis.

8.5.1.5 Grease Removal

The City educates customers on FOG as part of their general education program. It is anticipated that through video inspection, the City may identify pipes with heavy FOG. Initially, it is recommended the preventative maintenance activities involving FOG include outreach to local business or industries and or more frequent cleaning, especially if an area is persistently found to be impacted by FOG. If FOG is more widespread than currently thought, then the City may consider a FOG program.

8.5.1.6 Hydraulic Line Cleaning

Flushing is done every month for flat areas in the system. Where normal flushing is insufficient to address known problem areas, pipe jetting is completed either as preventative maintenance or on an as needed basis. The City would like to implement a comprehensive jetting program that may be completed by the City or will be contracted out to a third party.

8.5.1.7 Repair Sewers

Point repairs are conducted to address pipe deficiencies identified through CCTV inspection and are undertaken as required and as resources allow. Work may be completed by City staff or through a small works type contract.

8.5.1.8 STEP Maintenance

The City owns and maintains the STEP system. Currently, the City conducts solids pumping from about 600 STEP tanks annually through contractors. Additional it maintains the step tanks, pumps, and telemetry concurrently. The City has an active STEP tank education program with customers.

It is recommended to conduct a STEP tank condition assessment to identify repair and replacement needs including inspection of the STEP tank and connections to the STEP tank as well as an inspection of the proper function of the STEP tank. From this condition assessment, a STEP repair and replacement program should be developed and included in the City's Capital Improvement Program (CIP). Current STEP tank replacement costs are about $11,000 per STEP tank to be installed by a contractor.

8.5.2 Operations

The City operations group are generally divided into treatment, pump stations, and pipes.

The City operators at the WWTF conduct various activities, including: monitoring and adjusting treatment parameters, conducting water quality measurements and other related lab tests, and managing the City's Class A, Exceptional Quality Biosolids program.

The WWTF operators are also responsible to monitor the pump stations throughout the collection system. The treatment facility operators monitor the sanitary pump stations while the water/sewer staff monitor the septic tank effluent systems throughout the City.

City staff are responsible for pipe activities associated with operating the collection system, including repairing pipelines.

City staff also lead operations during emergencies or natural disasters. Emergency operations include preparing and planning for emergencies and conducting drills.

Individual staff duties and operations include administration tasks, training, and tool maintenance. Staff have their own administrative duties to complete weekly as well as meetings to attend in addition to their normal operator duties. They are also in charge of maintaining and cleaning their tools and equipment. The City values the importance of training staff; thus, staff will also allocate time annually to training and conferences as a means to further develop their skills.

8.6 Future Operation and Maintenance Needs

The WWTF plans to expand their internal maintenance capabilities while reducing dependency on third-party maintenance contracting. The WWTF is working to develop deeper pump, clarifier and instrumentation inspection and maintenance skills. The WWTF plans to constantly expand and improve their usage of the CMMS and its work ordering and tracking capabilities. Furthermore, the WWTF has an ongoing effort to develop an extensive set of Standard Operating Procedures for common operations, maintenance, safety, and administrative tasks.

As stated above, the City will contract with CCTV inspection contractors to complete video inspection in the collection system. It is recommended to develop a hydraulic line cleaning program while completing the video inspection. The hydraulic line cleaning program can be completed by the City or third-party contractors. With this inspection and cleaning program, it is expected that other repair needs will be identified for roots, FOG, and point repairs.

Currently the City's staffing focus is to fill the current vacant water/sewer supervisor and staff positions. In the future, to aid in the development of non-capital utility projects the City wants to add a staff civil engineer and an electrician to the utility team.

Chapter 9

CAPITAL IMPROVEMENT PLAN

9.1 Introduction

This chapter summarizes the Capital Improvement Plan (CIP) for the City of Camas (City) General Sewer Plan (Plan). The CIP includes projects needed to accommodate growth, repair and replace aged infrastructure, and attain level of service goals. The CIP is arranged in terms of short-term (2022-2031) and long term (2032-2041) periods. Projects are grouped into pipeline, pump station, septic tank effluent pump (STEP), inflow and infiltration (I/I), maintenance, treatment plant, and general types of infrastructure work. The CIP consists of the cost estimates and schedules for the recommended improvements.

The following sections present cost estimating assumptions, recommended projects, estimated costs for each project, and a summary of the CIP.

9.2 Cost Estimating Assumptions

Cost estimates were developed for each of the recommended projects in the CIP for budgeting purposes. The CIP costs are planning level estimates only and should be refined during pre-design of the projects as final costs of a project with depend on actual labor and materials costs, competitive market conditions, final project scope, implementation schedule, and other variable factors. The CIP cost estimate should be periodically reevaluated to account for changes in inflation.

All costs are in 2021 dollars and are benchmarked to an Engineering News Report (ENR) Construction Cost Index 20-city average of 12112 (June 2021). Cost estimates were developed using a Class 4 budget estimate, as established by the American Associate of Cost Estimators (AACE). This level of estimate is used for feasibility studies and assumes a one percent to 15 percent level of project definition. The expected accuracy range is of the Class 4 cost estimates are -30 percent to +50 percent.

9.2.1 Conveyance Cost Assumption

This section provides the CIP for pipelines, lift stations, and STEPs. Cost estimates for conveyance infrastructure represent total project cost including materials, construction, engineering, legal, and administrative costs. Costs were represented as unit costs, as described in subsequent sections. Costs are based on costs provided by the City or similar projects completed by Carollo Engineers. The following are the total marks-ups to direct costs: 30 percent for construction management contingency, 30 percent for engineering, legal, and design costs, and 10 percent for administration contingency.

9.2.1.1 Total Conveyance Project Capital Improvement Cost

The costs presented in this Plan are high-level planning costs to help the City in making financial decisions.

As shown in the following sample calculation of the conveyance projects capital improvement cost, the total cost of all project contingencies (construction and planning) and allied costs (engineering services, construction management, and project administration) is 82 percent of the baseline project cost.

Example:

Baseline Project Cost	**$1,000,000**
Construction Management Contingency (30%)	$300,000
Construction Cost	**$1,300,000**
Engineering, Legal, Design (30%)	$390,000
Administration (10%)	$130,000
Total Capital Improvement Cost	**$1,820,000**

9.2.1.2 Pipeline Unit Costs

For pipes, baseline project costs are calculated by multiplying the estimated new pipe length by a proposed unit cost. All of the known pipelines involved in this CIP are between eight-inches and 27-inches. Pipeline unit costs are available in Table 9.1; broken down by pipeline diameter and depth of installation. These unit costs were used to estimate the total cost of replacement. The unit costs assume open-trench construction in improved areas. Costs include pavement cutting, excavation, hauling, shoring, pipe materials and installation, backfill material and installation, and pavement replacement.

Table 9.1 Pipeline Construction Unit Costs

Pipeline Diameter (inches)	Cost per LF (10+ feet deep)	Cost per LF (5 feet deep)
8	$330	$223
10	$341	$233
12	$351	$243
15	$372	$266
18	$383	$277
21	$388	$282
24	$397	$287
27	$404	$298

Notes:
Abbreviations: LF - linear feet.

9.2.1.3 Pump Station Unit Costs

Pump station unit costs were based on costs to similar projects Carollo Engineers has completed in the past. There are unit costs for pump station upgrades and telemetry. Pump station upgrades include repair and replacement to the station itself and force main cleaning. Pump station telemetry includes upgrading or updating the SCADA system at the pump stations.

9.2.1.4 STEP Unit Costs

Since there was no data for the STEP systems, STEP CIP projects are targeted to assess the conditions of the STEP system to determine future maintenance and repair and replacement projects. STEP main conditioning assessment and cleaning, and STEP system lift stations SCADA were based on similar projects Carollo Engineers have completed for other cities in the past.

9.2.2 Treatment Cost Assumptions

Cost estimates for treatment projects include 30 percent for construction contingency, 1.3 percent for builder's risk and insurance, 15 percent for general contractor overhead, risk, and profit, and one percent for performance and payment bond for a total overall construction adjustment factor of 53 percent. Planning adjustment mark-ups include 25 percent for engineering, legal, and design and 5 percent for owner's reserve for change orders for a total overall planning adjustment factor of 30 percent.

9.2.2.1 Total Treatment Project Capital Improvement Cost

The costs presented in this Plan are high-level planning costs to help the City in making financial decisions.

As shown in the following sample calculation of the capital improvement cost, the total cost of all project contingencies (construction and planning) and allied costs (engineering services, construction management, and project administration) is 82 percent of the baseline project cost.

Example:

Baseline Project Cost	**$1,000,000**
Overall Construction Adjustment Factor (53%)	$530,000
Construction Cost	**$1,530,000**
Engineering, Legal, Design (25%)	$382,500
Owner's Reserve (5%)	$76,500
Total Capital Improvement Cost	**$1,989,000**

9.3 Capital improvement Plan

As discussed, the CIPs are prioritized based on their urgency and risk to mitigate deficient systems. The timing for implementing these improvement projects is based on the affordability and urgency of the project. It is recommended that the City monitor growth and adjust project implementation accordingly.

9.3.1 Planning Periods

The following terms are used to define timing and prioritization into three planning periods:

- **Short-term (2022 - 2031).** Proposed facilities determined to be a high priority.
- **Long-term (2032 - 2041).** Proposed facilities determined to be a low priority or proposed facilities to service major growth areas to be developed in the long-term.

9.3.2 Project Types

Projects are categorized by type. These types include the following:

- "G" = Growth.
- "R&R" = Repair and Replacement.
- "LOS" = Level of Service.

Growth projects are focused on updating infrastructure to address the needs of expanding. Repair and replacement projects are focused on renewing or replacing infrastructure in poor condition. Level of Service projects are focused on upgrading infrastructure to address level of service concerns. The types aid the City in determining the appropriate funding sources.

9.3.3 Project and Program Naming

An individual Project Sheet was generated for each CIP project and includes project identifiers, description, costs, project type, and comments to aid in future implementation. Project are separated into the following categories:

- "P" = Pipeline.
- "PS" = Pump Station.
- "G" = General.
- "S" = STEP.
- "I&I" = Inflow and infiltration.
- "M" = Maintenance.
- "TP" = Treatment plant.

A summary of all CIP projects by facility type and project type is shown in Table 9.2. A summary of costs by project category and type is presented at the end of the chapter.

Table 9.2 Capital Improvement Plan Summary

City of Camas

Notes:
1. CIP Project Subtotal is project cost before contingency costs are added. CIP Project Cost = Estimated Construction Cost. Total CIP Project Cost = Estimated Construction Cost plus merkups for contingency, construction overhead (as applicable), engineering, and administration.
2. Part of existing City CIP Project.

9.4 Pump Station Projects

Pump stations in the CIP are all recommended to be upgraded to provide pump redundancy under existing conditions. These stations do not meet the required firm capacity. It is recommended that the City improve these pump stations redundancy and add a third redundant pump with the same capacity as the current pumps.

9.4.1 PS-01: South Prune Hills Pump Station

The South Prune Hills Pump Station captures flows from the Southwest portion of the system. Based on the modeled flows to the pump station wet well, and City draw down testing, the pump station receives more peak wet weather flow (PWWF) than its firm capacity during existing and buildout conditions. The stations firm capacity needs to convey more than double its current firm capacity from 449 gallons per minute (gpm) to 1,113 gpm. Extensive upgrades to the station are recommended in the short-term. The estimated cost is $510,000 in 2023.

9.4.2 PS-02: West Camas Pump Station Improvements

The West Camas Pump Station captures flows from the Southwest portion of the system and is just downstream of the south Prune Hills PS. Based on the modeled flows to the pump station wet well, and City draw down testing, the pump station receives more PWWF than its firm capacity during existing and buildout conditions. The stations firm capacity needs to convey more than double its current firm capacity from 579 gpm to 1,302 gpm. Extensive upgrades to the station are recommended in the short-term, but later than project PS-01, which currently restricts flow to the West Camas Pump Station. The estimated cost is $510,000 and is planned for 2026.

9.4.3 PS-03: Crown View Hill Pump Station

The Crown View Hill Pump Station captures flows from the Northern portion of the system. Based on the modeled flows to the pump station wet well, and City draw down testing, the pump station receives more PWWF than its firm capacity during existing and buildout conditions. The stations firm capacity needs to convey more than triple its current firm capacity from 148 gpm to 530 gpm. Extensive upgrades to the station are recommended in the short-term. The estimated cost is $510,000 and is planned for 2024.

9.4.4 PS-04: Main Pump Station Improvements

The Main Pump Station captures flows from the majority of the system, except Flow Monitoring Basin 8-1-1. This station is just upstream on the WWTP. Based on the modeled flows to the pump station wet well, and City draw down testing, the pump station receives more PWWF than its firm capacity during existing and buildout conditions. The stations firm capacity needs to convey more than its current firm capacity from 3,851 gpm to 5,682 gpm. Extensive upgrades to the station are recommended in the long-term, after upstream stations have been upgraded. The estimated cost is $510,000 and is planned for 2030.

9.4.5 PS-05: Upgrade Pump Station Telemetry

The telemetry and control system is how flow rates are measures and maintenance needs are updated. Supervisory control and data acquisition (SCADA) systems collect data from City lift stations, which can then be accessed by Civil Engineers and control sub consultant to help the City maintain the system. Upgrades to improve the telemetry system are recommended for

Lacamas Shores, Suningdale Gardens, and Winchester Hills 2 in the near term. These sites run time data all showed a risk of capacity deficiencies. The addition of flow meters and pressure sensors is recommended to better understand these stations capacity or lack thereof. Updates to the other 22 stations are recommended in the long-term. The near-term section of the project is planned for 2025 and the estimated cost is $1,747,000. The remainder of the project has an estimated cost of $12,813,000 and is planned for the long term.

9.5 STEP Projects

Since data was not available to evaluate the STEP system, improvement projects were not developed. However, CIP STEP projects include monitoring, modeling, and condition assessments to evaluate the STEP system in the future.

9.5.1 S-01: STEP Main Flows

Issues with treatment plant inflow monitoring restricted the ability to separate out STEP flows from Gravity System Flows. Recently, this issue was resolved, and future monitoring will allow a greater understanding of the STEP Main flows. If Oak and Main PSs are flow metered, the STEP system flow can be determined. A future study is recommended once sufficient historical data is available. The estimated cost is $229,000 and is planned for the long term.

9.5.2 S-02: STEP Main Modeling

The STEP system should be added to the collection system model in order to evaluate that portion of the system. Additional metering at pump stations further upstream would allow calibration of the STEP portion of the model. The addition of a manhole with a flow meter near Northwest (NW) Lake Rd and NW Lacamas Drive or NW Parker Street and NW Knapp Lane to aid in calibration should also be considered. Figure 6.24 shows the potential overview of a STEP main model and proposed monitoring locations to add to the STEP system, shown as green circles. Inflows are shown in red and black triangles. These are based on the Gray and Osborne 2010 General Sewer Plan Appendix F. These inflows give an overview of where additional monitoring could be available in order to divide up the system during STEP model calibration. The estimated cost is $96,000 and is planned for the long term.

9.5.3 S-03: STEP Main Condition Assessment and Cleaning

The addition of manholes to the STEP system would help investigation of the STEP mains condition and allow any partially obstructed portion of the STEP Main to be identified. A future investigation of debris, solids, and other obstruction is recommended in the sags in the system. The estimated cost is $821,000 and is planned for 2024.

9.6 Pipeline Projects

CIP pipeline projects were determined from the results of a skeletonized model evaluation. Most pipeline projects address level of service concerns and some are combined growth and level of service projects.

9.6.1 P-01: NW Fargo Street Upsize

Model surcharging and manhole flooding at manholes 3-1-26 and 3-1-25 revealed the need for upsizing. To alleviate surcharging 1,007 LF of pipe between manholes 3-1-26 to 3-1-22 should be upsized from 8- to 12-inch pipe, along NW Fargo Street between NW 23rd and NW 19th Avenue. This project is at a depth of approximately 10 feet. This estimated cost is $644,000 and is planned for 2023.

9.6.2 P-02: Division Street Upsize

Model surcharging and manhole flooding at manholes 3-1-11, 3-1-10, and 3-1-6 revealed the need for upsizing. To alleviate surcharging 2,043 LF of pipe between manholes 3-1-11 to 3-1-2 should be upsized from 8 to 12-inch pipe. This project is a gravity pipeline along Division Street between NW 18th and 11th Avenue, at an approximate depth of 10 feet. The estimated cost is $1,306,000 and is planned for 2023.

9.6.3 P-03: NW 6th Place West Upsize

Model surcharging and manhole flooding at manholes 10-1-8 revealed the need for upsizing. To alleviate surcharging 188 LF of pipe between manholes 10-1-11 to 10-1-10 should be upsized from 8 to 12-inch pipe and 616 LF of pipe between manholes 10-1-8 to 10-1-5 from 10 to 12-inch pipe. This project is a gravity pipeline along NW 6th Place, just upstream of the South Prune Hills Pump Station, at an approximate depth of 10-15 feet. The estimated cost is $514,000 and is planned for 2023.

9.6.4 P-04: NW 6th Place East Upsize

Model surcharging and manhole flooding at manholes 10-1-3 revealed the need for upsizing. To alleviate surcharging 188 LF of pipe between manhole 10-1-3 to the West Camas Pump Station wet well should be upsized from 10 to 12-inch pipe. This project is a gravity pipeline along NW 6th Place between South Prune Hills PS and West Camas PS, at an approximate depth of 5-10 feet. The estimated cost is $376,000 and is planned for 2023.

9.6.5 P-05: NW 6th Avenue West Upsize

Model surcharging and manhole flooding at manholes 1-1-9, 1-1-8, and 1-1-7 revealed the need for upsizing. To alleviate surcharging 311 LF of pipe between manholes 1-1-9 to 1-1-7 should be upsized from 12- to 15-inch pipe, and 1,340 LF of pipe between manholes 1-1-7 to 1-1-2 should be upsized from 12-inch to 18-inch. This project is a gravity pipeline along NW 6th Avenue, downstream of the West Camas PS and through Forest Home Park, at an approximate depth of five feet. The estimated cost is $825,000 and is planned for 2023.

9.6.6 P-06: NW 6th Avenue East Upsize

Model surcharging occurs between manholes 2-1-3 to 5-1-12, along NW 6th Avenue. To alleviate surcharging 817 LF of pipe between manholes 2-1-3 to 2-1-1 should be upsized from 12 to 18-inch pipe, and 401 LF of pipe between manholes 2-1-1 to 5-1-12 should be upsized from 12-inch to 21-inch. This project is a gravity pipeline along NW 6th Avenue, between NW 7th Avenue and Southeast (SE) Adams Street, at an approximate depth of five feet. The estimated cost is $617,000 and is planned for 2023.

9.6.7 P-07: Adams Street Upsize

Model surcharging occurs along SE 3rd Avenue, and flooding emerges at manholes 5-1-5 and 5-1-6 during buildout conditions. To alleviate surcharging 773 LF of pipe between manholes 5-1-10 to 5-1-12 and manholes 5-1-6 to 5-1-8 should be upsized from 21 to 24-inch pipe, and 925 LF of pipe between manholes 5-1-10 to 5-1-8 and manholes 5-1-6 to 5-1-2 should be upsized from 24-inch to 27-inch. This project is a gravity pipeline along Northeast (NE) and SE Adams Street between SE 3rd Avenue and NW 6th Avenue, at an approximate depth of 5-10 feet. The total estimated cost is $1,235,000 and is planned for $554,00 in 2027 and $681,000 in 2030.

9.6.8 P-08: NW 18th Loop Upsize

Model surcharging occurs along NW 18th Loop, during buildout conditions. To alleviate surcharging 609 LF of pipe between manholes 3-1-1 to 3-1-16 and manholes 3-1-13 to 3-1-13 should be upsized from 8 to 12-inch pipe. This project is a gravity pipeline along NW 18th Loop, at an approximate depth of 5-10 feet. The estimated cost is $389,000 and is planned for the long-term.

9.6.9 P-09: NE 15th Avenue Upsize

Model surcharging occurs along NE 15th Avenue, during buildout conditions. To alleviate surcharging 256 LF of pipe between manholes 4-1-2 to 4-2-1 should be upsized from 8 to 18-inch pipe. This project is a gravity pipeline along NE 15th Avenue between NE Garfield Street and NE Franklin Street, at an approximate depth of 10 feet. The estimated cost is $179,000 and is planned for the long-term.

9.7 Inflow and Infiltration Projects

9.7.1 I&I-01: Ongoing I&I Program

The City has an on-going I&I program which should continue and focus on high I&I areas from the modeling efforts. Further discussion is provided in Chapter 5.

9.8 Maintenance Projects

9.8.1 M-01: WWTP Repair and Replacement

Ongoing R&R is an item in the City's 2020 Sewer Capital Budget. No construction, E/L/D, or admin are applied, as the $2,000,000 cost is from the City's budget.

9.8.2 M-02: Pump Station Repair and Replacement

Ongoing R&R is an item in the City's 2020 Sewer Capital Budget. No construction, E/L/D, or admin are applied, as the $600,000 cost is from the City's budget. The cost is multiplied by a quantity of 20 for an estimated total cost of $12,000,000.

9.8.3 M-03: Sewer Main Repair and Replacement

Ongoing R&R is an item in the City's 2020 Sewer Capital Budget. No construction, E/L/D, or admin are applied, as the $150,000 cost is from the City's budget. The cost is multiplied by a quantity of 20 for an estimated total cost of $3,000,000.

9.8.4 M-04: STEP Tank Repair and Replacement

A STEP Tank R&R program is recommended to maintain the STEP collection system and prevent aging infrastructure and increases to infiltration in the system. This program will be a three-step process of assessment, repairs, and replacement. This should be performed for all tanks in the STEP system over the next 5 years. The estimated cost is $5,100,000 and is planned from 2023 to 2028.

9.9 Treatment Plant Projects

Treatment plant projects in the CIP occur at the Wastewater Treatment Plant (WWTP). The projects aim to mitigate capacity limitations over the next 20 years and address current condition issues that prohibit reliability or performance. Projects were grouped together to consider construction sequencing and project timing.

9.9.1 TP-01: Aeration Basin Improvements

This project includes general modifications to the aeration basin to improve performance, including the following:

- Demolition of the existing marine plywood baffle walls at the upstream end of the aeration basin.
- Installation of new aeration diffusers and associated zone controls in the final anoxic zone to create a new aerated swing zone.
- Repair and releveling of the concrete walls dividing each zone in each aeration basin.

The estimated cost is $376,000 and is planned for 2028.

9.9.2 TP-02: Secondary Clarifier Improvements

This project involves the replacement of two of the existing aeration blowers with larger high-speed turbo blowers to meet projected future aeration demands. The estimated cost is $5,539,000 and is planned for 2029.

9.9.3 TP-03: Aeration Blower Replacement

This project includes the demolition of the existing Secondary Clarifier No. 1 and replacement with a new clarifier matching the design of the existing Secondary Clarifier No. 3, as well as replacement of the existing Secondary Clarifier No. 2 RAS pumps to provide firm capacity matching that of Secondary Clarifier No. 3. The estimated cost is $1,862,000 and is planned for 2030.

9.9.4 TP-04: Disinfection Building / Hydraulic Improvements

This project includes modifications to the Disinfection Building and general hydraulic improvements, including the following:

- Replacing the existing UV disinfection equipment and providing temporary UV skid to bypass existing channel.
- Modifying the filter bypass so it does not limit the plant hydraulic capacity.
- Reconfiguring the NPW Pump Station to prevent air entrainment in pump suction.
- Redirecting the headworks channel inlet pipe to improve flow measurement and prevent splashing of raw sewage out of the top of the structure.

The estimated cost is $1,252,000 and is planned for 2023.

9.9.5 TP-05: Effluent Pump Station Improvements

This project involves increasing the capacity of the existing effluent pump station as required to pump 100 percent of projected 2035 peak hour flows to the outfall in the Columbia River. It assumes that this is accomplished by replacement of the existing effluent pumps with larger pumps. The estimated cost is $1,276,000 and is planned for 2028.

9.9.6 TP-06: Grit Separation / Odor Control Improvements

This project involves replacement of existing grit separation equipment, including hydrocyclones and grit classifiers, as well as increasing the capacity of the odor control systems servicing the grit handling area and the dewatering building. The estimated cost is $1,010,000 and is planned for 2025.

9.9.7 TP-07: TPS Pump Replacement

This project involves replacement of the existing thickened primary sludge pumps with new progressive cavity pumps. The estimated cost is $154,000 and is planned for the long-term.

9.9.8 TP-08: Sludge Recirculation Pump Replacement

This project involves replacement of the existing digested sludge pumps with new double disc piston-style pumps. The estimated cost is $509,000 and is planned for the long-term.

9.9.9 TP-09: Mechanical Dewatering Improvements

This project involves rehabilitation of the existing dewatering centrifuge and the addition of a second dewatering centrifuge for redundancy. The estimated cost is $1,648,000 and is planned for 2026.

9.9.10 TP-10: Plant Drain Pump Station No. 1 Improvements

This project involves repair of the existing Plant Drain Pump Station No. 1 structure and replacement of the existing pumps. The estimated cost is $517,000 and is planned for 2023.

9.9.11 TP-11: SCADA Master Plan

The SCADA master plan will provide the City with a road map to planned system upgrades designed to address system deficiencies and enhance facility operation. Development of the master plan will include an in-depth investigation of the existing SCADA control system for the City's wastewater treatment facility (WWTF) and the associated remote sites. The estimated cost is $209,000 and is planned for 2024.

9.9.12 TP-12: SCADA Improvements

Upgrades to the existing SCADA system to provide redundancy and take advantage of modern features including advanced data analysis, report generation, and secure remote accessibility. The estimated cost is $654,000 and is planned for 2025.

9.9.13 TP-13: PLC and RIO Improvements

This project includes replacement of the existing Modicon Quantum hardware with the Modicon M580 PLC and X80 I/O. The estimated cost is $1,946,000 and is planned for 2025.

9.9.14 TP-14: Secondary Treatment Expansion Planning

This project plans for a future secondary treatment expansion to accommodate flows and loads outside the planning windows. The estimated cost is $75,000 and is planned for the long-term.

9.10 General Projects

9.10.1 G-01: Gravity Collection System Model

The gravity collection system model is heavily skeletonized, only 24 percent of the gravity system pipes are included. A full pipe or less skeletonized model is needed for a more robust evaluation of the system. In order to expand the model, accurate and updated GIS for the collection system should be developed. The estimated cost is $491,000 and is planned for the long-term.

9.11 Summary of CIP

Recommended improvements include five pump station projects, three STEP projects, nine pipeline projects, one inflow and infiltration project, four maintenance projects, 14 treatment plant projects, and one general project. Most projects are allocated as repair and replacement projects at $30.9 M. Level of service projects are at $17.5 M and growth projects are at $15.0 M. The total CIP is $63.4 M.

The CIP recommends budgeting $41.0 M in the short term. The average annual short-term cost for all recommended projects is approximately $4.1 M per year from 2022 through 2031. The CIP recommends $22.4 M in the long-term with an average annual long-term cost of approximately $2.2 M per year from 2032 through 2041.

Detailed sheets for each CIP project presented in this chapter can be found in Appendix K of the Plan. Table 9.3 summarizes the total cost and annual cost for each planning period.

Table 9.3 CIP Planning Period Summary

Planning Period	Total Cost	Annual Cost
Short-term (2022-2031)	$41.0 M	$4.1 M
Long-term (2032-2041)	$22.4 M	$2.2 M

Maintenance projects accounts for 35 percent of the CIP projects at $22.1 M, followed by treatment plant projects at $17.0 M (27 percent) and pump station projects at $16.6 M (26 percent). Table 9.4 summarizes the total estimated capital costs by facility type. Figure 9.1 shows the various project types of CIP allocation.

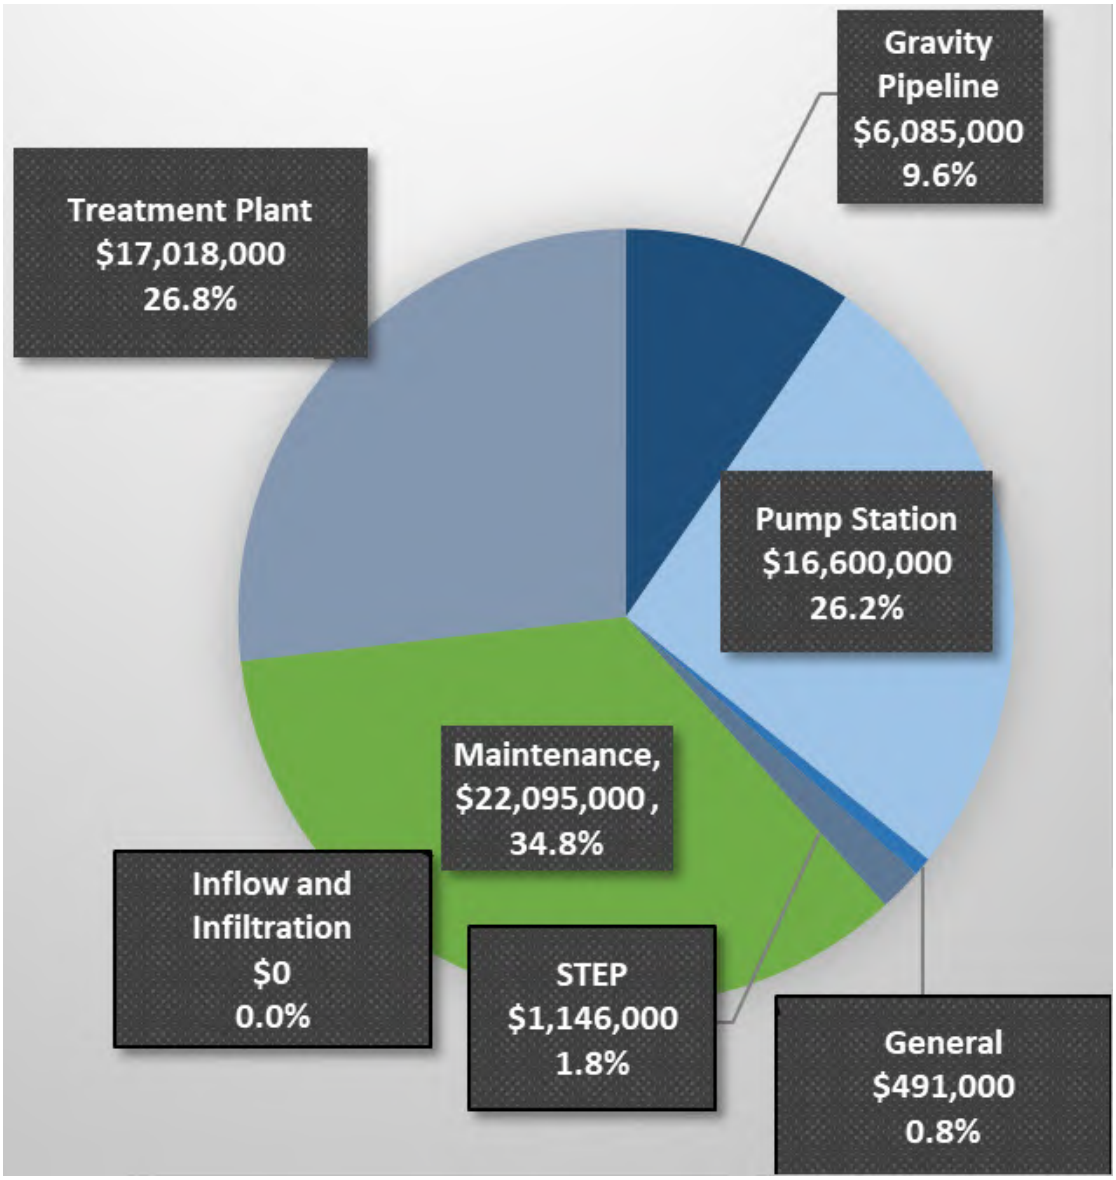

Figure 9.1 Cost by Project Type

Chapter 10

FINANCIAL PLAN

10.1 Introduction

This chapter was prepared by FCS GROUP to provide a financial program that allows the City of Camas (City) sewer utility to remain financially viable during the planning period. This financial viability analysis considers the historical financial condition, current and identified future financial and policy obligations, operation and maintenance (O&M) needs, and the financial impacts of the capital projects identified in this General Sewer Plan (Plan). Furthermore, this chapter provides a review of the sewer utility's current rate structure with respect to rate adequacy and customer affordability.

10.2 Past Financial Performance

This section includes a historical summary of financial performance as reported by the City, including fund resources and uses arising from cash transactions, as well as a historical summary of comparative statements of net position, which are useful indicators of the City's financial position.

10.2.1 Comparative Financial Statements

The City legally owns and operates both a water and sewer utility. Operations and financial reporting occur on a combined utility fund basis. Table 10.1 shows a summary of the utility fund resources and uses arising from cash transactions for the previous 6 years (2015 through 2020) for the water and sewer utilities combined. Table 10.2 shows a summary of assets and liabilities, with the difference between the two reported as "net position." Increases or decreases in net position are useful indicators of the financial position of the City's utility fund. Noteworthy findings and trends are discussed following each table to demonstrate the historical performance and condition of the City's combined utility fund.

Table 10.1 Summary of Historical Fund Resources and Uses Arising from Cash Transactions

	2015	2016	2017	2018	2019	2020
Operating Revenues						
Charges for Service	$11,202,674	$11,411,593	$12,034,637	$12,436,638	$12,625,383	$13,595,484

10.2.2 Findings and Trends

- The City's combined water and sewer charges for services increased from $11.2 million (M) in 2015 to $13.6M in 2020. The average annual compounding increase is 4.0 percent per year, with a total increase of 21.4 percent from 2015 to 2020. Expenses range from $9.0M in 2015 to $12.2M in 2020, showing increases every year. With an average annual compounding increase of 6.4 percent, expenses have grown faster than revenues over the past 6 years and have increased 36.5 percent overall. While combined water and sewer maintenance and operations expenses have increased 26.2 percent, the largest contributor to increases in expenses is depreciation and amortization, growing by 51.8 percent since 2015.
- The O&M coverage ratio (total operating revenues divided by total operating expenses) started at 125.0 percent in 2015 and has trended downward reaching a low of 102.2 percent in 2019 before recovering to 111.1 percent in 2020. A ratio of 100.0 percent or greater shows that revenue will successfully cover expenses, and the City has remained above this ratio for the past six-year period.
- Net operating income as a percent of operating revenue was 20.0 percent in 2015. This metric has varied over the past 6 years with a high of the 2015 figure of 20.0 percent reaching a low of 2.1 percent in 2019 before increasing to 10.0 percent in 2020. Similar to the O&M coverage ratio, these trends help to show how successfully operating revenue actually covered operating expenses, with higher positive numbers being the best and negative numbers showing need for improvement. In addition, these trends demonstrate the ability of the utility to invest in capital, whether through direct cash transfers or the issuance and servicing of debt.
- The debt service coverage ratio measures the amount of cash flow available to meet interest and principal payments. Typically, bond debt service coverage requires a minimum factor of 1.25 during the life of the loans. This ratio is calculated by dividing cash operating income (revenues less expenses before depreciation) by annual revenue bond expenses. The debt service coverage ratio for revenue bond debt ends 2015 at 5.93 and fluctuates year to year to a low of 3.09 in 2019 and a high of 10.45 in 2016. The ability of this ratio to remain at levels significantly higher than the bond covenant minimum of 1.25 indicates a stable capacity for new debt and will likely result in more favorable terms when entering the bond market.
- The current ratio is a measure of short-term liquidity or the City's ability to pay its current bills - it is calculated by dividing unrestricted current assets (excluding inventories and prepaid items) by current liabilities. A ratio of 1.0 indicates that the utility has exactly enough to pay its bills; higher values are desirable as they suggest an ability to pay large or unanticipated bills. The ratio begins at 1.5 in 2015 decreasing to 1.3 in 2016 before rebuilding to a high of 5.3 in 2019 and ending 2020 at 3.3 suggesting that the City has capacity to meets its short-term financial obligations.

10.3 Financial Plan

The sewer utility is responsible for generating sufficient revenue to meet all of its costs. The primary source of funding is derived from ongoing monthly service charges, with additional revenue coming from inspection fees, investment earnings, space and facilities leases, rents and charges and other miscellaneous revenues. The City controls the level of user service charges and, with City Council approval, can adjust user service charges as needed to meet financial objectives.

The financial plan can only confirm financial feasibility if it considers the total system costs of providing sewer services, both operating and capital. To meet these objectives, the following elements have been completed:

1. Capital Funding Plan. Identifies the total capital improvement plan (CIP) obligations of the planning period. The plan defines a strategy for funding the CIP, including an analysis of available resources from rate revenues, existing reserves, connection charges, debt financing, and any special resources that may be readily available (e.g., grants, developer contributions, etc.). The capital funding plan impacts the financial plan through the use of debt financing (resulting in annual debt service) and the assumed rate revenue made available for capital funding.
2. Financial Forecast. Identifies future annual non-capital costs associated with the operation, maintenance, and administration of the sewer system. Included in the financial plan is a reserve analysis that forecasts cash flow and fund balance activity, along with testing for satisfaction of actual or recommended minimum fund balance policies. The financial plan ultimately evaluates the sufficiency of utility revenues in meeting all obligations, including cash uses such as operating expenses, debt service, capital outlays, and reserve contributions, as well as any coverage requirements associated with long-term debt. The plan also identifies the future adjustments required to fully fund all utility obligations in the planning period.

10.3.1 Capital Funding Plan

To properly evaluate future capital funding needs, capital costs were escalated by 3.50 percent annually to the year of planned spending. The CIP used for this PLAN identifies $47.5M in project costs over the 10-year planning horizon from 2022-2031. The 20-year period through 2041 includes $86.0M in total project costs.

A summary of the 10-year and 20-year CIPs are shown in Table 10.3. As shown, each year has varied capital cost obligations depending on construction schedules and infrastructure planning needs. Table 10.4 provides more detail for the 10-year CIP.

Table 10.3 10-Year and 20-Year CIPs

Year	Escalated $
2022	$2,846,250
2023	8,923,304
2024	3,668,747
2025	8,166,921

10.4 Available Funding Assistance and Financing Resources

Feasible long-term capital funding strategies must be defined to ensure that adequate resources are available to fund the CIP identified in this PLAN. In addition to the City's resources, such as accumulated cash reserves, capital revenues, and rate revenues designated for capital purposes, capital needs can be met from outside sources, such as grants, low-interest loans, and bond financing. The following is a summary of the City's internal and external resources.

10.4.1 City Resources

Resources appropriate for funding capital needs include accumulated cash in the capital fund, rate revenues designated for capital spending purposes, developer contributions, and capital-related charges such as connection fee revenue. The first two resources will be discussed in the Fiscal Policies section of the Financial Forecast. Capital-related charges are discussed below.

10.4.1.1 System Development Charges

A connection charge such as the City's system development charge (SDC) refers to a one-time charge imposed on new customers as a condition of connecting to the sewer system. The purpose of the SDC is two-fold: 1) to promote equity between new and existing customers; and 2) to provide a source of revenue to fund capital projects. Revenue can only be used to fund utility capital projects or to pay debt service incurred to finance those projects. In 2021, the City charged all new customers an SDC dependent upon the location of the property. A charge of $2,493 per meter capacity equivalent (MCE) was charged for connections in the South Area while a charge of $4,420 per MCE was charged for connection in the North Shore Area.

10.4.1.2 Local Facilities Charges

While a connection charge is the manner in which new customers pay their share of system investment costs, local facilities charge funding is used to pay the costs of local facilities that connect each property to the system's infrastructure. Local facilities funding is often overlooked in rate forecasting because it is funded upfront by either connecting customers and developers, or through an assessment to properties, but never from rates.

A number of mechanisms can be considered toward funding local facilities. One of the following scenarios typically occurs: (a) the utility charges a connection fee based on the cost of the local facilities (under the same authority as the facilities assessment fee); (b) a developer funds an extension of the system to its development and turns those facilities over to the utility (contributed capital); or (c) a local assessment is set up called a Utility Local Improvement District (ULID/LID) or a Local Utility District (LUD), which collects tax revenue from benefited properties.

A local facilities charge (LFC) is a variation of the connection charge. It is a city-imposed charge to recover the cost related to service extension to local properties. Often called a front-footage charge and imposed on the basis of footage of the main "fronting" a particular property, it is usually implemented as a reimbursement mechanism to a city for the cost of a local facility that directly serves a property. It is a form of connection charge and thus can accumulate up to 10 years of interest. It typically applies in instances when no developer-installed facilities are needed through developer extension due to the prior existence of available mains already serving the developing property.

The developer extension is a requirement that a developer install on-site and sometimes off-site improvements as a condition of extending service. These are in addition to the connection charge required and must be built to City standards. Part of the agreement between the City and the developer planning to extend service might include a latecomer agreement, resulting in a latecomer charge to new connections for the developer extension.

Latecomer charges are a variation of developer extensions, whereby new customers connecting to a developer-installed improvement make a payment to the City based on their share of the developer's cost. The City passes this charge on to the developer who installed the facilities. As part of the developer extension process, this defines the allocation of costs and records latecomer obligations on the title of affected properties. No interest is allowed, and the reimbursement agreement cannot exceed 20 years in duration.

ULID/LID is another mechanism for funding infrastructure that assesses benefited properties based on the special benefit received by the construction of specific facilities. Most often used for local facilities, some ULIDs also recover related general facilities costs. Substantial legal and procedural requirements can make this a relatively expensive process, and there are mechanisms by which a ULID can be rejected.

10.4.2 Outside Resources

This section outlines various grant, loan, and bond opportunities available to the City through federal and state agencies to fund the CIP identified in the Plan.

10.4.2.1 Grants and Low-Cost Loans

Historically, federal and state grant programs were available to local utilities for capital funding assistance. However, these assistance programs have been mostly eliminated, substantially reduced in scope and amount, or replaced by loan programs. Remaining grant programs are generally lightly funded and heavily subscribed. Nonetheless, the benefit of low-interest loans makes the effort of applying worthwhile.

Appendix L to this Plan contains a document entitled "Funding Programs for Drinking Water and Wastewater Projects; Updated 2-14-2022". This document is maintained by the State of Washington's Department of Commerce and contains details on government programs, eligibility requirements, and contact information, should the City wish to inquire about program offerings and eligibility requirements.

10.4.2.2 Bond Financing

General Obligation Bonds - General obligation (G.O.) bonds are bonds secured by the full faith and credit of the issuing agency, committing all available tax and revenue resources to debt repayment. With this high level of commitment, G.O. bonds have relatively low interest rates and few financial restrictions. However, the authority to issue G.O. bonds is restricted in terms of the amount and use of the funds, as defined by the Washington constitution and statute. Specifically, the amount of debt that can be issued is linked to assessed valuation.

Revised Code of Washington (RCW) 39.36.020 states:

- (2)(a)(ii) Counties, cities, and towns are limited to an indebtedness amount not exceeding one and one half percent of the value of the taxable property in such counties, cities, or towns without the assent of three-fifths of the voters therein voting at an election held for that purpose.
  (b) In cases requiring such assent counties, cities, towns, and public hospital districts are limited to a total indebtedness of two and one-half percent of the value of the taxable property therein.

While bonding capacity can limit the availability of G.O. bonds for utility purposes, these can sometimes play a valuable role in project financing. A utility rate savings may be realized through two avenues: the lower interest rate and related bond costs, and the extension of repayment obligation to all tax-paying properties (not just developed properties) through the authorization of an ad valorem property tax levy.

Revenue Bonds - Revenue bonds are commonly used to fund utility capital improvements. The debt is secured by the revenues of the issuing utility. With this limited commitment, revenue bonds typically bear higher interest rates than G.O. bonds and require security conditions related to the financial performance (added bond debt service coverage) and may require maintenance of dedicated reserves (a bond reserve). The City agrees to satisfy these requirements by resolution as a condition of bond sale.

Revenue bonds can be issued in Washington without a public vote. There is no bonding limit, except perhaps the practical limit of the utility's ability to generate sufficient revenue to repay the debt and provide coverage. In some cases, poor credit might make issuing revenue bonds problematic.

10.4.2.3 Capital Financing Strategy

An ideal capital financing strategy would include the use of grants and low-cost loans when debt issuance is required. However, these resources are very limited and competitive in nature and do not provide a reliable source of funding for planning purposes. It is recommended that the City pursue these funding avenues but for planning purposes assume revenue bond financing to meet the needs which can't be met by available cash resources. The capital financing strategy developed to fund the CIP identified in this Plan assumes the following funding resources:

- Accumulated cash reserves, which may include proceeds from previously issued bonds,
- Transfers of excess cash (over minimum balance targets) from the Operating Fund,
- System development charge revenues, and
- Interest earned on Construction Fund balances and other miscellaneous capital resources.

The cash resources described above are anticipated to fund 61.29 percent of the 10-year CIP and 78.59 percent of the 20-year CIP. The remaining funding is assumed to come from new debt obligations. Table 10.5 presents the 10-year and 20-year capital financing strategy.

Table 10.5 10-Year and 20-Year Capital Financing Strategy

Year	Capital Expenditures Escalated	Revenue Bond Financing	Cash Funding	Total Financial Resources
2022	$2,846,250	-	$2,846,250	$2,846,250
2023	8,923,304	2,500,000	6,423,304	8,923,304
2024	3,668,747	-	3,668,747	3,668,747
2025	8,166,921	6,900,000	1,266,921	8,166,921
2026	3,445,478	-	3,445,478	3,445,478
2027	2,174,553	-	2,174,553	2,174,553
2028	3,056,015	-	3,056,015	3,056,015
2029	9,010,924	9,000,000	10,924	9,010,924
2030	5,183,099	-	5,183,099	5,183,099
2031	1,057,949	-	1,057,949	1,057,949
Subtotal	**$47,533,240**	**$18,400,000**	**$29,133,240**	**$47,533,240**
2032 - 2041	38,425,499	-	38,425,499	38,425,499
Total	**$85,958,739**	**$18,400,000**	**$67,558,739**	**$85,958,739**

10.5 Financial Forecast

The financial forecast, or revenue requirement analysis, forecasts the amount of annual revenue that needs to be generated by user rates. The analysis incorporates operating revenues, O&M expenses, debt service payments, rate-funded capital needs, and any other identified revenues or expenses related to operations. The objective of the financial forecast is to evaluate the sufficiency of the current level of rates. In addition to annual operating costs, the revenue needs also include debt covenant requirements and specific fiscal policies and financial goals of the City.

The analysis determines the amount of revenue needed in a given year to meet that year's expected financial obligations. For this analysis, two revenue sufficiency tests have been developed to reflect the financial goals and constraints of the City: cash needs must be met; and debt coverage requirements must be realized. In order to operate successfully with respect to these goals, both tests of revenue sufficiency must be met.

Cash Test: The cash flow test identifies all known cash requirements for the City in each year of the planning period. Typically, these include O&M expenses, debt service payments, rate-funded system reinvestment funding or directly funded capital outlays, and any additions to specified reserve balances. The total annual cash needs of the City are then compared to projected cash revenues using the current rate structure. Any projected revenue shortfalls are identified and the rate increases necessary to make up the shortfalls are established.

Coverage Test: The coverage test is based on a commitment made by the City when issuing revenue bonds and some other forms of long-term debt. For the purposes of this analysis, revenue bond debt is assumed for any needed debt issuance. As a security condition of issuance, the City would be required per covenant to agree that the revenue bond debt would have a higher priority for payment (a senior lien) compared to most other expenditures; the only outlays with a higher lien are O&M expenses. Debt service coverage is expressed as a multiplier of the annual revenue bond debt service payment. For example, a 1.00 coverage factor would imply that no additional cushion is required. A 1.25 coverage factor means revenue must be sufficient to pay O&M expenses, annual revenue bond debt service payments, and an additional 25 percent of annual revenue bond debt service payments. The excess cash flow derived from the added coverage, if any, can be used for any purpose, including funding capital projects. Targeting a higher coverage factor can help the City achieve a better credit rating and provide lower interest rates for future debt issues.

In determining the annual revenue requirement, both the cash and coverage sufficiency tests must be met, and the test with the greatest deficiency drives the level of needed rate increase in any given year.

10.5.1 Current Financial Structure

The City maintains a fund structure and implements financial policies that target management of a financially viable and fiscally responsible sewer system.

10.5.1.1 Fiscal Policies

A summary of the key financial policies employed by the City, as well as those recommended and incorporated in the financial program, are discussed below.

Operating Fund: Operating reserves are designed to provide a liquidity cushion to ensure that adequate cash working capital will be maintained to deal with significant cash balance fluctuations, such as seasonal fluctuations in billings and receipts, unanticipated cash expenses, or lower than expected revenue collections. Like other types of reserves, operating reserves also serve another purpose: they help smooth rate increases over time. Target funding levels for an operating reserve are generally expressed as a certain number of days of O&M expenses, with the minimum requirement varying with the expected revenue volatility. Industry practice for utility operating reserves ranges from 30 days (8 percent) to 120 days (33 percent) of O&M expenses, with the lower end more appropriate for utilities with stable revenue streams and the higher end more appropriate for utilities with significant seasonal or consumption-based fluctuations.

This financial plan targets a minimum balance in the sewer utility Operating Fund equal to 60 days of O&M expenses.

Capital Fund: A utility capital contingency reserve is an amount of cash set aside in case of an emergency should a piece of equipment or a portion of the utility's infrastructure fail unexpectedly. The reserve also could be used for other unanticipated capital needs, including capital project cost overruns. Industry practices range from maintaining a balance equal to 1 to 2 percent of fixed assets, an amount equal to a five-year rolling average of CIP costs, or an amount determined sufficient to fund equipment failure (other than catastrophic failure). The final target level should balance industry standards with the risk level of the City.

The City currently aims to maintain a capital fund balance target of $750,000 and is the target used in this financial plan.

System Reinvestment: System reinvestment funding promotes system integrity through ongoing repair and replacement of system infrastructure. Ideally, a detailed asset management plan would guide the level of rate funded system reinvestment, however, in absence of this level of effort, annual depreciation expense is commonly used as a measure of the decline in asset value associated with routine use of the system. Particularly for utilities that do not already have an explicit system reinvestment policy in place, implementing a funding level based on full depreciation expense could significantly impact rates. An alternative benchmark is annual depreciation expense net of debt principal payments on outstanding debt. This approach recognizes that customers are still paying for certain assets through the debt component of their rate and intends to avoid simultaneously charging customers for an asset and its future replacement. The specific benchmark used to set system reinvestment funding targets is a matter of policy that must balance various objectives, including managing rate impacts, keeping long-term costs down, and promoting "generational equity" (i.e., not excessively burdening current customers with paying for facilities that will serve a larger group of customers in the future).

The City does not currently have a policy in place for system reinvestment funding. No dedicated system reinvestment funding is assumed in this financial plan; however, on average, the City is able to fund approximately $2.0M annually through rates from 2022 through 2041. Dedicated system reinvestment funding is recommended for consideration during future policy review and rate planning.

Debt Management: It is prudent to consider policies related to debt management as part of a broader utility financial policy structure. Debt management policies should be evaluated and formalized, including the level of acceptable outstanding debt, debt repayment, bond coverage, and total debt coverage targets. The City has one outstanding sewer revenue bond, which will be fully redeemed in 2035. This bond carries a coverage requirement of 1.25. In addition to revenue bonds, the City has four junior lean debt obligations without a coverage requirement. While not an official policy, the City should target debt coverage ratio of 1.00 or greater on total debt to make sure enough cash is generated for the repayment of all debt.

10.5.1.2 Financial Forecast

The financial forecast is primarily based upon the City's 2022 budget and takes into consideration other key factors and assumptions needed to develop a complete portrait of the City's annual sewer utility financial obligations. The following is a list of the key revenue and expense factors and assumptions used to develop the financial forecast.

- Growth - Rate revenue escalation is based on the forecast of annual average flow provided in Chapter 3 of this PLAN. On average, annual growth for the forecast period is 2.14 percent.
- Revenue - The City has two general revenue sources: 1) sewer service charges (rate revenue); and 2) miscellaneous (non-rate) revenue. In the event of a forecasted annual shortfall, rate revenue can be increased to meet the annual revenue requirement. For the purpose of this financial forecast, rate revenues are forecasted to increase with customer growth. Non-rate revenues are forecasted to increase with either customer growth or general cost inflation.

- System Development Charge Revenue - The current SDC is forecast to generate revenue between $1.1M in 2022 and $1.7M in 2041 collected from an average of 424 new meter capacity equivalents per year.
- Expenses - O&M expense projections are based on the City's 2022 budget and forecast to increase with general cost inflation of 2.0 percent, labor cost inflation increases of 3.0 percent, and benefit cost inflation increases of 5.0 percent in subsequent years. Budget figures were used for taxes in 2022; future taxes are calculated based on forecasted revenues and prevailing tax rates.
- Existing Debt - The City's sewer utility currently has five outstanding debt issues, including one revenue bond, three PWTF loans, and one Department of Ecology loan. The revenue bond payments are on average $1.5M per year 2022 through 2035. PWTF payments range from $816,000 in 2022 to $190,000 in 2032. DOE loan payments range from $350,000 in 2021 to $175,000 in 2032. The total annual existing debt service obligations begin 2022 at $2.7M and are reduced to $1.5M in 2035, the year of final existing debt redemption.
- Future Debt - The capital financial strategy developed for this PLAN forecasts the need for $18.4M in new debt proceeds in three separate instances throughout the twenty-year forecast. The analysis performed assumes all new debt is through revenue bond financing. Annual new debt service obligations begin in 2023 at $221,000 increasing to $1.6M by 2029.
- Transfers to Capital - Operating fund balance above the minimum requirement is assumed to be available to fund capital projects and projected to be transferred to the Capital Fund each year. On average, the utility transfers $2.2M to the Capital Fund annually from 2022 to 2041.

Although the financial plan is completed through 2041, the rate strategy focuses on the shorter-term planning period of 2022 through 2031. It is recommended that the City revisit the proposed rates every 2 to 3 years to ensure that the rate projections developed remain adequate. Any significant changes should be incorporated into the financial plan and future rates should be adjusted as needed.

Table 10.6, following, summarizes the annual revenue requirements based on the forecast of revenues, expenditures, fund balances, and fiscal policies.

Table 10.6 11-Year Financial Forecast

Revenue Requirement	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031
Revenues										
Rate Revenues Under Existing Rates	$8,497,745	$8,679,362	$8,864,860	$9,054,322	$9,247,834	$9,445,482	$9,647,354	$9,853,541	$10,064,134	$10,279,228
Non-Rate Revenues	371,282	358,954	358,973	376,704	380,896	347,830	359,665	364,879	384,018	221,005
Total Revenues	**$8,869,027**	**$9,038,316**	**$9,223,833**	**$9,431,026**	**$9,628,730**	**$9,793,312**	**$10,007,019**	**$10,218,420**	**$10,448,152**	**$10,500,233**
Expenses										
Cash Operating Expenses	$5,281,720	$5,468,388	$5,624,604	$5,786,121	$5,952,570	$6,123,721	$6,301,205	$6,484,319	$6,673,633	$6,865,930
Existing Debt Service	2,695,128	2,695,053	2,690,328	2,688,603	2,684,627	2,678,403	2,629,788	2,074,276	2,074,528	2,071,804
New Debt Service		220,505	220,505	829,100	829,100	829,100	829,100	1,622,920	1,622,920	1,622,920
Total Expenses	**$7,976,848**	**$8,383,946**	**$8,535,438**	**$9,303,824**	**$9,466,298**	**$9,631,224**	**$9,760,093**	**$10,181,515**	**$10,371,080**	**$10,560,654**
Total Surplus (Deficiency)	**$892,179**	**$654,369**	**$688,395**	**$127,202**	**$162,432**	**$162,088**	**$246,926**	**$36,905**	**$77,071**	**$(60,421)**
Annual Rate Adjustment	**3.30%**	**3.30%**	**1.75%**	**1.75%**	**1.75%**	**0.00%**	**0.00%**	**0.00%**	**0.00%**	**0.00%**
Cumulative Annual Rate Adjustment	**3.30%**	**6.71%**	**8.58%**	**10.48%**	**12.41%**	**12.41%**	**12.41%**	**12.41%**	**12.41%**	**12.41%**
Rate Revenues After Rate Increase	$8,778,171	$9,261,651	$9,625,137	$10,002,888	$10,395,465	$10,617,641	$10,844,564	$11,076,338	$11,313,066	$11,554,853
Additional Taxes from Rate Increase	7,206	14,964	19,537	24,376	29,492	30,122	30,766	31,423	32,095	32,781
Net Cash Flow After Rate Increase	**$1,165,398**	**$1,221,696**	**$1,429,135**	**$1,051,392**	**$1,280,572**	**$1,304,125**	**$1,413,371**	**$1,228,279**	**$1,293,908**	**$1,182,423**
Coverage After Rate Increases	3.54	3.25	3.38	2.55	2.68	2.69	2.74	2.03	2.08	1.98

The financial forecast indicates that at existing rate levels the utility becomes deficient in 2031 as new debt is added to fund the capital program. This financial analysis recognizes the annual 3.30 percent adopted rate increases in 2022 and 2023. In addition to the adopted increases annual increases of 1.75 percent are needed starting in 2024 through 2026 to meet the forecast annual operating and capital needs of the system.

10.5.2 City Funds and Reserves

Table 10.7 shows a summary of the projected Operating Fund and Capital Fund ending balances through 2031 based on the rate forecasts presented above. The Operating Fund is maintained at a minimum of 60 days of O&M expenses, and the Capital Fund balance continues to exceed the annual $750,000 target.

Table 10.7 Ending Cash Balance Summary

Ending Fund Balances	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031
Operating Fund	$868,228	$898,913	$924,592	$951,143	$978,505	$1,006,639	$1,035,814	$1,065,915	$1,097,036	$1,128,646
Capital Fund	5,976,844	1,934,563	860,365	1,826,388	883,982	1,249,973	878,759	3,387,097	865,896	2,335,899
Total	**$6,845,072**	**$2,833,476**	**$1,784,957**	**$2,777,531**	**$1,862,487**	**$2,256,612**	**$1,914,574**	**$4,453,012**	**$1,962,931**	**$3,464,545**

10.6 Current and Projected Rates

10.6.1 Current Rates

The City's current rate structure consists of a fixed monthly charge based on customer class and a variable charge per hundred cubic feet (ccf) for all use. Customer located outside the City limits have an outside City multiplier of 1.50 added to both the fixed monthly charge and the variable charge of their rates. Table 10.8 shows the existing rate schedule.

Table 10.8 Existing Schedule of Rates

Volume Charge	**per ccf**
Residential	
Inside City	$4.15
Outside City	6.24
Commercial / Industrial	
Inside City	$5.55
Outside City	8.33

10.6.2 Projected Rates

The financial forecast discussed above indicates that while the sewer utility is covering all financial obligations in the near term, with the addition of new debt, rate increases are needed to satisfy all future financial responsibilities. In addition to the adopted 3.3 percent rate increase in 2022 and 2023, a rate strategy of 1.75 percent annually from 2024 through 2026 is recommended to satisfy this forecast deficiency. Table 10.9 shows the projected rates with increases applied uniformly to all rate components in all classes.

Table 10.9 Proposed Schedule of Rates

Monthly Rates	Existing	Adopted		Proposed							
	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031

10.7 Affordability

The Washington State Department of Health and the Department of Commerce Public Works Board use an affordability index to prioritize low-cost loan awards depending on whether rates exceed 2.00 percent of the median household income for the service area. The median household income for the City, expressed in 2019 dollars, was $111,584 between 2015 and 2019 according to the U.S. Census Bureau. The 2019 value is escalated based on the 2020 and 2021 Employment Cost Index Wages and Salaries index and utilizes the 2020 and 2021 two-year average of 2.15 percent to project the median household income in future years starting in 2022. Table 10.10 presents the City's monthly sewer bill projected to 2031, tested against the 2.00 percent monthly affordability threshold.

Table 10.10 Community Affordability Test

Year	Inflation	Median HH Income	2% Monthly Threshold	Projected Monthly Bill[(1)]	% of Median HH Income
2019		$111,584	$185.97	$52.78	0.57%
2020	2.22%	114,065	190.11	54.53	0.57%
2021	2.08%	116,439	194.07	56.31	0.58%
2022	2.15%	118,945	198.24	58.19	0.59%
2023	2.15%	121,506	202.51	60.10	0.59%
2024	2.15%	124,121	206.87	61.17	0.59%
2025	2.15%	126,793	211.32	62.25	0.59%
2026	2.15%	129,522	215.87	63.34	0.59%
2027	2.15%	132,310	220.52	63.34	0.57%
2028	2.15%	135,157	225.26	63.34	0.56%
2029	2.15%	138,067	230.11	63.34	0.55%
2030	2.15%	141,038	235.06	63.34	0.54%
2031	2.15%	144,074	240.12	63.34	0.53%

Notes:
(1) Average monthly bill assumes 7ccf water use.

Applying the 2.00 percent test, the City's rates are forecasted to remain within the indicated affordability range through 2031.

10.8 Conclusion

The results of this analysis indicate that rates must increase to provide revenue sufficient to cover all utility financial obligations, including the addition of new debt and partial cash funding of the capital program through 2031. In addition to the adopted annual increases of 3.30 percent in 2022 and 2023, annual 1.75 percent adjustments from 2024 through 2026 should provide for continued financial viability while maintaining generally affordable rates.

It is important to remember that the analysis performed in this chapter assumes growth rates from Chapter 3 of this Plan. If the future growth rates change, the existing rate strategy may need to be updated and revised.

It is recommended that the City regularly review and update the key underlying assumptions that compose the multi-year financial plan to ensure that adequate revenues are collected to meet the City's total financial obligations.

Stormwater Management Program

2026

City of Camas
Stormwater Division | Public Works

City of Camas WASHINGTON

Page left blank intentionally

Introduction

The National Pollutant Discharge Elimination System (NPDES) Permit addresses water pollution from point sources into surface waters, such as rivers, lakes, and streams. The U.S. Environmental Protection Agency (EPA) gave the Washington State Department of Ecology (Ecology) authority to write and issue the NPDES Permit in Washington State. The Western Washington Phase II Municipal Stormwater Permit (Permit) was first issued by Ecology in 2007.

The City of Camas (City) Municipal Separate Storm Sewer System (MS4) is regulated by the Permit. This Annual Report covers implementation of components from the 2024-2029 Permit. The 2024-2029 Permit was reissued on July 1, 2024, and became effective August 1, 2024. The Permit cycle is from August 1, 2024, to July 31, 2029. The City will continue to implement current programs and include new permit requirements as they come into effect.

The Stormwater Management Program (SWMP) is required per Section S5 of the Permit. The SWMP is organized per the program components listed in S5.C. The SWMP is updated annually and submitted to Ecology by March 31st of each year. The SWMP consists of the following components (program components, current activities and planned activities are discussed in the SWMP):

- S5.C.1 Stormwater Planning
- S5.C.2 Public Education and Outreach
- S5.C.3 Public Involvement and Participation
- S5.C.4 MS4 Mapping and Documentation
- S5.C.5 Illicit Discharge Detection and Elimination
- S5.C.6 Controlling Runoff from New Development, Redevelopment, and Construction Sites
- S5.C.7 Stormwater Management for Existing Development
- S5.C.8 Source Control Program for Existing Development
- S5.C.9 Operations and Maintenance

The SWMP is designed to protect water quality by reducing the discharge of pollutants from the regulated small MS4 to the Maximum Extent Practicable (MEP) and shall use All Known, Available, and Reasonable methods of prevention, control, and Treatment (AKART) to prevent and control pollution of waters of the State of Washington.

The City has an ongoing program for gathering, tracking, maintaining and using information to evaluate SWMP development, implementation, permit compliance, and to set priorities.

The SWMP is a planning and implementation document. The program has three separate objectives depending on the intended audience:

- Ecology – Provide written documentation on how the City will meet the permit requirements for the SWMP.
- The Public – Solicit input and build local support for the City's SWMP.
- City Staff and Officials – Build support and understanding for the SWMP.

S5.C.1 Stormwater Planning

The City has three distinct watersheds: the Lacamas Lake Basin, the Columbia River Basin and the Washougal River Basin. The three watersheds ultimately drain into the Pacific Ocean. The City has been rapidly growing since 2015, adding a significant amount of both new people and infrastructure to the City's watersheds. A Comprehensive Stormwater Plan was developed in 2013 to plan for new stormwater regulations and future capital improvements that would help meet the City's goals and growth demands. The Stormwater Planning Program is to inform and assist in the development of policies and strategies as water quality management tools to protect receiving waters.

PERMIT REQUIREMENTS (S5.C.1):

a. Convene an inter-disciplinary team to inform and assist in the development, progress, and influence of this program.

b. Coordination with long-range plan updates:
   - Describe how stormwater management needs and protection/improvement of receiving water health are (or are not) informing the planning update processes and influencing policies and implementation strategies. Annual reports shall describe the water quality and watershed protection policies, strategies, codes, and other measures intended to protect and improve local receiving water health through planning, considering stormwater management needs or limitations.

c. Low impact development (LID) code-related requirements:
   - Continue to require LID Principles and LID Best Management Practices (BMPs) when updating, revising, and developing new local development-related codes, rules, standards, or other enforceable documents, as needed. The intent shall be to make LID the preferred and commonly used approach to site development.
   - Annually, assess and document any newly identified administrative or regulatory barriers to implementation of LID Principles or LID BMPs since local codes were updated in accordance with the 2013 Permit, and the measures developed to address the barriers. If applicable, the report shall describe mechanisms adopted to encourage or require implementation of LID principles or LID BMPs.
   - No later than December 31, 2028, adopt and implement tree canopy goals and policies to support stormwater management.
   - Establish a long term (e.g. 5, 10 year or longer) goal of canopy, existing or future projection, to be used for stormwater management.
   - Specific considerations for canopy for stormwater management on Permittee-owned or operated lands shall include:
     - Maintaining or increasing canopy in overburdened communities.
     - Maintaining existing mature canopy.
     - Document considerations, reasoning, and rationale for goals and polices.

d. Stormwater Management Action Planning (SMAP):
   No later than March 31, 2027, develop a SMAP for at least one new high priority catchment area, or additional actions for an existing SMAP, that identifies all the following:
   - A description of the stormwater facility retrofits needed for the area, including the BMP types and preferred locations. Include

projects that address transportation-related runoff from high traffic areas.

- Land management/development strategies and/or actions identified for water quality management.
- Focused, enhanced, or customized implementation of stormwater management actions related to permit sections within S5, including: IDDE field screening, Prioritization of Source Control inspections, O&M inspections or enhanced maintenance, Public Education and Outreach behavior change programs. Identified actions shall support other specifically identified stormwater management strategies and actions for the basin overall, or for the catchment area in particular.
- If applicable, identification of changes needed to local long-range plans, to address SMAP priorities.
- A proposed implementation schedule and budget sources for: short-term actions (accomplished within six years), long-term actions (accomplished within seven to 20 years).
- Actions in the SMAP that may benefit overburdened communities, including specifically vulnerable populations and highly impacted Communities.
- A process and schedule to provide future assessment and feedback to improve the planning process and implementation of procedures or projects.

CURRENT ACTIVITIES (S5.C.1):

The City's Stormwater Control Ordinance (CMC 14.02) will maintain the requirements for LID Principles and LID BMPs in all developments within city limits.

Presented Camas City Council on NPDES Phase II Permit updates and upcoming requirements of 2024-2029 Permit term.

The City's interdisciplinary team will continue to collaborate in the stormwater planning process. The core team members include the Public Works Director, Utilities Manager, Operations Supervisor and Stormwater Permit Coordinator. Other departments may be involved, as needed. City Council and stakeholders will be notified and part of the decision-making process as planning progresses.

The Department of Ecology awarded the City two Water Quality Combined Funding Grants; the City of Camas Downtown Regional Stormwater Retrofit Project and the City of Camas Crown Park Regional Stormwater Retrofit Project. These projects were identified in the previous SMAP process. The grant funds will help the City complete the planning and design phases of the two projects. The projects will provide treatment of stormwater from 216 acres of largely untreated area. Both projects are in the planning and design phase.

PLANNED ACTIVITIES (S5.C.1):

The City's short-term actions in support of stormwater facility retrofits will be detailed feasibility reviews to identify and prioritize retrofit projects for the long-term planning of the SMAP.

The City is working to adopt and implement tree canopy goals and policies to support stormwater management, and will establish long -term goals of canopy, existing or future projection for City owned or operated lands. Goals and policies will be adopted no later than December 31, 2028.

The City will complete and submit a SMAP for one new high priority catchment area, or additional actions for the Upper Camas Slough priority catchment area. A new SMAP or additional actions to existing SMAP will be completed no later than March 31, 2027.

S5.C.2 Public Education & Outreach

The City continues to implement an education and outreach program for the area served by the MS4. The Education and Outreach Program is designed to build general awareness about methods to address and reduce impacts from stormwater runoff, effect behavior change to reduce or eliminate behaviors and practices that cause or contribute to adverse stormwater impacts, and create stewardship opportunities that encourage community engagement in addressing the impacts from stormwater runoff.

PERMIT REQUIREMENTS (S5.C.2):

Implement an education and outreach program for the area served by the MS4. The program design shall be based on local or regional water quality information and priority audience characteristics to identify high priority audiences, subject areas, and/or BMPs.

a. General Awareness: Annually select, at a minimum, one priority audience and one subject:

- *Priority audience*: General Public (including overburden communities, school age children, college/university, or trade students), or Businesses (including home-based and mobile businesses).
  Subject areas:
  1) General impacts of stormwater on surface waters, including impacts from impervious surfaces.
  2) Low impact development (LID) principles and LID BMPs.
- *Priority audience:* Engineers, contractors, developers, property owners/managers, or Land-use Planners.
  Subject areas:
  1) Technical standards for stormwater site and erosion control plans.
  2) LID principles and LID BMPs.
  3) Stormwater treatment and flow control BMPs/facilities.
  4) Source control BMPs for building materials to reduce pollution to stormwater, including but not limited to stormwater pollution from PCB-containing materials.
- Provide subject area information to the target audience on an ongoing or strategic schedule.

b. Behavior Change: To affect behavior change, Permittees shall select, at a minimum, one priority audience and one BMP.

- *Priority audience*; Residents, landscapers, property managers/owners, developers, school age children, college/university, trade students, or businesses (including home-based or mobile businesses).
  BMPs:
  1) Use and storage of: pesticides, fertilizers, and/or other household chemicals.
  2) Use and storage of: automotive chemicals, hazardous cleaning supplies, carwash soaps, and/or other hazardous materials.
  3) Prevention of illicit discharges.
  4) Yard care techniques protective of water quality.
  5) Carpet cleaning.
  6) Repair and maintenance BMPs for: vehicles, equipment, and/or home/building.
  7) Pet waste management and disposal.
  8) LID Principles and LID BMPs.
  9) Stormwater facility maintenance, include LID facilities.
  10) Dumpster and trash compactor maintenance.
  11) Litter and debris prevention.

12) Sediment and erosion control.
13) Source Control BMPs.
14) Locally-important, municipal stormwater-related subject area.

- Social marketing campaign development. No later than July 1, 2025, each Permittee shall follow social marketing practices and methods and develop a campaign that is tailored to the community, including development of a program evaluation plan.
- Behavior change campaign implementation. No later than September 1, 2025, begin to implement the developed strategy.
- Behavior change campaign evaluation. No later than March 31, 2029, evaluate and submit a report on the changes in understanding and adoption of behaviors resulting from the implementation of the strategy; and any planned or recommended changes to the campaign to be more effective; describe the strategies and process to achieve the results.
- Behavior change campaign adaptive management. Permittees shall use results of the evaluation to continue to direct effective methods and implementation of the ongoing behavior change program.

c. Stewardship: Provide and advertise stewardship opportunities and/or partner with existing organizations (including non-permittees) to encourage residents to participate in activities or events planned and organized within the community.

CURRENT ACTIVITIES (S5.C.2):

General Awareness – General Public:

- Contribute to Stormwater Partners (Partners) for regional education and outreach efforts.
- Participated in tree planting events along Everett Street corridor.
- Don't wait to inflate.
- Maintain stormwater website.
- Pet waste management and disposal.
- Provided pet waste signs.
- Proper disposal of household hazardous waste.
- Prohibit illegal dumping and littering in stormwater facilities.
- Illicit discharge hotline and flyer.

- KPTV 'Clean Water' public service announcement campaign.
- Neighborhood meetings for non-HOA neighborhoods to educate property owners on stormwater facility ownership, responsibilities and maintenance.
- Frequent stormwater social media post.
- Tabeling events at Camas Farmers Market to spread the word on Private Stormwater Facilities, IDDE, Poop Smart, Don't Drip and Drive and other stormwater program activities.

General Awareness – School age children

- Poop toss game to educate children on proper pet waste disposal.

- Student Video Contest for grades 6-12.
- Met with Girl Scouts to discuss stormwater and the surrounding environment.

General Awareness – college/university and trade students

- Educational presentations at local colleges.

General Awareness – Engineers, contractors, developers, property managers land use planners:

- City staff assist teaching Vegetated Stormwater Facilities Maintenance course at Clackamas Community College.
- City staff assisted in leading Private/Public Facility Inspection workshop at MuniCon 2025.

Behavior Change:

Pet Waste

Pet waste is an ongoing issue in the City. The City evaluated the existing pet waste program and decided to continue to tackle the pet waste issue. The City has joined forces with Clark County and neighboring cities to promote pet waste management with the Canines for Clean Water Campaign. The team developed a behavior change campaign strategy and schedule. The City continues to implement the strategy developed for the pet waste management campaign. The City hands out "There is no poop fairy" signs to residents and HOA's that experience excessive dog poop on lawns and in public spaces.

Dumpster Maintenance Campaign

The City, as a collaborator and contributor to Stormwater Partners (Partners), have selected Dumpster Maintenance as our new behavior change campaign. The Partners selected Point North Consulting to help implement the new Dumpster Maintenance Program. Social marketing campaign development started in the fall of 2024, where the team developed a strategy and schedule for a new priority audience and BMP behavior change campaign. The behavior change campaign strategy implementation began in July 2025. Phase I work included toolkit refinement and strategic planning. Phase II included pilot campaign implementation and evaluation. The campaign is currently in evaluation and strategy refinement.

Stewardships:

- Doody Pledge

- Backyard Habitat Certification Program
- Ivy League
- Lacamas Lake Clean-up
- Watershed Stewards Program
- Student Video Contest

- Adopt a Drain

PLANNED ACTIVITIES (S5.C.2):

The City will continue to implement the Current Activities.

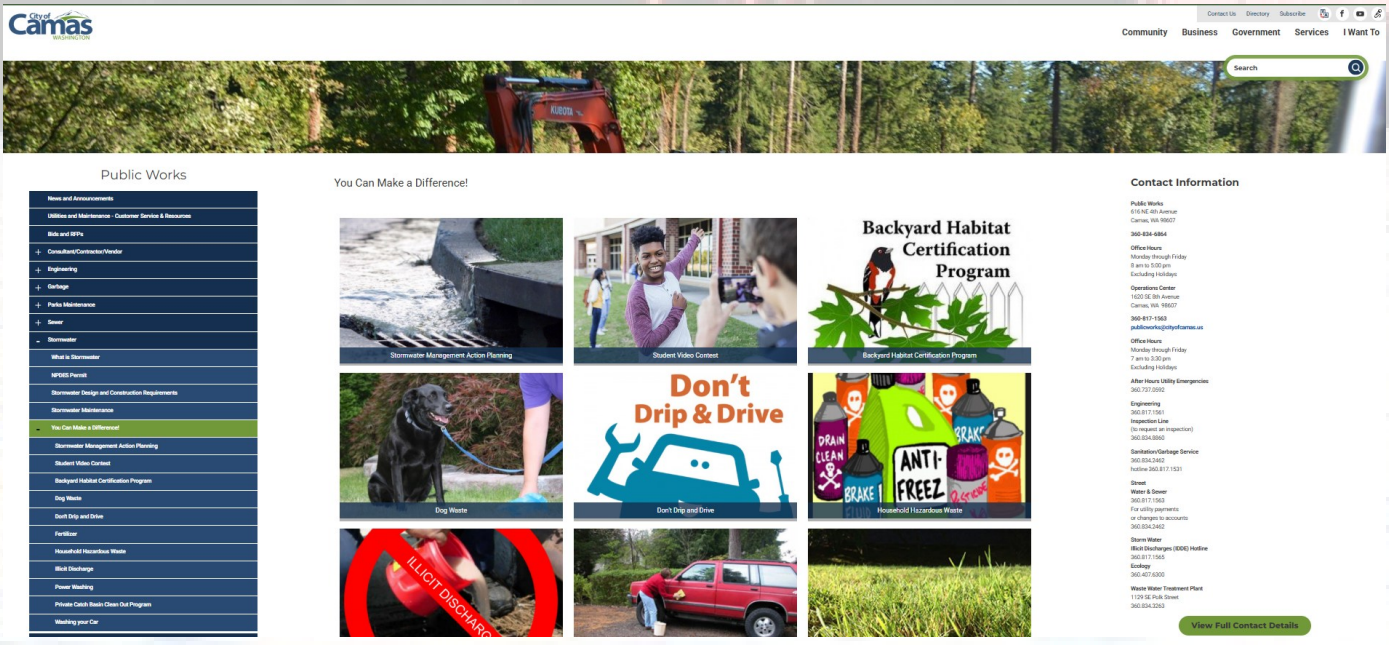
The City, in partnership with the Student Watershed Monitoring Network, are starting the Students Offer Runoff Mitigation Program (STORM) with selected Camas 5th grade classes. The program will continue watershed education in classes with an emphasis on watershed health and stormwater and how they can be improved by catch basin cleaning.

The City and Partners will continue to develop and implement the Dumpster Maintenance Campaign throughout Clark County.

The City and Partners are developing and hosting informational workshops to bring awareness of source control BMPs for building materials to reduce stormwater pollution from PCB-containing materials. The workshops will be offered in 2026 to municipal staff, contractors and building owners. Meetings will be both virtual and in person.

C5.C.3 Public Involvement & Participation

The City continues to provide ongoing opportunities for public involvement and participation through advisory councils, public hearings, watershed committees and other similar activities. The City complies with applicable state and local public notice requirements when developing elements of the SWMP and SMAP.

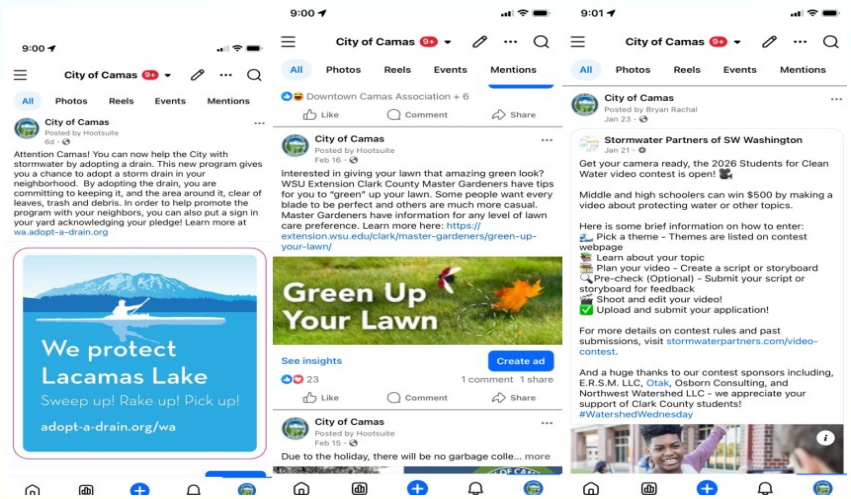


I. Annually, document specific public involvement and participation opportunities provided to overburdened communities and specifically highly impacted communities.

II. No later than December 31, 2026, document methods used to identify overburdened communities.

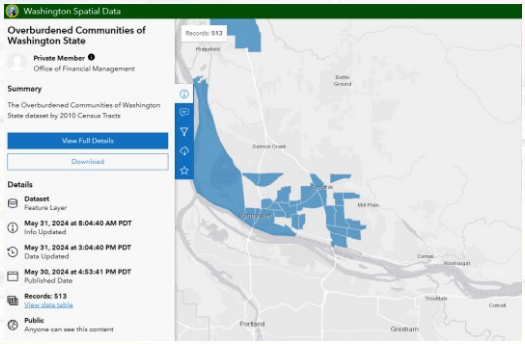
PERMIT REQUIREMENTS (S5.C.3):

a. Create opportunities for the public, including overburdened communities, to participate in the decision-making processes involving the development, implementing and update of the SMAP and SWAP. Specific outreach measures shall be documented for overburdened communities.



b. The City shall post the SWMP Plan and the annual report on the website, no later than May 31st of each year. All other submittals shall be available to the public upon request.

CURRENT ACTIVITIES (S5.C.3)



The City utilizes various communication mediums to convey involvement and participation events to the public, such as: social media, City website, newspaper articles and other web-based channels. The City posts the latest annual report and Stormwater Management Program (SWMP) on the website by March 31st each year. When the updated SWMP is posted on the City's website, a newsfeed is generated to notify the public and request for comments on the SWMP.

The City generates monthly to quarterly stormwater related topics and posts on City's social media to promote education and awareness. A link to the SWMP and SMAP are included in the post to help generate awareness and opportunity for the public to provide comments.
The City released 15 stormwater related posts on Facebook, Instagram and NextDoor in 2025.

PLANNED ACTIVITIES (S5.C.3):

The City will continue to implement the Current Activities and explore other means of public involvement opportunities. The public was a key stakeholder that we asked for input during the first SMAP process. Environmental justice data was incorporated in the development of the SMAP.

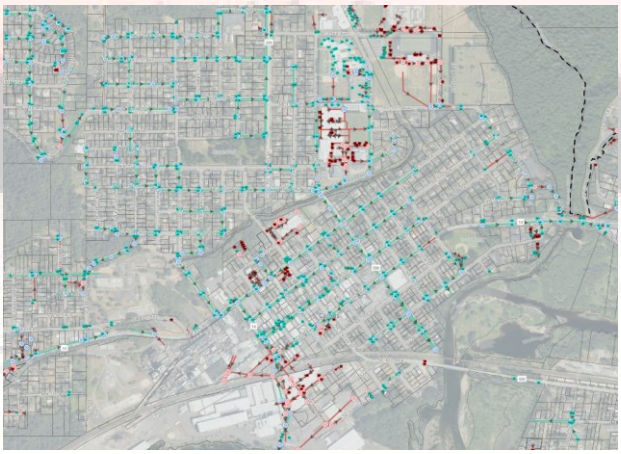
The City will continue to incorporate feedback from stakeholders in SMAP developments and decision making processes.

The City will document specific public involvement and participation opportunities provided to overburdened communities and specifically highly impacted communities.

The City will document methods used to identify overburdened communities no later than December 31, 2026.

S5.C.4 MS4 Mapping and Documentation

The City has an ongoing program for mapping and documentation of the MS4.



PERMIT REQUIREMENTS (S5.C.4):

a. Ongoing Mapping of MS4:
   - Known MS4 outfalls and known MS4 discharge points, including outfall size and material where known.
   - Receiving waters, other than groundwater.
   - Public stormwater treatment and flow control BMPs/facilities.
   - Geographic areas that do not discharge stormwater to the surface waters.
   - Tributary conveyance to all known outfalls and discharge points with a 24 inch diameter or larger, or an equivalent cross-sectional

area for non-pipe system (tributary conveyance type, material, size, associated drainage areas, land use).

- Connections between the MS4 owned or operated by the other municipalities or public entities.
- All connections to the MS4 authorized or allowed by the City after February 16, 2007.
- New Mapping requirements:
- No later than March 31, 2026, submit locations of all known MS4 outfalls according to the standard templates and format provided in the Annual Report. Report size and material of outfalls, where known.
- No later than December 31, 2026, using available, existing data, map tree canopy to support stormwater management on Permittee-owned or operated properties. Permittees shall develop and follow a methodology to intentionally identify canopy for stormwater management proposes, which may be updated annually or as needed.
- No later than March 31, 2028, implement a methodology to map and assess acreage of MS4 tributary basins to outfalls with a 24-inch nominal diameter or larger, or an equivalent cross-sectional area for non-pipe systems that have stormwater treatment and flow control BMPs/facilities owned or operated by the permittee.
- Submit with the March 31, 2028, Annual Report a map(s) (.pdf) and table (.xlsx) with a breakdown of the MS4 tributary basins quantifying estimated acres managed or unmanaged by stormwater treatment and flow control BMPs/facilities owned or operated by the Permittee.
- No later than December 31, 2028, using available, existing data map overburdened communities in relation to stormwater treatment and flow control BMPs/facilities, outfalls, discharge points, and tree canopy on Permittee-owned or operated properties.

b. The required format for mapping is electronic (e.g. Geographic Information System (GIS), CAD drawings, or other software that can map and store points, lines, polygons, and associated attributes), with fully described mapping standards.
c. Upon request, make maps available to Ecology.
d. Upon request, and to the extent appropriate, provide mapping information to federally recognized Indian Tribes, municipalities, and other Permittees. The Permit does not preclude the City from recovering reasonable costs associated with fulfilling mapping information requests by federally recognized Indian Tribes, municipalities and other Permittees.

CURRENT ACTIVITIES (S5.C.4):

The City maintains the MS4 mapping by incorporating record drawing information from new developments and correcting existing features as needed. All known MS4 outfalls (size and material) have been added to the MS4 mapping, update as needed. All known connections from the MS4 to privately owned stormwater system have been mapped. Staff are using GPS to add and adjust assets to correct locations. Desktop data entry using as-builts is being conducted to clean up the City's GIS layer. The City MS4 mapping is performed in ArcGIS.

The City will submit locations of all known MS4 outfalls according to the standard templates and format provided by Ecology.

The City is working with various mapping programs to map tree canopy to support stormwater management on Permittee-owned or operated properties.

PLANNED ACTIVITIES (S5.C.4):

The City will continue to update and maintain MS4 mapping within ArcGIS and associated applications.

The City will implement GIS capabilities on the television pipe line inspection vehicle for detailed pipe information and asset locations.

S5.C.5 Illicit Discharge and Elimination (IDDE)

Discharges from cities often include waste and wastewater from sources other than stormwater. Illicit discharges are those that enter the public storm system in two ways, (1) by direct connection of wastewater piping to storm lines; or (2) through indirect connections, such as infiltration from cracked wastewater piping, dumping of illicit material into storm drains, or accidental spills that result in wastewater flowing into storm drains.

PERMIT REQUIREMENTS (S5.C.5):

a. The program shall include procedures for reporting and correcting or removing illicit connections, spills and other illicit discharges when they are suspected or identified. The program shall also include procedures for addressing pollutants entering the MS4 from an interconnected, adjoining MS4.
   - Illicit connections and illicit discharges must be identified through, but not limited to: field screening, inspections, complaints/report, construction inspections, maintenance inspections, source control inspections, and/or monitoring information, as appropriate.

b. Inform public employees, businesses, and the public of hazards associated with illicit discharges and improper disposal of waste.

c. Implement an ordinance or other regulatory mechanism to effectively prohibit non-stormwater, illicit discharges into the MS4 to the maximum extent allowable under state and federal law.
   - The ordinance or other regulator mechanism in effect as of the effective date of this Permit shall be revised if necessary to meet the requirements of this Section no later than July 1, 2027.
   - External washdown of buildings with potential PCB containing materials shall not discharge washdown water to the MS4.

d. Implement an ongoing program designed to detect and identify non-stormwater discharges and illicit discharges and illicit connections into the MS4.
   - Implement a field screening methodology appropriate to the characteristics of the

MS4 and water quality concerns. Complete field screening for an average of 12% of the MS4 each year.

- Provide a publicly listed and publicized hotline or other telephone number for public reporting of spills and other illicit discharges.
- Ongoing training program for all municipal field staff on identification of an illicit discharge and/or connection, and on proper procedures for reporting and responding to the illicit discharge and/or connection. Provide follow-up training as needed to address changes in procedures, techniques, requirements, or staffing. Document and maintain records of the trainings provided and the staff trained.

e. Implement an ongoing program designed to address illicit discharges, including spills and illicit connections, into the MS4.

- Procedures for characterizing the nature of, and potential public or environmental threat posed by, any illicit discharges found by or reported to the City. Procedures shall address the evaluation of whether the discharge must be immediately contained and steps to be taken for containment of the discharge.

- Procedures for post-emergency clean-up following firefighting activities:
    - No later than December 31, 2026, the City shall coordinate with firefighting agencies/departments that serve the areas that discharge to the MS4 to be notified when PFAS-containing AFFFs are used during emergency firefighting activities.
    - No later than January 1, 2027, the City shall update and implement procedures to minimize discharges to the MS4 during post-emergency clean-up and disposal activities including, but not limited to, the immediate clean-up in all situations where PFAS-containing AFFFs have been used, diversions, and other measures that prevent discharges to the MS4. The City is not expected to deploy measures during an emergency.
- Procedures for tracing the source of an illicit discharge.
- Procedures for eliminating the discharge, including notification of appropriate authorities and property owners.

f. Ensure municipal staff who are responsible for identification, investigation, termination, cleanup, and reporting of illicit discharges, including spills, and illicit connections are trained to conduct these activities. Provide follow-up training as needed to address changes in procedures, techniques, requirements, or staffing. Document and maintain records of the training provided and the staff trained.

g. Recordkeeping: Track and maintain records of the activities conducted. In the Annual Report, submit data for the illicit discharges, spills and illicit connections including those that were found by, reported to, or investigated by the City during the previous calendar year.

CURRENT ACTIVITIES (S5.C.5):

The City's Illicit Detection and Discharge Elimination Ordinance (CMC 14.04) incorporates the various aspects of the Permit requirements.

The ongoing IDDE program includes procedures for addressing illicit discharges, source tracing, and eliminating the discharge.

The IDDE program continues to educate the public on the harmfulness of improper disposal of waste. An educational IDDE flyer with the hotline number is available to the public at City Hall, the Operations Center, and at tabling events at the Camas Farmers Market. The same information is available on the City's website where the public can access all year round.

The City maintains a hotline and mobile application (CamasConnect 24/7) that allows citizens to report illicit discharges/connections. Calls/complaints are routed to the appropriate staff. All reports are investigated immediately upon submission.

Outfall inspections are the chosen method for field screening assessment. The City tracks the total percentage of outfalls screened annually since the issuance of the 2019-2024 Permit.

The City inspected 21 outfalls for the IDDE screening and documented the inspections in Survey 123. Staff also completed GPS mapping of all known public outfalls and screened for illicit discharges when mapping.

Field staff are trained when first hired and then annually. Records of staff training is documented.

All inspections, investigations, illicit discharges and spill-related activities are tracked in excel spreadsheets and Customer Relationship Management (CRM) Software.

The City completed IDDE reporting data in accordance with the format provided in Appendix 12. The IDDE reporting data will be submitted with the Annual Report.

PLANNED ACTIVITIES (S5.C.5):

The City will continue to implement the Current Activities.

The City no longer uses PFAS-containing AFFFs during firefighting activities.

The City will update procedures to minimize discharges to the MS4 during post-emergency clean up and disposal activities by January 1, 2027.

S5.C.6 Controlling Runoff from Development & Construction

The City will implement, and enforce a program to reduce pollutants in stormwater runoff from new development, redevelopment, and construction site activities. The program shall apply to private and public development, including transportation projects.

PERMIT REQUIREMENTS (S5.C.6):

a. Implement an ordinance or other enforceable mechanism that addresses runoff from new development, redevelopment, and construction site projects.
   - Adopt and make effective a local program, no later than June 30, 2027, that meets the requirements of Section S5.C.6.b(i) through (iii), below, and shall apply to applications submitted:
     i. On or after July 1, 2027
     ii. Prior to January 1, 2017, that have not started construction by January 1, 2022
     iii. Prior to July 1, 2022, that have not started construction by July 1, 2027
     iv. Prior to July 1, 2027, that have not started construction by July 1, 2032

b. The ordinance shall include, at a minimum:
   - The Minimum Requirements, thresholds, and definitions in Appendix 1, or the 2019 Appendix 1 amended to include the changes identified in Appendix 10, or Phase I program approved by Ecology and amended to include Appendix 10, for new development, redevelopment, and construction sites. Adjustment and exceptions criteria equivalent to those in Appendix 1 shall be included. Such local requirements and thresholds shall provide equal protection of receiving waters and equal levels of pollutant control to those provided in Appendix 1.
   - The local requirements shall include the following requirements, limitations, and criteria that, when used to implement the minimum requirements in Appendix 1 will protect water quality, reduce the discharge of pollutants to the MEP, and satisfy the State requirements under chapter 90.48 RCW to apply AKART prior to discharge:
     i. Site planning requirements
     ii. BMP selection criteria
     iii. BMP design criteria
     iv. BMP infeasibility criteria
     v. LID competing needs criteria
     vi. BMP limitations
   - The legal authority, through the approval process for new development and redevelopment, to inspect and enforce maintenance standards for private stormwater facilities that discharge to the MS4.

c. The program shall include a permitting process with plan review, inspection and enforcement capability to meet the standards listed below, for both private and public projects, using qualified personnel. At a minimum, the program shall be applied to all sites that that meet the minimum thresholds adopted pursuant to S5.C.6.b.i.
   - Review all stormwater site plans for proposed development activities.
   - Inspect, prior to clearing and construction, all permitted development sites that have a high potential for sediment transport.
   - Inspect all permitted development sites during construction to verify proper installation and maintenance of required

erosion and sediment controls. Enforce as necessary based on the inspection.

- Inspect all stormwater treatment and flow control BMPs/facilities, and catch basins, in new residential developments at least twice per 12-month period with no less than 4 months between inspections, until 90% of the lots are constructed (or when construction has stopped and the site is fully stabilized), to identify maintenance needs and enforce compliance with maintenance standards as needed.
- Inspect all permitted development sites upon completion of construction and prior to final approval or occupancy to ensure proper installation of permanent stormwater facilities. Verify that a maintenance plan is completed and responsibility for maintenance is assigned for stormwater treatment and flow control BMPs/facilities. Enforce as necessary based on the inspection.
- Compliance by achieving at least 80% of scheduled inspections.
- Include a procedure for keeping records of inspections and enforcement actions by staff, including inspection reports, warning letters, notices of violations, and other enforcement records. Records of maintenance inspections and maintenance activities shall be maintained.
- An enforcement strategy shall be developed and implemented to respond to issues of non-compliance.

d. Make available the link to the electronic Construction Stormwater General Permit Notice of Intent (NOI) form and Industrial Stormwater General Permit NOI form. Continue to enforce local ordinances controlling runoff from sites that are also covered by stormwater permits issued by Ecology.

e. Ensure that municipal staff whose primary job duties are implementing the program to control stormwater runoff from new development, redevelopment, and construction sites, including permitting, plan review, construction site inspections, and enforcement, are trained to conduct these activities. Follow-up training must be provided as needed to address changes in procedures and techniques or staffing. Document and maintain records of the training provided and the staff trained.

CURRENT ACTIVITIES (S5.C.6):

The City has an ongoing program for the permit process with plan review, inspections and enforcement capabilities. All inspections are documented.

The City's Stormwater Control Ordinance (CMC 14.02) was adopted on February 1, 2010 and revised November 21, 2016, and incorporates the various Permit requirements.

The City adopted (CMC 14.02.050) the latest Stormwater Management Manual for Western Washington (SWMMWW) to help control runoff from developments and construction sites. The requirements, limitations, and criteria of the 2024 SWMMWW will protect water quality, reduce the discharge of pollutants to the MEP, and satisfy State AKART.

All applicable field staff are trained in erosion control inspection and have a Certified Erosion and Sediment Control Lead (CESCL) certification.

The City continues to refine the tracking mechanism for inspections and enforcements, development inspection procedures and site plan review standards.

The City inspects all stormwater treatment and flow control BMPs/facilities, and catch basins, in new residential developments at least twice per 12-month period with no less than 4 months inspections, until 90% of the lots are constructed (or when construction has stopped and the site is fully stabilized), to identify maintenance needs and enforce compliance with maintenance standards as needed.

PLANNED ACTIVITIES (S5.C.6):

The City will continue to implement the Current Activities.

S5.C.7 Stormwater Management for Existing Development

The City will implement a Program to control or reduce stormwater discharges to waters of the State from areas of existing development. The Program shall aim to focus on strategic stormwater investments over longer planning timeframes.

PERMIT REQUIREMENTS (S5.C.7):

a. Implement stormwater facility retrofits, or tailored SWMP actions that meet the criteria described in Appendix 12, using one or a combination of the following:
   i. Strategic stormwater investments identified in Stormwater Management Action Plan(s) (SMAP) or similar stormwater planning process and/or
   ii. Opportunistic stormwater investments identified by leveraging projects outside of SMAP areas to improve stormwater management infrastructure
b. With each Annual Report, the City shall provide a list of planned individual projects scheduled for funding or implementation during this Permit term for the purpose of meeting the assigned equivalent acreage in Appendix 12. Equivalent acreage for the City of Camas is 4.4 acres.
c. No later than March 31, 2028, Permittees shall fully fund, start construction, or completely implement project(s) that meet the assigned equivalent acreage and submit documentation with the Annual Report, due March 31, 2028.
d. Permittees may collaborate to meet regional goals.
e. The City shall report the amount of estimated or projected equivalent acres managed by stormwater facility retrofits for the next Permit term (2029-2032) by March 31, 2028.

CURRENT ACTIVITIES (S5.C.7):

The City has been awarded two Water Quality Combined Financial Assistance Grants from the Department of Ecology. The grants fund the City of Camas Crown Park Regional Stormwater Retrofit Project and the City of Camas Downtown Regional Stormwater Retrofit Project. The grants are to help fund planning and design of the two projects. The projects will capture and treat over 200 acres of minimally treated stormwater.

Due to timing of grant applications and the current timeline for the planning and design phase of the identified SMAP projects, it is undetermined if the grant funded projects identified in the SMAP process will count towards this current permit terms equivalent acres.

The City is working on prioritizing rehabilitation and retrofit projects on public stormwater facilities.

The city is currently implementing street sweeping, conveyance line cleaning and focused source control inspections in the priority catchment area to contribute towards the City's 4.4 acres.

PLANNED ACTIVITIES (S5.C.7):

The City will look for opportunities to meet the assigned equivalent acreage requirements.

S5.C.8 Source Control Program for Existing Development

The City shall implement a program to prevent and reduce pollutants in runoff from areas of existing development that discharge to the MS4. The program shall include application of source control BMPs, inspections, and enforcement.

PERMIT REQUIREMENTS (S5.C.8):

a) Enforce ordinance(s), or other enforceable documents, requiring the application of source control BMPs for pollutant generating sources associated with existing land uses and activities.
   - The City shall update and make effective the ordinance(s), or other enforceable documents, as necessary to meet the requirements of S5.C.8 by August 1, 2027.

b) Implement a program to identify publicly and privately owned institutional, commercial, and industrial sites which have the potential to generate pollutants to the MS4. Permittees shall update the inventory at least once every 5 years. The inventory shall include:
   i. Businesses and/or sites identified based on the presence of activities that are pollutant generating and;
   ii. Other pollutant generating sources, based on complaint response, such as: home-based businesses and multifamily sites.

c) Implement an inspection program, performed by qualified personnel, for sites identified in the inventory.

i. All identified sites with a business address shall be provided information about activities that may generate pollutants and the source control requirements applicable to those activities. This information shall be provided by mail, telephone, electronic communications, or in person. This information may be provided all at one time or spread out over the permit term to allow for tailoring and distribution of the information during site inspections.

ii. Annually complete the number of inspections equal to 20% of the businesses and/or site listed in their source control inventory to assess BMP effectiveness and compliance with source control.

iii. Inspect 100% of sites identified through credible complaints.

d) Implement a progressive enforcement policy that requires sites to comply with stormwater requirements within a reasonable time period.

e) Ensure municipal staff who are responsible for implementing the source control program are trained to conduct these activities. The ongoing training program shall cover the legal authority for source control, source control BMPs and their proper application, inspection protocols, lessons learned, typical cases, and enforcement procedures. Provide follow-up training as needed to address changes in procedures, techniques, requirements, or staff. Document and maintain records of the training provided and the staff trained.

CURRENT ACTIVITIES (S5.C.8):

The City has created a Business Inventory List of publicly and privately owned institutional, commercial, and industrial sites in accordance with Appendix 8 of the Permit. The City has adopted a Water Resources Protection ordinance CMC14.04.

The City has entered an Interlocal Agreement with Clark County Public Health, Ecology, and Washougal to fund a full-time employee to assist with City source control inspections. Postcards explaining the Source Control Program and a link to the Source Control webpage on City's website were sent to all businesses on the Business Inventory List in 2023.

At least 20% of businesses are inspected annually, with an emphasis on businesses within the priority catchment area.

All credible complaints are inspected immediately by City staff.

PLANNED ACTIVITIES (S5.C.8):

The City has implemented a business inspection program. City staff will follow up on all public requests for source control issues as well as any follow up issues during initial source control inspections.

Source Control inventory was updated in February 2025. New outreach materials will be produced for businesses and/or sites for specific types of job functions.

Review City ordinances and other enforceable documents by August 1, 2027.

Staff will continue to participate in trainings.

S5.C.9 Operations & Maintenance

The City developed and implemented an Operations and Maintenance (O&M) program to regulate and conduct maintenance activities to prevent or reduce stormwater impacts.

PERMIT REQUIREMENTS (S5.C.9):

a) Implement maintenance standards that are as protective, or more protective, of facility function than those specified in the SWMMWW. Maintenance standards shall be developed for facilities that do not have maintenance standards. No later than June 30, 2027, maintenance standards shall be updated to meet Permit requirements.
   i. Unless there are circumstances beyond the City's control, when an inspection identifies an exceedance of the maintenance standards, maintenance shall be performed:
      - Within 1 year for typical maintenance of facilities, except catch basins.
      - Within 6 months for catch basins.
      - Within 2 years for maintenance that requires capital construction of less than $25,000.
   ii. For each exceedance of the required timeframe, the Permittee shall document the circumstances and how they were beyond their control.

b) Implement a stormwater facility maintenance program for facilities regulated by the City.
   i. The program should include provisions to verify adequate long-term O&M of stormwater treatment and flow control BMPs/facilities that are permitted and constructed pursuant to S5.C.6.c and shall be maintained in accordance with S5.C.9.a.
      - Implementation of an ordinance or other enforceable mechanism that clearly identifies the party responsible for maintenance, requires inspection of facilities, and establishes enforcement procedures.
      - Annual inspections of all private stormwater treatment and flow control BMPs/facilities that discharges to the MS4 and were permitted by the City, including those permitted in accordance with requirements adopted pursuant to the 2007-2019 Permits.
   ii. Compliance with the inspection requirements by achieving at least 80% of required inspections.
   iii. The program shall include a procedure for keeping records, warning letters, notices of violations, and other enforcement records. Records of maintenance inspections and maintenance activities shall be maintained.

c) Implement a stormwater facility maintenance program for facilities owned or operated by the City.
   i. Annual inspection of all municipally owned or operated stormwater treatment and flow control BMPs/facilities and taking appropriate maintenance actions.
   ii. Spot check potentially damaged stormwater treatment and flow control BMPs/facilities after major storm events. Conduct repairs or take appropriate maintenance action in accordance with maintenance standards.
   iii. Inspect all catch basins and inlets owned or operated by the City every two years. Clean catch basins if the inspection indicates cleaning is needed to comply with maintenance standards established in the SWMMWW.

iv. Compliance by achieving 95% of required inspections.

d) No later than December 31, 2027, implement practices, policies, and procedures to reduce stormwater impacts associated with runoff from all lands owned or maintained by the City, and road maintenance activities under the functional control of the City. Lands owned or maintained by the City include, but are not limited to: streets, parking lots, roads, highways, buildings, parks, open spaces, road rights-of-way, maintenance yards, and stormwater treatment and flow control BMPs/facilities.

Program shall address the following activities:

- Pipe cleaning
- Cleaning of culverts that convey stormwater in ditch systems
- Ditch maintenance
- Street cleaning
- Road repair and resurfacing, including pavement grinding
- Snow and ice control
- Utility installation
- Pavement striping maintenance
- Maintaining roadside areas, including vegetation management
- Dust control
- Application of fertilizers, pesticides, and herbicides
- Sediment and erosion control
- Landscape maintenance and vegetation disposal
- Trash and pet waste management
- Building exterior cleaning and maintenance
    - For City owned buildings built or renovated between 1950-1980, update policies, practices, or procedures to include Source Control BMPs to minimize PCBs from entering the MS4. The City shall not discharge washdown water to the MS4 if the building is confirmed or suspected to have PCB-containing materials.
- Preparing City owned buildings for renovation or demolition
    - Update policies, practices, or procedures to include Source Control BMPs for building materials to prevent PCBs from entering the MS4 in preparation for and during demolition and renovations.

e) No later than July 1, 2027, develop and implement a municipal street sweeping program to focus on priority areas and times during the year that would reasonably be expected to result in the maximum water quality benefits to receiving waters. The following program elements shall be included:

- Priority areas: curbed municipal streets that discharge to outfalls and meet either/both of high traffic streets, such as arterials or collectors and/or streets that serve commercial or industrial land use areas.
- Program timing: sweep priority areas at least once between July and September of each year and at least two additional times a year.

    - Compliance is sweeping at least 90% of priority areas each sweeping event.
- Operational Procedures: follow equipment design and performance specifications.
- Street waste disposal: dispose of sweeper waste in accordance with Appendix 6 – Street Waste Disposal.
- Reporting: no later than March 31, 2028 submit with the annual report:
    - Priority areas swept identified on a map
    - Sweeping dates
    - Sweeping frequency
    - Type of sweeper
    - Total curb miles of priority areas and curb miles swept
    - Approximation of debris removed

f) Implement a Stormwater Pollution Prevention Plan (SWPPP) for all heavy equipment maintenance or storage yards and material storage facilities. SWPPPs shall include the following information at a minimum:
- A detailed description of the operational and structural BMPs in use at the facility and a schedule for implementation of additional BMPs when needed.
- At a minimum, annual inspections of the facility, including visual observations of discharges, to evaluate the effectiveness of the BMPs, identify maintenance needs, and determine of additional or different BMPs are needed.
- Inventory of materials and equipment stored on-site.
- A site map showing facility stormwater drainage, discharge points, and areas of potential pollutant exposure.
- A plan for preventing and responding to spills at the facility which would results in an illicit discharge.

g) Implement an on-going training program for staff whose primary construction, operations, or maintenance job functions may impact stormwater quality. The training program should address the importance of protecting water quality, operation and maintenance standards, inspection procedures, relevant SWPPPs, selecting appropriate BMPs, street sweeper operation, ways to perform their job activities to prevent or minimize impacts to water quality and procedures for reporting water quality concerns. Follow-up training shall be provided as needed to address changes in procedures, techniques, requirements, or staffing. Document and maintain records of training provided and staff trained.

h) Maintain records of activities conducted by the City to meet the requirements of this section.

CURRENT ACTIVITIES (S5.C.7):

The Operations storm maintenance crew has an ongoing program to inspect and clean catch basins, and to inspect and maintain public stormwater facilities. Street sweeping is done on a regular basis. There is a list of 'Hot Spots' that are checked after all major storm events.

The City has an ongoing program to inspect private stormwater facilities and coordinate with private owners for maintenance.

The City has an ongoing training program for employees, who encounter stormwater on a regular basis, to learn the importance of protecting water quality.

A SWPPP was developed for the City Operations Center to comply with permit requirements. This is a dynamic document; contents are updated as needed. The SWPPP was updated in December 2022.

The City updated the maintenance standards in June 2022.

The City has partnered with other local jurisdictions to support a Catch Basin Cleaning Assistance Program which allows private owners to pay only $50 per catch basin cleaning. The program is presented to HOA's and businesses during stormwater facility inspections, Camas Farmers Market and Source Control Inspections.

PLANNED ACTIVITIES (S5.C.7):

The City will continue to implement current activities.

The City will continue to inspect and maintain every public catch basin annually.

The City will continue to review the inventory of legacy stormwater facilities for rehabilitation and retrofit opportunities.

The City will continue to implement ESRI applications for more efficient and streamlined field operations and inspections.

The City will update policies, practices and procedures to include source control BMPs for building materials to prevent PCBs from entering the MS4.

Complete a new SWPPP for the Buma property, home of the stormwater maintenance crew.

The city will adjust and improve the street sweeping program to meet the requirements of S5.C.9 no late than July 1, 2027.

The City will review and update, if necessary, any maintenance standards identified in the SWMMWW no later than June 30, 2027.

S8 Monitoring & Assessment

During the 2019-2024 Permit term, the City chose S8.A.2 Regional Status and Trends Monitoring Option in which the City made a one-time payment into the Stormwater Action Monitoring (SAM) collective fund to implement regional small streams and marine nearshore areas status and trends monitoring in urban streams in the Lower Columbia River basin.

The City chose to continue this commitment during the current Permit term. The annual payments into the collective fund are due on or before August 15 each year beginning in 2025.

During the 2019-2024 Permit term, the City chose S8.B Effectiveness Studies Option in which the City made a one-time payment into the collective fund for Stormwater Action Monitoring (SAM) to

implement effectiveness studies and source identification studies.

The City chose to continue this commitment during the current Permit term. The annual payments into the collective fund are due on or before August 15 each year beginning in 2025.

The City's 2025 contribution for Regional Status and Trends Monitoring was $8,993 and for Stormwater Management Program (SWMP) Effectiveness and Source Identification Studies was $10,083.

S9 Reporting Requirements

a) An annual report is required to be submitted no later than March 31st of each year of the Permit, beginning in 2025. The report covers the reporting period from January 1st through December 31st unless otherwise specified. Annual Reports shall be submitted electronically using Ecology's Water Quality Permitting Portal (WQWebPortal) available on Ecology's website.

b) The City is required to keep all records related to the Permit and the SWMP for at least five (5) years.

c) All records related to this permit and the City's SWMP shall be available to the public at reasonable times during business hours. A copy of the most recent annual report will be provided to any individual or entity, upon request.
   - A reasonable charge may be assessed for making photocopies of records.
   - City may require reasonable advance notice of intent to review records related to this permit.

d) The annual report shall include the following:
   - The current Stormwater Management Plan (SWMP);
   - Submittal of the annual report form as provided by Ecology pursuant to S9.A, describing the status of implementation of the requirements of this permit during the reporting period.
   - Attachments to the annual report form including summaries, descriptions, reports, and other information as required, or as applicable, to the requirements of this permit during the reporting period.
   - If applicable, notice that MS4 is relying on another entity to satisfy any of the obligations under this permit.
   - Certification and signature pursuant to G19.D, and notification of any changes to authorization pursuant to G19.C.
   - A notification of any annexations, incorporations or jurisdictional boundary changes resulting in an increase or decrease in the Permittee's geographic area of permit coverage during the reporting period.

e) No later than March 31st of each year, the new annual report and the updated SWMP will be available to the public on the City's webpage at https://www.cityofcamas.us/publicworks/page/npdes-permit

Subject:	DRAFT Economic Conditions and Opportunities Analysis, City of Camas Comprehensive Plan Update

Section 1. Economic Profile Analysis

Introduction

The City of Camas Comprehensive Plan update offers an opportunity to refine **the Economic Development Element** vision, goals, and policies for the next two decades from 2025 to 2045 (current plan was adopted in 2015). The Comprehensive Plan is a foundational document that provides a vision and policy direction for managing growth and development while considering effects on the built and natural environment and public facilities. This guiding document provides clear linkages with future investments, priorities, land use changes, and can lead to revisions of codes and regulations. The updated plan must be responsive to changing community dynamics, the strategic vision established by the City Council and include focused goals to address social inequities and climate change.

The current Economic Development Element aims to include goals and policies that help ensure the economic development in the City of Camas provides a range of employment opportunities throughout the City. The economic health and well-being of the City are tied to commitments to promote a wide range of employment opportunities for the citizens of the community and to provide a setting and quality of life that attracts businesses and residents.

The approach for updating the Economic Development Element will be informed by community input, state legislation requirements, priorities for the city, a comprehensive housing inventory and analysis based on the best available existing data. This Economic Profile Analysis integrates the best available information from public and private data sources to assess the city's economic trajectory, opportunities, challenges, and economic conditions and competitiveness. The insights from this analysis help build a factual basis for the economic development goal and policy updates.

Planning Context

Growth Management Act Requirements

Comprehensive planning in Washington is guided by the Growth Management Act (GMA), a series of statutes first adopted in 1990 which requires cities and towns within eighteen of the state's most populous counties to fully plan for future growth (RCW 36.70A). Given Clark County and the City of Camas population size, both jurisdictions must address all the mandatory comprehensive plan elements, including land use, housing, capital facilities, utilities, and transportation. Economic development is included as a mandatory element (RCW 36.70A.070(7-8)), but since no state funds have been allocated to assist jurisdictions in creating these plans, they are currently optional.

Economic Development Planning in Washington

The City of Camas is including an Economic Development Element as part of the current comprehensive plan update process, following the GMA Goal 5 to:

> *"Encourage economic development throughout the state that is consistent with adopted comprehensive plans, promote economic opportunity for all citizens of this state, especially for unemployed and for disadvantaged persons, promote the retention and expansion of existing businesses and recruitment of new businesses, recognize regional differences impacting economic development opportunities, and encourage growth in areas experiencing insufficient economic growth, all within the capacities of the state's natural resources, public services, and public facilities[1]." (RCW.36.70A.070(7))*

In Washington, state provisions set limits on what actions cities and counties can take to support economic development, which often guides the strategies, goals, objectives, and policies that jurisdictions establish in economic development comprehensive plan elements. Article 8, Section 7 of the state constitution specifies that "No county, city, town or other municipal corporation shall hereafter give any money, property, or loan its money, or credit to or in aid of any individual, association, company or corporation, except for the necessary support of the poor and infirm."2 Given this limitation, cities generally cannot directly use public funds to attract private development and instead target policies that facilitate economic growth through land use, infrastructure, tourism, marketing, and partnerships with nonprofit community-based organizations.

[1] In 2023, E2SHB 1181 updated the language of Comprehensive Plan goals (including economic development) to reflect climate change and resiliency goals.

[2] RCW 35.21.703 does allow cities to contract with nonprofit corporations to advance economic development.

The City of Camas's first Comprehensive Growth Management Plan was adopted in 1994, which was replaced by the current Comprehensive Plan in June 2016 to fulfill the requirements of Washington State's Growth Management Act (GMA). The GMA is a series of state statutes first adopted in 1990 aimed at managing population growth, particularly in the state's fast-growing areas. In Clark County, RCW 36.70A.040 requires all cities to "fully plan" for the elements of a Comprehensive Plan, including land use, housing, capital facilities, utilities, transportation, and climate change.3 The current update process is part of a period update also required by the GMA, as part of an established schedule by County.

Regional Economic Development Planning

Cities in Washington also coordinate with county-level Associate Development Organizations (ADOs) that represent each of Washington's counties, funded in part by the state Department of Commerce. The Columbia River Economic Development Council (CREDC) represents Clark County and presents a baseline of goals and objectives for the region. Their current 2018-2023 Comprehensive Economic Development Plan outlines goals and actions based on a vision and set of values and guiding principles identified through extensive engagement with local partners.

Exhibit 1. Goals and Objectives from 2018-2023 CREDC Comprehensive Economic Development Plan
Source: CREDC

1. Expand the Existing Base	2. Support People	3. Create Place
• Become Industry Experts • Strategically Market Industry Clusters • Build a Startup Ecosystem	• Foster Skills Development • Prepare Youth for Economic Opportunity • Launch a Brain Gain Initiative • Promote an Ethical and Socially Just Society through an Intentional Commitment to Inclusion, Equity, and Diversity	• Each Community Creates a Placemaking Strategy • Embrace Economic Opportunity in our Urban Center • CREDC Tells the Story of Place • Make Employment Areas Desired by Industry Clusters Shovel Ready • Determine all Transportation Needs on a Regional Level Specifically to Support Economic Development

CREDC is now in the process of updating its 2018-2023 priorities and identifying new strategic actions to respond to Clark County's quickly changing demographic and economic profile, with a new plan anticipated to provide further guidance in 2024.

Implications for Growth Management

While economic development elements are currently optional under the GMA, aspects of the required land use and housing elements are linked to economic development and the associated

[3] The GMA includes other optional elements for economic development, parks and recreation, conservation, energy, sub areas, and ports.

current conditions within jurisdictions. Cities fully planning for adequate land capacity to meet the needs of the community must understand their current employment base, development trends, workforce housing availability, income segments of the population, and future projections.

State statute requires that land use elements must *"[designate] the proposed general distribution and general location and extent of the uses of land, where appropriate, for agriculture, timber production, housing, commerce, industry, recreation, open spaces and green spaces, urban and community forests within the urban growth area." (36.70A.070(1)) This includes population densities, building intensities, and estimates of future population growth. RCW 36.70A.070(2)(d) requires that a housing element "Makes adequate provisions for existing and projected needs of all economic segments of the community, including... consideration of housing locations in relation to employment location."*

To fully plan for growth and meet community needs in compliance with state provisions, more suburban cities like Camas that are growing in terms of employment must understand the dynamics of the local and regional economy, consider where employment is concentrated and how residents and workers access employment opportunities, what industries are growing or declining, and whether there is sufficient space to fulfill anticipated employment land needs alongside other uses.

Buildable Land Capacity and Employment Capacity

In 1997, Washington's Review and Evaluation Program, also known as the "Buildable Lands Program," was added to the GMA (RCW 36.70A.215). It requires some counties and cities within them to establish their own buildable lands programs (including Clark County) and produce a report every eight years. In 2017, the Washington legislature passed E2SSB 5254 which amended the buildable lands statute and required counties to *"determine whether [its] cities are achieving urban densities within urban growth areas by comparing growth and development assumptions, targets, and objectives contained in the countywide planning policies and the county and city comprehensive plans with actual growth and development that has occurred"* (RCW 36.70A.215).

RCW 36.70A.215 also includes provisions about determining the development capacity of land and identifying sufficient land for employment. Specifically, jurisdictions should identify the "*amount of land developed for commercial and industrial uses within the urban growth area since the adoption of a comprehensive plan... [and] the amount of land needed for commercial, industrial, and housing for the remaining portion of the twenty-year planning period.*"[4]

[4] The state's methodology used to evaluate employment land does not differentiate land by any market criteria such as size, infrastructure presence, cost, ownership, or availability.

In the last Comprehensive Plan update in 2016, Clark County adopted two planning assumptions (Resolution 2016-03-01) anticipating 100,200 new jobs in the County and a jobs-to-housing ratio of 1:1. The County's 2015-2035 Comprehensive Plan projected that based on the Vacant Buildable Lands Model (VBLM) this would include:

- 75,847 new jobs from vacant buildable lands;
- 16,775 jobs accommodated through redevelopment; and
- 7,400 public sector jobs on publicly owned parcels not included in the VBLM.

Clark County is now updating its VBLM as a part of their 2025 periodic update of their Comprehensive Plan. Exhibit 2 below shows the County's current allocation of jobs for the Camas Urban Growth Area (UGA) and land capacity in the interim planning analysis. This has been slightly modified since the County's 2020 Buildable Lands Report, which identified 963 net buildable acres (296 on commercial land, 667 on industrial land) in the Camas UGA (Exhibit 3).

Exhibit 2. Employment Capacity and Allocation by UGA, Clark County[5]
Source: Clark County Population, Housing and Employment Allocation. Vacant Buildable Lands Model (VBLM). Urban Growth Area (UGA).

Clark County's Buildable Lands Report, 2022, Key Findings:

Clark County's Buildable Lands Report was adopted in June 2022 to update the methodology and Vacant Buildable Lands Model (VBLM). The report found that:

Based on employment growth through 2020, redevelopment, and public sector job assumptions, the Clark County Buildable Lands Report indicates that there is sufficient employment capacity for employment growth in the county through 2035.

Clark County added 12,700 jobs in 2016-2020 out of its target from the 2015-2035 Plan of adding 100,200 jobs by 2035. **Therefore anticipating 87,500 more jobs to be added by 2035 in Clark County**.[6] Of this total, 72,878 jobs are expected to be accommodated on vacant buildable lands and the remainder through redevelopment or public sector employment.

The Camas UGA has the second largest share of total projected jobs in Clark County after the City of Vancouver and the Vancouver Unincorporated Urban Area (U). The City's UGA is expected to accommodate 11,921 jobs, with half of new employment on industrial land and half on commercial.

There are 963 total net buildable acres of employment lands identified in the Camas UGA; 30% (296 net acres) are commercial land, and 70% (667 net acres) are industrial land.

JURISDICTION	2023-2045 EMPLOYMENT ALLOCATION	2023 VBLM CAPACITY
Camas UGA	11,528	11,363
UGA TOTAL	65,071	65,091

[5] The County total estimate is 88,100 jobs accounting for government, construction, rural, and work from home jobs.

[6] Clark County Community Development, "Clark County Buildable Lands Report," June 2022. The Buildable Lands Report must meet the Washington State requirements described under RCW 36.70A.215.

Exhibit 3. Commercial and Industrial Land Capacity and Employment Capacity Estimates, by Clark County Jurisdiction, UGA, or Unincorporated Urban Area, 2020
Source: Clark County Buildable Lands Report.
Note: The calculation from gross to net acres involves several factors, including infrastructure and land constraints

Jurisdiction	Commercial			Industrial			Total Jobs
	Gross Acres	Net Acres	Jobs	Gross Acres	Net Acres	Jobs	
Battle Ground UGA	643	395	7,881	157	71	643	8,524
Camas UGA	452	296	5,920	1,398	667	6,001	11,921
La Center UGA	115	79	1,573	64	34	308	1,881
Ridgefield UGA	374	252	5,031	806	418	3,762	8,793
Vancouver	433	304	6,089	2,758	1,470	13,225	19,314
Vancouver (U)	638	444	8,886	1,710	953	8,579	17,465
Washougal UGA	165	114	2,281	509	262	2,362	4,643
Woodland UGA	-	-	-	-	-	-	-
Yacolt UGA	5	4	81	49	29	256	337
Urban Total	**2,825**	**1,888**	**37,742**	**7,451**	**3,904**	**35,136**	**72,878**

Notes: A – Employment growth target for 2035 set by Clark County Council Resolution 2016-03-01.
B – Urban Total includes capacity in incorporated cities/towns and their unincorporated urban areas.
C – Unincorporated urban area is designated with a (U).

Clark Countywide Planning Policies

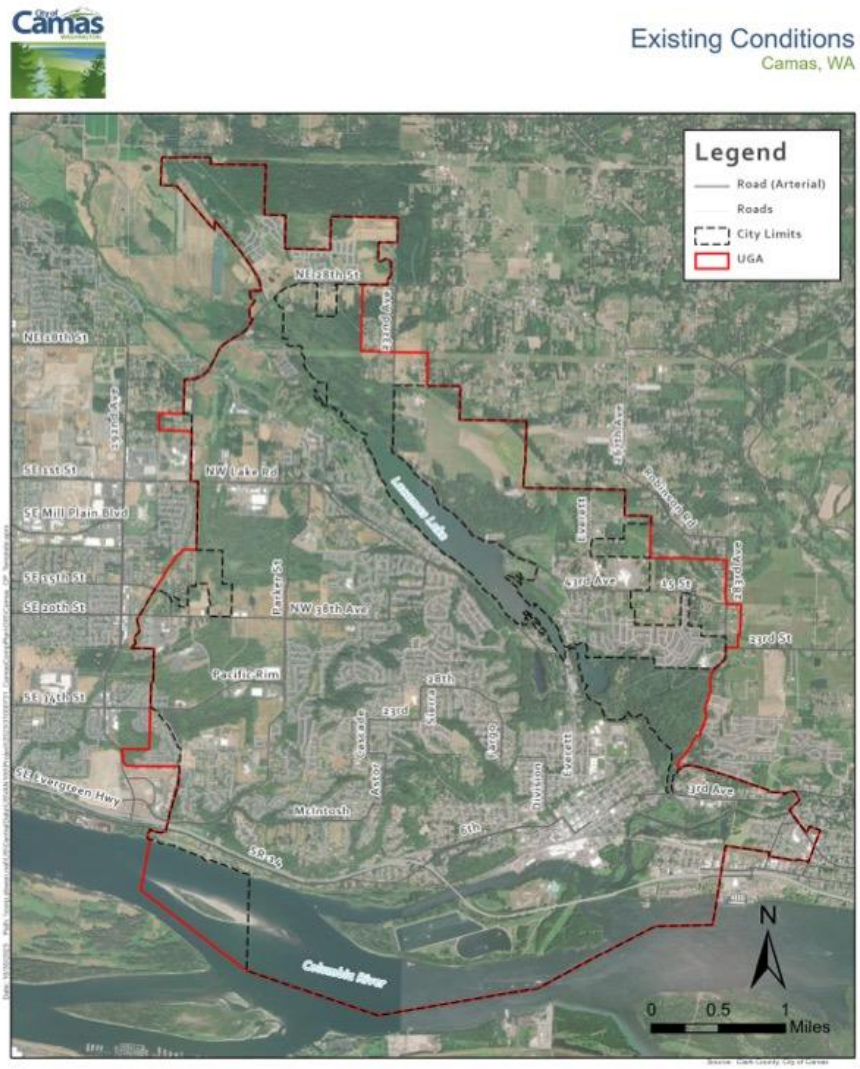
The Clark Countywide Planning Policies provide guidance on economic development across incorporated and unincorporated areas of the County (the County also distinguishes policies specifically for unincorporated areas, but not for jurisdictions and their UGAs). These policies (adopted in 2015) are currently being updated. The updated version will be reviewed as a part of the policy and goal development stage of the Comprehensive Plan update.

City of Camas Profile

More than 10,000 years ago, Native Americans occupied the Columbia River Valley in the area where Camas is now situated. Before Camas was incorporated, a paper mill owned by the LaCamas Colony Company was established in 1883 to help supply newsprint for The Oregonian. Shortly thereafter, the City of Camas became an incorporated city in 1906. The City is named after the camas lily, a deep blue flowered plant with edible onion-like bulbs valued by various Columbia river Native American Tribes.[7] The paper mill expanded in the early 20th Century

[7] City of Camas history: https://www.cityofcamas.us/community/page/camas-history

playing an important role in the local economy and grew to become Clark County's largest manufacturing company with 2,700 employees by 1971.[8] Located in the western edge of Downtown Camas along the Columbia River, the mill then experienced a downturn beginning in the 1980s that continued into the 21st Century, resulting in a reduced workforce. More recently, in 2018, the mill now owned by Georgia-Pacific, shut down facilities and all but one of its paper machines and downsized its workforce to roughly 150 workers.



The early economy in Camas was at first dominated by manufacturing but has shifted and diversified over time. The 2015 Comp Plan describes a transition where the City's past economic health was closely tied to the paper mill and then shifted to become more diversified supporting many technology and manufacturing firms, as well as a growing school system and professional offices. In the last four decades, the family-friendly City with close ties to the Portland Metropolitan Region has continued to attract more residents especially from 1990 to 2000 by almost doubling in size to almost 13,000 people, increasing to a little over 19,000 people in 2010, and then reaching 27,420 people by 2023. Similar to the City of Vancouver, Camas has experienced high population growth over the last two decades, with an average annual growth rate of 5.2% which is double the rate in Clark County and Washington State.

Today, the City of Camas is a highly desirable place to live, offering a prime location nearby the growing cities and employment centers of Vancouver and Portland, and the smaller cities of Washougal and Battle Ground in south Clark County. The City of Camas is sandwiched between the City of Vancouver (sharing a border on the west side of Camas) to the west and the City of Washougal to the east. At a regional level, the City is interconnected to the Portland Metropolitan region, located northeast of Portland (see map below).

Camas has been working to advance its economic development goals in recent years while investing in quality-of-life amenities that make it as competitive location for attracting workers and residents. The Port of Camas-Washougal is currently working towards a catalytic new project on the waterfront which broke ground in 2023; once completed this effort will bring new mixed-use residential development with apartments, retail, restaurants, and recreational space to the area to contribute to a growing sense of local identity. The City has also been expanding its inventory of parks space by leveraging the County's Legacy Lands program to expand its offerings of natural areas and recreation facilities. As larger economic trends increase locational flexibility (especially for professional services and traditionally office-based jobs), these types of investments will be critical for cities in the region to continue drawing in and retaining a residential base and workforce.

Exhibit 4. Site Location Map, City of Camas
Source: WSP, City of Camas

The following economic focused analysis helps build up the understanding of the city's economy, real estate market and demographics, and serves as a tool that can be leveraged to shape the city's economic development vision. Cities fully planning for adequate land capacity to meet the needs of the community must understand their current base of employment, development trends, workforce housing availability, income segments of the population, and future projections.

Summary of Demographic and Economic Trends

A summary of key findings from this Economic Development Element analysis is provided below to help describe key insights regarding the economic context, economic opportunities and

challenges, and to inform Comprehensive Plan policy updates. The next section provides the full results and detail regarding these findings.

Community Demographic Trends

- **Camas had a median age of 40 years in 2022, with a growing share of residents aged 60 years and over.** This group typically represents late-career workers or retirees. Median age in Camas is higher than Clark County overall and quickly growing since 2012, likely indicating a combination of natural growth and in-migration of older adults.
- **Camas has a higher share of residents 25 and over with bachelor's degrees and higher compared to Clark County or Washington State,** with 79% of residents holding these degrees in 2022. This share of residents with bachelor's degrees or higher rose quickly from only 37% in 2012. Likewise, the City has a shrinking share of residents 25 and over with a high school degree or less.
- **Median household income for all households in Camas was $133,000 in 2022, higher than Clark County or Washington State.** Since 2012, median income for residents of Camas increased by about 30% (in nominal dollars, not adjusted for inflation), more than either the County or State (both of which increased by about 20%).
- **The share of residents living below the poverty threshold determined by the US Census was lower in Camas compared to Clark County and Washington in 2022**. The share of residents living below poverty in the City decreased by 8 percentage points since 2012, which likely reflects new growth in high-income households earning $150,000 or more.

Economic Context

- **The City of Camas has seen generally positive trends in employment growth over the last two decades,** with notable increases in the number of workers in 2005, 2010, and 2016. Comparatively, Clark County overall had fluctuations in employment growth in the wake of the 2008 recession and at the onset of the COVID-19 in 2020. The County has also seen a fast rebound from pandemic trends, seeing roughly 6% positive growth between 2020 and 2021.
- **The current employment to housing ratio in Camas was 1.0 in 2021, meaning that there is about one employee working in the City for every housing unit.** This ratio indicates that Camas has well balanced housing stock to accommodate workers in the City that will be important to maintain as it grows in the coming years.
- **In 2021, the top five industries by employment in Camas were Finance and Insurance; Manufacturing; Educational Services; Professional, Scientific, and Technical Services; and Wholesale Trade.** In the County overall in 2021, four of these five top industries paid above average wages (all except Educational Services paid below average wages). Finance and Insurance was the City's fastest growing industry (with an average annual growth rate of about 33%). Other top industries saw more moderate increases except for Manufacturing, which remained among the City's top sectors but lost over 350 employees (or about 15% of workers) between 2011 and 2021.

- **Top employers also reflect many of the County's largest industries, including professional services like finance and insurance, technology, manufacturing, and health care. Four of the City's top ten employers were in the manufacturing industry as of 2020.** Within Camas, employment is concentrated at two nodes, including the Downtown area to the southeast and corporate campuses on the northwest side along the border with the City of Vancouver.

- **Camas is part of an interconnected region, with more residents commuting out of Camas for work than employees commuting in as of 2021.** Top commuting destinations for Camas residents are primarily nearby, larger cities with employment hubs like Vancouver and Portland, while only 10% remained in the City. The fourth most common destination for residents was Seattle, likely indicating remote workers at companies based in the Puget Sound area. Workers in Camas commuted from similar destinations, with one quarter coming from Vancouver.

- **Washington State Employment Security Department projections for future employment growth estimated that the Southwest Washington region will grow by about 19% overall by 2031.** The sectors expected to see the greatest increase in their share of employment are Professional and Business Services, Leisure and Hospitality, Education and Health Services, Information, and Other Services.

- **Camas has a larger share of remote workers compared with Clark County and Washington State. In 2022 one in four workers in Camas was a remote employee,** compared to 15% in both the County and State overall. The share of remote workers in Camas has grown since 2008-2012 with the onset and long-term implications of the COVID-19 pandemic likely driving this trend.

- **Since 2020, the City has issued 8,652 new business permits,** with the largest volume of new permits in 2020 and a decreasing amount annual since. General business establishments accounted for the largest portion of these permits (74%), followed by home occupations (25%), and nonprofits (1%). Regionally, 6,241 new business applications were filed in Clark County in 2022, with the annual number of applications rising steadily since 2012. Business applications in Clark County accounted for approximately 26% of all new firms started within the four-county metro area (including Clark, Clackamas, Multnomah, and Washington Counties) in 2022.

- **Camas's taxable retail sales were higher than those in most comparable jurisdictions in Clark County over the past decade,** competing primarily with the City of Battle Ground for the highest annual sales. In 2022, total taxable retail sales reached an all-time high of over $600 million in Camas.

Real Estate Market Trends

- **Office space in the City of Camas makes up only a small share of Clark County's overall office stock (6.5%), with slightly lower rents and higher vacancies in 2024 year-to-date (YTD).** Rents per square foot (PSF) grew steadily for office space grew Clark County since 2014, while fluctuating above and below County averages in Camas. Vacancy rates in Camas also fluctuated over the last ten years but fell from a high of nearly 16% in 2015 to 6.5 % in 2024 YTD. In comparison, Clark County's office vacancy rates steadily fell in general since 2014. The City and the County have generally had positive net absorption of office space since 2014, with the largest delivery of new office space in Camas in 2020 (132,000 new square feet).

- **Like office real estate, Camas's square footage of retail space made up a small part of Clark County's overall inventory (4.2%) in 2024 YTD. However, retail trends tracked closely with the County in terms of rent and vacancies.** Retail rents in both Camas and the County had slight upward growth since 2014, with rents in the City slightly lower than the County average. Vacancies in retail have fluctuated in Camas and Clark County over the past decade, with a general downward trend since 2014. Rising rents PSF coupled with falling vacancy rates indicate increasing demand for retail in both areas. However, some level of vacancy is indicative of a healthy market with natural turnover. In Camas, there have been some years with small spikes of new retail construction in the last decade, with the largest increase of about 27,000 SF in 2018 and 15,000 SF in 2023.

- **Industrial real estate in the City of Camas is performing well compared to Clark County in 2024 YTD.** The City is home to only about 3.9 % of Clark County's industrial real estate in square footage but saw a sharp increase of industrial rents PSF in 2022, growing by over 200% year-over-year (YOY) to $23. Vacancy rates for industrial real estate were also extremely low in Camas in 2024 YTD at 1.7%, indicating high demand in the industrial market locally. In comparison, industrial vacancies in Clark County have been generally low and steady, standing at 5.2% in 2024. Camas had its largest amount of new industrial square footage added in 2020 (75,000 SF).

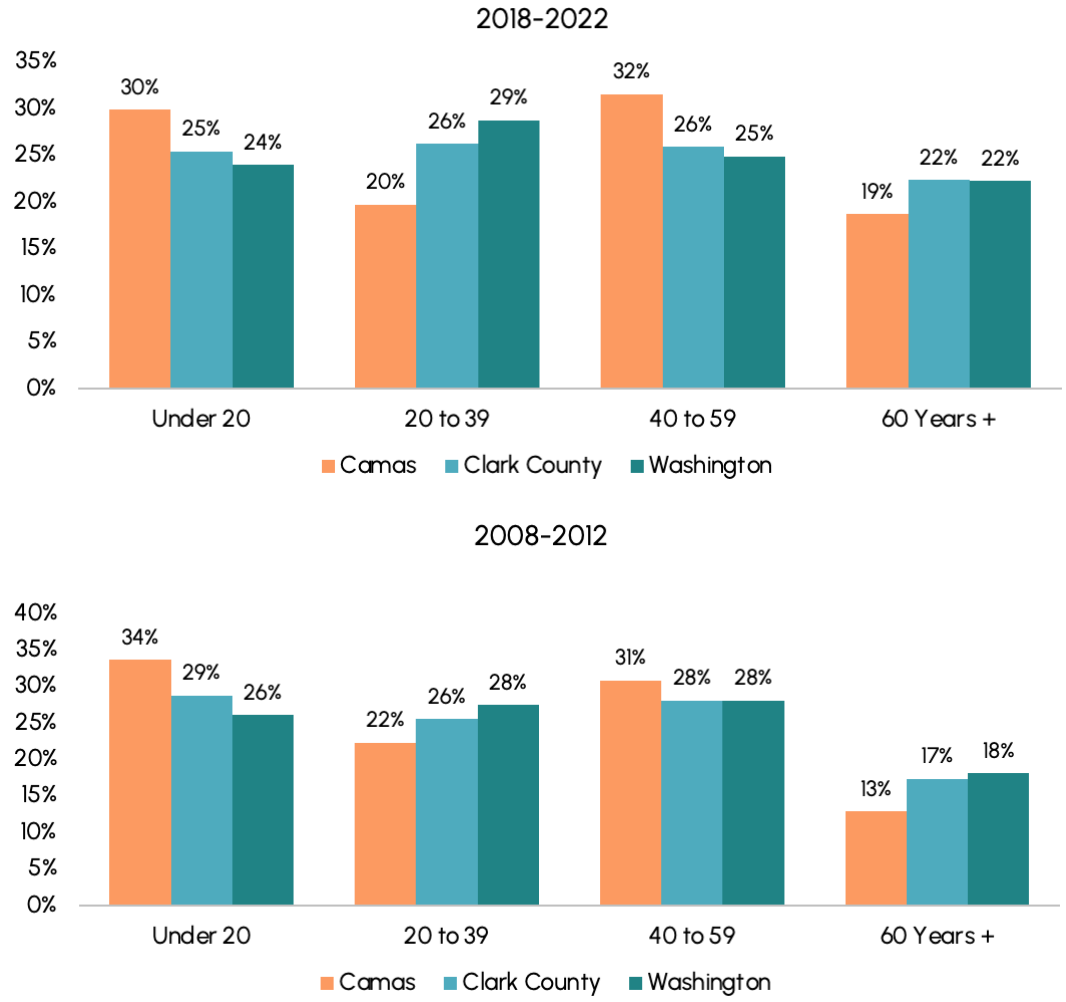
Community Demographic Trends

Population growth, demographic composition, and income distribution can all have important implications for a city's economic development. Key characteristics such as population growth over time, age of residents, median income, and disparities by race and ethnicity provide useful context about Camas's households and recent trends. The purpose of this analysis is to evaluate the socioeconomic conditions that will influence demand for different land uses and shape the economic opportunities in the city over the current comprehensive plan horizon. This information can also help to identify which communities in Camas are not benefiting from current efforts and inform the City's work to address current gaps for equitable economic development as part of the comprehensive plan update.

This section provides an overview of key socioeconomic conditions in Camas that are useful for evaluating economic opportunities and challenges. To better understand the City's standing within the region, the analysis also includes comparisons to Clark County and other geographies such as Washington State and surrounding cities as needed to contextualize conditions in Camas.

Population Growth, Age, Race and Ethnicity

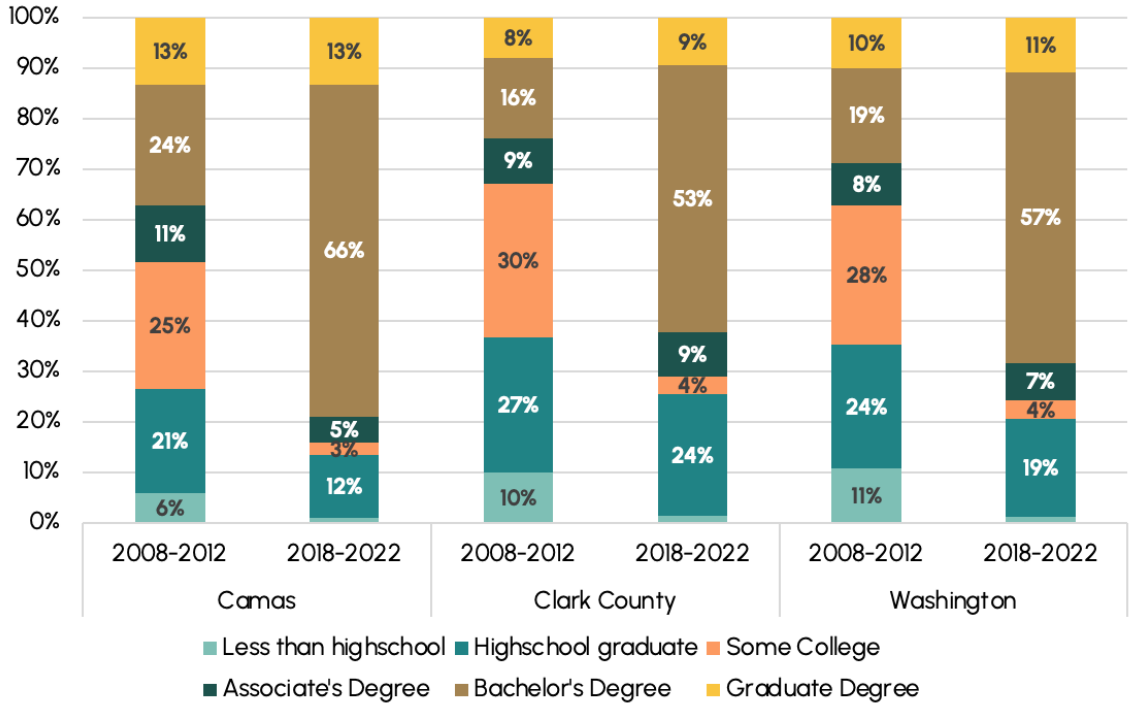
As cities grow, planning for economic development is important to help ensure opportunities for economic prosperity to all residents. See the **Camas Housing Inventory Analysis** for details about projected population and household growth.



Camas had a median age of 40 in 2022, higher than Clark County and quickly growing since 2012, likely indicating a combination of natural growth from the 40- to 59-year-old age group as well as in-migration of older adults.

Exhibit 5. Median Age, Camas, Clark County, Washington, and Comparison Geographies 2012 -2022
Source: U.S. Census Bureau, 2008-2012 and 2018-2022 ACS 5-Year Estimates

JURISDICTION	2008-2012	2018-2022	CHANGE
City of Camas	**36 years**	**40 years**	**+4.3**
Clark County	37 years	39 years	+2.0
State of Washington	37 years	38 years	+0.8



The distribution of age categories in the City shows that it has a growing share of residents aged 60 years and over (typically either late-career workers or retirees), although still lower compared to the County and the State (Exhibit 6).

Exhibit 6. Age Distribution, Camas, Clark County, and Washington, 2012 -2022
Source: U.S. Census Bureau, 2008-2012 and 2018-2022 ACS 5-Year Estimates.

Educational attainment is an important indicator for economic opportunities and the type of available workforce in an area. Economic development strategies may target different types of skill development, industry pipelines, or training programs depending on the existing level of education among residents. Between 2012 and 2022, Camas saw a sharp increase in residents with bachelor's degrees and higher, as well as a quick decrease in those with some college, a high school degree, or less than a high school degree. Educational attainment in the City is generally higher than the County as a whole, as well as Washington State.

Exhibit 7. Educational Attainment, Camas, Clark County, and Washington, 2012 -2022

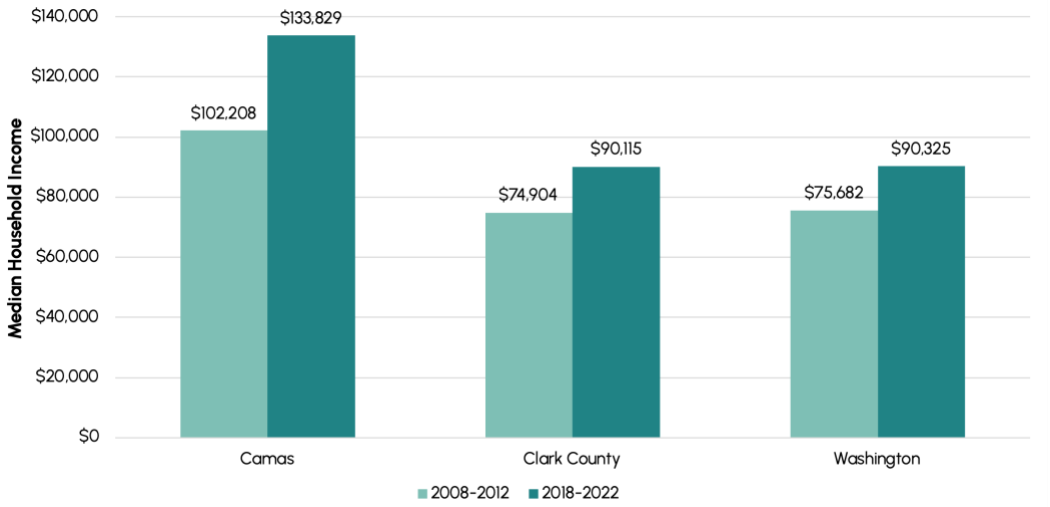
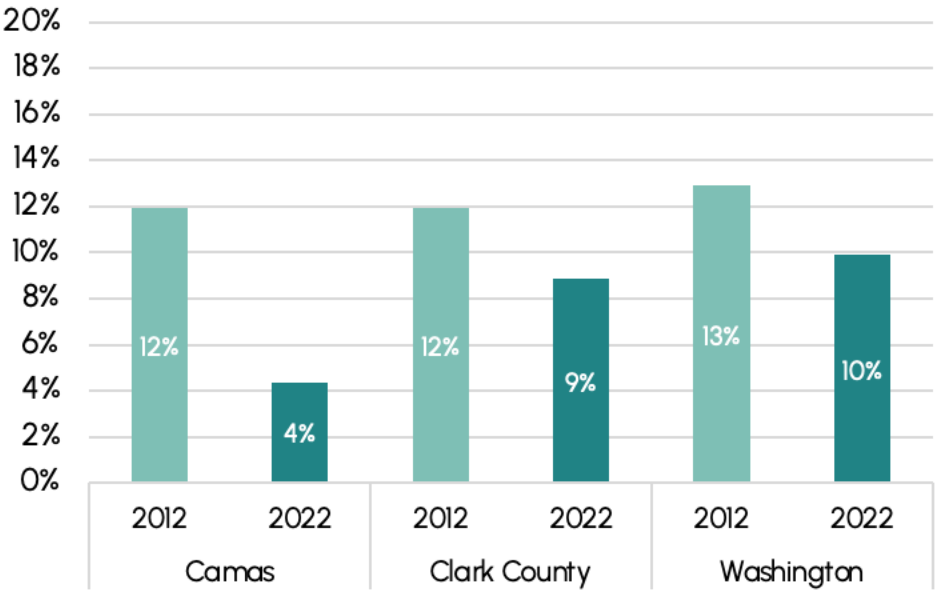
Note: Values less than or equal to 1% not shown on chart.



Economic Context

A number of factors can indicate changes in economic conditions for cities, their residents, and their workforce. This section provides context about current conditions and recent trends in Camas related to household income, employment, commuting, and wages.

Income



Overall income levels and distribution are critical indicators of economic prosperity for cities. Income levels directly reflect the purchasing power and standard of living of individuals and households; higher incomes generally enable people to afford better education, healthcare, and access to essential goods and services, contributing to overall well-being and productivity. The distribution of income and disparities between demographic groups are also critical considerations for addressing economic inequality and reducing concentrations of poverty. **Median household income in Camas is higher than both Clark County overall and the state of Washington at $133,000 in 2022. Adjusting for inflation, median income in the City still increased by 31% since 2008-2012. This increase is primarily due to grown in households earning over $100,000 per year (Exhibit 8).**

Exhibit 8. Median Household Income, Camas, Clark County, and Washington (2022$)
Source: U.S. Census Bureau, 2008-2012 and 2018-2022 ACS 5-Year Estimates
Note: 2008-2012 values are adjusted for inflation

The share of residents living below the poverty was also about the same in the City of Camas compared to Clark County and Washington in 2008-2012 at 12 % but decreased by 8 %age points by 2018-2022. This change likely reflects new growth in high-income households earning $150,000 or more during this period (indicated in the Camas Housing Inventory Analysis).

Exhibit 9. Percent of Population with Income Below Poverty Level in the Last 12 Months, 2012 -2022
Source: U.S. Census Bureau, 2008-2012 and 2018-2022 ACS 5-Year Estimates

Employment Trends

Clark County overall has seen fluctuations in employment change since 2000, with the most notable decreases in employment in the wake of the 2008 recession and at the onset of the COVID-19 in 2020. However, the County has also seen a fast rebound from pandemic trends, seeing roughly 6 % positive growth between 2020 and 2021. The City of Camas has generally seen positive growth in employment over the last two decades, with notable increases in the number of workers in 2005, 2010, and 2016. The City also saw less of a decrease during 2020 than Clark County overall, which may reflect Camas's growth in remote workers during this period (Exhibit 21).

Source: Washington Employment Security Department, LEHD-LODES
Note: LEHD-LODES data for the City of Camas only available through 2021

Growth in employment, population, and housing are interconnected. In general, communities with a high ratio of population to employment can be characterized as "bedroom" or commuter communities, where there are fewer jobs than residents in the city. **In Camas, this ratio has changed only slightly since 2010, with the number of persons per job decreasing from 3.0 in 2010 to 2.8 in 2021.** In the same period, the ratio of jobs to housing has slightly increased from 0.9 to 1.0, indicating a healthy balance of housing units in comparison with employment. As the City grows, maintaining this trend can help to ensure that there is adequate housing for those who work in Camas.

Exhibit 12. Population, Employment, and Jobs Comparison Ratios, Camas, 2010-2021
Source: OFM, LEHD-LODES
Note: Employment data is currently only available at the City level through 2021.

	TRENDS			RATIOS	
	POPULATION	EMPLOYMENT	HOUSING UNITS	POPULATION : JOBS	JOBS : HOUSING
2010	19,355	6,508	7,072	3.0	0.9
2021	26,870	9,558	9,586	2.8	1.0

In Camas, top employers reflect many of the County's largest industries, including professional services like finance and insurance and technology, manufacturing, and health care. **Four of the City's top ten employers were in the manufacturing industry as of 2020.**

Plexys	91	1.1%	Technology
Bodycote	50	0.6%	Manufacturing

Employment locations plays an important role in where people live and vice versa it can influence where people choose to relocate. Within Camas, employment is concentrated at two nodes, including the Downtown area to the southeast and corporate campuses on the northwest side along the border with the City of Vancouver (Exhibit 14).

Exhibit 14. Employment Density, Camas, 2021

Source: LEHD-LODES

Top commuting destinations for Camas residents are primarily nearby, larger cities with employment hubs like Vancouver and Portland, while only 10 % remained in the City. The fourth most common destination for residents was Seattle, likely indicating remote workers at companies based in the Puget Sound area. Workers in Camas commuted from similar destinations, with one quarter coming from Vancouver, as well as shares coming from Portland (8%) and Washougal (6%).

Industry data from the Washington Employment Security Division (ESD) is not available at the City level but given the City's interconnected relationship with surrounding jurisdictions a County and regional perspective provides relevant insights on industry grow and wage trends.

In Clark County, the industries with the largest employment in 2022 were **Healthcare and Social Assistance; Government; Retail Trade; Construction; and Accommodation and Food Services**. Of these industries, Government and Construction had average wages per employee above the average wage for all covered employment across the county, while Retail and Accommodation and Food Services paid below average wages. Healthcare and Social Assistance paid roughly equivalent wages with the county average.

At the City level, data is not available from ESD about employment and wages. However, the US Census provides estimates through its Longitudinal Employer-Household Dynamics Origin-Destination Employment Statistics (LEHD-LODES) data. This data is generated by merging previously collected survey and administrative data on jobs, businesses, and workers to understand commuting.[9] It provides an approximate picture of employment by industry locally but does not include information about wages.

In 2021, the top five industries by employment in Camas were **Finance and Insurance; Manufacturing; Educational Services; Professional, Scientific, and Technical Services; and Wholesale Trade**. In the County overall in 2021, four of these five top industries paid above average wages (only Educational Services paid below average wages). Finance and Insurance was the City's fastest growing industry, gaining over 2,000 new employees over the last decade (with an average annual growth rate of about 33%). Other top industries saw more moderate increases except for Manufacturing, which remained among the City's top sectors but lost over 350 employees (or about 15% of workers) between 2011 and 2021. Despite low overall employment in Camas, Real Estate and Rental and Leasing as well as Construction had high growth rates between 2011 and 2021, more than doubling the number of employees in that time period.

Regionally, the Washington State Employment Security Department provides projections for future employment growth. In 2021, ESD estimated that Southwest Washington was expected to grow by about 19 % overall by 2031 (Exhibit 18). The sectors expected to see the greatest increase in their share of employment were Professional and Business Services, Leisure and Hospitality, Education and Health Services, Information, and Other Services. This increasing share of many service businesses aligns with high-wage opportunities in Clark County (such as Professional, Scientific, and Technical Services and Information). However, both Education Services and Accommodation and Food Services paid well below the County average as of 2022.

Exhibit 20. Growth Target by Sector, Southwest Washington, 2021-2031
Source: Washington State Employment Security Department

Remote Workers

Camas has a larger share of remote workers compared with the County and State, which has grown since 2008-2012 with the onset of the COVID-19 pandemic influencing this trend in many industries nationwide. In 2018-2022, one in four workers in Camas was a remote employee, compared to 15 % in the County and State overall (Exhibit 21). **Median wages for remote workers were about on par with the workforce as a whole in Camas** in 2018-2022, despite larger gaps between remote and non-remote workers in the County and State (Exhibit 21).

Exhibit 21. Share of Remote Workers, Camas, Clark County, and Washington, 2012-2022

Business Changes

The City of Camas began requiring business licenses in 2019, so while local data does not have a long history it does help to capture post-pandemic trends in new establishments**. Since 2020, the City has issued 8,652 new business permits, with the largest volume of new permits in 2020 and a decreasing amount annual since.** General business establishments accounted for the largest portion of these permits (74%), followed by home occupations (25%). Nonprofit organizations were a very small share of new establishments (less than 1%).

Exhibit 23. Business Permits, City of Camas, 2020–2023
Source: City of Camas

	2020	2021	2022	2023
Nonprofit	17	16	18	15
Home Occupation Business	872	591	429	302
General Business	1997	1664	1520	1211

In a regional context, 6,241 new business applications were filed in Clark County in 2022, growing steadily by more than double (106%) from the 3,031 business applications filed in 2012. The growth rate for the four-county area over this time period was only 58%, potentially indicating that Clark County has been successfully growing in their ability to attract new firms relative to the region.

Applications in Clark County accounted for approximately 26% of all new firms started within the four-county metro area (including Clark, Clackamas, Multnomah, and Washington Counties) in 2022.

Exhibit 24. Annual Business Applications, Clark County and 4-County Portland Metro (Clark, Multnomah, Washington, and Clackamas Counties), 2012–2022
Source: US Census Bureau, Business Formation Statistics. Note: This data is only available at the county level.

Fiscal Conditions

Fiscal conditions are critical indicators for economic development, which have implications for jurisdictions' capacity to invest in essential services and growth. In Washington state, the lack of income tax makes sales and other tax trends particularly important for understanding economic trends and impact on local budgets.

The City of Camas's taxable retail sales were higher than those in most comparable jurisdictions in Clark County over the past decade, competing primarily with the City of Battle Ground for the highest annual amounts. On a per capita basis, Camas had higher taxable retail sales than unincorporated areas of the County, but slightly lower sales than the Cities of Battle Ground or Washougal. In 2022, total taxable retail sales reached an all-time high of over $600 million (

Exhibit 26). In Clark County overall, the City of Vancouver and unincorporated areas had by far the highest volume of taxable retail sales, with Vancouver reaching over $6.3 billion in 2022 (

Exhibit 27).

Exhibit 25. Per Capita Taxable Retail Sales by Clark County Jurisdictions, 2012-2022 (in 2022$)

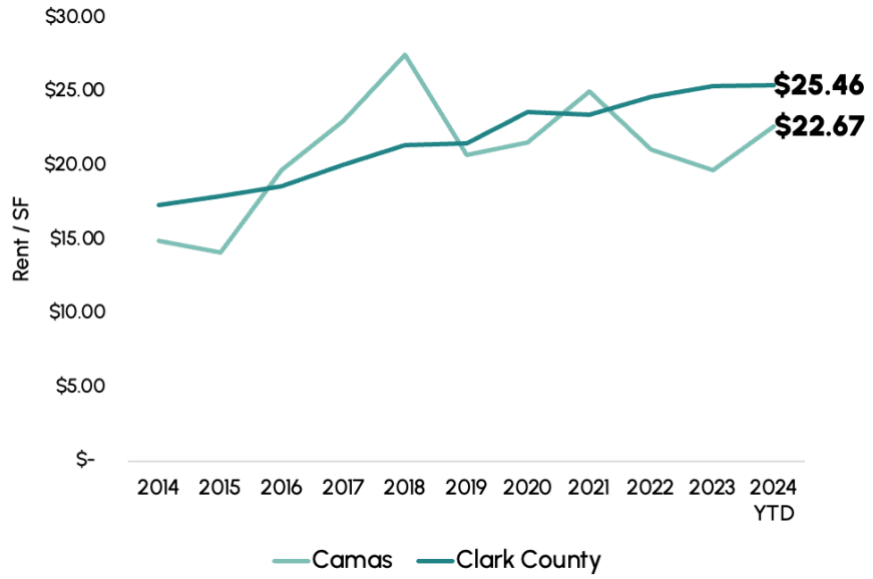
Economic Opportunities

Real Estate Market Conditions and Trends

Understanding Camas's real estate market opportunities can indicate what industries might locate and grow in the City, based on historic and current demand patterns across different real estate types. This section details Camas's commercial real estate conditions and identifies market drivers and trends that will influence the market appeal and viability of commercial uses in the area.

This report primarily covers nonresidential commercial real estate including office, industrial, and retail building types, as well as multifamily trends to illustrate opportunities for mixed-use development. The Housing Needs Assessment portion of this Comprehensive Plan Update covers the residential real estate market in greater depth. The exhibits in the section below show historical trends in the average effective rent rates and average annual vacancy rates for the analysis. In general, the analysis shows trends in Triple-Net (NNN) rents, vacancy rates, and deliveries (these are described below). This section also looks back to trends in the past decade years, capturing a longer cycle of real estate trends.



- **Triple-Net (NNN):** Represents annual rents on a per-square-foot (PSF) basis, not including any pass-through expenses such as taxes, insurance, and utilities or maintenance costs.
- **Vacancy Rates:** Represents how much space per-square-foot (PSF) is vacant in a submarket.
- **Deliveries:** Represent the total amount of new square feet of each product type that has been added to the market on an annual basis.
- **Net Absorption:** Represent annual net square feet of new occupancy or vacancy of space accounting for deliveries.

Office Market

Office space in the City of Camas made up about 6.5% of Clark County's overall office stock in 2023.

Rents PSF for office space grew in both the City and the County since 2014. The average rent in Camas fluctuated over the past ten years and were slightly below the County average in 2024 year-to-date (YTD) at $22.67 and $25.46 PSF respectively.

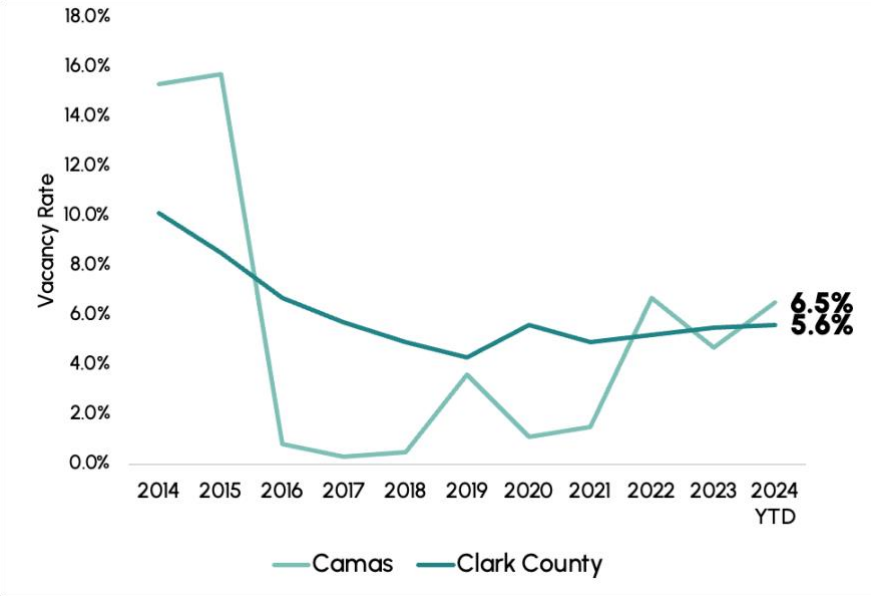


Exhibit 28. Average Office Rent per Square Foot, Camas and Clark County, 2014-2024 YTD
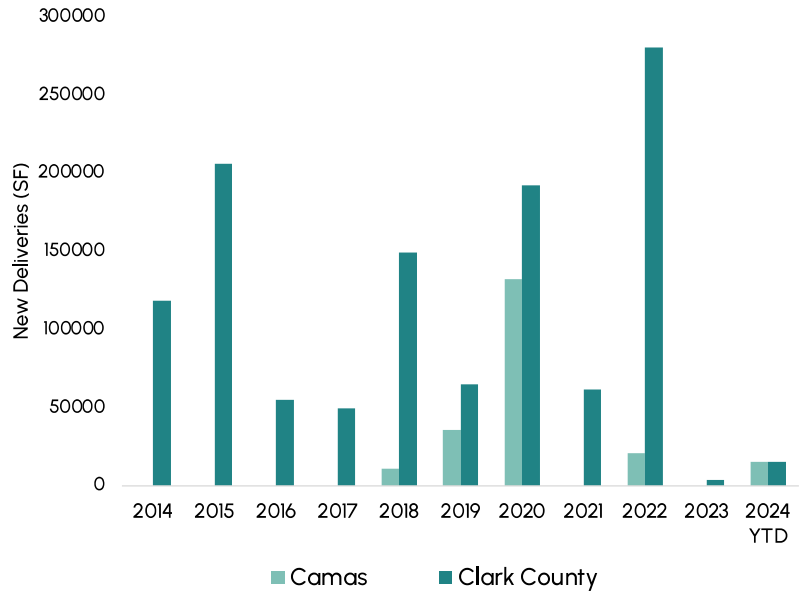
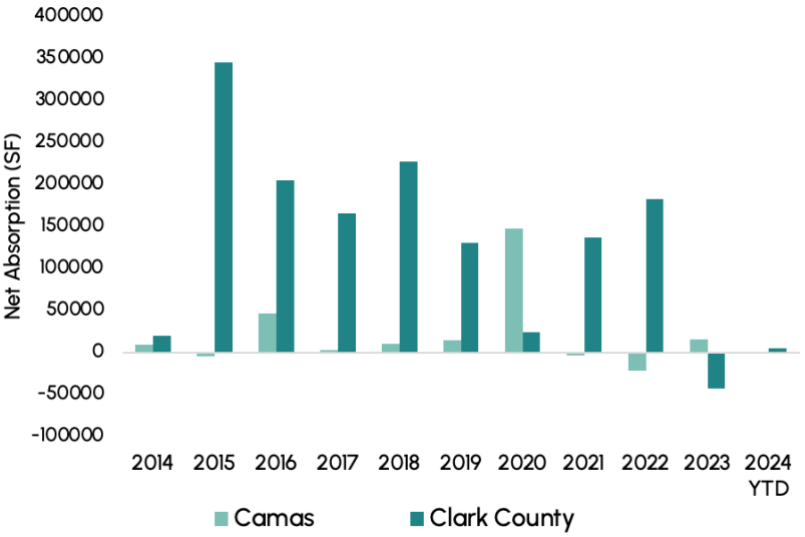
Source: CoStar

Vacancy rates in Camas also fluctuated over the last ten years, falling from a high of nearly 16% in 2015. In comparison, Clark County's office vacancy rates steadily fell in general since 2014, with a slight increase in 2020.



While many places throughout the United States saw spiking office vacancies in 2020 with, the City and County avoided this trend.

Exhibit 29. Average Office Vacancy Rate, Camas and Clark County, 2014-2024 YTD
Source: CoStar

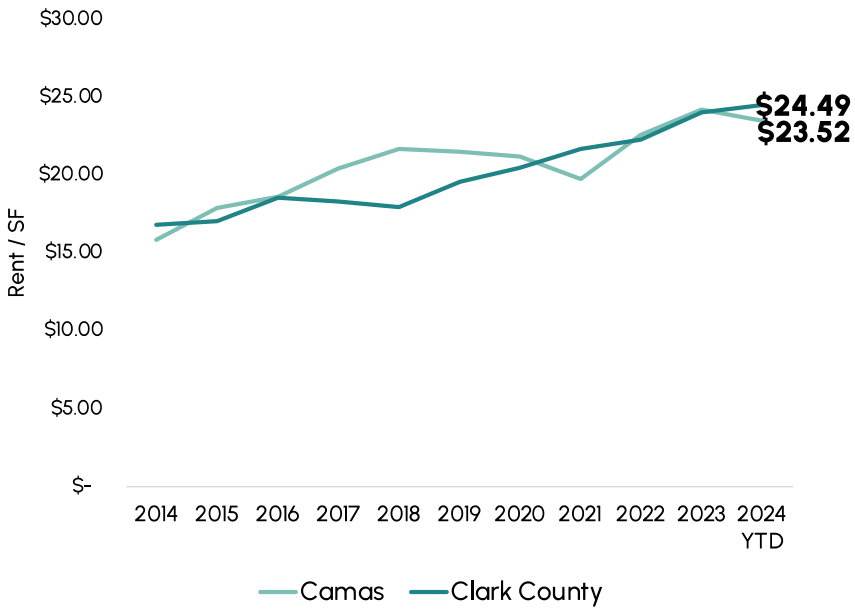


The City of Camas had its largest delivery of new office space in the last decade in 2020, adding approximately 132,000 new square feet to the market. Other areas of Clark County saw larger deliveries in 2022 and 2015.

Exhibit 30. Office Deliveries, Camas and Clark County, 2014-2024 YTD
Source: CoStar

The City and the County have generally had positive net absorption of office space since 2014, with some negative absorption in the City in 2022 (approximately 21,000 SF).

Exhibit 31. Office Net Absorption, Camas and Clark County, 2014-2024 YTD
Source: CoStar



Retail Market

Camas's square footage of retail space made up about 4.2% of Clark County's overall inventory.

Retail rents PSF in Camas generally tracked closely with Clark County trends since 2014, showing slight upward growth. Rents in the City were slightly lower than the County in 2024 YTD at $23.52 PSF compared to $24.49.

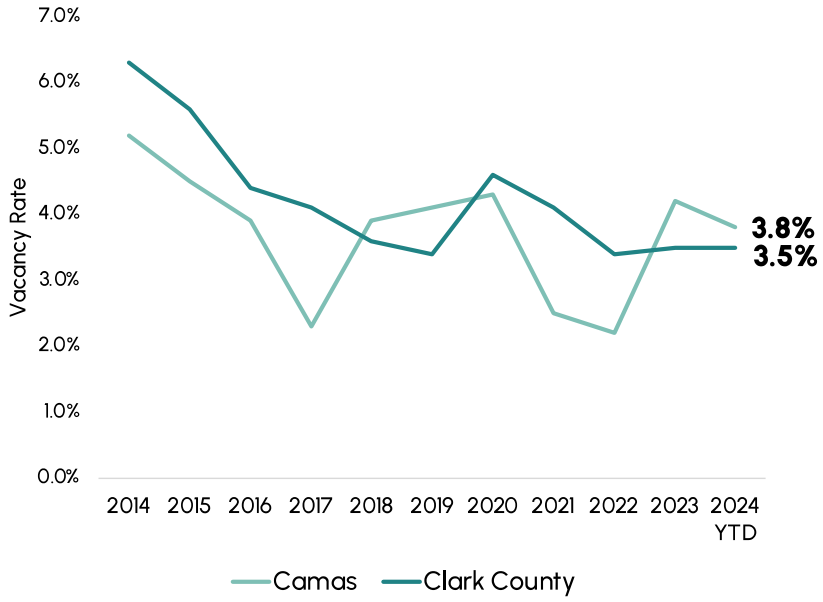


Exhibit 32. Average Retail Rent per Square Foot, Camas and Clark County, 2014-2024 YTD
Source: CoStar

Retail vacancies have fluctuated in Camas and Clark County over the past decade, with a general downward trend since 2014. Retail vacancies were slightly higher in Camas than Clark County in 2024 YTD at 3.8% compared to 3.5%.

Rising rents PSF coupled with falling vacancy rates indicate increasing demand for retail in both areas. However, some level of vacancy is indicative of a healthy market with natural turnover.

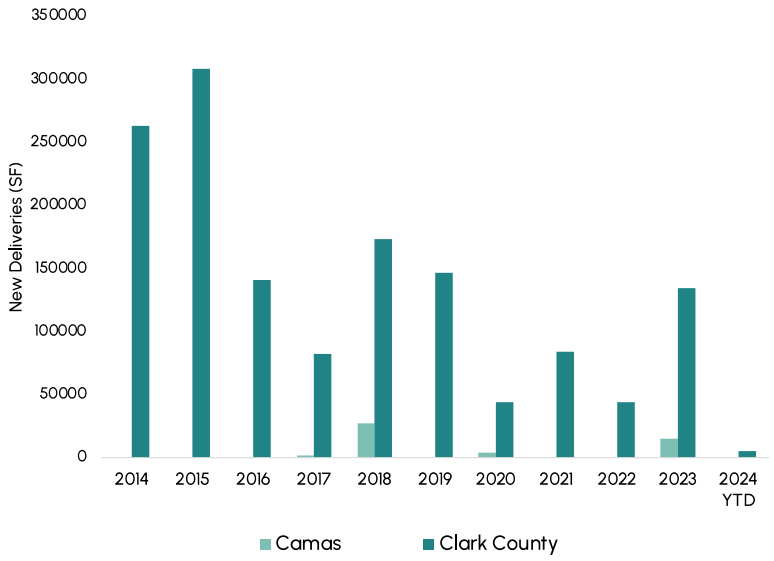

Exhibit 33. Average Retail Vacancy Rate, Camas and Clark County, 2014-2024 YTD
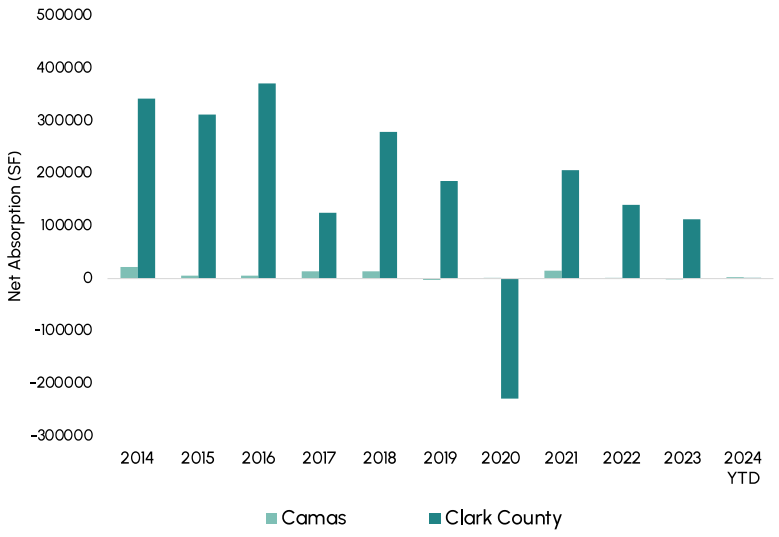
Source: CoStar

Clark County has seen large deliveries of new retail space primarily in 2014 and 2015, as well as additions of square footage in 2018 and more recently in 2023.



In Camas, there have been some years with small spikes of deliveries in the last decade, with the largest increase of about 27,000 SF in 2018 and 15,000 SF in 2023.

Exhibit 34. Retail Deliveries, Camas and Clark County, 2014-2024 YTD
Source: CoStar

Retail absorption has also been generally positive since 2014 in both the City and County, with the notable exception of about 229,000 square feet of negative absorption in Clark County in 2020. This is likely due to challenges in the wake of the 2020 pandemic.

Industrial and Manufacturing Market

The City of Camas is home to about 3.9% of Clark County's industrial real estate in square footage.

Since 2014, the County has generally had slow growth in industrial rents PSF, with an increase in 2022 and an average of $11.04 PSF in 2024 YTD.

The City of Camas saw a sharp increase of industrial rents PSF in 2022, growing by over 200% year-over-year (YOY). In 2024 YTD, industrial rent in Cams was $23.00 PSF.

Vacancy rates for industrial real estate were extremely low in Camas in 2024 YTD at 1.7%, indicating high demand in the industrial market locally. Since 2015, industrial vacancies have generally been very low in the City with the exception of 2021.

In comparison, industrial vacancies in Clark County have been generally low and steady, standing at 5.2% in 2024 YTD.

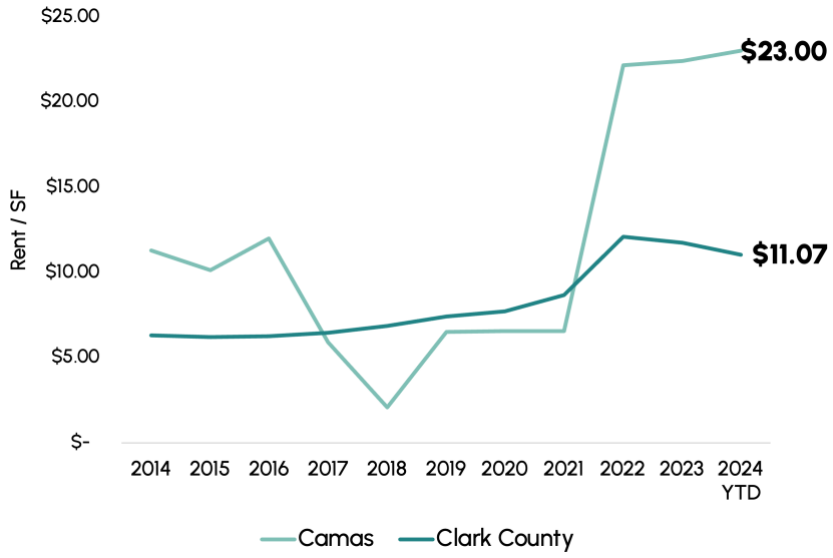
Source: CoStar



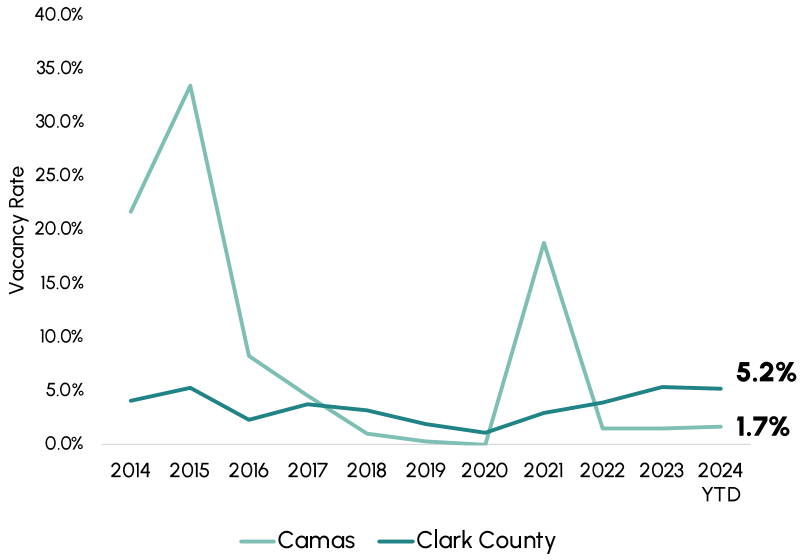


Exhibit 37. Average Industrial Vacancy Rate, Camas and Clark County, 2014-2024 YTD
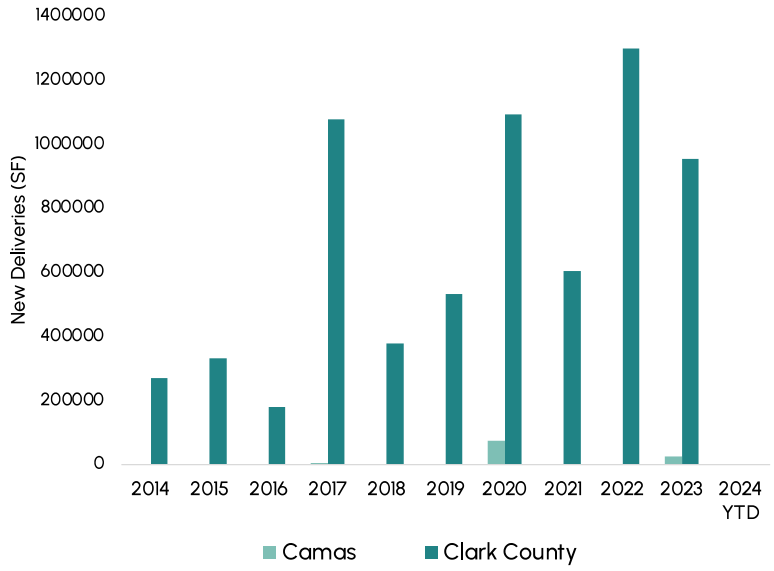
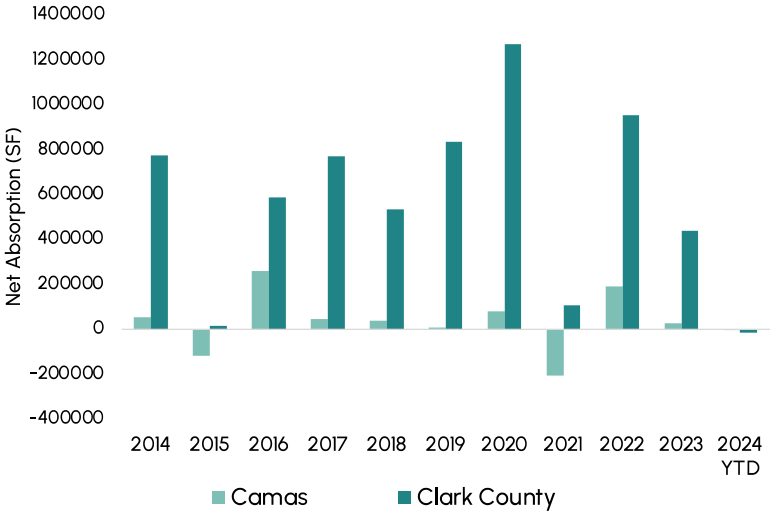
Source: CoStar



Clark County has seen growing industrial deliveries in the latter half of the 2010s and early 2020's, with large additions of new industrial space in 2017, 2020, and 2022.

Camas has seen fewer new deliveries but had its largest amount of new square footage added in 2020 (75,000 SF).

Exhibit 38. Industrial Deliveries, Camas and Clark County, 2014-2024 YTD



Source: CoStar

New industrial space has also generally had positive absorption in the City and County, although new deliveries from 2020 had negative absorption initially in 2021.

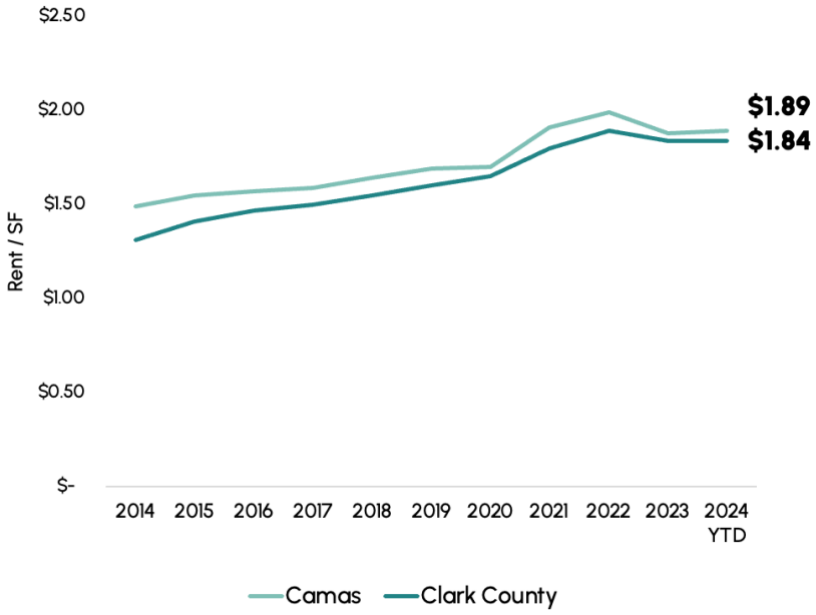
Mixed Use Development Opportunities



Mixed-use development with commercial and residential retail has seen growing demand nationally in recent years, as demand grows for dense, walkable areas. Trends in multifamily real estate in Camas show potential for combining demand for rental units with increases in the City's office or retail inventory.

Multifamily Residential Market

Camas's multifamily units make up about 4 % of units in the County.

Camas's multifamily rents PSF have closely followed Clark County overall, remaining slightly lower over the past decade. In 2024 YTD, multifamily rents in the City were $1.84 PSF compared to $1.89 PSF in the County.

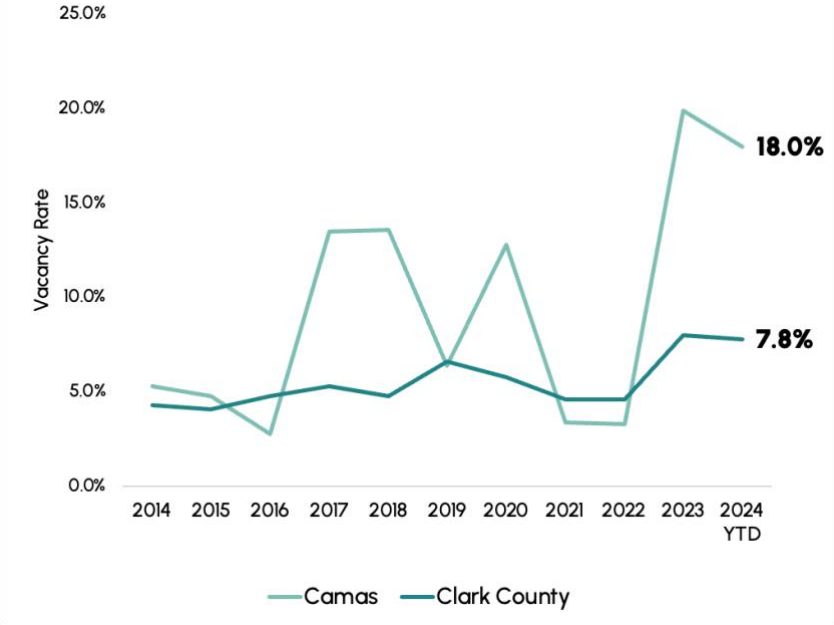


Exhibit 40. Average Multifamily Rent per Square Foot, Camas and Clark County, 2014-2024 YTD
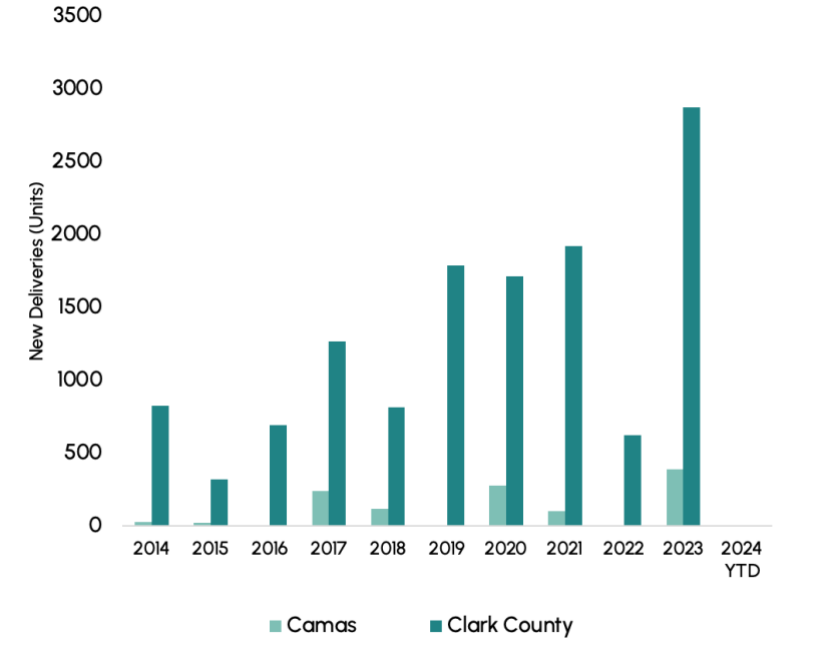
Source: CoStar

Multifamily rents were high in 2023 and 2024 YTD in Camas County, although this spike corresponds with a recent delivery of 389 units in 2023 (the largest annual number of units delivered in the past ten years). Increasing vacancies in 2017 and 2020 also track with new multifamily units delivered.



Multifamily vacancies were 7.8% in Clark County overall in 2024 YTD, also indicating increasing vacancies over time.

Exhibit 41. Average Multifamily Vacancy Rate, Camas and Clark County, 2014-2024 YTD
Source: CoStar

Clark County has seen an increase in multifamily deliveries in the past ten years, with the largest number of new units in 2023 (2,872 units).

Downtown Camas Analysis

The following charts measure visitation by visitors, employees, and residents in Downtown Camas from 2017 to 2024. Visitation trends help in providing insights into how the city is rebounding after the COVID-19 pandemic, using Placer.ai's foot traffic analytics platform integrating proprietary artificial intelligence to estimate the number of visits based on GPS data.10 Visitor and employee visits have increased to pre-pandemic levels and visitation by residents has been trending upward in recent years. Overall, this indicates a healthy level of foot traffic in the Downtown area showing an upward trajectory with visitors, employees, and residents coming to the Downtown area for shopping, work, or other purposes. Market analysis of retail activity in Downtown Camas shows retail rents increasing rapidly from approximately $15 per square foot in 2022 to almost $35 per square foot in 2024, the highest rate measured from 2017 to 2024. In addition, the vacancy rates for retail have remained very low below 1.5% since 2014 which is lower than the retail vacancy rates in both the City of Vancouver (3.7%) and Clark County (3.7%) in 2023, likely indicating increased demand for retail space above the available supply.

[10] Placer.ai uses anonymous mobile phone location data to estimate visitation. A "visit" is triggered in Placer.ai's database when a cell phone seeks two Wi-Fi signals five to fifteen minutes apart (this range differs by cell phone operating system; e.g., an Android phone scans for Wi-Fi every three to seven minutes). While this means that visitors may be counted multiple times, this data is useful to provide a relative picture of trends over time.

Competitive Position

As part of Clark County and the Portland Metro Area, Camas is interconnected with the regional economy. This section provides an overview of regional context and Camas's competitive position within the area to provide a basis for economic development policies.

Clark County overall has demonstrated considerable economic resilience and growth coming out of the COVID-19 pandemic. The county has recovered nearly all pandemic job losses, adding over 15,000 workers since early 2020, while many communities in the region and across the nation have experienced unpredictable changes in employment patterns.

Exhibit 48. Clark County Nonfarm Employment: February 2020 – May 2022

Source: Washington Employment Security Department, Nonfarm Employment, CREDC analysis

While the County's total population has also grown quickly in recent years, smaller communities like Camas are outpacing Vancouver with fast growth in population.

Like other smaller cities in Clark County, Camas has seen a higher rate of growth compared with Vancouver or unincorporated Clark County, more than doubling its number of residents since 2000.

Investment in quality-of-life amenities as well as new housing development and land annexations have contributed to this growth for Camas.

Camas shows some characteristics of a "bedroom community," but is expected to expand its local employment in coming decades. In 2020, the share of workers commuting to Vancouver from Camas increased and was the sixth largest group of workers in Vancouver. However, the County's projections for employment indicate that Camas will add more jobs than any city outside of Vancouver by 2045, primarily on its industrial lands.

Initial SWOT Analysis (to be updated after engagement)

SWOT analysis refers to an assessment of Strengths, Weaknesses, Opportunities, and Threats (SWOT). These represent internal and external factors that can have positive or negative impacts on economic outcomes in Camas. Exhibit 51 below outlines key findings for these factors in Camas when considering potential economic growth and development in the city.

Exhibit 51. SWOT Summary Analysis

CATEGORY	POSITIVE	NEGATIVE
INTERNAL	**Strengths:** • High quality of life amenities like parks and recreation opportunities. • Plans for place-based investments like waterfront development with Port of Camas-Washougal. • Downtown experiencing high visitation and high demand for retail spaces (increasing rents, low vacancy).	**Weaknesses:** • Rising housing costs, purchasing a home is unaffordable for those under 120% AMI. • High industrial rents and very low industrial real estate vacancies.
EXTERNAL	**Opportunities:** • Attract highly skilled workers with locational flexibility. • Develop pathways for youth to gain skills and seek jobs in Camas. • Identify target industries for managing land capacity and expected growth.	**Threats:** • Unequal rates of homeownership by race and ethnicity indicating unequal economic opportunities. • Disparities between remote and non-remote workers.

I. EXECUTIVE SUMMARY

The Washington State Growth Management Act (the "GMA") includes schools in the category of public facilities and services. The Camas School District ("District") is required by Clark County ("County") and the Cities of Camas, Washougal, and Vancouver ("Cities") to adopt a capital facilities plan to satisfy the requirements of the GMA and to identify school facilities necessary to meet the educational needs of current and projected enrollment growth for a six-year period. Due to the uncertainty of the impact of COVID-19 pandemic on student enrollment and public education and at the request of several school districts, including the District, Clark County suspended until 2022, their four-year update requirement.

The District has prepared a 2022 Capital Facilities Plan ("CFP") to provide the County and the Cities with a schedule and financing program for capital improvement needs over the next six years (2022-2028) to ensure that adequate facilities are available to serve new growth and development. The 2022 CFP includes the following elements:

- A description of standard of service and space requirements for educational programs (Section II)
- An inventory of existing capital facilities owned by the District (Section III)
- Future enrollment projections for each grade span (Section IV)
- A forecast of proposed capacities of expanded or new capital facilities over the next six years based on the inventory of existing facilities and the standard of service (Section V)
- A six-year plan for financing capital facilities within projected funding capacities, which identifies sources of public funds for such purposes. The financing plan separates projects and portions of projects which add capacity from those which do not, since the latter are generally not appropriate for impact fee funding (Section VI)
- A calculation of impact fees based on the formula in the County and City impact fee ordinances and supporting data substantiating such fees (Section VII)

In developing this CFP, the District used the following guidelines:

- The District will use information from recognized sources, such as professional demographers and planners, County and City adopted land use plans and County GIS data.
- The District will use data it generates from reasonable methodologies.
- The CFP and the methodology to calculate the impact fees will comply with the GMA and County and City codes.
- The six-year facility needs are based on an enrollment forecast that takes local development trends into account.
- The District plans to construct permanent/bricks and mortar facilities for its students and will develop a CFP to accomplish that objective. At the same time, the District expects there will be a time period when some of the students that the District serves will be housed in portables. Housing students in portables, temporarily, is necessary to qualify for state funds that are needed to build new schools.

Camas is a financially and academically sound school district. The 57 square mile Camas School District serves the majority of the Camas Urban Growth Area, a large section of the Washougal Urban Growth

Area, and a smaller portion of the Vancouver Urban Growth Area and rural Clark County. The District serves residents from the Cities of Camas, Washougal, Vancouver and unincorporated rural Clark County. It is bordered by Evergreen School District to the west, Hockinson School District to the north, Washougal School District to the east, and the Columbia River and the state line to the south.

The District served a population of 7,412 students in 2019 (October 1, 2019 enrollment). Due to the statewide closure of schools during the COVID-19 pandemic, and associated loss of public school enrollment, the District served a population of 7,055 students in 2020 (October 1, 2020 enrollment) and 7,045 students in 2021 (October 1, 2021 enrollment). The District expects no further enrollment loss and a recovery over 4-5 years to pre-pandemic enrollment.

For purposes of facility planning, the CFP considers grades K-5 as an elementary school, grades 6-8 as a middle school, and grades 9-12 as a high school. The District has six elementary schools; two standard middle schools and a third, smaller, application-based middle school; and a large comprehensive and two, smaller application-based high schools. In addition, the District serves Camas Connect Academy students in grades K-12 in an online platform, pre-school special needs students at the Heights Learning Center and Camas High School, and students aged 18-21 in the Transition Program.

In February 2016, voters approved a bond measure which included the funding for the projects noted below. Construction of the replacement Lacamas Lake Elementary School, the purchase of a 38.2 acre site and the associated remodel of a commercial building to house the new Odyssey Middle School, and the construction of the new Discovery High School on the same site have increased capacity to serve forecast growth.

School facility and student capacity needs are dictated by a complex matrix of regulatory mandates, educational program components, collective bargaining agreements, and community expectations, more fully described in Section II. The District's existing capital facilities are summarized in Section III. In addition, the District owns 32 portable classrooms located at school facilities – 24 of which currently house approximately 9.6%, or 680 students; and 8 additional portable classrooms that are available to accommodate enrollment growth.

Between 2014 and 2019, enrollment growth within the District grew an average 3.1% per year, compared to the countywide rate of 2.0%. A total of 847 students were added to Camas School District during that time. The District expects to continue to see an increase in enrollment over time, although at a slower rate. Much of the land within the District and urban growth boundaries has yet to be developed, and there continues to be market interest in housing development in Camas and Washougal. Future K-12 enrollment is projected to increase by an average 1.3% per year, or 688 students over the next 7 years (see Section IV). Thanks to the 2016 Bond, which provided an increase in educational facility capacity of 192 students at the elementary level, 360 students in middle school, and 600 students in high school, many of the projected number of students by 2028 can be accommodated in the District's existing educational facilities and portable classrooms, except that there will be a need to increase capacity at the middle school level, and slightly at elementary school level.

The calculated maximum allowable impact fees for the District are $6,652.48 per single family residence and $29,713.38 per multi-family residence (**Appendix A**).

II. DISTRICT EDUCATIONAL PROGRAMS AND STANDARDS OF SERVICE

School facility and student capacity needs are dictated by the types and amounts of space required to accommodate the District's adopted educational program. Quality education plays a vital role in growing a strong local economy. To provide quality education, the District must have quality facilities to serve as the supporting space for developing the whole child within a community to prepare them for a competitive world. The educational program components which typically drive facility space needs include grade configuration, optimum facility size, class size, educational program offerings, classroom utilization and scheduling requirements.

Student enrollment is determined by population growth, birth rates, and housing and demographic characteristics of the District. Individual schools within the District may or may not follow the overall District pattern shared in this report. For example, the majority of the new housing in the past decade has been in the central and western portion of the District and the schools in these areas saw the most enrollment growth. As these areas have built out, future housing is proposed more in the outer ring of the District, predominantly to the north and east. This affects the balance of student enrollment and individual school facility capacity in ways that are not reflected in the overall summary.

In addition to student enrollment, other factors such as collective bargaining agreements, government mandates, and community expectations also affect classroom space requirements. Basic education programs are augmented by other programs such as special education, physical education, and art and music. These programs can have a significant impact on the available student capacity of school facilities.

The District's current programs and educational standards are summarized below. The program and educational standards may vary during the six-year CFP planning horizon. Absent significant changes in factors that are beyond the District's control, the District will provide the following programs and standards of service in 2022 through 2028. If significant changes occur that require new facilities or improvements beyond what is identified in this CFP, the District will prepare and submit an updated CFP.

A. Elementary Educational Standards

- Elementary school capacity is calculated utilizing classroom spaces containing a basic education teacher and his/her complement of students. All students are integrated at some time during the day in a basic education classroom and are included in the total enrollment count. All students are pulled out to attend additional programs (which may also be held in classrooms, if there is no designated space available). Building capacity calculations do not include pull-out program areas such as special education learning support centers, resource rooms, technology labs, music instruction spaces, and gymnasiums.
- Class sizes for grades K-5 are targeted not to exceed 24 students per class.
- When feasible K-3 class sizes are reduced to maximize enhanced funding from the State.

B. Middle School Program Standards
    - Middle school capacity is calculated utilizing the number of basic education teaching stations. It is not possible to achieve 100% utilization of all teaching stations throughout the day due to schedule conflicts, the need for specialized rooms for certain programs and the need for teachers to have work space during their planning period. A utilization factor of 83% is used to reflect the actual use of the building. Building capacity calculations do not include pull out program areas such as special education learning support centers, resource rooms, and technology labs.
    - Class sizes for grades 6-8 are targeted not to exceed 30 students per class.
C. High School Program Standards
    - High school capacity is calculated utilizing the number of basic education teaching stations. It is not possible to achieve 100% utilization of all teaching stations throughout the day due to schedule conflicts, the need for specialized rooms for certain programs and the need for teachers to have work space during their planning period. A utilization factor of 83% is used to reflect the actual use of the building. Building capacity calculations do not include pull out program areas such as special education learning support centers, resource rooms, and technology labs.
    - Class sizes for grades 9-12 are targeted not to exceed 31 students per class.

III. CAPITAL FACILITIES INVENTORY

The facilities inventory serves to establish a baseline for determining facilities needed to accommodate future demand at acceptable levels of service. This section provides an inventory of capital facilities owned and operated by the District including schools, portables, undeveloped land, and support facilities. School capacity is based on the space requirements for the District's educational programs as outlined in Section II.

A. Elementary Schools

Elementary School	Location	Year of Occupancy	Building SF	Capacity	Teaching Stations
Dorothy Fox (K-5)	2623 NW Sierra St Camas WA 98607	1982/2000/ 2011	62,237	552	23

Discovery (9-12)	5125 NW Nan Henriksen Way Camas WA 98607	2018	92,000	600	24
Hayes Freedom (9-12)	1919 NE Ione St Camas WA 98607	2010	20,500	207	8
TOTALS:			**354,121**	**2,641**	**103**

D. Portables Inventory

Facility Type	Available Portable Classrooms	Capacity
Elementary Schools	14	336
Middle Schools	6	150
High Schools	12	310
TOTALS:	**32**	**796**

E. Support Facilities

Type	Location
Grounds Shop, Bus Maintenance and Warehouse (1963/2001)	1707 NE Ione St Camas WA 98607
Transportation Center (2001/2012)	1125 NE 22nd Ave Camas WA 98607
JD Zellerbach Administration Center (1967/1974/1985/1998/2010)	841 NE 22nd Ave Camas WA 98607
Doc Harris Stadium (2010)	1125 NE 22nd Ave Camas WA 98607
The Heights Learning Center (1963, 1984, 1998, 2008, 2018)	4600 NE Garfield Street Camas WA 98607
Jack, Will & Rob Family Resource Center (2002, 2017)	2033 NE Ione St Camas WA 98607
Transition House (remodeled 2009)	612 NE 2nd Ave Camas WA 98607

F. Land Inventory

The district owns the following under- and undeveloped sites:

- 57.6 acres located at 2815 NW Leadbetter Drive, Camas, WA 98607 – site includes a commercial office building
- 79.9 acres located at the northeast corner of NE 28th Street and NE 232nd Ave
- 19.6 acres located northwest of the intersection of NW Pacific Rim Blvd and NW Parker Street

IV. STUDENT ENROLLMENT PROJECTIONS

The District's six-year enrollment projection is based on a forecast prepared by Eric Hovee of E.D. Hovee & Company, LLC in February 6, 2020 and updated in December, 2021.

The approach used in making the updated enrollment forecast included the following:

- Kindergarten (K) enrollment is forecast based on the population of each school area (and expected population growth) together with birth rate data from five years previous using an age-cohort

methodology. Data required for the K-level forecast includes projections of population growth, women of childbearing age and age-specific fertility rates.

- Actual enrollment patterns from prior years are used as a basis for projecting future enrollment for grades 1-12. For example, the number of students in a particular grade as of October 1, 2019 are promoted into the next grade level for 2020 (adjusting for expected population growth together with gains or losses typically associated with a particular grade-to-grade change for each grade level at each individual school). The pattern for the District is for additional students to join as the grades increase, especially at the transition from elementary to middle and from middle to high school.
- The 2021/2022 school year enrollment is based on the October 1, 2021 enrollment data.
- Economic growth impacts, land use and zoning provisions, buildable lands inventory, and new residential developments are taken into account.
- The student generation rates by grade levels in the District for single family homes for the last six years is 0.237 Elementary School, 0.143 Middle School, and 0.202 High School students/new unit. Since there have been limited multi-family units constructed in the District over the last six years, the County code states that County wide averages should be used but the District is using a composite from larger districts with a significant amount of multi-family units. Accordingly, the District will apply a 6-year generation rate for the other larger school districts in Clark County (Battle Ground, Evergreen, and Vancouver). The composite weighted average for these three districts combined is a multi-family generation rate of 0.554 Elementary School, 0.344 Middle School, and 0.460 High School students/new unit.

A. Projected Enrollment 2022-2028 (Headcount)

Grade	Actual 2019	Actual 2020	Actual 2021	2022	2023	2024	2025	2026	2027	2028
K-5	3,117	2,852	2,866	2,954	2,904	3,071	3,041	3,183	3,231	3,308
6-8	1,863	1,737	1,735	1,721	1,758	1,721	1,790	1,766	1,862	1,877
9-12	2,432	2,389	2,444	2,428	2,484	2,453	2,457	2,515	2,494	2,549
TOTALS:	**7,412**	**6,978**	**7,045**	**7,103**	**7,146**	**7,245**	**7,288**	**7,464**	**7,587**	**7,734**

V. CAPITAL FACILITIES NEEDS

Facility needs for purposes of the Growth Management Act and impact fees are based on existing capacity and forecast enrollment. The 2028 Facility needs are shown in the table below and the amount of the facility need that is attributed to forecast growth is described under the table.

A. Forecast Facility Capacity Needs

- Elementary Schools: The enrollment forecast shows an increase of 442 students.
- Middle Schools: The enrollment forecast for middle school shows an increase of 142 students.
- High Schools: The enrollment forecast for high school shows an increase of 105 students.

- The projected number of students by 2028 indicate the need for an additional middle school and elementary school capacity. High school enrollment can be accommodated by the additions in our 2016 bond to our existing educational facilities.

Under the District's 2016 Bond Capital Program, the District purchased property that contained a commercial building in 2016, which was remodeled in 2017 to accommodate educational use and can serve 350 middle school students. In 2018, the District completed construction of a new high school that has a capacity to serve 600 students. In addition, the District completed construction of a replacement elementary school in 2018 to increase the capacity at the elementary level by 192 students. The District also added two double portable classrooms to the District inventory at the elementary level in 2019 and 2020 to address overcrowding at individual schools. The cost to purchase this land and build these schools and portables, which are now available to serve forecast growth are listed below as Facility Capacity Needs.

The District added capacity over the last 4-5 years that is available to serve forecast growth. New development, which places demands on schools will use the capacity that has been provided, and will contribute a small portion of the cost through the payment of school impact fees.

B. 6-Year Plan – Facility Capacity Needs

Project Description	Added Capacity	Estimated Cost	Cost for Added Capacity to Serve Growth
Woodburn Elementary Portable	48	$500,000	$500,000
Odyssey Middle School Addition	100	$15,000,000	$10,000,000
Property Acquisition		$7,000,000	0
Liberty Middle Portable	60	$500,000	$500,000
Middle School Construction	850	$100,000,000	$100,000,000
Leadbetter Campus Improvements for Educational Purpose	500	$87,000,000	0
TOTAL:	**2,158**	**$210,000,000**	**$111,000,000**

- Cost attributed to forecast growth is the proportionate share of the total cost to construct the improvement that is equal to forecast growth. Forecast growth at the elementary school level is 442 and the added capacity is 48. Because two middle schools will be at and over capacity during the 6-year period of this plan, the entire new middle school, addition, and portable are needed for growth. The estimated total cost includes all the costs to construct the improvement. Architect, engineer, professional services, furniture/fixtures/equipment, permit and owner contingency costs have been excluded from the cost allocated to serve forecast growth.
- Costs are estimates.

- The 2016 bond program also included replacement facilities and capital renewal projects that are not listed above. A detailed list of all bond improvements with project specific costs is on file with the District.
- To accommodate growth on a short term and immediate basis, the District may purchase and utilize portable classrooms, and this plan incorporates those facilities and the equipment and furniture necessary to equip these classrooms in the District's facility plan. Impact fee revenue can be available to fund portable facilities if these facilities are needed to serve growth.

VI. CAPITAL FACILITIES FINANCE PLAN

A. Six Year Financing Plan

Facility Capacity Need	Total	Estimated Impact Fees	State Construction Funds	Bonds
Secured	**$4,000,000**	$4,000,000	$0	$0
Unsecured	**$111,000,000**	$3,000,000	$13,000,000	$95,000,000

*Financing plan does not include all potential facility needs identified in table V. B. above.

The total cost for all 2016 bond projects, including facility improvements and property acquisition was $137.2 million dollars. Funding for planned improvements is typically secured from a number of sources including voter approved bonds, limited general obligation bonds, capital levies, state match funds and impact fees. The following information explains each of the funding sources in greater detail.

Capital Levies
In 2021, District voters approved a $11.5 million dollar Capital Levy to fund technology and necessary capital renewal projects; including roof replacements, HVAC replacements, fire protection upgrades, and other capital maintenance.

School Construction Assistance Program (SCAP)
The School Construction Assistance Program (SCAP) provides funding assistance to school districts that are undertaking a major new construction or modernization project. Funds primarily come from the Common School Construction Fund (the "Fund"). School districts may qualify for State construction funds for specific capital projects based on eligibility requirements and a state prioritization system. Based on the District's assessed valuation per student and the formula in the State regulations, the District is currently eligible for state construction funds for new schools at the 63.77% match level. The District received $13,065,000 for construction of the new high school.

Impact Fees
The collection of school impact fees generates partial funding for construction of public facilities needed to accommodate new development. School impact fees are collected by the cities and County on behalf of the District at the time plats are approved or building permits are issued. Impact fees are calculated based on a formula, which includes the portion of District construction resulting in increased capacity in schools.

Anticipated property acquisition and new construction is based on the enrollment forecast, capacity, the District's educational standards and the community's support of finance tools to fund improvements.

VII. SCHOOL IMPACT FEES

The Growth Management Act (GMA) authorizes jurisdictions to collect impact fees to supplement funding of additional public facilities needed to accommodate new development. Impact fees cannot be used for the operation, maintenance, repair, alteration, or replacement of existing capital facilities used to meet existing service demands.

Local jurisdictions in Clark County have adopted impact fee programs require school districts to prepare and adopt Capital Facilities Plans. Impact fees are calculated in accordance with the jurisdiction's formula, which is based on school facility costs to serve new growth. The formula allocates a portion of the cost for new facilities to a single family or multi-family residence that create the demand (or need) based on a student factor, or the average number of students that live in new single family or multi-family homes. The formula also provides a credit for SCAP funds the District receives and the projected future Bond Proceeds (or property taxes) that will be paid by the owner of the home.

The District's impact fees have been calculated utilizing the formula in the Clark County and the Cities of Camas, Washougal, and Vancouver Impact Fee Ordinances. Application of the formula is shown in Appendix A which follows on the next page.

In accordance with the school impact fee calculation in Appendix A, the District's maximum allowable school impact fees are:

$6,652.48 per single family residence
$29,713.38 per multi-family residence

The District Board of Directors, at its May 23, 2022 meeting, recommends collecting school impact fees in the following amounts:

$ 6,650.00 per single family residence
$ 6,650.00 per multi-family residence

Introduction

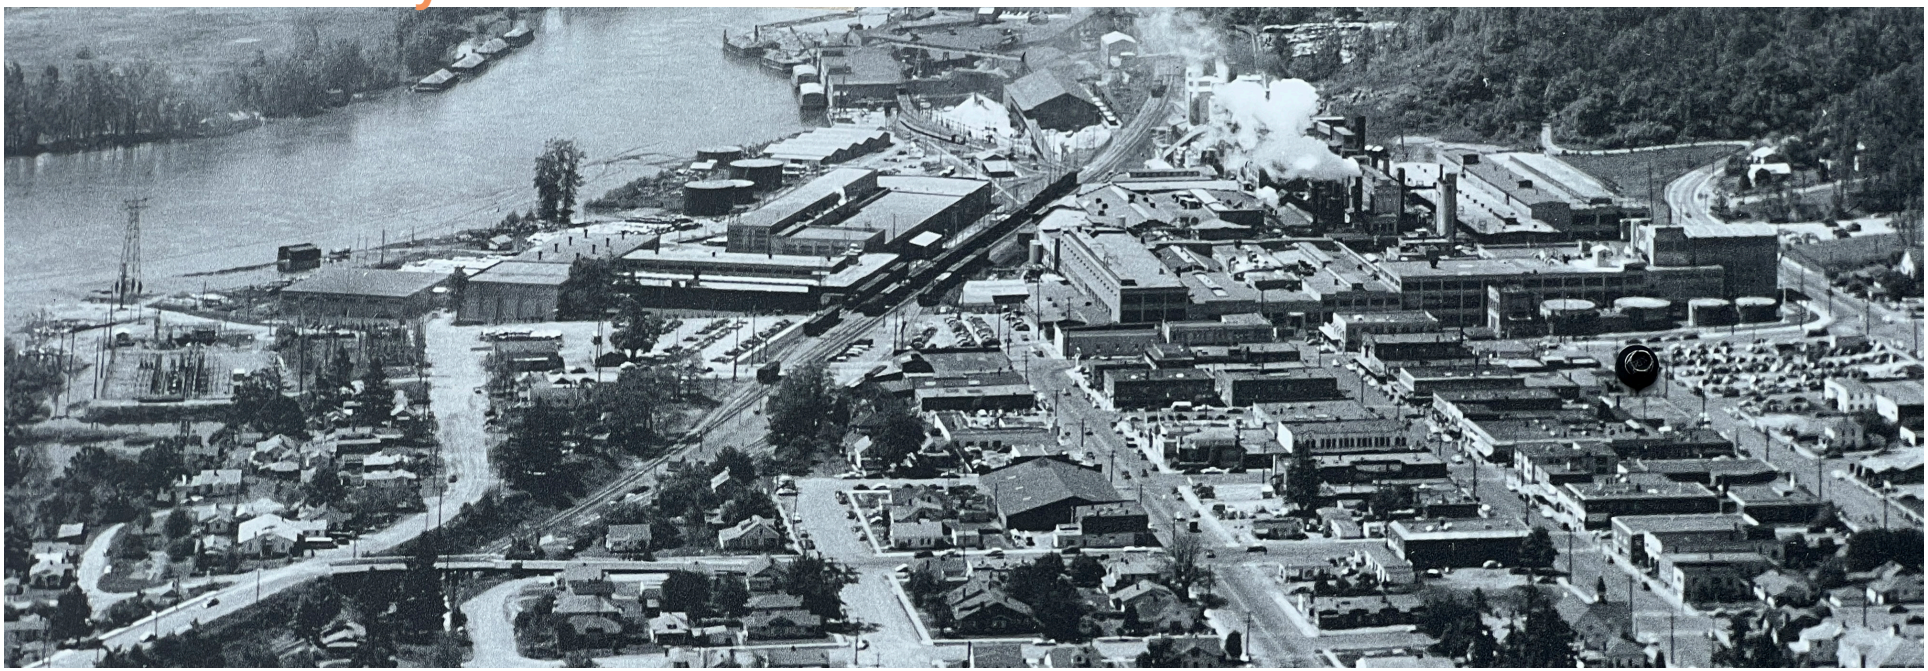
our 2045 Downtown Camas

Purpose

Over the last decade, the City of Camas has grown substantially. Access to outdoor recreation, schools, and a strong community-feel are frequently cited as the City's strengths, and Downtown Camas has played a crucial role as the heart of the City, defining its unique identity in the region. Since initiating the modern economic and industrial history of Camas, Downtown has continued to transform into a core commercial district that attracts residents and visitors alike to its authentic Main Street experience along NE 4th Avenue.

Whether for daily shopping trips or a monthly themed event, Downtown Camas continues to be a local retail hub and a regional destination. To date, downtown has kept pace with the demands of overall growth in Camas, but recent market demands and fluctuations led the City and downtown to address future transformations over the next 20 years.

To address future growth, the City of Camas prepared to update its citywide Comprehensive Plan ("Our Camas 2045"). City leaders and local stakeholders recognized a need to place a special focus on Downtown Camas through a Subarea Plan ("Our Downtown Camas 2045"). Completing these plans with a synchronous planning process offered a chance to consider unique needs at both the city-scale and downtown-scale, while understanding the vision and goals for each plan are intertwined. The plans were developed through an iterative community engagement process, input from local stakeholders at key project milestones, and ongoing guidance and input from City staff.

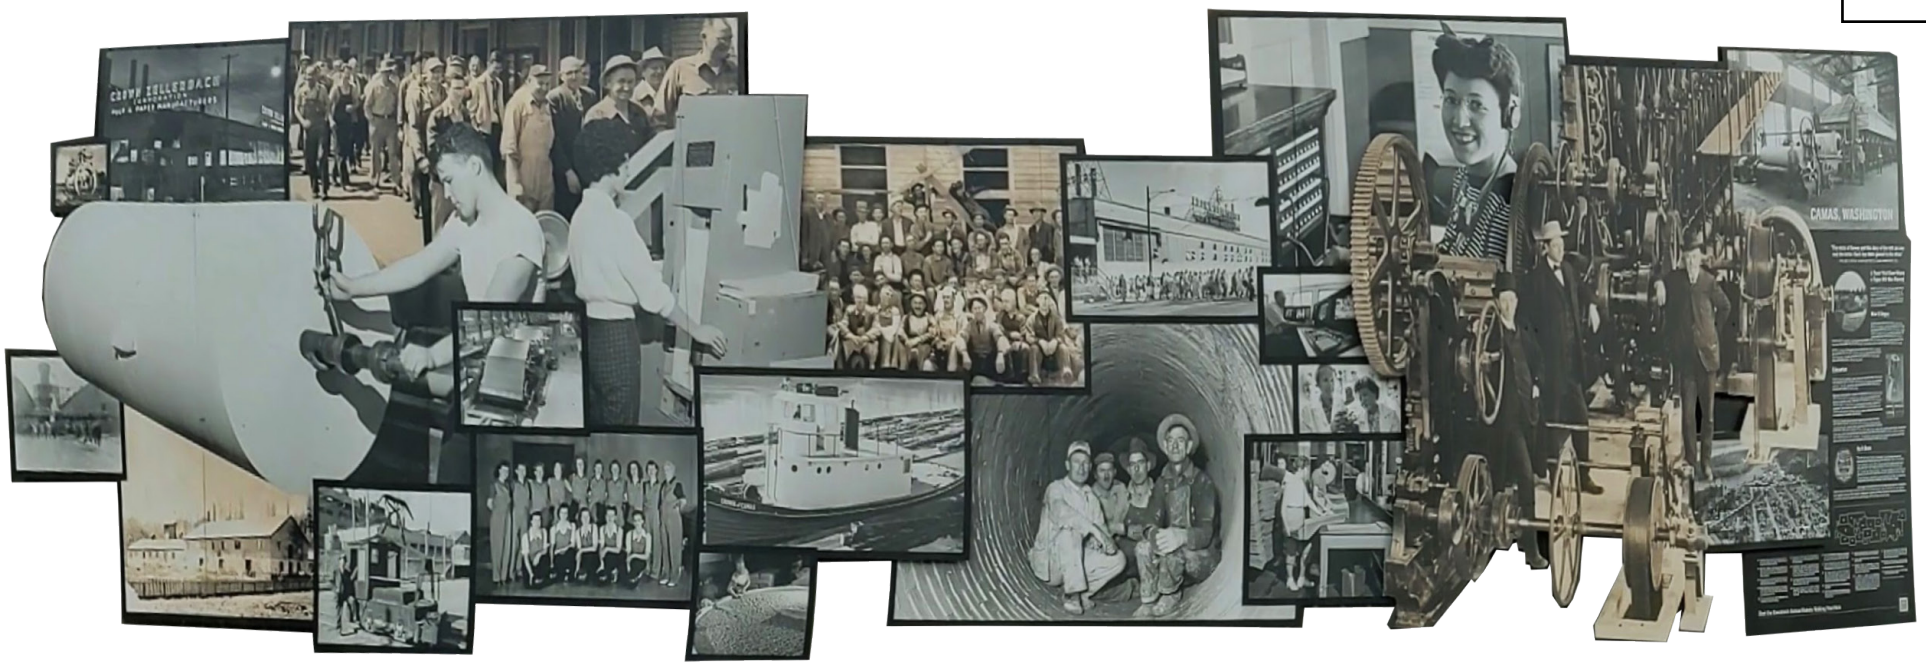


Bike Parked on Curb in Downtown Camas

The Downtown Subarea Plan considers the historic character of Downtown Camas and offers a strategy for balancing history with future transformations to make downtown a place that will continue to attract residents and visitors alike. The Subarea Plan is intended to serve as a shared commitment between city and downtown stakeholders, welcoming the development and business communities to help implement the vision. It also provides discussion about future expansion to the Camas Mill Property, when timing aligns with property owners' planning processes. The vision and goals set forth in this Plan intend to achieve the following outcomes:

1. Set the **policy direction** for future implementation in Downtown.
2. Guide development in a way that **reflects the community's vision** for the area through a set of clear and objective design guidelines.
3. Establish a framework for **connecting public and private spaces and transportation networks.**
4. Lay the groundwork for the future of the Camas Mill Property by **supporting an unrestricted environmental cleanup** level.

Context & History

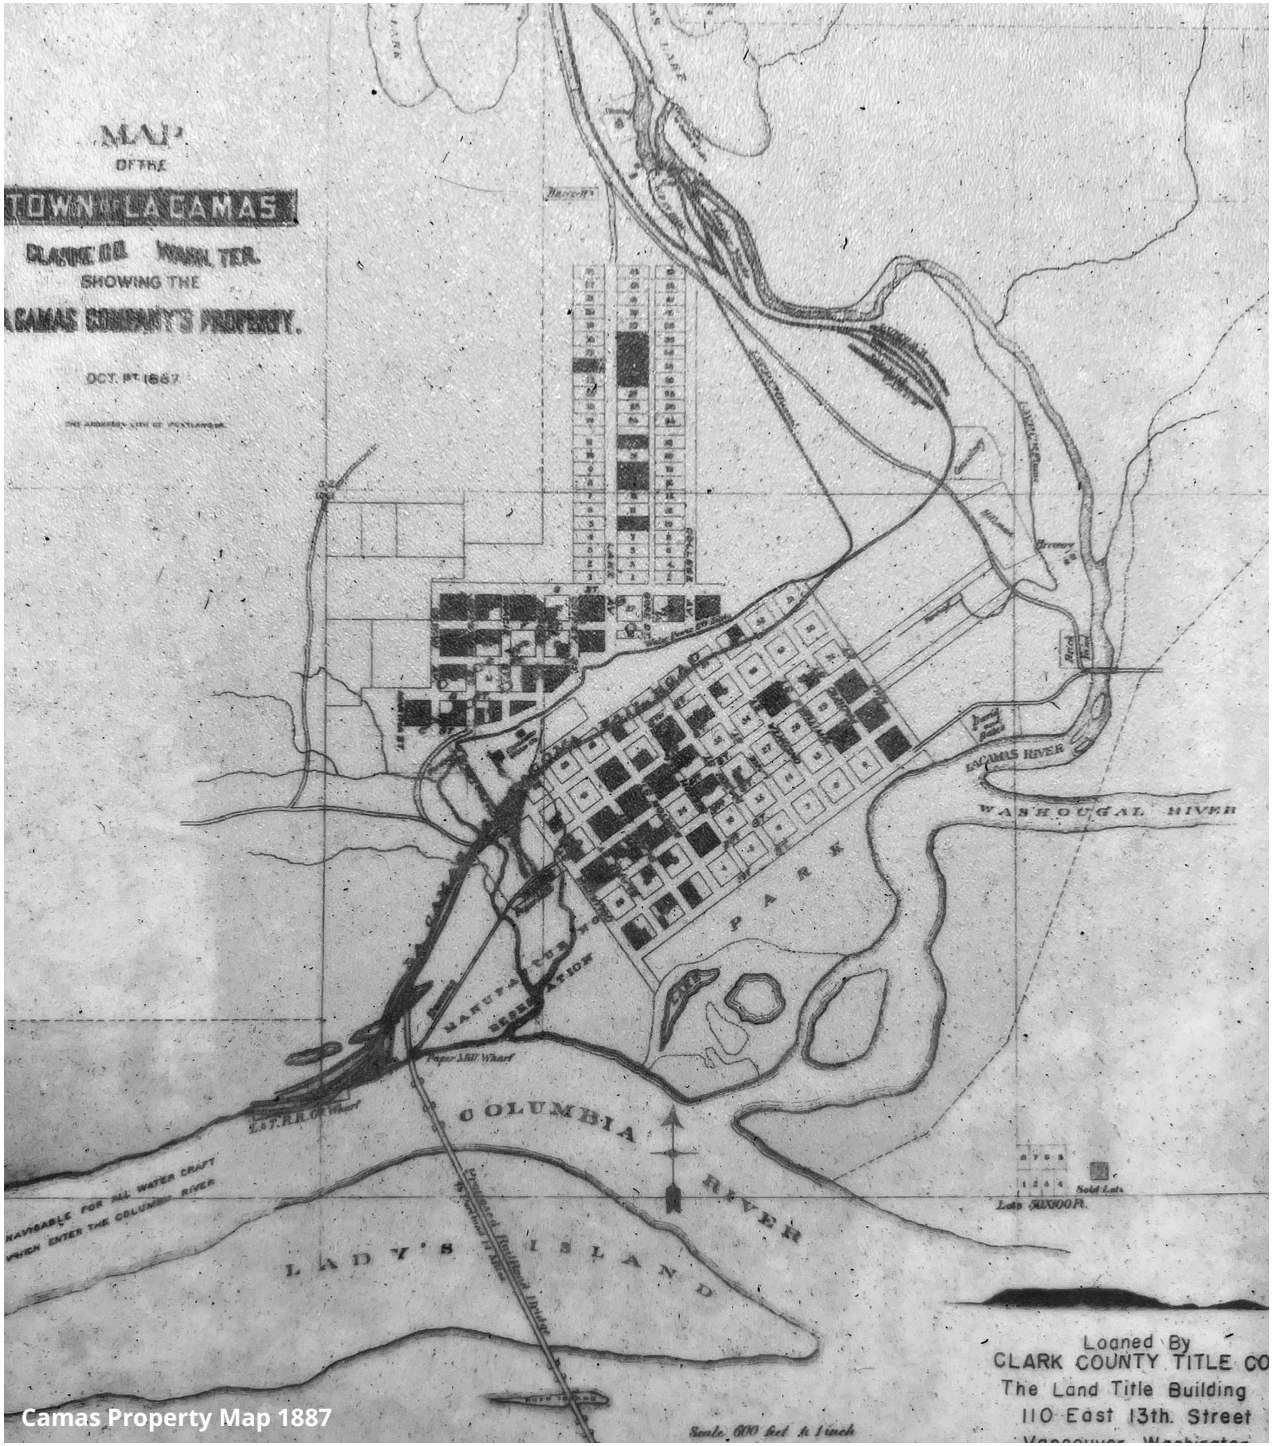


Downtown Camas has been a vital part of the city's history since its founding as the Town of Camas in *1883*. At that time, construction of the Camas Paper Mill began, which provided opportunities for the first businesses to open in downtown. These businesses served the people working at the mill and living in the town. The mill's involvement in and support of the community, as well as the standard for excellence, brought many years of civic prosperity and quality entrepreneurship to Downtown Camas.

With **increased suburban growth in the early *1960's***, anchor businesses in historic downtowns across the country were moving to shopping malls and the civic leaders of Camas grew concerned. Downtown business leaders were inspired by a transformative pedestrian shopping mall in Grand Junction, Colorado and proposed to do something similar in Downtown Camas. The effort was called "Operation 4Sight" and improvements included widened sidewalks, trees, flowers, benches, store awnings, gazebos, buried electrical and phone wires, better layout of parking spaces, outdoor telephones, and an outdoor sound system.

To communicate the potential changes to the community, civic leaders and downtown advocates temporarily redesigned NE 4th Ave with a mockup of the suggested improvements. These improvements were left in place for two months so residents could offer suggestions and get used to the changes. The community saw the benefit and the project moved forward.

Work began on the downtown mall in 1966 and was completed in *1967.* Funding came from the building owners of the downtown area, city revenues, and some federal aid. The vision of forward-thinking stakeholders at the time has created a unique experience in Camas today, including the wider pedestrian friendly sidewalks and iconic tree canopy. These efforts have helped the downtown busi



Camas Historic Mill Photo Collage at the Universal Martial Arts Building at the Corner of 4th Avenue and Adams.

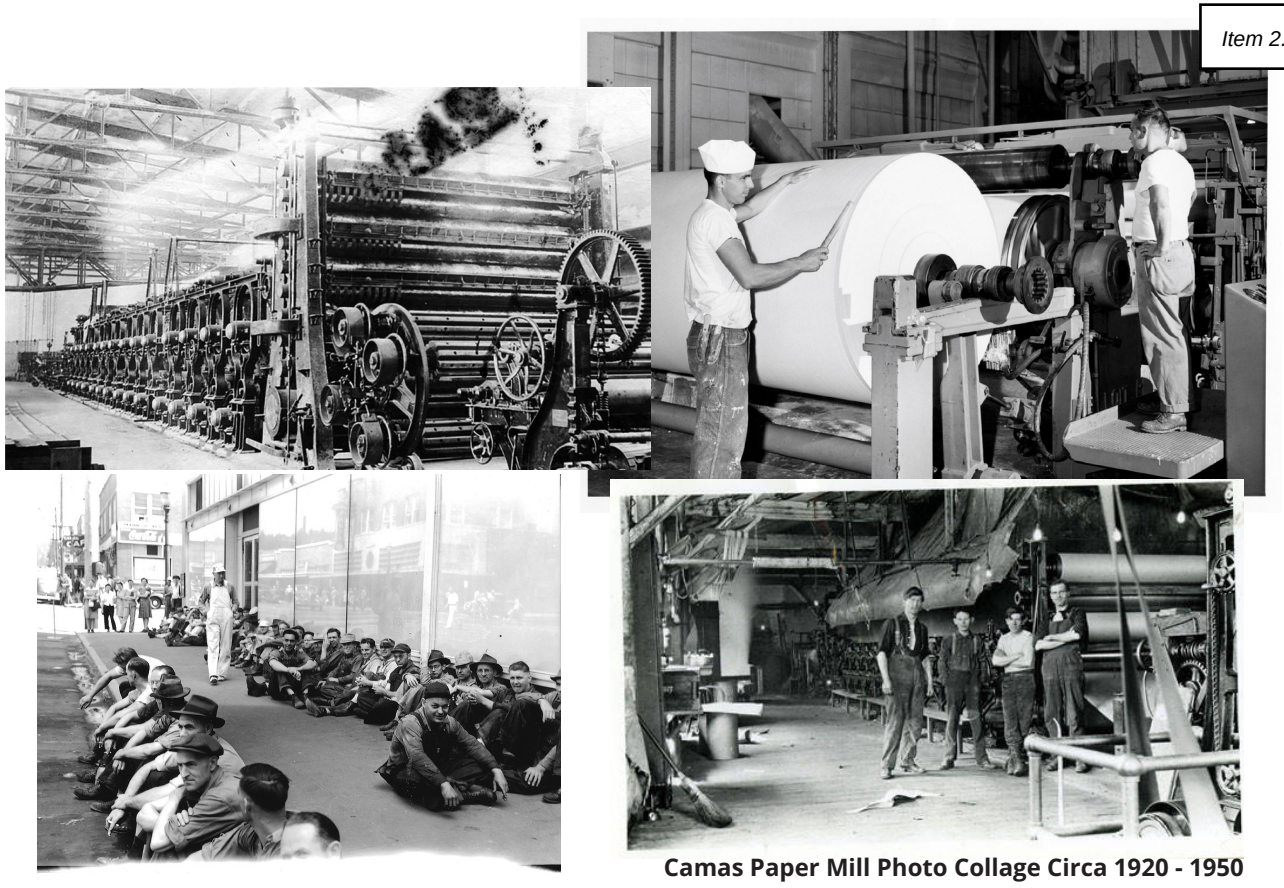
district to continue to thrive.
By the *1980's* and *90's*, a steady decline was occurring in downtown as mill employment was decreasing and many anchor businesses such as JC Penney, Sears, and Sprouse Reitz were closing or relocating to the Vancouver Mall. Farrell & Eddy, an anchor retailer for 53 years in downtown, closed in 1998, along with other retailers who depended on the bigger stores to help bring people to downtown.

In the early 2000's, the City of Camas started working with business leaders and community members in a city-funded committee called the Downtown Vision Coalition *(DVC)* to create a new vision for downtown and address building vacancies and necessary improvements. Progress was slow but by 2005, new small businesses had opened in downtown, and they worked to together on events, marketing, advertising, active referrals, and camaraderie to create collective success.

The Great Recession hit in 2008 and by 2009, downtown fell to a 60% vacancy rate. The City suspended funding, but the members of the DVC looked for opportunities for continued growth. The DVC joined the Washington State Main Street Program, seeking increased expert guidance in downtown revitalization and in 2009, incorporated into the 501c3 non-profit Downtown Camas Association (DCA). The mission of the DCA, which continues today, is to create a vibrant social, cultural and economic center of the community, emphasizing preservation and a vision for the future. The DCA promotes, represents and advocates for our town locally, regionally, and nationally.

Over the years, the DCA, City, businesses, and community have all strategically worked together to bring vitality, prosperity, and quality of life to Downtown Camas. ***Today*, downtown has a vacancy rate of less than 2%**, and a variety of high-quality shops, restaurants, a preserved historic theatre, a remodeled boutique

Camas Property Map 1887



hotel, and wellness services. Businesses work together and have strong community support. The DCA and the City have put considerable effort into beautifying downtown with tree and ridgeline lighting, engaging public art, benches and seating areas, flower baskets, landscaping, bike racks, signage, and lamp posts that match the authentic downtown aesthetic.

Over 25 consistent and long-term community events are held each year in downtown to stimulate economic vibrancy, grow awareness of Camas, and to bring the community together. Thousands of volunteer hours have been contributed. Private investment continues to increase and new housing has begun developing. Collectively, these efforts have worked to strengthen and preserve our downtown, but increased planning efforts and improved infrastructure are required to continue to increase downtown vitality, livability, and sustainability.

The Downtown Subarea Plan presents this opportunity as another key milestone in the history of downtown through updated visioning, planning, and implementation over the next 20 years.

Camas Paper Mill

Camas Paper Mill Photo Collage Circa 1920 - 1950

Founded in 1883 as the LaCamas Colony Mill and later operated by Crown Zellerbach and eventually Georgia-Pacific, the Camas Paper Mill was **once one of the largest employers in the region**, shaping the economic, physical, and cultural landscape of Camas. With its iconic smokestacks and waterfront facilities, the mill not shaped Camas' identity as a mill town but also supported generations of workers and families. The mill's proximity to the Columbia River and nearby forests made Camas an ideal site for pulp and paper production, and **the downtown core emerged in tandem, serving the needs of mill workers and their families.**

In recent decades, **the role of the mill has evolved**. Significant portions of the mill's operations were shut down in 2018 and the workforce has been reduced to about 150 employees. The mill's operations and footprint have contracted in recent years and **Georgia-Pacific is currently demolishing several unused buildings**, but there is no announced plan to shut down entirely.

While r**ecognizing the role that the mill has played in Camas's history** and its significance as an economic driver, the City of Camas is working closely with the Washington Department of Ecology and Georgia-Pacific to ensure that the site is cleaned up to a high environmental standard, opening the door for potential long-term reuse. In February 2025, the City Council adopted Resolution 25-002, in support of an **unrestricted environmental cleanup level.** "Given the site's legacy and its importance to our community," the resolution states, "it is imperative to ensure the cleanup efforts are fully protective of human health and the environment and preserve future private and public redevelopment options, including the flexibility to support a broad range of **future uses from residential and commercial development to natural and recreational spaces.**

Organization of the Plan

The Downtown Subarea Plan is intended for use by a range of stakeholders in Downtown Camas: from City decision makers setting priorities for City staff to implement, to Downtown Camas Association staff and members who continue to be champions for Downtown, to property and business owners who would like to contribute to and participate in continued growth, to community members wanting safer access to and through Downtown. This Plan reinforces the city's commitment to making downtown a safe and thriving place to live, work, and play, serving as the city's "living room" for years to come. The City welcomes the development and business community to work together to honor the foundation that the historic Downtown has set, and look for ways to transform beyond the core to create space for more opportunities.

The Plan is organized in the following sections:

01 Introduction. An explanation of the purpose, context, and history.
Why plan for Downtown now? How did we get here?

02 Existing Conditions Summary. A review of the existing physical, regulatory, and market conditions that exist in Downtown Camas today.
Where are we now?

03 Framework. A summary of the engagement process that set the priorities for the Downtown Subarea Plan; a vision statement and set of goals for Downtown Camas; and an urban design framework that illustrates the opportunities and constraints.
How did the community inform the plan? What is the vision for Downtown Camas? What are the opportunities and constraints for the future of Downtown Camas?

04 Land Use Concept. Presents how the vision and goals can be achieved through new development and redevelopment, including residential, commercial, and mixed-use development types.
What could Downtown transformation look like?

05 Open Space Network. Designs for improved and new open spaces that provide more gathering space and connected recreation opportunities Downtown.
What does this mean for park and open space?

06 Transportation Concepts. Analysis of potential effects on traffic and transportation networks Downtown, as development changes occur. *How will changes to Downtown affect traffic and transportation networks?*

07 Infrastructure Improvements. Analysis of potential effects on utilities and infrastructure.
What changes to infrastructure will need to occur over the next 20 years?

08 Implementation. A strategy that reflects the policy direction and intention for the next 20 years of Downtown set by the vision and goals in the Subarea Plan.
How will we get there?

09 Appendices. Supplemental information relevant to the Subarea Plan.

JUXTAPOSITION

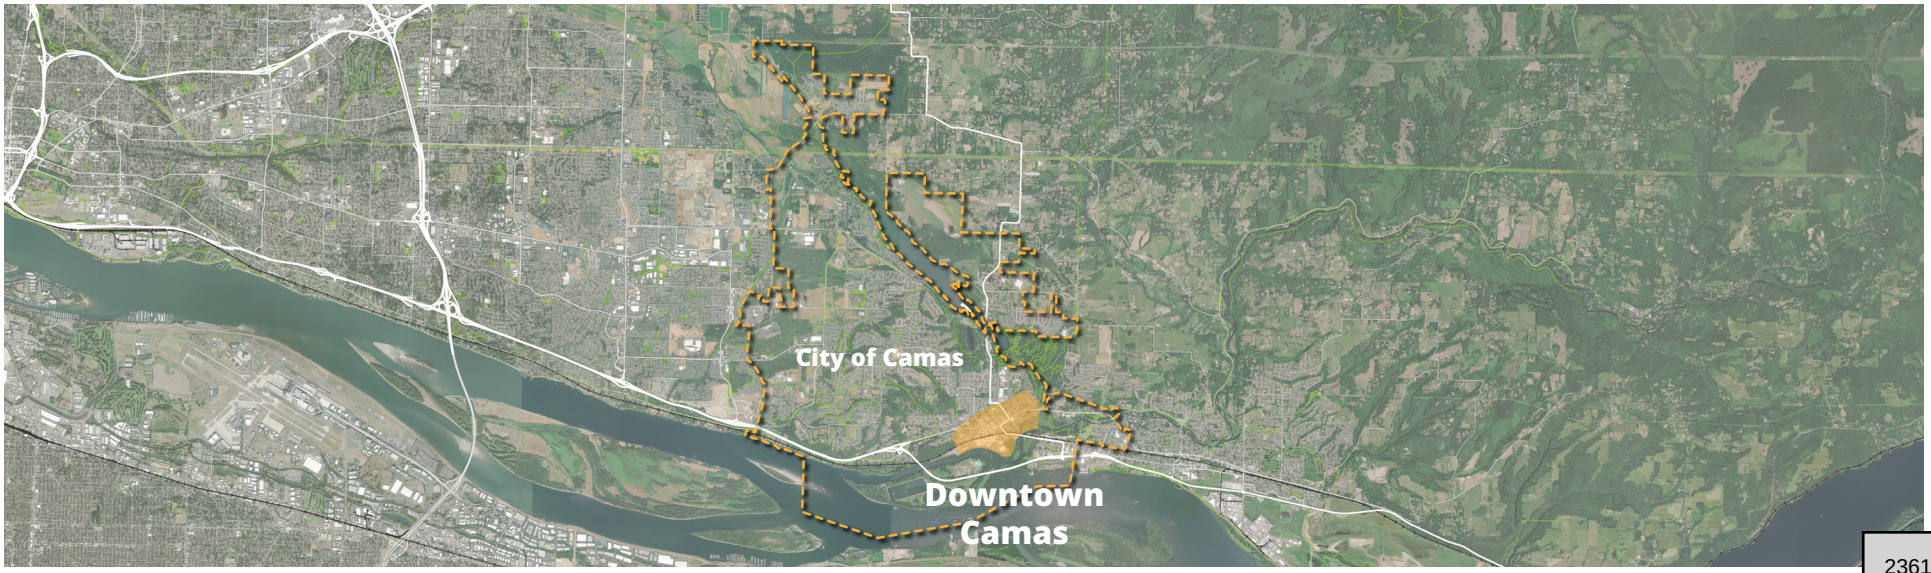
02
Existing Conditions



our 2045 Downtown Camas

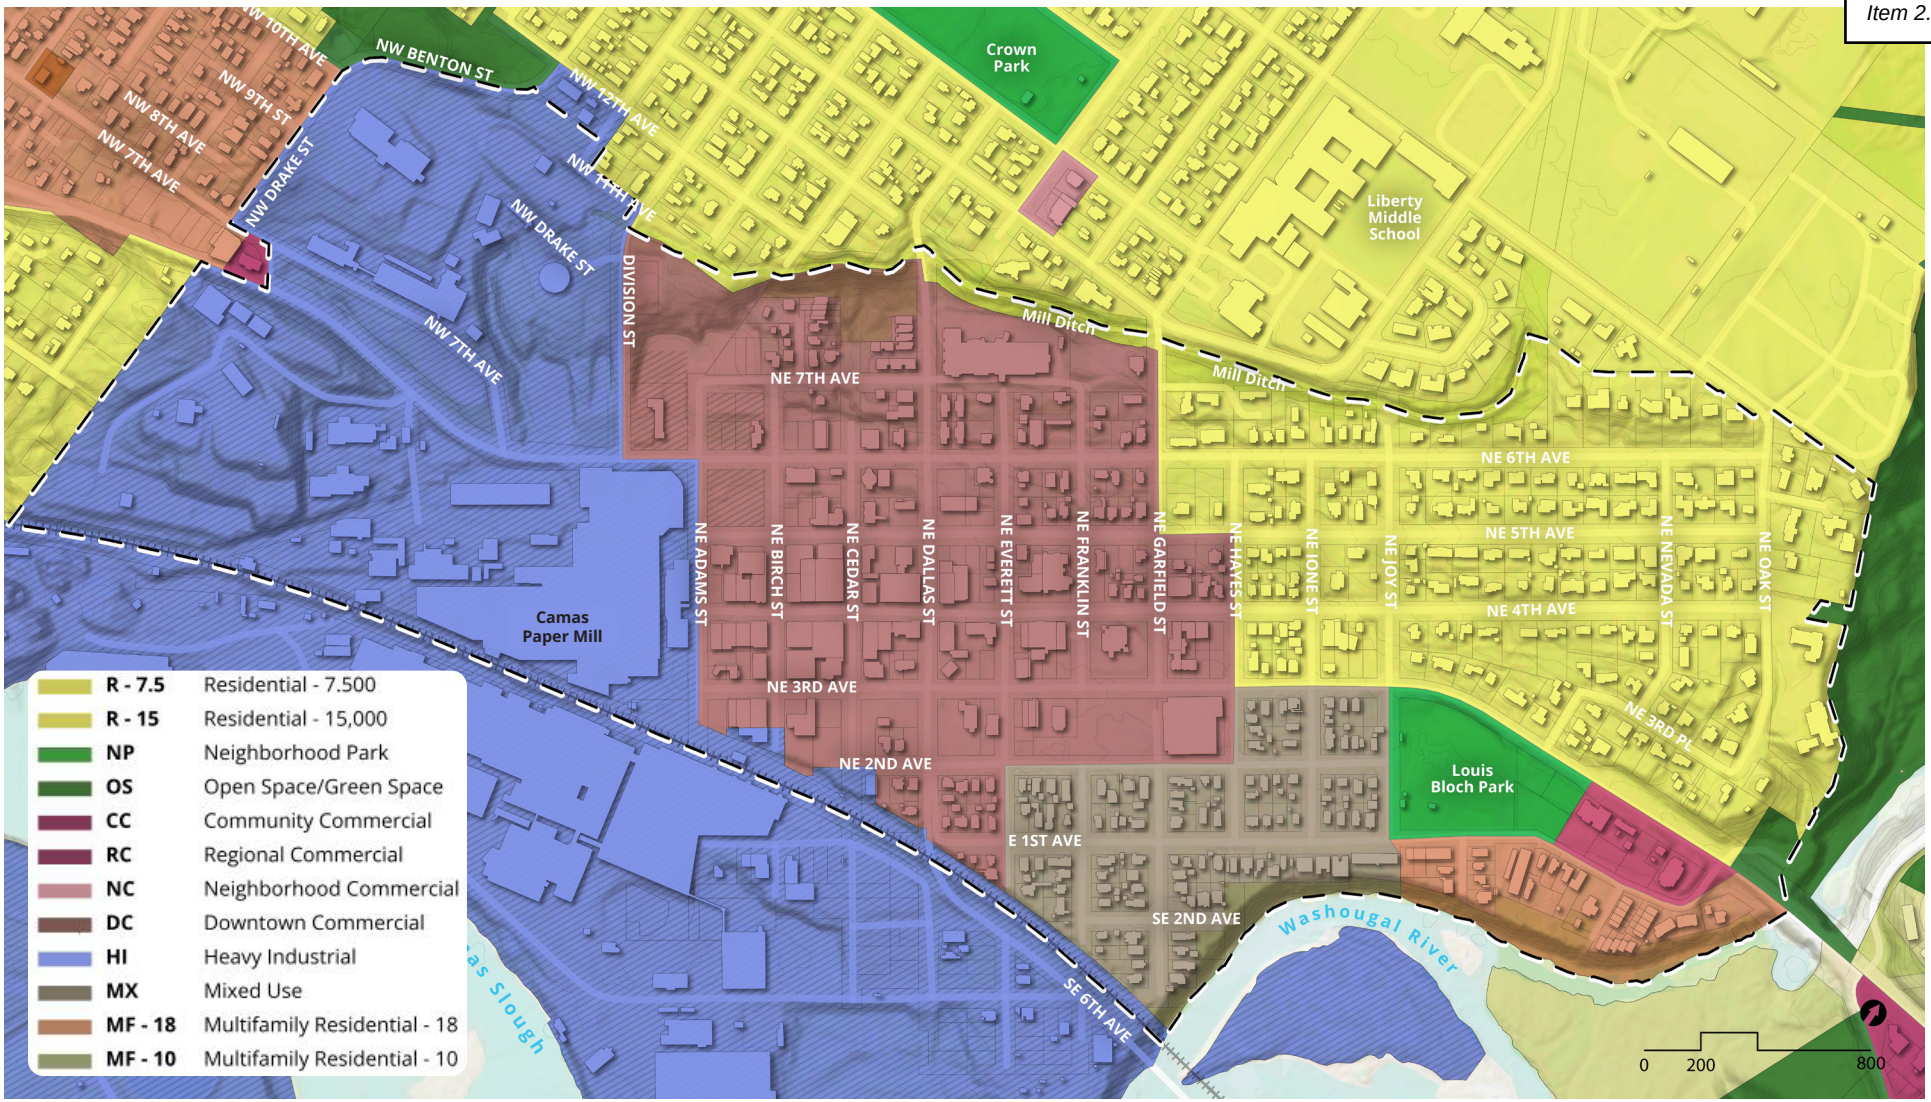
Context

The City of Camas is well-connected to the Portland-Vancouver Metro region, located off of Washington State Route 14. Downtown Camas, the well-established, recognized core of the city, is easily accessible with a gridded street network. Its historic main street on NE 4th Avenue, with buildings fronting the sidewalk, serves as an attraction for a range of activities including retail businesses, community events, and City services. The adjacent Camas Paper Mill property helped to establish this historic character, but downtown has evolved over the years to continue to be a destination for residents and visitors, serving today's needs and offering unique community events rooted in the city's history.

The Downtown Subarea Plan considered relevant context from previous City-adopted planning efforts that encompass the downtown area including the current Comprehensive Plan "Camas 2035," the Downtown Design Manual, and the Street Tree Succession Plan. Additionally, concurrent efforts that influenced the planning process included the Our Camas 2045 Comprehensive Plan, the Parks and Open Space Management Plan, the Station 41 Replacement Project, and the Department of Ecology environmental remediation process at the Georgia-Pacific multi-year revitalization project. These projects, along with community-led efforts in Downtown, provided insight into understanding common goals and desired outcomes that affect Downtown Camas.

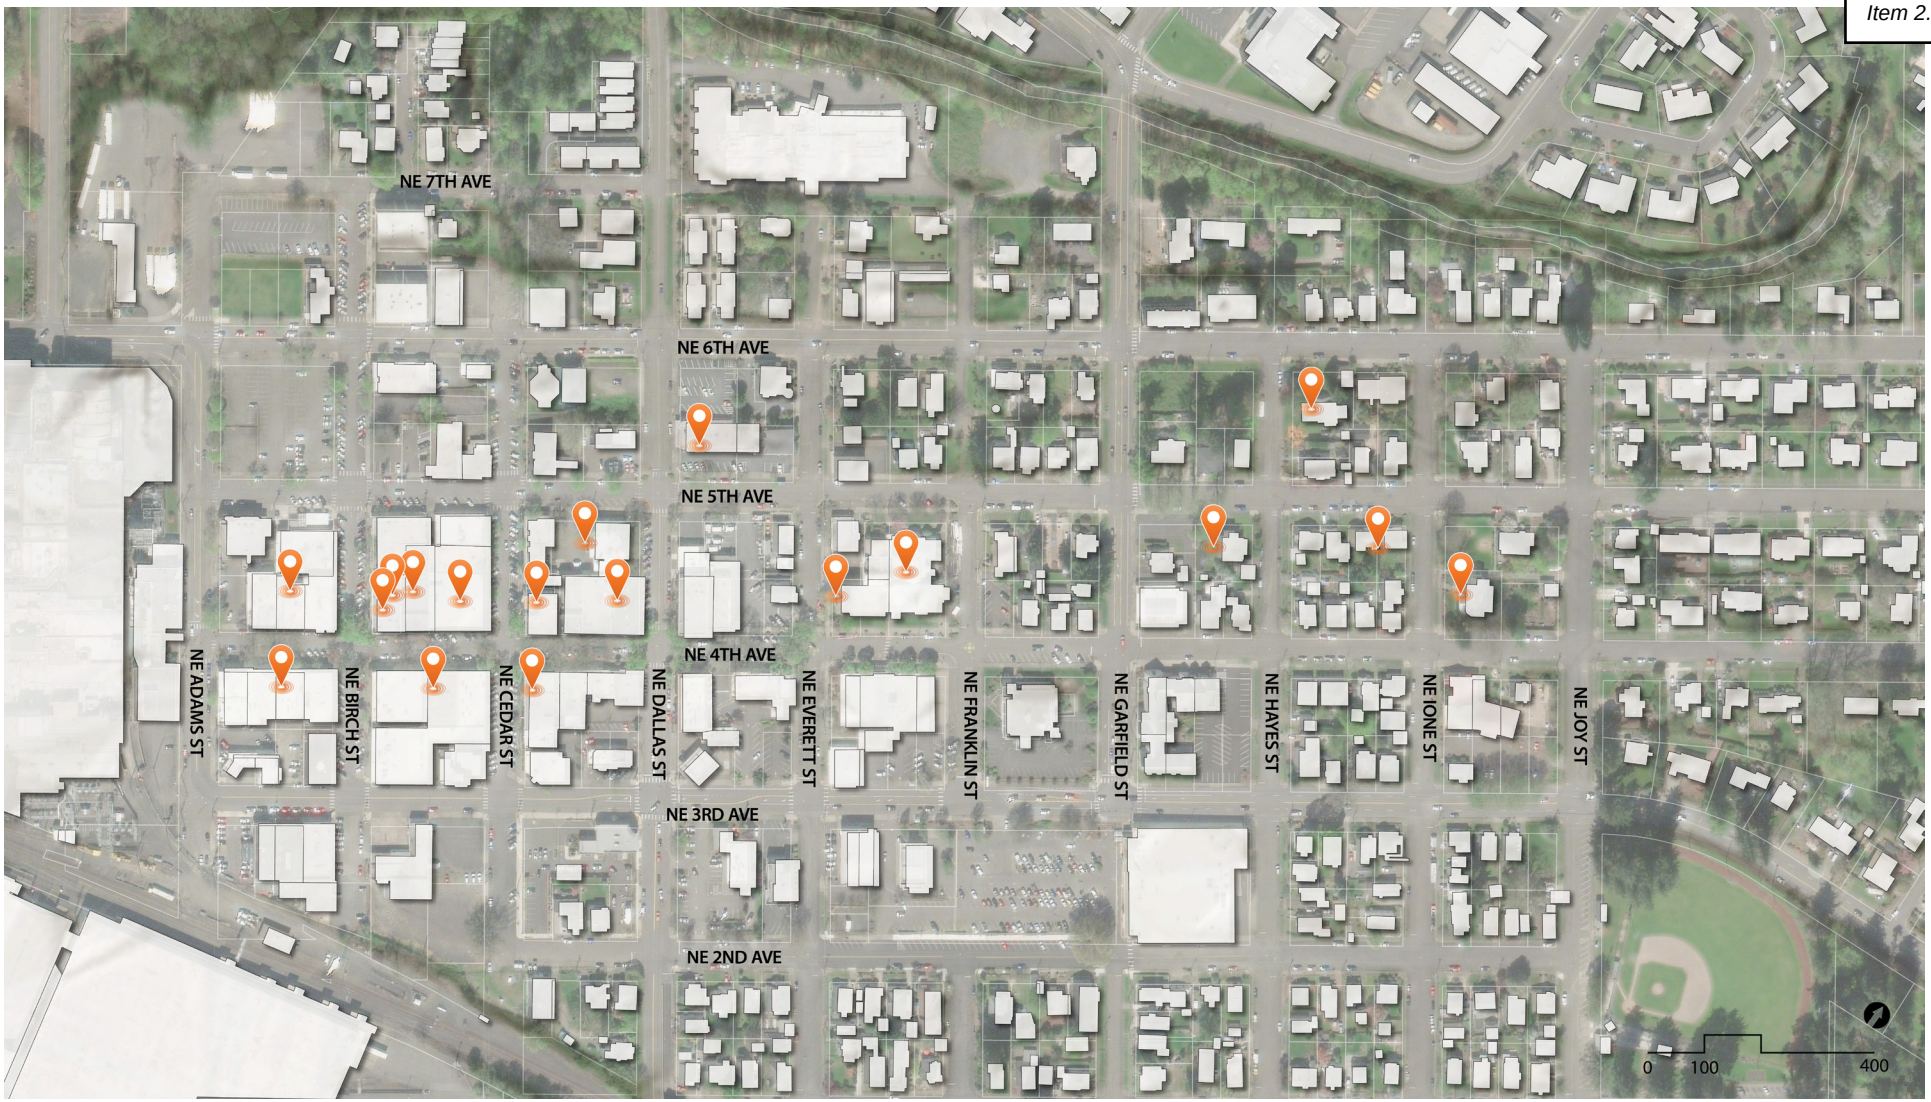
An early phase of planning for the future of Downtown Camas included a site assessment of existing conditions. This assessment, summarized in this section, includes findings from available data, discussions with City staff with institutional knowledge, visual assessments from site visits, and conversations with key stakeholders with lived experience in Downtown Camas.

2361



Physical Constraints

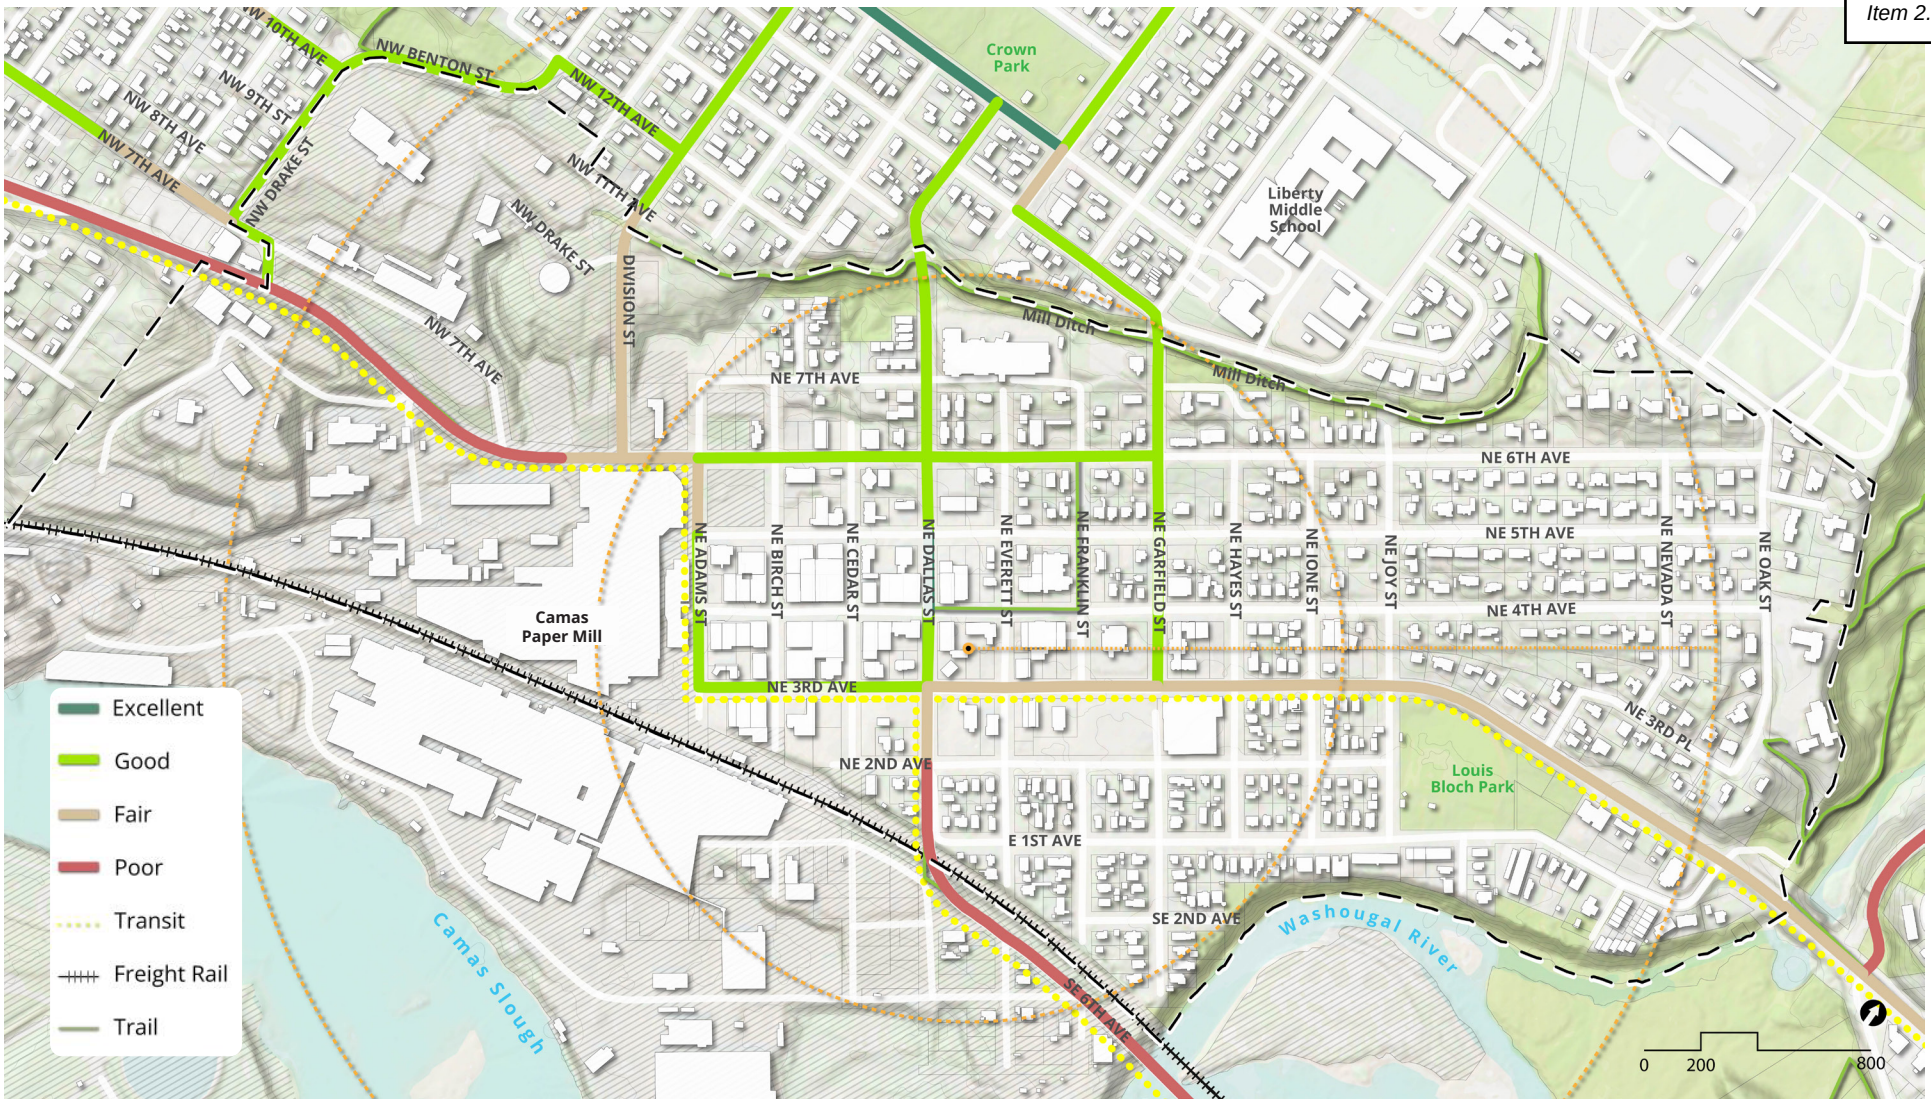
The boundary of Downtown Camas, as defined by its physical constraints, includes the Camas Paper Mill property to the west, steep slopes to the north, and the railroad tracks, Camas Slough, and Washougal River to the south and east. The downtown core is located on mostly flat land, but topography quickly changes to the north of NE 4th Ave, creating a separation of the commercial core and adjacent residential neighborhoods.



Open Space

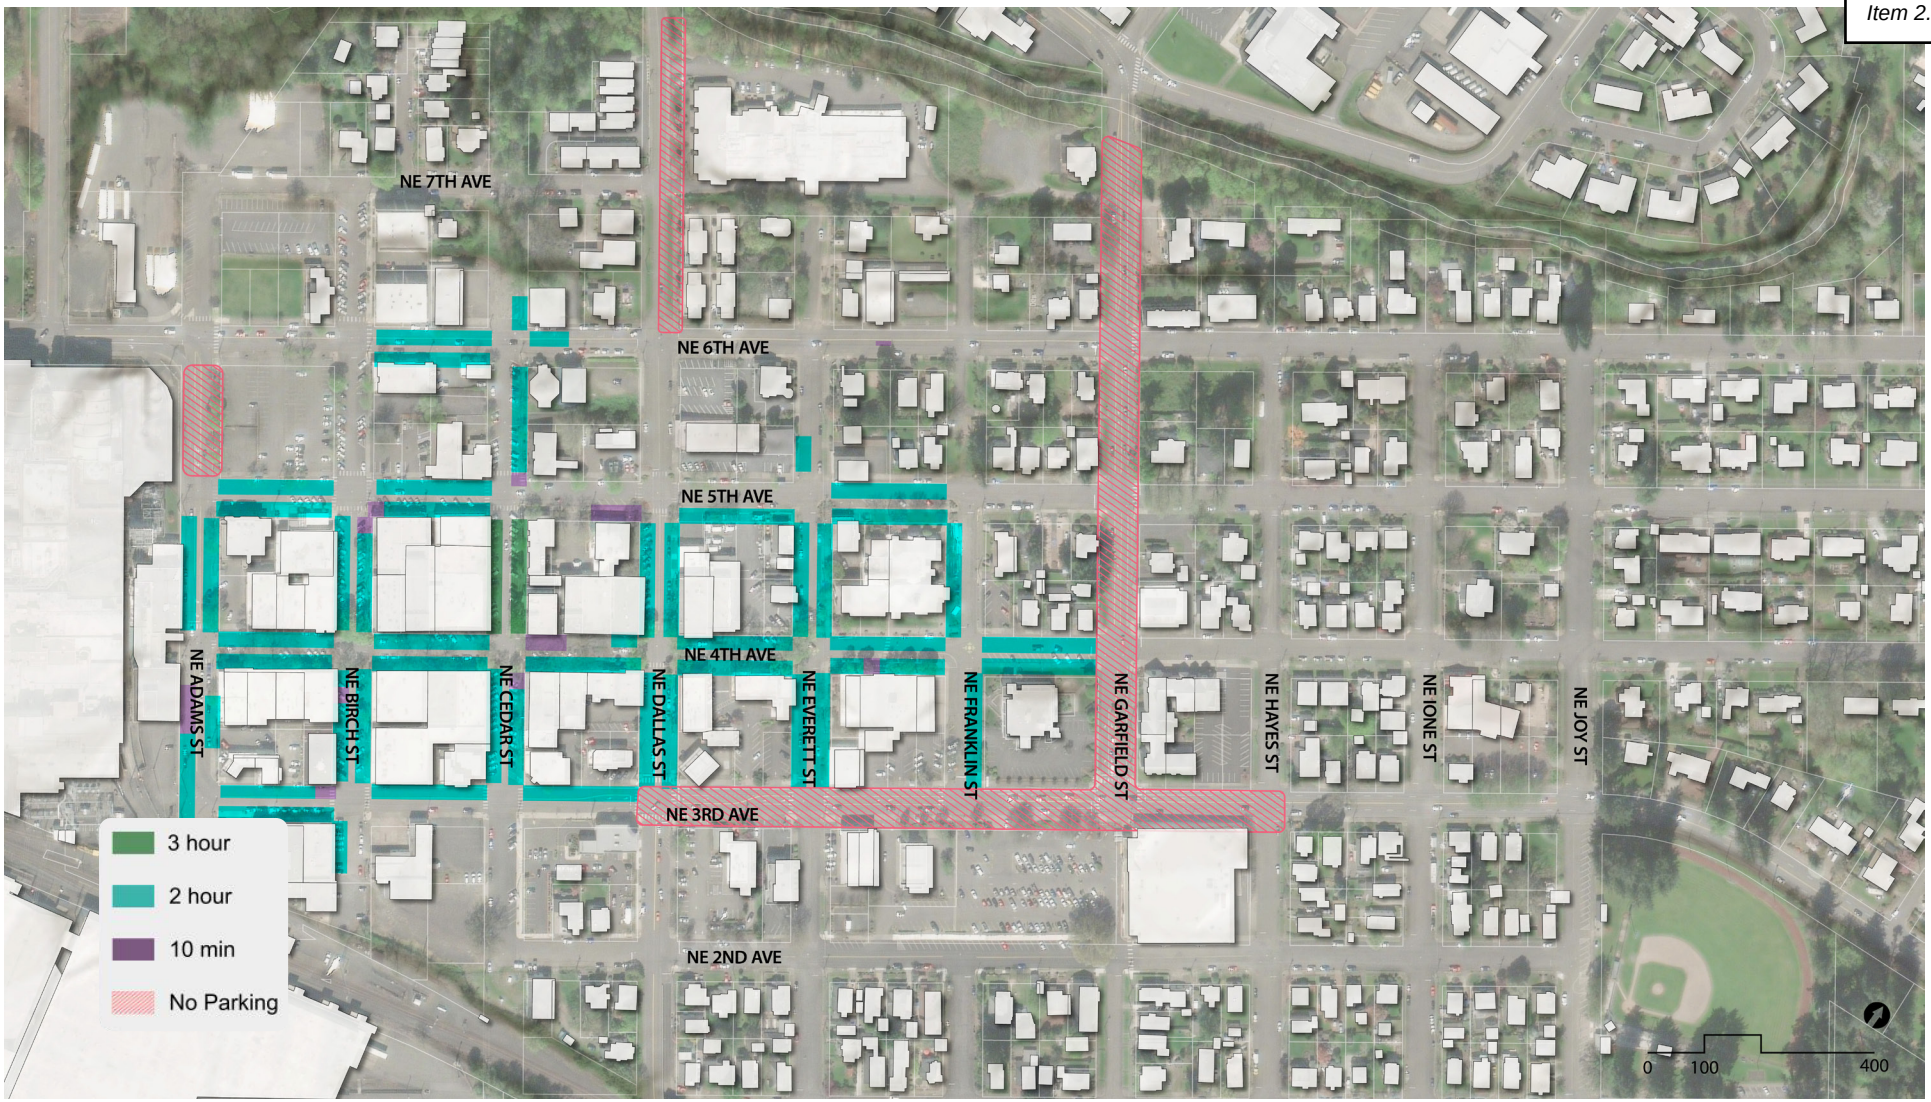
Downtown has access to parks within a half mile including Louis Bloch Park, Crown Park, and the Mill Ditch Trail. Lacamas Creek Trail is accessible within walking distance of the eastern edge of Downtown Camas. Community stakeholders communicated a need for more recreation and gathering spaces Downtown.

Zoning



The downtown core is zoned Downtown Commercial (DC) and Mixed Use (MX). The MX zoning district “provides for a wide range of commercial and residential uses. Compact development is encouraged that is supportive of transit and pedestrian travel.” The adjacent zones are primarily residential neighborhoods served by downtown amenities, with the exception of the Camas Paper Mill property to the west of the Downtown Core, which is zoned Heavy Industrial.

Historic Sites

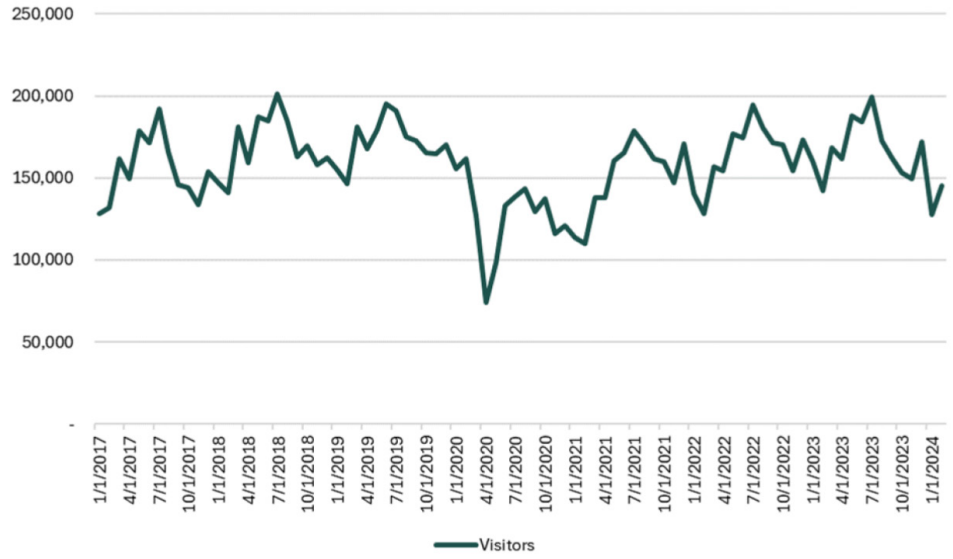


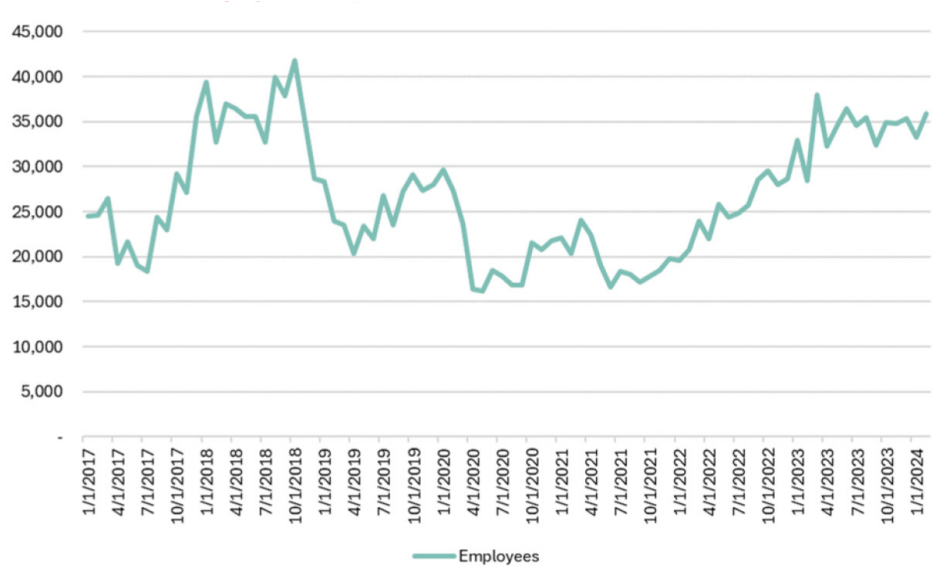
Downtown includes historic sites on the National Register of Historic Places and Clark County Heritage Register, as well as those identified in the Clark County Historic Resource Inventory. Historic structures in Downtown Camas are concentrated along NE 4th Avenue, which help to define the character of 4th Avenue as Downtown's Main Street. Community members expressed a desire to preserve historic structures Downtown, seeking a balance between preservation and new transformation in the future.

2365

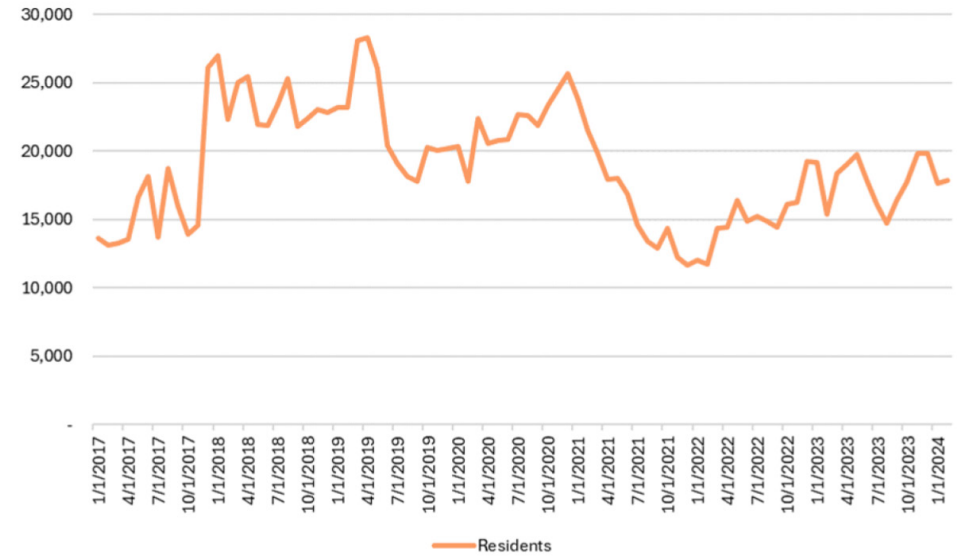
Connectivity

Downtown Camas is well-connected to City services and amenities. The small block size in downtown (about 250 square feet) creates a walkable grid, and a qualitative assessment showed that the pedestrian network Downtown ranked higher than other areas of Camas. Areas along NE 3rd Avenue to NE 7th Avenue and NE Adams Street to NE Garfield Street were identified as needing sidewalk improvements. The bicycle network could also be improved, especially to the bike network along NE 6th Avenue and 3rd Avenue. These assessments were reinforced in conversations with community members who would like to see safer crossings and a better pedestrian and bicycling experience in the areas Downtown surrounding NE 4th Ave





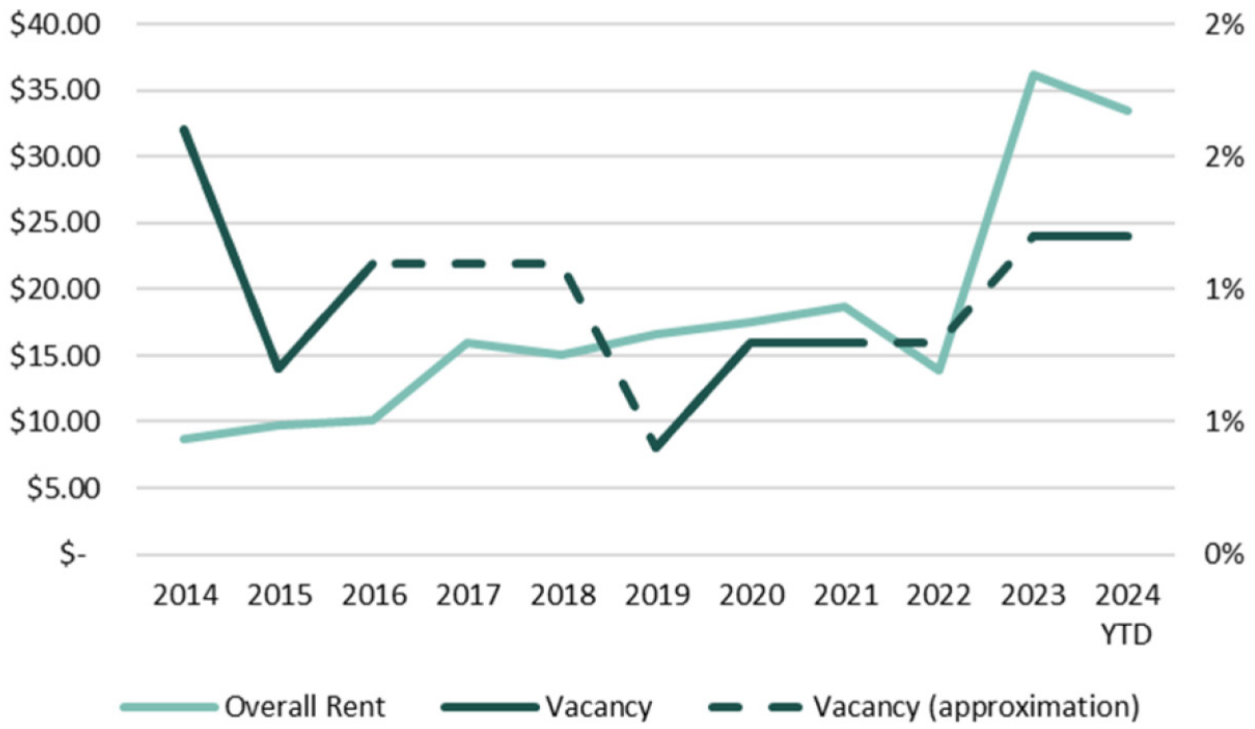
Parking



Most of the downtown core is regulated by 2-hour, non-metered parking. A few key blocks have 30-minute or 10-minute parking zones. Community members and downtown stakeholders reported a mixture of frustration and optimism related to parking downtown. Some expressed a need to reevaluate the time limits, as parking for workers at downtown businesses is difficult, given the concerns with unsafe crossings for pedestrians in areas without parking restrictions. Others offered insight that the lack of parking is a perception due to surges in demand for parking during large events. Designated off-street parking (e.g., lot or structure) was cited as a potential solution to the current parking perceptions.

Market Conditions

Visitor and employee visits to Downtown Camas increased to pre-pandemic levels and visitation by residents has been trending upward in recent years, including a healthy level of foot traffic in the downtown area. The market in Camas is on an upwards trajectory with visitors, employees, and residents coming to the downtown area for shopping, work, or other purposes.



Downtown Camas Visitor, Resident, and Employee Visits, 2017-2024
Source: ECOnorthwest; placer.ai

A market analysis of retail activity in Downtown Camas showed retail rents increasing rapidly from approximately $15 per square foot in 2022 to almost $35 per square foot in 2024. Vacancy rates for retail have remained very low below 1.5 percent since 2014; lower than the retail vacancy rates in both the City of Vancouver (3.7 percent) and Clark County (3.7 percent) in 2023, which indicates increased demand for retail space above the available supply.

Average Retail Rent per Square Foot and Average Retail Vacancy Rate (Percent) in Downtown Camas, 2014-2024 Year to Date

03
Framework

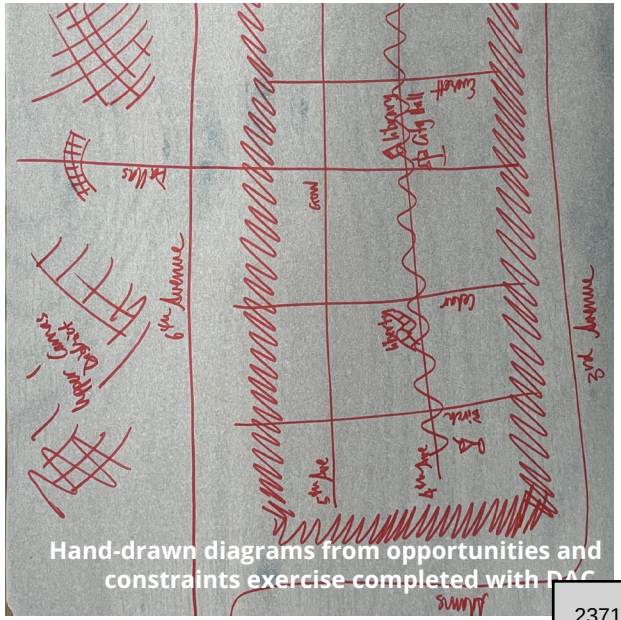
our 2045 Downtown Camas

Overview

Hand-drawn diagrams from opportunities and constraints exercise completed with DAC.

Through dedicated community efforts and intentional planning, Downtown Camas has remained the authentic and functional core of the City of Camas. Careful consideration of these long-term community efforts helped to craft a future vision that builds on this strong foundation. The Downtown Subarea Plan process also welcomed new ideas to create a vision and set of goals that represent the future evolution of Downtown Camas while maintaining its historic character and charm.

This section outlines the planning process of developing the Downtown Subarea Plan, including various engagement efforts. Early engagement led to a vision, set of goals, and an urban design framework that set the foundation for the Subarea Plan.

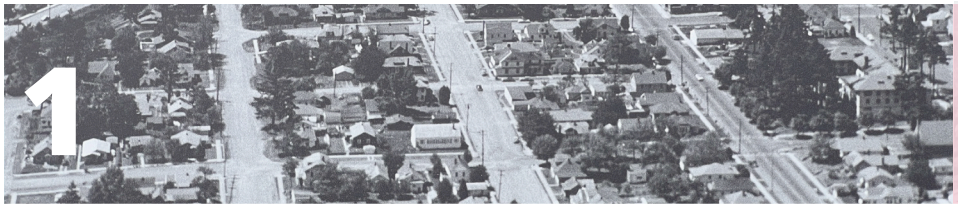


Process

Prior to beginning the Downtown Subarea Plan, City staff met with members of the Downtown Camas Association (DCA) board, City Council members, and City staff to gain a baseline understanding of the issues and priorities to address in the plan. Shortly after the official kickoff for the work, the planning team met with key stakeholders (downtown business owners, property owners, etc.) through one-on-one interviews.

These interviews focused on opportunities and constraints in Downtown Camas, from the interviewees' perspectives. These interviews helped to both reinforce findings in the existing conditions and provide new insights to issues or opportunities in the downtown area.

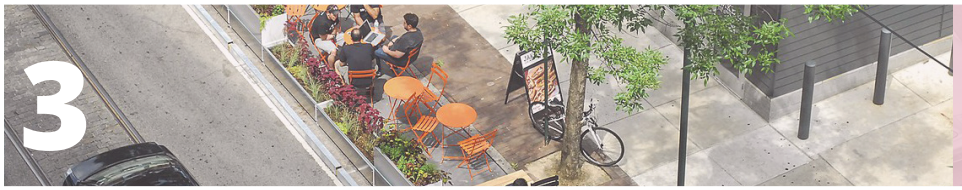
Additionally, the City convened a Downtown Advisory Committee (DAC) to provide feedback and discuss issues related to the Downtown Subarea Plan throughout the planning process. The DAC included members of the DCA as well as select members of the Community Advisory Committee (CAC) from the Our Camas 2045 Comprehensive Plan process. This helped to create a holistic perspective of community input on the future of Downtown Camas and bridged the efforts of the two concurrent projects. The DAC met 8 times throughout the planning process, providing feedback on draft deliverables at key milestones. Broader community engagement was completed as part of the Our Camas 2045 Comprehensive Plan process. The significant milestones of community engagement that provided insight for the Downtown Plan were:



- **Community conversations.** *Discussions with a range of community groups and Downtown stakeholders early in the project to gain an understanding of existing conditions and desired outcomes.*
- **Community summits.** *Held in an open-house style, the community summits provided an opportunity for members of the Camas community to provide feedback at key moments in the development of the Subarea Plan.*
- **Surveys.** *Online surveys included information that was available at the Community Summit, allowing community members an alternative way to provide feedback at their convenience.*

Hand-drawn diagrams from opportunities and constraints exercise completed with DAC

Goals



The Downtown Subarea Plan goals provide a set of themes that support the vision for Downtown Camas over the next 20 years. These themes guide the urban design framework and concepts presented in the Downtown Subarea Plan and also help set the key priorities for the implementation strategy.

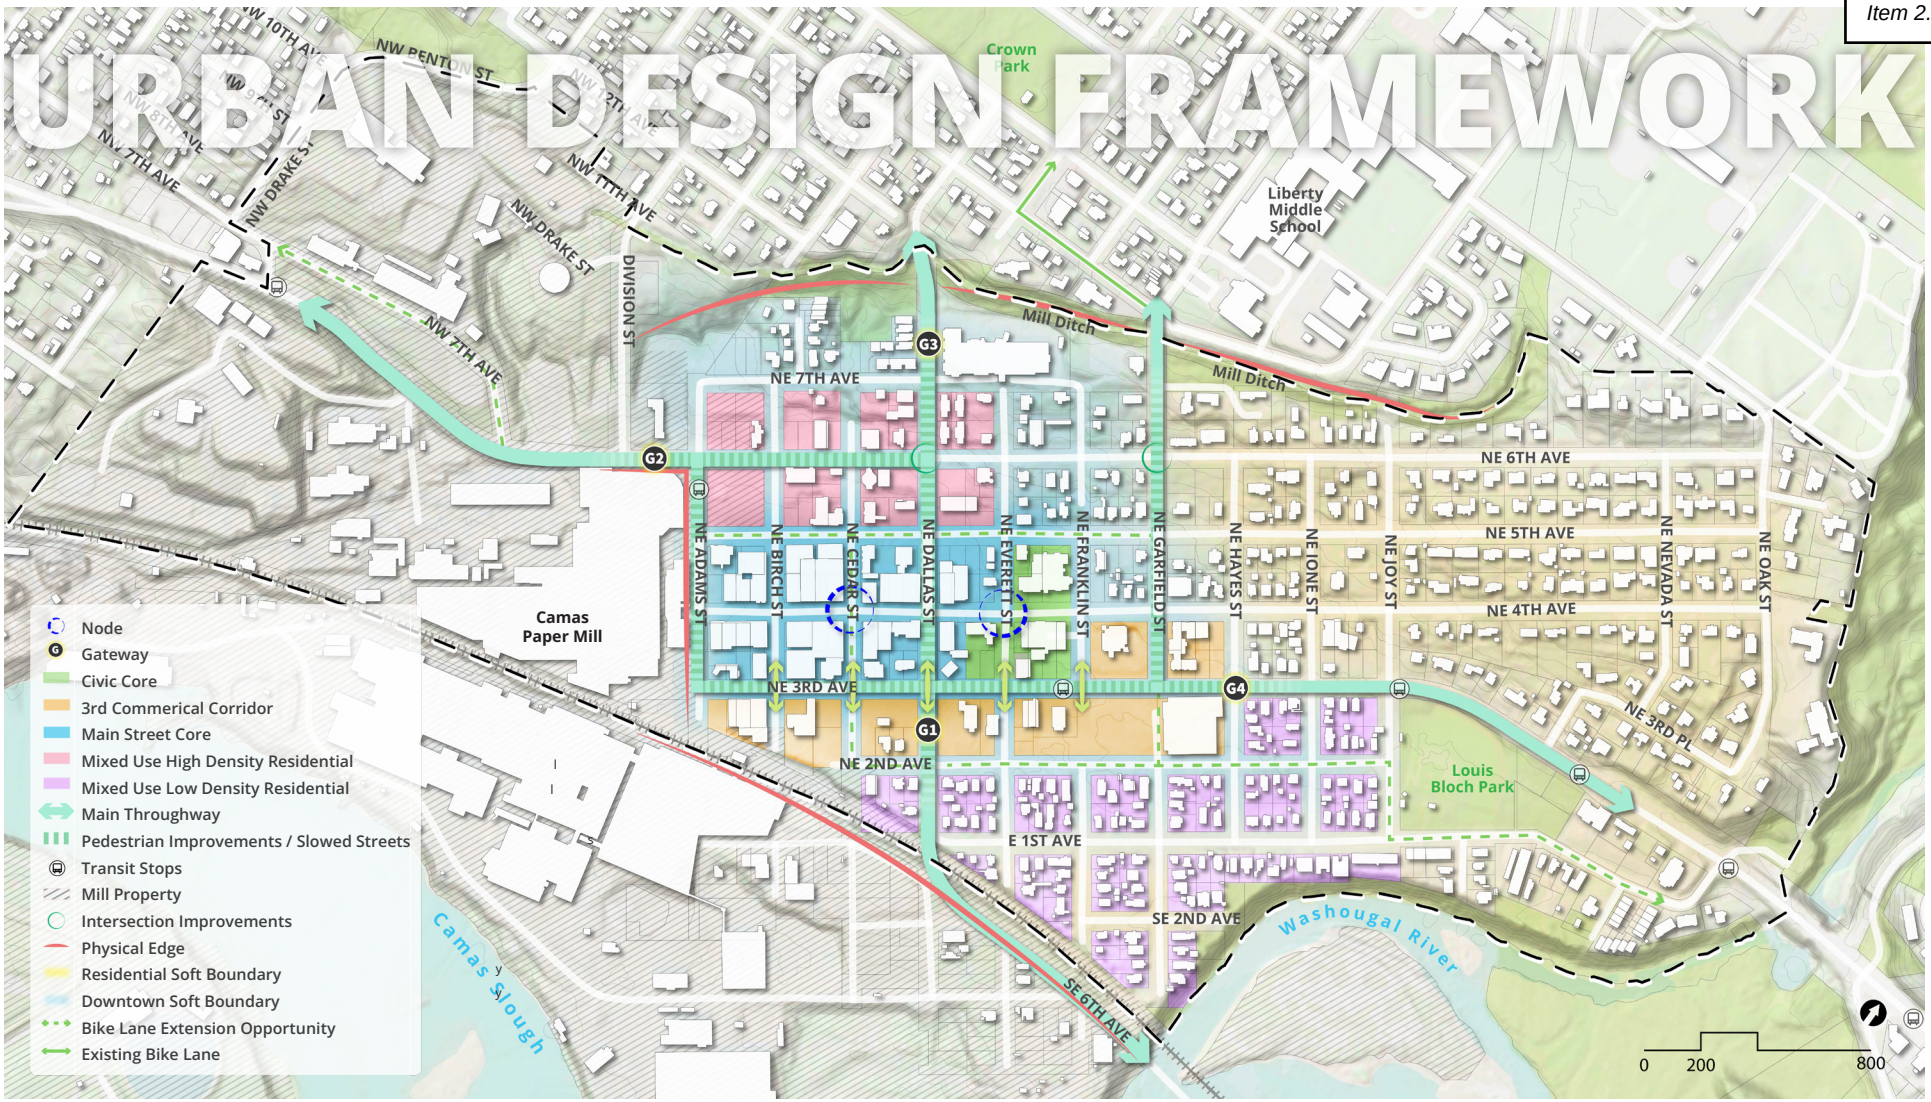
Retain Downtown's **historic character** and expand its **charm**

Incentivize a range of **housing** options that welcome more people to live Downtown

Provide the right mix of **development, services, and open spaces** that support ways for people to live, work, and play Downtown

Encourage **(re)development** to expand opportunities Downtown for retail, office, and residential

Expand on **civic life** and services Downtown through strategic use of City-owned property and vibrant community events



Create a **safe and connected** transportation network that makes Downtown walkable and bikeable

Vision Statement:

Charming, vibrant, and walkable, Downtown Camas is **the city's living room.** Downtown's history is complemented by new businesses and inclusive housing options. Expansion, resiliency, and a dynamic economic landscape are critical to its success. Downtown Camas **anchors the community while fostering a culture of pride, support, and connection.**

URBAN DESIGN FRAMEWORK

The urban design framework visualizes the opportunities and constraints shaping Downtown Camas' future. It highlights existing character areas that reinforce downtown's identity and potential areas for growth. The framework also highlights locations for connectivity improvements and sites for open space enhancements. As a whole, the diagram presents opportunities for expanding civic spaces, improving transportation networks, and enhancing pedestrian and bike accessibility, while also outlining existing traffic challenges and infrastructure limitations. By illustrating these elements, the framework serves as a strategic tool to guide the concepts presented in subsequent sections, ensuring downtown evolves into a more connected, vibrant, and accessible district that supports a mix of uses and community needs.

Home Converted to Business - Camas, WA

Local Non Profit in Downtown Camas - Camas, WA

Residential to Commercial Transition - Camas, WA

NE 4th Ave Historic Shopping District - Camas, WA

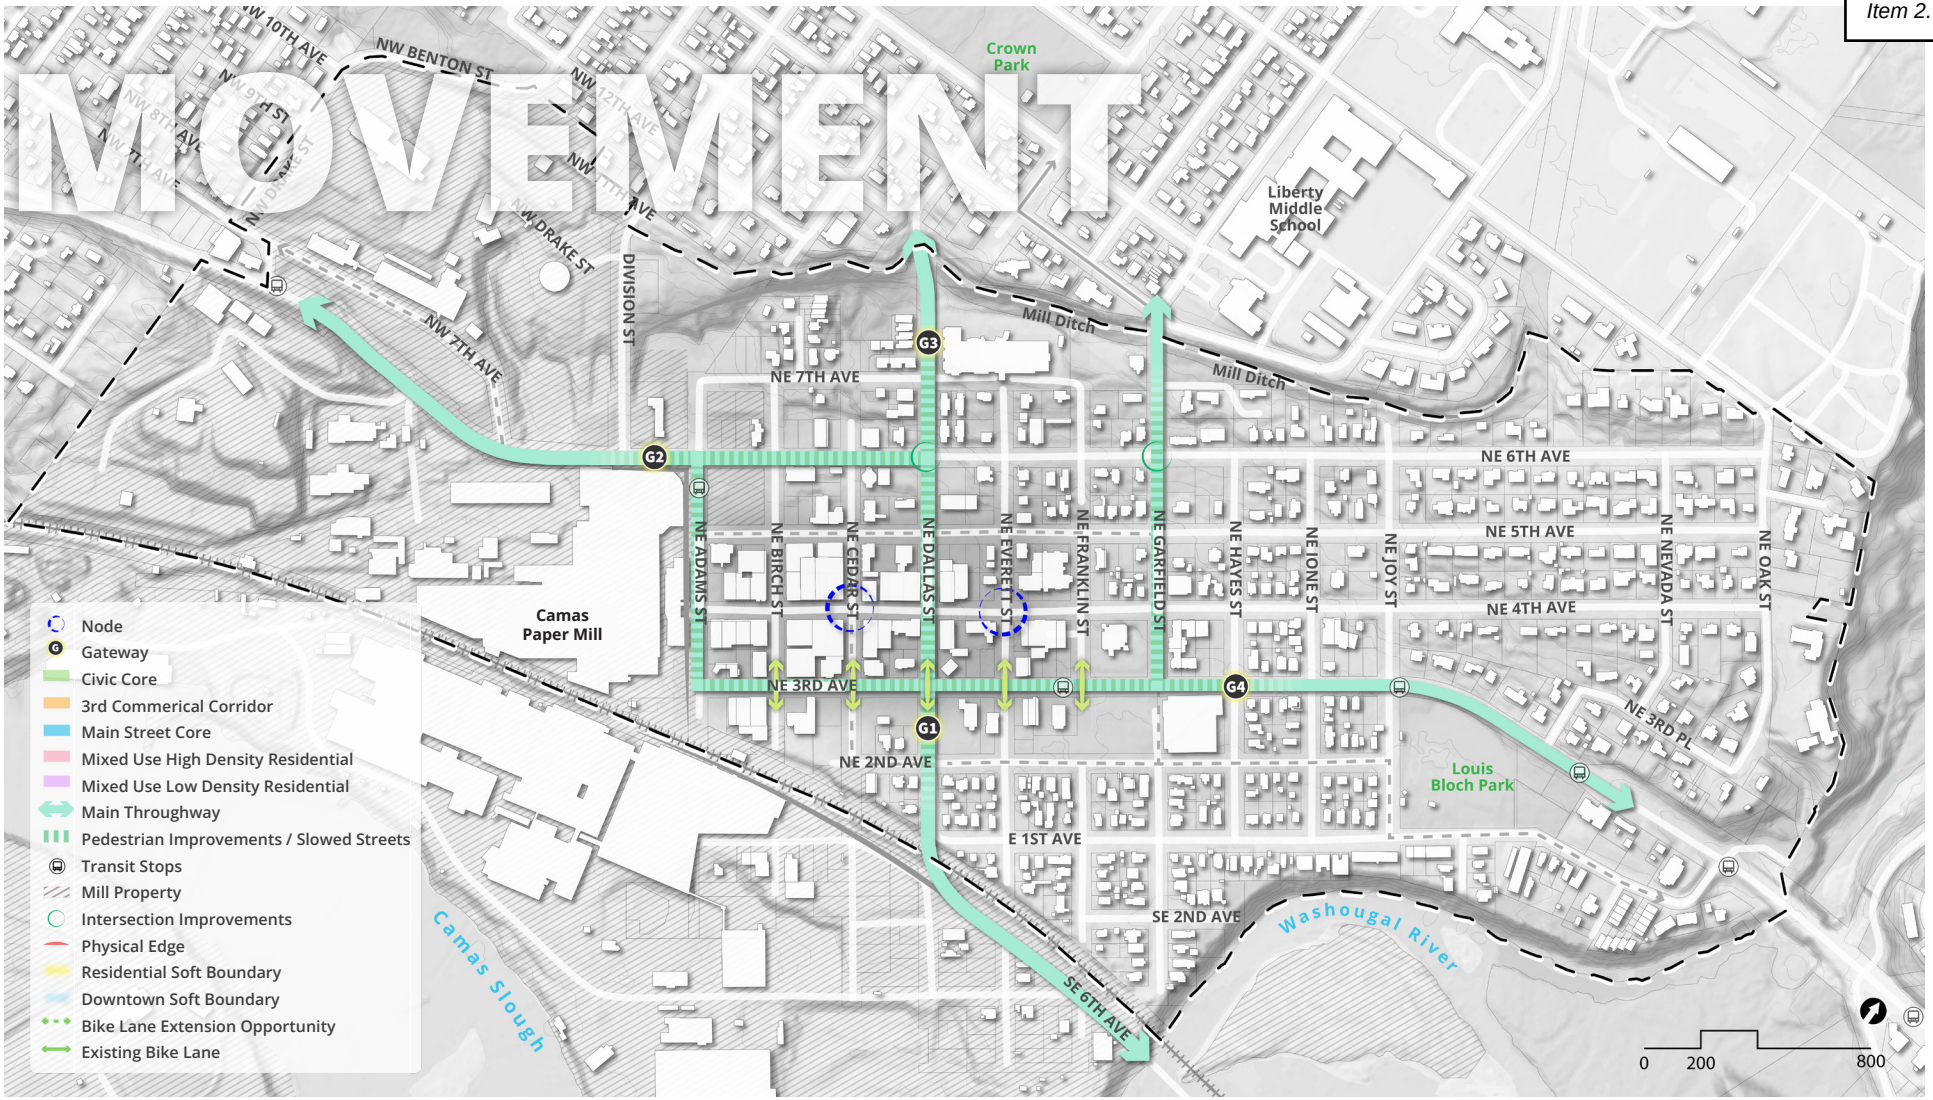
Office Building Adjacent to Single Family Housing - Camas, WA

Louis Bloch Park - Camas

IDENTITY

The vision and goals for the Downtown Subarea Plan are focused on intentional growth, while preserving the unique identity that defines Downtown Camas. This begins with identifying the character areas that shape the district. The Main Street Core includes the blocks on either side of historic NE 4th Avenue, bookended by the Camas Paper Mill property to the west and the Civic Core to the east. Areas for potential growth include the Mixed-Use High Density Residential area, north of the Main Street Core, where newer apartment buildings have been constructed in recent years. South of the Main Street Core is the NE 3rd Avenue Commercial Corridor and the Mixed Use Low Density Residential, areas with existing lower density and redevelopment potential. The Land Use Concept section further defines the potential transformations of these character areas, ensuring that as downtown grows, it remains a vibrant, welcoming place that reflects the uniqueness of Camas.

Existing Mixed-Use Building - Camas, WA



Existing Interpretive Signage along NE 4th Ave - Camas, WA

Public Library - Camas, WA

NE 4th Ave Crossing - Camas

Future growth in Downtown Camas relies on a safe transportation network that balances mobility for pedestrians, bicyclists, and cars. Key nodes in the existing street network, along NE 4th Ave offer starting points for transportation network improvements. The introduction of additional gateways into each access point of the downtown area can serve as wayfinding solutions and enhance its unique character. By exploring innovative design solutions, such as slowed streets, this framework also identifies corridors that create a more secure and welcoming downtown environment that encourages walking and cycling. The main throughways in Downtown Camas that primarily serve vehicle circulation will continue to ensure that cars can continue to serve the needs of residents and visitors effectively, while providing safer crossings across these corridors.

Integrated Bus Stop and Bike Lane - Nashville, TN

Camas Paper Mill Property - Camas, WA

NE 3rd Ave crossing at NE Dallas St - Camas, WA

Inman Square Bike Lane - Cambridge

Community members and local stakeholders expressed a need for expanded and enhanced recreational opportunities in Downtown Camas. The framework illustrates potential for these improvements by building upon existing open spaces like Louis Bloch Park and the Mill Ditch Trail as open space anchors on opposite ends of the Downtown boundary. Additionally, a central civic plaza or park would serve as a community gathering space. Ideally, these spaces will be connected through an improved transportation network of pedestrian and bicycle infrastructure, creating a system of accessible, active, and inviting outdoor areas for residents and visitors throughout downtown.

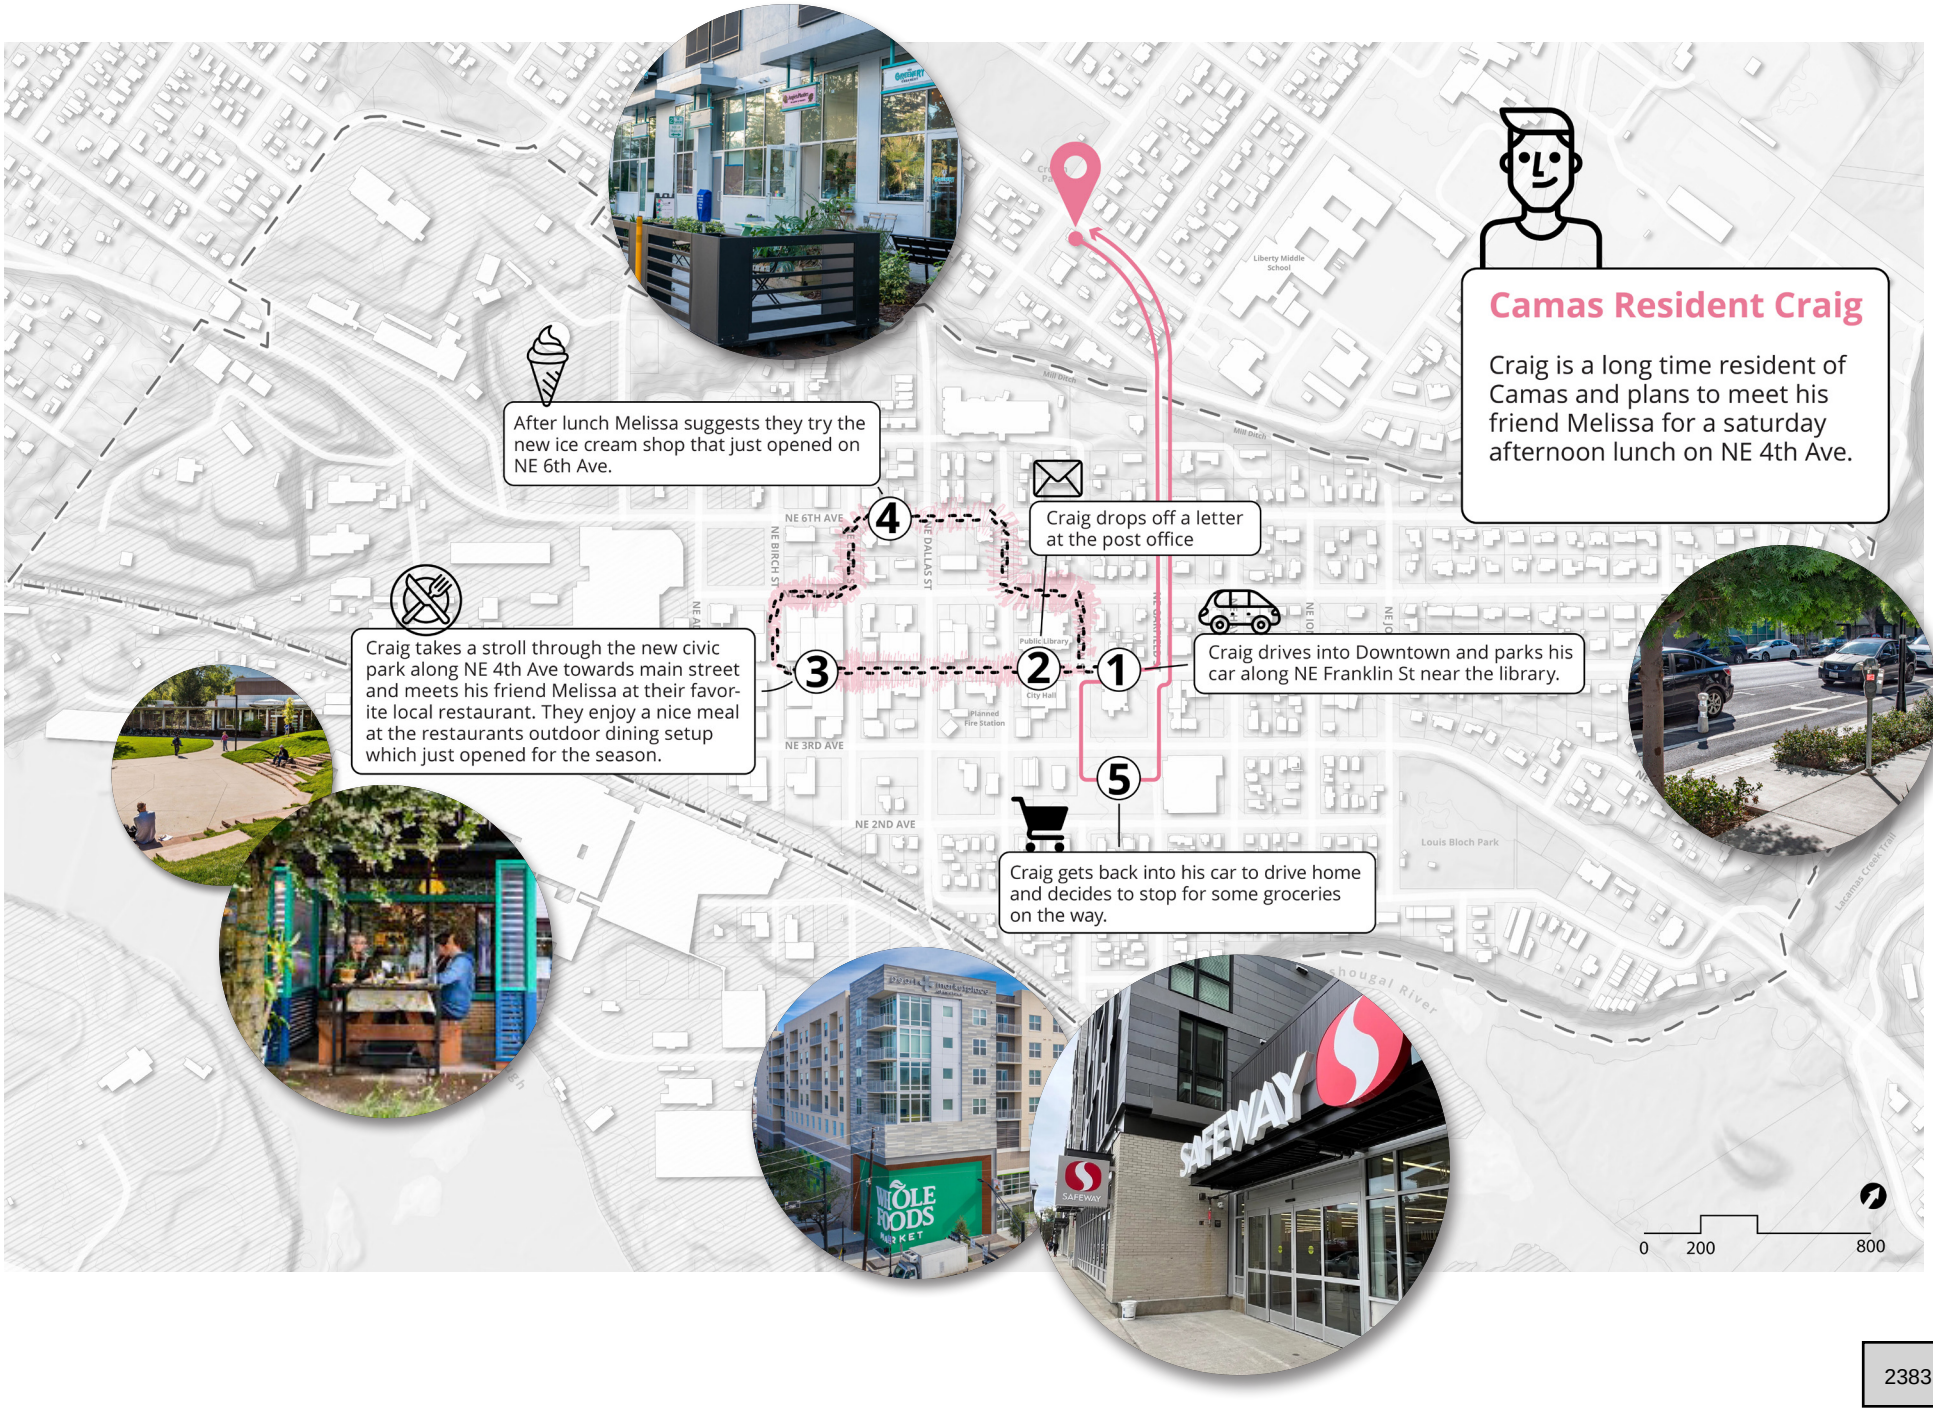
Mill Ditch Trail - Camas, WA

Louis Bloch Park - Camas, WA

Terraced Park example to Connect the Mill Ditch Trail to Greater Downtown - Hudson

Our Downtown Camas: 2045



The Downtown Subarea Plan envisions a vibrant, well-connected downtown that strengthens its identity among residents and visitors alike. Expanded beyond NE 4th Ave, downtown will feature a mix of housing, retail, and office spaces, fostering a dynamic, walkable environment.

The urban design framework illustrates potential enhancements that would help achieve this improved experience of navigating Downtown Camas, but it does not highlight how different visitors may interact with these enhancements. The following pages explore a few example journeys for a future “day in the life” in Downtown Camas in 2045.

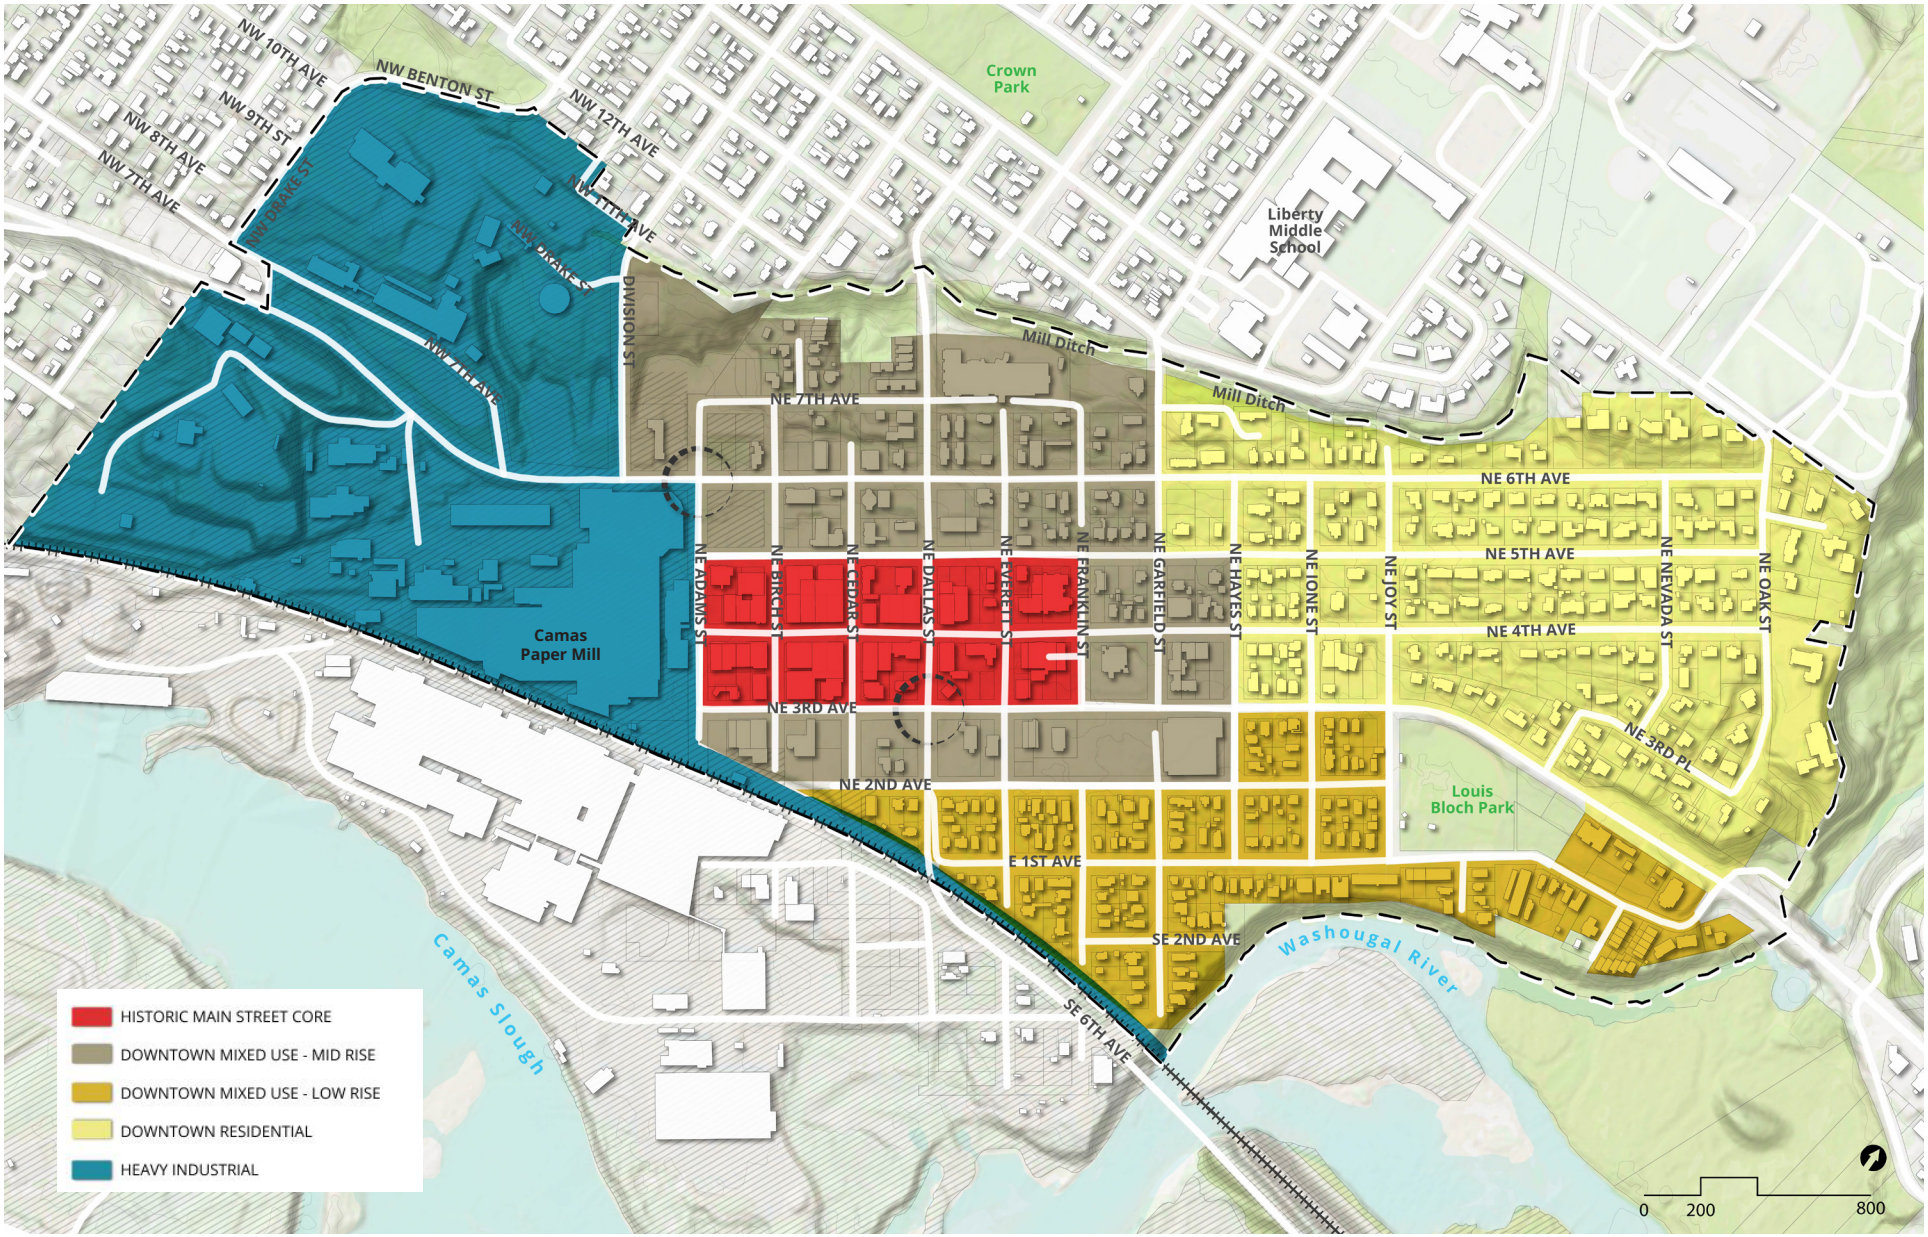
Tim and Janet Montgomery decide to take their kids for a nice sunday afternoon in Downtown Camas. They plan to hike, explore main street, and get dinner before they head home.

04
Land Use Concept

our 2045 Downtown Camas

Clara Apartments - Camas, WA



Overview

The land use concept is the result of iterative work with the Downtown Advisory Committee (DAC), City staff, and the broader community to illustrate the types of development that are appropriate for Downtown over the next 20 years. The planning team considered early feedback from stakeholders and worked with the DAC and City staff to identify potential opportunity areas.

Through evaluation of potential land use types, supplemented by market feasibility analysis, the planning team drafted three land use concepts that aligned with these potential areas of growth. Community members had an opportunity to review and provide comments on these concepts via both in-person and virtual engagement methods. Feedback on these initial concepts led to a refined land use concept that aligns with the overall Downtown Subarea Plan vision. Additionally, while the Camas Mill area remains designated Heavy Industrial, the City will closely monitor changes in this area and look for opportunities to consider future land use planning. This zone already allows a variety of commercial and recreational uses and this plan supports residential development on sites where industrial uses have ceased.

This section discusses each land use type included in the concept, supplemented with images that illustrate what these areas could look like within the context of Downtown Camas.

Land Use Concept

2388

Historic Main Street Core

Key Features:

- Active retail storefronts
- Maintains historic character

Downtown Mixed-Use Mid-Rise

Key Features:

- Mid-rise apartments with active ground floor
- Live/work units
- Higher densty middle housing allowed

Downtown Mixed-Use Low-Rise

Key Features:

- Mix of low-rise apartments with active ground floor
- Live/work units
- Duplexes
- Townhomes
- Triplexes

Downtown Residential

Key Features:

- Single-family homes
- Duplexes
- ADUs

Heavy Industrial

Key Features:

- Camas Paper Mill
- Industrial and Commercial uses
- Recreational and Educational uses
- Residential development

2389

Historic Main Street Core

The Downtown Subarea Plan identifies the Historic Main Street Core as the blocks along NE 4th Avenue, between NE 5th and 6th Avenues and between NE Adams and NE Garfield Streets. The NE 4th Avenue corridor has been the heart of Downtown Camas with its historic Main Street character. Its active retail frontages in historic buildings house a thriving business community, where storefronts are in short supply as coveted locations for Camas business owners. The NE 4th Avenue corridor hosts several events throughout the year, bringing residents and visitors of Camas to this central gathering space.

As with any unique, beloved place, there is a community desire to preserve the character of NE 4th Avenue while recognizing some potential areas for change. The streetscape defines this area as much as the buildings and uses do, with wide sidewalks, bulbouts, midblock crossings, and a mature tree canopy enhancing the pedestrian experience. Priorities in this area will include preserving existing buildings that contribute to the desired look and feel of Downtown Camas, supporting active street frontages for retail businesses, and enhancing the area's status as a central gathering space, as shown in the expansion of the Civic Hub.

Corner Conditions Along NE 4th Ave - Camas, WA

Street Crossing Along NE 4th Ave - Camas

Streetscape

NE Dallas St & NE 4th Ave

Slowing traffic by adding wider sidewalks and curb extensions on Dallas can create a clear north-south bike / pedestrian connection through Downtown and connect outlying parklands and greensp

Civic Hub

With the Camas Paper Mill property as the southwest bookend to historic NE 4th Avenue, the Civic Hub will serve as the vibrant northeast gateway to downtown. This reimagined civic center will unite existing city services—the Library, City Hall, and the new Fire Station 41—into a cohesive and welcoming district. A new City Hall, strategically positioned near NE 3rd Avenue, will create opportunities for a dynamic public plaza and a flexible festival street that can host community events, farmers markets, and public gatherings

The planned Fire Station 41 includes a small civic space, which could seamlessly connect to a larger, multi-functional plaza between City Hall and the Library. This central gathering space will strengthen the identity of downtown Camas, offering an inviting destination where civic life, cultural activities, and daily social interactions thrive. By integrating walkable connections, green spaces, and public art, the Civic Hub will become a true anchor for the community, fostering engagement and reinforcing the historic charm and future growth of downtown.

Civic Park - Boulder, CO

Green Street Woonerf - Edmonton, CA

Belle Street Park - Seattle

Streetscape

NE Everett St & NE 4th Ave

Moving City Hall south toward NE 3rd Avenue creates a civic campus with the library and opens up a great opportunity for a public plaza on NE 4th Avenue.

Downtown Mixed-Use Mid-Rise

Surrounding the Historic Main Street Core, the Mixed-Use Mid-Rise area would allow for expanded development in the blocks beyond NE 4th Avenue. Mixed-Use Mid-Rise development, typically ranging between three and five stories, would complement the retail and commercial uses along the Historic Main Street Core, while providing more opportunities for commercial space in mixed-use buildings. Frontages along NE 3rd and 5th Avenues will include a larger concentration of commercial space and active street frontages, and new development in this area could also include residential property types, such as townhomes or apartment buildings with a mix of rental and ownership options.

The priority for this area is to extend the experience of Downtown Camas as a walkable, livable area that provides a range of housing and commercial opportunities as the City grows.

Mixed Use Development - Boulder, CO

Ground Floor Grocery Store - Seattle, WA

Mid Rise Apartments - Chicago, IL

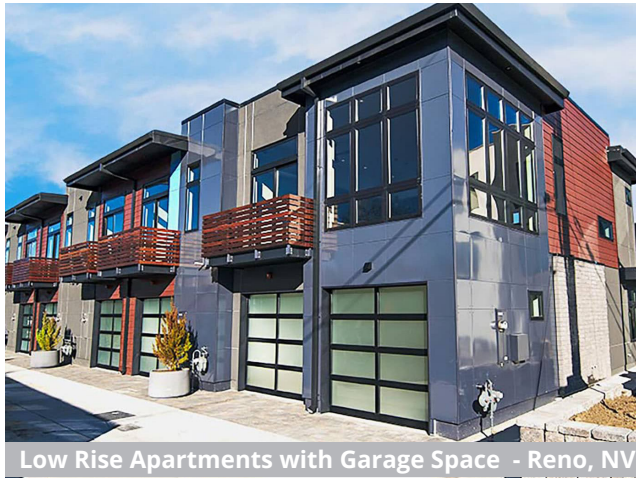
Clara Apartments - Camas, WA

Fire Clay Lofts - Denver, CO

Mixed Use Apartments - Portland

Streetscape

NE 5th Ave & NE Birch St



Widening sidewalks and adding bike lanes and curb extensions introduces a safer and more pedestrian-focused edge to the historic commercial district, which will see
enhanced business from new medium-density mixed-use apartment buildings.

2395

Downtown Mixed-Use Low-Rise

With higher-density development in the Mixed-Use Mid-Rise area, there is potential for existing underutilized areas south of NE 3rd Avenue to redevelop as Mixed-Use Low-Rise. This area would remain predominantly residential, with redevelopment focusing on middle housing types such as townhomes, duplexes, triplexes, and quadplexes, while commercial development would occur in mixed-use buildings along key corridors or corner lots. As this area was previously zoned Mixed Use with several in-home businesses, the City will continue to encourage live-work land uses and development.

Streetscape improvements and enhanced crossings along NE 3rd Avenue will strengthen connections between this district and the downtown core, making it easier for residents and visitors to engage with downtown businesses, services, and public spaces.

Low Rise Apartments with Garage Space - Reno, NV

Low Rise Ground Floor Corner Market - Seattle, WA

Modern Duplex - Denver, CO

Low Rise Apartments with Ground Floor Entry - Denver, CO

3 Story Townhomes - Ottawa, ON

Low Rise Ground Floor Retail - Oklahoma City

Streetscape

NE 2nd Ave & NE Everett St

As an important multimodal connector between the downtown historic district and Louis Bloch park, NE 2nd Ave provides pedestrians and cyclists an active but quieter thoroughfare away from the traffic of NE 3rd Ave.

Downtown Residential

The transition out of the commercial core of Downtown to the northeast leads to a lower-density existing residential area, Evergreen Terrace. Updated requirements to residential zoning codes citywide will apply to this zone. The area will remain residential, with potential for infill development as ADUs or middle housing in specific areas.

Streetscape improvements and an expanded tree canopy will enhance the neighborhood's character and walkability, while improved pedestrian crossings across Garfield Street will strengthen connections to the downtown core, making it safer and more accessible for residents.

Cottage Cluster Housing - Portland, OR

Accessory Dwelling Unit (ADU) Garage Conversion - Portland, OR

Accessory Dwelling Unit (ADU) - Portland, OR

Cottage Cluster Housing - Auburn, CA

Single Family Lots - Portland

2398

Streetscape

NE 6th Ave & NE Joy St

Our example residential street, NE 6th at NE Joy St, is currently 50-ft wide with curb-tight sidewalks. This street can be enhanced with curb extensions to slow traffic, improve safety and walkability, and provide planting areas for many new street trees.

05
Open Space

our 2045 Downtown Camas

Open Space Improvements

The City of Camas provides access to a range of high-quality recreation areas and open spaces, which are a major draw for residents. Many choose to live in Camas because of these exceptional parks and recreation opportunities. However, while NE 4th Avenue features wide sidewalks and a few seating areas, there is no dedicated city park or open space in the downtown core. During engagement for the Downtown Subarea Plan, community members and stakeholders expressed interest in more public spaces, community gathering areas, and stronger open space connections downtown.

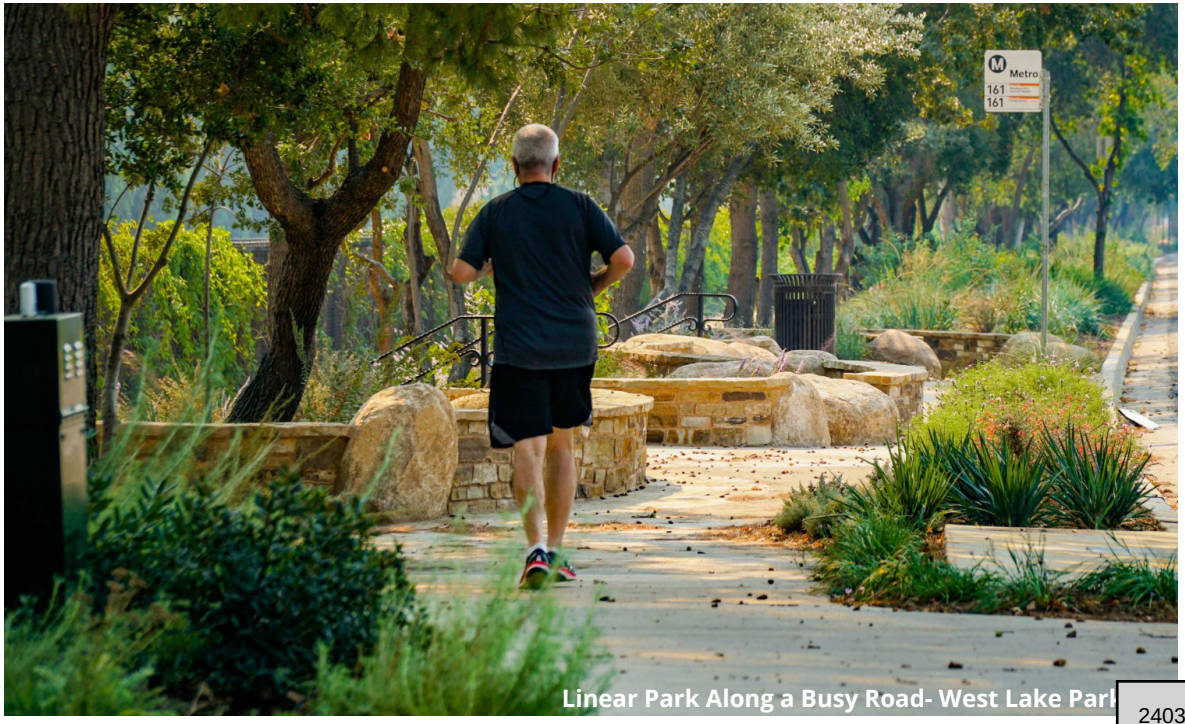
This section outlines potential enhancements to existing open spaces as well as new opportunities to introduce open space into the heart of Downtown.

Local Community Garden - Vancouver

Connected Network of Open Space

The urban design framework envisions a connected network of trails, parks, plazas, and parklets to enhance outdoor recreation and green space throughout Downtown Camas. By linking existing and new open spaces, this network will provide accessible, inviting areas for relaxation, social gatherings, and community events. Strategically placed plazas and parklets will complement larger parks and trails, creating a seamless flow of outdoor spaces that encourage walking, biking, and recreation. This approach aims to integrate more greenery into downtown while fostering a vibrant, active, and connected community environment.

2402



Gravel Trail Through the Woods - DuPage County, IL

Wooden Parklet Structure - London, UK

Sidewalk Landscaping Upgrades - Seattle, WA

Linear Park Along a Busy Road- West Lake Park

2403

Louis Bloch Park Enhancements

Planned enhancements for Louis Bloch Park aim to create a more dynamic and community-focused space. Proposed improvements include developing a designated area for programmed events and providing a flexible venue for gatherings, performances, and activities.

Upgrades to the sports facilities will enhance recreational opportunities, ensuring the park remains a hub for local athletics. Additionally, the addition of a play park for children will create a welcoming, family-friendly environment.

To support these improvements, the plan also emphasizes better connectivity between the park and the downtown core, encouraging more seamless access for pedestrians and cyclists. These enhancements will transform Louis Bloch Park into a more versatile and engaging space for residents and visitors.

2404

A Community Event Space

The programmed event space at Louis Bloch Park will provide a dedicated area for community gatherings, performances, and seasonal events. Designed for flexibility, it will accommodate a variety of activities, from concerts to markets, fostering a lively, engaging environment that strengthens community connections and enhances downtown's cultural and social offerings.

Covered Picnic Pavillion - Hillsborough NC

Outdoor Ampitheater for Public Events - Seattle, WA

B Sports Fields Improvements

Sports field improvements at Louis Bloch Park will enhance playability and accessibility for local athletes and recreational users. Upgrades may include improved turf, lighting, and seating, ensuring a better experience for players and spectators. These enhancements will support year-round use and strengthen the park's role as a key community sports hub.

Sand Volleyball Court - Central Park, NYC

Baseball Field Dugout Improvements - Ames, IA

C Play Park

The children's play park at Louis Bloch Park will provide a safe, engaging space for families. Featuring modern play structures, seating areas, and shaded spots, it will offer opportunities for active play and social interaction. This addition will make the park more family-friendly, enhancing its role as a community gathering space.

Immersive Childrens Playscape - San Francisco, CA

Playground in Local Park - Carme

2405

Mill Ditch Trail Improvements

Example Sketch of a Multi-Use Trail Through the Woods

The urban design framework identifies potential improvements to the Mill Ditch Trail that would enhance its accessibility and connection to Downtown Camas. Key improvements include adding wayfinding signage to better guide users to and from the trail, as well as establishing a trailhead to create a welcoming entry point.

As a historic, mostly flat, unpaved route following the former Camas Paper Mill water ditch, the 2.6-mile trail offers a unique recreational experience. Enhancing its visibility and access will encourage more use, strengthening its role as a key outdoor asset for the community.

2406

A Trail Connections to Downtown Camas

Improvements to the Mill Ditch Trail will enhance connections to Downtown Camas through wayfinding signage and strategic access points. Strengthening links at key streets like NE Dallas and NE Garfield will make the trail more accessible, encouraging walking and biking between downtown, surrounding neighborhoods, and recreational areas.

Trailhead Signage - Boulder, CO

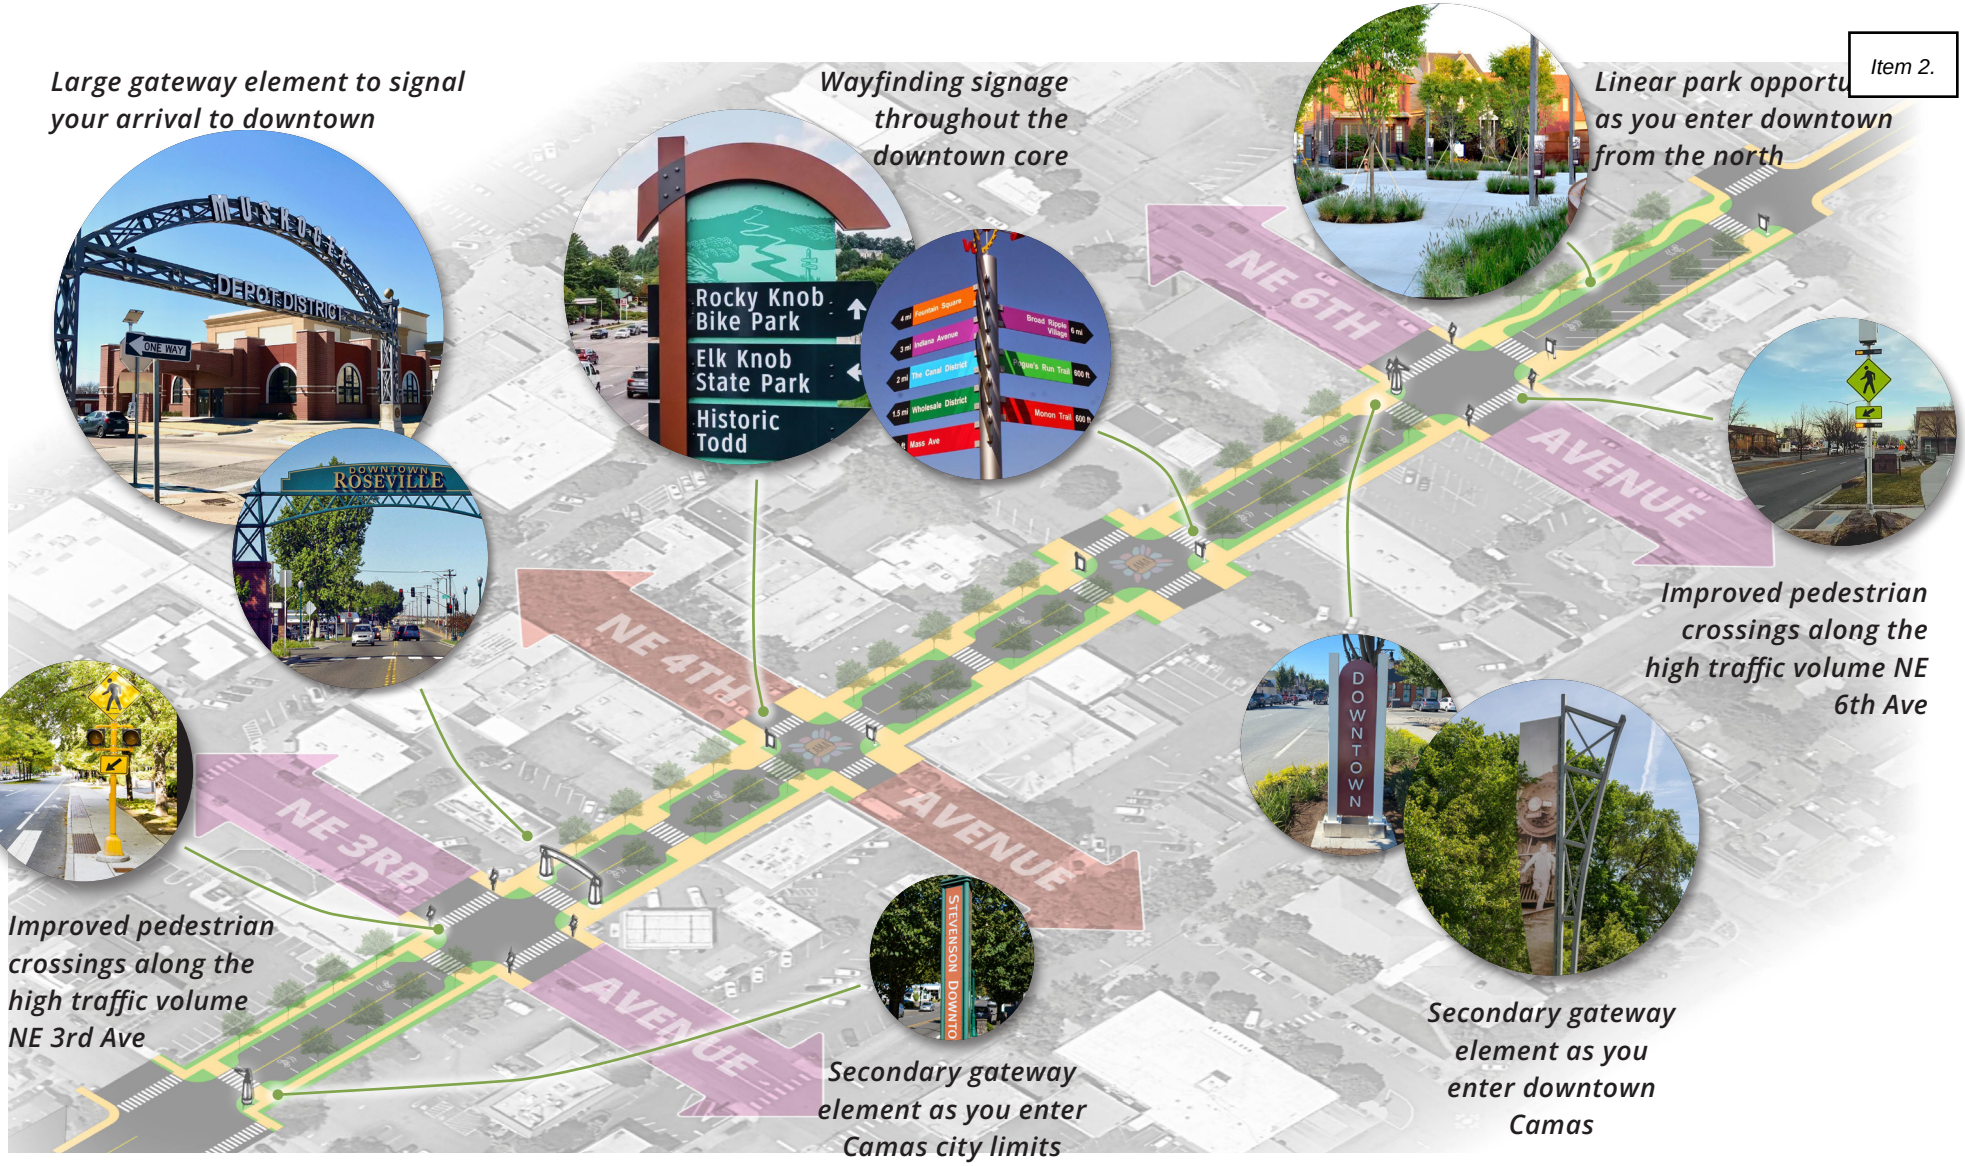
B Neighborhood Park Opportunities

Neighborhood park opportunities along the Mill Ditch Trail focus on transforming adjacent lots into accessible green spaces. These parks would provide seating, play areas, and natural landscaping, creating inviting community gathering spots. Strategically placed along the trail, they would enhance recreation, strengthen neighborhood connections, and improve access to Downtown Camas.

Small Park Along Trailhead - Cascade, MI

Example of a Hillside Park to Potentially Connect the Mill DitchTrail to Greater Downtown Camas

C Community Garden Sites



The plan explores opportunities for small community gardens along the Mill Ditch Trail to enhance its appeal and engage the community. These gardens would activate underutilized spaces, adding greenery and seasonal plantings while fostering community involvement. Strategically placed, they would create inviting, interactive spaces that complement the trail's natural character.

Low Impact Community Garden Site - Moraga, CA

Small Urban Farm Example - Seattle

2407

Dallas Linear Park

The Dallas Linear Greenway would transform NE Dallas Street into a safer, more inviting corridor for pedestrians and cyclists while maintaining vehicle access. Wider sidewalks, curb extensions, and mid-block crossings will enhance walkability and outdoor gathering spaces. The plan also introduces more on-street parking and increased street trees to improve both accessibility and aesthetics. A linear park between NE 6th and 7th Avenues will provide a welcoming green space for those arriving downtown from the north, strengthening connections to neighborhoods and surrounding parklands.

2408

Wayfinding Elements

The wayfinding elements along the Dallas Linear Greenway will include directional signage and maps to guide pedestrians and cyclists. These features will not only improve navigation between downtown and surrounding parks but also help establish a strong downtown identity, enhancing the area's sense of place and making it more welcoming.

Park Network Wayfinding Signage - Edmonton, CA

Historic Map - Washington, DC

Urban Trail Network Map - Austin, TX

On-Street Parking Improvements

The Dallas Linear Greenway will enhance on-street parking by making existing spaces more pronounced and identifying new areas for additional parking. These improvements will provide more convenient parking options for visitors, support local businesses, and improve the overall functionality and accessibility of Downtown Camas.

On Street Parking Nestled Amongst Landscaping - Nashville, TN

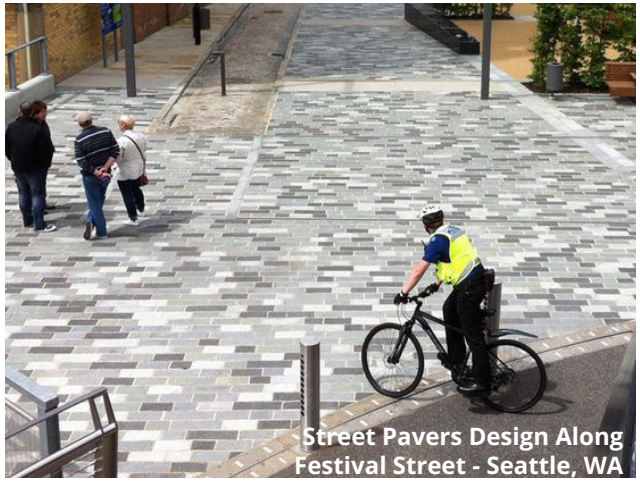
Pedestrian Realm Barrier Between Parking and Sidewalks - Los Angeles, CA

Street Tree Enhancements

The Dallas Linear Greenway will incorporate additional street trees along NE Dallas Street to enhance the pedestrian experience and improve aesthetics. These tree plantings will provide shade, create a more inviting environment, and contribute to the overall greenery of the area, helping to beautify and soften the streetscape.

Green Infrastructure Streetscaping - Nashville, TN

Increased Planter Beds for Street Trees - Paramount



High Level Conceptual Rendering

Civic Plaza

The proposed civic plaza aims to create a vibrant public space as the heart of a potential civic campus encompassing a relocated City Hall, existing library, and new fire station. This allows for a flexible plaza on NE 4th Ave, accessible to cars but easily closed for events like the farmer's market. The plaza will anchor NE 4th Ave, strengthening connections to the downtown historic core while providing a much-needed space for community gatherings and activities.

Festival Street

The new civic plaza will serve as a central gathering space for the community, hosting events like the farmer's market and other public activities. Its flexible design will enhance downtown's social life, providing a venue for cultural events and fostering a greater sense of community.

Street Pavers Design Along Festival Street - Seattle, WA

Shared Car and Pedestrian Street - Seattle, WA

Downtown Anchor

The civic plaza will anchor downtown by providing a central, vibrant space for community events and gatherings. Its strategic location at the eastern end of the historic NE 4th Ave will draw activity, create a focal point for the area, and enhance downtown's sense of place, making it a key destination within the district.

Farmers Market - Boulder, CO

Community Event - Cleveland, OH

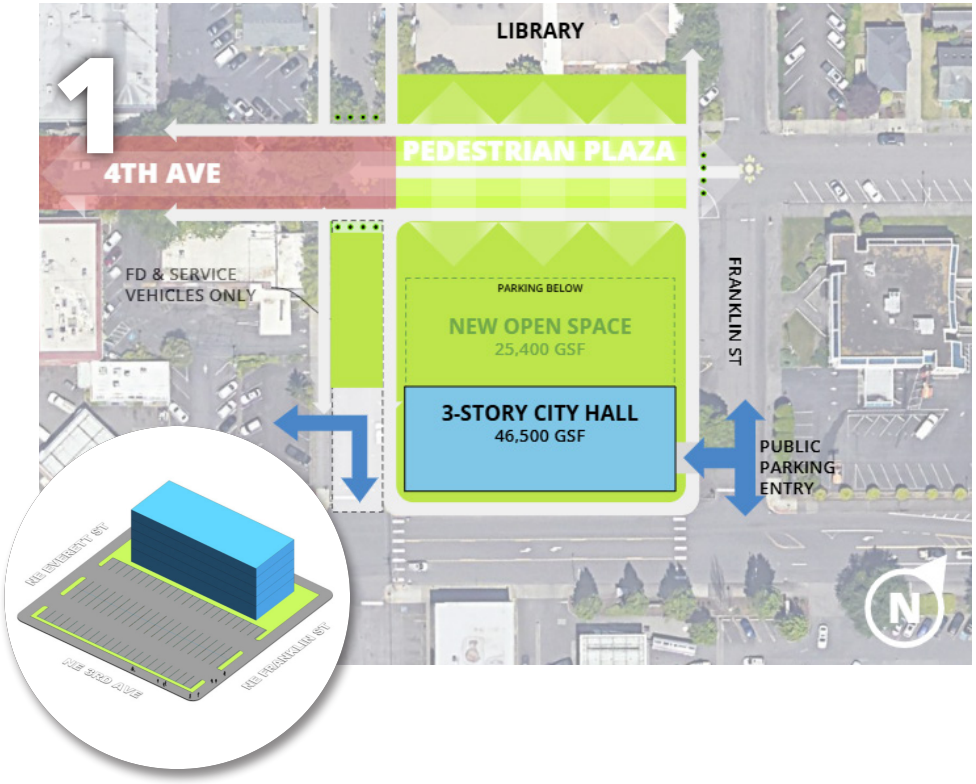
Center for Civic Life

The new civic campus will bring essential community services together in one area, making it easier for residents to access services. The integrated plaza will provide space for both civic activities and recreational use, offering opportunities for public events, play, and social interaction, fostering a stronger sense of community.

Encourage Residents to Stop and Hangout

Public Art Installations - Melbourne, Austi

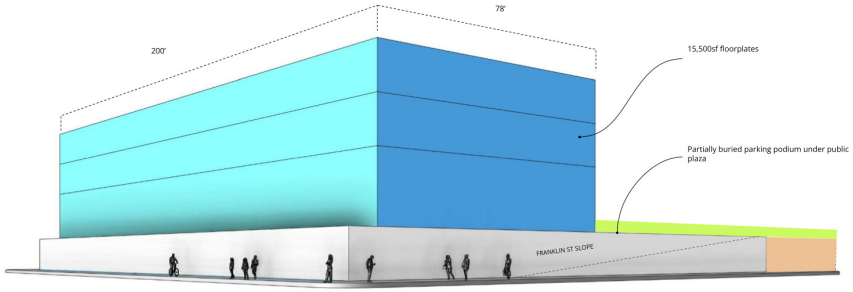
Development Feasibility Study



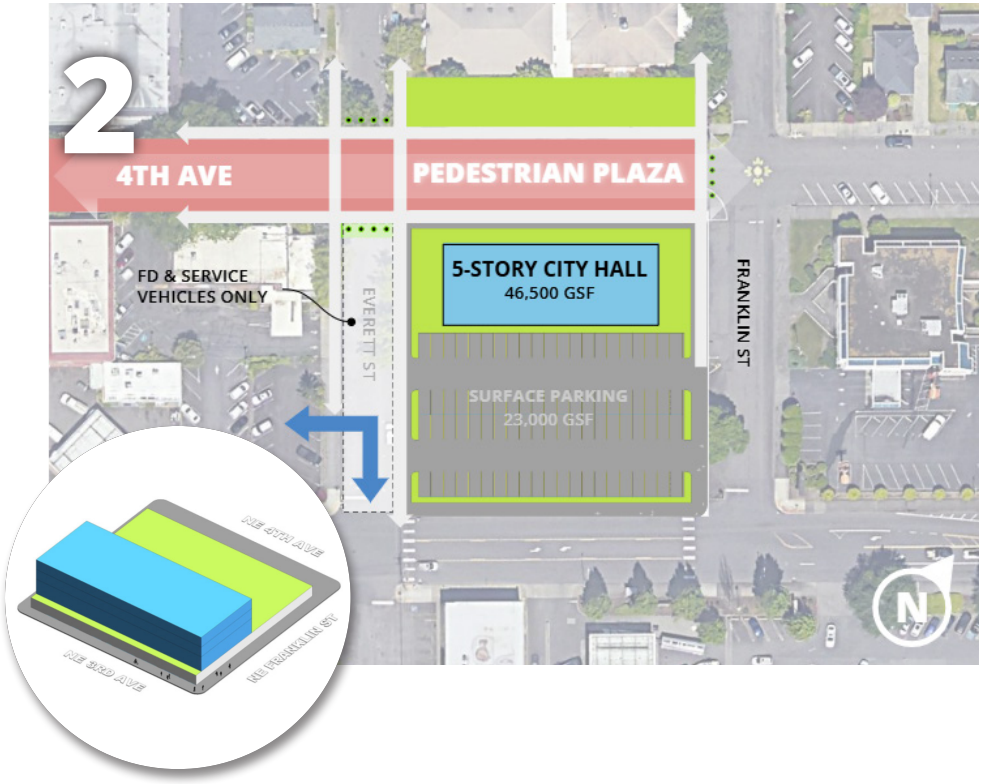
A development feasibility study focused on two possible scenarios for the civic plaza, considering market trends and regulatory factors. The study assessed how rising development costs, including materials, labor, and parking requirements, affect the plaza's feasibility. The study aimed to balance the need for a vibrant public space with current economic conditions, ensuring the plaza remains a practical and valuable addition to Downtown Camas.

Civic Plaza Conceptual Site Plan - Camas

2412



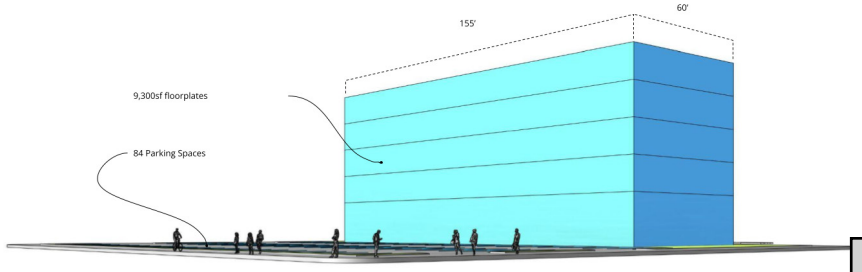
Development Scenarios



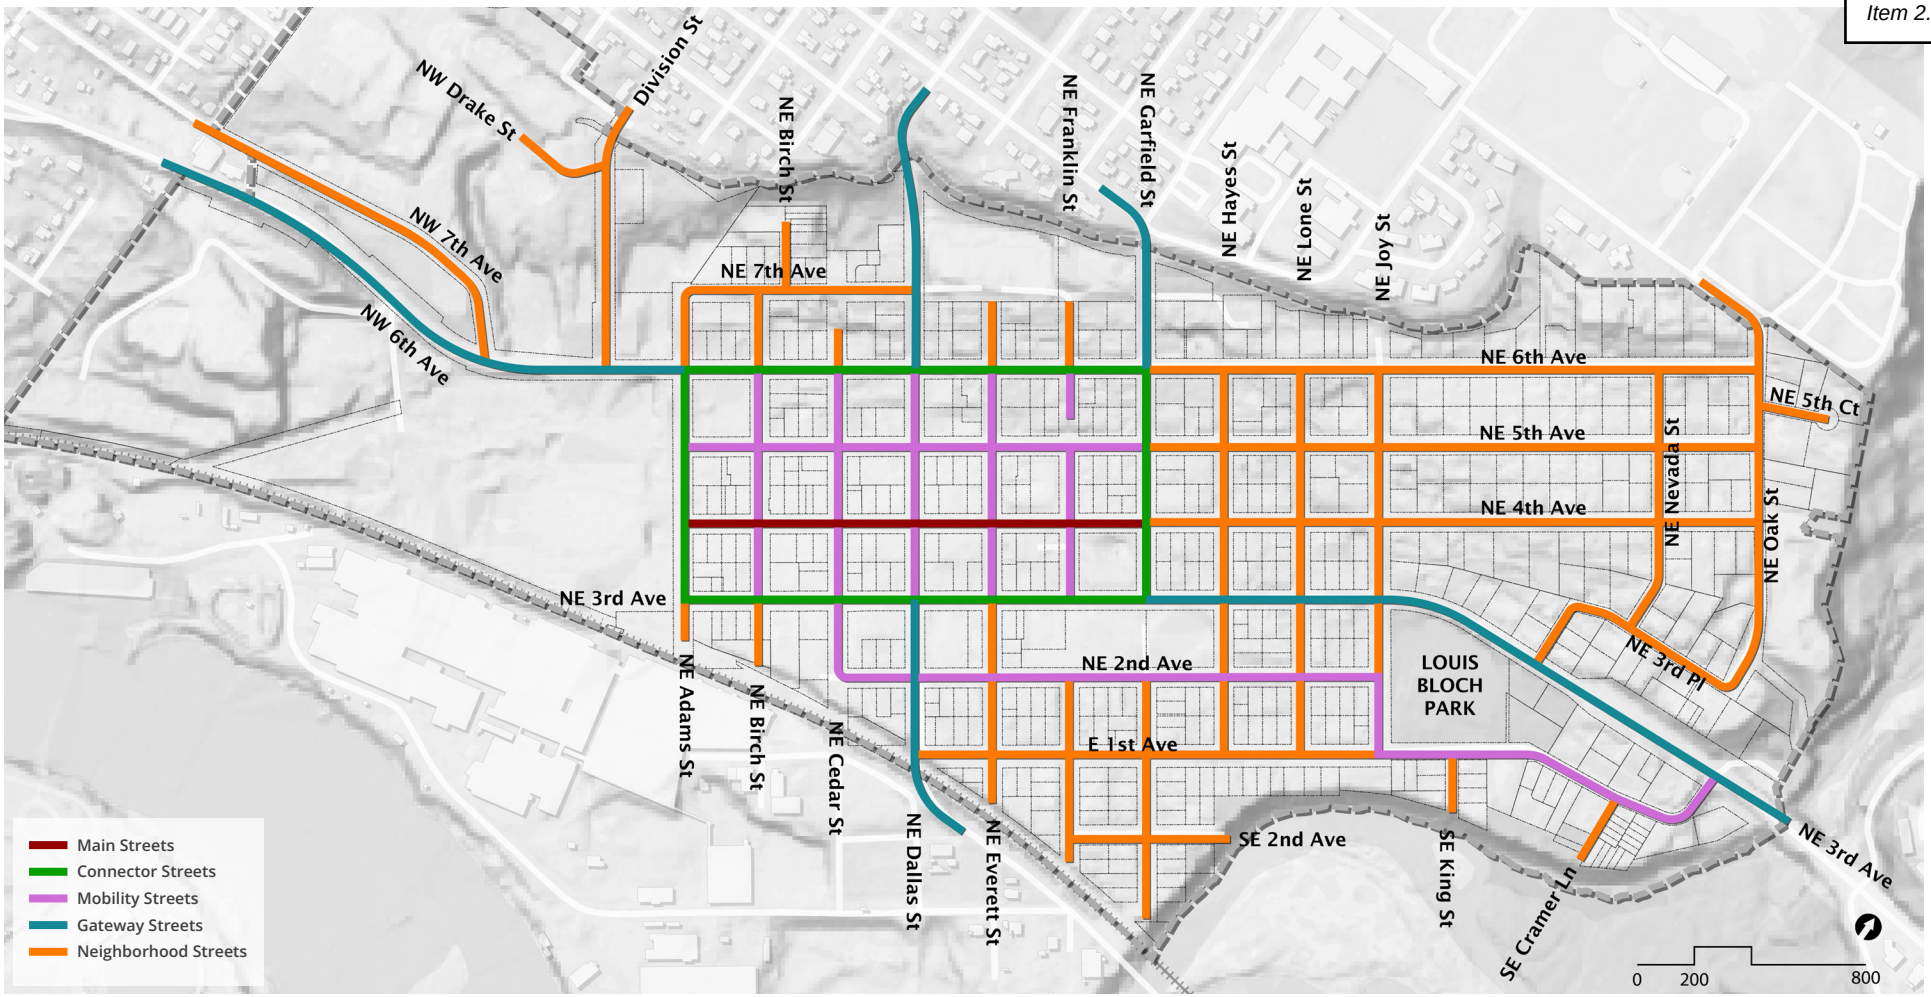
Move City Hall south to create a civic quad (public open space that stretches across 4th Ave to the Library) while simultaneously reinforcing taller construction and higher density on NE 3rd Avenue.

3-story, 46,500 sf new building = *~150% of current gsf*

36,000 SF parking podium = *116 of 117+ required off-street parking spaces*



Provide surface parking off the main auto thoroughfare of NE 3rd Avenue. Maintain City Hall's intimacy with NE 4th Ave while building up to increase density. No new open space.



5-story, 46,500 sf new building = *~150% of current gsf*

23,000 SF parking podium = *84 of 117+ required off-street parking spaces*

2413

06 Transportation

Street Network Overview

The street network of Downtown Camas supports a range of uses and needs that have evolved over time, as presented in this Plan. The core of Downtown Camas, NE 4th Avenue, is distinctive not only in its range of shops, restaurants, and other services that bring residents and visitors to Downtown, but also in its unique street type and public realm elements. Streets surrounding NE 4th Avenue support connectivity through Downtown and provide access to neighboring residential and commercial areas in the vicinity. These streets serve multiple modes of transportation, and planning for future development (as described in the Subarea Plan) will require coordination on the evolution of the street network. This section defines the street network according to five street types—Main Streets, Connector Streets, Mobility Streets, Gateway Streets, and Neighborhood Streets. These street types align with the definitions for regulation of the public realm in the Downtown Design Manual that accompanies the Downtown Subarea Plan.

Main Streets

Historic NE 4th Avenue, between NE Adam Street and NE Garfield Street, alone defines the Main Street type in Downtown Camas. It is intersected by a network of Mobility Streets and surrounded by a ring of Connector Streets. NE 4th Avenue sets the foundation for the public realm for the Historic Main Street Core land use type. NE 4th Avenue supports a range of active, ground-floor retail and service-based businesses. It creates an inviting atmosphere for pedestrians and cyclists along a curated streetscape.

Future planning for Downtown Camas will continue to consider NE 4th Avenue as a core feature of Downtown's character. This includes preserving the existing functions of the public realm and maintaining key elements including street trees, lighting, and other amenities.

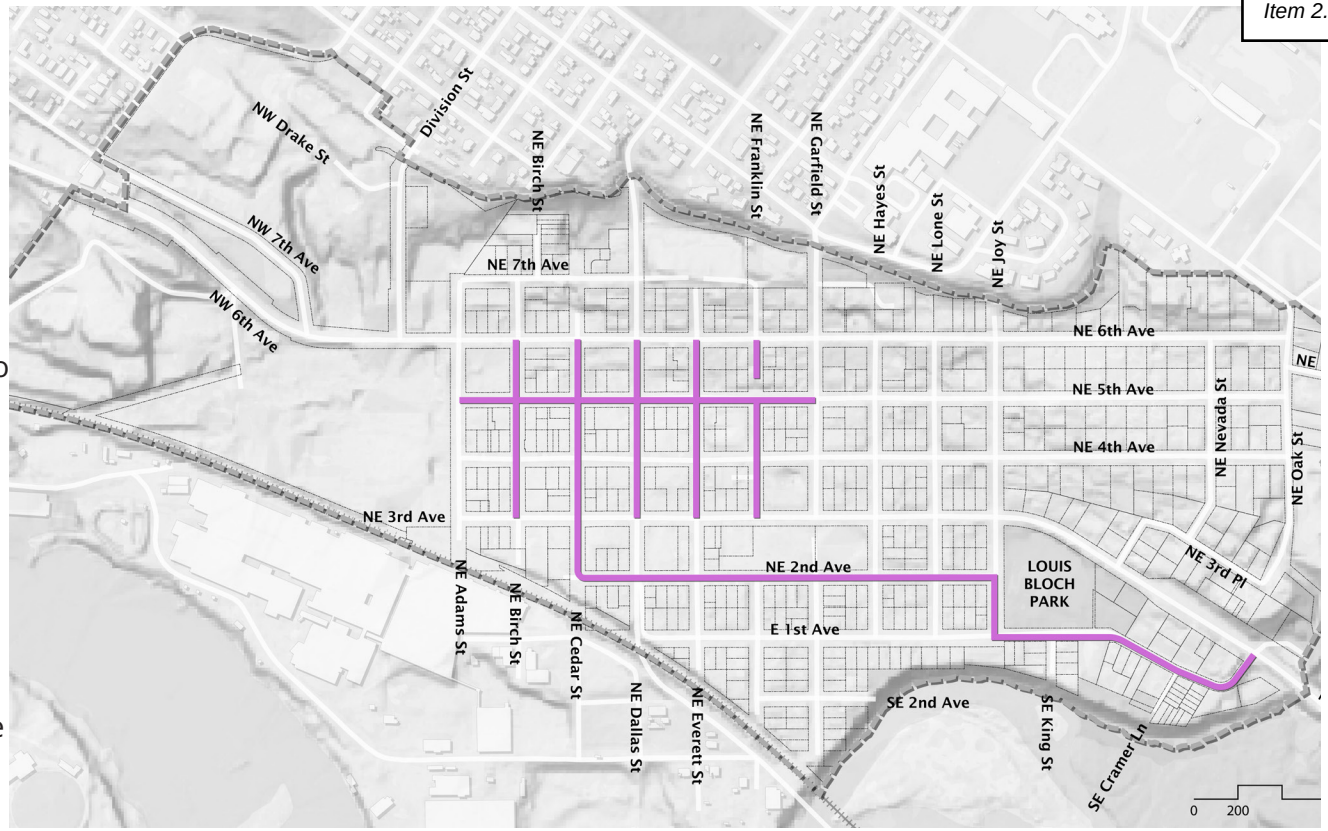
Main Streets Cross Section

2416

Connector Streets

The Connector Streets in Downtown Camas create a buffer around the Main Street Core, with NE Adams Street to the west, NE 3rd Avenue to the south, NE Garfield Street to the east, and NE 6th Avenue to the north. These streets, as the name implies, provide key connection points to NE 4th Avenue as well as provide a link to future development in the Mixed-Use Mid-Rise area. As new residents move into these areas of Downtown, improvements to pedestrian and bicycle facilities will create more walkable and bikeable access to and through Downtown.

Connector Streets will continue to be thoroughfares for vehicles to move efficiently through Downtown Camas, while considering opportunities to create safe routes for increased pedestrian and bicycle traffic. Improvements may include larger curb extensions at intersections or mid-block crossings, designated and / or protected bike routes, and efficient parking facilities.

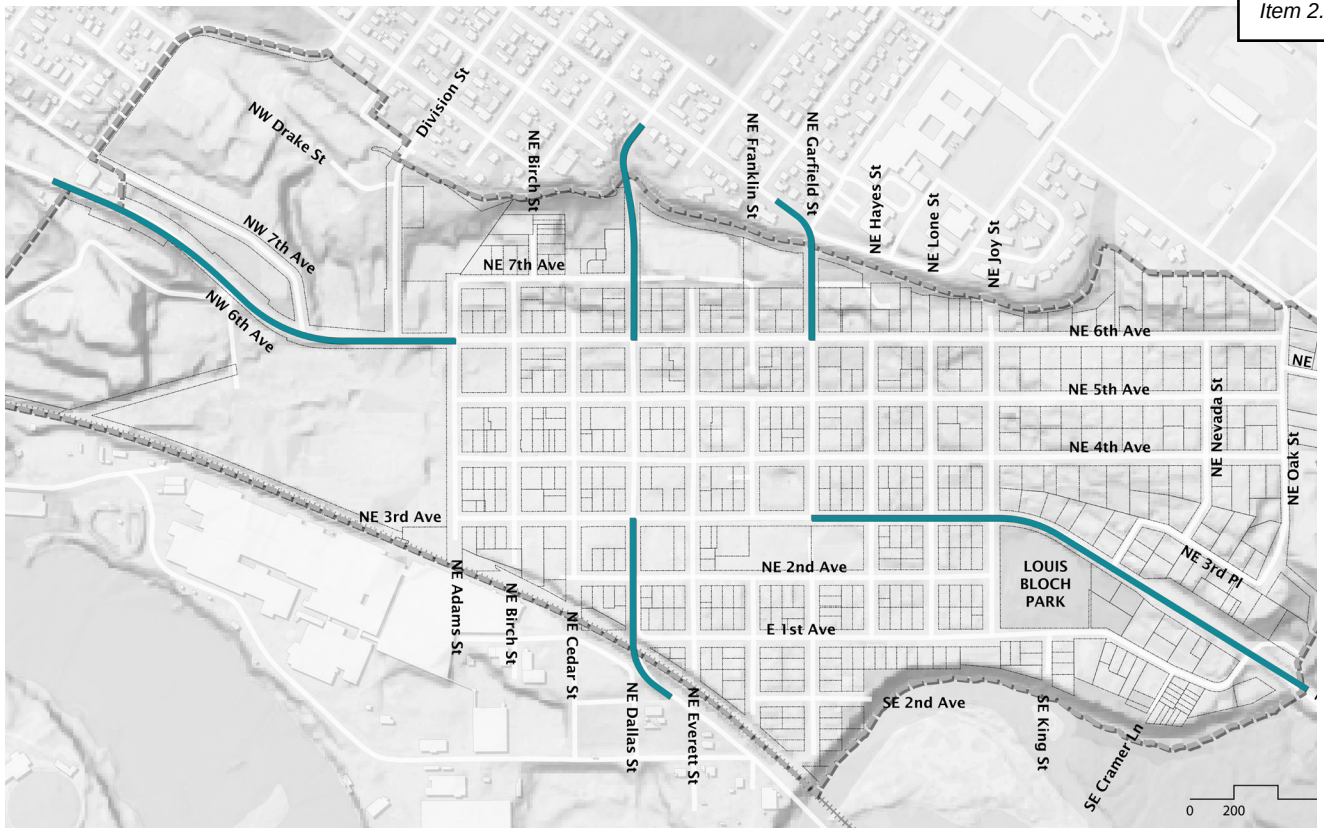


Connector Streets Cross Section

Mobility Streets

Mobility Streets weave into the core of Downtown Camas, allowing the highly walkable and bikeable nature of the Main Street Core to permeate through newly developed areas of Downtown. NE Dallas Street (also a Gateway Street near the periphery of Downtown), will transform into a greenway that provides an intersection between mobility and recreation in Downtown Camas. Similar to Connector Streets, the Mobility Streets balance multimodal transportation, providing adequate traffic flow (and parking) for vehicles, while focusing on safety and upgraded facilities for pedestrians and bicycles. The pathway along NE 2nd Avenue provides an alternative route to busier NE 3rd Avenue for pedestrians and bicycles, and connects Louis Bloch Park to the rest of Downtown.

Similar to future planning for the Connector Streets, Mobility Streets will see improvements to curb extensions at intersections and mid-block crossings, as well as bicycle facility improvements and wayfinding.



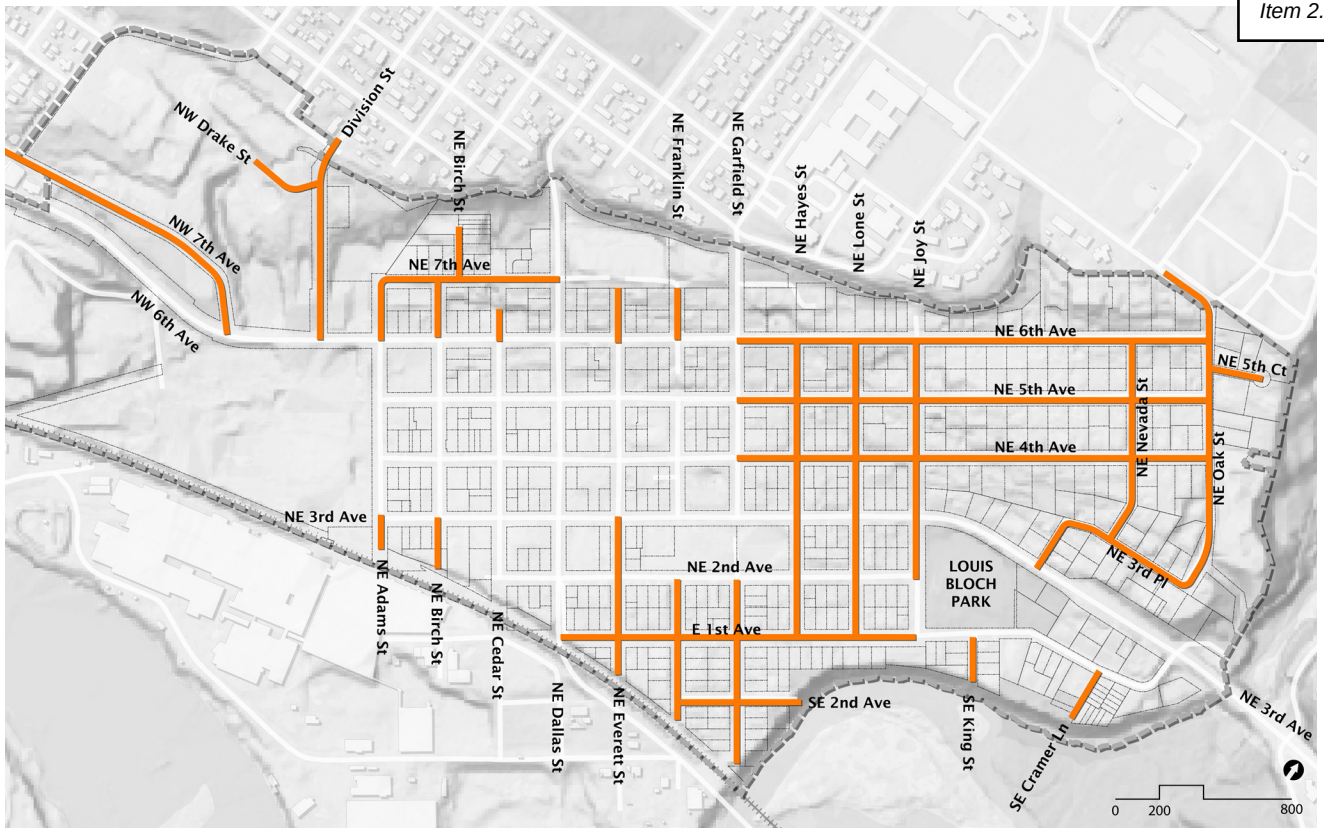
Mobility Streets Cross Section

2418

Gateway Streets

Gateway Streets serve as the entry point that defines Downtown Camas from the rest of the city. While the land uses and landmarks surrounding the Gateway Streets (e.g., the Camas Mill) also help to signify Downtown, the street network is what helps visitors arrive in a logical and efficient manner. The Gateway Street at NE 6th Avenue allows access to Downtown from the west side of Camas, and is currently the most prominent entrance to Downtown with its proximity to the Mill. Existing signage also welcomes visitors to the area. NE Dallas Street connects the northern and southern neighborhoods and future improvements as a greenway will offer a recreation-based attraction to Downtown. NE Garfield Street is a secondary gateway street connecting neighborhoods to the north of Downtown. NE 3rd Avenue is the primary gateway for vehicles arriving from the east side of Camas or the surrounding communities.

Future planning for Gateway Streets will consider traffic flow and speed as vehicles arrive Downtown. Improved access for pedestrians and bicycles will include protected and marked facilities as well as wayfinding.



Gateway Streets Cross Section

2419

Neighborhood Streets

The Neighborhood Streets provide all remaining intermittent connections to the street network within the lower-density residential areas of Downtown Camas. These streets will continue to primarily serve local residents within these neighborhoods, providing vehicular access at residential speeds, on-street parking, and sidewalks with improved crossing access for pedestrians.

Neighborhood Streets Cross Section

Existing Conditions of Downtown Camas Streets

2421

07 Infrastructure

Overview

The proposed land use concept defined in section 4 will create different needs for infrastructure in future development of Downtown Camas. This section summarizes the high-level review of the existing stormwater system and the potential impacts to the system under the proposed changes. (The full results and methodology used for this analysis is provided in Appendix A.) The analysis includes (1) stormwater runoff calculations and (2) a catch basin investigation.

Stormwater Drain - Downtown Camas

Stormwater Runoff

The stormwater runoff analysis includes calculations for the amount of stormwater runoff generated in both the existing and proposed scenarios, using a commonly used method (Rational Method) to determine peak runoff rates for largely impervious areas. The full methodology and formulas used in this method are provided in Appendix A. The summary results of the runoff calculations are shown in the table below.

The key variables used for this analysis included land use (existing and proposed); coverage area (acres); runoff coefficient (C) based on land use and approximate overland flow paths or slope; rainfall intensity (I); and rainfall concentration (Tc). Peak flow rates for a modeled 10-year event were then calculated as 384 and 339 cubic feet per second (cfs) for the existing and proposed scenarios, respectively.

Although these flow rate values may n reflect the exact peak flows in the real-world, they demonstrate that the changes in land usage over the next 20 years should not result in an increase in runoff. Rather, these numbers illustrate a decrease in the peak flowrate between the existing and proposed conditions.

While this analysis does not anticipate worsening flood impacts, it is recommended that the City of Camas produce detailed stormwater models of the downtown area to simulate realistic flows. More intensive modeling efforts will also allow for the identification of specific capacity issues and simulation of alternative methods for reducing flood risk.

Basin	**Sum of Acres x Runoff Coefficient** (by Land Use) (∑CA)	**Concentration** (Tc) (min)	**Intensity** (I) (in/hr)	**Peak Flowrate** (Q) (cfs)
Downtown Existing	176.34	5.00	2.18	**384.26**
Downtown Proposed	155.48	5.00	2.18	**338.81**

Catch Basin Investigation

The existing catch basins along NE 4th Avenue regularly experience ponding issues. Many of these inlets are placed in low points next to planters with full curb heights surrounding two or three sides of the catch basins. The city has observed water overflow onto the curb and sidewalk. Examples of the curbs in question are shown below.

To avoid future flooding at these catch basins, it is recommended that the city consider the following improvements. It should be noted that these are recommended from a conceptual view without knowing exactly how the storm water system is connected or how individual catch basins impact each other. Detailed as-built review, stormwater modeling, and geotechnical investigations would be required to confirm the feasibility and efficacy of each option.

- Regularly maintain all catch basins to remove any debris that may be blocking flow into the inlet and eliminate solids trapped in the sump.
- Reconstruct the curbs around the catch basins to allow for street sweeper vehicle access.

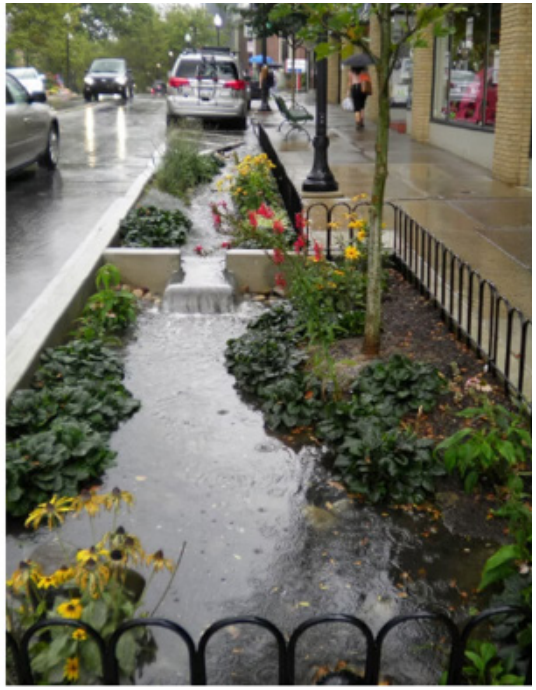
A Install curb cuts and regrade the existing planters to allow water to overflow into the planter, rather than onto the sidewalk.

B Incorporate additional planters, rain gardens, bioswales, or other stormwater best management practices (BMPs) into the new land use zones. This will have the added benefit of maintaining the towns' beauty.

C Install permeable pavement in the parking areas.

- Regrade 4th Ave. to reduce the transverse slope and avoid significant low points in the gutters. Place catch basins at the low point and connect new catch basins to the existing storm system to reduce the distance between inlets.
- Increase the number of inlets along 4th Ave between Nevada St and Joy St specifically. Current conditions reflect approximately 950 feet between inlets. The inlets at the bottom of the hill (at 4th Ave & Joy St) may become overwhelmed during extreme storms, which could lead to potential flooding downstream.
- Replace grates with larger grates that have increased spacing between bars.
- Replace catch basins with units that have sumps if the existing structures do not have sumps.

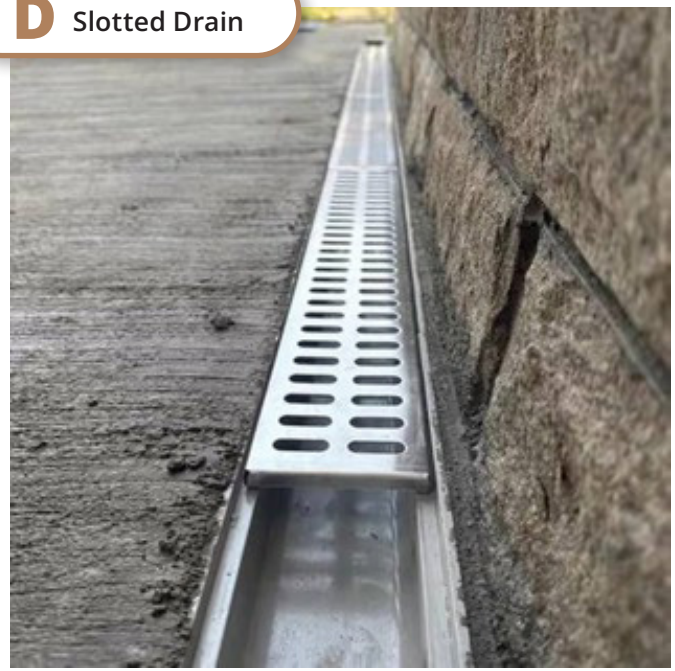
D Install slotted drains along the parking area curb.



- Create underground infiltration trenches and/or drywells that could contain water from extreme storm events and slowly release it into the surrounding soil.
- Determine if the existing pipe system is undersized through stormwater modeling. Replace pipe infrastructure if capacity is found to be the issue.
- Perform CCTV storm sewer inspection to locate any breaks or blockages in the existing storm pipe network. Repair and/or replace pipes depending on the CCTV evaluation.

A Planter with Curb Cuts

B Bioswale



C Permeable Pavement

D Slotted Drain

08
Goals, Policies, & Implementation

our Downtown Camas
Hometown. Downtown. Our Town. 2045

Clara Apartments - Camas, WA

Overview

Over the next 20 years, City staff and community partners will work to bring the Downtown Subarea Plan's concepts and recommendations to life. The goals and policies presented in this section align with the vision statement of the Subarea Plan and set the policy direction for decision makers when reviewing priorities for City-led actions.

The implementation plan further supports the goals and policies by outlining specific strategies and actions that will lead to the desired outcomes of the Subarea Plan. The implementation plan provides guidance on the estimated timing, leadership and partnership roles, and level of priority for each implementation action. Many actions will be City-led through various City Departments, while others will require partnership with community groups or regional agencies. Over the planning period, City staff and decision makers, in coordination with key stakeholders, may reevaluate the goals, policies, and implementation actions to respond to changes in priorities or other City planning efforts that affect the Downtown area.

Goal DT-1: Architecture and Design

Retain Downtown's historic design and expand its charm.

DT-1.1: Protect and enhance downtown's design, including the integrity of the Historic Main Street Core, through clear and objective zoning standards and design guidelines.

DT-1.2: Explore improvements to public spaces that reinforce downtown's character through a streetscape plan and investments in community amenities.

DT-1.3: Ensure downtown design standards are up-to-date and reflect the goals and policies of the Downtown Subarea Plan.

DT-1.4: Promote the addition of street trees, landscape planters, green walls, and other landscaping elements that improve aesthetics, provide shade, and enhance the pedestrian experience.

DT-1.5: Incorporate public art, murals, and interactive elements to create a unique sense of place.

DT-1.6: Require new buildings to complement the existing architectural character while allowing for contemporary design elements.

DT-1.7: Encourage pedestrian-scale building design and street lighting to highlight building facades and architectural features and enhance safety and visibility.

Patrons Enjoy a Meal Outdoors at Natalia's Cafe in Downtown Camas

Goal DT-2: Downtown Housing

Provide a range of housing options that welcome more people to live Downtown.

DT-2.1: Allow development of a range of housing types, including both rental and ownership options, for a wide range of income levels within the zoning districts in the Downtown Subarea Plan boundary.

DT-2.2: Explore incentives to increase housing capacity and encourage the development of diverse housing types, ADUs, affordable housing, senior housing, and mixed-use or live/work units within Downtown.

DT-2.3: Develop design standards for new housing to complement the existing downtown development and ensure clear and objective regulations and permitting processes.

DT-2.4: Implement housing affordability strategies that meet the needs of downtown households and preserve existing affordable housing.

DT-2.5: Encourage housing downtown to provide features that foster healthy living such as community gardens, open spaces, and recreation areas.

Cottage Cluster Housing in Portland, OR

Goal DT-3: Urban Amenities

Provide the right mix of development, services, and public spaces that support ways for people to live, work, and play Downtown.

DT-3.1: Require active ground floor uses and engaging street level design in the Historic Main Street Core zoning district.

DT-3.2: Support parks and open space improvements and connectivity to Mill Ditch Trail and Louis Bloch Park, as illustrated in the Downtown Subarea Plan.

DT-3.3: Evaluate regulations that support visitor lodging and tourism activities in downtown.

DT-3.4: Explore opportunities for additional public spaces, including public plazas, pocket parks, pedestrian-only streets, and community gardens.

DT-3.5: Create a parklet program that converts downtown curbside parking spaces into community seating spaces for businesses and residents

DT-3.6: Establish a policy to require new public and private projects to provide public art, including murals, sculptures, or interactive elements within public spaces

DT-3.7: Support and incentivize business and property owners to incorporate outdoor patios, seating areas, planters, and other landscape features that contribute to an inviting and dynamic streetscape.

Green Loop Pop-up Park in Salt Lake City Utah

Goal DT-4: Economic Development

Encourage (re)development to expand opportunities Downtown for retail, office, and residential.

DT-4.1: Support partnerships with community groups focused on advocating for the future of Downtown Camas, such as the Downtown Camas Association.

DT-4.2: Evaluate the Camas Municipal Code and permitting procedures to identify ways to increase flexibility to allow businesses to expand, grow, or redevelop at existing locations.

DT-4.3: Collaborate with public agencies, private parties, and non-profits in marketing and outreach efforts that attract visitors, sustain existing local businesses, attract new development/redevelopment, and maintain the historic character of downtown.

DT-4.4: Partner with the Downtown Camas Association, Camas-Washougal Chamber of Commerce, and other similar organizations to expand incentives available to small local businesses such as credit improvement programs.

DT-4.5: Prioritize City investments that capitalize on nearby redevelopment efforts to reinforce economic and physical connections to downtown.

DT-4.6: Evaluate financing tools to help investments in community infrastructure and encourage redevelopment of key areas.

DT-4.7: Address infrastructure improvements necessary for redevelopment projects.

DT-4.8: Encourage development and redevelopment that reinforces the role of public spaces in Downtown Camas as a vibrant center of activity, particularly for vulnerable populations.

DT-4.9: Develop strategies to mitigate displacement of existing businesses downtown, particularly in areas of increased investment and redevelopment.

DT-4.10: Work to achieve a diverse set of local businesses downtown that are complementary and economically resilient, balancing needs of residents, workers, and visitors.

DT-4.11 Actively participate in the Washington Department of Ecology cleanup process for the Camas Mill and support an unrestricted cleanup level to provide for the greatest flexibility for future land use.

Downtown Camas Associations 2025 Volunteer & Community Engagement Summit

Goal DT-5: Civic Life

Expand on civic life and services Downtown through strategic use of City-owned property and vibrant community events.

DT-5.1: Ensure that City Hall and primary services remain downtown.

DT-5.2: Develop a Civic Hub as a central gathering place and include a civic plaza to support existing and new community events.

DT-5.3: Support flexibility and provide infrastructure investments at the Civic Hub along NE 4th Ave to create shared spaces and accommodate pedestrian-friendly events.

DT-5.4: Develop guidelines and permitting procedures for seasonal or temporary use of public spaces for outdoor dining, retail displays, community events, and allow for pedestrian flow and safety.

Camas Plant & Garden Fair 2024

Goal DT-6: Multimodal Connectivity

Create a safe and connected transportation network Downtown for pedestrians, bicyclists and vehicles.

DT-6.1: Encourage placemaking and wayfinding efforts downtown to develop a distinct identity and attract visitors.

DT-6.2: Ensure downtown sidewalks are wide, unobstructed, and well-maintained to accommodate all users.

DT-6.3: Implement traffic-calming measures such as curb extensions, raised crosswalks and intersections, and unique pavement treatments that improve pedestrian safety and enhance downtown design.

DT-6.4: Improve bicycle infrastructure with new dedicated bike lanes, sharrows, intersection improvements, and bicycle parking. Encourage the use of priority bicycle parking for community events.

DT-6.5: Enhance connections between the historic Main Street core and downtown residential neighborhoods, including Evergreen Terrace and south of NE 3rd Ave.

DT-6.6: Install benches, shade structures, and public seating along pedestrian routes to create a more comfortable walking environment.

DT-6.7: Ensure adequate parking downtown for continued business growth and consider developing a parking management plan. Seek out opportunities for shared use parking and additional parking on the edges of the downtown district, which could also serve as a park and ride transit facility.

Two Way Protected Bike Lane - Ann Arbor, MI

Implementation Plan

The implementation plan for Downtown Camas provides specific actions for the City and key stakeholders to realize the vision and goals set forth in the Subarea Plan over the next 20 years. It is organized according to the policies previously defined in this section, identifies potential timing, project champions, and an initial prioritization, which may shift based on future City needs.

Action	Policy Alignment	Timing	Champion (Support)
DT-1 Architecture and Design			
Update and adopt design guideline manual to align with goals and policies of Downtown Subarea Plan.	DT-1.1, 1.3, 1.6, 1.7, 2.3	0-5 years	City – Community Dev.
Update and adopt zoning code to reflect updated zoning districts and intent defined in Downtown Subarea Plan.	DT-1.1, 1.7, 2.2, 3.1, 3.3, 5.4	0-5 years	City – Community Dev.
Prepare a comprehensive Downtown Infrastructure and Capital Improvement Study to identify streetscape plans, priority projects, implementation strategies, trail connections, and funding opportunities.	DT-1.2, 1.4, 1.5, 6.2, 6.3, 6.6	5-10 years	City – Public Works (Community Dev. and Parks)
DT-2 Housing			
Develop incentives for new housing development downtown.	DT-2.2	5-10 years	City – Community Dev.
Evaluate permitting processes to identify ways to streamline new residential development.	DT-2.2, 2.3, 2.5	0-5 years	City – Community Dev.
DT-3 Urban Amenities			
Explore options for improving downtown's connectivity to Louis Bloch Park.	DT-3.2	5-10 years	City – Parks (Community Dev. and Public Works)
Complete improvements to Mill Ditch Trail.	DT-3.2	5-15 years	City – Parks (Community Dev.)
Amend Parks and Recreation plans as needed to look for opportunities for parks and open space downtown.	DT-3.4	0-5 years	City – Parks (Community Dev.)
Develop code requirements for temporary and enhanced use of the public right-of-way and public spaces.	DT-3.5	0-5 years	City – Public Works (Community Dev. and Parks)
Review public art program guidelines and align with downtown goals.	DT-1.5, 3.6	0-5 years	City – Community Dev. (Parks and Public Works)
Explore options for useable open space requirements in new development.	DT-3.7	5-10 years	City – Parks (Community Dev.)

Action	Policy Alignment	Timing	Champion (Support)
Explore funding opportunities for urban amenities in the public realm to address ongoing operations and maintenance costs.	DT-1.2, DT-3.2, DT-3.4, DT-3.6, DT-5.3	5-10 years	City – Community Dev. (Public Works and Parks)
DT-4 Economic Development			
Work with downtown advocacy groups on refinements to façade improvement programs.	DT-4.1	5-10 years	City – Community Dev.
Review additional changes to municipal code to support business retention / attraction.	DT-4.2, 3.3, 5.4	0-5 years	City – Community Dev.
Develop strategy for retaining existing businesses.	DT-4.7	5-15 years	City – Community Dev.
Explore programs to assist business owners / downtown building owners for space improvements.	DT-4.3, 4.4, 4.6, 4.7, 4.8	0-5 years	City – Community Dev.
Work to attract employers that provide living-wage jobs through target industries research and site selection exercises.	DT-4.9	0-15 years	City – Community Dev.
Adopt code amendments that allow future residential and mixed-use redevelopment of the Camas Mill property, and actively participate in the Department of Ecology agreed order process to advocate for cleanup standards that support unrestricted future land use.	DT-4.11	0-5 years	City – Community Dev.
DT-5 Civic Life			
Advance planning and feasibility analysis for the Civic Plaza concept.	DT-5.1, 5.2, 5.3	5-15 years	City – Community Dev. (Public Works, Parks)
Evaluate public realm improvements that better support community events and seasonal activities, including opportunities to improve comfort, accessibility, infrastructure, and flexibility of use.	DT-5.3, 5.4, 6.6	5-10 years	City – Community Dev. (Public Works, Parks)
DT-6 Multimodal Connectivity			
Identify, prioritize, and implement quick-build pedestrian safety improvements downtown using low-cost, interim treatments that can be evaluated and refined over time.	DT-6.3	0-10 years	City –Public Works (Community Dev.)
Develop a placemaking and wayfinding strategy	DT-6.1	5-10 years	City – Community Dev. (Public Works)
Prioritize construction of the Transportation System Plan's recommended pedestrian and bicycle facilities in downtown area.	DT-6.4, 6.5	5-15 years	City – Public Works (Community Dev.)
Develop a comprehensive parking strategy addressing off-street parking requirements and management of on-street spaces.	DT-6.7	0-10 years	City – Community Dev. (Public Works)

Figure 1. Downtown Camas, Washington

1.1 Overview of the Manual.

This design manual, prepared as part of the Our Downtown Camas 2045 Downtown Subarea Plan, serves as a practical tool for implementing updated zoning regulations and design standards in Downtown Camas. Fully aligned with the City's adopted code, the zoning sections and design standards are supported by clear illustrations and visual aids, enabling applicants to interpret and apply requirements with confidence.

The design manual integrates key zoning standards that collectively shape the downtown's built environment. Zoning components include the regulating plan, base zoning districts, detailed provisions for land use and parking, and street types, creating a clear framework to guide future growth. These standards ensure predictability while supporting flexibility for high-quality development.

Complementing the zoning standards, the design standards offer frontage type definitions, public realm expectations, and recommended best practices to inform project design and review. Together, these elements foster cohesive, attractive, and pedestrian-friendly development that reflects the community's vision for a vibrant, well-designed downtown.

	DESIGN MANUAL SECTION	1.0 *Preamble*	2.0 *The Regulating Plan*	3.0 *Base Zoning Districts*	4.0 *Use and Parking*	5.0 *The Street Network*	6.0 *Frontage Standards*	7.0 *Public Realm Standards*	8.0 *General Standards*	0.0 *Definitions & Measures*
PROJECT TYPE	**OCCUPANCY** A change of occupancy to an existing building or structure.	✓	✓	✗	✓	✗	✗	✗	✗	✓
	MINOR ALTERATION Little or no exterior changes to buildings or structures; and no structural work.	✓	✓	✗	✗	✓	✗	✓	✓	✓
	MINOR ALTERATION WITH USE / OCCUPANCY CHANGE Minor alteration (per this table) with change in use or occupancy.	✓	✓	✗	✓	✓	✗	✓	✓	✓
	ADDITION OR MAJOR EXTERIOR CHANGE Changes to exterior or square footage addition of less than fifty (50%) percent with or without a change in use or occupancy.	✓	✓	✓	✓	✓	✓	✓	✓	✓
	NEW CONSTRUCTION All new buildings and changes to exterior or square footage addition of 50% or more.	✓	✓	✓	✓	✓	✓	✓	✓	✓

Figure 2. Applicability of Project Type by Manual Section

1.2 Applicability of Sections.

✓ SECTION IS APPLICABLE

✗ SECTION IS NOT APPLICABLE

Because this document combines zoning regulations with a range of design standards for future development, it is important to clearly identify which sections apply to each type of project within Downtown Camas. Distinguishing levels of project impact ensures that each development or modification is reviewed by the appropriate portion of the design manual proportional to its scale and potential influence on the area. Minor alterations with little or no exterior change, or a simple change in use, generally pose minimal impacts on urban design, public space, and community character, and therefore do not require the same level of review as larger projects. In contrast, substantial exterior modifications, additions, and new construction can significantly shape the public realm and architectural identity. The table on this page identifies which sections apply. In the event of a conflict between this manual and other regulations, the more stringent shall be applicable.

Figure 3. Chart Vibrant Frontage Along 4th Avenue

1.3 How to Use this Manual.

The following diagram illustrates the overall process and core components for using this guide during permitting to ensure all applicable requirements are met. The planning official may modify or adapt this process as needed to address site-specific conditions, ensure compliance, and coordinate with other relevant sections of the zoning code.

After completing the review in **Section 1.2** to confirm which provisions of this document apply, the steps that follow provide a clear, sequential overview of how to use this manual.

STEP #1
IDENTIFY PROJECT LOT OR LOTS ON THE REGULATING PLAN.

STEP #2
REVIEW STANDARDS IN THE BASE ZONING DISTRICTS.

STEP #3
VERIFY ADHERENCE TO USE AND PARKING STANDARDS.

STEP #4
CONFIRM APPLICABILITY OF DESIGN STANDARDS.

STEP #5
SELECT FRONTAGE TYPE AND VERIFY ADHERENCE TO STANDARDS.

STEP #6
VERIFY ADHERENCE TO PUBLIC REALM STANDARDS FOR STREET TYPE AND GENERAL STANDARDS FOR ALL IMPROVEMENTS.

Figure 4. How to Use this Document Flow

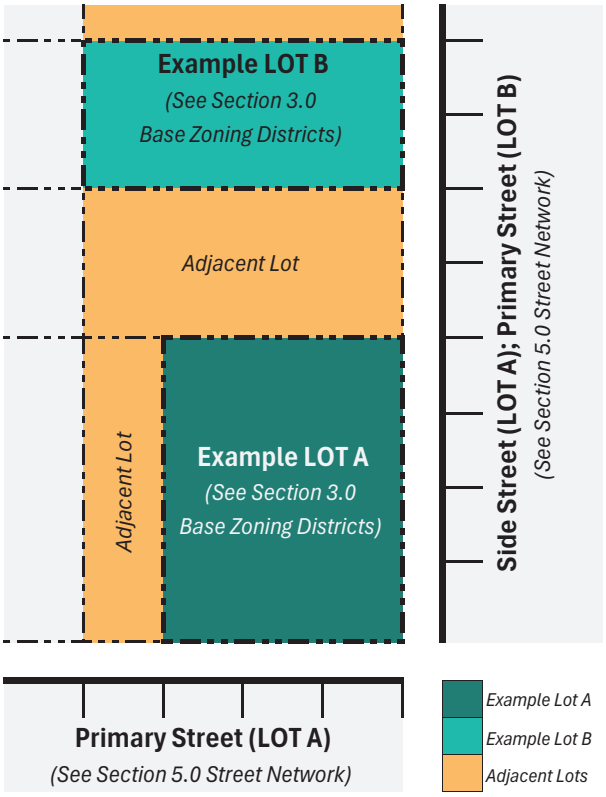

Figure 5. Typical Lot and Street Type Diagram

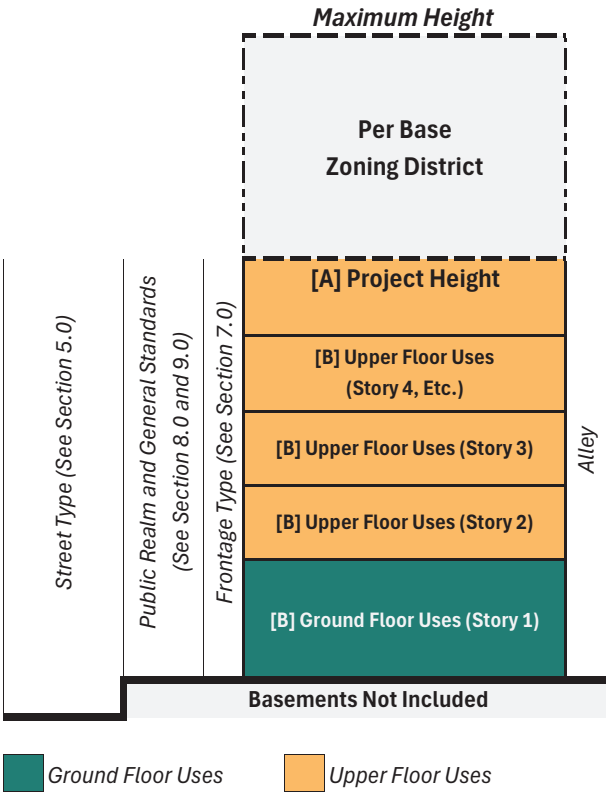

Figure 6. Typical General Standards: Height and Use

STEP 1: IDENTIFY PROJECT LOT OR LOTS ON THE REGULATING PLAN.

Begin by referencing the regulating plan **(Section 2.0)** and documenting the lot to determine:

- Which of the four (4) base zoning districts **(Section 3.0)** or existing zoning districts the lot or lots are located in; and
- Which of the five (5) street types **(Section 5.0)** are applicable to the lot or lots for all frontages onto public rights-of-way.

NOTE: Projects may contain lots with more than one (1) base zoning district or street type. Projects that fall within the Heavy Industrial district, open space district, or districts not listed in this manual must refer to the zoning code.

STEP 2: REVIEW STANDARDS IN THE BASE ZONING DISTRICTS.

Each base zoning district defines unique goals, building form parameters, height limits, and other requirements suited to its intended form and function (e.g., Historic Main Street, Downtown Mixed-Use, etc.). Refer to the specific base zoning district **(Section 3.0)** identified in Step 1 for specific requirements and review each for adherence to the purpose and intent, applicability, and standards. The general standards for each district include:

- **[A] Building height:** Measurement in feet (FT) and above-grade number (#) of stories.
- **[B] Building uses:** Primary use types **(See Section 4.0)** for percentage allowable on ground floor areas, ground floor frontages, and upper floor areas.

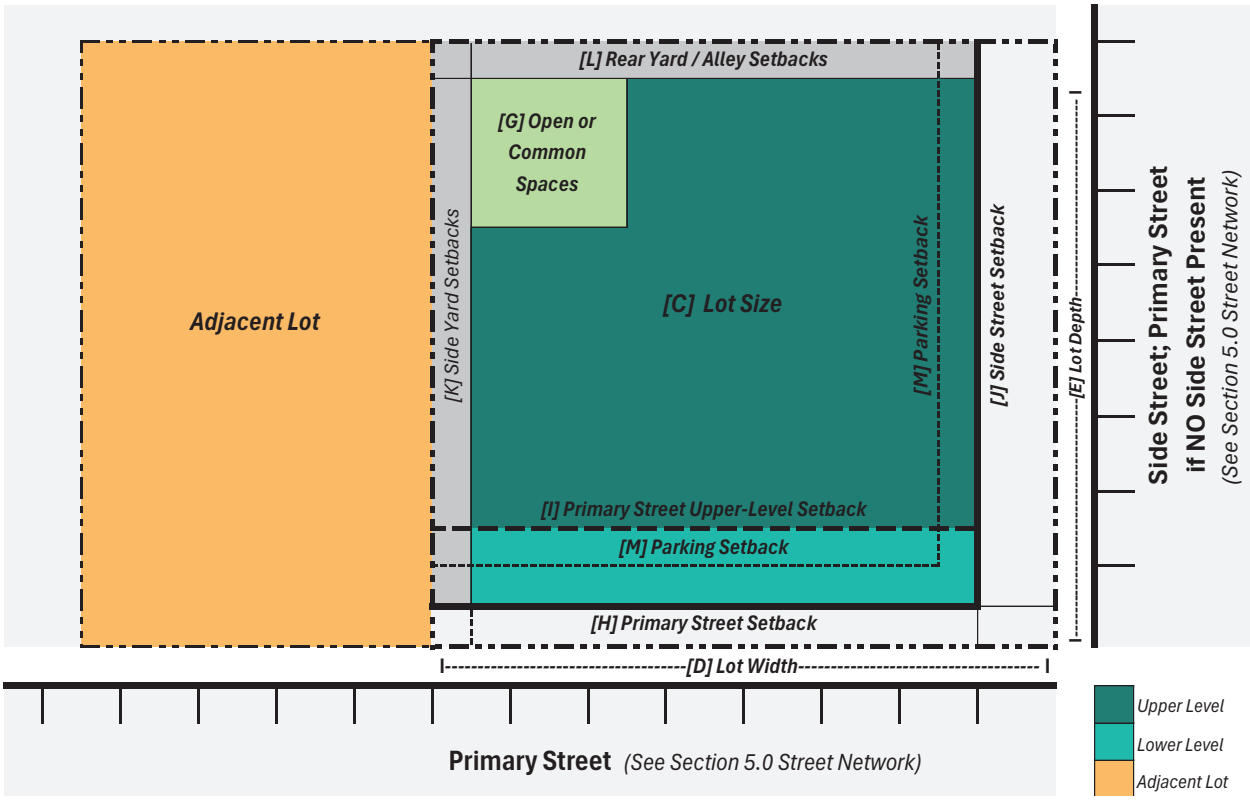

Figure 7. Typical Development Standards: Lot and Setback Requirements

In addition to the general standards that apply to all lots, each lot is also subject to specific development standards governing lot dimensions and setbacks. The development standards for each district include:

- **[C] Lot size:** Maximum lot size in square feet (SF) or the proportion of a typical downtown block (i.e. 1/8, 1/2, Etc.).
- **[D] Lot width:** Minimum dimension in linear feet (LF) of the lot from the primary street.
- **[E] Lot depth:** Minimum dimension in linear feet (LF) of the lot from the property line on the primary street.
- **[F] Lot coverage:** Minimum percentage (%) of the new building footprint (SF) respective to the lot (SF).
- **[G] Open or common spaces:** Required square footage (SF) of space on the lot for each dwelling unit provided on the lot.
- **[H] Primary street setbacks:** Maximum distance in linear feet (LF) of the placement of the building facade on the ground floor from the property line on the primary street.
- **[I] Primary street upper-level setbacks:** Minimum distance in linear feet (LF) of the placement of building facades on a designated upper-level from the ground floor building facade on the primary street.
- **[J] Side street setbacks:** Maximum distance in linear feet (LF) of the placement of the building facade from the property line on the side street.
- **[K] Side yard setbacks:** Maximum distance in linear feet (LF) of any building facades from property lines on adjacent lots.
- **[L] Rear yard / alley setbacks:** Minimum distance in linear feet (LF) of any building facades from property lines at the rear of the yard or onto an existing or proposed alley.
- **[M] Parking setbacks:** Minimum distance in linear feet (LF) of the placement of any structured or surface parking facilities or storage of vehicles on the site from the primary street or side street.

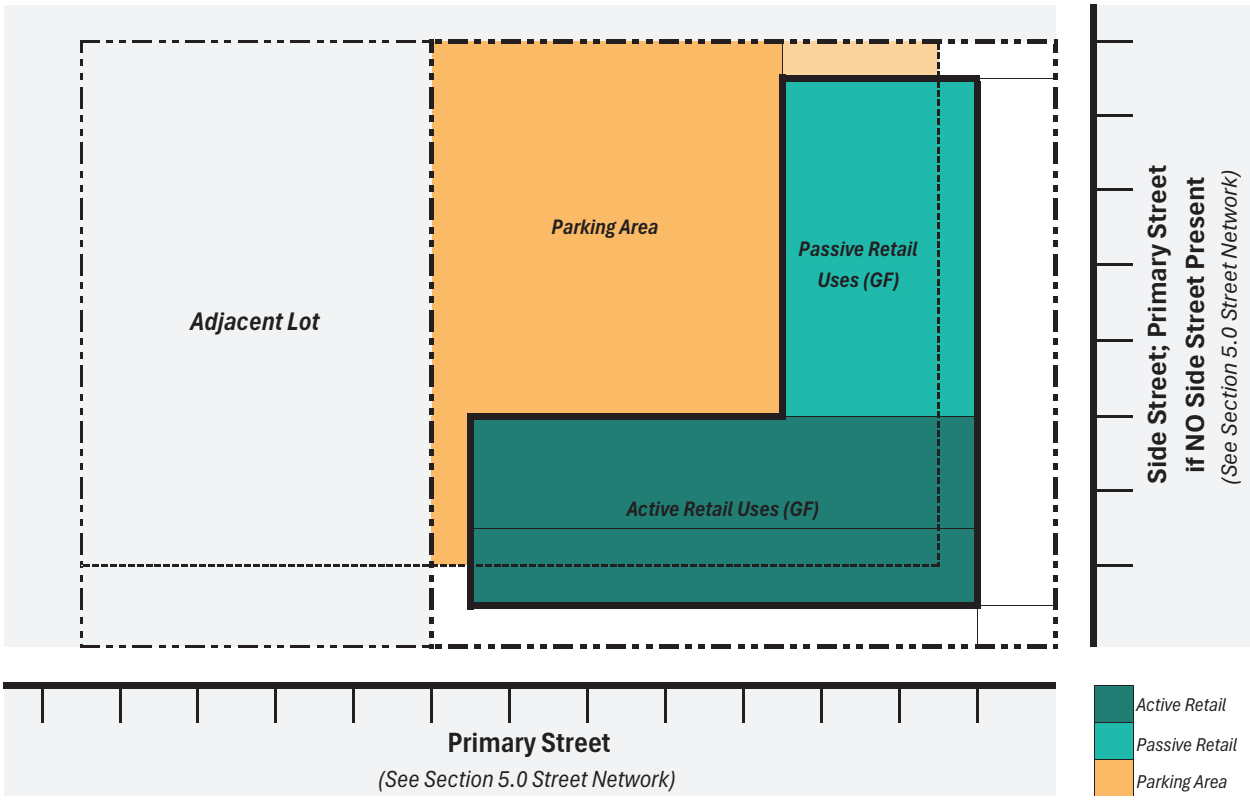

Figure 8. Typical Lot and Street Type Diagram

STEP 3: VERIFY ADHERENCE TO USES AND PARKING STANDARDS.

Based on the intended uses, consult the applicable use tables (**Section 4.0**) to determine which uses are permitted, conditional, or prohibited on the ground floor and upper floors. After confirmation, refer to the zoning code and review the corresponding parking requirements to ensure compliance with parking ratios. Primary use categories include the following:

- Active retail uses.
- Communication, utilities, and facilities uses.
- Educational uses.
- Incidental uses.
- Industrial uses.
- Manufacturing and/or processing uses.
- Passive retail uses.
- Recreational, religious, and cultural uses.
- Residential uses.
- Temporary uses.

Active Retail Uses VS Passive Retail Uses

Commercial uses are organized into two (2) categories per Section 4.2: Active Retail Uses and Passive Retail Uses. This distinction differentiates uses that generate high levels of foot traffic and pedestrian activity from those that contribute at a more limited scale. The purpose of this classification is to ensure that ground-floor spaces in designated downtown areas support vibrant, active streetscapes. Active Retail is intended to be concentrated along primary streets where pedestrian activity is most critical, while Passive Retail is better suited to side streets. Verify active retail uses and passive retail uses are appropriate per the table.

Figure 9. Overview of Active and Passive Retail

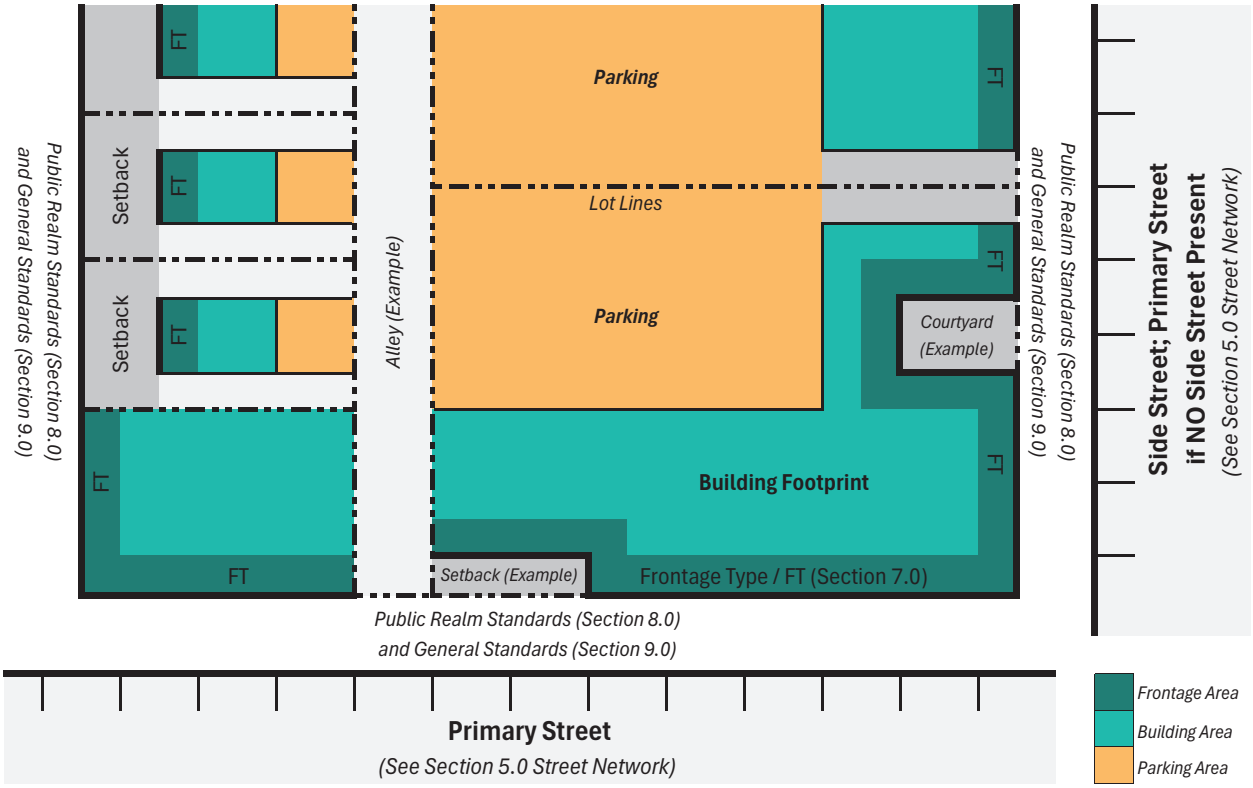

Figure 10. Typical Public Realm Diagram

STEP 4: CONFIRM APPLICABILITY OF DESIGN STANDARDS.

Confirm applicability **(Section 1.2)** of the design standards based on permit application, including applicability of frontage standards **(Section 6.0)**, public realm standards **(Section 7.0)**, and general Standards **(Section 8.0)**.

STEP 5: SELECT FRONTAGE TYPE AND VERIFY ADHERENCE TO STANDARDS.

If applicable to the lot, review the allowable frontage types **(Section 6.0)** for each street type. This includes adherence to any specific standards or dimensions for the frontage type. And although these standards are fairly minimal, frontage has a critical role in shaping public space and making sure the space between the public right of way and the building facade are lively, engaging, and conducive to walkability and pedestrian activity.

STEP 6: VERIFY ADHERENCE TO PUBLIC REALM STANDARDS FOR STREET TYPES AND GENERAL STANDARDS FOR ALL IMPROVEMENTS.

Where applicable, verify that each street type complies with the public realm standards **(Section 7.0)** and that all public realm improvements meet the general standards **(Section 8.0)**. While requirements vary by street type, general standards apply universally. Confirm with the planning official whether additional zoning code provisions apply. Supplemental public realm guidance is provided on the opposite page.

Figure 11. The Zones of Public Realm

The Zones of the Public Realm

For this design manual, the public realm is described through three (3) zones that extend from the curb edge to the building façade. These zones provide a framework for organizing streetscape elements and building frontage.

[1] Facade Zone: This zone is the vertical plane of the building face adjoining the sidewalk or setback, regulated to maintain cohesive street character through controls on blank walls, horizontal articulation, entrances, and other facade elements.

[2] Encroachment Zone: A flexible area between the building façade (including any setback) and the sidewalk circulation zone, accommodating elements such as signage, awnings, displays, seating, and weather protection that activate and support building uses.

[3] Amenity Zone: A flexible area between the sidewalk and curb, with a wide range of dimensions, accommodating trees, landscaping, lighting, furnishings, transit stops, bicycle parking, and related amenities enhancing safety, comfort, and character.

Note on the Sidewalk Area: *The primary clear path for pedestrian circulation, free of any obstructions, ensuring accessibility, safety, and comfort while connecting building entrances, transit stops, and public spaces along a streetscape.*

ZONING CODE

SECTION 2.0 REGULATING PLAN
SECTION 3.0 BASE ZONING DISTRICTS
SECTION 4.0 USE AND PARKING
SECTION 5.0 THE STREET NETWORK

2.0 The Regulating Plan.

The purpose of the regulating plan is to provide applicants with a clear, parcel-specific map of which base zoning districts and street types apply to each property within Downtown Camas. The base zoning districts guide applicants to the applicable general and development standards, while the street types direct them to the corresponding frontage and public realm requirements. Although the regulating plan functions as a visual navigation tool, each parcel is also formally codified with its assigned districts and street types to ensure clarity and regulatory certainty throughout the development process.

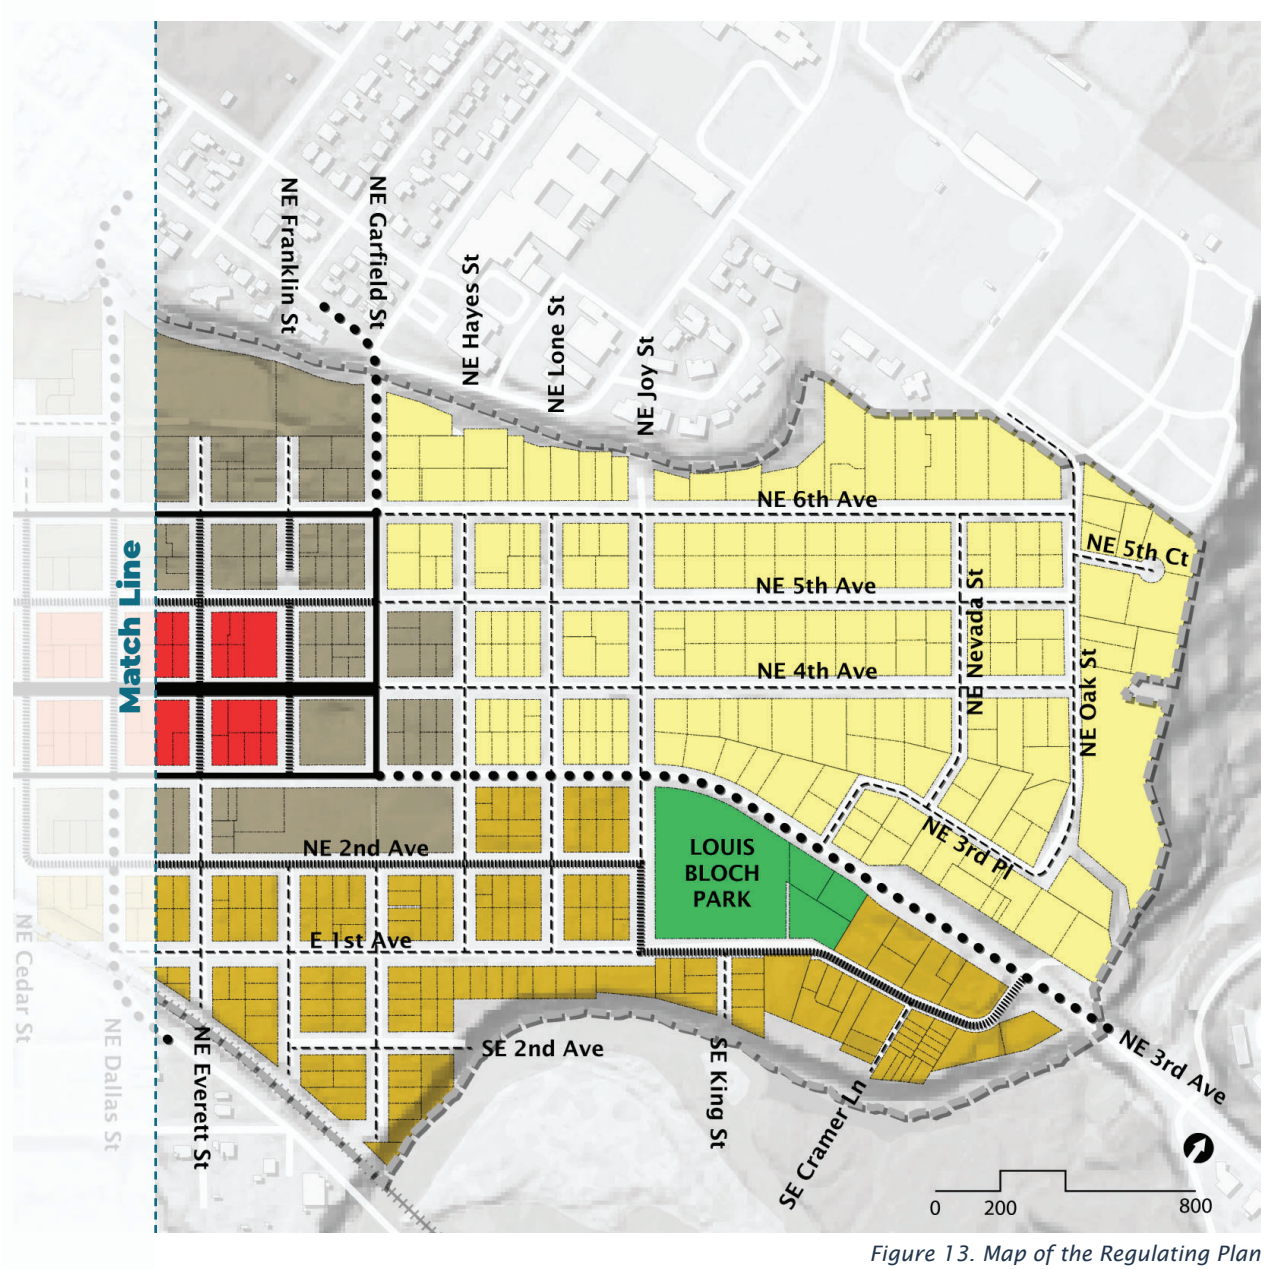

Figure 13. Map of the Regulating Plan

BASE ZONING DISTRICTS.

*See **Section 3.0** for further details.*

- 3.1 Historic Main Street Core
- 3.2 Downtown Mixed-Use: Mid Rise
- 3.3 Downtown Mixed-Use: Low Rise
- 3.4 Downtown Residential
- 3.5 Heavy Industrial (HI)
- 3.5 Neighborhood Park (NP)

STREET TYPES.

*See **Section 5.0** for further details.*

- 5.1 Main Streets (MNS)
- 5.2 Connector Streets (CNS)
- 5.3 Mobility Streets (MBS)
- 5.4 Gateway Streets (GWS)
- 5.5 Neighborhood Streets (NHS)

3.0 Base Zoning Districts

The Downtown Camas Transect Framework guides growth across four (4) base zoning districts, transitioning from the walkable Historic Main Street Core to surrounding residential and employment areas. Each district reflects context-appropriate building types, scale, and uses. Mid- and low-rise mixed-use zones provide housing and commerce near the core, while the Downtown Residential district preserves neighborhood character with gentle infill—balancing preservation, growth, and walkability for a cohesive downtown.

3.1
Historic Main Street Core.

The most compact and walkable district, featuring continuous street-facing buildings with minimal setbacks and active ground floors. Uses include retail, dining, civic, and upper-story office or residential. Architecture emphasizes preservation, human scale, and a fine-grain frontage pattern.

3.2
Downtown Mixed-Use: Mid Rise.

A vibrant, higher-density urban zone with buildings ranging in heights. Supports a mix of residential, commercial, and civic uses with structured parking and active ground-floor frontages. Streets are multimodal, with wide sidewalks, trees, and transit access.

PURPOSE OF THE BASE ZONING DISTRICTS.
The purpose of the base zoning districts is to provide the appropriate general and development standards for each district that will regulate the built form, including: building heights, building uses, lot sizes, lot widths, lot depths, lot coverage, open or common spaces, primary street setbacks, side street setbacks, side yard setbacks, rear yard/alley setbacks, and parking setbacks. See **Chapter 18.05 Zoning Map and Districts** of the Camas Municipal Code for codified base zoning districts.

Figure 14. Base zoning district Transect Diagrams

3.3
Downtown Mixed-Use: Low Rise.

A transitional zone with a range of building types and a mix of neighborhood-serving retail, offices, and housing, including a range of missing middle housing. Slightly deeper setbacks and increased landscaping support a softer urban edge while maintaining pedestrian orientation and urban form.

3.4
Downtown Residential.

A primarily residential area defined by smaller-scale housing types—such as cottages, duplexes, triplexes, fourplexes, and accessory dwelling units—often on existing single-family lots. The district maintains a lower-density character while allowing incremental infill that respects existing neighborhood patterns and historic scale.

Figure 15. Sample Historic Main Street Character

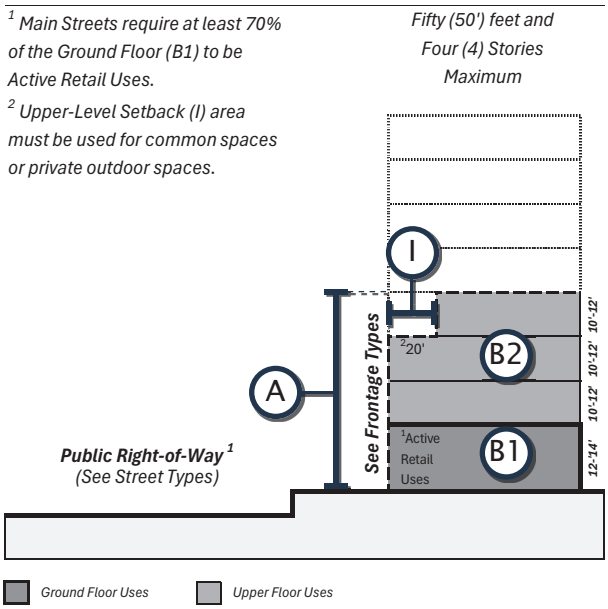

Figure 16. Height and Use Diagram (A-B)

3.1 Historic Main Street Core.

PURPOSE AND INTENT.

1. To continue the historic pedestrian-oriented characteristic along NE 4th Avenue, between NE Adams and NE Garfield Streets and enhance that same character throughout the district;
2. To recognize and accommodate primary retailers along 3rd, 4th, and 5th Avenue between Adams Street and Garfield Street within the Downtown Camas boundary;
3. To preserve the existing historic architectural character with design standards;
4. To preserve the historic character of primary uses, include a limited mix of small and local retail shops, restaurants, bars, and cafes;
5. To encourage and accommodate the adaptive reuse of existing development and emphasize multimodal accessibility and connectivity; and
6. Mixed use within this district refers to vertical mixed use where active primary uses are on the ground floor and secondary uses are above.

APPLICABILITY.

See **Chapter 18.05: Zoning Map and Districts** for further details.

GENERAL STANDARDS.

[A] Building Height.

- Maximum Fifty (50') feet and four (4) stories.
- An upper-level setback (See [I]) of twenty (20') feet along Main Streets would ensure that new development along 4th Avenue is setback for the fourth level as part of a development.

[B] Building Uses.

See **Section 4.0 Use and Parking** for further details.

- **[B1] Ground Floor Uses:** Main Streets must occupy at least seventy (70%) percent ground floor area and frontages with active retail uses. All other street types must occupy at least seventy (70%) percent of ground floor area and frontages with active retail uses or passive retail uses. Municipal uses may occupy up to one hundred (100%) percent of the ground floor area and frontages on any street type between 3rd Avenue and 5th Avenue east of Everett Street. Other uses may occupy as pursuant to **Section 4: Use and Parking** of this document.
- **[B2] Upper Floor Uses:** May occupy up to one hundred (100%) of upper floor area on any street type with other uses permitted within this zone pursuant to **Section 4: Use and Parking** of this document. Municipal uses may occupy up to one hundred (100%) percent of the upper floor on any street type between 3rd Avenue and 5th Avenue east of Everett Street.

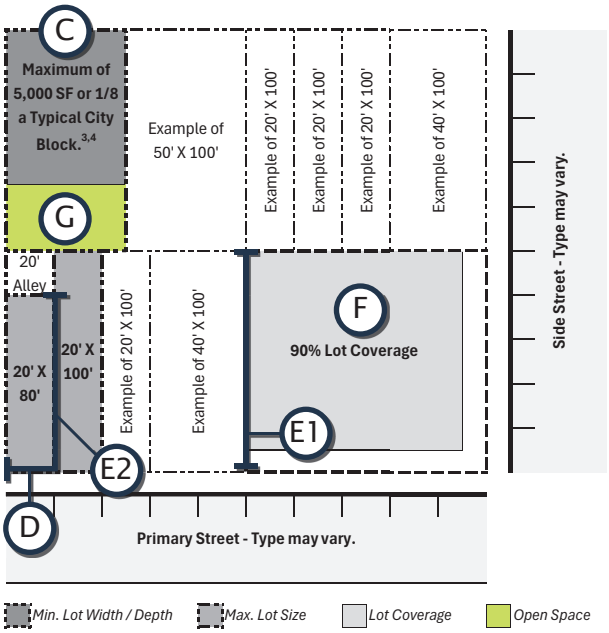

Figure 17. Lot Requirements Diagram (C-G)

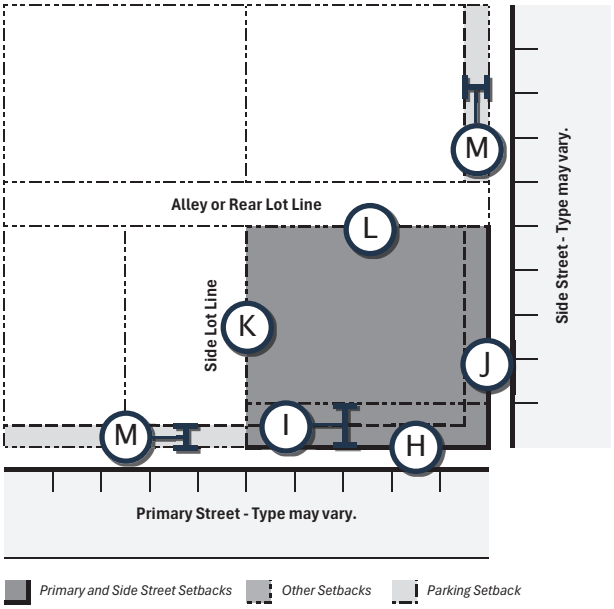

Figure 18. Setback Requirements Diagram (H-M)

DEVELOPMENT STANDARDS.

LOT REQUIREMENTS

[C] Lot Size.

- Maximum five thousand (5,000 SF) square feet or one-eighth (1/8) of a typical city block when located west of NE Dallas St.
- Maximum ten thousand (10,000 SF) square feet or one-quarter (1/4) of a typical city block when located east of NE Dallas St.
- Lot sizes are not applicable to any municipal uses.

[D] Lot Width.

- Minimum twenty (20') feet.

[E] Lot Depth.

- [E1] Minimum one hundred (100') feet.
- [E2] Minimum eighty (80') feet with provision of alley.

[F] Lot Coverage.

- Minimum ninety (90%) percent.
- Coverage may be decreased for municipal uses.

[G] Open or Common Spaces.

- Minimum square feet of usable, shared open or common space per dwelling unit: Ten (10 SF) square feet per dwelling unit.

SETBACK REQUIREMENTS

[H] Primary Street Setback

- Maximum distance of Ground Floor Facade from public ROW on Primary Street: Zero (0') lot line.
- Setback may be increased for municipal uses.

[I] Primary Street Upper-Level Setback

- Minimum distance from Ground Floor Facade for upper-levels in building: Minimum twenty (20') feet for stories three (3) or more. Upper-Level Setback area must be used for common spaces or private outdoor spaces.

[J] Side Street Setback

- Zero (0') feet maximum (Zero Lot Line).

[K] Side Yard Setback

- Zero (0') feet maximum (Zero Lot Line).

[L] Rear Yard / Alley Setback

- Not applicable.

[M] Parking Setback

- Minimum five (5') feet from primary street lot line; and never in front of the primary street or side street facade line.
- See **Section 4.0 Use and Parking** for parking ratios.

Figure 19. Sample Downtown Mixed-Use: Mid Rise Character

3.2 Downtown Mixed-Use: Mid Rise.

PURPOSE AND INTENT.

1. To recognize and accommodate a mix of uses including retail and residential, within the downtown mixed use – low rise zone within the Downtown Camas boundary;
2. To promote the development of low-rise apartments with active ground floor, live/work units, duplexes, townhomes, triplexes, and quadplexes; and
3. To encourage and accommodate higher density middle housing.

APPLICABILITY.

See **Chapter 18.05: Zoning Map and Districts** for further details.

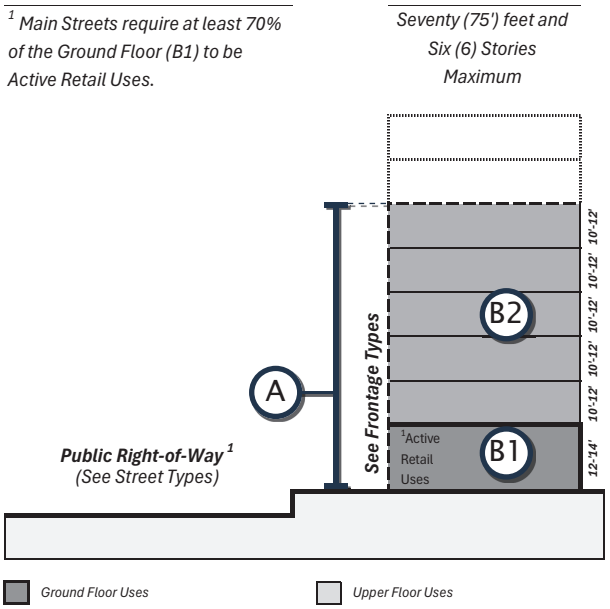

Figure 20. Height and Use Diagram (A-B)

GENERAL STANDARDS.

[A] Building Height.

- Maximum seventy-five (75') feet and six (6) stories.
- An upper-level setback (See [I]) of twenty (20') feet when located on 5th Avenue directly across from Historic Main Street Core district would ensure that new development near the historic downtown is sensitive to historic buildings.

[B] Building Uses.

See **Section 4.0 Use and Parking** for further details.

- **[B1] Ground Floor Uses:** Main Streets must occupy at least seventy (70%) percent ground floor area and frontages with active retail uses. Mobility Streets and Gateway Streets must occupy at least seventy (70%) percent ground floor area and frontages with active retail uses or passive retail uses. All other streets may occupy a maximum of seventy (70%) percent ground floor area and frontages with residential uses. Other uses may occupy as pursuant to **Section 4: Use and Parking** of this document.

- **[B2] Upper Floor Uses:** May occupy up to one hundred (100%) of upper floor area on any street type with other uses permitted within this zone pursuant to **Section 4: Use and Parking** of this document.

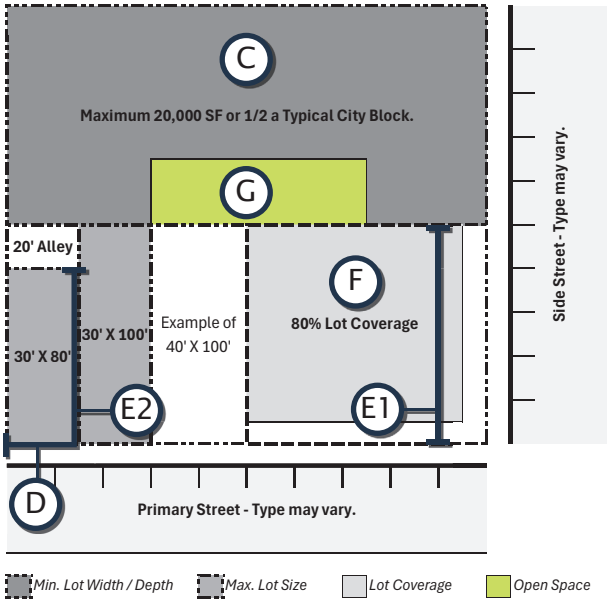

Figure 21. Lot Requirements Diagram (C-G)

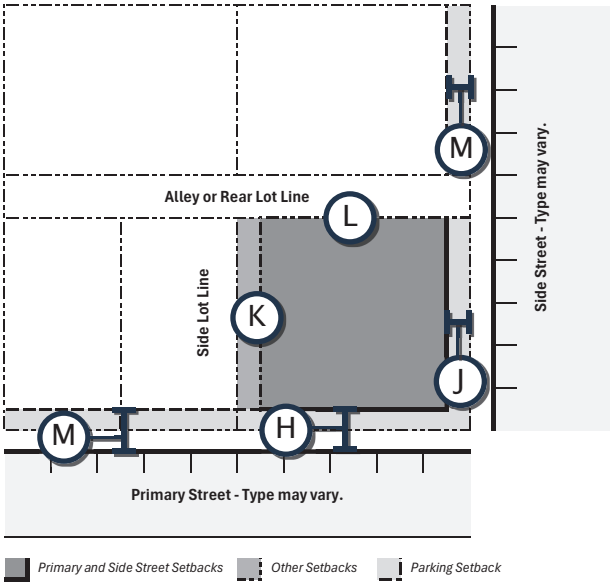

Figure 22. Setback Requirements Diagram (H-M)

DEVELOPMENT STANDARDS.

LOT REQUIREMENTS

[C] Lot Size.

– Maximum twenty thousand (20,000 SF) square feet or one-half (1/2) of a typical city block.

[D] Lot Width.

– Minimum thirty (30') feet.

[E] Lot Depth.

– [E1] Minimum one hundred (100') feet.
– [E2] Minimum eighty (80') feet with provision of alley.

[F] Lot Coverage.

– Minimum eighty (80%) percent.

[G] Open or Common Spaces.

– Minimum square feet of usable, shared open or common space per dwelling unit: Fifty (50 SF) square feet per dwelling unit.

SETBACK REQUIREMENTS

[H] Primary Street Setback

– Maximum distance of Ground Floor Facade from public ROW on Primary Street: Ten (10') feet.

[I] Primary Street Upper-Level Setback

– Minimum distance from Ground Floor Facade for upper-levels in building located on 5th Avenue directly across from Historic Main Street Core: Minimum twenty (20') feet for stories three (3) or more. Upper-Level Setback area must be used for common spaces or private outdoor spaces.

[J] Side Street Setback

– Maximum distance of Ground Floor Facade from public ROW on side street: Ten (10') feet.

[K] Side Yard Setback

– Maximum five (5') feet.

[L] Rear Yard / Alley Setback

– Not applicable.

[M] Parking Setback

– Minimum five (5') feet from primary street lot line; and never in front of the primary street or side street facade line.
– See **Section 4.0 Use and Parking** for parking ratios.

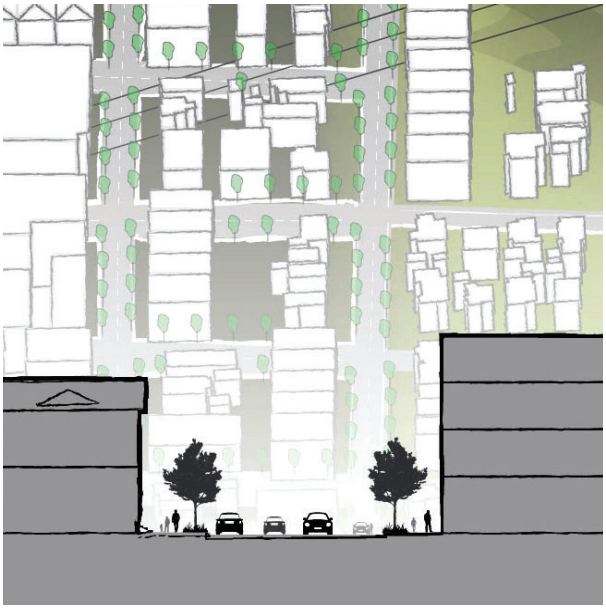

Figure 23. Sample Downtown Mixed-Use: Low Rise Character

3.3 Downtown Mixed-Use: Low Rise.

PURPOSE AND INTENT.

1. To recognize and accommodate a mix of uses including retail and residential, within the downtown mixed use – low rise zone within the Downtown Camas boundary;
2. To promote the development of low-rise apartments with active ground floor, live/work units, duplexes, townhomes, triplexes, and quadplexes; and
3. To encourage and accommodate the adaptive reuse of existing development and emphasize multimodal accessibility and connectivity.

APPLICABILITY.

See **Chapter 18.05: Zoning Map and Districts** for further details.

[1] *Residential Uses are only allowed on the Ground Floor (B1) of Neighborhood Streets.*

[2] *Upper-Level Setback (I) area must be used for common spaces or private outdoor spaces.*

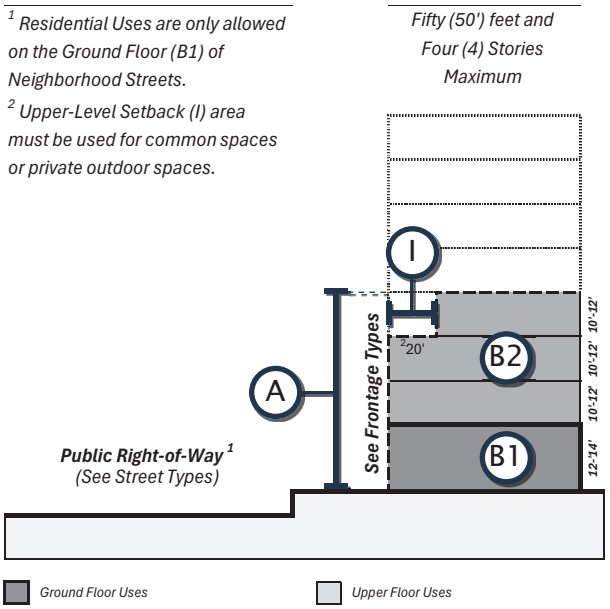

Figure 24. Height and Use Diagram (A-B)

GENERAL STANDARDS.

[A] Building Height.

- Maximum (50') feet and four (4) stories.
- An upper-level setback (See [I]) of twenty (20') feet along all street types will ensure that new development is sensitive to existing residential areas.

[B] Building Uses.

See **Section 4.0 Use and Parking** for further details.

- **[B1] Ground Floor Uses:** Active retail uses and passive retail uses may occupy up to seventy (70%) of ground floor area and frontage on Gateway Streets and Mobility Streets. Residential uses may occupy up to one hundred (100%) percent of ground floor area and frontages on any street. Other uses may occupy as pursuant to **Section 4: Use and Parking** of this document.

- **[B2] Upper Floor Uses:** May occupy up to one hundred (100%) of upper floor area on any street type with other uses permitted within this zone pursuant to **Section 4: Use and Parking** of this document.

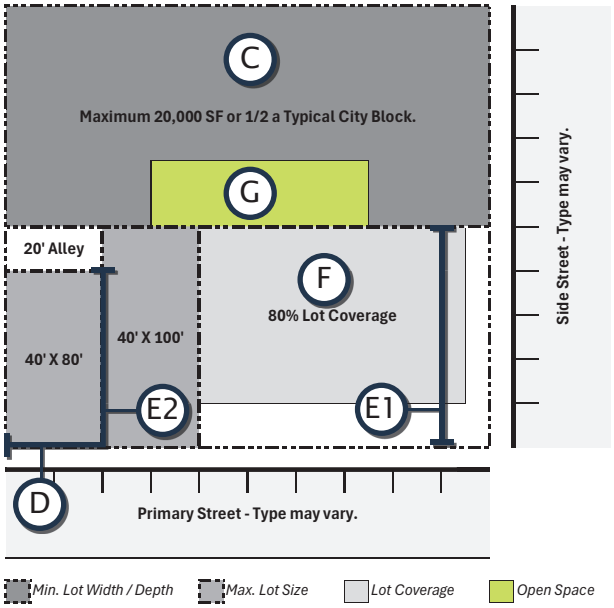

Figure 25. Lot Requirements Diagram (C-G)

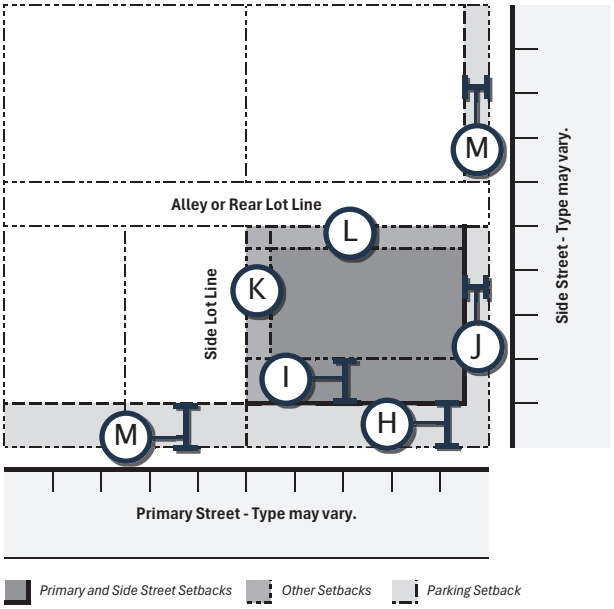

Figure 26. Setback Requirements Diagram (H-M)

DEVELOPMENT STANDARDS.

LOT REQUIREMENTS

[C] Lot Size.

- Maximum twenty thousand (20,000 SF) square feet or one-half (1/2) of a typical city block.

[D] Lot Width.

- Minimum forty (40') feet.

[E] Lot Depth.

- [E1] Minimum one hundred (100') feet.
- [E2] Minimum eighty (80') feet with provision of alley.

[F] Lot Coverage.

- Minimum eighty (80%) percent.

[G] Open or Common Spaces.

- Minimum square feet of usable, shared open or common space per dwelling unit: Fifty (50 SF) square feet per dwelling unit. This provision is not required for single-family residential (attached or detached).
- Requirement does not apply to single-family residential projects.

SETBACK REQUIREMENTS

[H] Primary Street Setback

- Maximum distance of Ground Floor Facade from public ROW on Primary Street: Fifteen (15') feet.

[I] Primary Street Upper-Level Setback

- Minimum distance from Ground Floor Facade for upper-levels in building: Minimum twenty (20') feet for stories four (4) or more. Upper-Level Setback area must be used for common spaces or private outdoor spaces.

[J] Side Street Setback

- Minimum distance of Ground Floor Facade from public ROW on Primary Street: Five (5') feet.
- Maximum distance of Ground Floor Facade from public ROW on Primary Street: Ten (10') feet.

[K] Side Yard Setback

- Maximum five (5') feet.

[L] Rear Yard / Alley Setback

- Minimum five (5') feet.

[M] Parking Setback

- Minimum five (5') feet from primary street lot line; and never in front of the primary street or side street facade line.
- See **Section 4.0 Use and Parking** for parking ratios.

Figure 27. Sample Downtown Residential Character

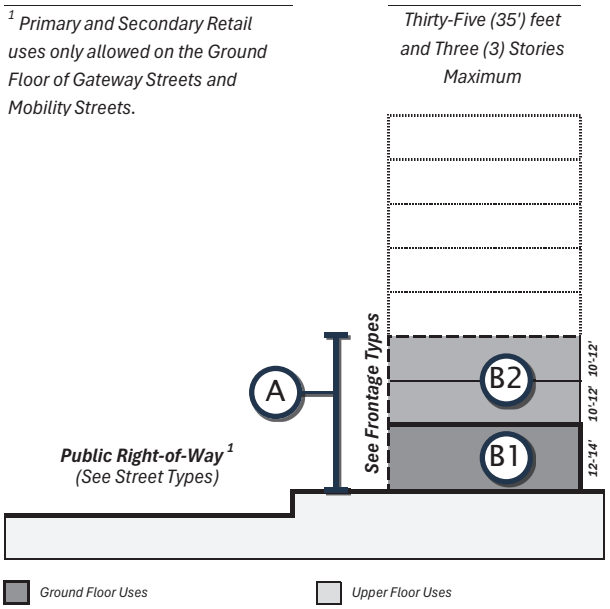

Figure 28. Height and Use Diagram (A-B)

3.4 Downtown Residential.

PURPOSE AND INTENT.

1. To recognize and preserve existing single-family housing stock within the Downtown Camas boundary while supporting gradual redevelopment and the addition of middle housing consisted with the neighborhood's established character;
2. To encourage and accommodate the transitional permeability of existing residential development with downtown commercial activity and emphasize the neighborhood's character and walkability.

APPLICABILITY.

See **Chapter 18.05: Zoning Map and Districts** for further details.

GENERAL STANDARDS.

[A] Building Height.

- Maximum twenty-five (25') feet and two (2) stories on Neighborhood Streets; and
- Maximum thirty-five (35') feet and three (3) stories on all other street types.

[B] Building Uses.

See **Section 4.0 Use and Parking** for further details.

- **[B1] Ground Floor Uses:** Active retail uses and passive retail uses may occupy up to seventy (70%) percent of ground floor area and frontages on Gateway Streets and Connector Streets. Residential uses may occupy up to one hundred (100%) percent of ground floor area and frontages on any street. Other uses may occupy as pursuant to **Section 4: Use and Parking** of this document.
- **[B2] Upper Floor Uses:** May occupy up to one hundred (100%) of upper floor area on any street type with other uses permitted within this zone pursuant **Section 4: Use and Parking** of this document.

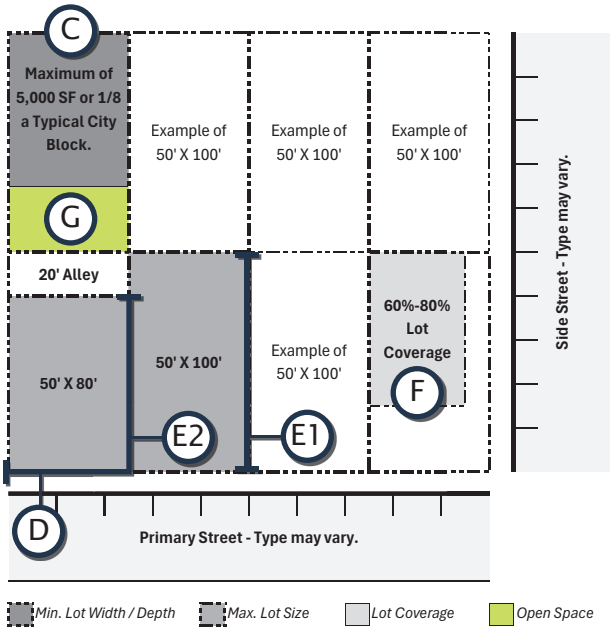

Figure 29. Lot Requirements Diagram (C-G)

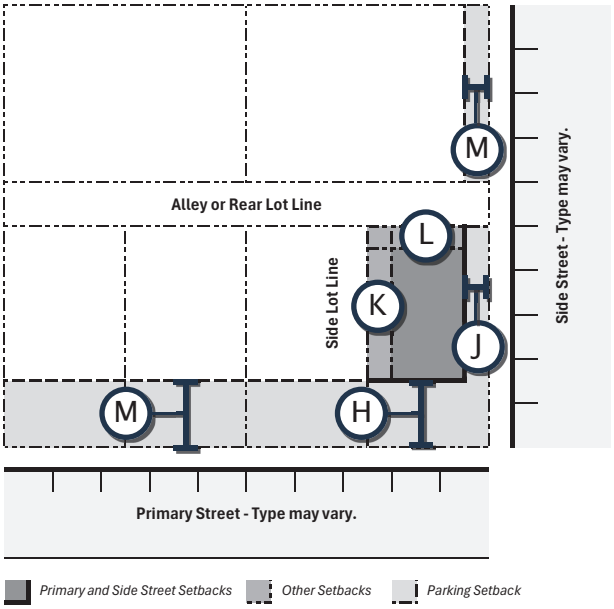

Figure 30. Setback Requirements Diagram (H-M)

DEVELOPMENT STANDARDS.

LOT REQUIREMENTS

[C] Lot Size.
- Maximum five thousand (5,000 SF) square feet or one-eighth (1/8) of a typical city block.

[D] Lot Width.
- Minimum fifty (50') feet.

[E] Lot Depth.
- [E1] Minimum one hundred (100') feet.
- [E2] Minimum eighty (80') feet with provision of alley.

[F] Lot Coverage.
- Minimum sixty (60%) percent.
- Maximum eighty (80%) percent.

[G] Open or Common Spaces.
- Not applicable.

SETBACK REQUIREMENTS

[H] Primary Street Setback
- Minimum distance of Ground Floor Facade from public ROW on Primary Street: Fifteen (15') feet.
- Maximum distance of Ground Floor Facade from public ROW on Primary Street: Twenty-five (25') feet.

[I] Primary Street Upper-Level Setback
- Not applicable.

[J] Side Street Setback
- Minimum distance of Ground Floor Facade from public ROW on Primary Street: Ten (10') feet.

[K] Side Yard Setback
- Minimum five (5') feet; Maximum ten (10') feet.

[L] Rear Yard / Alley Setback
- Minimum five (5') feet.

[M] Parking Setback
- Minimum twenty (20') feet from primary street lot line; and never in front of the primary street or side street facade line.
- See **Section 4.0 Use and Parking** for parking ratios.

4.0 Use and Parking.

Figure 31. Allowable Use by Floor for all Base Zoning Districts

4.1 Use Table.

The following use table provides use authorization for the ground floor (GF) and upper floors (UF) for each base zoning district. Please see **CMC Chapter 18.07.060 Downtown Zoning Districts** for all individual land uses. Please see **CMC 18.11 Parking** for all parking requirements. In the event of a conflict, the zoning code shall supersede this manual.

NOTES:

(1) Verify all individual land uses per CMC Chapter 18.07.060 Downtown Zoning Districts. Verify all percentages allowable per district in Section 3.0 Base Zoning Districts.

(2) Active Retail Uses are required on Ground Floor (GF) of Main Streets.

(3) Active Retail and Passive Retail Uses only permitted on Ground Floor (GF) when located on Gateway Streets or Connector Streets.

(4) Refer to CMC Chapter 18.35 for Wireless Communication Facilities.

4.2 Active and Passive Retail Uses.

To support enforcement of the zoning code provisions in this design manual, commercial uses are classified as either active retail uses or passive retail uses per **CMC Chapter 18.07.060 Downtown Zoning Districts**. These uses are as follows:

[A] Active Retail Uses.

Active retail refers to street-facing, ground-floor uses that encourage walkability and activate sidewalks, such as shops, cafés, restaurants, and other active, customer-oriented businesses. Active retail uses include:

- Antique shop
- Appliance sales and service
- Artisanal/craft/makers
- Bakery (retail)
- Barber and beauty shops
- Book store
- Bowling alley/billiards
- Building, hardware and garden supply store
- Candy; confectionery store
- Clothing store
- Coffee shop, cafe or kiosk
- Day care, mini-center
- Delicatessen (deli)
- Department store
- Event center
- Feed store
- Fitness center/sports club
- Florist shop
- Food cart/food truck/ food delivery business
- Furniture store
- Grocery, neighborhood scale
- Grocery, small scale
- Hotel, motel
- Laundry/dry cleaning (retail)
- Liquor store
- Nursery, plant
- Office supply store
- Pet shops
- Pharmacy
- Photographic/ electronics store
- Restaurant
- Restaurant, fast food
- Second-hand/ consignment store
- Specialty goods production (e.g. brew pub)
- Taverns
- Theater, except drive-in

[B] Passive Retail Uses.

Passive retail refers to commercial activities that primarily serve building occupants or a smaller customer base—such as boutique offices, lobby kiosks, or specialty shops—which typically generate less foot traffic and require less window visibility. Passive retail uses include:

- Animal kennel, commercial boarding
- Animal shelter
- Automobile repair (garage)
- Automobile sales, new or used
- Automobile service station
- Automobile wrecking
- Bakery (wholesale)
- Banks, savings and loan
- Boat building
- Boat repair and sales
- Bus station
- Cabinet and carpentry shop
- Convention center
- Day care center
- Day care, adult
- Day care, family home
- Equipment rental
- Funeral home
- Furniture repair; upholstery
- Gas/fuel station
- Gas/fuel station with mini market
- Grocery, large scale
- Hospital, emergency care
- Household appliance repair
- Industrial supplies store
- Laundry (self-serve)
- Laundry/dry cleaning (industrial)
- Machine shop
- Manufactured home sales lot
- Medical or dental clinics (outpatient)
- Mini-storage/vehicular storage
- Newspaper printing plant
- Nursing, rest, convalescent, retirement home
- Parcel freight depots
- Pawnshop
- Permanent supportive housing
- Plumbing, or mechanical service
- Printing, binding, blue printing
- Professional office(s)
- Public agency
- Real estate office
- Recycling center
- Recycling collection point
- Recycling plant
- Research facility
- Roadside produce stand
- Sand, soil, gravel sales and storage
- Sexually oriented business
- Shoe repair and sales
- Smoke shop
- Stock broker, brokerage firm
- Truck terminals
- Veterinary clinic
- Warehousing, wholesale and trade
- Warehousing, bulk retail

Figure 32. Map of the Street Network In the Downtown Core

5.0 The Street Network.

The street network weaves together and unifies the base zoning districts throughout downtown. The street network plan illustrated above identifies the five (5) street types assigned to all streets within the Downtown area, as also shown in the regulating plan in Section 2.0: The Regulating Plan.

For the purposes of this design manual, these street types assign standards for frontage types, general improvements, and specific street-type standards. They also define activities and standards for the façade zone, encroachment zone, sidewalk zone, and amenities zone, with variations that help shape the distinct character of each street.

STREET TYPES.

- 5.1 Main Streets (MNS)
- 5.2 Connector Streets (CNS)
- 5.3 Mobility Streets (MBS)
- 5.4 Gateway Streets (GWS)
- 5.5 Neighborhood Streets (NHS)

DESIGN STANDARDS

SECTION 6.0 FRONTAGE STANDARDS
SECTION 7.0 PUBLIC REALM STANDARDS
SECTION 8.0 GENERAL STANDARDS

Figure 34. A Range of Frontage Types along Historic 4th Avenue

6.0 Frontage Standards.

Frontage is defined as the area between a building and its lot line (or setback area), including façades, porches, stoops, shopfronts, and yards. In some cases, frontage may extend into the public right-of-way through elements such as awnings, seating, or landscaping. Frontage defines how buildings engage the street, supports walkability, and enhances the public realm. Frontage standards are allowed based on the street type or types adjacent to a lot, and a single building may incorporate more than one applicable frontage type. When frontage standards conflict with other requirements of this manual, the planning official will determine which applies. See general standards **(Section 8.0)** for other improvements related to frontage.

✓ ALLOWED ON THE STREET TYPE.

✗ NOT ALLOWED ON THE STREET TYPE.

Figure 35. Allowable Frontage Type by Street Type

Figure 36. Example of Alcove Frontage

6.1 Alcove Frontage.

Alcove frontage can be described as typical passive retail frontage with awnings or recessed spaces and doors with limited glass and less outdoor-focused spaces; often used for passive retail (such as personal services, medical offices, or other less-active uses). Must meet the following standards:

- Maximum coverage of fifty (50%) percent of primary building façade.
- Minimum width of eight (8') feet and maximum depth of six (6') feet.
- Entry point must be located within the covered alcove area.
- Columns supporting the alcove and other elements such as awnings must not be located within the public right-of-way.

Figure 39. Street Type Allowance

Figure 40. Example of Café Frontage

6.2 Café Frontage.

Café frontage can be described as typical active retail frontage with awnings, windows, entry points, and fixed walls or railings around exterior spaces for outdoor dining; often used for active retail uses (such as bars, dining, and other entertainment purposes). Must meet the following standards:

- Minimum of eighty (80%) percent facade transparency on all street types.
- Maximum depth of four (4') feet in the window zone and minimum depth of six (6') feet in the amenities zone.
- Must retain minimum of six (6') feet sidewalk zone through the café area; and limit any "pinch points" at four (4') feet in width for maximum of ten (10') feet distance.
- Medallions or markings on the ground may be used to delineate café area.
- Vertical barriers are allowed as required by the LCB for any business serving alcohol; and minimum café entry points in vertical barrier required every eight (8') feet.
- When included, a vertical barrier must be a maximum of forty-two (42") tall and minimum two (2") inch wide separating cafe from other spaces.

Figure 44. Example of Civic Frontage

6.3 Civic Frontage.

Civic frontage can be described as typical frontages for civic uses—such as libraries, city halls, schools, and places of worship—often include a single point of entry and adjacent exterior public spaces, but have limited requirements to let them reflect their civic importance, distinctive character, or public-serving functions. Must meet the following standards:

- Primary entry point must be clear, visible, and covered and accessed by accessible pedestrian walkways linking with the primary street.
- No surface parking is allowed in any of the frontage between the building facade and the primary street.
- Public spaces must be hardscaped, landscaped, and provide amenities (such as benches, trash cans, public art, etc.).

Figure 48. Example of Forecourt Frontage

6.4 Forecourt Frontage.

Forecourt frontage can be described as typical active retail frontage with awnings, windows, entry points, and fixed walls or railings around exterior spaces for outdoor dining; often used for active retail uses (such as bars, dining, and other entertainment purposes). Must meet the following standards:

- Maximum coverage of fifty (50%) and thirty (30') feet of primary building façade.
- Maximum depth of thirty (30') feet.
- Must be accessed by accessible pedestrian walkways.
- Walls or fences enclosing forecourts must be no less than forty-two (42") and no greater than seven (7') feet tall; and no less than two (2") inches thick.
- Gates must be at least thirty-six (36") inches wide.
- Must not be located within the public right-of-way.

Porch frontage can be described as typical single family (1 unit) or small, multifamily (2-4 unit) frontage which consists of a wide, large space with seating area, covering, small run of stairs, landscaping, and fencing to blend with a variety of housing types. Must meet the following standards:

- Minimum coverage of seventy-five (75%) of primary building façade.
- Minimum clear depth of six (6') feet and maximum clear depth of ten (10') feet on primary building façade.
- Minimum height of eight (8') feet above the finished first floor grade.
- Landscaping such as trees, shrubs, and other ground cover must be provided in front yard setbacks.
- May not be located within the public right-of-way.

6.6 Shop Frontage.

Shop frontage can be described as typical active retail frontage with awnings, windows, entry points, and storefront displays; often used for active retail uses (such as shopping or sales or dining with no fixed outdoor seating). Must meet the following standards:

- Minimum of eighty (80%) percent facade transparency on all street types.
- Minimum linear awning coverage of seventy-five (75%) percent of primary building façade, and must cover all windows and points of entry.
- Minimum four (4') foot awning covering depth and maximum six (6') foot awning covering depth (over the window zone).
- Minimum awning height of eight (8') feet above the adjacent sidewalk.
- Must include planters, public art, movable seating, or other amenities in the window zone where feasible.
- May be used to meet Weather Protection requirements for the street type.

Stoop frontage can be described as typical single family (1 unit) or small, multifamily (2-4 unit) frontage which consists of a small porch area with covering, small run of stairs, landscaping, and fencing to blend with a variety of housing types. Must meet the following standards:

- Maximum coverage of twenty-five (25%) of primary building façade.
- Minimum clear depth of four (4') feet and maximum clear depth of six (6') feet on primary building façade.
- Must not be elevated greater than six (6') feet above the adjacent sidewalk.
- Landscaping such as trees, shrubs, and other ground cover must be provided in front yard setbacks.
- Steps or stairs associated with a stoop that extend into the public right-of-way must not impeded ADA accessibility.

6.8 Walkup Frontage.

Walkup frontage can be described as typical urban residential frontage with covered entry point, glass, and some public realm improvements to reinforce the building wall, match more commercial context, and maintain an urban street context. Must meet the following standards:

- Minimum three (3') foot deep and five (5') foot wide covering (in the window zone) over all entry points.
- Finished ground floor must not be elevated greater than six (6") inches above the adjacent sidewalk.
- Must provide built-in planters and landscaping in setback area when not zero lot line to maintain the urban wall.
- Only rain coverings may extend over property line and into public right-of-way.

Figure 68. Example of Yard Frontage

6.9 Yard Frontage.

Yard frontage can be described as typical single family (1 unit) or small, multifamily (2-4 unit) frontage which is mostly limited to covered entryway with grassy area, landscaping, and fencing to blend with a variety of housing types. Must meet the following standards:

- Retaining walls or terracing required for yards elevated greater than three (3') feet above the grade of the adjacent sidewalk.
- Fencing required for adjacent side lots, minimum of four (4') feet tall.
- In lieu of fencing, a landscape buffer (that when full maturity) is no less than two (2') feet wide and no less than four (4') feet tall must be provided.
- Landscaping such as trees, shrubs, and other ground cover must be provided in front yard setbacks.
- May not be located within the public right-of-way.

7.0 Public Realm Standards.

To support implementation of the street network (**Section 5.0**) throughout Downtown Camas, each street type includes a set of standards for the zones of the public realm. These public realm standards establish expectations for the design, function, and character of spaces between the building façade and the curb lines, including sidewalks, planting areas, amenity zones, lighting, and furnishings. They provide the essential regulations for how these elements must enhance walkability, safety, comfort, and visual quality while supporting adjacent land uses.

PUBLIC REALM	SECTION
Main Street Public Realm Standards	7.1
Connector Street Public Realm Standards	7.2
Mobility Street Public Realm Standards	7.3
Gateway Street Public Realm Standards	7.4
Neighborhood Street Public Realm Standards	7.5

Figure 73. Chapter Index for Public Realm Standards

7.1 Main Streets (MNS) Public Realm

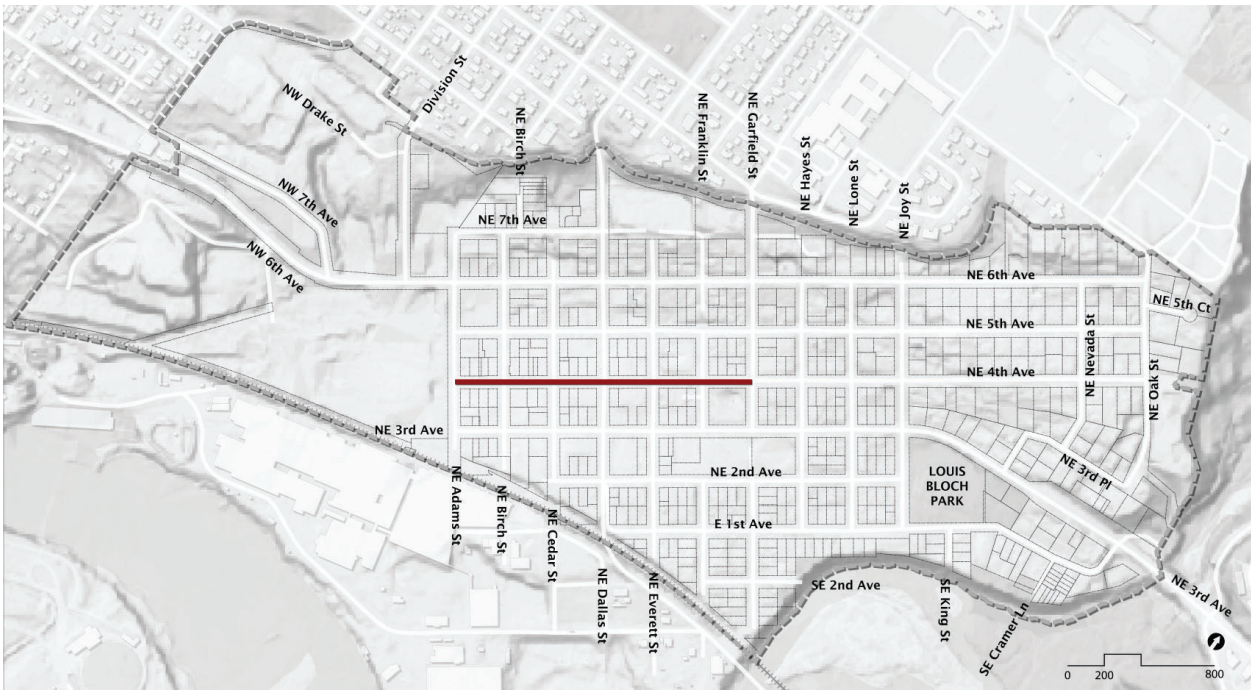

Figure 74. Map of Main Streets in Downtown Camas

The purpose of the public realm standards for the main street public realm is to reinforce 4th Avenue as the community's central activity area by establishing a cohesive, walkable streetscape. The standards regulate elements within the facade zone, encroachment zone, and amenities zone; while maintaining a clear sidewalk zone.

NAME	TYPICAL CHARACTERISTICS
Public Realm Space	*Ten (10') feet minimum (both sides), eighteen (18') feet maximum (one side) > Includes larger extended curb areas due to "chicane" street and parking configuration.*
Sidewalk Width	*Unobstructed clear width of six (6') feet is preferred; may be reduced to four (4') feet at "pinch points" for no more than ten (10') feet in distance.*

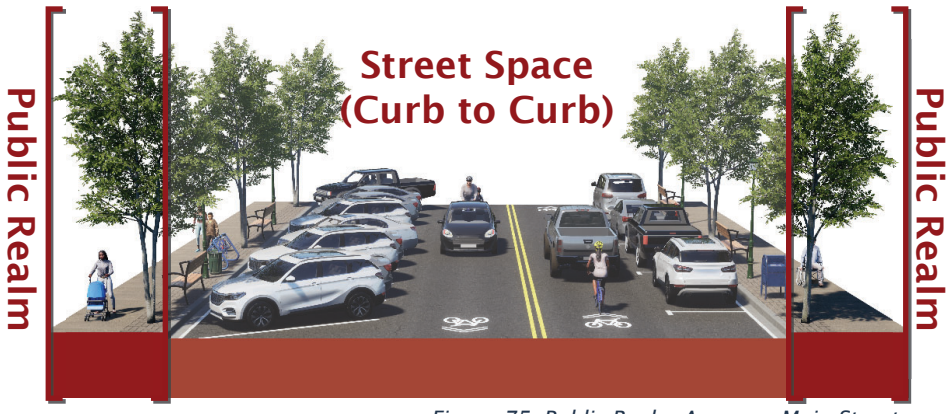

Figure 75. Public Realm Areas on Main Streets

7.1 Main Streets (MNS) Public Realm

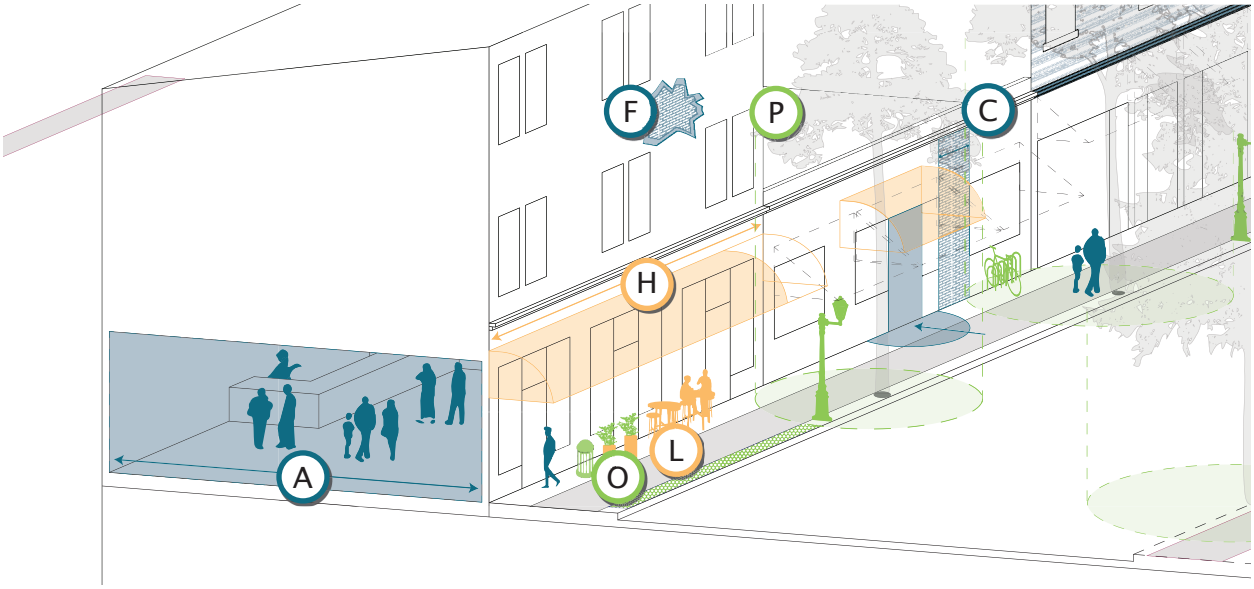

Figure 76. Typical Main Street Segment Diagram

7.1.1 Facade Zone.

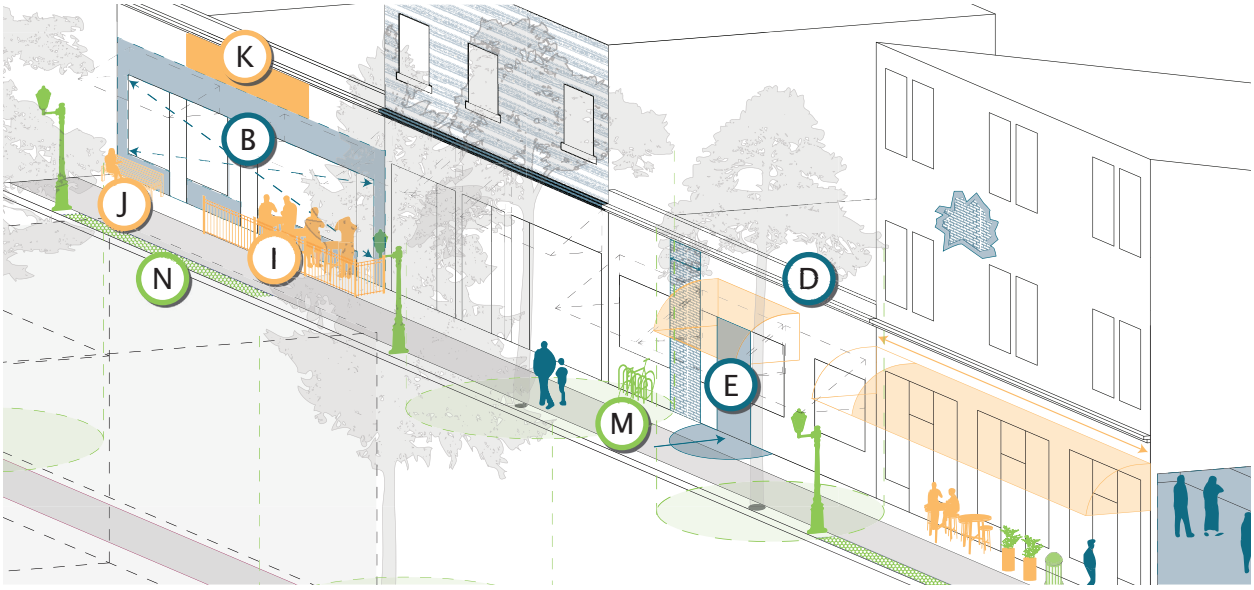
[A] Retailing Depth
- Minimum thirty (30') feet depth for ground-floor retail to support viable commercial activity.

[B] Ground Floor Transparency
- Minimum sixty (60%) percent transparency between two (2') feet and ten (10)' feet above sidewalk grade using clear, non-reflective glass.
- Transparency must be maintained on existing buildings when renovated, restored, or modified.

[C] Blank Wall Limitations
- No length of wall greater than ten (10') feet without architectural articulation including transparency, plane breaks, or entrances.

[D] Horizontal Banding
- The ground floor shall be emphasized through banding with material or color differentiation or projection of two (2") inches to six (6") inches at a height between twelve (12') feet and fourteen (14') feet above the sidewalk.

[E] Pedestrian Entrances
- Entrances must be clearly visible from the street and directly accessible from the sidewalk.
- Minimum fifty (50%) transparent for visual connection.
- Multi-tenant buildings must have entrances for each tenant.



[F] Materiality and Colors
- Materials and finishes shall be durable, low-maintenance, weather-resistant, and drawn from a muted, coordinated palette consistent with the established downtown character; highly reflective, unfinished, or overly bright colors are prohibited.

[G] Setback Buffering
- Not applicable and not identified on diagram.

7.1.2 Encroachment Zone.

[H] Weather Protection
- Eighty (80%) percent of linear front facades must have rain protection or awnings with minimum four (4') feet covering depth and must include all entrances, exits, and windows.

[I] Vertical Barriers
- Use transparent or semi-transparent materials for outdoor dining enclosures.
- Ensure dining walls do not obstruct pedestrian flow.
- Dining enclosure must not exceed forty-two (42") inches in height.
- Barriers shall be constructed of durable, weather-resistant materials, securely anchored or weighted for stability, capable of withstanding wind and pedestrian contact, and shall not include temporary, flimsy, or unfinished materials.

[J] Outdoor Seating
- Provide modular, movable, and durable seating in public spaces. Ensure seating areas are shaded and accessible.

[K] Building Signage
- Signs shall be pedestrian-scaled, architecturally integrated, legible, durable, and not internally illuminated.
- See **Chapter 18.15 Signs** for standards.

[L] Movable Elements
- Provide movable seating, planters, and furnishings to support active use and seasonal programming.

7.1.3 Amenities Zone.

[M] Multimodal Features
- Provide bike racks, scooter parking, and information kiosks adjacent to the intersection or mid-block crossing.
- See **Chapter 8.3 Hardscaping** for standards.

[N] Pervious Surfaces
- Use permeable pavers where possible to contribute to a minimum twenty (20%) percent permeability within each block.

[O] Planters
- Planter are required.
- See **Chapter 8.2 Landscaping** for standards.

[P] Street Tree Canopy
- Maintain a continuous canopy achieving thirty (30%) percent to sixty (60%) percent street tree canopy over the total sidewalk area at maturity to reinforce pedestrian comfort and street character.
- Tree grates are required.
- See **Chapter 8.2 Landscaping** for standards.

[Q] Hardscaping
- See **Chapter 8.3 Hardscaping** for standards.

[R] Lighting
- Building, window, and decorative overhead lighting required.
- See **Chapter 8.4 Lighting** for standards.
- Must incorporate a minimum of three (3) of the lighting types identified in **8.4.1 Lighting Types**.

[S] Screening
- See **Chapter 8.5 Screening** for standards.

[T] Public Art
- See **Chapter 8.6 Public Art** for standards.

This Page Left Intentionally Blank

7.2 Connector Streets (CNS) Public Realm

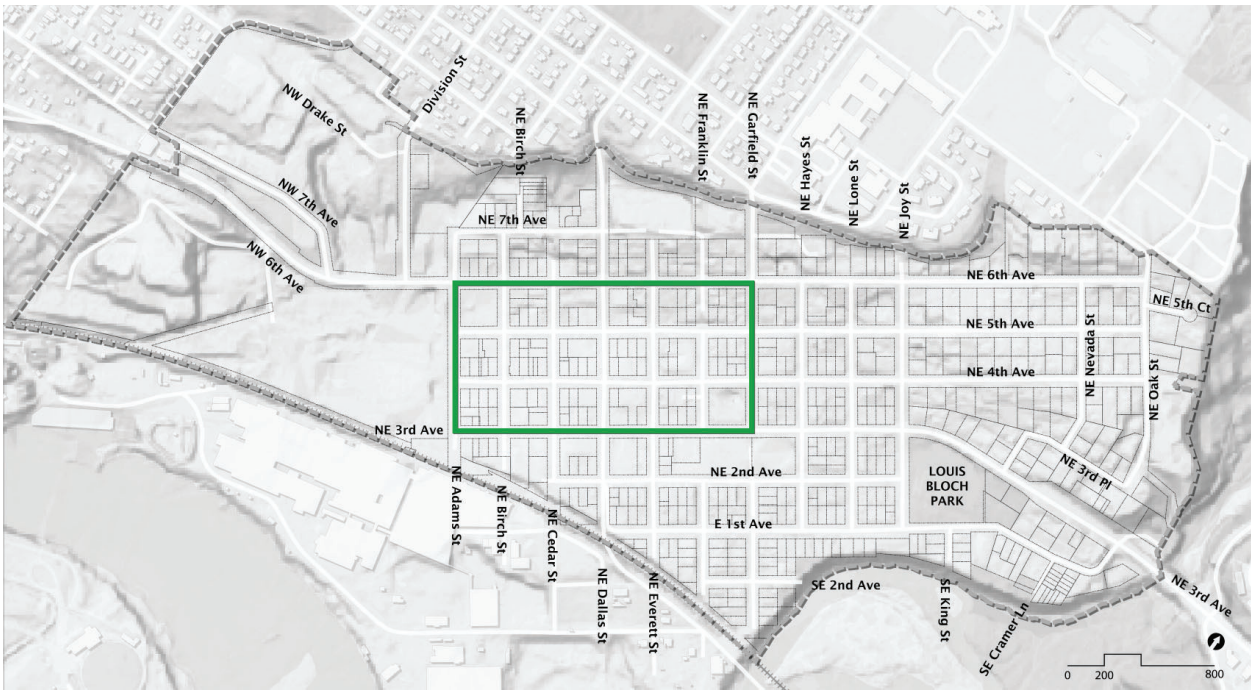


Figure 77. Map of Connector Streets in Downtown Camas

The purpose of the public realm standards for the connector street public realm is to reinforce the edges of the downtown core area and better link walkability to new downtown areas. The standards regulate elements within the facade zone, encroachment zone, and amenities zone; while maintaining a clear sidewalk zone.

NAME	TYPICAL CHARACTERISTICS
Public Realm Space	*Up to fourteen (14') feet maximum (both sides) > May include larger extended curb areas at intersections or mid-blocks.*
Sidewalk Width	*Unobstructed clear width of six (6') feet is preferred; may be reduced to four (4') at "pinch points" for no more than ten (10') feet in distance.*

Figure 78. Public Realm Areas on Connector Streets

7.2 Connector Streets (CNS) Public Realm

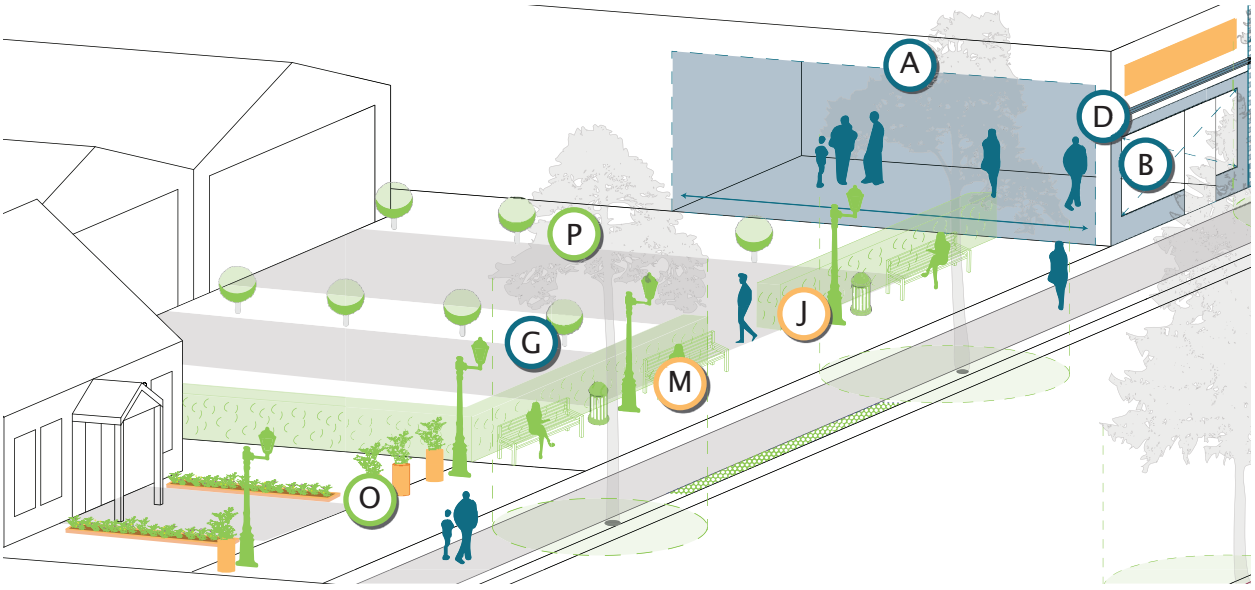

Figure 79. Typical Connector Street Segment Diagram

7.2.1 Facade Zone.

[A] Retailing Depth.

– Minimum twenty five (25') feet depth for ground-floor retail to support viable commercial activity, when applicable.

[B] Ground Floor Transparency.

– Minimum forty (40%) percent transparency between two (2') feet and ten (10') feet above sidewalk level using clear, non-reflective glass.

[C] Blank Wall Limitations.

– No length of wall greater than fifteen (15') feet without architectural articulation including transparency, plane breaks, or entrances.

[D] Horizontal Banding.

– The ground floor shall be emphasized through banding with material differentiation or projection of two (2") to six (6") inches at a height between twelve (12') feet and fourteen (14') feet above the sidewalk.

[E] Pedestrian Entrances.

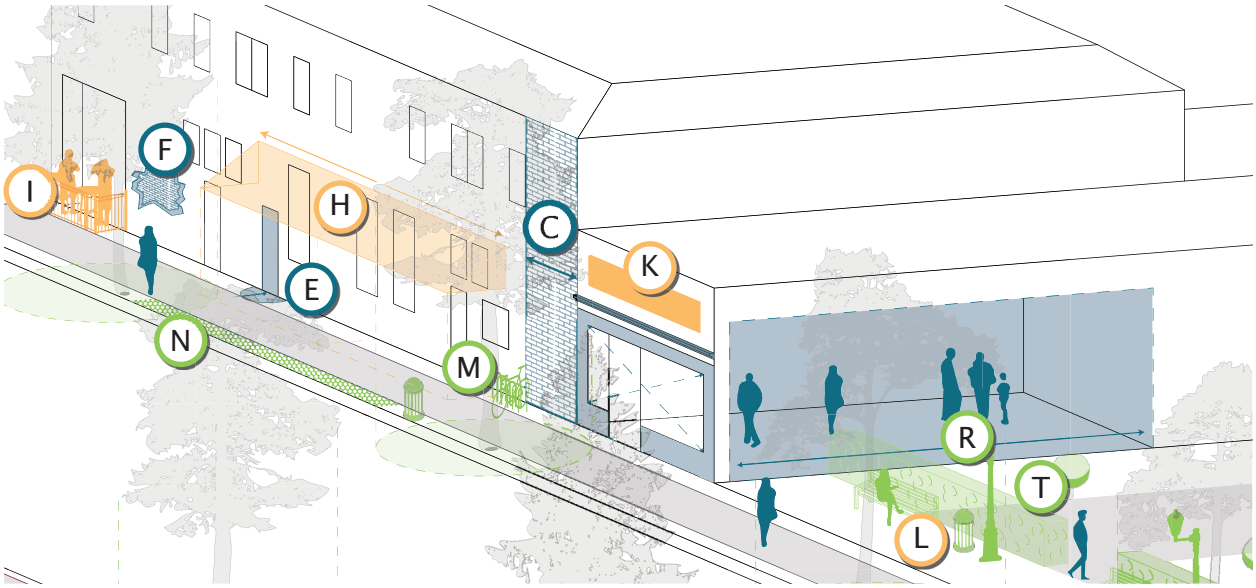
– Entrances must be clearly visible from the street and directly accessible from the sidewalk.
– Minimum fifty (50%) transparent for visual connection.
– Multi-tenant buildings must have entrances for each tenant.

[F] Materiality and Colors.

– Materials and finishes shall be durable, low-maintenance, weather-resistant, and drawn from a muted, coordinated palette consistent with the established downtown character; highly reflective, unfinished, or overly bright colors are prohibited.

[G] Setback Buffering.

– Use landscaped buffers with seating, lighting, walls, screening, planters and public art to create a sense of enclosure. Ensure that at least forty (40%) percent of the setback frontage area includes seating, lighting, and hardscaping.



7.2.2 Encroachment Zone.

[H] Weather Protection.

– Sixty (60%) percent of linear front facades must have rain protection or awnings with minimum four (4') feet covering depth and must include all entrances, exits, and windows.

[I] Vertical Barriers.

– Use transparent or semi-transparent materials for outdoor dining enclosures. Ensure dining walls do not obstruct pedestrian flow.
– Dining enclosure must not exceed forty-two (42") inches in height.

– Barriers shall be constructed of durable, weather-resistant materials, securely anchored or weighted for stability, capable of withstanding wind and pedestrian contact, and shall not include temporary, flimsy, or unfinished materials.

[J] Outdoor Seating.

– Provide modular, movable, and durable seating in public spaces. Ensure seating areas are shaded and accessible.

[K] Building Signage.

– Signs shall be pedestrian-scaled, architecturally integrated, legible, durable, and not internally illuminated.
– See **Chapter 18.15 Signs** for standards.

[L] Movable Elements

– Provide movable seating, planters, and furnishings to support active use and seasonal programming.

7.2.3 Amenities Zone.

[M] Multimodal Features.

– Provide bike racks, scooter parking, and information kiosks at regular intervals.
– See **Chapter 8.3 Hardscaping** for standards.

[N] Pervious Surfaces.

– Use permeable pavers where possible to contribute to a minimum twenty-five (25%) percent permeability within each block.

[O] Planters.

– Planter are recommended.
– See **Chapter 8.2 Landscaping** for standards.

[P] Street Tree Canopy.

– Maintain a continuous canopy achieving thirty (30%) percent to sixty (60%) percent street tree canopy over the total sidewalk area at maturity to reinforce pedestrian comfort and street character.
– Tree grates are required.
– See **Chapter 8.2 Landscaping** for standards.

[Q] Hardscaping.

– See Chapter 8.3 Hardscaping for standards.

[R] Lighting.

– Building and window lighting required
– See **Chapter 8.4 Lighting** for standards.
– Must incorporate a minimum of three (3) of the lighting types identified in **8.4.1 Lighting Types**.

[S] Screening.

– See **Chapter 8.5 Screening** for standards.

[T] Public Art.

– See **Chapter 8.6 Public Art** for standards.

7.3 Mobility Streets (MBS) Public Realm

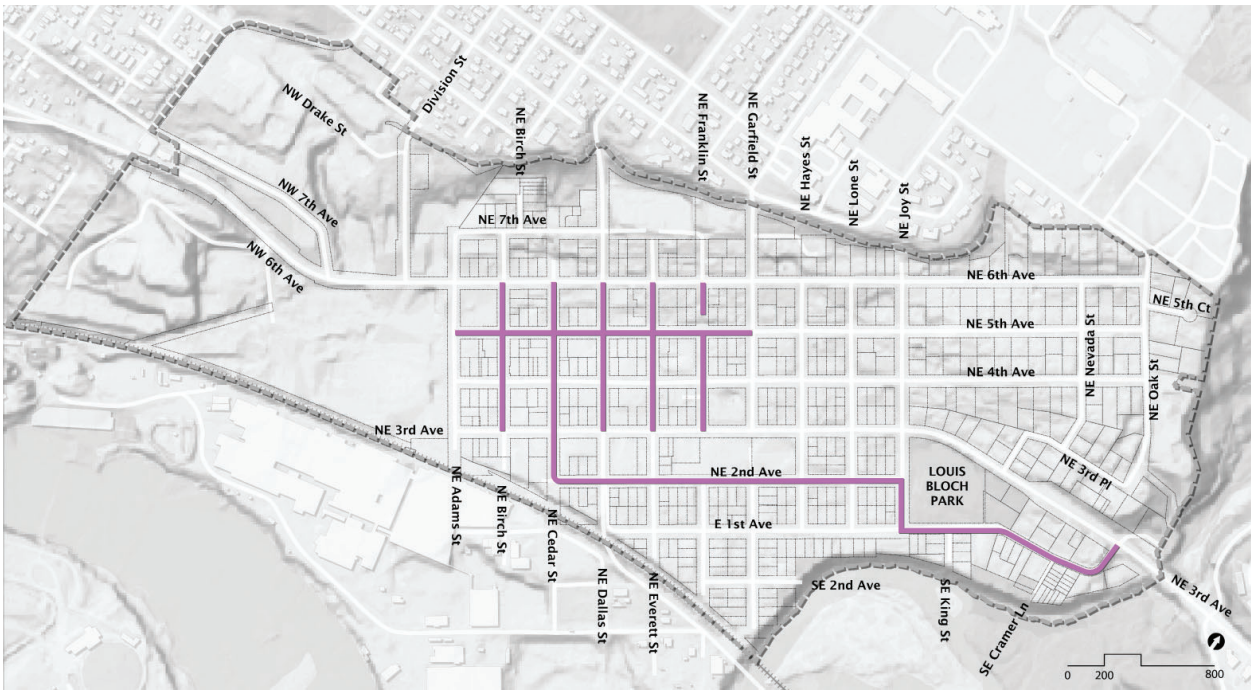

Figure 80. Map of Mobility Streets in Downtown Camas

The purpose of the public realm standards for the mobility street public realm is to balance efficient movement through downtown with a safe and comfortable multi-modal environment. The standards regulate elements within the facade zone, encroachment zone, and amenities zone; while maintaining a clear sidewalk zone.

NAME	TYPICAL CHARACTERISTICS
Public Realm Space	*Eleven (11') feet minimum to fourteen (14') feet maximum (both sides) > May include larger extended curb areas at intersections or mid-blocks.*
Sidewalk Width	*Unobstructed clear width of six (6') feet is preferred; may be reduced to four (4') at "pinch points" for no more than ten (10') feet in distance.*

Figure 81. Public Realm Areas on Mobility Streets

7.3 Mobility Streets (MBS) Public Realm

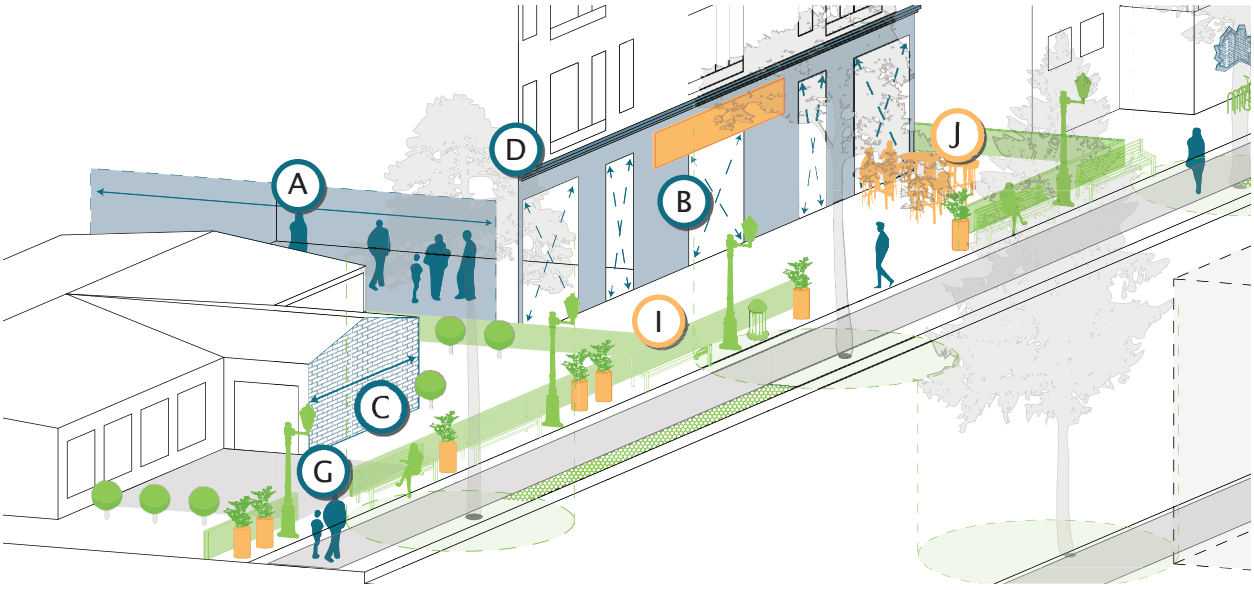

Figure 82. Typical Mobility Street Segment Diagram

7.3.1 Facade Zone.

[A] Retailing Depth.

– Minimum twenty (20') feet depth for ground-floor retail to support viable commercial activity, when applicable.

[B] Ground Floor Transparency.

– Minimum forty (40%) percent transparency between two (2') feet and ten (10') feet above sidewalk level using clear, non-reflective glass.

[C] Blank Wall Limitations.

– No length of wall greater than fifteen (15') feet without architectural articulation including transparency, plane breaks, or entrances.

[D] Horizontal Banding.

– The ground floor shall be emphasized through banding with material differentiation or projection of two (2") to six (6") inches at a height between twelve (12') feet and fourteen (14') feet above the sidewalk.

[E] Pedestrian Entrances.

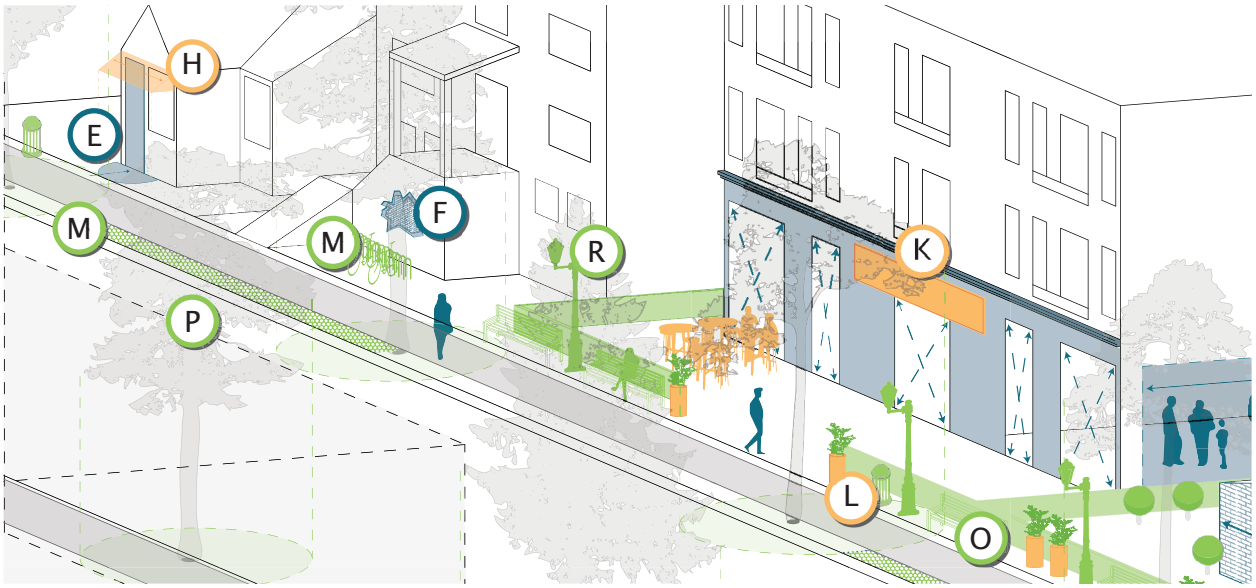
– Entrances must be clearly visible from the street and directly accessible from the sidewalk.
– Minimum fifty (50%) transparent for visual connection.
– Multi-tenant buildings must have entrances for each tenant.

[F] Materiality and Colors.

– Materials and finishes shall be durable, low-maintenance, weather-resistant, and drawn from a muted, coordinated palette consistent with the established downtown character; highly reflective, unfinished, or overly bright colors are prohibited.

[G] Setback Buffering.

– Use landscaped buffers with seating, lighting, walls, screening, planters and public art to create a sense of enclosure. Ensure that at least sixty (60%) percent of the setback frontage area includes seating, lighting, and hardscaping.



7.3.2 Encroachment Zone.

[H] Weather Protection.

– Sixty (60%) percent of linear front facades must have rain protection or awnings with minimum four (4') feet covering depth and must include all entrances, exits, and windows.

[I] Vertical Barriers.

– Use transparent or semi-transparent materials for outdoor dining enclosures. Ensure dining walls do not obstruct pedestrian flow.
– Dining enclosure must not exceed forty-two (42") inches in height.

– Barriers shall be constructed of durable, weather-resistant materials, securely anchored or weighted for stability, capable of withstanding wind and pedestrian contact, and shall not include temporary, flimsy, or unfinished materials.

[J] Outdoor Seating.
– Provide modular, movable, and durable seating in public spaces. Ensure seating areas are shaded and accessible.

[K] Building Signage.
– Signs shall be pedestrian-scaled, architecturally integrated, legible, durable, and not internally illuminated.
– See **Chapter 18.15 Signs** for standards.

[L] Movable Elements.
– Provide movable seating, planters, and furnishings to support active use and seasonal programming.

7.3.3 Amenities Zone.

[M] Multimodal Features.
– Provide bike racks, scooter parking, and information kiosks at regular intervals.
– See **Chapter 8.3 Hardscaping** for additional standards.

[N] Pervious Surfaces.
– Use permeable pavers where possible to contribute to a minimum twenty (20%) percent permeability within each block.

[O] Planters.
– Planter are recommended.
– See **Chapter 8.2 Landscaping** for standards.

[P] Street Tree Canopy.
– Maintain a continuous canopy achieving thirty (30%) percent to sixty (60%) percent street tree canopy over the total sidewalk area at maturity to reinforce pedestrian comfort and street character.
– Tree grates are required.
– See **Chapter 8.2 Landscaping** for standards.

[Q] Hardscaping.
– See **Chapter 8.3 Hardscaping** for standards.

[R] Lighting.
– Building and window lighting required
– See **Chapter 8.4 Lighting** for standards.
– Must incorporate a minimum of three (3) of the lighting types identified in **8.4.1 Lighting Types**. Not required on 1st Avenue and 2nd Avenue.

[S] Screening .
– See **Chapter 8.5 Screening** for standards.

[T] Public Art.
– See **Chapter 8.6 Public Art** for standards.

This Page Left Intentionally Blank

7.4 Gateway Streets (GWS) Public Realm

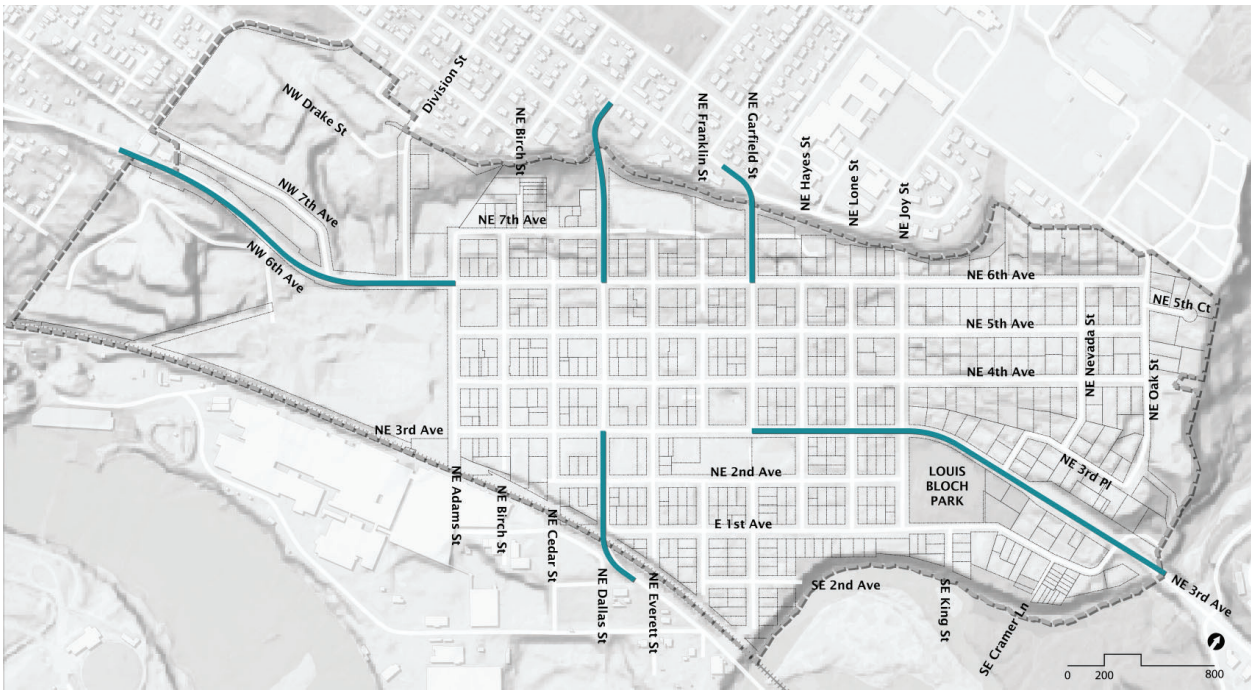


Figure 83. Map of Gateway Streets in Downtown Camas

The purpose of the public realm standards for the gateway street public realm is to establish a welcoming streetscape that signals entry into the downtown core while maintaining a safe, legible pedestrian environment. The standards regulate elements within the facade zone, encroachment zone, and amenities zone; while maintaining a clear sidewalk zone.

NAME	TYPICAL CHARACTERISTICS
Public Realm Space	*Up to eleven (11') feet maximum (both sides) > May include larger extended curb areas at intersections.*
Sidewalk Width	*Unobstructed clear width of six (6') feet is preferred; may be reduced to four (4') at "pinch points" for no more than ten (10') feet in distance.*

Figure 84. Public Realm Areas on Gateway Streets

7.4 Gateway Streets (GWS) Public Realm

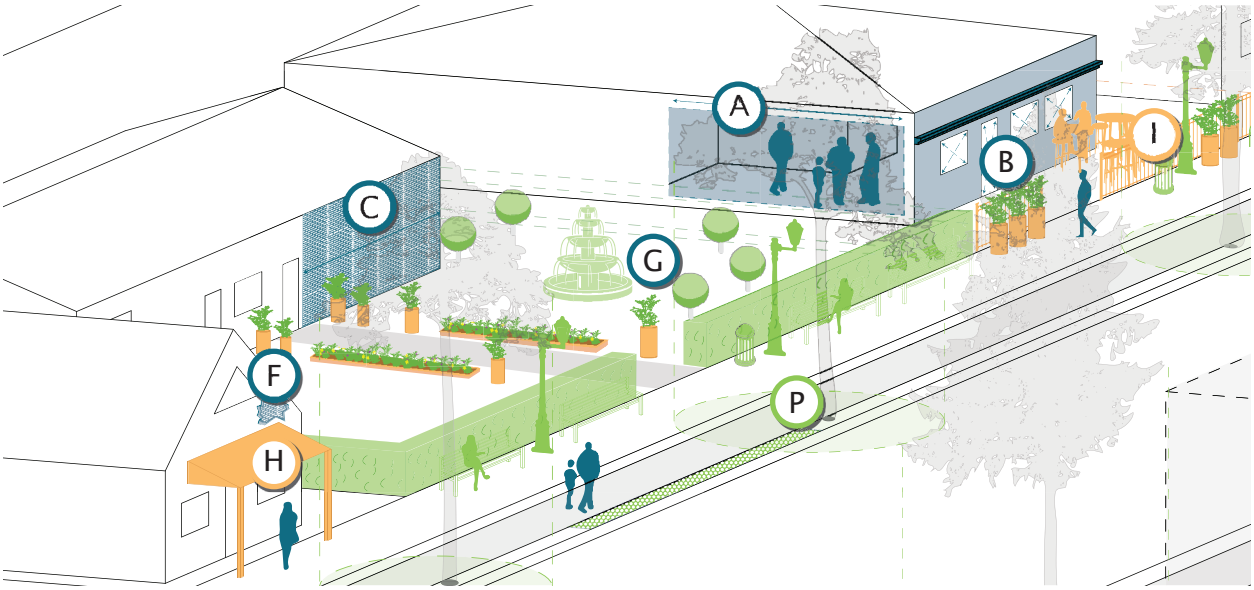

Figure 85. Typical Gateway Street Segment Diagram

7.4.1 Facade Zone.

[A] Retailing Depth.

– Minimum twenty (20') feet depth for ground-floor retail to support viable commercial activity, when applicable.

[B] Ground Floor Transparency.

– Minimum twenty (20%) percent transparency between two (2') feet and ten (10') feet above sidewalk level using clear, non-reflective glass.

[C] Blank Wall Limitations.

– No length of wall greater than twenty-five (25') feet without architectural articulation including transparency, plane breaks, or entrances.

[D] Horizontal Banding.

– Not applicable and not identified on diagram.

[E] Pedestrian Entrances.

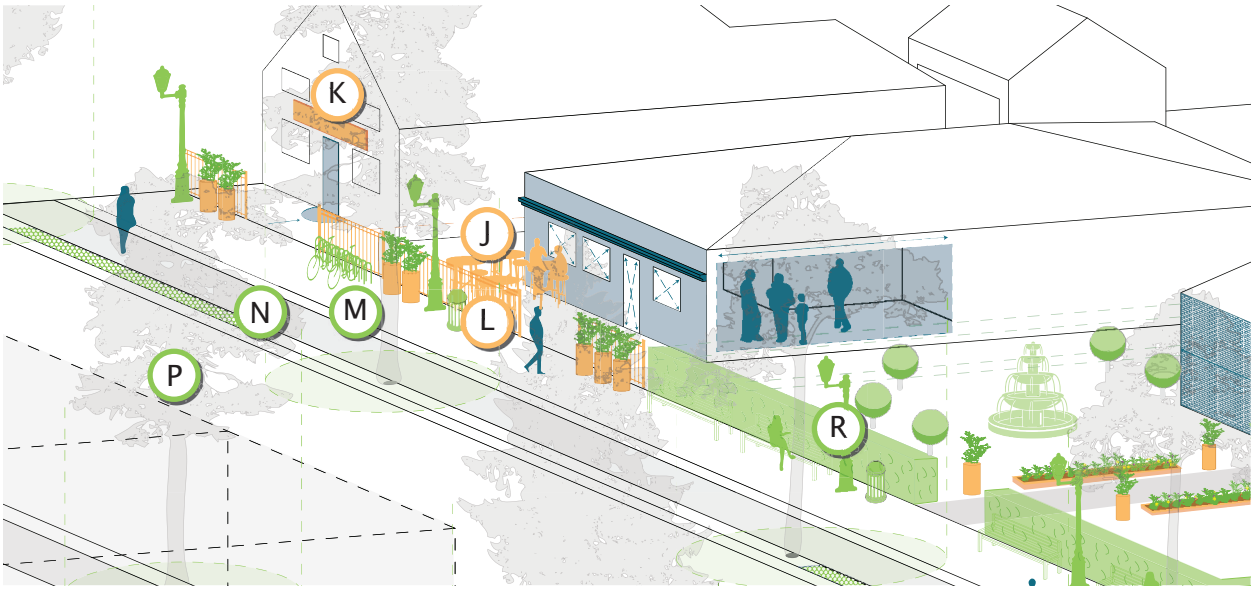
– Not applicable and not identified on diagram.

[F] Materiality and Colors.

– Use materials and colors that are durable, low-maintenance, and environmentally friendly that complement the existing downtown character at present and over time as they age.
– Avoid reflective or unfinished materials and overly bright colors.

[G] Setback Buffering.

– Use landscaped buffers with seating, lighting, walls, screening, planters and public art to create a sense of enclosure. Ensure that at least thirty (30%) percent of the setback frontage area includes seating, lighting, and hardscaping.



7.4.2 Encroachment Zone.

[H] Weather Protection.

– Provide continuous rain protection or awnings at all building entrances and exits, with covering depth extending no less than four (4') feet.

[I] Vertical Barriers.

– Use transparent or semi-transparent materials for outdoor dining enclosures. Ensure dining walls do not obstruct pedestrian flow.
– Dining enclosure must not exceed forty-two (42") inches in height.

– Barriers shall be constructed of durable, weather-resistant materials, securely anchored or weighted for stability, capable of withstanding wind and pedestrian contact, and shall not include temporary, flimsy, or unfinished materials.

[J] Outdoor Seating.
– Provide shaded seating at key locations.

[K] Building Signage.
– Signs shall be pedestrian-scaled, architecturally integrated, legible, and durable.
– See **Chapter 18.15 Signs** for standards.

[L] Movable Elements.
– Allow movable elements that enhance the entry experience and do not obstruct visibility.

7.4.3 Amenities Zone.

[M] Multimodal Features.
– Include bike parking and transit shelters near intersections.
– See **Chapter 8.3 Hardscaping** for standards.

[N] Pervious Surfaces.
– Use permeable pavers where possible to contribute to a minimum thirty five (35%) percent permeability within each block.

[O] Planters.
– Not applicable and not identified on diagram.

[P] Street Tree Canopy.
– Maintain a continuous canopy achieving thirty (30%) percent to fifty (50%) percent street tree canopy over the total sidewalk area at maturity to reinforce pedestrian comfort and street character.
– See **Chapter 8.2 Landscaping** for standards.

[Q] Hardscaping.
– See **Chapter 8.3 Hardscaping** for standards.

[R] Lighting.
– Building and window lighting is recommended.
– See **Chapter 8.4 Lighting** for standards.

[S] Screening .
– See **Chapter 8.5 Screening** for standards.

[T] Public Art.
– See **Chapter 8.6 Public Art** for standards.

This Page Left Intentionally Blank

7.5 Neighborhood Streets (NHS) Public Realm

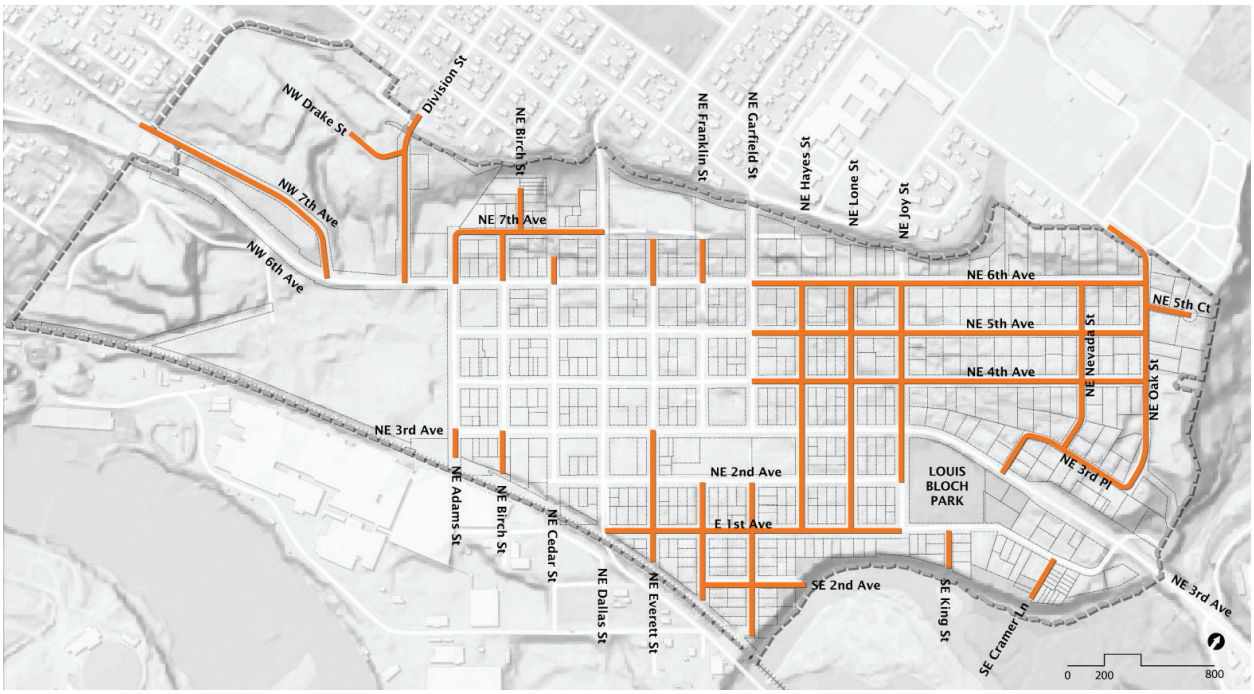


Figure 86. Map of Neighborhood Streets in Downtown Camas

The purpose of the public realm standards for the neighborhood street public realm is to support a calm, comfortable streetscape that prioritizes residential character and local activity. The standards regulate elements within the facade zone, encroachment zone, and amenities zone; while maintaining a clear sidewalk zone.

NAME	TYPICAL CHARACTERISTICS
Public Realm Space	*Eleven (11') feet minimum to fourteen (14') feet maximum (both sides) > May include larger extended curb areas at intersections or mid-blocks.*
Sidewalk Width	*Unobstructed clear width of six (6') feet is preferred; may be reduced to four (4') at "pinch points" for no more than ten (10') feet in distance.*

Figure 87. Public Realm Areas on Neighborhood Streets

7.5 Neighborhood Streets (NHS) Public Realm

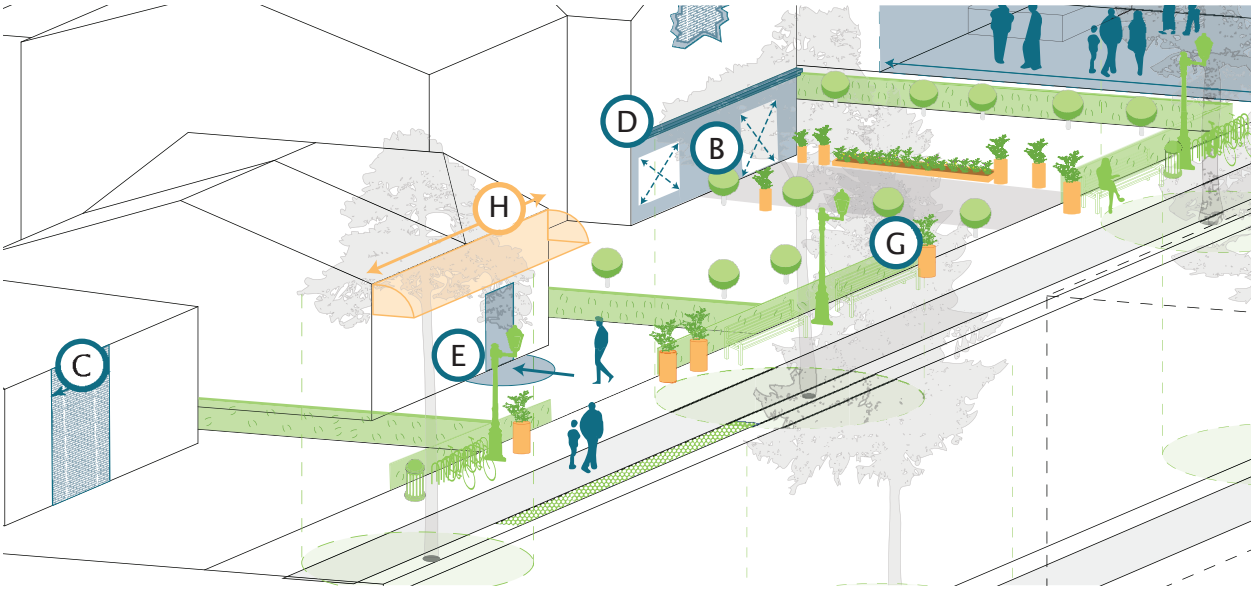

Figure 88. Typical Neighborhood Street Segment Diagram

7.5.1 Facade Zone.

[A] Retailing Depth.

– Retail depth not required unless part of mixed-use development. If part of a mixed use development, provide a minimum of twenty (20') feet.

[B] Ground Floor Transparency.

– Minimum ten (10%) percent transparency between two (2') feet and ten (10') feet above sidewalk level using clear, non-reflective glass.

[C] Blank Wall Limitations.

– No length of wall greater than thirty (30') feet without architectural articulation including transparency, plane breaks, or entrances.

[D] Horizontal Banding.

– Not applicable and not identified on diagram.

[E] Pedestrian Entrances.

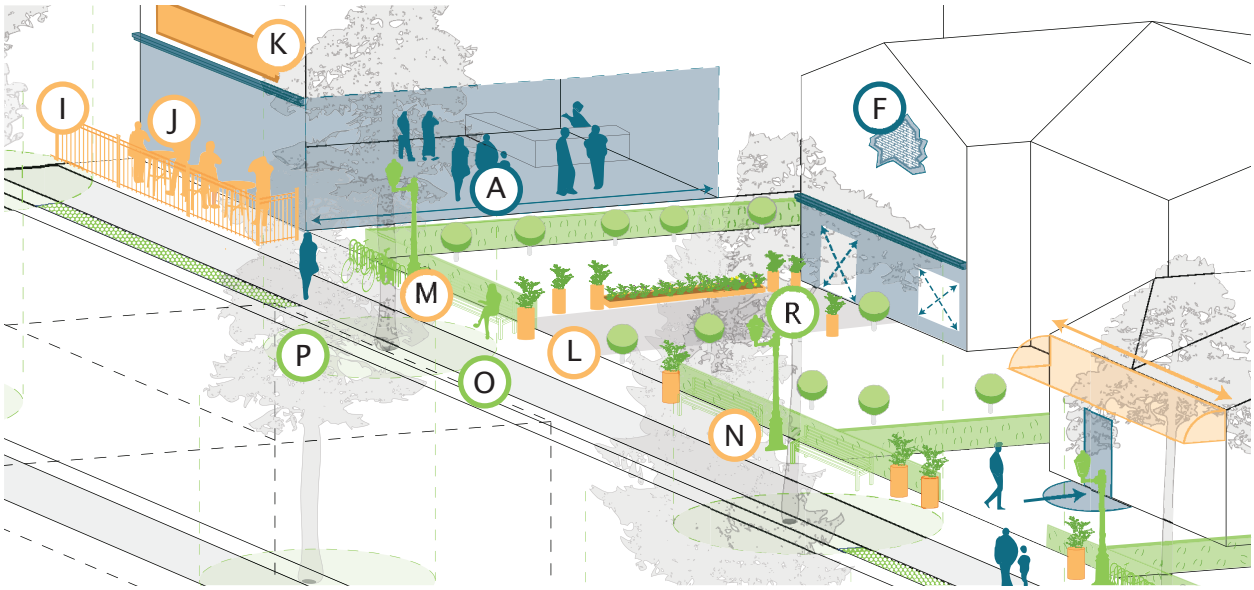
– Not applicable and not identified on diagram.

[F] Materiality and Colors.

– Use materials and colors that are durable, low-maintenance, and environmentally friendly that complement the existing downtown character at present and over time as they age.
– Avoid reflective or unfinished materials and overly bright colors.

[G] Setback Buffering.

– Use landscaped buffers with seating, lighting, walls, screening, planters and public art to create a sense of enclosure. Ensure that at least forty (40%) percent of the setback frontage area includes seating, lighting, and hardscaping.



7.5.2 Encroachment Zone.

[H] Weather Protection.

– Provide continuous rain protection or awnings at all building entrances and exits, with covering depth extending no less than four (4') feet.

[I] Vertical Barriers.

– Not applicable and not identified on diagram.

[J] Outdoor Seating.
- Provide shaded seating at key locations.

[K] Building Signage.
- Signs shall be pedestrian-scaled, architecturally integrated, legible, and durable.
- See **Chapter 18.15 Signs** for standards.

[L] Movable Elements.
- Allow movable elements that enhance the entry experience and do not obstruct visibility.

7.5.3 Amenities Zone.

[M] Multimodal Features.
- Not applicable and not identified on diagram.

[N] Pervious Surfaces.
- Use permeable pavers where possible to contribute to a minimum thirty (30%) percent permeability within each block.

[O] Planters.
- Not applicable and not identified on diagram.

[P] Street Tree Canopy.
- Maintain a continuous canopy achieving thirty (30%) percent to fifty (50%) percent street tree canopy over the total sidewalk area at maturity to reinforce pedestrian comfort and street character.
- See **Chapter 8.2 Landscaping** for standards.

[Q] Hardscaping.
- See **Chapter 8.3 Hardscaping** for standards.

[R] Lighting.
- Building and window lighting is recommended.
- See **Chapter 8.4 Lighting** for standards.

[S] Screening.
- See **Chapter 8.5 Screening** for standards.

[T] Public Art.
- See **Chapter 8.6 Public Art** for standards.

Figure 89. Image of Downtown Camas Streetscape

8.0 General Standards.

Unless otherwise noted in this section, the general standards provide a range of standards for any street or frontage within the downtown area, including landscaping, hardscaping, lighting, screening, and public art. In the event of a conflict between the Public Realm Standards **(Section 7.0)** and these General Standards, the Public Realm Standards for the specified Street Type or Street Types shall supersede.

8.1 General Principles.

The general standards are intended to aspire to the following principles for elements within the public realm in Downtown Camas:

- **Implement Adopted Plans.** Advance the goals and policies of the City of Camas Comprehensive Plan and Capital Facilities Plan.
- **Strengthen Downtown Vitality.** Enhance livability, environmental quality, and economic vitality through a diverse and complementary mix of downtown uses.
- **Use Public Resources Efficiently.** Promote the efficient and coordinated use of public facilities, infrastructure, and services.
- **Create a Complete and Safe Downtown Environment.** Foster a safe, attractive, and convenient setting that supports living, working, shopping, and recreation, with active ground-floor uses and residential or office uses above.
- **Support Economic Development.** Encourage economic growth by creating an inviting downtown environment that attracts a broad and diverse consumer base.
- **Attract and Retain Businesses.** Establish a stable and economically viable downtown that supports existing businesses and attracts new investment.
- **Promote Sustainable Development.** Encourage development practices that support long-term environmental, social, and economic sustainability.

Figure 90. Character Image of Landscaping

Figure 91. Landscape Located within Curb Extension Area

8.2 Landscaping.

Vegetation and green infrastructure are essential components of a healthy, attractive urban environment. They manage stormwater, reduce urban heat island effect, and improve air quality while enhancing the pedestrian experience. Thoughtfully integrated, they soften the built form, support biodiversity, and create a more comfortable, visually engaging streetscape. The following applies to all street types:

8.2.1 LANDSCAPING STANDARDS

1. **Location:** Landscaping and trees shall be selected and located to dampen sound, filter air contaminants, curtail erosion, minimize stormwater run-off, contribute to living privacy, reduce the visual impacts of large buildings and paved areas, screen, and emphasize or separate outdoor spaces of different uses or character.
2. **Variety:** Must include a combination and multiple layers of canopy trees, under-story trees, shrubs, and ground cover to achieve the goal of this section.
3. **Parking Areas:** Must be landscaped in accordance with this section.

Figure 92. Typical Street Tree and Tree Well

Figure 93. Example of Landscape Planters

4. **Setback Buffering Area:** Landscape must be utilized in setback buffering areas per this section.
5. **Tree Density:** Minimum forty (40) tree units per acre of land.
6. **Tree Caliper:** Minimum of two (2") inch caliper, fully branched, and staked at the time of planting.
7. **Tree Undercanopy:** Must be maintained to a minimum of eight (8') feet clearance above any sidewalk and ten (10') feet above any street.
8. **Tree Spacing:** Install deciduous trees at intervals of thirty (30') feet along sidewalks.
9. **Tree Placement:** Minimum of thirty (30") inches from the center of the caliper to the back of any curb or not within twenty-five (25') feet of a light pole.
10. **Tree Wells and Grates:** Provide a minimum planting area of four (4') by four (4') feet for tree grates, or four (4') by six (6') feet for open planters. Tree grates must be ADA accessible and have removable expansion rings to accommodate tree growth.
11. **Soil Volume:** Ensure each tree has access to at least two (2 CF) cubic feet of soil for every one (1') foot of crown at maturity. Ideally loose soil which will allow for root penetration.
12. **Planter Dimensions:** Raised planters must be at least four (4') feet wide; at-grade planting strips must be no less than five (5') feet wide. Must include root barriers and cannot impede ADA accessibility.
13. **Stormwater Features:** Incorporate bioswales or rain gardens with a minimum width of four (4') feet and ponding depth of six (6") to twelve (12") inches where possible.
14. **Pervious Surface.** Must meet the pervious surface requirements for the associated street type.
15. **Plant Selection:** Use sixty (60%) percent native or northwest climate-adapted species such as ornamental grasses, flowering perennials, small shrubs, or drought-tolerant vegetation; and fifty (50%) percent evergreen species. All plant materials shall be suitable for the climatic conditions.

Figure 94. Example of Hanging Baskets

Figure 95. Example of Raingardens

16. **Height:** Landscape materials must not exceed thirty (30") inches in height on corners or impede sight lines for vehicles and cyclists.
17. **Hanging Baskets:** The bottom of any hanging basket must be at least eighty (80") inches above the grade of the sidewalk; except when an effective barrier - such as a planter box, potted plant, or other physical barrier is located in the ground in such a way to effectively mitigate any hazard created by the hanging item.
18. **Maintenance:** Require irrigation for the first three (3) years and establish a quarterly maintenance schedule for pruning and weeding.
19. **Damage:** The property owner shall be responsible for any future damage to a street, curb, or sidewalk caused by landscaping.
20. **Raingardens:** Raingardens are allowed as long as ADA accessibility is preserved.
21. **Irrigation:** All landscape planting shall be irrigated with an automatic, underground irrigation system design with water conservation in mind. Utilization of techniques such as separate water zones based on soil type, sun exposure, and plant water requirements are encouraged. Hanging baskets and individual planter pots may be hand watered. All irrigation materials located within the public right-of-way shall utilize the materials and construction techniques as required by the City.
22. **Existing Tree Retention:** Retain existing trees that are not already protected as "significant trees" under the Camas Municipal Code. In the event retention is not possible, require the project to provide two (2) new trees in replacement of one (1) existing tree.

Figure 96. Example of Specialty Brick Pavers at Mid-Block Crossing

Figure 97. Example of a Curb Extension with Paving, Landsdcaping, and other Amenities

8.3 Hardscaping.

Hardscape elements establish the physical framework of the public realm and must be designed for long-term durability, universal accessibility, and visual cohesion. Materials and site furnishings must support pedestrian comfort, encourage gathering, and reflect local character while accommodating a broad range of activities, from informal seating and daily use to larger, organized events. The following applies to all street types:

8.3.1 HARDSCAPING STANDARDS

1. **Elements:** Hardscape elements such as natural stone, water features, drinking fountains, decorative sidewalks, enhanced paving, and other site furnishings are strongly encouraged.
2. **Sidewalk Width:** Provide a minimum width of six (6') feet in commercial areas and ten (10') feet where possible in high-traffic zones and right-of-way is available.
3. **Paving Materials:** Use scored concrete or other materials with a compressive strength of at least four thousand (4,000 psi) pounds per square inch.
4. **Curb Extensions:** Design curb extensions to be at least six (6') feet deep and eighteen (18') feet wide, with ADA-compliant ramps. Typical curb extension must be eight (8') feet wide and coordinated with on-street, parallel parking.

Figure 98. Example of Existing Bench along 4th Avenue in Downtown Camas

Figure 99. Example of Existing Water Feature in Downtown Camas

5. **Furnishings:** Allocate a two (2') foot to four (4') foot wide zone between the curb and pedestrian path for benches, drinking fountains, trash receptacles, and bike racks. Placement of any furnishings must not impede or constrict pedestrian movement or ADA accessibility.
6. **Drinking Fountains:** All drinking fountains shall be ADA accessible.
7. **Benches:** Install one six (6') foot bench with armrests and backrests every two hundred and seventy (270') linear feet on average, unless already provided by others.
8. **Bike Racks:** Provide one (1) bike rack per ten (10) vehicle parking spaces associated with the primary use or every two hundred (200') linear feet of frontage, unless already provided by others. Shall be placed within the public sidewalk, pocket plazas, and parks to encourage multimodal access. Uses that generate a high potential for bike parking such as arcades or movie theaters are strongly encouraged to locate a bike rack within their frontage. Preferred near public entrances or shared entrances to buildings. Must also be accessible from the street to discourage biking on the sidewalk.
9. **Trash Receptacles:** Shall be placed with the public sidewalk, pocket plazas, and parks to encourage public sanitation and a litter free environment. Uses that generate a high potential for immediately disposable trash such as takeout restaurants are strongly encouraged to locate a receptacle within their frontage.
10. **Water Features:** May be provided in lieu of some of these requirements based on review by the planning official.
11. **Subsurface Access Points:** Any improved hardscapes must not interfere with existing subsurface access point for businesses.

Figure 100. Example of Downtown Ripon which incorporates numerous types of lighting to make visitors feel welcome. [Photo credit: Craig Tebon]

Figure 101. Example of wrapped trees that clearly define the edges of the Broadway district in Green Bay, WI.

8.4 Lighting.

Lighting is a critical element of the streetscape, enhancing safety, extending activity into evening hours, and reinforcing the area's character. It must provide clear, comfortable illumination for pedestrians, cyclists, and drivers, minimize glare and light pollution, and thoughtfully highlight architectural features and public spaces without dominating the environment.

Because a significant share of consumer activity occurs during evening hours, particularly in winter months with limited daylight, adequate downtown lighting is essential to economic vitality and public safety. Lighting shall support safe and comfortable pedestrian movement, encourage exploration throughout the district, and reinforce active ground-floor uses. Light emitted from storefronts and building frontages must contribute to a welcoming streetscape and signal downtown activity after dark.

Evaluation of existing nighttime conditions shall consider the coordinated use of multiple "layers of light" that support wayfinding, visibility, and a positive pedestrian experience, including the following:

- District Edge and Ridgeline Lighting,
- Facade and Architectural Feature Lighting,
- Signage and Business Lighting,
- Pathway and Pedestrian Lighting,
- Entryway and Building Entrance Lighting,and
- Window Display and Interior Visibility Lighting.

When coordinated, these lighting layers contribute to a safe, comfortable, and engaging nighttime environment. Improvements may be implemented incrementally and are not required to occur simultaneously. Priority must be given to lighting interventions that provide the greatest public benefit, including integration with planned capital projects or the use of incentive programs to encourage enhanced façade, window, and signage lighting by private property owners.

Figure 102. Example of ridgeline and building edge lighting from Country Club Plaza, Kansas City, MO

Figure 103. Example of architectural lighting that draws attention to unique architecture, in this case the simple columns of the building, making it stand out even at night. Apartment building, Duluth, MN. [Photo credit: Seanette Corkill]

8.4.1 LIGHTING TYPES

District Edge and Ridgeline Lighting

District edge and skyline lighting elements may be used to visually define the boundaries and perceived extent of the business district during evening hours. Similar to daytime gateway features, lighting that is introduced at district edges and continues within the district can signal arrival, reinforce identity, and communicate district scale when visibility is limited.

This lighting may include continuous or regularly spaced lighting along building rooflines where such features exist. In areas without consistent rooflines, or where gaps between buildings occur, comparable visual continuity may be achieved through illumination of tree trunks or canopies, or by integrating lighting on streetlights or other vertical streetscape elements, provided such lighting is coordinated and avoids glare or light spill onto adjacent properties.

Facade and Architectural Feature Lighting

Façade and architectural feature lighting may be used to highlight distinctive architectural elements, landmark buildings, or historically significant features in order to reinforce district identity and aid nighttime orientation. Emphasis must be placed on buildings with notable architectural character or cultural significance to create visual focal points and support interpretation of the district's architectural context.

This lighting may include ground-mounted floodlights, wall-mounted sconces, or focused spotlights directed at towers, cornices, entries, or other defining features. Lighting shall be designed to avoid glare, excessive brightness, and light spill onto adjacent properties or the public right-of-way.

Signage and Business Lighting

Signage and business lighting shall be illuminated to support nighttime visibility, orientation, and wayfinding within the district. Sign lighting must allow signs to remain legible after business hours in order to help visitors navigate the district and understand the range of available businesses, including those not open during evening hours. This lighting shall be directed toward the sign face and shielded to prevent glare or light spill onto adjacent buildings, sidewalks, or residential areas. Gooseneck fixtures, angled shades, or similar focused luminaires may be used. Fixtures must be spaced and aimed to provide uniform illumination across the entire sign face, with overlapping light coverage to minimize shadows and ensure legibility. See **Chapter 18.15 Signs** for standards.

Pathway and Pedestrian Lighting

Pathway and pedestrian lighting shall be provided to illuminate pedestrian routes and spaces, supporting safe, comfortable, and intuitive nighttime movement throughout the district. Pedestrian lighting must reinforce key connections between destinations such as parking areas, transit stops, hotels, residential neighborhoods, and primary downtown streets. This lighting shall provide a continuous and even wash of light focused on walking surfaces and pedestrian-scale spaces. Wall-pack fixtures, unshielded ceiling lights, or security-style luminaires are discouraged due to glare and negative impacts on pedestrian comfort. Acceptable lighting strategies may include wall-mounted sconces, gooseneck fixtures with shields, lighting integrated under awnings, or illuminated streetscape elements, provided lighting is directed toward pedestrian areas and avoids excessive brightness or spillover.

Figure 104. Example of facade fixture where a linear wash of light illuminates a sign in Walla Walla, WA [Photo credit: Seanette Corkill]

Figure 105. Example of facade fixture where a sign holder with lights on arms integrated into the bracket hold bulbs exactly the right distance from the sign face in Camas, WA [Photo credit: Seanette Corkill]

Figure 106. Example of shielded light located at a human scale height and that falls directly on the sidewalk supports comfortable navigation to and from destinations in Vancouver, WA [Photo credit: Seanette Corkill]

Entryway and Building Entrance Lighting

Entryway and building entrance lighting shall be provided at business and building entrances to clearly define entry locations, improve visibility, and support safe access during evening hours. Entryway lighting must illuminate doors, thresholds, and posted information such as business hours and contact details, and contribute to a secure environment for employees and patrons when entering or exiting a building. This lighting shall be designed for pedestrian-scale use and located to avoid direct glare due to close proximity to users. Light sources must be shielded within fixtures and not directly visible from the public right-of-way. Where bulbs are visible, low-output lamps or glare-reducing bulb types, such as chrome-dipped or similarly treated bulbs, may be used to limit direct light exposure.

Window Display and Interior Visibility Lighting

Window display and interior visibility lighting must activate storefronts and enhance nighttime visual interest along sidewalks. Illuminating interior spaces visible from the public right-of-way supports pedestrian wayfinding, reinforces district vitality after business hours, and allows visitors to understand available goods and services when businesses are closed. Fixtures must be located near glazing and spaced to provide even coverage. Lighting shall be directed inward toward displays and merchandise and shielded to minimize glare for pedestrians. For service-oriented uses, interior lighting may highlight reception areas, feature walls, or business identification elements visible from the sidewalk.

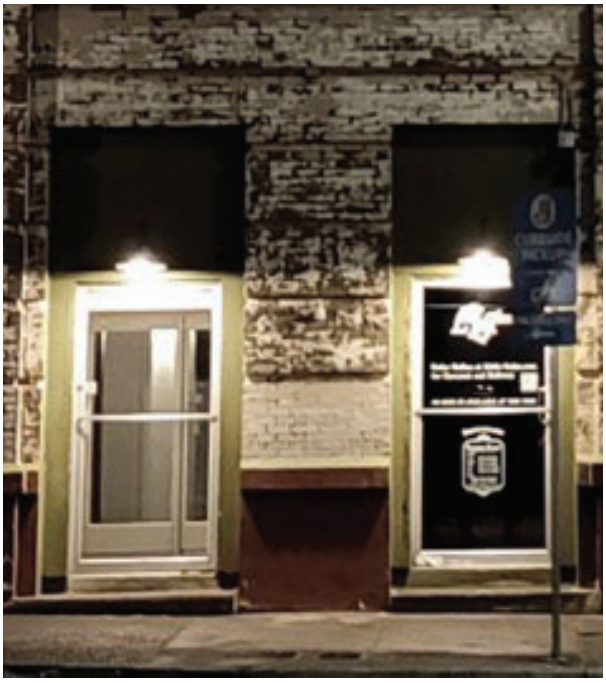


Figure 107. Example of entrance lights over doorways (front or back) that are pedestrian scale and shield the viewer from light bulb in Vancouver, WA [Photo credit: Seanette Corkill]

Figure 108. Example of entrance lights with some personality or unique flare that can delight visitors by communicating a business's vibe in Portland, OR [Photo credit: Seanette Corkill]

Figure 109. Example of wrapped light poles that clearly define the edges of Uptown's Main Street in Vancouver, WA. [Photo credit: Seanette Corkill]

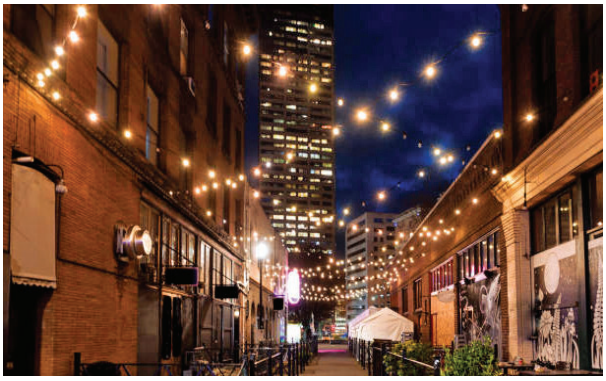

Figure 110. Example of decorative overhead lighting in an alley in Portland, OR.

8.4.2 LIGHTING STANDARDS

The following applies to all street types:

1. **Light Pole Height:** Use pedestrian-scale poles between twelve (12') and fourteen (14') feet tall; vehicular corridor poles may be up to twenty (20') feet tall.
2. **Light Fixture Type:** Install full cutoff LED fixtures with a color temperature between two thousand seven hundred (2,700 K) and three thousand (3,000 K) Kelvin. LED should utilize screw-base bulbs.
3. **Light Pole Spacing:** Space pedestrian lights sixty (60') feet to eighty (80') feet apart, adjusted for tree canopy and building height.
4. **Light Pole Location:** Shall not be placed within thirty (30") inches of the curb line or within twenty-five (25') feet of an existing tree.
5. **Illumination Levels:** Maintain one (1 FC) to two (2 FC) foot-candles on sidewalks at the back of curb and five (5 FC) foot-candles at crosswalks. See definitions for footcandle.
6. **Building Lighting (on buildings):** Allow architectural lighting up to a combined maximum of three (3 FC) foot-candles to highlight building features or public art.
7. **Decorative Overhead Lighting:** Permit string lights in plazas and alleys, mounted at heights between ten (10') and fourteen (14') feet.
8. **Window Lighting:** Must be located near glazing on primary facades to provide flexible and even coverage at intervals of eighteen (18") inches to twenty-four (24") inches; and must be directed inward toward displays and merchandise and shielded to prevent glare toward pedestrians and vehicles.

Figure 111. Example of Commercial or Residential Dumpster Screening

8.5 Screening.

Screening helps preserve the visual quality of the streetscape by concealing service areas, utilities, and parking from public view. It must be designed to complement surrounding architecture and landscape, using durable materials that maintain accessibility, ensure safety, and reinforce the overall character of the public realm. The following applies to all street types:

8.5.1 SCREENING STANDARDS

1. **General:** Screening must reduce visibility from public streets, sidewalks, alleys, and adjacent residential uses.
2. **Materials:** Materials must be durable, compatible with building architecture, and maintain a cohesive urban design character
3. **Accessibility:** Screening elements must not obstruct sight lines, pedestrian paths, or ADA access.
4. **Landscaping:** Landscaping used for screening must be maintained and replaced if dead or damaged.
5. **Trash Enclosures:** Construct six (6') foot high walls with opaque gates; set back at least five (5') feet from sidewalks.
6. **Utility Screening:** Use two (2') wide by three (3') foot tall shrubs at maturity, decorative fencing, or public art to screen all utility boxes.
7. **Mechanical Equipment (on rooftops):** Must be screened by parapets, penthouses, or integrated architectural forms. Screening must be equal to or greater than the height of the equipment. Equipment must be grouped and set back from roof edges to minimize views from the street.
8. **Mechanical Equipment (on the ground):** Must be fully screened by a combination of architectural enclosures, landscaping, or fencing at least three (3') feet to six (6') feet high. Preferred solutions include low walls that match building materials, dense evergreen shrubs, or integrated cabinets. Equipment must be oriented away from primary streets when possible.
9. **Service Areas:** Locate loading docks and dumpsters at the rear or side of buildings; screen with materials that match the primary building.
10. **Parking Lot Screening:** All parking lots shall provide a continuous perimeter treatment along any lot lines adjacent to a street. The treatment may consist of ornamental fencing, masonry walls, or dense hedges and shall be between three (3') feet and five (5') feet tall with at least fifty (50%) percent opacity. Pedestrian connections must remain open, visible, and safe.
11. **Structured Parking Buffers:** Ground floors facing streets must include windows, art, or architectural treatments to avoid blank walls. Openings must be screened with decorative grilles, louvers, or architectural panels.
12. **Blank Walls:** Blank walls longer than twenty (20') feet must be treated with murals or public art, vines or green screens, or landscaping beds to reduce scale and enhance the pedestrian experience.

Figure 112. Example of Existing Sculpture along 4th Avenue in Downtown Camas

Figure 113. Example of Existing Mural Art along 4th Avenue in Downtown Camas

8.6 Public Art.

Public art enriches the streetscape by adding cultural value, visual interest, and a distinct sense of identity. It can function as a landmark, convey local stories, or introduce playful, interactive elements. Art must be thoughtfully integrated into the built environment, ensuring accessibility, durability, and a meaningful reflection of the community's character and values. The following applies to all street types:

8.6.1 PUBLIC ART STANDARDS

1. **Funding:** All projects within a Downtown Zoning District must allocate at least one (1%) percent of construction cost to public art.
2. **Placement (in public spaces):** Must include art in an exterior, publicly visible area such as at major intersections, plazas, amenities zones (along a street), mid-block crossings, building entry points, park spaces, and gateways. Upon approval by the planning official, placement of a permanent public art display may be in lieu of some (or all) of the required elements for a particular project.
3. **Placement (in private spaces):** For sites with new public space, must be integrated into site or building design where possible and treated similarly to placement in public spaces.

Figure 114. Example of Mural

Figure 115. Example of Plaza Sculpture

4. **Access:** Public art must avoid any conflicts with pedestrian circulation, ADA access, sight-distance (for vehicles or cyclists), utilities, or emergency egress.
5. **Design:** Avoid materials that create hazards such as glare, sharp edges, or climbable surfaces near traffic.
6. **Materials:** Must use durable, weather-resistant materials suitable for the climate (e.g., treated metal, stone, laminated glass, ceramic, etc.)
7. **Maintenance:** Consider long-term maintenance and safety requirements.
8. **Lighting:** Must be integrated and fully shielded following state energy code and dark sky guidelines, nor can it create glare into sidewalks, streets, or adjacent properties.
9. **Murals:** Allow murals to cover up to seventy-five (75%) percent of a wall surface; apply anti-graffiti coatings.
10. **Sculpture Pads:** Must provide a minimum two (2') foot by two (2') foot concrete bases with optional electrical conduit for lighting.
11. **Community Engagement:** Encourage participation from local artists, schools, and community groups in creating public art.
12. **Themes:** Must avoid imagery or content that may be discriminatory, culturally inappropriate, or inconsistent with community values.

OTHER

SECTION 9.0 DEFINITIONS & MEASURES

9.0 Definitions & Measures.

The following section provides general definitions for all new terms and terminology included in this design manual, as well as guidance on measuring for specified terms.

Alcove Frontage: A frontage type characterized by recessed building entries or display areas partially sheltered by the building mass, intended to provide transition space between the public sidewalk and interior uses.

Alley Setback: Minimum distance in linear feet (LF) of any building facades from property lines onto an existing or proposed alley.

Amenity Zone: The portion of the public realm located between the sidewalk zone and curb, intended to accommodate trees, lighting, furnishings, transit amenities, and other streetscape elements.

Active Retail Use: Active retail refers to street-facing, ground-floor uses that encourage walkability and activate sidewalks, such as shops, cafés, restaurants, and other active, customer-oriented businesses. See **Section 4.0 Use and Parking** for further detail.

Base Zoning District: The mapped zoning classification that establishes permitted uses, building form, height, and development standards applicable to lots within Downtown Camas. See **Section 3.0 Base Zoning Districts** for further details.

Blank Wall: A building façade segment lacking transparency, articulation, or pedestrian-oriented features for a continuous length exceeding the maximum permitted by this manual.

Building Footprint: For the purposes of this manual, the building footprint is the total square footage (SF) of any habitable structures or accessory buildings on a lot or lots as determined by the perimeter of those buildings on a site plan.

Building Frontage: The portion of a building façade that directly abuts or faces a public right-of-way, setback area, or frontage zone and is subject to frontage standards.

Building Height: A general standard for each base zoning district, building height measures the vertical dimension of a building in feet and stories.

HOW TO MEASURE: Building height is measured in linear feet and stories (#) by measuring the distance from the adjacent grade of the sidewalk on the primary street to the bottom of the eaves or parapet. Building height does not include any levels below-grade.

Building Uses: A general standard for each base zoning district, building uses are the primary uses of the main building on a site, not including any accessory or temporary uses. See **Section 4.0 Use and Parking** for further details.

Encroachment Zone: The area between the building façade or setback line and the sidewalk zone where limited projections, seating, signage, or weather protection elements may be permitted.

Facade Zone: The vertical plane of the building face adjoining the public realm, regulated to ensure transparency, entrances, articulation, and compatibility with street character.

Footcandle: A unit of illuminance used to measure the intensity of light on a surface. One footcandle is equal to the amount of light produced by one lumen uniformly distributed over one square foot. Footcandles are measured using a light meter, which is placed at the location being evaluated, such as on the ground for a sidewalk or parking lot. The sensor is typically pointed upward to capture the amount of light falling on that surface, and the device displays the result in footcandles.

Frontage Type (or Standards): A classified method as part of this manual by which a building interfaces with the public realm, including but not limited to shop, café, porch, stoop, forecourt, civic, or yard frontage. See **Section 6.0 Frontage Standards** for further details.

General Standards (for Public Realm): A set of standards as part of this manual which regulates common elements of the public realm on all street types within the street network. See **Section 8.0 General** for further details.

Ground Floor (Uses): The lowest occupied story of a building above finished grade, intended to accommodate uses and design features that directly engage the public realm. See **Section 4.0 Use and Parking** for further details.

Lot Coverage: The percentage (%) of a lot area occupied by the building footprint, calculated in accordance with the measurement standards of this manual.

HOW TO MEASURE: Lot coverage is calculated by dividing the footprint (in square feet) of the building or buildings on the lot or lots by the total lot size (in square feet) to derive a percentage.

Lot Depth: Lot depth is the dimension in feet of a lot or lots perpendicular to the primary street frontage along the public right-of-way.

Lot Size: Lot depth is the dimension in feet of a lot is the area, typically a maximum area, in square feet (FT) and determined by its length and width.

HOW TO MEASURE: Lot size can be measured easily by multiplying the lots width (in feet) by depth (in feet) for standard lots, and calculating the area based on GIS or other public sources for irregular shaped lots such as flag lots or triangular lots.

Lot Width: Lot width is the dimension of a lot or lots along the primary street frontage parallel with the public right-of-way.

Mixed Use: A development pattern in which multiple primary uses, such as residential and commercial, are integrated within a single building or site, typically in a vertical configuration.

Open or Common Spaces: For the purposes of this manual, open or common spaces are considered usable outdoor spaces or exterior spaces in square feet (SF) on a building that are accessible by all inhabitants of a building or open to the public.

Parking Setback: Minimum distance in linear feet (LF) of the placement of any structured or surface parking facilities or storage of vehicles on the site from the primary street or side street.

Passive Retail: Passive retail refers to commercial activities that primarily serve building occupants or a smaller customer base—such as boutique offices, lobby kiosks, or specialty shops—which typically generate less foot traffic and require less window visibility. See **Section 4.0 Use and Parking** for further detail.

Primary Street: The primary street is the dominant street for a lot as determined by the address on the parcel of land.

Primary Street Setback: Maximum distance in linear feet (LF) of the placement of the building facade on the ground floor from the property line on the primary street.

Primary Street / Upper-Level Setback: Minimum distance in linear feet (LF) of the placement of building facades on a designated upper-level from the ground floor building facade on the primary street.

Primary Uses: The primary use on the lot in the main building as identified in this manual per **Section 4.0 Use and Parking** for further details.

Public Realm (Standards): All publicly accessible spaces between the building façade and curb line, including sidewalks, planting areas, amenity zones, and related streetscape elements, regulated as part of this manual. See **Section 7.0 Public Realm Standards** for further details.

Rear Yard Setback: Minimum distance in linear feet (LF) of any building facades from property lines at the rear of the yard.

Regulating Plan: The official map that assigns base zoning districts and street types to individual parcels, establishing the framework for applicable zoning and design standards. See **Section 2.0 Regulating Plan** for further details.

Setback: The required minimum or maximum distance between a building façade and a property line (or public right-of-way line), measured horizontally and regulated by base zoning district.

Street Network: The mapped network of streets based on intended character within Downtown Camas which assigns frontage standards, public realm standards for the purposes of this manual. See **Section 5.0 The Street Network** for further details.

Sidewalk Zone: The unobstructed portion of the public realm reserved primarily for pedestrian circulation, required to meet minimum width and accessibility standards.

Side Street: The side street is the less-dominant street for a lot which is often a street perpendicular and secondary to the primary street. If no primary street is present, the side street shall serve as the primary street for the purposes of this manual.

Side Street Setback: Maximum distance in linear feet (LF) of the placement of the building facade from the property line on the side street.

Side Yard Setback: Maximum distance in linear feet (LF) of any building facades from property lines on adjacent lots.

Street Type: A functional and design classification assigned to a public street that determines applicable frontage standards, public realm dimensions, and streetscape requirements.

Transparency: The percentage of a building façade composed of clear, non-reflective glazing that allows visual connection between interior spaces and the public realm.

Upper Floor (Uses): Any occupied building story located above the ground floor, subject to distinct use, setback, and design standards. See **Section 4.0 Use and Parking** for further details.

Zero Lot Line: The condition when the facade of a building on a primary street or side street is built on or very near the public right-of-way, resulting in a zero (0') foot or very near zero foot setback.

For all other definitions or measurements, see **Chapter 18.03 Definitions** of the Camas Municipal Code.

Chapter 17.09 SHORT SUBDIVISIONS[1]

17.09.010 Scope.

A. Except as provided in CMC Section 17.01.030B. or a binding site plan under Chapter 17.15 of this title, any land being divided into nine or fewer lots, unit lots, sites or parcels for the purpose of conveyance, shall meet the requirements of this chapter.

B. Tracts may be in addition to the lot count provided that the tract is reserved as forested lands, part of the open space network, serving as stormwater detention and treatment, or set aside as an unbuildable area due to critical lands.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

(Ord. No. 25-025, § I (Exh. A), 12-15-2025)

17.09.020 Decision process.

Applications for short plat approval shall be processed as a Type II decision, subject to the provisions of CMC Chapter 18.55.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

17.09.030 Preliminary short plat approval.

A. Preapplication.

1. In accordance with CMC Chapter 18.55, the applicant must proceed with the formal preapplication process prior to application submittal for review.

2. The applicant shall submit to the community development department the preapplication form and copies of their proposal drawn to an engineer scale on paper, showing lot sizes, topography and overall lot dimensions.

B. Application/Fees. In addition to those items listed in CMC 18.55.110, the following items are required, in quantities specified by the City of Camas, for a complete short plat application for preliminary approval. Items may be waived if, in the judgment of the community development director, they are not applicable to the proposal:

1. Completed general application form as prescribed by the community development director with the applicable application fee;

2. Complete and submit a transportation impact study to determine the adequacy of the transportation system to serve the proposed development, and to mitigate impacts of the proposal on the surrounding transportation system, if required;

3. Complete applications for other required land use approvals applicable to the proposal;

[1]Prior ordinance history: Ords. 2443 and 2455.

4. Vicinity map showing location of the site; and
5. Site and development plans which provide the following information:
    a. A preliminary plat map meeting the standards identified in CMC Section 17.01.050,
    b. The names of owners of adjacent land and the names of any adjacent subdivisions,
    c. Lines marking the boundaries of the existing lot(s) (any existing lot to be eliminated should be a dashed line and so noted),
    d. Names, locations, widths and dimensions of existing and proposed public street rights-of-way, public and private access easements, parks and other open spaces, reservations, and utilities,
    e. Location, footprint and setbacks of all existing structures on the site,
    f. Location of existing and proposed sidewalks, street lighting, and street trees,
    g. Lot area and dimensions for each lot,
    h. Location of proposed new property lines and numbering of each lot,
    i. Location of proposed building envelopes and sewer tanks,
    j. Location, dimensions and purpose of existing and proposed easements. Provide recorded documents that identify the nature and extent of existing easements,
    k. Location of any proposed dedications,
    l. Existing and proposed topography at two-foot contour intervals, extending to ten feet beyond the project boundaries,
    m. Location of any critical areas and critical area buffers, to indicate compliance with all applicable provisions of the critical areas legislation, as required under Title 16 and Title 18 of this code,
    n. Description, location and size of existing and proposed utilities, storm drainage facilities, and roads to service the lots,
    o. Locations of all fire hydrants within five hundred feet of the proposal,
    p. A survey of existing significant trees as required under CMC Section 18.13.045; and
    q. Show location and height of all proposed retaining walls, regardless of height. Provide cross sections for retaining walls over four feet in height.
6. For properties with slopes of ten percent or greater a preliminary grading plan will be required with the development application that shows:
    a. Two-foot contours,
    b. The proposed lots and existing topography,
    c. The proposed lots with proposed topography, and
    d. Total quantities of cut and fill;
7. Preliminary stormwater plan and preliminary stormwater technical information report (TIR). The preliminary stormwater TIR is to be prepared in accordance with Ecology's latest edition Stormwater Management Manual for Western Washington (SWMMWW);
8. For properties with development contemplated on slopes of ten percent or greater a preliminary geotechnical report will be consistent with CMC Chapter 16.59;

9. A narrative addressing ownership and maintenance of open spaces, stormwater facilities, public trails and critical areas, and the applicable approval criteria and standards of the Camas Municipal Code.

10. An engineering estimate of costs for site improvements, both public and private, shall be submitted at the time of application.

C. Review Procedures.

1. Referral to Other Departments. Upon receipt of a complete application for a short subdivision, the community development department shall transmit one copy of the application to any department or agency deemed necessary to review the proposal.

2. Additional Submittals. The review process will determine if additional studies or submittals are required with regard to SEPA, critical areas, archeological or historical significance. If further material is required, the review process will stop until the required information is submitted in accordance with CMC Chapter 18.55.

3. Proposed short subdivisions located adjacent to the right-of-way of state highways shall be submitted to the Washington Department of Transportation (WSDOT) for review, consideration and recommendation. This condition may be satisfied as part of the SEPA process. However, if a SEPA checklist is not required, it is the applicant's responsibility to notify WSDOT of the proposal. Recommendations from Washington Department of Transportation shall be considered by the City in the conditions of approval for the short subdivision.

4. Community Development Director. The community development director or designee may approve, approve with modifications, or deny the application for a preliminary short plat.

D. Criteria for Preliminary Short Plat Approval. The community development director or designee shall base their decision on an application for preliminary plat approval on the following criteria:

1. The proposed short plat is in conformance with the Camas comprehensive plan, neighborhood traffic management plan, Camas parks and open space comprehensive plan, and any other city adopted plans;

2. Provisions have been made for water, storm drainage, erosion control and sanitary sewage disposal for the short plat which are consistent with current standards and plans as adopted in the Camas Design Standard Manual;

3. Provisions have been made for roads, utilities, street lighting, street trees, and other improvements that are consistent with the six-year street plan, the Camas Design Standard Manual and other state adopted standards and plans;

4. Provisions have been made for dedications, easements and reservations;

5. Appropriate provisions are made to address all impacts identified by the transportation impact study;

6. The design, shape and orientation of the proposed lots are appropriate to the proposed use for which the lots are intended;

7. Provisions are made for the maintenance of commonly owned private facilities;

8. The short plat complies with the relevant requirements of the Camas land development and zoning codes, and all other relevant local regulations; and

9. That the plat meets the requirements of Chapter 58.17 RCW and other applicable state and local laws which were in effect at the time of preliminary plat approval.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 18-014, § IX, 9-4-2018; Ord. No. 19-001, § I(Att. A), 1-22-2019; Ord. No. 19-012, § II(Exh. A), 11-4-2019; Ord. No. 21-005, § I(Exh. A), 3-15-2021; Ord. No. 22-007, § I, 5-16-2022; Ord. No. 25-025, § I (Exh. A), 12-15-2025)

17.09.040 Expiration.

If the short plat is not recorded within five years of the date of preliminary short plat approval, the short plat shall become null and void. Upon written request by the developer prior to the expiration date, the community development director may grant an extension of not more than two years. The director shall consider economic conditions and such other circumstances as may warrant the extension. If the director denies a request for an extension, the developer may appeal that decision to the city council by filing a written notice of appeal with the director not later than thirty days after the date of the decision.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2645, § I, 3-19-2012; Ord. No. 17-005, § I(Exh. A), 5-15-2017; Ord. No. 19-012, § II(Exh. A), 11-4-2019)

17.09.050 Limitations on further subdivision.

Any land short platted shall not be further divided for a period of five years after the final short plat is recorded without following the provisions for subdivision. This provision applies to any lots, tracts or parcels recorded as part of the plat.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

17.09.060 Contiguous short plats.

No application for a short plat shall be approved if the land being divided is held in common ownership with a contiguous parcel that has been divided in a short plat within the preceding five years.

(Ord. 2483 § 1 (Exh. A (part)), 2007)

17.09.070 Unit Lot Subdivisions.

A unit lot subdivision (ULS) creates new lots much like a typical subdivision, except a ULS allows flexible application of dimensional standards. In a ULS, the development as a whole is on the "parent lot" which conforms to the zoning dimensional standards while individual "unit lots" are not required to. Unit lots (also called child lots) are individual, sellable, legal lots of record with their own tax or parcel identification number.

A. Applicability. A lot to be developed with middle housing (including accessory dwelling units) or multiple detached single-family residences, in which no dwelling units are stacked on another dwelling unit or other use, may be subdivided into individual unit lots as provided herein.

B. Process. Unit lot subdivisions shall follow the application, review, and approval procedures for a short subdivision.

C. Development as a whole on the parent lot, rather than individual unit lots, shall comply with applicable design and development standards.

D. Subsequent platting actions and additions or modifications to structure(s) may not create or increase any nonconformity of the parent lot.

E. Access easements, joint use and maintenance agreements, and covenants, conditions and restrictions (CC&Rs) identifying the rights and responsibilities of property owners and/or the homeowners' association shall be executed for use and maintenance of common garage, parking, and vehicle access areas; bike parking; solid waste collection areas; underground utilities; common open space; shared interior walls; exterior building facades and roofs; and other similar features shall be recorded with the county auditor.

F. Portions of the parent lot not subdivided for individual unit lots shall be owned in common by the owners of the individual unit lots, or by a homeowners' association comprised of the owners of the individual unit lots.

G. Notes shall be placed on the face of the plat or short plat as recorded with the county auditor to state the following:

1. The title of the plat shall include the phrase "Unit Lot Subdivision."

2. Approval of the development (design and layout) on each unit lot was granted by the review of the development, as a whole, on the parent lot under file #.

3. Subsequent subdivision actions, additions, or modifications to the unit lot housing development, including all structures, may not create or increase any nonconformity of the parent lot as a whole, and shall conform to the approved unit lot housing development project or to the land use and development standards.

4. If a structure or portion of a structure within the unit lot housing development project has been damaged or destroyed, any repair, reconstruction, or replacement of any structure shall conform to the approved unit lot housing development project or to the land use and development standards in effect at the time the proposed repair, reconstruction, or replacement project's permit application becomes vested.

5. Additional development or redevelopment of the individual unit lots may be limited as a result of the application of development standards to the parent lot.

(Ord. No. 25-025, § I (Exh. A), 12-15-2025)

17.09.080 Administrative Lot Split.

Pursuant to RCW 58.17.145, an existing residential lot may be split into two lots for the purpose of sale, lease, or transfer of ownership pursuant to this section.

A. Applicability. Administrative lot splits are permitted only within residential zones. A lot is not eligible for an administrative lot split if the proposed lot split would result in a lot that is not buildable under applicable locally adopted development regulations, including, but not limited to, critical areas, shorelines, stormwater, setbacks, impervious surface area, and building coverage standards.

B. Process. Except as provided for in this section, administrative lot splits shall follow the application, review, and approval procedures for a short subdivision.

C. General Requirements.

1. An administrative lot split must only create one additional lot.

2. The parent lot must not have been created by an administrative lot split authorized by this section.

3. Both the parent lot and the proposed new lot must meet the minimum lot size of the zone in which the administrative lot split is located. The newly created lot is not subject to any maximum lot size requirement.

4. Access and utility rights must be granted or conveyed as necessary on or before recording of the lot split survey to provide access for the maximum number of dwelling units that could be developed on the newly created lot, provided such access rights may be reduced through review of a subsequent application for a building permit, short plat, unit lot subdivision, or subdivision if less than the maximum number of dwelling units are built on the newly created lot.
5. If a lot split results in a newly created lot of a size that would allow for further land division, subsequent lot splits are not allowed but the newly created lot may be divided under other applicable land subdivision processes.
6. If the lot split would require demolition or alteration of any existing housing that would displace a renter, the applicant must recommend a displacement mitigation strategy that may include, but is not limited to, relocation assistance.

D. Right-of-way dedication, frontage requirements, and improvements.

1. A proposed lot split may be conditioned upon dedication of right-of-way on the parent lot to the extent such dedication would otherwise be required for the development, short plat, or subdivision of the parent lot absent an administrative lot split.
2. Development of dwelling units on the newly created lot or further subdivision of the newly created lot may be conditioned upon construction of frontage improvements to a right-of-way adjacent to either the parent lot or the newly created lot.

E. Administrative lot split survey.

A lot split survey must be recorded with the Clark County Auditor's Office and shall include, as notes, and comply with the following requirements, as applicable:

1. Further administrative lot splits are not permitted on either the parent lot or newly created lot;
2. The city is immune from any liability, loss, or other damage suffered by another that is related to the city's approval of the lot split, including if the lot split creates a lot that is later determined unbuildable, RCW 58.17.145;
3. If applicable, indicate whether future development will require frontage improvements;
4. If applicable, indicate whether dedication of right-of-way is required and note the location of the right-of-way to be dedicated; and
5. If applicable, note the location of all required access and utility rights granted or conveyed.

Chapter 18.03 DEFINITIONS

18.03.010 Purpose.

The purpose of the definitions chapter is to carry out the intent of the city's development regulations. The terms defined in this chapter are the minimum necessary to resolve questions of interpretation. Terms not defined shall hold their common and generally accepted meaning, unless specifically defined otherwise in this code.

18.03.020 Interpretation of terms.

A. Terms in this title that are not defined in this chapter hold their common and accepted meaning.

B. The following terms shall be interpreted as follows:

1. Words used in the present tense include the future;
2. The plural includes the singular and vice-versa;
3. The words "will" and "shall" are mandatory;
4. The word "may" indicates that discretion is allowed;
5. The word "used" includes designed, intended, or arranged to be used;
6. The masculine gender includes the feminine and vice-versa;
7. The word "person" may be taken for persons;
8. The word "building" includes a portion of a building or a portion of the lot on which it stands;
9. Distances shall be measured horizontally unless otherwise specified;
10. The word "occupied" includes designed or intended to be used.

18.03.030 Definitions.

For the purposes of this title, the following definitions shall apply:

"Accessory residential storage lot" means a designated lot within a North Shore residential zone (LD-NS, HD-NS) for the use as a storage facility for recreational vehicles, boats, and/or other watercraft. A Homeowner's Association (HOA) shall operate and maintain the storage facility. Only residents within the established HOA may use the facility. The HOA will establish rules and regulations for the storage facility to be recorded within the Covenants, Conditions & Restrictions for the HOA during the subdivision application period. Lots created for use as accessory residential storage facilities shall meet the dimensional requirements of the designated North Shore land use designation they are in. The North Shore Design Manual defines additional development requirements for accessory residential storage lots.

"Abutting" means adjoining.

“Access easement.” See "Street."

“Access panhandle.” See "Flag lot."

"Accessory dwelling unit" means a dwelling unit located on the same lot as a single-family housing unit, duplex, triplex, townhome, or other housing unit. Refer to Chapter 18.27 Accessory Dwelling Units.

"Accessory structure or accessory use" means a structure or use incidental and subordinate to the principal use or structure and located on the same lot or tract.

"Adult entertainment facility." See CMC Chapter 5.36 Sexually Oriented Business.

"Adult family home" means a dwelling, licensed by the State of Washington Department of Social and Health Services, in which a person or persons provide personal care, special care, room and board to more than one but not more than six adults who are not related by blood or marriage to the person or persons providing the services. An existing adult family home may provide services to up to eight adults upon approval from the Department of Social and Health Services in accordance with RCW 70.128.066. Adult family homes are a permitted use in all areas zoned for residential use.

"Adverse environmental impact" means an impact caused by vegetation removal which creates a risk of landslide or erosion, or which alters or damages wetlands, wetland buffers, wildlife habitat, streams, or watercourses.

"Affordable housing" means residential housing whose monthly costs, including utilities other than telephone, do not exceed 30 percent of the monthly income of a household whose income is: (a) For rental housing, 60 percent of the median household income adjusted for household size, for Clark County, as reported by the United States Department of Housing and Urban Development; or (b) For owner-occupied housing, 80 percent of the median household income adjusted for household size, for Clark County, as reported by the United States Department of Housing and Urban Development.

"Alley" means a narrow street primarily for vehicular service access to the rear or side of properties otherwise abutting on another street.

"Alteration of watercourse" is any action that will change the location of the channel occupied by water within the banks of any portion of a riverine waterbody.

“Animal kennel.” See "Kennel."

"Annexation" means the legal process in which a parcel or contiguous group of parcels in an unincorporated area become part of the city taking the action of incorporation.

"Antique shop" means an establishment engaged in the sale of collectibles, relics or objects of an earlier period than the present.

"Appliance sales and incidental service" means an establishment engaged in the sale and repair of household or office tools or devices operated by gas or electric current. Such tools or devices may include stoves, fans, refrigerators, etc.

“Approval authority” means the person or decision-making body authorized by this title to approve, approve with conditions, or deny an application or other request. Depending on the applicable review procedure, the approval authority may include the community development director or designee, hearing examiner, city council, or other decision-making body designated by this title.

"Area of shallow flooding" means a designated zone AO, AH, AR/AO or AR/AH (or VO) on a community's Flood Insurance Rate Map (FIRM) with a one percent or greater annual chance of flooding to an average depth of one to three feet where a clearly defined channel does not exist, where the path of flooding is unpredictable, and where velocity flow may be evident. Such flooding is characterized by ponding or sheet flow. Also referred to as the sheet flow area.

"Area of special flood hazard" means the land in the floodplain within a community subject to a one percent or greater chance of flooding in any given year. It is shown on the Flood Insurance Rate Map (FIRM) as zone A, AO, AH, A1-30, AE, A99, AR (V, VO, V1-30, VE). "Special flood hazard area" is synonymous in meaning with the phrase "area of special flood hazard".

“Arterial.” See "Street."

"Assessment project" means the assessment may be a local improvement district (LID) or equitable reimbursement method.

"Assisted living" means any group residential program that provides personal care and support services to people who need help with daily living activities as a result of physical or cognitive disability. Assisted living communities usually offer help with bathing, dressing, meals and housekeeping. The amount of help provided depends on individual needs, however, full-time (twenty-four hours a day) care is not needed. Assisted living communities go by a variety of names: adult homes, personal care homes, retirement residences, etc.

"Automobile repair garage" means a building designed and used for the storage, care repair, or refinishing of motor vehicles including both minor and major mechanical overhauling, paint and body work.

"Automobile sales, new or used" means an establishment that provides for the sale of motorized vehicles as its primary use.

"Automobile service station" means any premises used primarily for supplying motor fuel, oil, minor servicing, excluding body and fender repair, and for sale of accessories as a secondary service for automobiles at retail direct to the customer.

"Automobile wrecking" means the dismantling or wrecking of used motor vehicles or trailers, or the storage, sale or dumping of dismantled, partially dismantled, obsolete or wrecked vehicles or their parts when screened from view from a public roadway and adjoining properties.

“Bakery (retail),” or "retail bakery," means an establishment where the majority of retail sale is of products such as breads, cakes, pies, pastries, etc., which are baked or produced and for sale to the general public.

“Bakery (wholesale),” or "wholesale bakery," means an establishment where breads, cakes, pies, pastries, etc. are baked or produced primarily for wholesale rather than retail sale.

“Bar.” See "Tavern."

"Base flood elevation (BFE)" means the elevation to which floodwater is anticipated to rise during the base flood.

"Base flood" means the flood having a one percent chance of being equaled or exceeded in any given year (also referred to as the "one hundred-year flood").

"Basement" means any area of the building having its floor subgrade (below ground level) on all sides.

"Bed and breakfast inn" means a dwelling or portion thereof, where short-term lodging rooms and meals are provided. The operator of the inn shall live on the premises or in adjacent premises. A bed and breakfast which includes six or more guest rooms shall be classified and defined as a hotel.

"Best available information" means, in the absence of official flood insurance rate map data, communities can use data from other federal, state, or other sources; provided this data has either been generated using technically defensible methods or is based on reasonable historical analysis and experience. Flood data from existing flood events may be used where flood events are considered more accurate indicators of past base flood conditions. Any variance from adopted flood insurance rate maps must be of a more restrictive nature.

"Binding site plan" means a drawing to scale which: (1) identifies and shows the areas and locations of all streets, roads, improvements, utilities, open spaces, and any other matters specified by local regulations; (2) contains inscriptions or attachments setting forth limitations and conditions for the use of the land; and (3) contains provisions making any development be in conformity with the site plan.

"Boat sales, and repair" means a business primarily engaged in sales and repair of new and used motorboats, sailboats, and other watercraft. Also includes businesses primarily engaged in the sale of supplies for boating.

"Book, stationery and art supply store" means an establishment engaged in the retail sale of books and magazines, stationery, record and tapes, video and art supplies, including uses.

"Boundary line adjustment" means an adjustment of boundary lines between platted or unplatted lots or both, which does not create any additional lot, tract, parcel, site or division.

"Breakaway wall" means a wall that is not part of the structural support of the building and is intended through its design and construction to collapse under specific lateral loading forces, without causing damage to the elevated portion of the building or supporting foundation system.

"Breezeway" means a structure for the principal purpose of connecting the main building or buildings on a property with other main buildings or accessory buildings.

“Brew pub.” See "specialty goods production."

"Buffer" means either: (i) an area adjacent to hillsides which provides the margin of safety through protection of slope stability, attenuation of surface water flows, and landslide, seismic, and erosion hazards reasonably, necessary to minimize risk to the public from loss of life, well-being, or property damage resulting from natural disasters; or (ii) an area adjacent to a stream or wetland which is an integral part of the stream or wetland ecosystem, providing shade; input of organic debris and coarse sediments; room for variation in stream or wetland boundaries; habitat for wildlife; impeding the volume and rate of runoff; reducing the amount of sediment, nutrients, and toxic materials entering the stream or wetland; and protection from harmful intrusion to protect the public from losses suffered when the functions and values of stream and wetland resources are degraded.

"Building and hardware and garden supply store" means an establishment engaged in selling lumber and other building materials such as paint, glass, wallpaper, tools, seeds and fertilizer.

"Building envelope" means a delineated area identifying where a primary building may be established. See Figure 18.03-3.

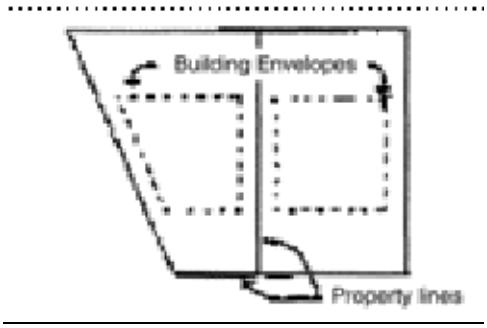

Figure 18.03-3
Building Envelopes

"Building height" means the vertical distance above a reference datum measured to the highest point of the coping of a flat roof or to the deck line of a mansard roof or to the average height of the highest gable of a pitched or hipped roof. The reference datum shall be selected by either of the following, whichever yields a greater building height: (a) the elevation of the highest adjoining sidewalk or ground surface within a five-foot horizontal distance or the exterior wall of the building when such sidewalk or ground surface is not more than ten feet above the lowest grade; (b) an elevation ten feet higher than the lowest grade when the sidewalk or ground surface described in subsection (a) of this definition is more than ten feet above the lowest grade. The height of a stepped or terraced building is the maximum height of segment of the building. See Figure 18.03-4.

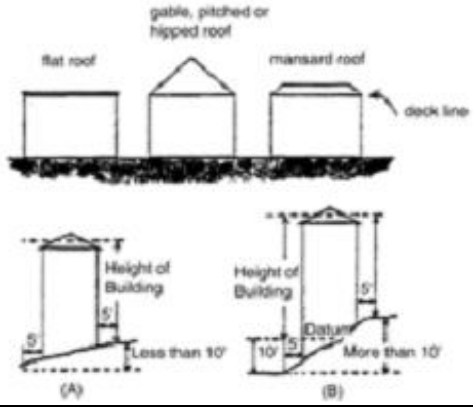

Figure 18.03-4 Building Height

"Building line" means a line on a plat indicating the limit beyond which primary buildings or structures may not be erected.

"Building" means any structure used or intended for supporting or sheltering any use or occupancy.

"Bus station" means an establishment for the storage, dispatching, repair and maintenance of coaches and vehicles of a transit system.

"Child care." See "Day care."

"Church" means a permanently located building commonly used for religious worship, fully enclosed with walls and roof. A memorial chapel is similar to a church, with the exception that no funeral home activities, such as embalming or casket display are permitted.

"City" means the City of Camas.

"Clinic" means a building or portion of a building containing offices and facilities for providing medical, dental and psychiatric services for outpatients only.

"Collector." See "Street."

"Commission" means the Planning Commission of the City of Camas.

"Community center" means a facility owned and operated by a public agency or nonprofit corporation; provided, that the principal use of the facility is for public assistance, recreation, community improvement, or public assembly.

"Comprehensive plan" means the comprehensive plan for the City of Camas, comprising plans, maps or reports, or any combination thereof relating to the future economic and physical growth and development of the city.

"Contractor" means the person/firm hired by the applicant to perform work.

"Convenience store." See "Grocery, neighborhood."

"Convention center" means an establishment developed primarily as a meeting facility; including facilities for recreation and related activities provided for convention participants, excluding overnight lodging.

"Cottage housing" means residential units on a lot with a common open space that either: (a) is owned in common; or (b) has units owned as condominium units with property owned in common and a minimum of 20 percent of the lot size as open space.

"Council" means the Council of the City of Camas.

"Court" means a space open and unobstructed to the sky, located at or above grade level on a lot and bounded on three or more sides by walls of a building.

"Courtyard apartments" means up to four attached dwelling units arranged on two or three sides of a yard or court.

"Critical facility" means a facility for which even a slight chance of flooding might be too great. Critical facilities include (but are not limited to) schools, nursing homes, hospitals, police, fire and emergency response installations, and installations which produce, use, or store hazardous materials or hazardous waste.

"Critical root zone" is the area of soil around a tree trunk where roots are located that provide stability and uptake of water and minerals required for tree survival.

“Cul-de-sac.” See "Street."

“Data Center” means a facility or portion of a facility housing networked computer systems and telecommunications equipment used for remote storage, processing, and distribution of data. This definition does not include server rooms or information technology infrastructure that is accessory to the principal use of the site.

"Day care center" means a state-licensed entity regularly providing care for thirteen or more children for periods of less than twenty-four hours. A day care center is not located in a private family residence unless the portion of the residence to which the children have access is used exclusively for the children during the hours the center is open or is separate from the usual quarters of the family.

“Day care, family home<” or "family home day care," means an entity regularly providing care during part of the twenty-four hour day to six or fewer children in the family abode of the person(s) under whose direction the children are placed; or, a state licensed entity regularly providing care during part of the twenty-four hour day to between six and twelve children in the family abode of the person(s) under whose direction the children are placed.

“Day care, mini-center,” or "mini-center day care," means a state licensed entity providing care during part of the twenty-four hour day period for twelve or fewer children in a facility other than the family abode of the person or persons under whose direct care the children are placed, or for the care of seven through twelve children in the family abode of such person or persons.

"Dedication" means the deliberate appropriation of land by an owner for any general and public uses, reserving to the owner no other rights than such as are compatible with the full exercise and enjoyment of the public uses to which the property has been devoted.

"Delicatessen (deli)" means retail food stores selling ready-to-eat food products such as cooked meats, prepared salads or other specialty food items. This definition includes seafood, health food and other specialty foods.

"Density transfer" means a transfer of dwelling units located on a site identified as sensitive lands or open space to the developable portion of land on the site. (Refer to Section 18.09.060 Density Transfers)

"Developed/net acreage" means the total acreage of a land use development exclusive of open space and critical areas.

"Development" within the area of special flood hazard means any manmade change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation, or drilling operations, or storage of equipment or materials located within the area of special flood hazard.

"Diameter at breast height (DBH)" means the diameter of the tree measured at four feet six inches above soil grade.

"Director" means community development director or designee.

"Drainage facility" means the system of collecting and storing surface and stormwater runoff. Drainage facilities shall include but not be limited to all surface and stormwater runoff conveyance and containment facilities including streams, pipelines, channels, ditches, wetlands, closed depressions, infiltration facilities, retention/detention facilities, and other drainage structures and appurtenances, both natural and man-made.

"Driveway" means the required traveled path to or through a parking lot for three or more vehicles. A "driveway" also refers to the vehicular access for single-family dwelling.

"Drug store" means an establishment engaged in the retail sale of prescription drugs, nonprescription medicines, cosmetics and related supplies.

"Duplex or two-family dwelling" means a residential building with two attached dwelling units.

"Dwelling unit" means an independent living unit within a dwelling structure designed and intended for occupancy by not more than one family and having its own housekeeping and kitchen facilities. Hotel, motel, and bed and breakfast that are primarily for transient tenancy are not considered dwelling units.

“Dwelling unit, Accessory,” or "accessory dwelling unit," means an additional, smaller, subordinate dwelling unit on a lot or attached to an existing or new house. Refer to Chapter 18.27 Accessory Dwelling Units.

“Dwelling, condominium,” or "condominium dwelling," means two or more units where the interior space of which are individually owned; but the balance of the property (both land and/or building) is owned in common by the collective owners of the building.

“Dwelling, cottage cluster,” or "cottage-style home," or "cottage cluster" means a grouping of no fewer than four detached dwelling units with a maximum footprint of one thousand square feet each and that includes a common courtyard. Cottage clusters may be located on a single lot or parcel or on individual lots or parcels. Cottage clusters are allowed on up to twenty-five percent of the developable acreage of a project site. Cottage cluster development standards are detailed in the North Shore Design Manual.

“Dwelling, duplex or two-family,” or "duplex or two-family dwelling," means a structure containing two dwelling units on one lot.

“Dwelling, multifamily<’ or "multifamily dwelling" or "apartment," means a building containing three or more dwelling units on a lot or parcel.

“Dwelling, single-family attached (row house),” or "single-family attached dwelling," means a single household dwelling attached to another single household dwelling by a common vertical wall, and each dwelling is owned individually and located on a separate lot. These are more commonly referred to as townhouses or rowhouses.

“Dwelling, single-family,” or "single-family dwelling," means a detached building containing one dwelling unit.

"Easement" means a grant of the right to use land for specific purposes.

"E-cigarette" means any electronically actuated device or inhaler meant to simulate cigarette smoking that uses a heating element to vaporize a liquid solution, popularly referred to as "juice," and that causes the user to exhale any smoke, vapor, or substance other than that produced by unenhanced human exhalation. The juice used in e-cigarettes typically contains nicotine, and for this reason e-cigarettes and their juice fall under the classification of tobacco products and tobacco paraphernalia.

"Electric vehicle battery charging station" and "rapid charging station" mean an electric component assembly, or cluster of component assemblies designed specifically to charge batteries within electric vehicles, which meet or exceed any standards, codes, and regulations set forth by RCW Chapter 19.28.

"Electric vehicle infrastructure" means structures, machinery, and equipment to support electric vehicles such as a battery exchange station or facility, and which may be subject to site plan permits.

"Elevated building" means for insurance purposes, a non-basement building that has its lowest elevated floor raised above ground level by foundation walls, shear walls, post, piers, pilings, or columns.

"Environmentally sensitive area(s)" or "sensitive lands" means areas within the city that are characterized by, or support unique, fragile or valuable natural resources, or that are subject to natural hazards. Sensitive areas include wetlands and wetland buffers, streams and watercourses, steep slopes, and areas with potentially unstable soils, as those areas are defined and identified pursuant to this title and Title 16.

"Erosion control bond" insures the satisfactory installation, maintenance, and operation of erosion control measures within an approved development. The developer/owner is the principle and the city is the obligee. The bond shall remain in full force and effect until released by the city.

"Established grade" means the curb line grade established by the city.

"Event center" means a building or property used by groups for celebratory events (e.g. weddings, parties, reunions, etc.), meetings and other events. Occupancy must be less than two hundred persons otherwise it shall be regulated as a convention center. Events may occur outdoors. Typically food service and alcohol are associated with this use.

“Facility, essential public,” or "essential public facility," means and includes those facilities that are typically difficult to site, such as airports, state education facilities and state or regional transportation facilities, state and local correctional facilities including substance abuse facilities, mental health facilities, and group homes.

"Facility, public," "public facility," means streets, roads, highways, sidewalks, street and road lighting systems, traffic signals, domestic water systems, water towers, storm and sanitary sewer systems, parks and recreation facilities, and schools that are open to the general public and owned by or in trust for a government entity.

"Family" means an individual, or two or more persons related by blood or marriage, or two persons with functional disabilities as defined in this chapter, or a group of not more than five unrelated persons (excluding servants), living together in the same dwelling unit.

"Fence" means a structure, other than a building, designed, constructed and intended to serve as a barrier or as a means of enclosing a yard or other structure; or to serve as a boundary feature separating two or more properties. Landscaping plantings do not fall within this definition.

“Fence, sight-obstructing,” or "sight-obstructing fence," means a fence so arranged as to obstruct vision.

"Final acceptance" means city council approval of the complete public improvements and acceptance of the warranty for the public improvements. The end of the warranty period signifies the city responsibility for maintenance and repair of any public improvements.

"Final plat" means the final drawing of the subdivision or short subdivision and dedication, prepared for filing for record with the county auditor and containing all elements and requirements set forth in this chapter and in state law.

"Fitness center/sports club" means an establishment engaged in operating physical fitness facilities, sports and recreation clubs.

"Flag lot" means a lot that does not have full frontage on a public street and the "pole" of the flag lot is less than half the width of the average lot width. Flag poles shall be a minimum of twenty feet wide, provide a minimum of twelve feet wide pavement and extend no longer than three hundred feet.

"Flood elevation study" means an examination, evaluation, and determination of flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation, and determination of mudslide (i.e., mudflow) and/or flood-related erosion hazards. Also known as a flood insurance study (FIS).

"Flood insurance rate map (FIRM)" means the official map of a community, on which the Federal Insurance Administrator has delineated both the special hazard areas and the risk premium zones applicable to the community. A FIRM that has been made available digitally is called a digital flood insurance rate map (DFIRM).

"Flood insurance study (FIS)" means the official report provided by the Federal Insurance Administration that includes flood profiles, the flood insurance rate maps, and the water surface elevation of the base flood.

"Flood," or "Flooding" means:

A. A general and temporary condition of partial or complete inundation of normally dry land areas from:

1. The overflow of inland or tidal waters.

2. The unusual and rapid accumulation or runoff of surface waters from any source.

3. Mudslides (i.e., mudflows) which are proximately caused by flooding as defined in paragraph [B.] of this definition and are akin to a river of liquid and flowing mud on the surfaces of normally dry land areas, as when earth is carried by a current of water and deposited along the path of the current.

B. The collapse or subsidence of land along the shore of a lake or other body of water as a result of erosion or undermining caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusually high water level in a natural body of water, accompanied by a severe storm, or by an unanticipated force of nature, such as flash flood or an abnormal tidal surge, or by some similarly unusual and unforeseeable event which results in flooding as defined in paragraph [A.] of this definition.

"Flood proofing" means any combination of structural and nonstructural additions, changes, or adjustments to structures which reduce or eliminate risk of flood damage to real estate or improved real property, water and sanitary facilities, structures, and their contents. Flood proofed structures are those that have the structural integrity and design to be impervious to floodwater below the base flood elevation.

"Floodplain administrator" means the community official designated by title to administer and enforce the floodplain management regulations.

"Floodplain or flood prone area" means any land area susceptible to being inundated by water from any source. See "flood or flooding."

"Floodway" means the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height. Also referred to as "regulatory floodway."

"Floor area" means the area included within the surrounding exterior walls of a building or portion thereof, exclusive of vent shafts and courts. The floor area of a building, or portion thereof, not provided with surrounding exterior walls shall be the usable area under the horizontal projection of the roof or floor above.

"Florist shop" means establishments engaged in the retail sale of flowers and plants.

"Food carts/food trucks/food delivery business" means a business in which food is primarily prepared and sold from a vehicle or trailer. Restaurants or fast food restaurants in a permanent building are not included in this definition. Food carts are generally not allowed to conduct business within the public right-of-way and must be located on leased or owned property. For more information refer to zoning structure setbacks, uses allowed in the zone, and siting requirements at CMC Chapter 18.18 Site Plan Review.

"Fourplex" means a residential building with four attached dwelling units.

“Fulfillment centers" means a building or facility that is principally used for receiving, picking, packing, and shipping goods and orders directly to customers, and relies on optimizing speed and efficiency over longer-term inventory storage.

"Functionally dependent use" means a use which cannot perform its intended purpose unless it is located or carried out in close proximity to water. The term includes only docking facilities, port facilities that are necessary for the loading and unloading of cargo or passengers, and ship building and ship repair facilities, and does not include long term storage or related manufacturing facilities.

"Funeral home" means a building where services and/or ceremonies are held in conjunction with human burial or cremation. Crematories may be an accessory use to a funeral home.

"Furniture store" means establishments engaged in the retail sale of household furniture and furnishings for the home.

"Gas/fuel station with mini market" means establishments engaged in the sale of gasoline or other auto fuel together with a minor incidental building in which incidental items including snack foods and beverages are sold.

"Gas/fuel station" means establishments engaged primarily in the sale of automobile gasoline or other auto fuel to the general public.

"Golf course" means a recreational facility, under public or private ownership, designed and developed for uses including, but not limited to a golf course, driving range, putt-putt golf, and other auxiliary facilities such as a pro shop, caddy shack building, restaurant, meeting rooms, and storage facilities.

"Grade (adjacent ground elevation)" means the lowest point of elevation of the finished surface of the ground paving or sidewalk within the area between the building and the property line or, when the property line is more than five feet from the building, between the building and a line five feet from the building.

“Grocery, large scale,” or "large scale grocery," means a retail business enclosed within a structure greater than thirty thousand square feet with the majority of sales relating to food for the consumption off-premises.

“Grocery, neighborhood,” or "neighborhood grocery," means a retail business enclosed within a structure less than six thousand square feet with the majority of sales relating to food and associated items. Limited outdoor storage may be permitted; provided it complies with screening requirements. Where outdoor storage occurs, the use shall be defined as a small scale grocery.

“Grocery, small scale,” or "small scale grocery," means a retail business enclosed within a structure between six thousand square feet and thirty thousand square feet with the majority of sales relating to food for the consumption off-premises.

"Gross area" means the total usable area including accessory and common space dedication to such things as streets, easements and uses out of character with the principal use but within a unit of area being measured.

"Guest house" means an accessory, detached dwelling without kitchen facilities, designed for and used to house transient visitors or guests of the occupants of the main building without compensation.

“Half street.” See "Street."

"Hammerhead" means a term used to describe a particular style of turnaround for emergency vehicles designed in accordance with guidelines in the Camas Design Standard Manual.

“Hardware store.” See "Building, hardware and garden supply store."

"Hazard tree," means any tree with a combination of structural defect and/or disease, which makes it subject to a high probability of failure and a proximity to persons or property which makes it an imminent threat.

"Hazardous waste storage" means the holding of dangerous waste for a temporary period, as regulated by state dangerous waste regulations, Chapter 173-303, Washington Administrative Code.

“Hazardous waste treatment and storage facility, off-site,” or "off-site hazardous waste treatment and storage facility," means treatment and storage facilities of hazardous wastes generated on properties other than those on which the off-site facility is located.

“Hazardous waste treatment and storage facility, on-site,” or "on-site hazardous waste treatment and storage facility," means treatment and storage of hazardous wastes generated on-site.

"Hazardous waste treatment" means the physical, chemical or biological processing of dangerous waste to make waste nondangerous or less dangerous, safer for transport, amenable for energy or material resource recovery, amenable for storage, or reduced in volume.

"Hazardous waste" means all dangerous and extremely hazardous, as defined in RCW 70.105.010, except for moderate-risk waste.

"Hearings examiner" conducts quasi-judicial public hearings for land development applications and renders decisions based on regulations and policies as provided in Camas Municipal Code and other ordinances. See CMC Chapter 2.15 Hearing Examiner System.

“Height of building.” See "Building height."

"Highest adjacent grade" means the highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

"Hillsides" means geological features of the landscape having slopes of fifteen percent or greater. To differentiate between levels of hillside protection and the application of development standards, the city categorizes hillsides into four groups: hillsides of at least fifteen percent but less than forty percent; hillsides with unstable slopes; hillsides of forty percent slope and greater; hillsides which are ravine sidewalls or bluffs.

"Historic structure" means any structure that is:

A. Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

B. Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the secretary to qualify as a registered historic district;

C. Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of Interior; or

D. Individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either:

    1. By an approved state program as determined by the Secretary of the Interior, or

    2. Directly by the Secretary of the Interior in states without approved programs.

"Home occupation." See CMC Chapter 18.39 Home Occupations.

"Home, designated manufactured" means a manufactured home which:

(a) is comprised of at least two fully enclosed parallel sections each not less than twelve (12) feet wide by thirty-six feet long;

(b) was originally constructed with and now has composition or wood shake or shingle, coated metal, or similar roof, or not less than 3:12 pitch;

(c) has exterior siding similar in appearance to siding materials commonly used on conventional site-built IBC single-family residences; and

(d) is placed upon a permanent foundation.

"Home, manufactured" means a single-family residence constructed after June 15, 1976, in accordance with the U.S. Department of Housing and Urban Development (HUD) requirements for manufactured housing, and bearing the appropriate insignia indicating such compliance.

"Home, mobile" means a single-family residence transportable in one or more sections that are eight feet or more in width and thirty-two feet or more in length, built on a permanent chassis, designed to be used as a permanent dwelling and constructed before June 15, 1976. Such home shall be installed in accordance with applicable WAC rules and regulations.

"Home, modular" means a structure constructed in a factory in accordance with the International Building Code and bearing the appropriate insignia indicating such compliance. This definition includes "prefabricated," "panelized," and "factory built" units. Such home shall be installed in accordance with applicable WAC rules and regulations.

"Homeowner's association" means an incorporated, nonprofit organization operating under recorded land agreements through which: (a) each lot owner is automatically a member; and (b) each lot is automatically subject to a charge for a proportionate share of the expenses for the organization's activities, such as maintaining a common property.

"Hospital" means an establishment that provides sleeping and eating facilities to persons receiving medical, obstetrical or surgical care and nursing service on a continuous basis.

"Hotel" means a building or buildings in which short-term lodging is provided for a fee for up to thirty consecutive nights. The facility may provide such things as restaurants, meeting rooms, self-service kitchens, and/or other auxiliary facilities and services. This definition is interchangeable with "motel," "hostel," and "inn."

"IBC" means the International Building Code as adopted by city council.

"IFC" means the International Fire Code as adopted by the city council.

"Infrastructure acreage" means the total area of public improvements including any utility or private road outside of the lot area, street right-of-way, and storm drainage facilities.

"IRC" means the International Residential Code as adopted by the city council.

“Junkyard.” See "Wrecking yard."

"Kennel/boarding (incidental use)" means any premises or building in which four or more dogs or cats at least four months of age are kept commercially for training or board. Propagation and sale of pets may not occur as an incidental use. Facilities for the boarding of animals may occupy no more than 30 percent of the gross floor area of the primary building and must be indoors. Excessive barking may be considered cause for revocation of permit in accordance with CMC Section 9.32.050 Public disturbance noises.

"Kennel/commercial boarding (primary use)" means any premises or building in which four or more dogs or cats at least four months of age kept commercially for board, propagation or sale. Facilities for kennels/boarding must be entirely indoors, unless otherwise approved with a Type III permit.

"Land development" means any project subject to review under Title 16, 17 or 18.

“Laundry, self-service,” or "self-service laundry," means a business providing coin-operated machines for home type washing, drying, and/or ironing to be performed primarily by customers.

“Laundry/dry cleaning (industrial),” or "industrial laundry/dry cleaning," means a business supplying bulk laundry services, such as linen and uniform services on a rental or contract basis. May also include cleaning used carpets and upholstery.

“Laundry/dry cleaning (retail),” or "retail laundry/dry cleaning," means a business providing drop-off and pick-up services of laundry and dry cleaning (except coin- operated); and providing specialty cleaning services for specific types of garments and other textile items (except carpets and upholstery), such as fur, leather, or suede garments; wedding gowns; hats; draperies; and pillows.

“Live work unit,” or "live-work," means a type of residential mixed-use development that combines a nonresidential use with a residential use in the same unit, and where a resident uses the workspace. The living space may be located in front or behind the workspace on the same floor or on a separate floor.

"Lot area" means the total square footage of a lot.

"Lot coverage" means the portion of a lot that is occupied by the principal and accessory buildings, including all projections except eaves, expressed as a percentage of the total lot area.

"Lot depth" means the horizontal distance from the midpoint of the front lot line to the midpoint of the rear lot line.

"Lot line" means the property line bounding a lot.

“Lot line, front,” or "front lot line," means, in the case of an interior lot, the lot line separating the lot from a street other than an alley, and in the case of a corner lot, the shortest lot line separating the lot from a street other than an alley.

“Lot line, rear,” or "rear lot line," means a lot line which is opposite and most distant from the front lot line. In the case of an irregular shaped lot, a line ten feet in length within the lot parallel to and most distant from the front lot line shall be considered the rear lot line for purposes of determining required setbacks. See Figure 18.03-6.

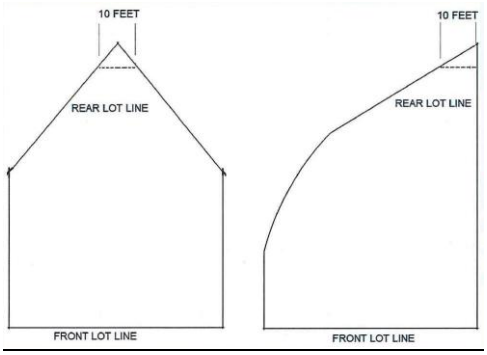

Figure 18.03-6 Rear Lot Line in the Case of an Irregular Lot

“Lot line, side,” or "side lot line," means any lot line not a front or rear lot line. See Figure 18.03-8.

"Lot width" means the horizontal distance between the side lot lines at a point midway between the front and rear property lines.

"Lot width" means the horizontal distance between the side lot lines at a point midway between the front and rear property lines.

"Lot" means a fractional part of divided lands having fixed boundaries, being of sufficient area and dimension to meet minimum zoning requirements for width and area. The term shall include parcels.

“Lot, corner,” or "corner lot," means a lot abutting on two intersecting streets other than an alley provided that the streets do not intersect at an angle greater than one hundred thirty-five degrees. See Figure 18.03-7.

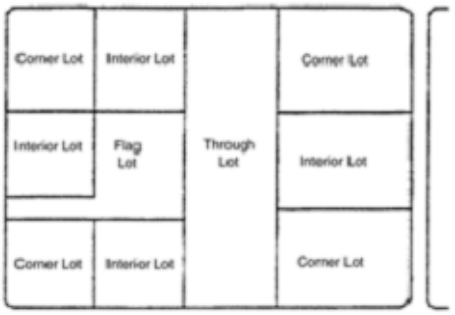

Figure 18.03-7
Lot Configuration

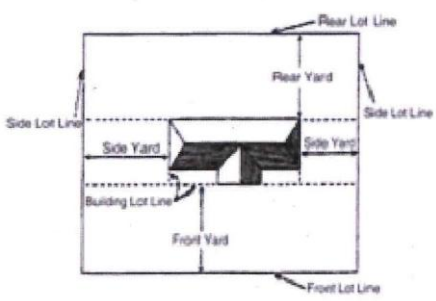

Figure 18.03-8
Yard and Lot Lines

"Lot, interior," or "interior lot," means a lot other than a corner lot. See Figure 18.03-7.

"Lot, parent" means a lot which is subdivided into unit lots through the unit lot subdivision process; or a lot that is subjected to the administrative lot split process

"Lot, through," or "through lot," means a lot having frontage on two parallel or approximately parallel streets. See Figure 18.03-7.

"Lot, unit" means a lot created from a parent lot and approved through the unit lot subdivision process.

"Lowest floor" means the lowest floor of the lowest enclosed area (including basement). An unfinished or flood-resistant enclosure, usable solely for parking of vehicles, building access or storage, in an area other than a basement area, is not considered a building's lowest floor; provided, that such enclosure is not built so as to render the structure in violation of the applicable non-elevation design requirements found in CMC Chapter 16.57.

"Major transit stop" means a stop on a high capacity transportation system funded or expanded under the provisions of chapter 81.104 RCW, commuter rail stops, stops on rail or fixed guideway systems, and stops on bus rapid transit routes.

"Manufactured home park" means any property meeting the minimum standards established in CMC Chapter 18.29 "Manufactured home parks," which would be divided into individual spaces for sale, lease or rent for the accommodation of occupied manufactured/mobile homes.

"Marginal access street." See "Street."

"Marijuana processor" means a facility licensed by the Washington Liquor Control Board to transform marijuana into usable marijuana and marijuana-infused products into useable marijuana and marijuana-infused

products, package and label useable marijuana and marijuana-infused products for sale in retail outlets, and sell usable marijuana and marijuana-infused products at wholesale to marijuana retailers. Processors are classified as follows:

Processor I, a facility limited to drying, curing, trimming, and packaging; and

Processor II, a facility that extracts concentrates, infuses products, or involves mechanical and/or chemical processing in addition to drying, curing, trimming, and packaging.

"Marijuana producer" means a facility licensed by the Washington State Liquor Control Board for the growing and sale at wholesale of marijuana to marijuana processors and other marijuana producers.

"Marijuana retailer" means a facility licensed by the Washington State Liquor Control Board for the sale to consumers of usable marijuana and marijuana-infused products.

“Mass timber construction” means a building with structural components primarily made of mass timber products as defined in RCW 19.27.570.

"Mean sea level" for purposes of the National Flood Insurance Program, the vertical datum to which base flood elevations shown on a community's flood insurance rate map are referenced.

"Meeting facility" means a primary or secondary use in which a room or series of rooms are available for businesses purposes on an hourly or daily rate.

"Middle housing" means buildings that are compatible in scale, form, and character with single-family houses and contain two or more attached, stacked, or clustered homes including duplexes, triplexes, fourplexes, townhouses, stacked flats, courtyard apartments, and cottage housing.

"Mini-storage facility" means a building consisting of individual, small, self-contained units that are leased or owned for the storage of business and household goods or contractor's supplies. May also include an accessory residential use, which will not exceed nine hundred square feet of floor area or forty percent of the primary building size, whichever is lesser. This singular, accessory dwelling is intended solely as living quarters for security staff or for the manager, and shall not be leased to non-employees of the facility.

“Minor street.” See "Street."

"Mitigation" means the use of any combination of, or all of the following actions:

A. Avoid impacts to environmentally sensitive areas by not taking a certain action, or parts of an action;

B. Minimize impacts by limiting the degree or magnitude of the action and its implementation, by using appropriate technology, or by taking affirmative steps to avoid or reduce impacts;

C. Rectifying the impact by repairing, rehabilitating, or restoring the affected environmentally sensitive area;

D. Reducing or eliminating the impact over time by reservation and maintenance operations during the life of the development proposal;

E. Compensating for the impact by replacing or enhancing environmentally sensitive areas, or providing substitute resources.

"Modular construction" means a multistory residential or commercial building constructed of standardized components produced off-site, which are transported and assembled at a final location.

"New construction" for the purposes of determining insurance rates, means structures for which the "start of construction" commenced on or after the effective date of an initial flood insurance rate map or after December 31, 1974, whichever is later, and includes any subsequent improvements to such structures. For floodplain management purposes, "new construction" means structures for which the "start of construction" commenced on

or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures.

"Newspaper printing plant" means a building housing a business to include the writing, layout, editing, and publishing of a newspaper.

"Nonconforming building or use." See CMC Chapter 18.41 Nonconforming Uses.

“Non-residential use” means a use, building, or structure that is intended for something other than residential living, including commercial, retail, office, and personal services use, but excluding storage or warehousing of any kind.

“Nursery, plant,” or "plant nursery," means an enterprise, establishment, or portion thereof that conducts the retailing or wholesaling of plants grown on the site, as well as accessory items (but not farm implements). The accessory items normally sold include items such as clay pots, potting soil, fertilizers, insecticides, hanging baskets, rakes and shovels.

"Nursing, rest or convalescent home" means an establishment which provides full-time care for three or more chronically ill or infirm persons. Such care shall not include surgical, drug or alcohol treatment services, or obstetrical or acute illness services. See residential treatment facility (RTF) definition for drug and alcohol treatment services.

"Office supply store" means stores selling office products such as stationery, legal forms, writing implements, typewriters, computers, copiers, office furniture, and the like.

"Open space connectors" means tracts of land with typically no sensitive lands that connect parcels of land to form the open space network.

"Open space network" means a network of open space composed of mostly wooded areas, steep slopes, ravines, streams and waterways, as areas identified in the comprehensive parks, recreation, and open space plan.

"Open space" means land set aside and maintained in a natural state, providing air, light, and habitat for wildlife, and/or containing significant trees and vegetation. Open space may contain environmentally sensitive lands, which include but are not limited to steep slopes and areas with unstable soils, wetlands, and streams and watercourses. Open space may also provide for active and passive recreation use. There are two general categories of open space, which are as follows:

A. "Natural open space" means land devoted to protecting environmentally sensitive lands as defined in this title and CMC Title 16. Natural open space generally has no developed areas, with the exception of trails as identified in the comprehensive parks, recreation, open space plan, or by a condition of development approval.

B. "Recreational open space" means land set aside for recreational opportunities, which may contain trails, sports fields, playgrounds, swimming pools, tennis courts, and picnic areas. Recreational open space is generally limited in size and intensity, proportionate to the development, and is intended for the enjoyment of the residents of the development.

"Owner" means the persons/organization who hold legal right to the property. The owner may also serve as applicant, developer and contractor.

"Passive house requirements" means the criteria for certification as a passive house by Phius or the international passive house institute.

"Pawnshop" means establishments who lend money on goods deposited until redeemed.

"Pawnshop" means establishments who lend money on goods deposited until redeemed.

"Pedestrian way" means a right-of-way for pedestrian traffic connecting two streets other than at an intersection.

"People with functional disabilities" means a person who, because of a recognized chronic physical or mental condition or disease, is functionally disabled to the extent of:

1. Needing care, supervision or monitoring to perform activities of daily or instrumental activities of daily living;
2. Needing supports to ameliorate or compensate for the effects of the functional disability so as to lead as independent a life as possible;
3. Having a physical or mental impairment which substantially limits one or more of such person's major life activities; or
4. Having a record of having such an impairment, but such term does not include current, illegal use of or active addiction to a controlled substance.

"Performance bond" means a pledge, guarantee or bond, usually to back the performance of an individual or company. The bond guarantees the contractor's performance. A performance bond is generally used to ensure that a particular obligation will be completed at a certain date or that a contract will be performed as stated. It has no end date, but terminates upon successful completion of obligation.

"Permanent supportive housing" means subsidized, leased housing with no limit on of stay, that prioritizes people who need comprehensive support services to retain tenancy and utilizes admissions practices designed to use lower barriers to entry than would be typical for other subsidized or unsubsidized rental housing, especially related to rental history, criminal history, and personal behaviors. Permanent supportive housing is paired with on-site or off-site voluntary services designed to support a person living with a complex and disabling behavioral health or physical health condition who was experiencing homelessness or was at imminent risk of homelessness prior to moving into housing to retain their housing and be a successful tenant in a housing arrangement, improve the residents' health status, and connect the resident of the housing with community-based health care, treatment, or employment services. Permanent supportive housing is subject to all of the rights and responsibilities defined in chapter 59.18 RCW.

"Person" means an individual, firm, partnership, corporation, company, association, syndicate or any legal entity, including any trustee, receiver, assignee or other similar representative thereof.

"Pet shop" means establishments engaged in the retail sale of pets, pet food, supplies and the grooming of pets and other small animals.

“Pharmacy.” See "Drug store."

"Phase" means a group of lots, tracts or parcels within well identified and fixed boundaries. The term shall include blocks. Phases shall be consecutively numbered.

"Photographic store" and "electronic store" mean establishments engaged in the retail sale of camera and photographic supplies and a variety of household electronic equipment.

"Planned residential development (PRD)." See CMC Chapter 18.23 Planned Residential Development.

"Planning commission" means the planning commission of the City of Camas.

"Planning control area" means an area in a state of incomplete development within which special control is to be exercised over land partitioning.

"Plat" means a map or representation of a subdivision, showing thereon the division for a tract or parcel of land into lots, blocks, streets and alleys, or other divisions and dedications.

"Preliminary plat" means a neat and approximate drawing of a proposed subdivision showing the general layout of streets and alleys, lots, blocks, tracts and other elements of a land division consistent with the requirements of this chapter. The preliminary plat shall be the basis of the approval or disapproval of the general layout of the land division.

"Principal use" means the primary or predominant use of a lot, building, structure, or tenant space, as distinguished from an accessory use.

"Print shop" means a retail establishment that provides duplicating services using photocopy, blueprint, and offset printing equipment, including collating of booklets and reports.

"Professional offices" means an office containing activities such as those offered by a physician, surgeon, dentist, lawyer, architect, engineer, accountant, artist or teacher, real estate or insurance sales.

"Protective mechanism" means a method of providing permanent protection to open space, and shall include conservation easements, dedication to the city, conveyance to a public or private land trust, conveyance to a homeowner's association, restrictive covenants, or any combination of such mechanisms.

"Public agency" means any agency office for the administration of any governmental activity or program.

"Punch list" means a term used by the engineering department to designate items still to be completed per conditions of approval and city standards for the land use to reach final acceptance phase of the approval process.

"Ravine sidewall" means a steep slope which abuts and rises from the valley floor of a stream, and which was created by the wearing action of the stream. Ravine sidewalls contain slopes predominantly in excess of forty percent, although portions may be less than forty percent. The toe of a ravine sidewall is the stream valley floor. The top of a ravine sidewall is typically a distinct line where the slope abruptly levels out. Where there is no distinct break in slope, the top is where the slope diminishes to less than fifteen percent. Minor natural or man-made breaks in the slope of ravine sidewalls shall not be considered as the top. Benches with slopes less than fifteen percent, and containing developable areas, shall be considered as the top.

"Recreational vehicle (RV) park" means any lot of land upon which two or more recreational vehicle sites are located, established, or maintained for occupancy by recreational vehicles of the general public as temporary living quarters for recreation or vacation purposes.

"Recreational vehicle" means a vehicle which is: a) built on a single chassis; b) four hundred square feet or less when measured at the largest horizontal projection; c) designed to be self-propelled or permanently towable by a light duty truck; and d) designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel, or seasonal use.

"Recycling center" means a building in which used material is separated and processed prior to shipment to others who will use those materials to manufacture new products.

"Recycling collection point" means a collection point for recoverable resources, such as newspapers, glassware, and metal cans, with processing of items occurring off-site. See Figure 18.03-1.

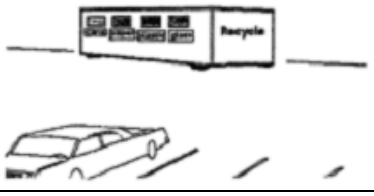

Figure 18.03-1 Recycling Collection Point

"Recycling plant" means a facility that is not a junkyard and in which recoverable resources, such as newspapers, glass, metal cans and other products are reprocessed and treated to return such products to a condition in which they may again be used for production.

"Residential care facility" means a facility, licensed by the state of Washington, that cares for at least five but not more than fifteen people with functional disabilities, and that has not been licensed as an adult family home pursuant to RCW 70.128.175.

"Residential treatment facility (RTF)" means a facility meeting applicable state and federal standards that provides support services including, but not limited to, counseling, rehabilitation and medical supervision for the need of drug or alcohol treatment. An RTF may function as a residence, day-treatment facility, or a combination thereof. An RTF may be staffed by resident or nonresident staff and may include more than eight unrelated individuals. An RTF shall not be located within one thousand feet of public and private schools, public parks, public libraries, other RTFs, or similar uses.

"Restaurant" means an establishment that serves food and beverages primarily to persons seated within the building. This includes cafes, coffee shops, tearooms, and outdoor cafes.

“Restaurant, fast food,” or a "fast food restaurant," means an establishment that offers quick food service, which is accomplished through a limited menu of items already prepared and held for service, or prepared, fried, or grilled quickly, or heated in a device such as a microwave oven. Orders are not generally taken at the customer's table, and food is generally served in disposable wrapping of containers. The establishment may also offer drive-up or drive-through service.

“Retail, active” means street-facing, ground-floor uses that encourage walkability and activate sidewalks, such as shops, cafés, restaurants, and other active, customer-oriented

“Retail, passive” refers to commercial activities that primarily serve building occupants or a smaller customer base – such as boutique offices, lobby kiosks, or specialty shops – which typically generate less foot traffic and require less window visibility.

"Right-of-way" (commonly referred to as ROW) means the area between boundary lines of a street or other easement.

"Roadside produce stand" means an establishment engaged in the retail sale of local fresh fruits and vegetables and having permanent or semi-permanent structures associated with such use.

"Roadway" means the portion of a street right-of-way developed for vehicular traffic.

"Rowhouse." See "Dwelling, single-family attached."

"Second-hand/consignment store" means an establishment engaged in the retail sale of used clothing, sports equipment, appliances and other merchandise.

"Sensitive area(s) map(s)" means those maps adopted, and/or incorporated by reference, by the city to identify the general location of environmentally sensitive or valuable areas. In case of questions as to map boundaries or mapping errors, the presence or absence of a sensitive area shall be determined in the field by a qualified professional, experienced in a discipline appropriate to evaluation of the appropriate feature, and shall determine the applicability of this chapter.

"Sensitive areas and open space." For related definitions see CMC Section 18.03.050 Environmental definitions.

"Setback." See "Yard."

"Shorelines." For related definitions see CMC Section 18.88.030 Definitions in Chapter 18.88 Shoreline Management.

"Short plat" means a map or representation of a short subdivision.

"Short subdivision" means the division of land into nine or fewer lots, sites or divisions for the purpose of sale or lease.

"Sidewalk area" means the portion of a street right-of-way between proposed curb line and adjacent lot line.

"Sidewalk" means a pedestrian walkway with permanent surfacing to city standards.

"Significant trees" means evergreen trees eight inches DBH, and deciduous trees twelve inches DBH. Does not include hazard trees or invasive species.

"Signs." For related definitions see Chapter 18.15 Signs.

"Single-family attached dwelling" means a single household dwelling attached to another single household dwelling by a common vertical wall, and each dwelling is owned individually and located on a separate lot. See also "townhouses".

"Smoke shop/head shop" means any premises where the primary use (fifty percent or more of the net floor area of a business) is dedicated to the display, sale, distributions, delivery, offerings, furnishing, or marketing of tobacco, tobacco products or tobacco paraphernalia.

"Sober living homes" means a home-like environment that promotes healthy recovery from a substance use disorder and supports persons recovering from a substance use disorder through the use of peer recovery support. Sober living homes are limited to no more than eight unrelated individuals.

"Social gathering hall" means a building used primarily by community groups and organizations for meetings, celebrations, bingo and other events.

"Specialty goods production" means small-scale businesses that manufacture artisan goods or specialty foods. Small manufacturing production aims at direct sales rather than the wholesale market. This use may include public viewing, tasting area for consumption on site, restaurant or café, and other customer service space. This use category includes the following: Microbreweries (a.k.a. Brew pub), microdistilleries, and wineries; fruit and vegetable preserving and specialty foods; and artisan leather, glass, cutlery, hand tools, wood, paper, ceramic, textile and yarn products.

"Stacked flat" means dwelling units in a residential building of no more than three stories on a residential zoned lot in which each floor may be separately rented or owned.

"Start of construction" means and includes substantial improvement, and means the date the building permit was issued, provided that the actual start of construction, repair, reconstruction, placement, or other improvement was within one hundred eighty days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the state of excavation; of the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading, and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers or foundation, or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

"Steep slopes" or "area with potential unstable soils" means any land potentially subject to landslides, severe erosion, or seismic activity (earthquake faults). Steep slopes are generally characterized by slopes of fifteen percent or greater, impermeable subsurface material (sometimes interbedded with permeable subsurface material), and/or springs or seeping groundwater during the wet season. Seismic areas are those lying along or adjacent to identified earthquakes faults.

"Stock broker, brokerage firm" means a qualified and regulated professional or company that oversees financial assets, buys and sells (trades) shares or stocks, and other securities through market makers on behalf of investors.

"Story" means the space between two successive floors in a building. The top floor shall be the space between the floor surface and the underside of the roof framing. A basement shall be counted as a story if over fifty percent of its ceiling is over six feet above the average finished grade of the adjoining ground surface.

"Story, first," or "first story," means the lowest story in a building which qualifies as a story, as defined in this chapter, except that a floor level in a building having only one floor level shall be classified as a first story, provided such floor level is not more than eight feet below grade, as defined in this chapter, at any point.

"Story, half," or "half-story," means a space under a roof which has the line of intersection of roof decking and exterior wall face not more than four feet above the top floor level. A half-story containing one or more dwellings shall be counted as a full story.

"Stream" or "watercourse" means those areas where surface waters produce a defined channel or bed. The channel or bed need not contain water year-round. This definition does not include irrigation ditches, canals, storm or surface water conveyance devices, or other entirely artificial watercourses. Streams are further categorized as Class 1 through 5 in accordance with the classifications used by WAC 222-16-030.

"Street" means the entire width between the boundary of property or lot lines, for the purpose of vehicular and pedestrian traffic. See Table 17.19-1.

1. "Access easement" refers to "private road."
2. "Alley" means a narrow street primarily for vehicular service access to the back or side of properties otherwise abutting on another street.
3. "Arterial" means a street of considerable continuity that is primarily a traffic artery for intercommunication among large areas. There are usually three to five lanes of traffic.
4. "Collector" means a street supplementary to the arterial street system and a means of intercommunication between this system and smaller areas; used to some extent for through traffic and to some extent for access to abutting properties. There are usually two to three lanes of traffic.
5. "Cul-de-sac (dead-end street)" means a short street having one end open to traffic and being terminated by a vehicle turnaround. See Design Standards Manual for required right-of-way, pavement, curb and gutters.
6. "Driveway" see "Private road."
7. "Half street" means a portion of the width of a street usually along the edge of a subdivision where the remaining portion of the street could be provided in another subdivision.
8. "Marginal access street" means those streets whose primary function is the circulation of through traffic and shall include all major and secondary arterials and all collector streets identified in the city comprehensive plan.
9. "Minor street" means a street intended exclusively for access to abutting properties. Also referred to as a neighborhood street. This type of street has only two lanes of traffic.
10. "Private road" means a strip of land that provides access to a lot, tract or parcel. This road is privately maintained but is designed and installed per Table 17.19-1 and with approval of the engineering manager.

"Structural alteration" means any change to the supporting members of a building including foundations, bearing walls or partitions, columns, beams or gliders, or any structural change in the roof.

"Structure" for floodplain management purposes, means a walled and roofed building, including a gas or liquid storage tank, that is principally above ground, as well as a manufactured home.

"Structure" means that which is built or constructed. An edifice or building of any kind or any piece of work artificially built up or composed of parts joined together in some definite manner.

"Subdivision improvement bond" means a guarantee that improvements to an approved residential development will be completed in accordance with city standards, and code as stated in conditions of approval.

The owner is the principle and the city is the obligee. There is no expiration date on this type of bond but it terminates upon acceptance of improvements by the city. The bond is issued in the amount equal to one hundred five percent of the cost of all public improvements and any improvements required as part of the conditions of approval per CMC Section 17.21.050 Bonds and other financial agreements.

"Subdivision" means a division or redivision of land into ten or more lots, tracts, sites or divisions for the purpose of sales, lease or transfer of ownership.

"Substantial damage" means damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed fifty percent of the market value of the structure before the damage occurred.

"Substantial improvement" for the purposes of CMC 16.57 Frequently Flooded Areas, means any repair, reconstruction, or improvement of a structure, the cost of which equals or exceeds fifty percent of the market value of the structure either:

1) Before the improvement or repair is started; or

2) If the structure has been damaged and is being restored, before the damage occurred. For the purposes of this definition "substantial improvement" is considered to occur when the first alteration of any wall, ceiling, floor, or other structural part of the building commences, whether or not that alteration affects the external dimensions of the structure.

The term can exclude:

1) Any project for improvement of a structure to correct pre-cited existing violations of state or local health, sanitary, or safety code specifications which have been previously identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions, or

2) Any alteration of a structure listed on the National Register of Historic Places or a State Inventory of Historic Places.

"Supported living arrangement" means a living unit owned or rented by one or more persons with functional disabilities who receive assistance with activities of daily living, instrumental activities of daily living, and/or medical care from an individual or agency licensed and/or reimbursed by a public agency to provide such assistance.

"Tavern" means an establishment primarily serving alcoholic beverages for consumption on-site. Secondary activities may include dining, music, bottling, and sale of bottled beverages prepared on-site.

"Telecommunications." See Section 18.35.030 Definitions in Chapter 18.35 Telecommunications Ordinance.

"Tiny house communities" means real property rented or held out for rent to others for the placement of tiny houses with wheels or tiny houses as approved through site plan review (Chapter 18.18).

"Tiny house" and "Tiny house with wheels" mean a dwelling to be used as permanent housing with permanent provisions for living, sleeping, eating, cooking, and sanitation built in accordance with state building code.

"Tobacco paraphernalia" means any paraphernalia, equipment, device, or instrument that is primarily designed or manufactured for the smoking, chewing, absorbing, dissolving, inhaling, snorting, sniffing, or ingesting by any other means into the body of tobacco, tobacco, tobacco products, marijuana, marijuana products, or other controlled substances as defined by the state of Washington. Items or devices classified as tobacco paraphernalia include but are not limited to the following: pipes, punctured metal bowls, bongs, water bongs, electric pipes, e-cigarettes, e-cigarette juice, buzz bombs, vaporizers, hookahs, and devices for holding burning material. Lighters and matches shall be excluded from the definition of tobacco paraphernalia.

"Tobacco product" means any product in leaf, flake, plug, liquid, or any other form, containing nicotine derived from the tobacco plant, or otherwise derived, which is intended to enable human consumption of the tobacco or nicotine in the produce, whether smoked, chewed, absorbed, dissolved, inhaled, snorted, sniffed, or ingested by any other means. For the purposes of this chapter, the term "tobacco product" excludes any product that has been specifically approved by the United States Food and Drug Administration (FDA) for sale as tobacco/smoking cessation product or for other medical purposes, where such product is marketed and sold solely for such an approved purpose.

"Townhouses" means buildings that contain three or more attached single-family dwelling units that extend from foundation to roof and that have a yard or public way on not less than two sides.

"Tract" means an area dedicated to such things as streets, easements and uses out of character with the principal use, but within a unit of area being measured. Tracts may include critical areas, storm ponds, and forestlands, parkland and other open space. Tracts shall not be considered lots for the purpose of determining short plat or subdivision status. Tracts shall not be considered buildable lots of record.

"Transitional housing" means a project that provides housing and supportive services to homeless persons or families for up to two years and that has as its purpose facilitating the movement of homeless persons and families into independent living.

"Tree protection zone" is an arborist-defined area surrounding the trunk intended to protect roots and soil within the critical root zone and beyond, to ensure future tree health and stability. Tree protection zones may be calculated based on multiplying the tree's DBH by a factor of twelve depending on the tree's species and tolerance of root disturbance.

"Triplex" means a residential building with three attached dwelling units.

"Turn-arounds" are any location identified by the city engineering manager as necessary to be improved for emergency and other vehicles to turn around.

"UBC." See "IBC" or "IRC."

"Unit density" means the number of dwelling units (including accessory dwelling units) allowed on a lot, regardless of lot size.

"Unit lot subdivision" means the division of a parent lot into two or more unit lots within a development and approved through the unit lot subdivision process.

"Usable Open Space" means areas planned and improved to provide opportunities for active recreation, passive relaxation, or community interaction, and that are accessible to the public or to residents, employees, or customers in common. Examples include plazas, courtyards, private parks, sport fields and courts, and viewpoints overlooking natural resource areas. Usable Open Space does not include public parks unless the parks were approved as Usable Open Space and conveyed to the City.

"Use" means an activity or a purpose for which land or a structure is designed, arranged or intended, or for which it is occupied or maintained.

“Utility facilities, minor,” or "minor utility facilities," means those facilities which have a local impact on surrounding properties and are necessary to provide essential services such as:

1. Substations (transmission and distribution);

2. Pump stations;

3. Outfalls;

4. Water towers and reservoirs;

5. Public wells;

6. Cable television receiver and transmission facilities, excluding wireless communications facilities as defined in CMC Section 18.35.030 Definitions;

7. Catch basins, retention ponds, etc.;

8. Water treatment facilities.

"Variance" means a grant of relief by a community from the terms of a floodplain management regulation.

"Veterinarian clinic" means a facility established to provide examination, diagnostic, and health maintenance services for medical and services for medical and surgical treatment of companion animals on an outpatient basis. A veterinarian clinic operates during regular business hours and discharges all patients prior to closing time.

"Veterinarian hospital" means a facility established to provide examination, diagnostic and health maintenance services for medical and surgical treatment of companion animals and equipped to provide housing and nursing care for them during illness or convalescence.

"Vision clearance area" means a triangular area on a lot at the intersection of two streets, or a street and an alley, or a street and a railroad, two sides of which are lot lines measured from their corner intersection for a distance specified in the code. The third side of the triangle is a line across the corner of the lot adjoining the ends of the other two sides. Where the lot lines at intersections have rounded corners, the lot lines will be extended in a straight line to a point of intersection. See Section 18.17.030 [Corner lot vision clearance area,] along with Figures 18.17-030-1 and 18.17-030-2.

"Vision clearance hazard," means an object that interferes with vision near intersections of roadways and motor vehicle access points where a clear field of vision is required for traffic safety and to maintain adequate sight distance. See also ["Corner lot vision clearance area"] design provisions at Section 18.17.030.

“Warehouse, bulk retail,” or "bulk retail warehouse," means a building primarily used for the storage and retail sale of large quantities of goods and materials.

“Warehouse, wholesale and distribution,” or "wholesale and distribution warehouse," means a use engaged in storage, wholesale, and distribution of manufactured products, supplies, and equipment, but excluding bulk storage of materials that are inflammable or explosive or that create hazardous or commonly recognized offensive conditions.

"Warranty bond" means and is referred to as a function and maintenance bond, it is generally used to insure the satisfactory operation to public improvements within an approved development. The developer is the principal and the city is the obligee. The warranty bond has a beginning and ending date in amount specified per CMC Section 17.21.040(B)(1). At the end of the warranty period, the city will assume responsibility for the maintenance and repair of the public improvement.

"Water dependent" means a use or portion of a use that cannot exist in a location which is not adjacent to the water, and which is dependent on the water by reason of the intrinsic nature of it operations. Examples include, but are not limited to: aquaculture, marinas, or float plane facilities.

"Wetland bond" insures the satisfactory installation, maintenance, and monitoring of wetland creation or enhancement as may be required as part of the SEPA or wetland mitigation plans. The bond has a beginning and ending date, and shall be in the amount as specified in CMC Section 17.21.050(B)(3).

"Wetland buffer" means a naturally vegetated and undisturbed, enhanced or revegetated area surrounding wetland that is part of a wetland ecosystem and protect a wetland from adverse impacts to its function, integrity, and value. Wetland buffers serve to moderate runoff volume and flow rates; reduce sediment, chemical nutrient and toxic pollutants; provide shading to maintain desirable water temperatures; provide habitat for wildlife; and protect wetland resources from human activities.

"Wetlands" means areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation

typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs and similar areas. Wetlands do not include those artificial wetlands intentionally created from nonwetland sites, including, but not limited to, irrigation and drainage ditches, grass-lined swales, canals, detention facilities, wastewater treatment facilities, farm ponds, and landscape amenities. However, wetlands include those artificial wetlands intentionally created to mitigate conversions of wetlands.

"Wildlife habitat" means areas that provide food, protective cover, nesting, breeding, or movement for threatened, endangered, sensitive, monitor, or priority species of wildlife, or other wildlife species of special concern. "Wildlife habitat" shall also mean areas that are the location of threatened, endangered, sensitive, monitor, or priority species of plants, or other plant species of special concern.

"Wireless." See Chapter 18.35 Telecommunication Ordinance.

"Yard" means an open space, other than a court or accessory structure, unobstructed from the ground to the sky, except where specifically provided by this code, on the lot on which a building is situated. See Figure 18.03-8.

"Yard, front," or "front yard," means an open space between the side lot lines and measured horizontally, from the front lot line at right angles to the front lot line, to the nearest point of the building. See Figures 18.03-8 and 18.03-6.

"Yard, rear," or "rear yard," means an open space between side lot lines and measured horizontally, at right angles from the rear lot line, to the nearest point of the main building. See Figures 18.03-8 and 18.03-6.

"Yard, sde," or "side yard," means an open space between a building and the side lot line measured horizontally, at right angles from the side lot line, to the nearest point of the main building. See Figure 18.03-8.

Chapter 18.05 ZONING MAP AND DISTRICTS

18.05.010 Zoning maps administration.

A. This title shall consist of the text titled the "City of Camas Zoning Code," and that certain map or books of maps identified by the approving signatures of the mayor and the city clerk, and marked and designated as "The Zoning Map of the City of Camas," which map or book of maps shall be placed on file in the offices of the city clerk, county auditor, and other city departments. This title, and each and all of its terms and map details, is to be interpreted in light of the context of the book of maps in relationship to the comprehensive plan. In any conflict between the maps and the text of this code the text shall prevail.

B. Zoning Text and Map Amendments. Amendments may be proposed by city council or by the planning commission on its own motion, or such an amendment may be proposed by an applicant or city staff pursuant to CMC Chapter 18.51 Comprehensive Plan and Zoning Amendments.

C. Administration and Procedures. A correct copy of each amendment to the text or to the map established by this title shall be maintained on file in the offices of the city clerk and the planning official.

D. Site Specific Rezones. A site specific rezone involves an application of an owner of a specific parcel or set of contiguous parcels that does not require modification of the comprehensive plan. Site specific rezones are decided by the hearing officer after a public hearing. The criteria for reviewing and approving a site specific rezone are as follows:

1. The use or change in zoning requested shall be in conformity with the adopted comprehensive plan, the provisions of this title, and the public interest.

2. The proposed zone change shall be compatible with the existing established development pattern of the surrounding area in terms of lot sizes, densities and uses.

E. Timing and Responsibility for Updating Official Zoning Map. All amendments hereafter made to the zoning map by ordinance shall be shown on such map(s), and it shall be the responsibility of the planning official to keep the maps up to date at all times. Any amendments to the zoning map shall be made in accordance with the comprehensive plan map, as amended.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.05.020 Districts designated.

For the purposes of the Code, the city is divided into zoning districts designated as follows:

District	Symbol	Comprehensive Plan Designation
Residential-6	R-6	Residential - Low
Residential-7.5	R-7.5	Residential - Low
Residential-10	R-10	Residential - Low
Residential-12	R-12	Residential - Low

Residential-15	R-15	Residential - Low
Multifamily 10	MF-10	Residential - Medium
Multifamily 18	MF-18	Residential - High
Multifamily 24	MF-24	Residential - High
Mixed Use	MX	Mixed Use
Neighborhood Commercial	NC	Commercial
Community Commercial	CC	Commercial
Regional Commercial	RC	Commercial
Mixed Employment	ME	Mixed Employment
Heavy Industrial	HI	Industrial
Parks and Open Space	POS	Parks and Open Space
Cottage Overlay	COT	Residential - High
North Shore Lower Density Residential	LD-NS	Residential - Low
North Shore Higher Density Residential	HD-NS	Residential - High
North Shore Mixed Use	MX-NS	Mixed Use
North Shore Commercial	C-NS	Commercial
North Shore Mixed Employment	ME-NS	Mixed Employment
Downtown Residential	DT-R	Residential - Low
Downtown Mixed Use - Low Rise	DT-MXL	Mixed Use
Downtown Mixed Use - Mid Rise	DT-MXM	Mixed Use
Downtown Historic Main Street Core	DT-HMSC	Mixed Use

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2547, § II(Exh. B), 5-18-2009; Ord. No. 2667, § I, 12-17-2012; Ord. No. 2672, § I(Exh. A), 1-22-2013; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 2694, § I, 2-3-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 23-010, Exh. A, 8-7-2023)

18.05.030 Boundary determination.

Unless otherwise specified or shown on the zoning map, district boundaries are lot lines or the centerlines of streets, alleys, railroad, and other rights-of-way:

A. Where boundaries are other than lot lines or centerlines of streets, alleys, railroad, and other rights-of-way, they shall be determined by dimensions shown on the zoning map;

B. Where actual streets or other features on the ground vary from those shown on the zoning map, interpretations or adjustments shall be made by the planning commission;

C. Where a district boundary line, as shown on the zoning map, divides a lot in single ownership at the time of passage of the code, the property owner may elect to apply the zoning district classification that has been applied to greater than fifty percent of such lot to the entire lot or to utilize the zoning district classifications as they apply to each portion of the lot, consistent with the zoning map.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 25-025, § I (Exh. A), 12-15-2025)

18.05.040 Residential ~~and multifamily~~ zones.

A. R-15 Residential-15~~,000~~. This zone is intended for single-family and middle housing dwellings with a minimum density of two to three ~~dwellings~~lots per acre. This zone will permit the rural character of a number of existing neighborhoods to be maintained. The average lot size is fifteen thousand square feet.

B. R-12 Residential-12~~,000~~. This zone is intended for single-family and middle housing dwellings with densities of three to four dwelling ~~units~~lots per acre. This zone is designated for areas with steep topography for greater flexibility in site layout, and where potential hazards do not exist. The average lot size is twelve thousand square feet.

C. R-10 Residential-10~~,000~~. This zone is intended for single-family and middle housing dwellings with densities of four to five ~~dwellings~~lots per acre. This zone is intended to be zoned near low density residential districts, and where potential natural hazards do not exist. The average lot size is ten thousand square feet.

D. R-7.5 Residential-75~~7,500~~. This zone is intended for single-family and middle housing dwellings with densities of five to six ~~dwellings~~lots per acre. This zone should have less slope than lower density zones, and be adjacent to existing high density residential districts. The average lot size is seven thousand five hundred square feet.

E. R-6 Residential-6~~,000~~. This zone is intended for for single-family and middle housing dwellings with densities of six to seven ~~dwellings~~lots per acre. The slope of property is less than other lower density residential zones. This zone serves a transition to multifamily or commercial zones. The average lot size is six thousand square feet.

F. LD-NS North Shore Lower Density Residential. This zone is intended for residential dwellings in the North Shore subarea with a minimum density of four dwellings per acre and a maximum density of five and eight tenths dwellings per acre. This zone will reflect the rural character of a number of existing residences and can support transitions from existing uses to more dense zones.

G. MF-10 Multifamily Residential. This zone provides for a diversity of dwellings such as duplexes, triplexes, fourplexes, rowhouses, and apartment complexes, with a density of up to ten units per acre. It is desirable for this zone to be adjacent to parks and multi-modal transportation systems. This zone can also serve as a transition between commercial and residential zones.

H. MF-18 Multifamily Residential. These zones are intended to provide for dwellings such as rowhouses and apartment complexes. It is desirable for these zones to be adjacent to parks and multi-modal transportation systems. These zones also serve as a transition between commercial and residential zones.

I. MF-24 Multifamily Residential. These zones are intended to provide for dwellings such as rowhouses and apartment complexes. It is desirable for these zones to be adjacent to parks and multi-modal transportation systems. These zones also serve as a transition between commercial and residential zones.

~~I~~J. HD-NS North Shore Higher Density Residential. This zone is intended for residential dwellings in the North Shore subarea with a minimum density of ten dwellings per acre and a maximum density of eighteen dwelling units per acre. This zone provides for a diversity of dwellings and serves as a transition between commercial areas and residential uses.

~~J. MF-C Cottage. This is an overlay zone, which is intended to increase the housing supply and style choices for smaller, single-level dwellings. It is desirable that cottages are designed to include unique architectural elements such as a front porch, steep-pitch gable roof, and a recessed garage; and to accommodate those with mobility impairments. This overlay zone may be utilized within multi-family zones only, and upon approval of a zoning district change. This overlay zone is not required for cottage dwellings in the North Shore District. See 18.07.030 and 18.07.040 for allowed uses in the North Shore.~~

K. DT-R Downtown Residential. A primarily residential area defined by smaller-scale housing types—such as cottages, duplexes, triplexes, fourplexes, and accessory dwelling units—often on existing single-family lots. The district maintains a lower-density character while allowing incremental infill that respects existing neighborhood patterns and historic scale.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2691, § I(Exh. A), 1-21-2014;Ord. No. 2694, § II, 2-3-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 23-010, Exh. A, 8-7-2023)

18.05.050 Commercial, mixed use, and industrial zones.

The purpose of the commercial, mixed use and industrial, ~~and high technology~~ zones are to provide services and employment primarily to residents. These areas are zoned according to the services they provide. As a result, each zone has different characteristics as summarized below:

A. NC Neighborhood Commercial. This zone provides for the day-to-day needs of the immediate neighborhood. This zone is intended to be small, but fairly numerous throughout the city. Typical uses include, but are not limited to ~~C~~convenience goods (e.g., food, drugs and sundries), along with personal services (e.g., dry cleaning, barbershop or beauty shop), are common goods and services offered.

B. CC Community Commercial. This zone provides for the goods and services of longer-term consumption, and tend to be higher-priced items than the neighborhood commercial zone district. Typical goods include clothing, hardware and appliance sales. Some professional services are offered, e.g., real estate office or bank. Eating and drinking establishments may also be provided. This zone tends to vary in size, but is larger than the neighborhood commercial zone.

C. RC Regional Commercial. This zone provides apparel, home furnishings, and general merchandise in depth and variety, as well as providing services for food clusters and some recreational activities. Regional commercial is the largest of the commercial zones and is designed to serve the region or a significant portion of the region's population.

~~D. DC Downtown Commercial. This zone is designated as a large community commercial area, providing a large range of goods and services. This area is designed to promote commercial diversification to serve the immediate residential and office uses in the surrounding areas. Compact development is encouraged that is supportive of transit and pedestrian travel, through higher building heights and floor area ratios than those found in other commercial districts.~~

D. DT-HMSC Historic Main Street Core. The most compact and walkable district, featuring continuous street facing buildings with minimal setbacks and active ground floors. Uses include retail, dining, civic, and upper-story office or residential. Architecture emphasizes preservation, human scale, and a fine-grain frontage pattern typically up to four (4) stories tall.

E. DT-MXM Downtown Mixed-Use: Mid Rise. A vibrant, higher-density urban zone with buildings ranging up to six (6) stories. Supports a mix of residential, commercial, and civic uses with structured parking and active ground-floor frontages. Streets are multimodal, with wide sidewalks, trees, and transit access.

F. DT-MXL Downtown Mixed-Use: Low Rise. A transitional zone with up to four (4) story buildings and a mix of neighborhood-serving retail, offices, and housing, including a range of missing middle housing. Slightly deeper setbacks and increased landscaping support a softer urban edge while maintaining pedestrian orientation and urban form.

G. ME Mixed Employment. This zone is designated to recognize and accommodate certain areas that may have typically developed with light industrial or business park uses but are transitioning from an exclusively industrial orientation to a broad mix of light industrial, artisan/craft industrial, commercial, office, and personal service uses, within a more amenity rich environment. Retail uses are generally seen as secondary uses. The ME districts encourage innovation and a business environment that flourishes through adaptation and resiliency.

~~E~~H. C-NS North Shore Commercial. This zone is designated as a commercial area in the North Shore subarea, meaning a range of goods and services are available.

~~F~~I. ME-NS North Shore Mixed Employment. This zone allows a wide variety of employment uses in the North Shore subarea, including retail, office space, warehouse, manufacturing, and other employment uses.

~~G. LI Light Industrial. This zone provides for uses that are more compatible with commercial, residential, or multifamily uses. Typical uses in this zone include assembly and manufacturing of electronic and precision instruments. More intensive industry, e.g., metal fabrication, is excluded.~~

~~H. BP Business Park. This zone provides for employment growth in the city by protecting industrial areas for future employment. Design of business park facilities in this district will be campus-style, with landscaped buffers, and architectural features compatible with surrounding areas.~~

~~I. LI/BP Light Industrial/Business Park. This zone provides for uses such as, offices related to industrial usage, research and development, limited commercial, and associated warehousing uses, including the provision of employee recreation opportunities. Development in campus-like setting with generous landscaping, well-designed buildings and near major traffic corridors is anticipated.~~

J. HI Heavy Industrial. This zone provides for a wide range of industrial and manufacturing uses. Types of activities in this zone include assembly, manufacturing, fabrication, processing, bulk handling and storage, research facilities, associated warehousing, and heavy trucking. West of Lacamas Creek/Washougal River, residential uses may be allowed as a conditional use as part of a mixed-use development.

K. MX Mixed Use. This zone provides for a wide range of commercial and residential uses. Compact development is encouraged that is supportive of transit and pedestrian travel.

L. MX-NS North Shore Mixed Use. This zone provides for a wide range of commercial and residential uses in the North Shore subarea. Compact development that supports transit and pedestrian travel is encouraged. Mixed-use areas should create spaces for community gathering, waiting, discussion, and outdoor commercial activities. Horizontal and vertical mixed-use developments are allowed. Mixed-use development should include multiple entries and windows on the ground floor to facilitate business access, create visual interest, and promote safety. For the residential uses, this zone allows a maximum density of twenty-four dwellings per acre and minimum density of ten dwelling units per acre. Each horizontal mixed-use development should have no more than seventy percent of the total acreage of the development dedicated to residential uses. Each vertical mixed-use development shall, at a minimum, dedicate the ground floor to commercial uses (up to fifty percent of the ground floor may be used for indoor parking). Residential multifamily is allowed only on the second floor or above or in the back of commercial buildings as a live-work unit (only twenty-five percent of the required thirty percent can be live-work units).

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006; Ord. No. 23-010, Exh. A, 8-7-2023)

(Ord. No. 2547, § III(Exh. C), 5-18-2009; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 19-001, § I(Att. A), 1-22-2019; Ord. No. 23-010, Exh. A, 8-7-2023)

18.05.060 Overlay zones/special planning areas.

Overlay zones implement the goals and values expressed in the comprehensive plan. Uses within this area may be subject to standards which deviate from those in the primary zone.

A. COT Cottage Overlay. This is an overlay zone, which is intended to increase the housing supply and style choices for smaller, single-level dwellings. It is desirable that cottages are designed to include unique architectural elements such as a front porch, steep-pitch gable roof, and a recessed garage; and to accommodate those with mobility impairments. This overlay zone may be utilized within multi-family zones only, and upon approval of a zoning district change. This overlay zone is not required for cottage dwellings in the North Shore District. See 18.07.030 and 18.07.040 for allowed uses in the North Shore.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.05.070 Park and open space zoning.

~~The park zoning districts provide recreation and open space functions for the long-term benefit and enjoyment of city residents, adjacent neighborhoods and visitors. These districts apply only to land held in public trust.~~ The park and open spaces zone supports the preservation, development, and use of public and private parks, open spaces, and natural areas that contribute to community health, environmental protection, recreation, and quality of life.

(Ord. No. 2667, § II, 12-17-2012; Ord. No. 2691, § I(Exh. A), 1-21-2014)

Chapter 18.07 USE AUTHORIZATION

18.07.010 Establishment of uses.

The use of a property is defined by the activity for which the building or lot is intended, designed, arranged, occupied or maintained. The use is considered permanently established when that use will, or has been, in continuous operation for a period exceeding sixty days. A use which will operate for less than one hundred eighty days is considered a temporary use, and shall be governed by Chapter 18.47 "Temporary Use Permits." All applicable requirements of this code, or other applicable state or federal requirements, shall govern a use located in the city.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.07.020 Interpretation of land use tables.

The land use tables in this chapter determine whether a specific use is allowed in a zone district. The zone district is located on the vertical column and the specific use is located on the horizontal rows of these tables.

A. If the letter "X" appears in the box at the intersection of the column and the row, the use is not allowed in that district, except for certain temporary uses.

B. If the letter "P" appears in the box at the intersection of the column and the row, the use is allowed in that district subject to review procedures in accordance with CMC Chapter 18.55 "Administration and Procedures."

C. If the letter "C" appears in the box at the intersection of the column and the row, the use is allowed subject to the conditional use review procedures specified in Chapter 18.43 "Conditional Use Permits," and the general requirements of the Camas Municipal Code.

D. If the letter "T" appears in the box at the intersection of the row, the use is temporarily permitted under the procedures of Chapter 18.47 "Temporary Use Permits." Other temporary uses not listed may be authorized as provided in Chapter 18.47.

E. If a number appears in a box at the intersection of the column and the row, the use is subject to the requirements specified in the note corresponding with the number immediately following the table.

F. Uses accessory to a use permitted or conditionally permitted in any zone may be authorized subject only to those criteria and/or processes deemed applicable by the head of the planning department.

G. If a use is not listed under either Section 18.07.030 Table 1 or 18.07.040 Table 2, and is not an accessory or temporary use, then the use shall be subject to a zoning code text amendment. Notwithstanding a zoning code text amendment, the community development director may determine whether a proposed land use not specifically listed in a land use table is allowed in a zone. The director shall take into consideration the following when making a determination:

   1. Whether or not the proposed use in a particular zone is similar impact to other permitted or conditional uses or is compatible with other uses; and

   2. Whether or not the proposed use is consistent with the zone's purpose.

   A use listed in one table but not the other shall be considered a prohibited use in the latter.

H. For the Downtown Zoning Districts in CMC Chapter 18.07.060, use authorization appearing as "G / U" refers to "G = ground floor / U = upper floor" uses specifically.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017)

Temporary Uses													
Temporary sales office for a development[4][2]	T	~~T~~	T	T	T	T	~~T~~	~~T~~	~~T~~	T	T	T	T

Notes:

1. See CMC Chapter 5.36 Sexually Oriented Businesses for additional regulations for siting sexually oriented business facilities.

~~2. Similar uses are permitted in the zone district only at the discretion of the community development director or designee.~~

~~3. Reserved.~~

42.See CMC Chapter 18.47 "Temporary Uses" for additional regulations.

~~5. See secondary use provisions of LI/BP zone.~~

~~6. See CMC Chapter 18.19 "Design Review" for additional regulations. CMC Chapter 18.19 is not applicable to development in the LI/BP zone.~~

~~7. Residential uses may be outright permitted if part of a mixed use building, where residential use is not located on the ground level; otherwise it shall be a conditional use.~~

~~8. If grocery store is less than one hundred thousand square feet then use is outright permitted. If one hundred thousand square feet or over then a conditional use permit is required.~~

93. A. Must be sited a minimum one thousand feet of the perimeter of the grounds of any elementary or secondary school, playground, recreation center or facility, child care center, public park, public transit center, or library, or game arcade to which is not restricted to persons twenty-one years or older as defined in WAC 314-55-010 on June 20, 2015;

B. The business shall post clear signage in a conspicuous location near each public entrance stating no person under the age of twenty-one may enter the premises; and

C. No smoke shop/head shop subject to this note shall be located within five miles of an existing lawfully established smoke shop/head shop. All measurements under (A) and (C) shall be measured from the nearest property line of the property on which the use is proposed to the nearest property line of an existing business utilizing Clark County GIS.

~~10~~4. On tracts ten acres or more, subject to approval by city council of a master plan and development agreement, a mixed use development may be approved provided no less than fifty-one percent of the net developable acreage is committed to commercial uses.

~~11~~5. Conditional use permit is required if facilities for kennels are proposed outdoors.

~~12~~6. A Residential Treatment Facility shall not be located within one thousand feet of public and private schools, public parks, public libraries, other RTFs or similar uses.

~~13~~7. Permitted only on sites where automobile repair was previously established and where the existing site or building design, configuration, layout, or access makes it particularly suited for this use.

8. West of Lacamas Creek/Washougal River, residential uses may be allowed as a conditional use only when part of a mixed-use development project. Heavy industrial uses must have ceased on the portion of the site proposed for residential development and the applicant must demonstrate that the proposed residential development will not interfere with any continuing industrial operations on adjoining properties in a manner that cannot be reasonably mitigated through conditions of approval.

Railroad tracks and facilities 1	C	C
Temporary Uses		
Sales office for a development in a dwelling[1, 4]	T	T
Sales office for a development in a trailer[3, 4]	T	T

Notes:

1. See Chapter 18.19 "Design Review" for additional regulations.

2. Permitted pursuant to Chapter 18.25, Middle Housing and in the LD-NS zone.

3. Site plan review required per CMC Section 18.18.020(A)(1).

4. Notwithstanding the time limitations of a temporary use, a sales office proposed and approved through a Type III application may be approved with a longer time frame than one hundred eighty days.

5. A Residential Treatment Facility shall not be located within one thousand feet of public and private schools, public parks, public libraries, other RTFs, or similar uses.

6. Permitted in the LD-NS and HD-NS zones only.

7. Those Neighborhood Commercial uses listed as permitted (P) are allowed within residential zones along design overlay corridors on corner lots at intersections with collector or arterial streets, pursuant to Chapter 18.20. The neighborhood commercial use must be pedestrian oriented with access to a public sidewalk or walkway and may have a maximum building footprint of 2,500 square feet and no more than five (5) off-street parking spaces, which can be satisfied by on-street parking provided they are along the frontage of the subject parcel.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 § 1 (Exh. A (part)), 2007; Ord. 2443 § 3 (Exh. A (part)), 2006)

Notes:

1. Pursuant to Section 3.1 of the Downtown Design Manual, at least 70% of ground floor area and frontages on Main Streets must be occupied by active retail uses. On all other street types, at least 70% of ground floor area and frontages must be occupied by active or passive retail uses. Municipal uses may occupy 100% of ground floor area and frontages on any street type east of NE Everett St between NE 3rd Ave and NE 5th Ave.

2. Pursuant to Section 3.2 of the Downtown Design Manual, at least 70% of ground floor area and frontages on Main Streets must be occupied by active retail uses. On Mobility and Gateway Steets, at least 70% of ground floor area and frontages must be occupied by active or passive retail uses. On all other street types, residential uses may not occupy more than 70% of ground floor area and frontages.

3. Pursuant to Section 3.3 of the Downtown Design Manual, at least 70% of ground floor area and frontages must be occupied by active or passive retail uses on Mobility and Gateway Steets. Residential uses may occupy 100% of ground floor area and frontages on any street, including Mobility and Gateway Streets.

4. Pursuant to Section 3.4 of the Downtown Design Manual, active or passive retail uses may occupy up to 70% of ground floor area and frontages on Gateway and Connector Steets. Residential uses may occupy 100% of ground floor area and frontages on any street.

5. A. Must be sited a minimum one thousand feet of the perimeter of the grounds of any elementary or secondary school, playground, recreation center or facility, child care center, public park, public transit center, or library, or game arcade to which is not restricted to persons twenty-one years or older as defined in WAC 314-55-010 on June 20, 2015;

   B. The business shall post clear signage in a conspicuous location near each public entrance stating no person under the age of twenty-one may enter the premises; and

   C. No smoke shop/head shop subject to this note shall be located within five miles of an existing lawfully established smoke shop/head shop. All measurements under (A) and (C) shall be measured from the nearest property line of the property on which the use is proposed to the nearest property line of an existing business utilizing Clark County GIS.

6. A Residential Treatment Facility shall not be located within one thousand feet of public and private schools, public parks, public libraries, other RTFs or similar uses.

7. See CMC Chapter 18.47 "Temporary Uses" for additional regulations.

8. Notwithstanding the time limitations of a temporary use, a sales office proposed and approved through a Type III application may be approved with a longer time frame than one hundred eighty days

9. Incidental uses are only allowed as incidental to a residential use, with exception of electric vehicle battery charging station and rapid charging stations.

10. Those Neighborhood Commercial uses listed as permitted (P) are allowed residential zones along design overlay corridors on corner lots at intersections with collector or arterial streets, pursuant to Chapter 18.20. The neighborhood commercial use must be pedestrian oriented with access to a public sidewalk or walkway and may have a maximum building footprint of 2,500 square feet and no more than five (5) off-street parking spaces, which can be satisfied by on-street parking provided they are within 500 feet of the subject parcel. See Chapter 18.20, Design Overlays, for additional provisions.

11. Permitted pursuant to Chapter 18.25, Middle Housing.

Chapter 18.09 DENSITY AND DIMENSIONS[1]

18.09.010 Purpose.

The purpose of this chapter is to establish requirements for development relative to basic dimensional standards, as well as specific rules for general application. The standards and rules are established to provide flexibility in project design, maintain privacy between adjacent land uses, and promote public safety. Supplementary provisions are included to govern density calculations for residential districts and specific deviations from general rules.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.020 Interpretation of tables.

A. The Camas Municipal Code Sections 18.09.030 through ~~18.09.050~~ 18.090.055 (Tables) contain general density and dimension standards of the particular zone districts. Additional rules and exceptions are stated in Sections 18.09.060 through 18.09.180.

B. The density and dimension tables are arranged in a matrix format on ~~three~~ four separate tables, and are delineated into three general land use categories:

1. Commercial, mixed use, mixed employment and industrial;
2. ~~Single-family residential~~ Residential; ~~and~~
3. Multifamily residential; and ~~.~~
4. Downtown zones.

C. Development standards are listed down the left side of the tables, and the zones are listed across the top. Each cell contains the minimum or maximum requirement of the zone. Footnote numbers identify specific requirements found in the notes immediately following the table. Additional dimensional and density exceptions are included in Sections 18.09.060 through 18.09.180 of this chapter following the tables.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

[1]Ord. No. 17-013, § I(Exh. A), adopted Oct. 2, 2017, added a second table to § 18.09.040 pertaining to density and dimensions for single-family residential zones, and revised the table designations provided in various section catchlines. For purposes of organization and clarity, the editor has removed table designations (e.g. Table 1, Table 2, etc.) from the catchlines of §§ 18.09.030—18.09.050 and included them with the table headers, also conforming said catchlines stylistically.

18.09.030 Density and dimensions—Commercial, mixed use, mixed employment and industrial zones.

Table 1—Density and Dimensions for Commercial, Mixed Use, Mixed Employment and Industrial Zones

	NC	~~DC~~	CC	RC	MX	ME	~~LI~~	~~BP~~	HI	~~LI/BP[Note 2]~~	C-NS	MX-NS	ME-NS

Maximum building height (feet)	2.5 stories; or 35	~~None~~	None	None	Vertical mixed use 60; Horizonal mixed use 45	100 [6]	~~acre or less: 35'; 1 to 2 acres: 45'; 2 acres or more: 60'~~	~~None~~	None	~~60~~	100[6]	100[6]	100[6, 8]

Notes:

1. If along a flanking street of corner lot.
2. The densities and dimensions in the LI/BP zone may be reduced under a planned industrial development. See Chapter 18.21 Light Industrial/Business Park.
3. Maximum setback at front building line is ten feet.
4. Residential dwelling units shall satisfy the front setbacks of CMC Section 18.09.040 Table 2, based on comparable lot size.

5. Areas that provide opportunities for active and passive uses and encourage community interaction. These spaces are accessible to the general public or to residents, employees, or customers and can include, but are not limited to plazas, courtyards, sports courts, and viewpoints (see 18.03.040 "Definitions for development terms").
6. Building heights shall "step-down" and provide compatible scale and privacy between developments. See the North Shore Design Manual.
7. If buildings are rear loaded from an alley, the rear yard setback shall be twenty feet.
8. Does not apply to cottage-style development.
9. Passive pedestrian space, as identified in the North Shore Design Manual and including elements such as seating and building overhangs, is allowed within the fifteen foot front yard setback.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § V(Exh. E), 5-18-2009; Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2672, § III(Exh. C), 1-22-2013; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 23-010, Exh. A, 8-7-2023)

Minimum density (~~dwelling units~~lots/net acre)	X	X	X	X	X	4
Average lot area (square feet)[4]	6,000	7,500	10,000	12,000	15,000	7,500
Minimum lot size (square feet)	4,800	6,000	8,000	9,600	12,000	5,400[8]
Maximum lot size (square feet)[3]	9,000	12,000	14,000	18,000	24,000	12,000
Minimum lot width (feet)	60	70	80	90	100	40[9]
Minimum lot depth (feet)	80	90	100	100	100	90[10]
Maximum building lot coverage[5]	40%	40%	35%	30%	30%	N/A
Average building lot coverage[6]	N/A	N/A	N/A	N/A	N/A	45%
Maximum building height (feet)[2]	35	35	35	35	35	35[11]
B. Density Transfer Lots[1]						
Maximum density (~~dwelling units~~lots/net acre)	7.2	5.8	4.3	3.6	2.9	5.8
Minimum lot size (square feet)	4,200	5,250	7,000	8,400	10,500	5,250
Maximum lot size (square feet)[3]	7,200	9,000	12,000	14,400	18,000	9,000
Minimum lot width (feet)[1]	50	60	60	70	80	40
Minimum lot depth (feet)[1]	80	80	90	90	100	80
Maximum building lot coverage	40%	40%	40%	35%	35%	60%
Maximum building height (feet)[2]	35	35	35	35	35	35

Notes:

1. For additional density and dimension provisions, see CMC Sections 18.09.060 through 18.09.180.
2. Maximum building height: three stories and a basement, not to exceed height listed.
3. For parcels with an existing dwelling, a one-time exception may be allowed to partition from the parent parcel a lot that exceeds the maximum lot size permitted in the underlying zone. Any further partitioning of the parent parcel or the oversized lot must comply with the lot size requirements of the underlying zone.
4. The minimum front yard setback may be reduced by up to five feet for the non-garage portions of a dwelling when any garage is set back the full minimum front yard distance required in the underlying zone. This allowance is intended to promote varied building facades and reduce the visual prominence of garages along the street.
5. The maximum building lot coverage for single-story homes may be up to forty-five percent in R-6, R-7.5, and LD-NS zones, and forty percent in R-10 and R-12 zones. To qualify for increased lot coverage, a single-story home cannot include a basement or additional levels.
6. Average building lot coverage is based on the square footage of all lots within the development or plat with an LD-NS zoning designation. The average building lot coverage may increase to fifty-five for single-story development and/or lots below five thousand square feet.
7. Does not apply to cottage-style development.
8. Minimum lot size for cottage-style development shall be two thousand four hundred square feet and rowhouse developments shall be one thousand eight hundred square feet.
9. Minimum lot width for cottage-style development shall be thirty feet and rowhouse developments shall be twenty feet.

10. Minimum lot depth for cottage-style and rowhouse development shall be fifty feet.

11. Maximum building height for cottage-style development shall be twenty-five feet.

Table 2—Building Setbacks for ~~Single-Family~~ Residential Zones[1]

Lot Area	Up to 4,999 sq. ft.	5,000 to 11,999 sq. ft.	12,000 to 14,999 sq. ft.	15,000 or more sq. ft.	LD-NS
Minimum front yard (feet)	20[2]	20[2]	25[2]	30[2]	10-25[3]
Minimum side yard (feet)	5	5	10	15	5
Minimum side yard flanking a street and corner lot rear yard (feet)	10	10	15	15	10
Minimum rear yard (feet)	20	25	30	35	10-20[4]
Minimum lot frontage on a cul-de-sac or curve (feet)	25	30	35	40	25

Notes:

1. Setbacks may be reduced to be consistent with the lot sizes of the development in which it is located. Notwithstanding the setbacks requirements of this chapter, setbacks and/or building envelopes clearly established on an approved plat or development shall be applicable. In the LD-NS zone, cottage-style development setbacks are identified in the North Shore Design Manual.

2. The minimum front yard setback may be reduced by up to five feet for the non-garage portions of a dwelling when any garage is set back the full minimum front yard distance required in the underlying zone. This allowance is intended to promote varied building facades and reduce the visual prominence of garages along the street.

3. LD-NS subarea developments are encouraged to vary the front yard building setbacks to provide visual interest along a residential block. Garage faces shall maintain a minimum setback of twenty feet. Lots with alley-access garages may have a minimum front yard building setback of ten feet.

4. LD-NS subarea developments with street-access garages may have a minimum rear yard setback of ten feet. LD-NS developments with alley-access garages must maintain a twenty foot rear-yard building setback from the alley.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 15-010, § I, 8-17-2015; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 19-012, § II(Exh. A), 11-4-2019; Ord. No. 21-005, § I(Exh. A), 3-15-2021; Ord. No. 23-010, Exh. A, 8-7-2023; Ord. No. 25-025, § I (Exh. A), 12-15-2025)

18.09.050 Density and dimensions—Multifamily residential zones.

Table 1—Density and Dimensions for Multifamily Residential Zones

	MF-10	MF-18	MF-24	MF-C Overlay	HD-NS
Density					
Maximum density (dwelling units per net acre)	10	18[Note 10]	24 [Note 11]	24	18[Notes 6, 10]
Minimum density (dwelling units per net acre)	6.0	6.0	8	6.0	10
Standard lots					

Minimum lot area (square feet)	3,000	2,100	1,800	None	1800
Minimum lot width (feet)	36	26	20	None	20
Minimum lot depth (feet)	70	60	60	None	60
Maximum gross floor area (GFA) per dwelling unit (square feet)	No max	No max	No max	1,000[Note 4]	No max
Setbacks					
Minimum front yard/at garage front (feet)	15/20	10/20	10/20	0/20	10/20
Minimum side yard (feet)	3[Note 1]	3[Note 1]	3 [Note 1]	0 / If abutting R-zone than setback is 10'	3[Note 1]
Minimum side yard, flanking a street (feet)	15	15	15 [Note 8]	15	15[Note 8]
Minimum rear yard	10	10	10	0 / If abutting R-zone than setback is 10'	10
Standard lots coverage					
Maximum building lot coverage	55%	65%	65%	Building coverage is limited by a minimum of 200 sq. ft. of useable yard adjacent to each dwelling unit.	65%
Building Height					
Maximum building height (feet)	35[Note 2]	50[Note 5]	50 [Note 5]	18[Note 3]	50[Notes 5, 9]

Table Notes:

1. The non-attached side of a dwelling unit shall be three feet, otherwise a zero-lot line is assumed.
2. Maximum three stories and a basement but not to exceed height listed.
3. Maximum one story and a basement but not to exceed height listed.
4. Gross floor area (GFA) in this instance does not include covered porches or accessory structures as defined per CMC 18.17.040.
5. Maximum four stories but not to exceed height listed.
6. Does not apply to cottage-style development.
7. In the HD-NS zone, cottage-style development setbacks are identified in the North Shore Design Manual.
8. Minimum side yard flanking street shall be ten feet for cottage-style and rowhouse developments.
9. Building heights shall "step-down" and provide compatible scale and privacy between developments. Building height transitions shall be applied to new and vertically expanded buildings in the HD-NS zone within twenty feet (measured horizontally) of an existing single detached residential building thirty feet or less in height. The building-height-transition standard is met when the height of the taller building does not exceed one foot of height for every one foot separating the new building from the existing single detached residential structure.
10. To encourage apartment development on larger sites, properties that are five acres or larger and developed exclusively with apartment buildings may be developed at up to double the maximum allowed density for the zone.

11. To encourage apartment development on larger sites, properties that are five acres or larger and developed exclusively with apartment buildings may be developed at up to a 50% increase of the maximum allowed density for the zone.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2694, § III, 2-3-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 23-010, Exh. A, 8-7-2023; Ord. No. 25-025, § I (Exh. A), 12-15-2025)

18.09.055 Density and dimensions—Downtown zones.

Development in the Downtown Subarea and zones shall comply with the general standards and development standards found in section 3.0 of the Downtown Design Manual.

Table 1—Density and Dimensions for Downtown Zones

DT – HMSC	DT – MXM	DT – MXL	DT – R
See General and Development Standards in Section 3.1 of the Downtown Design Manual	See General and Development Standards in Section 3.2 of the Downtown Design Manual	See General and Development Standards in Section 3.3 of the Downtown Design Manual	See General and Development Standards in Section 3.4 of the Downtown Design Manual

18.09.060 Density transfers.

A. Purpose. To achieve the density goals of the comprehensive plan with respect to the urban area, while preserving environmentally sensitive lands and the livability of the single-family residential neighborhoods, while also maintaining compatibility with existing residences.

B. Scope. This section shall apply to new development in all residential (R) zoning districts.

C. Where a land division proposes to set aside a tract for the protection of a critical area, natural open space network, or network connector (identified in the city of Camas parks plan), or approved as a recreational area, lots proposed within the development may utilize the density transfer standards under CMC Section 18.09.040~~.B Table 1~~ Table 1, Section B.

D. Where a tract under "C" above, includes one-half acre or more of contiguous area, the city may provide additional or negotiated flexibility to the lot size, lot width, lot depth, building setback, or lot coverage standards under CMC Section 18.09.040 Table 1 and 2. In no case shall the maximum density of the overall site be exceeded. A letter explaining the request for negotiated flexibility shall be submitted to the director for consideration. The city may also provide the landowner with:

   1. A credit against park and open space impact fees per Chapter 3.88; or

   2. Cash from the parks and open space impact fee fund or other public fund.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 18-014, § XII, 9-4-2018; Ord. No. 19-001, § I(Att. A), 1-22-2019; Ord. No. 21-005, § I(Exh. A), 3-15-2021)

18.09.080 Lot sizes.

A. In planned residential developments with sensitive lands and the required recreational open space set aside, a twenty per-cent density bonus on a unit count basis is permitted. Density may be transferred for sensitive areas but the total lot count shall never exceed the number of lots established in the density standards established in CMC Section 18.23.040 "Density Standards."

B. When creating new lots via short plats or subdivisions that are adjacent to a different residential zone designation, the new lots along that common boundary shall be the maximum lot size allowed for the zone

designation of the new development (if a lower density adjacent zone), or the minimum lot size allowed for the zone designation of the new development (if a greater density adjacent zone), as based on CMC 18.09.040 Table ~~2~~1, Section A. In applying this section, where a land division is required to increase the size of lots, the land division may utilize the density transfer provisions provided for in CMC Section 18.09.060.

C. For residentially zoned parcels owned or controlled by a religious organization, a twenty percent density bonus to the dwelling unit maximum (Refer to Sections 18.09.040 and 18.09.050) is permitted for the development of affordable housing, when the following criteria are met:

1. Affordable housing is for low-income households. "Low-income household" means a single person, family, or unrelated persons living together whose adjusted income is less than eighty percent of the median family income, adjusted for household size for Clark County;

2. A lease or other binding obligation shall require development to be used exclusively for affordable housing purposes for at least fifty years, even if the religious organization no longer owns the property; and

3. Does not discriminate against any person who qualifies as a member of a low-income household.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 21-004, § II(Exh. A), 3-15-2021)

18.09.090 Reduction prohibited.

No lot area, yard, open space, off-street parking area, or loading area existing after the effective date of the ordinance codified in this chapter shall be reduced below the minimum standards required by the ordinance codified in this chapter, nor used as another use, except as provided in Chapter 18.41 "Nonconforming Lots, Structures, Uses."

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.100 Lot exception.

If at the time of passage of the code, a lot has an area or dimension which does not conform with the density provisions of the zoning district in which it is located, the lot may be occupied by any use permitted outright in the district, subject to the other requirements of the district. The person claiming benefits under this section shall submit documentary proof of the fact that the lot existed by title at the time of passage of the code. See Section 18.41.040 "Buildable lot of record."

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.110 Height—Exception.

A. The following type of structures or structural parts are not subject to the building height limitations of the code: tanks, church spires, belfries, domes, monuments, fire and hose towers, observation towers, transmission towers, wind turbines, chimneys, flag poles (see setbacks at CMC Section 18.09130(G)), radio and television towers, masts, aerials, cooling towers, and other similar structures or facilities.

B. The heights of telecommunication facilities are addressed in CMC Chapter 18.35 Telecommunication Ordinance.

C. Building heights may exceed the maximum allowable height by eight inches to accommodate additional insulation.

D. Building heights may exceed the maximum allowable height by 48 inches to accommodate roof-mounted solar energy panels.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.09.120 Roof overhang permitted.

The maximum a roof overhang may intrude into yard setbacks shall be as follows:

Yard Setback	Maximum Roof Overhang[1]
5 feet	2 feet
10 feet	3.5 feet
15 feet	5 feet
15 feet or greater	5 feet

1. In the C-NS zone, roof overhangs may intrude up to fifteen feet in the front yard setback.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006; Ord. No. 23-010, Exh. A, 8-7-2023)

18.09.130 Setback—Exception.

A. Cornices, eaves, chimneys, belt courses, leaders, sills, pilasters, or other similar architectural or ornamental features (not including bay windows or vertical projections) may extend or project into a required yard not more than two feet.

B. Open balconies, unenclosed fire escapes, or stairways, not covered by a roof or canopy, may extend or project into a required front yard, or a required rear yard along a flanking street of a corner lot, or into a required side yard not more than three feet.

C. Open, unenclosed patios, terraces, roadways, courtyards, or similar surfaced areas, not covered by a roof or canopy, and not more than thirty inches from the finished ground surface, may occupy, extend, or project into a required yard.

D. Cantilevered floors, bay windows, or similar architectural projections, not wider than twelve feet, may extend or project into the required side yard along a flanking street of a corner lot not more than two feet. The total of all projections for each building elevation shall not exceed fifty percent of each building elevation.

E. Detached accessory buildings or structures may be established in a side or rear yard, provided such structure maintains a minimum setback of five feet from side and rear lot lines, and a minimum six feet setback from any building. In no event shall an accessory building(s) occupy more than thirty percent of a rear yard requirement. For accessory dwelling units, see Chapter 18.27.

F. On sloping lots greater than fifty percent, only uncovered stairways and wheelchair ramps that lead to the front door of a building may extend or project into the required front yard setback no more than five feet in any R or MF zone.

G. Flag poles may be placed within any required yard but shall maintain a five-foot setback from any lot line.

H. The portion of exterior wall assemblies that includes insulation may to project up to an additional eight inches into setbacks on all sides.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.09.140 Front yard—Exception.

A. Commercial , Mixed Employment, Mixed Employment, and Industrial Districts. For a lot in a NC, CC, RC, ~~LI~~, MX, ME or HI districts proposed for commercial, mixed use, mixed employment, or industrial development, which is across a street from a residential (R) zone, the yard setback from the street shall be fifteen feet.

B. Sloping Lot in Any Zone. If the natural gradient of a lot from front to rear along the lot depth line exceeds an average of twenty percent, the front yard may be reduced by one foot for each two percent gradient over twenty percent. In no case under the provisions of this subsection shall the setback be less than ten feet. The front of a garage shall not be closer than eighteen feet from the back of the sidewalk.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.09.150 Side yard—Exception.

For a lot in a NC, CC, MX, ME, or RC district containing a use other than a dwelling structure, and adjoining a residential zoning district, minimum side yard along a side lot line adjoining a lot in a residential zoning district shall be fifteen feet. In the case of a lot in ~~a LI or~~ an HI district the side yard setbacks shall be twenty feet. If the adjoining residential district is within an area shown in the comprehensive plan for future commercial or industrial use or expansion, no minimum side yard shall be required.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.160 Side yard—Flanking street.

For a corner lot in a NC, CC, RC, ~~LI~~ ME, MX, or HI district proposed for commercial or industrial development, which is across a street from a residential (R) zone, the yard setback from the street shall be fifteen feet.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.170 Rear yard—Exception.

For a lot in a NC, CC ME, MX, or RC district containing a use other than a dwelling structure and adjoining a residential zoning district, minimum rear yard along a rear lot line adjoining a side or rear yard of a lot in a residential zoning district shall be fifteen feet. In the case of a lot in a ~~LI or~~ an HI district, the rear yard setback shall be twenty feet. If the adjoining residential district is within an area shown in the comprehensive plan for future commercial or industrial use or expansion, no minimum rear yard shall be required.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.09.180 Elevated decks.

Rear Yard Setback. The rear yard setback for an elevated deck shall be fifteen feet. As used herein, an elevated deck shall mean a deck thirty inches or more aboveground level that is physically attached to a residential structure. The areas covered by an elevated deck shall be counted when calculating the maximum lot coverage permitted under the applicable density provisions.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

Chapter 18.11 PARKING

18.11.010 Parking policy designated.

Except as hereafter provided for the ~~MX District and DC District~~Downtown and Mixed-Use zoning districts, in all Districts there shall be provided minimum off street parking spaces in accordance with the requirements of ~~Section 18.11.020~~this chapter. Such off street parking spaces shall be provided at the time of erecting new structures, or at the time of enlarging, moving, or increasing the capacity of existing structures by creating or adding dwelling units, commercial or industrial floor space, or seating facilities. Under no circumstances shall off street parking be permitted in the vision clearance area of any intersection. Off street parking will only qualify if located entirely on the parcel in question, and not on City owned right-of-way or privately owned streets less than twenty feet in width. Covered parking structures shall not be permitted within the front yard set back or side yard set back along a flanking street.

~~For projects one-half block or less in size in the DC District and MX District, the Community Development Director may waive the off street parking requirements if the City Engineer finds that the anticipated parking needs of the project can be adequately met by existing off street parking on site, if any, and on street parking adjacent to the project. The Community Development Director may, as a condition of waiving the off street parking requirements of Section 18.11.020, require that on street parking be converted at the expense of the applicant to angle parking or another parking configuration approved by the City Engineer.~~

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § VI, 5-18-2009)

18.11.020 Design.

The design of off-street parking shall be as follows:

A. Ingress and Egress. The location of all points of ingress and egress to parking areas shall be subject to the review and approval of the city.

B. Backout Prohibited. In all commercial and industrial developments and in all residential buildings containing five or more dwelling units, parking areas shall be so arranged as to make it unnecessary for a vehicle to back out into any street or public right-of-way.

C. Parking Spaces—Access and Dimensions. Adequate provisions shall be made for individual ingress and egress by vehicles to all parking stalls at all times by means of unobstructed maneuvering aisles.

1. Off-street parking space dimensions shall be as follows or as otherwise approved by the director:

    a. Standard spaces shall be a minimum of nine feet in width;

    b. Standard spaces shall be a minimum of eighteen feet in length.

2. Aisle width dimensions shall be as follows or as otherwise approved by the director:

    a. One-way aisle width shall be fifteen feet;

    b. Two-way aisle width shall be twenty-four feet.

D. Small Car Parking Spaces. A maximum of thirty percent of the total required parking spaces may be reduced in size for the use of small cars, provided these spaces shall be clearly identified with a sign permanently affixed immediately in front of each space containing the notation "compacts only." Spaces designed for small cars may be reduced in size to a minimum of eight feet in width and fifteen feet in length. Where feasible, all small car spaces shall be located in one or more contiguous areas and/or adjacent to ingress/egress points within parking facilities. Location of compact car parking spaces shall not create traffic congestion or impede traffic flows.

E. Wheel stops. Wheel stops shall be installed where parking spaces are oriented toward sidewalks, walkways, or landscape areas and vehicle overhang may obstruct pedestrian access, interfere with maintenance, or damage trees, shrubs, groundcover, flowers, or other plantings. Wheel stops may be omitted where sidewalks are wide enough to maintain required pedestrian clearance despite vehicle overhang, or where plantings are set back sufficiently to avoid damage or maintenance conflicts.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.11.030 Location.

Off-street facilities shall be located as hereafter specified. Such distance shall be the maximum walking distance measured from the nearest point of the parking facility to the nearest point of the building that such facility is required to serve:

A. For single-family or two-family dwelling and motels: on the same lot with the structure they are required to serve.

B. For multiple dwelling, rooming or lodging house: two hundred feet.

C. For hospital, sanitarium, home for the aged, or building containing a club: three hundred feet.

D. For uses other than those specified above: four hundred feet.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

~~18.11.040 Units of measurement.~~

~~A. In a stadium, sports arena, church, or other place of assembly, each twenty inches of bench seating shall be counted as one seat for the purpose of determining requirements for off-street parking facilities.~~

~~B. For purposes of determining off-street parking as related to floor space of multilevel structures and building, the following formula shall be used to compute gross floor area for parking determination:~~

~~Main floor~~	~~100%~~
~~Basement and second floor~~	~~50%~~
~~Additional stories~~	~~25%~~

~~(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)~~

18.11.~~050~~040 Change or expansion.

Except in a ~~DC District or MX District~~Downtown or Mixed Use zoning district, whenever a building is enlarged or altered, or whenever the use of a building or property is changed, off street parking shall be provided for such expansion or change of use.

A. The number of off street parking spaces required shall be determined for only the square footage of expansion and not the total square footage of the building or use; however, no additional off street parking space need be provided where the number of parking spaces required for such expansion, enlargement, or change in use since the effective date of this Code is less than ten percent of the parking spaces specified in the Code.

B. No additional off-street parking spaces shall be required for the addition of dwelling units added within an existing building.

C. Nothing in this provision shall be construed to require off-street parking spaces for the portion and/or use of such building existing at the time of passage of the Code.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § VII, 5-18-2009)

~~18.11.060 Unspecified use.~~

~~In case of a use not specifically mentioned in Section 18.11.130 of this chapter, the requirements for off-street parking facilities shall be determined by the city in accordance with a conditional use permit. Such determination shall be based upon the requirements for the most comparable use listed.~~

~~(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)~~

18.11.~~070~~050 Joint use.

Cumulative parking requirements for mixed-use occupancies or shared facilities may be reduced where it can be shown that the peak parking requirements of the various uses occur at different times of the day, week or year. Methods for calculating parking reduction and submission requirements are outlined in this section. Two methods for determining parking reduction are as follows:

A. Parking Occupancy Rates. When a parking reduction is requested based on parking demand calculations from Table 18-11-1, the applicant shall submit a parking demand summary showing the calculations outlined in this section. To determine the number of parking stalls required:
    1. Determine the minimum required minimum number of parking stalls for each use.
    2. Multiply the minimum required number of stalls by the “occupancy rate” for the corresponding use in Table 18-11-1 (or as determined by a parking study) to produce an adjusted minimum requirement for each use for weekday day, evening and night periods, and for weekend day, evening and night periods.
    3. Sum the adjusted minimum number of stalls for each use for each time period to produce an aggregate adjusted minimum number of stalls for each period.
    4. The greatest of the aggregate adjusted minimum number of stalls for each period shall be the minimum number of shared parking stalls required.

5. Parking reserved for specified individual persons, positions, businesses, or offices, hotel or residential units do not count toward shared parking.

Table 18-11-1. Parking Occupancy Rates

Use[a]	Weekdays[a]			Weekends[a]		
	Day (7:00 a.m. – 6:00 p.m.)	Evening (6:00 p.m. – 11:00 p.m.)	Night (11:00 p.m. – 7:00 a.m.)	Day (8:00 a.m. – 5:00 p.m.)	Evening (5:00 p.m. – 12:00 a.m.)	Night (12:00 a.m. – 8:00 a.m.)
Residential	60%	100%	100%	80%	100%	100%
Office/Industrial/Warehouse	100%	20%	5%	5%	5%	5%
Retail/Commercial	90%	80%	5%	100%	79%	5%
Hotel	70%	100%	100%	70%	100%	100%
Restaurant	70%[b]	100%	10%	70%[b]	100%	20%
Theater (Movie or Live)	40%	80%	10%	80%	100%	10%
Entertainment/Recreation	40%	100%	10%	80%	100%	10%
Convention/Conference	100%	100%	5%	100%	100%	5%
Place of Worship	10%	5%	5%	100%	50%	5%

(a) Weekends are the period from 6:00 p.m. on Friday to 6:00 p.m. on Sunday.

(b) Fast food and breakfast/lunch oriented facilities = 100%

B. Parking Study.

1. A parking study may substitute for a parking occupancy rates summary for uses not found in the table above; for parking reductions based on seasonal variation or other time frames not found in the table; or for a parking reduction greater than provided for in the table.
2. The parking study shall meet the requirements of Section 18.11.110.

~~The city may authorize the joint use of parking facilities for the following uses or activities under conditions specified:~~

~~A. Up to fifty percent of the parking facilities required by the code for a theater, bowling alley, tavern, or restaurant may be supplied by the off-street parking facilities provided by certain types of buildings or uses herein referred to as "daytime" uses in subsection D of this section.~~

~~B. Up to fifty percent of the off-street parking facilities required for any building or use specified in subsection D of this section, "daytime" uses, may be supplied by the parking facilities provided by uses herein referred to as "nighttime or Sunday" uses in subsection E of this section.~~

~~C. Up to one hundred percent of the parking facilities required for a church or for an auditorium incidental to a public or parochial school may be supplied by the off-street parking facilities provided by uses herein referred to as "daytime" uses in subsection D of this section.~~

~~D. For the purpose of this section, the following and similar uses are considered as primary daytime uses: banks, offices, retail, personal service shops, household equipment or furniture stores, clothing or shoe repair shops, manufacturing or wholesale buildings, and similar uses.~~

~~E. For the purpose of this section, the following and similar uses are considered as primary nighttime or Sunday uses: auditorium incidental to a public or parochial school, churches, bowling alleys, theaters, taverns or restaurants.~~

~~F. Owners of two or more buildings or lots may agree to utilize jointly the same parking space, subject to such conditions as may be imposed by the city. Satisfactory legal evidence shall be presented to the city in the form of deeds, leases, or contracts to establish the joint use. Evidence shall be required that there is no substantial conflict in the principal operating hours of the buildings or uses for which joint off-street parking is proposed.~~

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.~~080~~060 Plan submittal.

Every tract or lot hereafter used as public or private parking area, having a capacity of five or more vehicles, shall be developed and maintained in accordance with the requirements and standards of this chapter.

The plan of the proposed parking area shall be submitted to the city at the time of the application for the building for which the parking area is required. The plan shall clearly indicate the proposed development, including location, size, shape, design, curb cuts, lighting, landscaping, and other features and appurtenances required. The parking facility shall be developed and completed to the required standards before an occupancy permit for the building may be issued.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.~~090~~070 Landscaping.

Landscaping requirements for parking areas shall be provided under Chapter 18.13 "Landscaping."

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.~~100~~080 Single-family r~~R~~esidential parking.

Residential off-street parking space shall consist of a parking strip, driveway, garage, or a combination thereof, and shall be located on the lot they are intended to serve.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.~~110~~090 Parking for the handicapped.

Off-street parking and access for the physically handicapped persons shall be provided in accordance with the international building code.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.~~120~~100 Additional requirements.

In addition to the basic standards and requirements established by other sections of this chapter, the city may make such other requirements or restrictions as shall be deemed necessary in the interests of safety, health and general welfare of the city, including, but not limited to, lighting, jointly development of parking facilities, entrances and exits, accessory uses, and conditional exceptions. Further, performance bonds may be required in such cases where the city determines that such shall be necessary to guarantee proper completion of improvements within time periods specified.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.110 Parking study.

A. A parking study is required when:
   1. An applicant proposes fewer parking spaces than allowed under the alternative minimum standards in Section 18.11.120;
   2. A multifamily development containing more than twenty dwelling units requests use of the alternative minimum standards;
   3. No reasonably comparable parking standard exists for an unspecified use; or
   4. The Community Development Director determines that the scale, mix of uses, operating characteristics, or phasing of a development warrants additional parking analysis.

   Approval under this section is an alternative method of compliance and is not a variance under Chapter 18.45.

B. The parking study shall determine the anticipated parking demand of the proposed development, justify any difference between the parking requirements of this chapter and the proposed parking supply, demonstrate that adequate parking will be provided for each phase and the ultimate development scenario, if applicable, and evaluate alternative methods of meeting parking demand, including shared parking, off-site parking, on-street parking, and transportation demand management.

C. A parking study shall use accepted engineering and planning principles and shall include:
   1. The project name, property address, purpose of the study, site location, and a brief description of the proposed development, including the type of development, development statistics such as the number of dwelling units and site area, proposed parking areas, access points, amenity areas, and proposed phasing, if applicable.
   2. For nonresidential uses, the gross floor area, in square feet, by use and the anticipated hours of operation, if known.
   3. A description of existing on-site conditions and the surrounding area, including streets, natural areas, buildings, and parking areas.
   4. A concept plan showing proposed building locations, parking areas, vehicular, bicycle, and pedestrian access and circulation, amenity areas, landscaping, grading, natural features, and known natural hazards.
   5. The parking requirements applicable to the proposed development under this chapter.
   6. Any previously approved parking reductions or modifications applicable to the property or development.
   7. An outline of the proposed parking supply, broken down by land use and development phase, if applicable.
   8. Identification of the applicable accessible parking requirements and the number of accessible parking spaces proposed.
   9. A description of existing parking and any shared or off-site parking proposed or relied upon, including applicable parking agreements.

10. For existing vacant or unoccupied tenant spaces, identification of anticipated tenants or uses, if known. If future tenants or uses are unknown, the analysis shall assume a reasonably foreseeable use with parking demand at the higher end of the range of uses likely to occupy the space.
11. The location of nearby transit facilities and a description of any proposed transportation demand management measures.
12. A summary of the parking analysis, findings, and conclusions, including any reductions or adjustments to the standards of this chapter relied upon in the analysis.
13. A recommendation for the parking supply necessary to meet the anticipated parking demand of the proposed development.
14. Any other special considerations, conditions, or circumstances supporting the recommended parking supply.
15. Other information reasonably required by the Community Development Director to evaluate the proposed parking supply.

D. The parking study shall be submitted with the applicable development application. The Community Development Director will review the study to determine whether the proposed recommended off-street parking supply, outlined in the parking study, will accommodate the needs generated by the proposed development project.

E. The Community Development Director may impose conditions necessary to ensure continued compliance, including shared or off-site parking agreements, transportation demand management measures, parking management or monitoring, or additional review if the use or operating characteristics change materially from those assumed in the approved study.

18.11.120 Alternative minimum standards

As provided by RCW 35A.21.445, the following minimum alternative off-street parking standards may be allowed with an approved parking assessment:

A. No more than 0.5 parking space per multifamily dwelling unit.
B. No more than one space per single-family home.
C. No more than two parking spaces per 1,000 square feet of commercial space.
D. No minimum parking spaces for:
    1. Residences under 1,200 square feet;
    2. Commercial spaces under 3,000 square feet;
    3. Affordable housing;
    4. Senior housing;
    5. Child care centers defined in RCW 43.216.010;
    6. Ground level nonresidential space in mixed use buildings; and
    7. A building undergoing a change of use from a nonresidential to a residential use or a change of use for a commercial use.
E. Parking assessment. A parking assessment shall include:
    1. A site plan and brief description of the proposed development, including the proposed uses and parking supply;
    2. The parking requirement under Section 18.11.130 and the alternative minimum requested;
    3. A brief explanation of the anticipated parking needs of the development based on its size, use, and operating characteristics;
    4. A description of existing on-site and abutting on-street parking, including applicable restrictions;
    5. A description of available transit, pedestrian and bicycle facilities, shared or off-site parking, and proposed transportation demand management measures, as applicable; and
    6. A description of any site constraints affecting the ability to provide the otherwise required parking.

D. The Director may approve the alternative minimum upon finding that the proposed parking supply is reasonably expected to serve the development, considering the information provided in the parking assessment and the availability of other parking and transportation options.

E. Multifamily residential projects with more than twenty units are required to conduct a parking study under Section 18.11.110 in place of a parking assessment in order to utilize the alternative minimum standards.

18.11.130 Standards.

A. The minimum number of off-street parking spaces for the listed uses shall be shown in Table 18.11-~~1~~2, Off-Street Parking Standards. The city shall have the authority to request a parking study when deemed necessary.

B. Unspecified uses. For a use not specifically listed in Section 18.11.130, the required number of off-street parking spaces shall be determined by the Director based on the listed use with the most similar parking demand and operating characteristics. The Director may require a parking study under Section 18.11.065 when no reasonably comparable use exists.

C. Downtown and mixed-use zones. Commercial uses and ground-floor nonresidential space in a mixed-use building have no minimum parking requirements. For other uses in projects one-half block or less in size, the Community Development Director may reduce the off-street parking requirements if the City Engineer finds that the anticipated parking needs of the project can be adequately met by existing off-street parking on site, if any, and on-street parking adjacent to the project. The Community Development Director may, as a condition of this section, require that on-street parking adjacent to the project be converted at the expense of the applicant to angle parking or another parking configuration approved by the City Engineer.

Table 18.11-2 Off-Street Parking Standards

Use	Required Number of Off-Street Parking Spaces
Residential	
Single-family dwelling, ~~duplex, rowhouse~~ middle housing	2 per unit on lots greater than 6,000 square feet 1 per unit on lots smaller than 6,000 square feet
Studio apartment	1 per unit
Apartment 1 bedroom/ 2+ bedrooms	1.5/2
Housing for elderly (apartment/unassisted)	.33 per unit
Retirement dwellings	2 per unit
Residential care facility/assisted living	1 per 2 beds + 1 per day shift employee
Affordable housing	No minimum
Residential new construction or retrofit of existing buildings meeting passive house requirements	No minimum
Residential modular construction	No minimum
Residential mass timber construction	No minimum
Lodging	
Hotel or motel	1 space per unit plus additional for bars, restaurants, assembly rooms
Bed and breakfast	1 space per room
Recreation	
Marina	1 space per 2 slips
Miniature golf	1 per hole
Golf course	6 spaces per hole and 1 per employee

Golf driving range	1 space per 15 feet of driving line
Theater, auditorium	1 space per 4 seats maximum occupancy
Stadium, sports arena	1 space per 4 seats, or 1 for each 8 feet of benches, plus 1 space per 2 employees
Tennis, racquetball, handball, courts/club	3 spaces per court or lane, 1 space per 260 square feet of gross floor area (GFA) of related uses, and 1 space per employee
Basketball, volleyball court	9 spaces per court
Bowling, bocce ball center, billiard hall	5 spaces per alley/lane, and/or table
Dance hall, bingo hall, electronic game rooms, and assembly halls without fixed seats	1 space per 75 square feet of gross floor area (GFA)
Sports club, health, spa, karate club	1 space per 260 square feet of gross floor area, plus 1 space per employee
Roller rink, ice-skating rink	1 space per 100 square feet of gross floor area
Swimming club	1 space per 40 square feet of gross floor area
Private club, lodge hall	1 space per 75 square feet of gross floor area
Institutional	
Church/chapel/ synagogue/temple	1 space per 3 seats or 6 feet of pews
Elementary/middle/ junior high school	1 space per employee, teacher, staff, and 1 space per 15 students
Senior high school	1 space per employee, teacher, staff, and 1 space per 10 students
Technical college, trade school, business school	1 space per every 2 employees, staff, and 1 space per every full-time student, or 3 part-time students
University, college, seminary	1 per every 2 employees and staff members, and either 1 per every 3 full-time students not on campus, or 1 for every 3 part-time students, whichever is greater
Multi-use community centers	1 per 4 seats maximum occupancy
Museum, art gallery	1 space per 500 square feet of gross floor area
Library	1 per employee and 1 per 500 square feet of gross floor area
Post office	1 per 500 square feet of gross floor area, plus 1 space per each 2 employees
Medical care facilities	
Hospitals	1 per 2 beds
Veterinary clinic/hospital	1 space per 250 square feet of gross floor area
Medical/dental clinic/office	1 per employee plus 1 per 300 square feet of gross floor area
Office	
General offices	1 per employee, plus 1 per 400 square feet of gross floor area
General office (no customer service)	1 per 250 square feet of gross floor area
Office park	1 space per 400 square feet of gross floor area
Meeting rooms	1 per 4 person occupancy load, and 1 per 2 employees
Commercial/service	
Automobile sales new/used	1 per 400 square feet of gross floor area
Auto repair accessory to auto sales	2 spaces per auto service stall

Automobile repair shop, automobile service station, automobile specialty store, automobile body shop	4 per bay
Gas station	1 per 2 fuel pumps
Gas station with mini-market	1 per nozzle plus 1 per 250 square feet of gross floor area
Car wash or quick service lubrication facilities	2 spaces per stall, and 1 space per 2 employees
Beauty parlor, barber shop	1 per 300 square feet of gross floor area
Massage parlor	1 per 300 square feet of gross floor area
Exhibition halls, showrooms, contractor's shop	1 space per 900 square feet of gross floor area
Photographic studio	1 space per 800 square feet of gross floor area
Convenience market, supermarket	1 space per 250 square feet of gross floor area
Multi-use retail center	1 per 250 square feet of gross floor area
Finance, insurance, real estate office	1 per employee plus 1 per 400 square feet of gross floor area
Bank	1 per employee, plus 1 per 400 square feet of gross floor area
Drug store	First 5,000 square feet = 17 spaces plus 1 per additional 1,500 square feet
Furniture/appliance store	1 per 500 square feet of gross floor area
Clothing store	1 per 400 square feet of gross floor area
Lumber yard, building material center	1 space per 275 square feet of indoor sales area, plus 1 space per 5,000 square feet of warehouse/storage
Hardware/paint store	1 per 400 square feet of gross floor area
Restaurant	1 per 100 square feet of gross floor area
Restaurant, carry-out	1 space per 225 square feet of gross floor area
Fast food restaurant/coffee kiosk	1 space per 110 square feet of gross floor area, plus 6 stacking spaces for drive-through lane
Repair shop	1 per 400 square feet of gross floor area
Laundromats, coin-operated dry cleaners	1 space per every 3 washing or cleaning machines
Mortuary	1 space per 150 square feet of gross floor area
Express delivery service	1 space per 500 square feet of gross floor area, plus 1 space per employee
Retail stores in general	Less than 5,000 square feet: 1 per 300 square feet. Greater than 5,000 square feet: 17 plus 1 per 1,500 square feet
Industrial	
Industrial, manufacturing	1 per 500 square feet of gross floor area
Warehousing, storage	1 per 1,000 square feet of gross floor area
Public or private utility building	1 per 1,000 square feet of gross floor area
Wholesaling	2 plus 1 per 1,000 square feet of gross floor area
Research and development	1 per 500 square feet of gross floor area
LI/BP general office	1 per employee peak plus 15%
LI/BP research	1 per employee peak + 10%

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.11.140 Loading standards.

In all districts except the DC districts, buildings or structures to be built or substantially altered which receive and distribute material and merchandise by trucks shall provide and maintain off-street loading berths in sufficient numbers and size to adequately handle the needs of the particular case.

The following standards in Tables 18.11-~~2~~3 and 18.11-~~3~~4, shall be used in establishing the minimum number of berths required:

Table 18.11-~~2~~3 Berth Standards for Commercial and Industrial Buildings

Number of Berths	Gross Floor Area of the Building in Square Feet
1	Up to 20,000
2	20,000—50,000
3	50,000—100,000
* One additional berth is required for each 50,000 in excess of 100,000	

Table 18.11-~~3~~4 Berth Standards for Office Buildings, Hotels, Hospitals and Other Institutions

Number of Berths	Gross Floor Area of the Building in Square Feet
1	Up to 100,000
2	100,000 to 300,000
3	300,000 to 600,000
* One additional berth is required for each 300,000 in excess of 600,000	

No loading berth shall be located closer than fifty feet to a lot in any residential zoning district unless wholly within a completely enclosed building, or unless screened from such lot in the residential district by a wall, fence, or sight-obscuring evergreen hedge not less than six feet in height.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.11.150 Bicycle parking.

Bicycle parking shall be provided for new development unless otherwise exempt under this section. Single-family dwellings, middle housing, accessory dwelling units, home occupations, and temporary uses are exempt.

A. **Minimum spaces required.** Bicycle parking shall be provided as shown in Table 18.11-5. When a calculation results in a fraction, the number of spaces shall be rounded up to the nearest whole number.

Table 18.11-5 Bicycle Parking Standards

Use	Short-term bicycle parking	Long-term bicycle parking
Multifamily dwellings, 5 or more units	2 spaces, or 1 per 20 dwelling units, whichever is greater	1 per 5 dwelling units
Nonresidential and mixed-use buildings, 10,000 gross square feet or more	2 spaces, or 1 per 10,000 gross square feet, whichever is greater	2 spaces, or 1 per 20,000 gross square feet, whichever is greater
Hotels and lodging	2 spaces	1 per 20 guest rooms

B. **Short-term bicycle parking.** Short-term bicycle parking shall be located outside the building, within 50 feet of a primary entrance, and visible from the entrance or public right-of-way, and shall not obstruct sidewalks, walkways, drive aisles, fire lanes, or required accessible routes. Short-term bicycle parking spaces shall use racks or lockers securely anchored to the ground or structure and allow the bicycle frame and at least one wheel to be locked to the rack.

C. **Long-term bicycle parking.** Long-term bicycle parking shall be covered and secured within a building, bicycle room, locked enclosure, individual locker, garage, or other area accessible only to residents, employees, or other authorized users. Long-term bicycle parking for residential uses may be provided in private garages or storage areas assigned to individual dwelling units or inside individual dwelling units.

D. **Electric bicycle charging.** Electric bicycle charging facilities are encouraged near short-term and long-term parking areas. Where provided, charging equipment shall be located or managed so they do not create tripping hazards or obstruct required access.

18.11.160 Electric vehicle charging.

New developments shall provide electric vehicle charging infrastructure in compliance with WAC 51-50-0429.

Chapter 18.13 LANDSCAPING

18.13.010 Purpose.

A. To establish minimum standards for landscaping in order to provide screening between incompatible land uses, minimize the visual impact of paved areas, provide for shade, and minimize erosion; and

B. To implement the city's comprehensive plan goals which include preserving natural beauty in the city, and protecting Camas' native landscape and mature tree cover.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 18-014, § XIII, 9-4-2018)

18.13.020 Scope.

A. Unless otherwise exempted, the standards of this chapter shall apply to any site to be developed. All applicable development activities shall be required to prepare a landscape plan and shall be required to meet the minimum tree density herein created.

B. The standards of this chapter shall apply to the following:

1. Commercial, industrial, governmental uses, and land divisions;
2. Redevelopment including change of use when Site Plan Review is applicable (refer to Chapter 18.18 Site Plan Review);
3. Parking lots with greater than four spaces;
4. Development that is subject to Design Review (refer to Chapter 18.19 Design Review);
5. Undeveloped property converting to an allowed use in the zone (e.g. infill lots); and
6. Conditional uses. The standards for landscaping will be the same as the landscaping standards in commercial zones if conditional use will occur in a residential zone.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 18-014, § XIII, 9-4-2018)

18.13.025 Exemptions.

The following activities are exempt from submittal of a Landscape Tree and Vegetation Plan:

A. Commercial Nurseries. Removal of trees and vegetation which are being grown to be sold as landscape trees.

B. Forest Practices Permit. Removal of trees as allowed with a forest practices permit issued by the Washington State Department of Natural Resources. Exemption does not include conversion of forest land to other uses.

C. Developed Residential Lots. Removal of trees on lots which: (1) are less than twenty-four thousand square feet and are part of a subdivision or short plat; (2) which cannot be further divided in accordance with the underlying zoning district; and (3) trees to be removed are not within shoreline areas or critical areas.

D. Undeveloped property and developed lots (twenty-four thousand square feet and greater). Removal of up to six trees per acre, up to a total of six trees within any twelve consecutive month period when: (1) the property is intended to remain undeveloped for a period of six years and such intent is recorded in a covenant; (2) if a minimum tree density of thirty tree units per acre is maintained; and (3) the trees to be removed are not within shoreline areas or critical areas. Removal of trees on parcels of less than one acre in size shall be limited in proportion to six trees per acre (e.g. a half acre parcel can remove three trees).

E. Downtown commercial zone. Downtown commercial zone properties must include properly spaced street trees, and other landscape screening in accordance with downtown design review standards, but are not required to meet tree density minimums.

F. Minor development. A Landscape, Tree and Vegetation plan is not required for any site disturbance less than five hundred square feet and where no tree will be removed or adjacent tree(s) impacted.

(Ord. No. 18-014, § XIV, 9-4-2018)

18.13.030 Expansion.

In a case where a site expands, landscaping shall be provided only for the percentage of expansion.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.13.040 Procedure for landscape, tree and vegetation plans.

A. Applicants shall submit a detailed Landscape, Tree and Vegetation Plan with building and site improvement plans. Included in the plans (at a minimum) shall be type, size, and location of plants and materials.

B. A tree survey must be included for any applicable development proposing to remove trees.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 18-014, § XIII, 9-4-2018)

18.13.045 Tree survey.

A. The applicant must submit a tree survey that is prepared by a certified arborist or professional forester.

B. A tree survey must contain the following:

1. Inventory.

   a. Map of the site, with tree locations numbered

   b. Include all significant trees that will be impacted by the proposed development, which may include trees off-site if canopies overhang the subject property. Open space tracts to be set aside for conservation purposes do not need to be included in survey.

   c. Provide the common and scientific name of inventoried trees.

2. Assessment.

    a. Size. Measure and provide the diameter at breast height (DBH).

    b. Tree protection zone. (Refer to CMC 18.03.050 Environmental Definitions)

    c. Tree health. An overall assessment of the trees structural stability and failure potential based on specific structural features (e.g. decay, conks, co-dominate trunks, abnormal lean) and rated as good, fair or poor.

    d. Recommendation for preservation or removal. The recommendation will consider proposed grading, trenching, paving, fencing and other construction plans.

    e. If hazardous, then an evaluation of hazardous trees will include a numerical value of hazard based on the following: failure potential; size of part most likely to fail; and distance to target (e.g. new residence).

(Ord. No. 18-014, § XIV, 9-4-2018)

18.13.050 Standards for landscape, tree and vegetation plans.

A. The property owner shall be responsible for any future damage to a street, curb, or sidewalk caused by landscaping.

B. Landscaping and trees shall be selected and located to deter sound, filter air contaminants, curtail erosion, minimize stormwater run-off, contribute to living privacy, reduce the visual impacts of large buildings and paved areas, screen, and emphasize or separate outdoor spaces of different uses or character.

C. Landscape, Tree and Vegetation Plan must include a combination of trees, shrubs, and ground cover to achieve the purposes of this chapter.

    1. Required landscaping shall be comprised of a minimum of sixty percent native vegetation (or adapted to northwest climate), or drought-tolerant vegetation, and fifty percent evergreen.

    2. Deciduous trees shall have straight trunks, be fully branched, have a minimum caliper of two inches, be equivalent to a fifteen-gallon container size, and be adequately staked for planting.

    3. Evergreen trees shall be a minimum of five feet in height, fully branched, and adequately staked for planting.

D. Street trees will be required as part of the frontage improvements. Species, size and spacing of the trees must be consistent with the Design Standards Manual. Unless otherwise specified, trees must generally be spaced thirty feet apart. Substitute varieties are subject to approval by the City of Camas.

E. Proposed vegetation cannot be an invasive species as listed within the most current edition of the Clark County Noxious Weed List (e.g. English Ivy cultivars).

F. Shrubs shall be a minimum of five-gallon pot size. Upright shrubs shall have a minimum height at planting of eighteen inches. Spreading shrubs at planting shall have a minimum width of eighteen inches (smaller shrub sizes may be approved where it is more appropriate within a particular landscape plan).

G. Ground Cover, defined as living material and not including bark chips or other mulch, shall be from containers of one gallon or larger. Plants shall be planted and spaced in a triangular pattern which will result in eighty percent cover in three years. Lawn cannot be the primary ground cover within required landscape buffers unless approved for stormwater conveyance. Grass species, if used as ground cover, shall be native or drought-tolerant, and appropriate for the use of the area.

H. Appropriate measures shall be taken, e.g., installation of irrigation system, to assure landscaping success. If plantings fail to survive, it is the responsibility of the property owner to replace them.

I. Required trees, as they grow, shall be pruned in accordance with the International Society of Arboriculture. The pruned tree will provide at least ten feet of clearance above sidewalks and fourteen feet above street roadway surfaces.

J. Existing trees may be used as street trees if there will be no damage from the development which will kill or weaken the tree. Sidewalks of variable width and elevation may be utilized to save existing street trees, subject to approval by the city.

K. Vision clearance hazards shall be prohibited.

L. Street trees and other required landscaping which dies or is removed, must be replaced within one year of death or removal. Replacement street trees may be an alternative species from the city's recommended tree list, and may be in a different location as approved by the city.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017; Ord. No. 18-014, § XIII, 9-4-2018; Ord. No. 21-005, § I(Exh. A), 3-15-2021)

18.13.051 Minimum tree density requirement.

A. Tree Density. A minimum tree density per net acre is required and must be incorporated within the overall landscape plan. The tree density may consist of existing trees, replacement trees or a combination of existing and replacement trees, pursuant to the priority established in Section 18.13.052. At least fifty percent of minimum tree density shall be achieved through retention of existing trees where the existing tree coverage on the site would allow for this standard to be met. If this standard cannot be met, an arborist report is required to demonstrate that it cannot be met. Replacement trees must be native and/or coniferous species.

18.13.051 Table 1: Required Tree Density

Proposed Activity	Required Minimum Tree Density per Net Acre	Required Tree Replacement	~~North Shore Subarea Required Minimum Tree Density per Net Acre~~[1]
New Development	~~20~~ 30 Tree Units	~~20~~ 30 Tree Units per acre	~~30 Tree Units~~
Residential	~~20~~ 30 Tree Units	~~20~~ 30 Tree Units per acre	~~30 Tree Units~~
Developed commercial and industrial properties	~~20~~ 30 Tree Units	3 Tree Units for every 1 tree unit removed up to the minimum tree density per acre.	~~30 Tree Units~~

[1] At least fifty percent of minimum tree density shall be achieved through retention of existing trees where the existing tree coverage on the site would allow for this standard to be met. If this standard cannot be met, an arborist report is required to demonstrate that it cannot be met. Replacement trees must be native and/or coniferous species. More information is included in the North Shore Design Manual.

B. Tree Density Calculation. Specific instructions on how to perform tree density calculations are provided in the Design Standards Manual. "Tree Unit" is a unit of measurement based upon the size of the diameter of the tree measured at the breast height ("dbh"). New trees are given a value of one (1) Tree Unit, as they must be a minimum of 2" dbh when planted. Tree Unit values are summarized in the following Table:

18.13.051 Table 2: Tree Units for Existing Trees

Diameter at Breast Height "dbh"	Tree Units	Diameter at Breast Height "dbh"	Tree Units
1" to 5"	1	31" to 32"	12
6" to 12"	2	33" to 34"	13
13" to 14"	3	35" to 36"	14
15" to 16"	4	37" to 38"	15
17" to 18"	5	39" to 40"	16
19" to 20"	6	41" to 42"	17
21" to 22"	7	43" to 44"	18
23" to 24"	8	45" to 46"	19
25" to 26"	9	47" to 48"	20
27" to 28"	10	49" to 50"	21
29" to 30"	11	For larger trees, allow a ½ tree unit for every additional inch of dbh.	

(Ord. No. 18-014, § XIV, 9-4-2018; Ord. No. 23-010, Exh. A, 8-7-2023)

18.13.052 Tree and native vegetation preservation.

A. When determining where to retain or plant trees, locations with healthy soils, native understory vegetation, and mature trees shall have priority when there are feasible alternative locations on site for proposed buildings and site improvements to achieve the minimum tree unit density per acre. This may require site redesign. Provided, where necessary, density transfer areas may be used to ensure protection and retention of trees. Residential and mixed-use developments may use density transfer standards when setting aside area outside of critical or natural areas to protect existing trees.

B. In designing a development project and in meeting the required tree density, the applicant must provide a Landscape, Tree and Vegetation plan that retains healthy, wind firm trees in the following priority:

   1. Trees located within critical area buffers. Trees must be identified within a protected tract.

   2. Significant wildlife habitat, or areas adjacent and buffering habitat.

   3. Significant trees that are greater than 36 inch dbh.

   4. Groves of trees, or other individual healthy trees with the intent to retain must be located in separate tract if part of a land division, or other protective mechanism if other development type,

   5. Trees, that if removed would cause trees on adjacent properties to become hazardous.

C. Mitigation and Replacement. In areas where there are currently inadequate numbers of existing trees to meet minimum tree density, where the trees are inappropriate for preservation, the soils are poor, or there are significant invasive species, then mitigation shall be required to meet the minimum tree density. The applicant's proposed location for replacement trees or mitigation shall be subject to the city's approval of the Landscape Plan. Replacement trees shall be planted in the following priority:

   1. Onsite.

      a. Within or adjacent to critical area buffers or wildlife habitat areas

      b. Adjacent to stormwater facilities

      c. Landscaping tracts, such as at entrances, traffic islands or other common areas

d. Removal of invasive species and restorative native vegetation planting equivalent to the area necessary for new tree planting.

2. City tree fund. When on-site locations are unavailable or infeasible, then the applicant can pay an amount equal to the market value of the replacement trees into the city's tree fund.

(Ord. No. 18-014, § XIV, 9-4-2018; Ord. No. 23-010, Exh. A, 8-7-2023)

18.13.055 Landscape buffering standards.

A. Landscape buffers shall be in compliance with the below referenced table:

Table 1—Landscape Buffers

Abutting Zone ▶	Residential		Commercial		~~Business Park~~ Mixed Employment		Industrial	
Uses on Site ▼	Not Separated by a Street	Separated by a Street	Not Separated by a Street	Separated by a Street	Not Separated by a Street	Separated by a Street	Not Separated by a Street	Separated by a Street
Multifamily Residential	5' L1	5' L1	10' L3	10' L2	10' L2	10' L2	10' L2 w/F2 Fence	10' L3
Commercial	10' L3	5' L2	5' L1	5' L2	5' L2	5' L2	10' L3	10' L2
Industrial	10' L2 w/F2 Fence	10' L2	10' L3	L2	10' L3	5' L2	5' L2	5' L1

B. Landscaping and Screening Design Standards.

1. L1, General Landscaping.

a. Intent. The L1 standard is intended to be used where distance is the principal means of separating uses or development, and landscaping enhances the area between them. The L1 standard consists principally of groundcover plants; trees and high and low shrubs also are required.

b. Required Materials. There are two ways to provide trees and shrubs to comply with an L1 standard. Shrubs and trees may be grouped. Groundcover plants, grass lawn, or approved flowers must fully cover the landscaped area not in shrubs and trees.

2. L2, Low Screen.

a. The standard is applied where a low level of screening sufficiently reduces the impact of a use or development, or where visibility between areas is more important than a greater visual screen.

b. Required Materials. The L2 standard requires enough low shrubs to form a continuous screen three feet high and ninety-five percent opaque year-round. In addition, one tree is required per thirty lineal feet of landscaped area, or as appropriate to provide a tree canopy over the landscaped area. Groundcover plants must fully cover the remainder of the landscaped area. A three-foot high masonry wall or fence at an F2 standard may be substituted for shrubs, but the trees and groundcover plants are still required.

3. L3, High Screen.

    a. The L3 standard provides physical and visual separation between uses or development principally using screening. It is used where such separation is warranted by a proposed development, notwithstanding loss of direct views.

    b. Required Materials. The L3 standard requires enough high shrubs to form a screen six feet high and ninety-five percent opaque year-round. In addition, one tree is required per thirty lineal feet of landscaped area, or as appropriate to provide a tree canopy over the landscaped area. Groundcover plants must fully cover the remainder of the landscaped area. A six-foot high wall or fence that complies with an F1 or F2 standard may be substituted for shrubs, but the trees and groundcover plants are still required. When applied along street lot lines, the screen or wall is to be placed along the interior side of the landscaped area.

4. Fences.

    a. F1, Partially Sight-Obscuring Fence.

        i. Intent. The F1 fence standard provides partial visual separation. The standard is applied where a proposed use or development has little impact, or where visibility between areas is more important than a total visual screen.

        ii. Required Materials. A fence or wall that complies with the F1 standard shall be six feet high, and at least fifty percent sight-obscuring. Fences may be made of wood, metal, bricks, masonry, or other permanent materials.

    b. F2, Fully Sight-Obscuring Fence.

        i. Intent. The F2 fence standard provides visual separation where complete screening is needed to protect abutting uses, and landscaping alone cannot provide that separation.

        ii. Required Materials. A fence or wall that complies with the F2 standard shall be six feet high, and one hundred percent sight obscuring. Fences may be made of wood, metal, bricks, masonry or other permanent materials.

5. The applicant may provide landscaping and screening that exceeds the standards in this chapter provided:

    a. A fence or wall (or a combination of a berm and fence or wall), may not exceed a height of six feet above the finished grade at the base of the fence or wall (or at the base of a berm, if combined with one), unless the approval authority finds additional height is necessary to mitigate potential adverse effects of the proposed use, or other uses in the vicinity; and landscaping and screening shall not create vision clearance hazards.

    b. The community development director may approve use of existing vegetation to fulfill landscaping and screening requirements of this chapter, if that existing landscaping provides at least an equivalent level of screening as the standard required for the development in question.

    c. Required landscaping and screening shall be located on the perimeter of a lot or parcel. Required landscaping and screening shall not be located on a public right-of-way or private street easement.

(Ord. No. 17-013, § III(Exh. A), 10-2-2017)

18.13.060 Parking areas.

A. Parking areas are to be landscaped at all perimeters.

B. All parking areas shall provide interior landscaping for shade and visual relief.

C. Parking lots shall include a minimum ratio of one tree per six parking spaces.

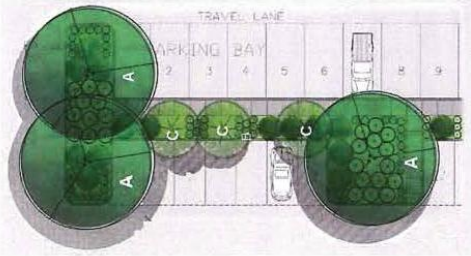

Figure 18.13.060-1 Example of Parking Lot Planter Areas.

In this example, there are three medium-sized trees ("A") for eighteen parking spaces, with ground cover ("B") and shrubs ("C").

D. Planter strips (medians) and tree wells shall be used within parking areas and around the perimeter to accommodate trees, shrubs and groundcover.

E. Planter areas for trees must provide a minimum of five hundred cubic feet of soil, and shall provide eight-foot by eight -foot minimum of clear planting space. For other vegetative buffer areas a minimum of a five foot clear width must be provided.

F. Wheel stops ~~should be used adjacent to tree wells and planter areas to protect landscaping from car overhangs.~~ shall be installed where parking spaces are oriented toward sidewalks, walkways, or landscape areas and vehicle overhang may obstruct pedestrian access, interfere with maintenance, or damage trees, shrubs, groundcover, flowers, or other plantings. Wheel stops may be omitted where sidewalks are wide enough to maintain required pedestrian clearance despite vehicle overhang, or where plantings are set back sufficiently to avoid damage or maintenance conflicts.

G. Curbed planting areas shall be provided at the end of each parking aisle to protect parked vehicles.

H. No more than fifteen parking spaces shall be located in a row without a landscaped divider strip (See Figure 18.13.060-1).

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006; Ord. No. 18-014, § XIII, 9-4-2018; Ord. No. 19-012, § II(Exh. A), 11-4-2019)

18.13.070 Assurance device.

In appropriate circumstances, the city may require a reasonable performance of maintenance assurance device, in a form acceptable to the finance department, to assure compliance with the provisions of this chapter and the approved landscaping plan.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

Chapter 18.15 SIGNS[1]

18.15.010 Purpose.

The city council finds that the manner of the construction, location, and maintenance of signs affects the public health, safety, and welfare of the people; the safety of motorists, and other users of the public streets are affected by the number, size, location, lighting, and movement of signs that divert attention of such users. Uncontrolled and unlimited signs may degrade the aesthetic attractiveness of the natural and man-made attributes of the community that could undermine economic value of tourism, visitation, and economic growth. The regulations in this chapter are found to be the minimum necessary to achieve these purposes.

(Ord. No. 2600, § II, 11-1-2010)

18.15.020 Scope.

The primary intent of this chapter shall be to regulate signs of a commercial nature intending to be viewed from any vehicular or pedestrian right-of-way. This chapter shall not apply to building design, to official traffic or government signs, or to any sign authorized or permitted by any other ordinance or resolution of the city. This section shall further not apply to the display of street numbers or to any display or construction not defined herein as a sign.

(Ord. No. 2600, § II, 11-1-2010)

18.15.030 Maintenance and repair of signs.

A. All signs and all components thereof, including supports, braces and anchors, shall be kept in a state of good repair. With respect to freestanding signs, components not bearing a message shall be constructed of materials that blend with the surrounding environment.

B. Abandoned signs and all supporting structural components shall be removed by the sign owner, owner of the property where the sign is located, or other party having control over the sign. Each is individually and severally responsible for removing such sign within thirty days after abandonment, unless such sign is replaced with a conforming sign.

C. If a sign suffers more than fifty percent damage or deterioration as determined or is dangerous because of insecure construction or fastening with resultant danger of falling by the building official, or because it is an extreme fire hazard as deter-mined by the fire marshal then such sign shall be brought into conformance with this code or removed.

(Ord. No. 2600, § II, 11-1-2010)

[1]Editor's note(s)—Ord. No. 2600, § I, adopted November 1, 2010, repealed former Ch. 18.15, §§ 18.15.010—18.15.240. Section II of said ordinance enacted provisions designated as a new Ch. 18.15 to read as herein set out. See also the Code Comparative Table and Disposition List.

18.15.040 General definitions and regulations.

A. Regulated. In the event that a definition is not listed in this section and is necessary in the interpretation of this chapter, the director shall primarily rely upon the general definitions established for this title, and secondarily on the definition found in a standard English dictionary. For the purpose of this chapter the following definitions and regulations shall apply:

1. "Abandoned" means a sign which no longer identifies or advertises a bona fide business, service, owner, product, or activity, and/or for which no legal owner can be found.

2. "Awning" is a structure that may support a sign. An awning is a shelter projecting from, and supported by, the exterior wall of a building, constructed of non-rigid materials on a supporting framework. [Refer to "awning signs."]

3. "Commercial" means the purpose of the sign is to engage in commerce, or to advertise for one's work that is intended for sale.

4. "Date of adoption" means the date the ordinance codified in this chapter was originally adopted or the effective date of an amendment to it, if the amendment makes a sign nonconforming.

5. "Height" is defined at "Dimensions of Signs" within this chapter.

6. "Internally illuminated" means signs where the source of the illumination is inside the sign and light emanates through the message of the sign, rather than being reflected off the surface of the sign from an external source. Neon signs are considered internally illuminated signs.

7. "Multiple building complex" means a group of structures housing at least one retail business, office, commercial venture, or independent or separate part of a business which shares the same lot.

8. "Nit" means a luminance unit equal to one candela per square meter measured perpendicular to the rays from the source.

9. "Off-premises sign" means a sign that advertises products, services, or facilities, or directs person to premises different than where the sign is placed.

10. "On-premises sign" means a sign that advertises products or services related to the building or structure where it is located.

11. "Permanent sign" means a sign that is intended to remain for the life of the project or business without fundamental or marked changes and is attached to a building or structure by means of a rigid wall, frame, or structure.

12. "Public right-of-way." There are two distinctions of right-of-way. "Privately maintained right-of-way" means that portion of the public right-of-way maintained by the abutting property owner. "Publicly maintained right-of-way" means that portion of the public right-of-way maintained by the City of Camas or other public agency. Signs placed in the public right-of-way must be located outside vision clearance areas and may not pose a traffic hazard or other threat to human safety.

13. "Sign" means any device, structure, or placard using graphics, logos, symbols, and/or written copy designed specifically for the purpose of advertising or identifying any establishment, product, goods, or services.

14. "Sign area" is defined at "Dimensions of Signs" within this chapter.

15. "Sign schedule" means a listing of multiple signs proposed within an application or development project, which consists of dimensions and descriptions; normally this is in a tabular format (e.g., spreadsheet).

16. "Site plan" means a drawing of the location of a sign or multiple signs within the city limits.

B. Sign Types—Regulations and Limitations. In the event that a sign type as provided in this section is in conflict with provisions elsewhere in this chapter, the more restrictive criteria shall apply.

1. "Animated sign." [Refer to "electronic message board" sign.]

2. "Awning signs." Signage on awnings shall not exceed thirty percent of the awning and shall be included in the combined sign calculation for particular business or storefront.

3. "Banner" is a sign constructed of fabric, vinyl or other non-rigid, durable material that can withstand the typical weather in this area, and does not exceed sixty square feet in size. Banners primarily announce a special occasion, such as a grand opening or special event. National, state or municipal flags are not considered banners.

4. "Bulletin board" is often installed to provide a central location for people to gather information about events or classes that are happening within the building or community in which it is installed. Bulletin boards are included in the overall signage calculation for the site. They are not electronic, LED or otherwise programmable for messaging.

5. "Cabinet sign" is generally a wall sign. This type of sign is usually internally illuminated with a removable face and is enclosed on all edges with a metal cabinet, and does not extend more than ten inches from the wall face on which it is mounted.

6. "Construction sign" means a temporary sign identifying an architect, contractor, subcontractor, and/or material supplier participating in construction on the property on which the sign is located.

7. "Directory sign" identifies two or more establishments and/or the complex as a whole. If a tenant in a multi-building complex has a sign on the freestanding directory sign, then the tenant shall not have an individual freestanding sign. Directory sign area may not exceed one-hundred square feet.

8. "Electronic message board sign," "animated sign," and "LED sign" are considered to be similar sign types for purposes of this chapter. These signs use changing lights to form a message, or messages in sequence, uses movement or change of lighting to depict action or create a special effect or scene. This element of a sign may not exceed thirty percent of total sign area or thirty-six square feet, whichever is less. This calculation does not include post or mounting framework. The electronic board must avoid using flashing, rotating or blinking lights or videos.

9. "Entrance structure." Refer to "monument sign."

10. "Freestanding sign" is attached to, erected on, or supported by some structure (such as a pole, mast, frame, or other structure) that is not itself an integral part of or attached to a building or other structure whose principal function is something other than the support of a sign.

    a. Height limit. Freestanding sign height shall not exceed twenty-five feet from the ground to the top of sign in any zone.

    b. Construction. Rigid, fire-proof material that can withstand wind pressure of thirty mph per square foot.

    c. Combination. A freestanding sign is permitted in combination with wall signs; however, the size of all permitted signs cannot exceed the overall size permitted per building face per zone. A freestanding sign is not permitted in combination with a projecting or monument sign.

11. "Incidental sign" means a small sign, two square feet or less in surface area. Included are decals informing the public of goods, facilities, or services available on the premises, e.g., designating restrooms, a credit card sign, hours of operation, or "help wanted." May also contain the name or logo of an establishment, e.g., parking, or exit and entrance signs. Incidental signs if placed in windows may

not cover more than twenty-five percent of window area in combination with any other permitted signs.

12. "Monument sign" is a sign not attached to a building, not more than five feet in height or twenty feet in length, which is attached to the ground by means of a wide base of solid appearance. Monument signs must be designed so as to be compatible with adjacent architecture and landscaping, and must be constructed with materials conductive to abutting structures and the surrounding area. They may not be constructed from fabric or banner material.

13. "Pennant" is a small, double-faced sign that is intended to be viewed by pedestrians and is hung above the sidewalk or street, with the bottom edge conforming to sign height regulations. Pennants may not exceed four square feet, may not be placed closer than twenty feet apart, and are constructed of fabric or other durable materials with a message, logo or artistic rendering on the sign face.

14. "Portable sign" means any sign designed to be moved easily, and not permanently affixed to the ground, or other permanent structure, to include such other descriptive names such as "A-frame," "sandwich board," and "poster panels."

    a. Size. The sign shall not exceed forty-two inches above ground, and six square feet in sign area per side.

    b. Construction. Portable signs shall be firmly and solidly constructed so as to be able to bear a wind pressure of at least thirty pounds per square foot of area.

    c. Location. It is unlawful to erect or maintain any portable sign in such a position as to obstruct any fire escape or any window or door leading thereto, or within vision clearance at intersections; and must allow for a pedestrian clearance of five feet on sidewalks.

    d. Portable signs may only be displayed during business hours. If business hours continue past daylight hours, precautions should be taken to place the sign in a location that is visible after dark.

    e. One sign per business entity and located on same lot as business entity.

15. "Poster" is a piece of sales literature that presents information through words and graphic images. It has text and symbols or pictures to convey an idea or concept. Usually, it is designed vertically and displayed on a wall or window. Posters, where allowed, may not exceed six square feet.

16. "Projecting sign" is a sign affixed to a building or wall in such a manner that its leading edge extends more than ten inches beyond the surface of such building or wall.

17. "Real estate sign" means a temporary sign advertising that real estate is for rent, lease, or sale.

18. "Roof sign" means any sign erected over or on the roof of a building. The roof sign may not exceed the maximum building height allowed in the zoning district in which it is located. If the zoning district has no limitation to building height, then the height from base of sign shall not exceed that of a freestanding sign, which is limited to twenty-five-feet tall.

19. "Sandwich board sign." [Refer to definition of "Portable Sign."]

20. "Temporary sign" means a sign that is used in connection with a circumstance, situation, or event that is designed, intended or expected to take place or to be completed within a reasonably short or definite period after erection of such sign; or is intended to remain on the location where it is erected or placed for a short period of time [refer to additional requirements in Section 18.15.100 CMC]. "Temporary signs" include, but are not limited to, the following examples:

    a. Political signs advocating political candidates or political issues;

    b. Real estate signs advertising property for sale or lease;

c. Construction signs identifying the builder of a structure or the developer of a residential, commercial or industrial development;

d. Special event signs or banners advertising grand openings, fairs, carnivals, circuses, festivals; or

e. Community events, garage and yard sale signs, and any other sign of a similar purpose.

21. "Vehicular sign" means a sign adhered to or mounted to the vehicle body that is parked along a vehicular right-of-way for the principle purpose of displaying advertising.

22. "Wall sign" is any permanent sign that is attached parallel to and extending not more than ten inches from the wall of a building. This includes painted, individual letter, cabinet signs and signs attached to a mansard roof (if constructed at an angle of seventy-five degrees or more from horizontal). No more than two wall signs are permitted per building face, and in combination with all other permitted signs shall not exceed ten percent of wall area.

C. Determination of number of signs.

1. For the purpose of determining the number of signs permitted, a sign shall be considered to be a single display surface or display device containing elements organized, related, and composed to form a unit. Where matter is displayed in a random manner without organized relationship of elements, each element shall be considered a single sign. A two-sided or multi-sided sign shall be regarded as one sign if the sign faces are identical.

2. Only one projecting or monument sign is permitted per street frontage (either one or the other) and neither is permitted in combination with a freestanding sign, per lot.

3. Only one permanent sign per lot in residential zones.

4. Combination. Only one freestanding sign may be allowed per street frontage for each commercial and industrial zoned lot on which the business is located in combination with a maximum of two wall signs (if the lot does not contain a monument or projecting sign). The combined square footage of signs may not exceed size allowance per building face per zone. If a lot contains a multi-building complex a directory sign is permitted in combination with a freestanding sign and wall signs. For a multi-building complex with property frontage that exceeds three-hundred feet, an additional freestanding sign may be allowed for each three hundred feet and set apart no less than one-hundred feet.

5. Refer to "Temporary Sign" section of this chapter for limitation on number of temporary signs.

D. Dimensions of signs.

1. Sign Area. The sign area is defined as the area of the surface, or surfaces, which displays letters or symbols identifying the business or businesses occupying the parcel, together with any allowable electronic message board. In calculating the sign area, the following apply:

a. The sign area shall not include the base or pedestal to which the sign is mounted.

b. The sign surface area of a double-faced (back-to-back) sign shall be calculated by using the area of only one side of such sign and shall be considered one sign structure.

c. The sign surface area of double-faced signs constructed in a "V" shall be calculated by using the area of only one side of such sign and shall be considered one sign structure.

d. The sign surface area of three dimensional signs shall be computed by including the total of all sides designed to attract attention or communicate information that can be seen at any one time by a person from one vantage point.

2. Sign Height. Height is measured from the finished grade at the point of support to the topmost point of a sign. Height limitations are determined by type of sign as defined in this chapter.

3. Placement. All signs, unless attached to a building, must be set back from the property line by a minimum of five feet, unless otherwise stated in this chapter. Setbacks may be increased or decreased during plan review if there are concerns for vision clearance or other public safety concerns. Signs must provide a minimum clearance of fourteen feet over any vehicular use area, and ten feet over any pedestrian area. Where a sign is affixed to an awning over a pedestrian area, the minimum pedestrian clearance may be reduced to 7 feet six inches.

(Ord. No. 2600, § II, 11-1-2010; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 19-012, § II(Exh. A), 11-4-2019)

18.15.050 Signs controlled by zoning district.

The following table identifies signs by zoning district as permitted (P), prohibited (X), or only allowed with a Conditional Use Permit (C). All permitted signs are subject to the requirements of this chapter, and any other applicable sections of CMC. If dimensions of a sign vary by zone, then it is noted in this table.

Table 1 - Signs controlled by Zoning District

Sign Types as defined in this chapter	Residential and Multi-family Zones	Commercial, Industrial, and Park Zones	LI/BP
Animated/electronic message board signs	C	P	P
Awning signs	X	P	P
Bulletin board	P[Note 4]	P[Note 2]	P[Note 2]
Cabinet	X	P[Note 2]	P[Note 2]
Directory sign	X	P	P
Freestanding sign	X	P[Note 2]	P[Note 2, 3]
Incidental sign	P	P	P
Monument sign	P	P	P
Portable sign	X	P[Note 2]	P[Note 2]
Projecting sign	X	P[Note 2]	P[Note 2]
Roof sign	X	P[Note 2]	P
Temporary sign (e.g., construction signs, real estate, banners, and other sign types as defined in this chapter)	P[Note 1]	P[Note 2, 3]	P[Note 2, 3]
Vehicular signs	P	P	P
Wall signs	P[Note 1]	P[Note 2]	P[Note 2]

Notes:

[1] Sign may not exceed six square feet in area per lot unless approved with a Master Sign Permit.

[2] Sign may not exceed ten percent of the size of the wall area in combination with all other permitted signs on the same plane and visible from public view unless approved with a Master Sign Permit.

[3] If lot is vacant, then sign is limited to ninety-six square feet.

[4] Only allowed if approved in combination with a Type III development permit.

(Ord. No. 2600, § II, 11-1-2010)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.15.060 General sign permit requirements.

A. Sign permit required.

1. Except as otherwise provided in this chapter, no sign may be erected, placed, or substantially altered in the city except in accordance with the provisions of this chapter and the requirements of the International Building Code, current adopted edition.

2. If plans submitted for a Conditional Use Permit (Type III permit) or Design Review include sign construction plans in sufficient detail to determine compliance with the provisions of this chapter, then issuance of such conditional use or design review may constitute approval of the proposed placement of sign or signs (other structural/mechanical permits may be required).

B. Application Requirements. Applications for a General Sign Permit shall contain the following information when submitted to the Community Development Department at a minimum:

1. Application form and payment of current fee as determined by resolution.

2. Site Plan. Drawn to scale showing the subject property, streets, all existing buildings, and the location of any existing freestanding signs, utility poles and other structures within fifty feet of the proposed new sign's location;

3. Construction Drawings. Includes the structural details of the proposed sign, including its dimensions, heights, materials, type of illumination, landscaping (if required) and structural support;

4. Photographs. Provide photographs of all existing signs on the subject property and building(s), and marked to indicate the proposed location of the new sign(s). Staff will accept original photos, color copies or compatible electronic format (e.g. compact disc).

5. When required by the building official, the construction of the sign may require submittal of structural and/or mechanical drawings prepared by a licensed Washington State professional.

(Ord. No. 2600, § II, 11-1-2010; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.15.070 Master sign permit requirements.

A. Purpose. The purpose of this section is to establish a binding Master Sign Permit that will allow for placement of both permanent and temporary signs on a group of lots or within a business complex, in order to encourage comprehensive sign design, and reward proper placement and prompt removal of temporary signs, which combined will benefit the city by reducing municipal costs for code enforcement. This section allows the size of signs on a lot or within a zoning district to be exceeded and other bonuses as set forth. Individual signs may be permitted by the building department without additional General Sign Permits after a Master Sign Permit has been approved.

B. Application Requirements. Applications for a Master Sign Permit shall contain the following materials in addition to the requirements for a General Sign Permit:

1. Application form and payment of current fee as determined by resolution.

2. Site Plan. Site plan shall include the proposed placement of all signs, both on-premises and off-premises.

3. Consent of property owner for placement of signs within privately-maintained right-of-way or on private lots. The provisions of this section shall not apply to allow placement of any signs within the public right-of-way.

4. Sign Schedule - existing conditions. The schedule will include a calculation of the combined maximum sign area permitted and the number of signs allowed on the proposed lot(s).

5. Sign Schedule - proposed. The schedule will include a calculation of the combined total proposed sign area included in the plan, sign types, number, and short description.

6. Construction Plans. Detailed construction plans shall be provided at a reasonable scale to include type of material and method of installation.

7. Time frame for installation of each sign indicated on plan.

8. Narrative that supports how this application meets or exceeds the criteria for approval for a Master Sign Permit and other regulations in this chapter.

C. Maximum total area of all signs. The combined sign area of all proposed signs on a lot or lots under consideration for a Master Sign Permit shall not exceed ten (10) percent of the total ground floor area (GFA) of the building(s) or in the case of a vacant lot then ten (10) percent of the area of building lot coverage.

D. Bonus. If the owners of two or more contiguous (disregarding intervening streets and alleys) lots or the owner of a single lot with more than one building (not including any accessory building) file with the Director for such lots a Master Signage Plan conforming with the provisions of this section, a thirty percent (30%) increase in the maximum total sign area of that zone shall be allowed for each included lot. This bonus shall be allocated within each lot as the owner(s) elects. Or if a subdivision, then the applicant may combine potential sign area from multiple lots for a single sign to be no greater than thirty-two (32) square feet in lieu of the residential zone size limitation of six square feet.

E. Criteria of Approval for Master Sign Permit.

1. Provisions have been made to have a consistent design with regard to: color scheme; lettering or graphic style; lighting; location of each sign on the buildings or on the lots or elsewhere; material; and sign proportions.

2. Provisions have been made to install signs that will not detract from the natural beauty of the city or contribute to urban blight.

3. The locations of off-premises signs do not exceed one sign per radius of 300-feet.

4. The application and plans shall be consistent with the applicable regulations of the adopted development codes, comprehensive plans, shoreline master plan, state and local environmental acts and ordinances in accordance with RCW 36.70B.030.

F. Approval and Modification. The designated official shall approve a master sign permit and subsequent modifications. Any deviation from the approved master sign permit such as additional signs, relocating signs, and any other changes (excluding tenant name changes and maintenance) shall require a modification to the master sign permit on file with the city.

G. Expiration. Master Sign Permits expire in two years from date of issuance unless at least one sign of the Master Sign Permit has been installed prior to that date.

(Ord. No. 2600, § II, 11-1-2010; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.15.080 Signs prohibited.

The following signs are specifically prohibited in the city:

A. Signs attached to any telephone or utility pole;

B. Signs located in such a manner so that by location, color, size, shape, nature would tend to obstruct the view or be confused with official traffic signage.

C. Signs advertising activities that are illegal under state or federal laws, or regulations in effect at the location of such signs, or at the location of such activities.

D. Signs emitting pollutants (e.g. smoke, or sound).

E. Posters. The tacking or pasting of posters to exterior walls, which are visible from the public right-of-way, is prohibited unless otherwise permitted as a sign in this chapter.

(Ord. No. 2600, § II, 11-1-2010)

18.15.090 Exemptions.

A. No permit is required for mere repainting; changing the message of a sign, or routine maintenance shall not in and of itself be considered a substantial alteration.

B. Although no permits will be issued, compliance with this chapter is required.

C. Signs that are exempt and that do not require a permit are as follows:

1. Signs not exceeding six square feet in area that are customarily associated with residential use, and that are not of a commercial nature, such as: signs giving property identification names or numbers, or names of occupants; signs on mailboxes or newspaper tubes; and signs posted on private property that warn the public against trespassing or danger from animals;

2. Integral decorative or architectural features of buildings, or works of art, so long as such features or works do not contain commercial trademarks, moving parts, or lights (e.g. commemorative plaques or inscriptions with the name of a building, its date of construction). Feature must be attached to the face of the building and shall not exceed three square feet in sign area.

3. Signs painted on or otherwise permanently attached to currently licensed motor vehicles;

4. Traffic or other municipal signs, signs required by law, legal notices, or signs of public utility companies indicating danger;

5. Flag, emblem, or insignia of a nation or other governmental unit or institution, or non profit organization subject to the guidelines concerning their use set forth by the government or organization which they represent;

6. Signs located in the interior of a building or within a sport complex that are designed and located to be viewed exclusively by patrons within the building or sport complex

(Ord. No. 2600, § II, 11-1-2010)

18.15.100 Temporary signs.

A. Temporary signs are exempt from permit requirements as described in this section. Although no permits will be issued, compliance with this chapter is required. Temporary signs may be permitted with a Master Sign Permit as described in this chapter.

1. Number. One sign per lot, per candidate, issue or event.

2. Size. Refer to "Table 1" of this chapter for sign dimensions per zoning district and bonuses as allowed with a Master Sign Permit.

3. Consent. If displayed on private property, the responsible party must obtain consent of property owner.

4. Location. Temporary signs are prohibited from being placed within the center island of roundabouts, any splitter islands adjacent to any roundabout, and within ten feet of the outer curb of all circulatory travel lanes that are within the public right-of-way of any roundabout, and within the center median of any public right-of-way.

B. Temporary signs may not be illuminated.

C. Removal. Temporary signs shall be removed by sign owner within ten days after occurrence of the event. For example, political signs should therefore be removed within ten days following an election, real estate signs should be removed within ten days following sale or lease of the property, construction signs should be removed within ten days following issuance of the certificate of occupancy for the building, special event signs should be removed within ten days after occurrence of the special event, and yard and garage sale signs should be removed within ten days following the sale.

D. Confiscation. The city or property owner may confiscate signs installed in violation of this chapter and dispose of it. The property owner is not responsible for notifying owners of confiscation of the illegal sign.

(Ord. No. 2600, § II, 11-1-2010; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 22-008, § I, 5-16-2022)

18.15.110 Sign illumination and electronic message board signs.

Unless otherwise prohibited by this chapter, signs may be illuminated if such illumination is in accordance with this section.

A. No sign within one hundred fifty feet of a residential district may be illuminated between the hours of midnight and six a.m., unless the impact of such lighting beyond the boundaries of the lot where it is located is entirely inconsequential.

B. Lighting directed toward a sign shall be hooded or shielded so that it illuminates only the face of the sign and does not shine directly onto a public right-of-way or a residential property.

C. Except as herein provided, internally illuminated signs are not permitted in residential districts. Where permitted, internally illuminated signs may not be illuminated during hours that the business or enterprise advertised by such sign is not open for business, or in operation.

D. All electronic message board signs shall be constructed as an integral part of a permanent sign constructed on-site. Integral shall be considered to be incorporated into the framework and architectural design of the permanent sign.

E. Maximum Luminance:

a. Daytime: five thousand nits.

b. Nighttime (one-half hour before sunset and one-half hour after sunrise): five hundred nits.

c. Signs shall include ability to adjust brightness and auto-dimming features with light-sensory capabilities to dim the sign to allowable luminance levels.

(Ord. No. 2600, § II, 11-1-2010; Ord. No. 19-012, § II(Exh. A), 11-4-2019)

18.15.120 Nonconforming signs.

A. Existing signs which do not conform to the specific provisions of the chapter may be eligible for the designation "legal nonconforming"; provided that:

1. The building department determines that such signs are properly maintained and do not in any way endanger the public;

2. The sign was covered by a permit deemed valid by the city, or complied with all applicable laws on the date on which it was established.

B. A "legal nonconforming" sign may lose this designation if the following occur:

1. The sign is relocated or replaced;

2. The structure or size of the sign is altered in any way except toward compliance with this chapter. This does not refer to change of copy or normal message;

3. The business, use, or product for which the sign is directed has been abandoned (has not occurred on the property for a period of six consecutive months). The burden of demonstrating non-abandonment shall be on the owner.

C. Removal of nonconforming signs. A sign which has been removed and held by the city longer than thirty days and not recovered by its owner, shall be declared abandoned and discarded by the city.

(Ord. No. 2600, § II, 11-1-2010)

Chapter 18.18 SITE PLAN REVIEW

18.18.010 Intent.

This chapter is intended to provide procedures for the review of site plan applications. Site plan review is intended to ensure that development projects carried out in given zoning districts are executed in a manner consistent with existing ordinances concerning public utilities, traffic, facilities, and services, and provide unified site design, access, landscaping, screening, building placement and parking lot layout. The site plan review process is not intended to review and determine the appropriateness of a given use on a given site. It is intended to ~~insure~~ ensure that development of a site will provide the features necessary to protect the health, safety, and general welfare of the citizens of the city.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.18.020 Applicability.

A. Site plan review and approval shall be required for the following development activities prior to issuance of a building permit:

1. All new nonresidential uses for the location of any building(s);
2. Any multifamily development in which more than two dwelling units would be contained, not including any middle housing or accessory dwelling unit development on a single residential lot;
3. The expansion of any building or development as defined in CMC Section 18.18.020(A) exceeding twenty percent of the existing floor or site area, or any one thousand square foot addition, or increase in impervious coverage thereto, whichever is lesser.

B. Exemptions. The following developments and land use categories shall be exempt from site plan review:

1. Planned unit developments, land divisions, binding site plans and boundary line adjustments pursuant to CMC Titles 17 and 18;
2. ~~Light industrial/business park development applications pursuant to CMC Chapters 18.20 North Dwyer Creek Residential Overlay and 18.21 Light Industrial/Business Park;~~
2~~3~~. Normal or emergency repair or maintenance of public or private buildings, structures, landscaping, or utilities;
3~~4~~. Interior remodeling and tenant improvements to buildings previously reviewed and approved; and
4~~5~~. Unless otherwise required, proposals that are subject to Type I procedures under CMC Chapter 18.55 Administration and Procedures.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 § 1 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.18.030 Site plans and review procedures.

A. Any use that is subject to the requirements for a site plan review shall be processed in accordance with the procedures established under CMC Chapter 18.55 Administration and Procedures for Type II project permit applications.

B. Site plan review and approval shall be required prior to issuance of grading or other building permits.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 § 1 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.18.040 Submittal and contents of a complete application.

In addition to the submittal requirements under CMC Chapter 18.55 Administration and Procedures, each application for site plan review shall contain the following information. Items may be waived if, in the judgment of the community development department, the items are not applicable to the particular proposal.

A. A written description addressing the scope of the project, the nature and size in gross floor area of each use, and the total amount of square feet to be covered by impervious surfaces;

B. A vicinity map showing site boundaries, and existing roads and accesses within and bounding the site;

C. A topographic map based upon a site survey delineating contours, existing and proposed, at no less than five-foot intervals, and which locates existing streams, marshes, and other natural features;

D. Site plans drawn to a scale no smaller than one inch equals fifty feet showing location and size of uses, buffer areas, proposed areas of disturbance or construction outside of the building footprint, yards, open spaces and landscaped areas, and any existing structures, easements and utilities;

E. A circulation plan drawn to a scale acceptable to the community development director illustrating all access points for the site, the size and location of all driveways, streets, and roads, with proposed width and outside turning radius, the location, size, and design of parking and loading areas, and existing and proposed pedestrian circulation system. If a project would generate more than one hundred average daily trips either based on the latest edition of the International Transportation Engineer's (ITE) Trip Generation Manual or evidence substantiated by a professional engineer licensed in the state of Washington with expertise in traffic engineering, a traffic impact study shall be submitted;

F. A preliminary stormwater technical information report (TIR) supporting the preliminary stormwater drainage and runoff plan. The preliminary stormwater TIR is to be prepared in accordance with Ecology's latest edition Stormwater Management Manual for Western Washington (SWMMWW);

G. A utility plan;

H. A plot plan of all proposed landscaping including the treatment and materials used for open spaces, and the types of plants and screening to be used; and

I. Typical building elevation and architectural style.~~; and~~

~~J. Reserved.~~

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 § 1 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 19-012, § II(Exh. A), 11-4-2019; Ord. No. 21-005, § I(Exh. A), 3-15-2021)

18.18.050 Reserved.

Editor's note(s)—Ord. No. 2612, § I(Exh. A), adopted February 7, 2011, repealed § 18.18.050, which pertained to application open for public inspection. See also the Code Comparative Table and Disposition List.

18.18.060 Criteria for approval.

The city shall consider approval of the site plans with specific attention to the following:

A. Compatibility with the city's comprehensive plan;

B. Compliance with all applicable design and development standards contained in this title and other applicable regulations;

C. Availability and accessibility of adequate public services such as roads, sanitary and storm sewer, and water to serve the site at the time development is to occur, unless otherwise provided for by the applicable regulations;

D. Adequate provisions are made for other public and private services and utilities, parks and trails (e.g., provide copies of private covenant documents);

E. Adequate provisions are made for maintenance of public utilities; and

F. All relevant statutory codes, regulations, ordinances and compliance with the same. The review and decision of the city shall be in accordance with the provisions of CMC Chapter 18.55 Administration and Procedures.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.18.070 Improvements for residential development.

A. Public. Prior to the issuance of a building permit for residential construction, all public improvements required to adequately service that portion of the plat for which the building permit will be issued shall be installed, or the developer shall provide financial surety acceptable to the city pursuant to CMC Section 17.21.050 Bonds and Other Financial Agreements.

B. Private. Prior to issuance of final occupancy permits all public and private improvements shall be completed in accordance with CMC Section 17.21.070 Final Acceptance.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 § 2 (Exh. A (part)), 2007)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.18.080 Duration of approval.

Construction on the project must commence within twenty-four months from the date of final action by the city; otherwise, the approval of the project becomes null and void.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.18.090 Amendments to a site plan.

A. Minor site plan adjustments may be made and approved when a building permit is issued. Any such alteration must be approved by the community development director. Minor adjustments are those which may affect the precise dimensions or siting of building (i.e., lot coverage, height, setbacks) but which do not affect the basic character or arrangement and number of buildings approved in the plan, nor the density of the development or the amount and quality of open space and landscaping. Such dimensional adjustments shall not vary more than ten percent from the original, but shall not exceed the standards of the applicable district.

B. Major amendments are Type II permit applications and are processed in accordance with CMC Chapter 18.55 Administration and Procedures. Major amendments are those that substantially change the character, basic design, density, open space or other requirements and conditions of the site plan. When a change constitutes a major amendment, no building or other permit shall be issued without prior review and approval by the city.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2481 (Exh. A (part)), 2007: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

Chapter 18.19 DESIGN REVIEW[1]

18.19.010 Purpose.

This chapter is intended to provide for orderly and quality development consistent with the design principles of the "Camas Design Review Manual: Gateways, Commercial, Mixed-Use and Multifamily Uses," hereafter referred to as the Design Review Manual (DRM), the "Downtown design manual," and the "North Shore design manual." The design review process is not intended to determine the appropriateness of a given use on a given parcel. The design review process is intended to produce a meaningful integration of building, landscaping and natural environment. This will protect the general health, safety, and welfare of the community by making efficient use of the land, which is consistent with the visual character and heritage of the community.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 23-010, Exh. A, 8-7-2023)

18.19.020 Scope.

A. Design review is required for all new developments within commercial, mixed-use, mixed employment~~business park,~~ or multifamily zones, redevelopment (including change in use, e.g., residential to commercial), or major rehabilitation (exterior changes requiring a building permit or other development permit). Commercial uses in the context of design review include both traditional uses listed as commercial under the zoning code, including those listed as active or passive retail uses in the Downtown design manual, as well as recreational, religious, cultural, educational, and governmental buildings and associated properties. Additionally, design review is applicable to all new developments or redevelopments within a design overlay~~gateway area~~ as defined in Chapter 18.20 Design Overlays~~the design review manual~~. Design review is also required for all development within the North Shore subarea, consistent with the North Shore design manual.

B. Consistency with this chapter shall be reviewed by the approval authority during the development review process.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 23-010, Exh. A, 8-7-2023)

18.19.025 Applicability and scope of the downtown design manual (DDM).

The provisions of this manual shall be applied to public and private parcels located within the downtown subarea~~commercial zone~~. Development of parcels within the downtown subarea shall comply with the standards found in the DDM. ~~The standards within the DDM supersede the general requirements of the DRM for parcels located within the downtown commercial zone.~~

(Ord. 2518 § 1 (Exh. A (part)), 2008)

[1]Prior ordinance history: Ords. 2443 and 2515.

18.19.030 Design review manual adopted.

The city's design standards are primarily contained in the design review manual, which was adopted by the city.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

18.19.035 Downtown design manual adopted.

The city's design standards for the downtown subarea~~commercial zone~~ are contained in the manual, which is adopted by the city.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

~~18.19.040 Design review committee.~~

~~A. The city council shall establish a seven-person design review committee (DRC) for the purposes of reviewing specific proposals, and recommending conditions and/or other actions necessary for consistency with the principles of the DRM. The DRC members serve at the pleasure of the city council. The DRC shall consist of six members appointed by the city council, including two from the development community, one council member, one planning commissioner, and two citizens at large. A seventh member shall be a neighborhood representative of the surrounding neighborhood to a specific proposal, or a United Camas Association of Neighborhoods member.~~

~~B. The DRC will hold a public meeting to consider a design review application when:~~

~~1. The city planner determines that the issues related to a specific proposal are complex enough to warrant a review by the DRC;~~

~~2. The proposal varies from the guidelines of the DRM; or~~

~~3. When an administrative decision on a design review application is appealed with no prior review by the DRC.~~

~~C. The DRC shall not issue a decision, but shall prepare a written recommendation, together with findings to support the recommendation, to the approval authority within ten days of a public meeting held for that purpose (RCW 36.70.020(5)).~~

(Ord. 2518 § 1 (Exh. A (part)), 2008)

18.19.050 Design principles.

The principles as provided in the DDM or DRM are mandatory and must be demonstrated to have been satisfied in overall intent in order for approval of a design review application to be granted. Standard principles listed below shall apply to all commercial, mixed use, or multifamily uses outside of Downtown. Specific principles are used in addition to the standard principles outside of Downtown for design overlays~~gateways and corridors~~, commercial~~,~~ and mixed uses, ~~and~~ multifamily (e.g. ~~apartments~~stacked housing~~,~~ ~~townhouses, duplexes~~), and the North Shore subarea. Design principles for Downtown are included in the DDM.

A. Standard Principles.

1. Landscaping shall be done with a purpose. It shall be used as a tool to integrate the proposed development into the surrounding environment.

2. All attempts shall be made at minimizing the removal of significant natural features. Significant natural features shall be integrated into the overall site plan.

3. Buildings shall have a "finished" look. Any use of panelized materials shall be integrated into the development in a manner that achieves a seamless appearance.

4. A proposed development shall attempt to incorporate or enhance historic/heritage elements related to the specific site or surrounding area.

B. Specific Principles.

1. All new development and redevelopment within design overlays shall meet the minimum requirements in Chapter 18.20 Design Overlays~~Gateways~~, which supersede the specific principles for Commercial and Mixed Uses and Multifamily as described in 18.19.050.B.2 and B.3 below.

~~a. Gateways shall be devoid of freestanding signs. Preexisting freestanding signs will be subject to removal at the time of any new development, redevelopment, or major rehabilitation on the site. Exemptions include approved directional or community information signage as approved by the city.~~

~~b. Business signage not placed on buildings shall be integrated into the landscaping/streetscaping of the subject property.~~

~~c. Permanent signage within a gateway shall be standardized in a manner that creates a consistent look within the gateway in question.~~

~~d. The surface of pedestrian walkways within intersections shall be accentuated with a unique character.~~

~~e. A consistent streetscape lighting scheme shall be used.~~

2. Commercial and Mixed Uses.

a. On-site parking areas shall be placed to the interior of the development unless site development proves prohibitive. All on-site parking areas along adjacent roadways shall be screened with landscaping. ~~Downtown commercial and mixed-use areas shall not be required to provide on-site parking.~~

b. Buildings shall be used to define the streetscape unless site conditions prove prohibitive.

c. Structures abutting, located in, or located near less intensive uses or zoned areas (such as commercial developments next to residential areas) shall be designed to mitigate size and scale differences.

d. Developments containing ~~a~~ multiple ~~of~~ uses/activities shall integrate each use/activity in a manner that achieves a seamless appearance, or creates a cohesive development.

e. Mixed-use developments that place uses throughout the site (horizontal development) shall organize elements in a manner that minimizes their impact on adjacent lower intensity uses.

f. Walls shall be broken up to avoid a blank look and to provide a sense of scale.

g. Outdoor lighting shall not be directed off-site.

3. Multifamily

a. Stacked Housing.

i. All on-site parking areas shall be screened with landscaping. Parking spaces shall be clustered in small groups of no more than six to ten spaces.

ii. Stacked houses abutting or located in single-family residentially zoned areas shall be designed to mitigate size and scale differences.

iii. Walls shall be articulated in order to avoid a blank look and to provide a sense of scale. Consistent with RCW 36.70A.815, this standard does not apply to affordable housing, new construction meeting passive house requirements, retrofit of existing buildings meeting passive house requirements, the conversion of existing buildings to housing, modular construction, mass timber construction.

iv. Detached garages shall be located to the rear of stacked unit(s) so as not to be directly viewable from a public street.

v. Attached garages shall account for less than fifty percent of the front face of the structure. Garages visible from the street shall be articulated by architectural features, such as windows, to avoid a blank look except as not allowed per RCW 36.70A.815, as noted in 18.19.050.B3.iii above.

b. ~~Townhomes and Rowhouses.~~

~~i. All on-site parking areas (excluding driveways and garages) shall be screened with landscaping.~~

~~ii. Buildings shall be used to define the streetscape unless site conditions prove prohibitive.~~

~~iii. When appropriate, structures abutting or located in single-family residentially zoned areas shall be designed to mitigate size and scale differences.~~

~~iv. Walls shall be articulated in order to avoid a blank look and to provide a sense of scale.~~

~~v. Detached garages shall be located to the rear of the townhouse or rowhouse unit(s) so as not to be directly viewable from a public street.~~

~~vi. Attached garages shall account for less than fifty percent of the front face of the structure. Garages visible from the street shall be articulated by architectural features, such as windows, to avoid a blank look.~~

~~c. Duplex, Triplex and Four-Plex.~~

~~i. Garages shall account for less than fifty percent of the front face of the structure. Garages visible from the street shall be articulated by architectural features, such as windows, to avoid a blank look.~~

4. North Shore Subarea. All development within the North Shore subarea shall meet the minimum requirements determined in North Shore Design Manual.

a. Use a stepped-transition in building height and mass to move from higher density to lower density and from more intense mix-of-uses to single uses to provide compatible scale and privacy between developments. Building height transitions shall be applied to new and vertically expanded buildings in the HD-NS, C-NS, MX-NS, and ME-NS zones within twenty feet (measured horizontally) of an existing single detached residential building thirty feet or less in height. The building height transition standard is met when the height of the taller building does not exceed one foot of height for every one foot separating the new building from the existing single detached residential structure.

b. Vary lot sizes, front yard setbacks, and building product type for residential uses to avoid predictable suburban development patterns (also known as "cookie cutter" development) and better reflect the natural geography.

c. Minimize the visibility of off-street surface parking where feasible by instead integrating structured and tuck-under parking in buildings or locating surface parking behind buildings.

d. Provide public-facing facades and building entries-regardless of land use-that provide weather protection from wind, rain, sun, and the occasional snow.

e. Include multiple entries and windows on ground floor commercial uses facilitate business access, create visual interest, and promote safety.

f. Encourage an aesthetic that complements the surroundings (such as the Pacific Northwest style) through site design, exterior building materials, landscaping, and other features. Exterior building materials may include: concrete, wood, standing-seam sheet metal, glass, board-and-batten, wood siding, corrugated sheet metal, board-formed concrete, board-and-batten siding, commercial/industrial terra-cotta, stone siding, spaced wood sun screens, ply-formed concrete, horizontal wood siding, brick, sheet metal panels, standing-seam metal roofing, stucco, and/or heavy-timber.

g. Use dark-sky friendly lighting for outdoor areas, such as full cutoff fixtures, or limiting light trespass from buildings into the street.

h. Design the development to maximize potential for passive solar and solar-ready construction.

5. Downtown Subarea. All development within the Downtown Subarea shall meet the minimum requirements in the Downtown Design Manual.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 16-006, § I, 5-2-2016; Ord. No. 23-010, Exh. A, 8-7-2023)

18.19.060 Guidelines.

A. The guidelines include five major categories:

1. Landscaping and screening;

2. Architecture;

3. Massing and setbacks;

4. Historic and heritage preservation; and

5. Circulation and connections.

B. Each of the major guidelines include subcategories. Compliance with the guideline categories and subcategories demonstrate compliance with the principles. However, not every guideline may be deemed applicable, and therefore required, by the approval authority. Additionally, there may be circumstances where an alternative design solution is proposed that meets the guidelines and intent of the established principles, but is not in strict compliance. Development proposals with alternative design solutions are subject to review by the approval authority, and the approval authority may approve a ~~variance~~ deviation from one or more guidelines, provided the overall intent of the principles is satisfied.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.19.070 Application requirements.

Application for design review shall be submitted on the most current forms provided by, and in a manner set forth by the ~~community development director or designee~~Community Development Director (Director). The application shall include such drawings, sketches, and narrative as to allow the approval authority review of the specific project on the merits of the city's design review manual and other applicable city codes. An application shall not be deemed complete unless all information requested is provided.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.19.090 Deviations to design review guidelines.

A design review application that includes a deviation from any of the five major guidelines of the DRM shall be subject to review ~~and recommendations~~ from the approval authority~~design review committee~~. The approval authority~~DRC~~ shall base ~~its~~their ~~recommendation~~decision upon findings setting forth and showing that all of the following circumstances exist:

A. Special conditions or circumstances exist which render a specific requirement of the DRM unreasonable, given the location and intended use of the proposed development;

B. The special conditions and circumstances are characteristic of the proposed general use of the site, and not of a specific tenant;

C. The specific conditions and circumstances are not representative of typical development which may be allowed within the zoning district;

D. The requested deviation is based upon functional consideration rather than economic hardship, personal convenience or personal design preferences;

E. Variation from a guideline(s) has sufficiently been compensated by other site amenities; and

F. The requested deviation will not result in a project that is inconsistent with the intent and general scope of the DRM principles.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

18.19.100 Enforcement.

Failure to comply with the requirements of this chapter, or a decision resulting from this chapter are enforceable under Article VIII of CMC Chapter 18.55 Administration and Procedures.

(Ord. 2518 § 1 (Exh. A (part)), 2008)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

Chapter 18.20 Design Overlays

18.20.010 Purpose and Applicability.
18.20.020 Permitted Uses.
18.20.030 Downtown Design Overlays
18.20.040 General Overlay Design Standards.
18.20.050 Tier 1 and Tier 2 Corridors Design Overlays
18.20.060 Incentives.

18.20.010 Purpose and Applicability.

A. Purpose and Intent

1. To encourage new development and business opportunities along identified corridors throughout the city;
2. To elevate the design standards beyond the base zoning requirements along the identified corridors that result in developments that are arranged, scaled, and designed to create a unique sense of place that is complementary with surrounding land uses; and
3. To promote a mix of uses with a compact growth pattern to efficiently use the remaining developable land and to help support community and neighborhood businesses and residents.

B. Applicability.

1. Unless provided elsewhere in this title or in adopted manuals, this chapter applies to all new development and redevelopment (including change in use, e.g., residential to commercial) within the identified overlays, which are shown on the City's Design Overlays map as Tier 1 and Tier 2 corridors. The overlay applies to properties within 200 feet of the frontage on these corridors. The underlying zoning standards still apply along with the overlay requirements. New development and redevelopment shall submit a site plan review application in accordance with Camas Municipal Code (CMC) Chapter 18.18 Site Plan Review, unless otherwise exempted in this title.
2. All new developments and redevelopment shall be required to submit a design review application in accordance with CMC Chapter 18.19 Design Review of this title prior to applying for a building permit.
3. Unless noted elsewhere in this title or in adopted manuals, landscaping requirements shall be the same as landscaping standards in the underlying base zones.
4. Development and redevelopment of public and private properties that have frontage along corridors in the Downtown Subarea shall comply with the standards found in the Downtown Design Manual.
5. To demonstrate arrival into the community, entry points along Tier 1 corridors shall feature public and private amenities in the form of public art and entry signage.

18.20.020 Permitted Uses.

The uses permitted in a Design Overlay shall be governed by *Chapter 18.07 Use Authorization*.

18.20.030 Downtown Design Overlays

All development and redevelopment within the Downtown Subarea shall meet the minimum design standards in the Downtown Design Manual.

18.20.040 General Overlay Design Standards.

Before any approval of a design review application is granted, all new development and redevelopment (including change in use, e.g., residential to commercial) within each design overlay shall comply with the general overlay design standards.

General standards are developed with the intent of being applied throughout each design overlay regardless of the underlying land use. Public improvements applied within design overlays that transition between the street segments of the Downtown Subarea and adjacent areas shall be consistent. Development/redevelopment within a design overlay must adhere to the applicable Design Overlay goals and policies in the Land Use element of the Comprehensive Plan. Development/redevelopment must also adhere to the applicable goals and policies in the Community Character, Land Use, Housing, Transportation, and Economic Development elements, as well as applicable development regulations and other design review standards.

1. Entry points shall be devoid of freestanding signs. Pre-existing freestanding signs will be subject to removal at the time of any new development, redevelopment, or major rehabilitation (exterior changes requiring a building permit) on the site. Exemptions include approved directional or community information signage as allowed by the approval authority.
2. Placement, size, and type of signs will be controlled by the zoning district and Chapter 18.15 Signs.
3. Permanent wayfinding, historic, and/or interpretive signage within a Design Overlay shall be standardized in a manner that creates a consistent look within the Design Overlay area. Permanent signage within entry points shall be standardized in terms of size, color, and materials.
4. The surface of pedestrian walkways within intersections shall be accentuated, consistent with ADA standards, with a unique character, such as stamped or colored concrete or pavers.
5. Bike lanes shall be incorporated into the public right of way where feasible, as determined by the City Engineer and approval authority.
6. A consistent iconic streetscape lighting scheme shall be used that portrays the primary development period, architecture characteristics, or predetermined theme as identified in a concept plan, sub-area plan, or master plan recognized by the City.
7. Layered landscaping must be provided as a transition to properties adjacent to the public right of way, including a mix of trees, shrubs, rockeries, and ground cover.
8. Sidewalks shall be separated from the roadway through the use of planter strips (minimum 4-feet wide), 6-foot diameter tree wells, or if feasible, raingardens/bioswales.
9. Street trees of no less than two inches in diameter shall be planted within planter strips or tree wells at a spacing that creates the appearance of a continuous canopy at tree maturation. Street trees must be replaced with an appropriate species as defined by the City's Plant Materials document if they are removed due to a hazardous condition or other reasons that are first verified by a certified arborist.

18.20.050 Tier 1 and Tier 2 Corridors Design Overlays

As shown on the Design Overlays map, Tier 1 and Tier 2 corridors extend along intersections and identified routes throughout the city. Tier 1 corridors are located along arterial roadway functional classifications. Tier 2

corridors primarily extend from Tier 1 corridors and include arterial and collector roadway functional classifications. Specific overlay design standards apply to Tier 1 and Tier 2 corridors. All development and redevelopment within the corridors shall comply with the special design standards outlined below.

A. The following list of streets and street segments are referred to as Tier 1 corridors to which other standards below apply.
   a. NE Ingle Road Corridor: Just north of N 92nd Avenue to NE Goodwin Road.
   b. NE Goodwin Road Corridor: NW Camas Meadows Drive to N Boxwood Street.
   c. North Shore Boulevard Corridor: SR-500 to NE 232nd Ave
   d. NE Everett Street Corridor: NE 15th Avenue to the northern Urban Growth Boundary and from SR-14 to E 1st Avenue.
   e. NW Lake Road Corridor: NW Friberg-Strunk Street to NW Leadbetter Drive.
   f. NW Brady Road/NW Parker Street Corridor: City Limits to NW Lake Road.
   g. NW 38th Avenue Corridor: City Limits to NW Parker Street.
   h. NW Pacific Rim Blvd Corridor: City Limits to NW Parker Street.
   i. NW 6th Avenue Corridor: NW 6th Ave/Hwy 14 roundabout to NW Drake Street.
   j. NE 3rd Avenue Corridor: 6th Street/Lechner to NE Joy Street.

B. The following list of streets and street segments are referred to as Tier 2 corridors to which other standards below apply.
   a. NE Ingle Road Corridor: The northern Urban Growth Boundary to N 92nd Avenue.
   b. Green Mountain Corridor: NE 92 Avenue to N Boxwood Street.
   c. NW Camas Meadows Drive Corridor: NE Goodwin Road to NW Lake Road.
   d. NW Friberg-Strunk Street Corridor: NE Goodwin Road to and NW Lake Road.
   e. NW Lake Road Corridor: NW Leadbetter Drive to NE Everett Street.
   f. NW 38th Avenue Corridor: NW 38th Avenue to NW Lake Road.
   g. NW Sierra Street Corridor: NW Brady Road to NW 43rd Avenue.
   h. NW McIntosh Road Corridor: NW Brady Road to NW 18th Avenue.
   i. Division Street Corridor: NE 6th Avenue to NW Sierra Street.
   j. NE Dallas Street Segment: NE 13th Avenue and NE 15th Avenue.
   k. NE Garfield Street Segment: NE Ione Street and NE 15th Avenue.
   l. SE Crown Road Corridor: NE 3rd Avenue to SE 15th Street.
   m. NE 43rd Avenue/SE 15th Street Corridor: NE Everett Street and SE 283rd Avenue.

Table 18.20-1. Design Overlay Specific Standards

Design Standards	Tier 1 Design Overlay	Tier 2 Design Overlay
18.20-010 Landscaping and Screening Standards		
A. Landscaping adjacent to the public right-of-way shall provide multiple layers of plantings, including canopy trees, understory trees, shrubs and groundcover.	S	S

Design Standards	Tier 1 Design Overlay	Tier 2 Design Overlay
B. Hanging baskets shall be used along building frontages to add visual interest, and must be installed so that the bottom of the basket is a minimum of 80 inches above the finished grade of the sidewalk.	S	N/A
C. Median planting design/plant selection shall create a unique and cohesive streetscape design.	S	S
18.20-020 Use Standards		
A. If allowed in the underlying zone, drive-throughs are allowed in a Tier 1 Design Overlay and shall be screened with landscaping or architectural features that integrate them into the building. Freestanding drive-throughs are not allowed.	S/C (if allowed in underlying zone, see Chapter 18.07 Use Authorization)	N/A
B. Those Neighborhood Commercial uses listed as permitted (P) are allowed within residential zones on corner lots at intersections with collector or arterial streets. The neighborhood commercial use must be pedestrian oriented with access to a public sidewalk or walkway and may have a maximum building footprint of 2,500 square feet and no more than five (5) off-street parking spaces, which can be satisfied by on-street parking provided they are along the frontage of the subject parcel.	S	S
18.20-030 Architecture Standards		
A. Permanent signage within Design Overlays shall be standardized in terms of size, color, and materials.	S	N/A
18.20-040 Massing and Setback Standards		
A. New construction shall include a maximum setback of 20 feet. Main entrances to the buildings must be oriented to the street.	S	N/A
B. On-site parking areas shall be located to the rear or the side of a building.	S	N/A
C. Setbacks shall include landscaping, hardscaping, and public art to enhance the pedestrian experience.	S	N/A
18.20-050 Historic and Heritage Preservation Standards		
A. The use of historic markers, information kiosks, project names, architectural features, or other elements of the project shall promote the historic heritage of the site or surrounding area, where appropriate.	S	N/A
18.20-060 Circulation and Connections Standards		
A. Orient the main public entrance toward the public right-of-way. Pedestrian walkways shall connect each building's front entry with the sidewalk, without conflicting with accessways on the site.	S	S
B. New developments shall include plans for alternative transportation, such as providing attractive and convenient bus stop shelters, bicycle parking, etc.	S	S

Design Standards	Tier 1 Design Overlay	Tier 2 Design Overlay
C. Trees and planting strips or raingardens/bioswales shall be used for separating vehicles and pedestrian movements, as well as provide a secure and pedestrian friendly environment.	S	S
18.20-070 Public Realm Standards		
A. Where applicable (as determined by the City), and when corridors intersect with an existing street, provide modular, movable, and durable seating in public spaces and ensure seating areas are shaded and accessible.	S/C (see *Chapter 18.07 Use Authorization)*	S/C (*see Chapter 18.07 Use Authorization*)

NA – Not Applicable

S – Standard

S/C – Standard with certain conditions

C. Design Overlay Features

Specific design standards in Table 18.20-1 apply to Tier 1 and Tier 2 corridors. Additional design features are recommended to be included along Tier 1 and Tier 2 corridors that represent the character and style desired for a particular design overlay area. Development/redevelopment proposals within Tier 1 and Tier 2 Design Overlays should include public and private design features listed in Table 20-2 to demonstrate arrival into the community.

a. Tier 1 Design Overlay areas should include two additional design features from Table 20- 2.

b. Tier 2 Design Overlay areas should include one additional design feature from Table 20- 2.

Table 20-2. List of unique design overlay features.

Sidewalks	• Wide sidewalk (minimum of 8 feet) • Bus stop improvements (shelter, lighting, bench) – develop consistent bus stop standards to be implemented throughout the city
Roadway Right-of-way	• Roundabouts at entry point intersections • Public art in center of roundabout • Protected or buffered bike lanes to provide a horizontal separation of 1 to 3 feet between the bike lane and motor vehicle lane
Other Public Realm amenities and features	• Install posts/poles for community pride/event banners (less than 16 square feet), such as school pendants and community events • Identify and develop locations for public green spaces and pedestrian access through campus style development • Iconic guardrails (e.g., Columbia River Highway) • Limit lighting to allow for views of the night sky (motion sensors, or other technology to limit excessive light) • Deep/wide frontage landscaping areas should match the natural areas along the DNR property that is west of Ingle Road.

18.20.060 Incentives.

A. Public Art. A five percent increase in lot coverage area may be granted upon staff approval for providing public art, equal in value to 1% of a project's construction cost, within a proposed project.

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § I(Exh. A), 5-18-2009)

Chapter 18.22 Mixed Employment (ME)

18.22.010 Purpose

18.22.020 Site development standards

18.22.030 Building design guidelines

18.22.040 Warehousing

18.22.010 Purpose

A. Purpose and Intent. The Mixed Employment District provides a variety of employment focused activities located in strategic areas of the community. These areas are important to the local and regional economy, contributing to the overall economic sustainability of the City of Camas by enhancing service variety and job diversity through a range of employment opportunities closer to residents with access to good transportation options. Mixed Employment Districts are characterized by higher employment density such as advanced manufacturing, research and development, service commercial, offices, and limited retail uses. These districts encourage innovation and a business environment that is flexible and resilient to changing economic conditions and customary business cyclical conditions.

The ME district standards encourage and accommodate the adaptive reuse of existing development and emphasize multimodal accessibility and connectivity. It also provides a zoning designation for uses which will create local higher wage employment opportunities and offer a wide range of uses that are compatible with one another as well as adjoining residential and commercial areas. The ME districts can be located on small or large sites and present a sustainable alternative to solely commercial or industrially designated areas while retaining legacy light industrial and business park uses. Primary uses include a broad mix of light industrial, research and development, advanced technology production, artisan/craft industrial, commercial, office, and personal service uses, within a more amenity-rich environment.

B. Flexibility of Property Development Regulations. The ME district provides for flexibility of certain property development regulations, placement and clustering of buildings, and provisions for site design intended to promote innovative approaches to planning, including:
    1. The encouragement of employment expansion to the city's economic base through emerging business types and new capital investment;
    2. The preservation of natural features, open space areas and native vegetation;

3. The provision of on-site essential services for industries, employees, and customers;
4. The protection of adjacent properties from adverse impacts; nearby existing and future non-employment land uses and activities; and
5. The arrangement of buildings and land use intensities, as they relate to surrounding land uses to minimize and mitigate adverse impacts.

C. Anticipated Benefits. Development within the ME district is of direct and indirect economic benefit to the city in the form of high-wages, innovative and resilient employers, local employment with a diverse work force, desirable creative designs for projects, and tax revenue for the city to fund urban services at appropriate levels. Development within this district will also diversify the economy by realizing diverse employers and uses.

18.22.020 Site development standards

Site improvements shall be designed to result in a complementary appearance that will blend with surroundings and be compatible with neighboring developments.

A. Dimensional Standards are established in Section 18.09.030.

B. Grading and Drainage. Site grading and drainage shall be designed by a Washington licensed civil engineer. Grading and slopes are to be compatible with landscaping materials, shall not permit erosion, and shall minimize use of retaining walls to control slopes. Plans submitted for building permits shall include a construction phase mitigating procedure to control temporary runoff, erosion, sedimentation, or other objectionable effects.

C. Parking and Loading.

1. Shared parking is encouraged between adjacent uses.

2. Parking areas available to the general public should be clearly identified.

3. Parking areas between the primary street and the front of the building should be limited to visitor and accessible spaces. Employee parking should be located behind the front of the building screened from the public right of way.

4. Parking areas between the primary street and front of building should have a minimum landscape area of 20 feet from right of way to the paved area.

5. All new developments should provide multimodal connections throughout the development, as well as to adjacent developments.

6. All loading areas within parking areas shall be located to minimize viewing from adjacent properties and roadways. They shall be screened from horizontal view with the use of dense landscaping, mounds, view screen fencing, or other approved means.

7. Truck docks and loading areas are not permitted on the front elevation of the property and are to be screened from the front view if located within the side yards.

D. Refuse/Storage. Refuse areas and service/storage areas are to be located under cover. Refuse areas should be located behind the building screened from the right of way.

E. Utilities. All utility service lines are to be located underground. All pad-mounted equipment and other visible utility and service equipment are to be carefully located to minimize appearance and shall be appropriately screened consistent with required access and safety requirements.

F. Fencing. Perimeter fencing shall be so constructed as to minimize visual impacts. Walls or fences separating adjoining parcels may be located at the property line. No wall or fence taller than three feet shall be placed within the landscape setbacks along rear or side lot lines, and no wall or fence exceeding three feet in height shall be located on the property, except for security fencing. Security fencing shall blend into and be compatible with landscaping. Fencing shall have earth tone colors of brown, tan, gray, or green. Walls shall be constructed of materials compatible with the building architecture.

G. Lighting. Site and building lighting shall be designed to minimize glare to the adjacent properties. Site-lighting poles shall not exceed twenty feet in height and shall direct the light downward. Lighting sources viewed from above or below on adjacent property shall be shielded. Building lighting is to be concealed and indirect. Lighting in service areas is to be contained to conceal visibility of light sources from street and adjacent property. Site lighting is to be designed to provide uniform distribution, and the light levels shall be adequate for reasonable security and safety on the premises.

18.22.030 Building design guidelines

A. All structures should be designed to complement the local setting and with neighboring developments, while contributing to the overall architectural character of the area. The building design should appear as an integrated part of the design concept. All facilities should be designed by a Washington licensed architect and reflect a high standard of architectural design. Buildings should be either reinforced concrete and steel, masonry, or wood frame construction. Prefabricated metal buildings or sheet metal-

sided structures are not permitted, unless an exception is made by staff review, based upon a design that meets or exceeds the overall architectural character of the area.

B. Building design should consider the orientation toward major streets and thoroughfares; vehicular and pedestrian flow patterns; the character of neighboring development; expression of the facilities functional organization and individual character; and the satisfaction of the physical and functional needs of facility users.

C. Design features that can contribute to the design character of a project include entrance drives, enhanced visitor parking areas, highlighted visitor entrances and entry plazas, decorative pedestrian plazas and walkways, focal landscape treatments and site sculptures, employee lunch areas (with amenities such as outdoor seating, garden areas, etc.), atriums and interior courts, dynamic building and roof forms, distinctive window patterns, shade and shadow patterns, surface treatments, and accent lighting and landscaping.

D. Long, blank, straight building facades are generally discouraged as they are uninviting and visually uninteresting. Building setbacks shall be varied, and all facades articulated to add visual variety, distinctiveness, and human scale. Space created by the varied setbacks of the building facades can accommodate landscaping and pedestrian/employee areas that contribute to visual interest. Buildings should orient along the length of the primary street frontage in order to avoid visual exposure of loading areas to the public right of way.

E. Exterior building colors shall be compatible with the surrounding man-made and natural environments, and not in competition with surrounding elements for attention (i.e., building color should not, in any way, become signing for the site). Generally, muted colors are encouraged with primary colors or other bright colors used only as accents to enliven the architecture. Repetition and overuse of a single approach to the use of color, such as horizontal stripes/bands, can result in this treatment losing its effectiveness.

F. Roof-mounted equipment that is visible from adjacent, elevated property should be painted a compatible color with the roof screen.

G. All rooftop or outdoor mechanical equipment shall be fully screened from public view in a manner which is architecturally integrated with the structure. Screening shall be constructed to a finished standard using materials and finishes consistent with the rest of the building. Building designs should consider potential visibility of equipment from elevated rights-of-way or adjoining property.

H. All vents, flues, or other protrusions through the roof, less than sixteen inches in diameter need not be screened from view but must be painted or treated to blend with the color of the background. All such vents, flues, or other protrusions through the roof, more than sixteen inches in diameter shall be considered mechanical equipment and shall be screened from view.

18.22.040 Warehousing

A. Warehousing, indoor storage, and distribution activity may be allowed only as an accessory use when directly associated with and subordinate to a permitted principal use located on the same site. Accessory warehousing may include storage of raw materials, equipment, inventory, finished goods, tools, vehicles, or supplies used in connection with the principal use, but shall not function as a stand-alone warehouse, distribution center, fulfillment center, freight terminal, mini-storage facility, self-service storage facility, or outdoor storage yard.

B. Accessory warehousing, indoor storage, and distribution areas shall not exceed fifty percent of the gross floor area of the building or tenant space unless a greater percentage is approved by the approval authority upon finding that the storage area is necessary to support the principal permitted use, the principal use remains the dominant use of the site or tenant space, and the use will not generate traffic, truck trips, loading activity, outdoor storage, noise, or other operational impacts inconsistent with the purpose of the zone.

Chapter 18.23 PLANNED RESIDENTIAL DEVELOPMENT (PRD)

18.23.010 Purpose.

The purpose of this chapter is to promote the public health, safety and general welfare of the citizens of the City of Camas in accordance with state law and the city's comprehensive plan; to facilitate the innovative development of land; and to provide for greater flexibility in the development of residential lots in ~~medium and high-density~~ residential districts.

A further purpose of this chapter is to allow for the modification of certain regulations when it can be demonstrated that such modification would result in a development which would not increase the density and intensity of land use (except as provided for in Section 18.23.040 of this chapter); would preserve or create features or facilities of benefit to the community such as, but not limited to, open space or active recreational facilities; would be compatible with surrounding development; and would conform to the goals and policies of the City of Camas' comprehensive plan.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.020 Definitions.

In addition to those definitions listed in CMC Chapter 18.03, the following definitions shall also apply:

"Density bonus" means a percentage of units allowed in a PRD over and above the number of units provided for in the zoning district absent a PRD proposal.

"Density transfer" means a transfer of dwelling units located on a site identified as sensitive lands or open space to the developable portion of land on the site. (Refer to Section 18.09.060 Density transfers)

"Development agreement" means a legal contract between the city and the developer relative to a specific project and piece of property. The agreement may specify and further delineate, and may include but is not limited to, findings of council, actions, requirements of the developer and city, benefits to the parties involved, conditions of approval, time frames, etc. A development agreement shall become binding upon the land.

"Master plan" means a planned proposal for development that includes and illustrates the division of land into lots, the location and sizes of streets, roads and accessways, pedestrian circulation, landscaping, parking areas and the location of and types and densities of uses. A master plan further identifies the dimensions, height, location, and setbacks of all such buildings to the extent necessary to comply with the purpose and intent set forth in this chapter.

"Open space" means land that is set aside and maintained in a natural state, providing air, light, and habitat for wildlife, and/or containing significant trees and vegetation. Open space may also contain environmentally sensitive lands, which include but are not limited to steep slopes and areas with unstable soils, wetlands, and streams and watercourses. Open space may also provide for active and passive recreation use. There are two general categories of open space:

1. Natural open space is land that is devoted to protecting environmentally sensitive lands as defined in this code. Natural open space generally has no developed areas, with the exception of trails as identified in the comprehensive parks, recreation, and open space plan, or by a condition of development approval.

2. Recreational open space is land that is set aside and shall include development for recreational opportunities such as trails, sports fields, playgrounds, swimming pools, tennis courts, and picnic areas. Recreational open space is generally limited in size and intensity, proportionate to the development, and is intended for the enjoyment of the residents of the development.

"Peripheral yard" means those areas which form the boundary between a planned unit or planned residential development district and any other zoning district, planned unit, or planned residential development.

"Planned residential development" (hereinafter referred to as a PRD) means a development constructed on land of at least ~~ten~~ five acres in size, designed and consistent with an approved master plan. A PRD is comprised of two primary components: detached single-family and middle housing or multifamily units. ~~The single-family component shall contain only single-family detached residences on lots equal to or greater than four thousand square feet~~. The middle housing or multifamily component may contain duplexes, triplexes, fourplexes, townhouses, stacked flats, courtyard apartments, and cottage housing or apartments~~either attached or detached single-family residences on lots smaller than four thousand square feet, or it may contain, but may not be limited to, duplexes, rowhouses, apartments, and designated manufactures homes~~, all developed in accordance with Section 18.23.030(A) of this chapter. Secondary components include park and recreational amenities, accessory uses, and limited commercial uses as provided in this chapter.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006; Ord. No. 15-008, § I, 3-16-2015)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.23.030 Scope.

Planned residential developments (PRDs) are optional. If proposed, it shall be established under the following criteria:

A. A PRD may be allowed in all ~~R and MF~~ residential zoning districts. Where residentially zoned land is contiguous to lands zoned for commercial uses, the city may, subject to a development agreement, provide for the inclusion of the commercial area into the PRD for the purposes of establishing continuity community design, pedestrian and commercial circulation, streetscape standards and design, and effective transitions between commercial and residential uses.

B. The minimum land area necessary to apply for a PRD shall be ~~ten~~ five acres of contiguous land.

C. All land in which a PRD is to be developed shall be held and maintained in a single ownership, including but not limited to an individual, partnership, corporation, or homeowner's association. Evidence of such ownership shall be provided to the ~~planning commission and city council~~ Hearings Examiner before PRD approval.

D. Permissible uses within a PRD include any use listed as a permitted use or condition use in the applicable zones, as per CMC Chapter 18.07, when approved as part of a master plan. Notwithstanding an approved master plan, incidental accessory buildings, incidental accessory structures, and home occupations may be authorized on a case by case basis.

E. A minimum of fifty percent to a maximum of seventy percent of the overall permitted residential density of the PRD must be single-family homes.

F. The middle housing or multifamily component ~~(two or more attached dwelling units)~~ of a PRD shall ideally be developed toward the interior of the tract, rather than the periphery, to ensure compatibility with existing single-family residences that border the surrounding properties. Alternatively, when the tract borders a non-residential use or a collector or arterial street, the middle housing or multifamily components can be located on the periphery to act as a transition or buffer. Deviation from this

requirement shall be requested during the preliminary master plan review, and specifically approved by the ~~planning commission and city council~~Hearings Examiner.

G. Density standards and bonuses for the residential portion of a PRD shall be in accordance with CMC Sections 18.23.040 and 18.23.050.

H. ~~An equivalent amount of up to twenty~~ At least fifteen percent of the ~~developable~~ gross land area shall be set aside ~~and developed~~ as ~~recreational~~ open space in a PRD, and shall include the following:

1. Passive or active recreation concentrated in large usable areas;

2. Existing groves of matures trees or other individual healthy mature trees to be retained;

~~2~~3. Provide trails and open space for connection and extension with the city's open space and trail plan, if feasible; and

~~3~~4. Be held under one ownership, and maintained by the ownership; or be held in common ownership by means of homeowners' association, and maintained by the homeowners' association. The open space and recreation areas shall be dedicated for public use and be maintained by the ownership or homeowners' association.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 15-008, § II, 3-16-2015)

18.23.040 Density standards.

A. Density standards for a PRD shall be based on the gross area of the parcel being considered. Open space, greenways, sensitive areas, parks, and recreation areas set aside within the tract shall be used in the computation of the gross development area. The maximum number of dwelling units in the PRD shall be determined as follows:

Divide the gross land area (in square feet) by the minimum lot size (in square feet) of the underlying zoning district.

B. The minimum lot size for a single-family dwelling within the single-family component of the PRD shall be four thousand square feet. The minimum lot width, depth and setback requirements, and maximum lot coverage requirement shall be established for each PRD as part of the approval process. The minimum lot size for the dwellings within the middle housing or multifamily component of the PRD shall be established as part of the master plan approval.

C. If more than one zoning district is included within the PRD area, the number of dwelling units allowed in each zoning district shall be computed, and then combined to determine the total number of dwelling units within the entire development.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.050 Density bonus.

A density bonus of ~~no more than twenty~~ fifteen percent ~~may~~shall be granted ~~by the city council~~ for a PRD~~, as demonstrated by site design and layout~~. For example: ten acres in an R~~1~~-10 zone yields four hundred thirty-five thousand six hundred square feet. This is then divided by ten thousand square feet. Using this example, the maximum number of units equals forty-three and one-half units, and with a ~~twenty~~fifteen percent density bonus the maximum number of units allowed would be fifty~~-two~~. The hearing examiner may grant an additional density

bonus of up to twenty percent for any PRD that sets aside twenty percent or more open space under Section 18.23.030(H).

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.060 Permitted uses.

Permitted or conditional uses currently listed in the applicable zoning classification shall be considered permitted within a PRD. All proposed uses shall be reviewed in conjunction with the preliminary master plan review.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.070 ~~Preliminary m~~Master plan—Requirements.

A. Initial Conference. Schedule a pre-application conference to discuss and resolve conceptual problems prior to submission of the ~~preliminary~~ master plan related to such application.

B. Contents. The ~~preliminary~~ master plan shall include the following information:

1. The legal description of the total site proposed for development;
2. The existing and proposed land uses within the development, and the existing and proposed location of all structures;
3. The proposed residential density for the development, which shall include the number and types of dwelling units;
4. The proposed lot sizes and building envelopes. Approved building envelopes will establish the setbacks for each lot or parcel in which development may occur;
5. A site plan drawn to scale and depicting the following:
    a. The location of all areas to be conveyed, dedicated, or maintained as public or private streets; access and egress to the development showing proposed traffic circulation, parking areas, and pedestrian walks,
    b. The proposed location of any residential buildings, and any other structures, including identification of all buildings as single-family, duplex, townhouse, apartment, condominium, designated manufactured home, or otherwise,
    c. The location of areas to be maintained as common open space, and a description of the proposed use of those areas,
    d. The location of areas to be maintained as open space network, if applicable,
    e. Proposed lot or boundary lines for residential, open space, parks, and recreational areas, management or allocation purposes;
6. An accurate survey of the property showing the topography in five-foot contours, identifying slopes above fifteen percent, all existing, isolated trees six inches or more in diameter, all wooded areas, all existing streets, utility easements, drainage patterns, structures, and other improvements, the location of all easements and rights-of-way for utilities, including, but not limited to water, sanitary sewers, storm sewer, electricity, gas, telephone, and cable TV lines;
7. A document containing agreements, provisions, and covenants regarding the establishment of a homeowner's association, which provides for the permanent ownership, maintenance, protection, and

use of the planned development, including streets (if privately owned), storm drain facilities, utilities, common areas (e.g., storage areas, parking areas, and landscaping) open spaces, greenways, parks, and recreational areas;

8. A landscaping plan drawn to scale and demonstrating compliance with CMC Chapter 18.13 Landscaping of this title. Additionally, the landscape plan shall indicate the landscaping features such as screening, fences, lighting, and signage;

9. A development schedule outlining the expected schedule and phases of development;

~~10. The calculation of all applicable impact fees. This shall be coordinated with the city prior to submission of the preliminary master plan.~~

C. Effect of Approval. Approval by the ~~city council~~ Hearings Examiner of a ~~preliminary~~ master plan shall constitute provisional approval of the PRD. This approval is contingent upon the applicant submitting a final development plan ~~and development agreement, if required,~~ that complies with the provisions of this chapter.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.23.080 Professional preparation.

A. The applicant for a proposed PRD shall certify that one or more of the following have been involved with the preparation of the ~~preliminary~~ master plan:

1. An architect licensed in the state of Washington;

2. A landscape architect licensed in the state of Washington;

3. A registered civil engineer or a registered land surveyor licensed in the state of Washington; and/or

4. A certified landscape architect, certified arborist, or a qualified biologist, if a vegetation management plan is required.

B. All plans and specifications required for the development shall be prepared and designed by engineers and/or architects licensed in the state of Washington.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.100 Approval standards.

Approval for a PRD shall be based on the following standards:

A. The proposed PRD conforms to:

1. The City of Camas' comprehensive plan;

2. All provisions of the Camas Zoning Code which are not proposed for modification;

3. All engineering design standards; and

4. Any other applicable city, state, federal regulations, policies, or plans, except those standards proposed for modification.

B. Utilities and other public services necessary to serve the needs of the proposed development shall be made available, including open spaces, drainageways, streets, alleys, other public ways, potable water,

transit facilities, sanitary sewers, parks, playgrounds, schools, sidewalks, and other improvements that assure safe walking conditions for students who walk to and from school.

C. The probable adverse environmental impacts of the proposed development, together with any practical means of mitigating adverse impacts, have been considered such that the proposal shall not have ~~an unacceptable~~ a significant adverse effect upon the quality of the environment, in accordance with CMC Title 16 and 43.21C RCW.

D. Approving the proposed development shall serve the public use and interest, and adequate provision has been made for the public health, safety, and general welfare.

E. The proposed development satisfies the standards and criteria as set forth in this chapter.

F. The proposed development shall be superior to, or more innovative than conventional development, and shall provide greater public benefit without additional probable adverse impacts to public health, safety, or the environment, than available through the use of conventional zoning and/or development standards.

G. The proposed development shall provide at least two access points (where a PRD does not have access to a primary or secondary arterial) that distribute the traffic impacts to adjacent streets in an acceptable manner.

H. ~~Preliminary~~Master plan approval alone does not constitute approval to obtain any building permits or begin construction of the project.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.110 Relationship to adjacent areas.

The design and layout of a planned development shall take into account the integration and compatibility of the site to the surrounding areas. The perimeter of the planned development shall be so designed as to minimize any undesirable impact on adjacent properties. Setbacks from the property lines of the planned development shall be comparable to, or compatible with, those of any existing development on adjacent properties. Or, if adjacent properties are undeveloped, then setbacks shall conform to the type of development that may be permitted on adjacent properties.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.23.120 Amendments.

A. Minor Amendments. In issuing building permits for construction of a PRD, the city may approve minor adjustments provided that such adjustments shall not:

1. Increase the number of dwelling units;

2. Decrease the amount of parking spaces, loading spaces, or open space;

3. Permit structures to be located closer to any property line;

4. Change any points of ingress or egress to the development as set forth in the final development plan;

5. Conflict with any conditions or statements within a development agreement;

6. Increase the height of buildings beyond the limits of the underlying zone.

B. Amendment of Final Development Plan. Any change in the final development plan, other than those minor adjustments specifically authorized in writing by the city at the time building permits are issued, must be

reviewed by the ~~planning commission~~ Hearings Examiner ~~and recorded in the minutes thereof. The recommendation of the planning commission regarding any change in the final development plan, together with its reasons therefore, shall be submitted to the city council for its approval~~. Upon approval of such changes by the ~~city council~~ Hearings Examiner, the final development plan shall be considered amended to that extent.

C. Unauthorized Changes. Unauthorized changes or substantial deviations from the final development plan shall be subject to a stop work order by the city. If not corrected, no occupancy permits shall be issued until the development is brought into compliance with the approved final development plan.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.23.130 Procedure.

An application for a PRD shall be processed as a Type III procedure pursuant to CMC Chapter 18.55 Administration and Procedures of this title. A public hearing before the ~~planning commission and review by the city council~~ Hearings Examiner is required for ~~preliminary~~ master plan approval. ~~Final master plan approval is subject to review and acceptance by the city council at a public meeting. Final approval shall be in accordance with the provisions of this chapter.~~

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2451 § 3, 2006: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

Chapter 18.24 MIXED USE[1]

18.24.010 Purpose.

A. To encourage new development and business opportunities;

B. To foster the development of mixed use areas that are arranged, scaled, and designed to be compatible with surrounding land uses;

C. To promote a compact growth pattern to efficiently use the remaining developable land and to help sustain neighborhood businesses; and

D. To promote new construction of multi-story structures with commercial uses on the ground floor and residential uses on the upper stories.

E. To require design integration if the mixed use project is proposed and constructed in a horizontal, rather than vertical regime.

F. To encourage vibrant, walkable neighborhoods that integrate a variety of land uses and foster economic vitality.

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § I(Exh. A), 5-18-2009)

18.24.020 Applicability.

A. All new development within the Mixed Use (MX) zone shall submit a site plan review application in accordance with CMC Chapter 18.18 Site Plan Review of this title unless otherwise exempt per this title.

B. All new developments and uses shall be required to submit a design review application in accordance with CMC Chapter 18.19 Design Review of this title prior to applying for a building permit.

C. Landscaping requirements shall be the same as landscaping standards in community commercial zones.

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § I(Exh. A), 5-18-2009)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.24.030 Mix of Uses

A. To ensure projects within the Mixed Use zone have a mix of commercial and residential uses, and no one use predominates the other, development proposals shall include a mix of nonresidential and residential uses through either vertical mixed use, horizontal mixed use, or a combination of both. The mix of uses shall be demonstrated through approval of a site plan.

B. Vertical Mixed Use. Residential uses may be located above ground-floor commercial or nonresidential uses. A building with ground-floor commercial or nonresidential uses and residential uses above shall be considered consistent with the mixed-use intent of this chapter.

[1]Editor's note(s)—Ord. No. 2547, § I, adopted May 18, 2009, amended Ch. 18.24, in its entirety, to read as herein set out. See also the Code Comparative Table and Disposition List.

C. Horizontal Mixed Use. Where commercial or nonresidential uses and residential uses are provided in separate buildings, separate portions of a site, or otherwise in a horizontal development pattern, the development shall consist of a maximum of fifty percent residential uses and a minimum of fifty percent commercial or nonresidential uses.

1. The required use mix may be measured using either site acreage, based on the portion of the site devoted primarily to each use; or gross floor area, based on the total floor area devoted to each use.

2. When the use mix is measured by site acreage, the area devoted to each use shall include buildings, outdoor use areas, service areas, loading areas, and parking areas primarily associated with that use. Shared parking areas, drive aisles, internal circulation, stormwater facilities, landscaping, open space, and other common improvements may be allocated proportionally between uses based on floor area, parking demand, or another reasonable method approved by the approval authority.

3. The development shall be designed as a cohesive mixed-use project. The site plan shall demonstrate integration of uses through building orientation, shared or coordinated parking, pedestrian connections, landscaping, open space, architectural compatibility, signage, lighting, and other design features that connect the commercial or nonresidential and residential components.

D. Commercial Frontages. Where a development site has frontage on an arterial, collector, or design overlay corridor, commercial or nonresidential uses shall be located and oriented towards the street frontage so as to maximize visibility and accessibility of these uses to the street.

E. Smaller lots. On lots smaller than 20,000 square feet, a development proposal may be allowed to be either 100% commercial or 100% residential.

F. Residential Flexibility. The approval authority may allow residential uses to exceed fifty percent of the site acreage, up to a maximum of seventy percent residential acreage, when the applicant demonstrates that the proposal will provide a superior mixed-use outcome by ensuring timely delivery of the commercial or nonresidential component. Approval of residential acreage above fifty percent may be conditioned on:

1. Concurrent construction of the commercial or nonresidential component with the residential component where building permits for the commercial or nonresidential components are issued and construction is started before or at the same time as the residential components; or

2. Execution of a development agreement with a phasing plan.

G. Property Previously Zoned Residential. Any property that was zoned for residential use immediately prior to being rezoned to Mixed Use as part of the 2026 Comprehensive Plan Update may be developed with up to one hundred percent residential uses.

18.24.040 General Standards

A. Building height: Buildings shall be limited to four stories and 60 feet in height for vertical mixed use and 45 feet in height for horizontal mixed use.

B. Ground floor design standards: In vertical mixed-use developments, ground floors shall be designed to support adaptable uses and meet the following requirements:

1. A minimum floor-to-ceiling height of fifteen feet, unless the approval authority determines that a lesser height is appropriate due to building design or other site-specific conditions; and

2. A minimum façade transparency of sixty percent.

3. To support small business and flexible tenant occupancy, ground floors shall be designed to be capable of subdivision into a variety of tenant spaces, demonstrated by location of walls, entrances, and mechanical

systems. This requirement does not apply where the applicant demonstrates that a larger tenant space is needed for a specific tenant, anchor tenant, build-to-lease arrangement.

C. Shared parking requirements: Mixed-use developments are encouraged to make efficient use of parking through shared parking, reduced parking demand, pedestrian and bicycle access, and connections between complementary uses. Required parking may be reduced pursuant to Section 18.11.050 when the mix of uses on a site have different peak parking demand periods or when parking can be effectively shared among uses, buildings, parcels, or phases of development.

18.24.~~030~~050 Incentives.

A. Traffic Impact Fee (TIF) Reduction. A reduction of the TIF may be granted pursuant to § 18.22.100 CMC.

B. Public Art. A five percent increase in lot coverage area may be granted ~~upon design review committee approval~~ for providing public art within proposed project.

C. Sustainability. Up to a ten percent reduction in building and/or engineering review fees may be authorized at the discretion of the director in proportion to a proposed low-impact development method.

D. To encourage affordable housing development, regulated affordable units may be exempted from the residential portion of the use percentage and counted towards the non-residential percentage minimum.

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § I(Exh. A), 5-18-2009)

18.24.~~040~~060 Exemptions.

Newly created lots, via short plats or subdivisions or combined lots, that are adjacent to existing single-family lots shall not be required to bevel to existing platted lots (Refer to §18.09.080-B).

(Ord. No. 2545, § III, 5-4-2009; Ord. No. 2547, § I(Exh. A), 5-18-2009)

Chapter 18.26 FLEXIBLE DEVELOPMENT

18.26.010 Purpose and intent.

This chapter is optional in all zoning districts ~~except the LI/BP zone~~. The purpose and intent of this chapter is to promote the public health, safety and general welfare of the citizens of the City of Camas in accordance with state law and the City's Comprehensive Plan; and

A. To provide for greater flexibility in the development of properties;

B. To foster the development of land that is arranged, scaled, and designed to be compatible with existing and potential densities;

C. To promote a growth pattern to efficiently use land;

D. To promote construction and redevelopment that implements ~~the most current~~ sustainable features;

E. Retain historical building or other structures to the greatest extent possible; and

F. To allow for the modification of certain regulations when it can be demonstrated that such modification meets the minimum points for development under this chapter.

G. To encourage site and building design that supports renewable energy, electric vehicle charging infrastructure, low-impact development, tree retention and planting, and other features that advance Comprehensive Plan climate and resiliency goals and policies.

G. To provide for an alternative to CMC Chapter 18.23 - Planned Residential Development (PRD). The city shall review a proposal for either a PRD or a flexible development, not a combination.

(Ord. No. 2628, § I(Exh. A), 10-17-2011)

18.26.030 Permitted uses.

Only permitted land uses within the underlying zoning classification shall be considered permitted within a flexible development. A use listed as conditional use within the underlying zoning classification may be proposed in combination with a flexible development if submitted concurrently with an application for such use.

(Ord. No. 2628, § I(Exh. A), 10-17-2011)

18.26.040 Definitions of terms.

For the purposes of this chapter, the flexible development score sheet, the following definitions shall apply in addition to those definitions within Chapter 18.03:

A. "Building envelope" means the exterior dimensions of a structure. For detached multi-family housing, a suitable size and configuration includes a building envelope capable of siting a twenty-foot by fifty-foot dwelling within the building envelope.

B. "Double-frontage lot" means a lot, other than a corner lot, having street frontage on two sides. If proposed on streets other than arterials, then both sides of the lot must provide pedestrian access to the sidewalk, and the more intensely traveled street must be the front of the structure. This could

require that each frontage provide a gate if fencing is proposed or the installation of stairs if there is a slope.

C. "Green roof" means a landscaped area on the roof of a structure that provides stormwater benefits. Green roofs may serve dual purposes of stormwater management and as an aesthetic enhancement.

D. "GFA" means the gross floor area of a structure as measured from the outside surface of the outer building wall for all levels.

E. "Permeable paving" means that the method and material of paving will allow the movement of water and air through the paving material.

F. "Energy star/LEED (Leadership in Energy and Environmental Design)" are nationally recognized programs for measuring the amount of overall environmental benefit that is provided in a building versus conventional methods.

G. "LED lighting" means "light-emitting diode." These lights consume less energy, have a longer useable life, and are smaller in size than other lights with the same amount of lighting output.

H. "Meandering sidewalks" means that the course of the walkway is winding or curving rather than straight. This design may cost more to develop given that more land may be required for curvature and landscaping.

I. "Rain gardens" are landscaped areas planted with wild flowers and other native vegetation to soak up rain water, mainly from the roof of a house or other building. The rain garden fills with a few inches of water after a storm and the water slowly filters into the ground rather than running off to a storm drain. Compared to a conventional patch of lawn, a rain garden allows about thirty percent more water to soak into the ground.

J. "Recreational open space" means lands that are developed for active recreation such as for park and trail use. These lands may contain critical features such as streams, steep slopes or wetlands, however only the unencumbered area of land is used in the score sheet calculations.

K. "Repurpose structure" means to alter or renovate a building for a different purpose, on a long-term basis in lieu of demolition (e.g., renovating a barn into a restaurant, or a warehouse into a performing arts theatre).

L. "Solar lighting" is any use of sunlight or sky light for illuminating the interior of a building, or may be defined as the conversion of sunlight to power a fixture.

M. "Vegetated wall" means a vertical surface designed and planted to be covered at maturity by plants.

N. "White roof" means a roof with reflective shingles that exceed a 0.15 reflectivity, as established by the Department of Ecology. White roofs increase energy efficiency and lower the heat island effects of new development.

(Ord. No. 2628, § I(Exh. A), 10-17-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.26.050 Score sheet adopted.

The city's "Flexible Development Score Sheet" (score sheet) is a required form for this chapter and is adopted by the city by resolution (RES1223, or as amended).

(Ord. No. 2628, § I(Exh. A), 10-17-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.26.060 Application requirements for flexible development proposals.

In addition to those items listed in CMC 18.55.110, the following items are required for a complete application for a flexible development. Items may be waived if, in the judgment of the director or designee, the items are not applicable to the particular proposal:

A. Flexible development score sheet;

B. Complete and signed SEPA checklist;

C. A transportation impact study to determine the adequacy of the transportation system to serve the proposed development and to mitigate impacts of the proposal on the surrounding transportation system;

D. Preliminary stormwater plan and preliminary stormwater technical information report (TIR). The preliminary stormwater TIR is to be prepared in accordance with Ecology's latest edition Stormwater Management Manual for Western Washington (SWMMWW);). If proposed, rain gardens-shall meet the standards of CMC Section 17.19.030.F.6 Storm Drainage Facilities;

E. Preliminary grading plan;

F. Site plan drawn to scale and depicting the following:

1. The existing land uses within the development, and the existing location of all structures (indicate if any structures are to be repurposed);

2. A list of owners of land adjacent to the proposed development;

3. The proposed location of all buildings, if commercial or industrial project;

4. The proposed lot sizes and building envelopes, if subdivision project;

5. Location of any critical areas, critical area buffers, and significant trees in compliance with CMC Chapter 18.31 and CMC Title 16 Environment;

6. Location of sidewalks, driveways, street lighting and street trees;

7. The location of all areas to be conveyed, dedicated, or maintained as public or private streets/tracts;

8. Provide a plan with the ingress/egress to the development with the proposed traffic circulation, parking areas, pedestrian walkways;

9. A draft document containing agreements, provisions, and covenants regarding the permanent ownership, maintenance, protection, and use of the development;

G. A preliminary landscape plan;

H. Building elevations for each unique type of structure; and

I. Narrative to describe how the proposed project complies with this chapter in balance with proposed flexible elements, relevant requirements of Camas Land Development and Zoning Codes, and the requirements of Chapter 58.17 RCW, if applicable. The city shall not consider variances to the minimum provisions of this chapter.

(Ord. No. 2628, § I(Exh. A), 10-17-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 21-005, § I(Exh. A), 3-15-2021)

18.26.070 Professional preparation

The applicant for a proposed flexible development shall certify that one or more of the following have been involved with the preparation of the preliminary plan:

A. An architect or engineer licensed in the State of Washington.

B. A landscape architect licensed in the State of Washington.

C. A registered civil engineer or a registered land surveyor licensed in the State of Washington.

(Ord. No. 2628, § I(Exh. A), 10-17-2011)

18.26.080 Criteria for approval.

A preliminary flexible development plan approval may be authorized by the decision maker if findings are made that the following criteria is satisfied:

A. The proposal shall meet the purpose and intent of a flexible development as stated in this chapter in balance with development bonuses.

B. The proposal ~~meets the minimum~~ scores at least 0.30 ~~per the~~according to the "flexible development score sheet"~~ based on the particular land use zone~~.

~~Residential zones0.3~~

~~Commercial zones0.3~~

~~Industrial zones0.3~~

~~LI/BP ZonesNot applicable~~

C. The proposal is in conformance with the Camas Comprehensive Plan.

(Ord. No. 2628, § I(Exh. A), 10-17-2011)

18.26.090 Development bonuses.

Upon meeting the minimum standards of a flexible development per the score sheet, the project may be eligible for the following additional flexibility in land development standards:

A. If proposed to meet the standards of this chapter, then rain gardens are exempt from the thirty-foot setback standard of CMC Section 17.19.030.F.6 Storm Drainage Facilities.

B. Residential development:

1. May increase density of residential development in accordance with the Density Transfer Standards of CMC Section 18.09.040 ~~of the underlying zone, or, if a multifamily zone, then standards may reflect those of the MF-18 zone of CMC Section~~or 18.09.050, if landscaping is not sacrificed.

2. If project scores higher than minimum score, then for standard lots, building setbacks may be reduced to five feet on all sides of the structure with eighteen feet from garages (if driveways are accessed at the front of the lot). Refer to Figure 1.

3. On corner lots, vision clearance setbacks must be maintained in accordance with CMC Section 17.19.030.D.7 Corner Lots.

4. Height of buildings may exceed the maximum building height of the zoning district by one story or ten feet, whichever is less.

C. Commercial/industrial projects.

1. If project scores higher than a minimum score, then the applicant may reduce the required off-street parking for the GFA by twenty-five percent ~~and participate in the city's Commute Trip Reduction Program~~, provided that the project provide bicycle parking equal to the number of parking spaces reduced.

2. If a green roof is proposed, then the applicant may reduce up to fifty percent of the required off-street parking spaces (calculated on the first level ~~if~~ of a multi-story building) for the equivalent square footage of a green roof, provided that the project provide bicycle parking equal to the number of parking spaces reduced. Refer to Figure 2 for formula.

(Ord. No. 2628, § I(Exh. A), 10-17-2011; Ord. No. 2691, § I(Exh. A), 1-21-2014; Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.26.100 Development assurances.

A. To assure full performance of the proposed flexible development, the developer shall provide certification from the qualified professional of record that the project element has been built as approved in the decision, prior to receiving an occupancy permit from the Building Department.

B. Perpetual maintenance covenant.

1. The applicant shall be required to perform maintenance functions on the flexible development aspects of their approved project in perpetuity to maintain functionality at the current industry standards (e.g. roof gardens or solar panels).

2. The maintenance covenant in a form acceptable to the city shall be recorded with the Clark County Auditor for each applicable lot or parcel. A copy of the recorded document must be provided to the Building Department prior to receiving an occupancy permit.

3. The maintenance covenant as described herein shall run with the land and be binding upon the heirs, successors, and assigns of the applicant or owner.

C. Amount of financial security. The director may require financial security to be provided for certain elements of the project that are not otherwise required to be secured pursuant to CMC Chapter 17.21-Procedures for Public Improvements. The financial security shall be based on one hundred five percent of the cost estimates. Cost estimates of the following shall be submitted to and approved by the director:

1. Estimated construction cost for green roofs, white roofs, and solar lighting.

2. Estimated installation costs for landscaping and maintenance for a period of three years post-construction.

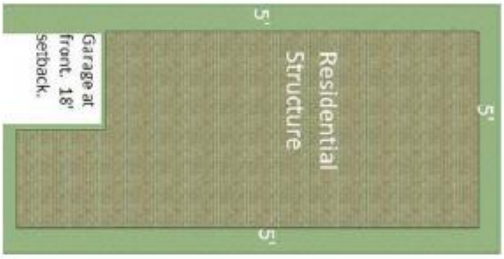

Figure 1: Potential reduced building setbacks.

Figure 2: Formula for parking calculation.

Answer 1 is [(SF of green roof) ÷ (parking # per use [note])] ÷ 2 = ____

Answer 2 is (SF of standard roof) ÷ (parking # per use [note]) = ____

Answer 1 + Answer 2 = parking spaces required

Example: 1,750 SF Office Building with 500 SF of green roof.

Answer 1: (500 SF ÷250) ÷ 2 = 1

Answer 2: 1,250 SF ÷ 250 = 5

1 + 5 = 6 parking spaces are required

Notes: *The amount of parking spaces for the equation is determined from* ***CMC 18.11.130*** *Parking Standards Table.* "SF" = Square Feet

(Ord. No. 2628, § I(Exh. A), 10-17-2011)

Chapter 18.32 PARKS AND OPEN SPACE ZONE~~ZONING~~[1]

18.32.010 ~~Applicability~~ Purpose.

The regulations of this chapter apply only to land held in public trust.

(Ord. No. 2667, § IV, 12-17-2012; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.32.020 Permitted uses.

Uses shall be allowed in accordance with Table 18.07.050 - Park and open space land uses. Park use is also subject to the requirements and limitations of Chapter 12.32 Park Rules and Regulations.

(Ord. No. 2667, § IV, 12-17-2012; Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.32.030 Development standards.

A. Lot Area. There is no minimum or maximum lot size in the Park zoning districts.

B. Setbacks. The minimum setbacks are twenty feet.

C. Building lot coverage. The maximum building lot coverage shall not exceed thirty-five percent of lot area, with the exception of community or recreation centers, where lot coverage shall not exceed sixty percent.

D. Landscaping. All required yard setbacks shall be landscaped. Any storage areas visible to the right-of-way shall be screened. Parking area landscaping shall be consistent with CMC Chapter 18.13 Landscaping.

E. Parking. The number and location of off-street parking shall be consistent with CMC Chapter 18.11 Parking.

F. Signs. Signs shall be permitted according to the provisions of Chapter 18.15 Signs, under the commercial zoning standards.

(Ord. No. 2667, § IV, 12-17-2012)

18.32.040 Site plan review ~~and design review~~.

A. Before a clearing, grading or building permit will be issued; Site Plan approval per Chapter 18.18 Site Plan Review is required. A phased site plan may be allowed in order to guide a new park development as funds and resources become available.

~~B. When Design Review is applicable; the Parks & Recreation Commission shall conduct design review and find that the development is generally consistent with the design standards of CMC Chapter 18.19 Design Review, guidelines and principles for commercial and mixed uses.~~

(Ord. No. 2667, § IV, 12-17-2012)

[1]Ord. No. 2691, § I(Exh. A), adopted Jan. 21, 2014, amended the code by retitling Ch. 18.32 to read as herein set out. Ch. 18.32 was formerly titled Park Zoning.

Chapter 18.43 CONDITIONAL USE PERMITS

18.43.010 Purpose.

It is the purpose of this chapter to establish review and permit approval procedures for unusual or unique types of land uses which, due to their nature, require special consideration of the impact on the neighborhood and land uses in the vicinity.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.43.020 Scope.

This chapter shall apply for each application for a conditional use permit (CUP). Only those uses indicated by a "C" in the use tables contained in CMC Chapter 18.07 Use Authorization of this title will be considered for a conditional use permit.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.43.030 Application.

Application for a conditional use permit shall be filed with the community development department on forms provided by the city. The application shall be accompanied by a filing fee as may be set from time to time by resolution of the city council. The application and review process shall be subject to a Type III procedure, pursuant to CMC Chapter 18.55 Administration and Procedures of this title.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.43.050 Criteria.

The hearings examiner shall be guided by all of the following criteria in granting or denying a conditional use permit:

A. The proposed use will not be materially detrimental to the public welfare, or injurious to the property or improvements in the vicinity of the proposed use, or in the district in which the subject property is situated;

B. The proposed use shall meet or exceed the development standards that are required in the zoning district in which the subject property is situated;

C. The proposed use shall be compatible with the surrounding land uses in terms of traffic and pedestrian circulation, density, building, and site design;

D. Appropriate measures have been taken to minimize the possible adverse impacts that the proposed use may have on the area in which it is located;

E. The proposed use is consistent with the goals and policies expressed in the comprehensive plan;

F. Any special conditions and criteria established for the proposed use have been satisfied. In granting a conditional use permit the hearings examiner may stipulate additional requirements to carry out the intent of the Camas Municipal Code and comprehensive plan.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.43.070 Expiration and renewal.

Expiration, renewals or extensions of any conditional use permit shall be governed by the terms of CMC Section 18.55.260.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 22-007, § I, 5-16-2022)

18.43.090 Performance bond or security.

A performance bond or other adequate and appropriate security may be required by the hearing examiner for any elements of the proposed project which the ~~city council~~ hearing examiner determines are crucial to the protection of the public welfare. Such bond shall be in an amount equal to one hundred fifty percent of the cost of the installation or construction of the applicable improvements.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.43.100 Resubmittal of application.

An application for a conditional use permit that has been denied may not be resubmitted within one year from the date of the disapproval.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

18.43.115 Reserved.

Editor's note(s)—Ord. No. 2655, § I, adopted July 16, 2012, repealed § 18.43.115, which pertained to special conditions and criteria for licensed liquor establishments in the downtown commercial zone. See also the Code Comparative Table and Disposition List.

Chapter 18.45 VARIANCES

18.45.010 Purpose.

A variance to any development standard contained in this title, other than density and lot area, may be granted when practical difficulties, unnecessary hardship, or results inconsistent with the general purposes of CMC Title 16, Environment, and CMC Title 18, Zoning, would result from the literal enforcements of its requirements. The sole purpose of any variance shall be to prevent such difficulties, hardship, or results and no variance shall be granted that would have the effect of granting a special privilege not shared by another property in the same vicinity and zone, except when necessary to avoid such difficulties, hardship, or results.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011; Ord. No. 2649, § I, 5-21-2012)

18.45.020 Approval process.

A. Minor Variance. A minor variance is one that results in the modification of up to ten percent of a numerical development standard (other than lot area or density) or up to one foot of setback that shall be subject to Type I procedure, pursuant to CMC Chapter 18.55 Administration and Procedures, and subject to the approval criteria contained in CMC Section 18.45.030(A).

B. Major Variance. A major variance is one that results in the modification of a numerical development standard by more than ten percent but less than forty percent. ~~The board of adjustment is generally the decision maker regarding major variances. Where a variance is consolidated with an application for a Type III decision, the decision maker shall be the same as that for the Type III application.~~ A major variance is subject to a Type III procedure with a final decision issued by the hearing examiner. A major variance shall not be approved unless findings are made by the approval authority that all of the approval criteria under CMC Section 18.45.030 are satisfied.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2612, § I(Exh. A), 2-7-2011)

18.45.030 Minor variance.

The community development director may grant a minor variance upon demonstration by the applicant of compliance with all of the following approval criteria:

A. Unusual circumstances or conditions apply to the property and/or the intended use that do not apply generally to other property in the same vicinity or district;

B. The variance requested is the minimum necessary to relieve the unusual circumstances or conditions identified in subsection (A) of this section;

C. The granting of such variance will not be materially detrimental to the public welfare or injurious to property in the vicinity or district in which property is located;

D. The proposed variance does not exceed ten percent of the requested dimensional standard in which the variance is requested or one foot of setback, whichever is greater.

E. The unusual circumstances and conditions associated with the variance are not a result of the actions of the applicant or property owner.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.45.040 Major variance.

A. The hearing examiner ~~board of adjustment (or hearing examiner, or planning commission, in accordance with Section 18.45.020(B))~~ shall consider all requests for major variances from the zoning code.

B. Approval of a major variance must demonstrate with findings of compliance with all of the following criteria:

1. The variance shall not constitute a grant of special privilege inconsistent with the limitation upon uses of other properties in the vicinity and zone in which the subject property is located;

2. That such variance is necessary, because of special circumstances or conditions relating to the size, shape, topography, location, or surroundings of the subject property, to provide it with use, rights, and privileges permitted to other properties in the vicinity and in the zone in which the subject property is located;

3. The granting of such variance will not be materially detrimental to the public welfare or injurious to the property or improvements in the vicinity and in the zone in which the subject property is located.

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

18.45.050 Conditions for granting—Extension.

In authorizing the variance, the hearing examiner~~approval authority~~ may attach thereto such conditions that it deems to be necessary or desirable in order to carry out the intent and purpose of this chapter and the public interest. A variance so authorized shall become void after the expiration of one year, or a longer period as specified at the time of the approval authority action, if no building permit has been issued in accordance with the plans for which such variance was authorized, except that the community development director~~approval authority~~ may extend the period of variance authorization, without a public hearing, for a period not to exceed twelve months upon a finding that there has been no basic change in pertinent conditions surrounding the property since the time of the original approval.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

Ord. No. 2691, § I(Exh. A), adopted Jan. 21, 2014, repealed § 18.45.050, which pertained to application requirements, and renumbered § 18.45.040 as § 18.45.050. See also the Code Comparative Table and Disposition List.

18.45.060 Prohibited variance.

Under no circumstances shall the approval authority grant a variance to permit a use not outright or conditionally permitted in the zone involved, or any use expressly or by implication prohibited by the terms of this title.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 2691, § I(Exh. A), 1-21-2014)

Chapter 18.51 COMPREHENSIVE PLAN AND ZONING AMENDMENTS[1]

18.51.010 Application for amendments to comprehensive plan.

Any interested person, including applicants, citizens, planning commission, city council, city staff, and other agencies, may submit an application in the month of January each year for a comprehensive plan amendment. The application shall specify:

A. A detailed statement of what is proposed and why;

B. A statement of the anticipated impacts of the change, including the geographic area affected, and issues presented by the proposed change;

C. An explanation of why the current comprehensive plan is deficient or should not continue in effect;

D. A statement of how the proposed amendment complies with and promotes the goals and specific requirements of the growth management act;

E. A statement of what changes, if any, would be required in functional plans (i.e., the city's water, sewer, stormwater or shoreline plans) if the proposed amendment is adopted;

F. A statement of what capital improvements, if any, would be needed to support the proposed change which will affect the capital facilities plans of the city;

G. A statement of what other changes, if any, are required in other city or county codes, plans, or regulations to implement the proposed change; and

H. The application shall include an environmental checklist in accordance with the State Environment Policy Act (SEPA).

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § IV, 10-2-2017)

Ord. No. 17-013, § IV, adopted Oct. 2, 2017, amended the catchline of § 18.51.010 from "Application and criteria therein" to read as herein set out.

18.51.020 Application review process for comprehensive plan.

The comprehensive plan shall be reviewed once a year as a Type IV legislative process, and in accordance with RCW 35A.63.070—073, unless there is an emergency, with the following procedure:

A. In the months of November and December, city staff and applicants shall complete preapplication meetings;

B. In the month of January of each year, applicants shall submit an application form containing all of the information required by Section 18.51.010 of this chapter;

[1]Ord. No. 17-013, § IV, adopted Oct. 2, 2017, retitled Ch. 18.51 from "Comprehensive Plan Amendments" to read as herein set out.

C. The city may take as much as sixty days from the closing of the application period (January 31) to complete the initial review of proposals. Environmental determination requirements associated with an application may lengthen this period. If no amendments are received, the chairman of the planning commission shall so report to the mayor and city council, and the annual review of the comprehensive plan shall be considered completed.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, §§ I(Exh. A), IV, 10-2-2017)

Ord. No. 17-013, § IV, adopted Oct. 2, 2017, amended the catchline of § 18.51.020 from "Application review" to read as herein set out.

18.51.025 Zoning text and map amendments.

A. Amendments to the zoning code text or other development regulations shall follow procedures for a Type IV legislative process. Requests amending the zoning code text or development regulation shall include the following information with an application:

1. Narrative that addresses the following:

a. The specific code text or the development regulation and the rationale for the amendment;

b. A statement of how the amendment is warranted due to changed circumstances, error, or because of a demonstrated need for the change in the zoning text or regulation;

c. A statement of how the public safety and welfare is improved by the amendment; and

d. A statement of what the effect would be if the amendment is not granted.

B. Requests for zoning map amendments shall follow procedures for a Type III decision, and include the following information with an application:

1. An application form indicating the applicant(s), application date, property information (including address, size, zoning, and current use), specific map amendment request, and other pertinent information.

2. Narrative that addresses the following criteria:

a. The map amendment shall be consistent with the policies and provisions of the comprehensive plan including the comprehensive plan map;

b. The amendment shall be compatible with the uses and zoning of the adjacent properties and surrounding areas;

c. The amendment is warranted due to changed circumstances, error, or because of a demonstrated need for additional property in the proposed zoning district;

d. The subject property is suitable for development in conformance with zoning standards under the proposed zoning district;

e. Adequate public facilities and services are likely to be available to serve the development allowed by the proposed zone;

f. Specific information about the intended use and development of the property.

C. An applicant may propose a concomitant rezone in conjunction with a zoning map amendment and shall be subject to a Type IV legislative process. Where a concomitant rezone is proposed by an applicant, the application shall also include the materials identified in Section 18.51.040.

(Ord. No. 17-013, § I(Exh. A), 10-2-2017)

18.51.030 Evaluation criteria.

For consideration of any proposed amendment to either the comprehensive plan, zoning code text, or development regulations, the planning department shall prepare and submit to the planning commission a staff report which evaluates the following:

A. Impact upon the city of Camas comprehensive plan and zoning code;

B. Impact upon surrounding properties, if applicable;

C. Alternatives to the proposed amendment; and

D. Relevant code citations and other adopted documents that may be affected by the proposed change.

The report shall include a copy of the application for each proposed amendment, any written comments on the proposals received by the department, and shall contain the department's recommendation on adoption, rejection or deferral of each proposed change; and the SEPA checklist with the determination.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § I(Exh. A), 10-2-2017)

Ord. No. 17-013, § IV, adopted Oct. 2, 2017, amended the catchline of § 18.51.030 from "Staff report" to read as herein set out.

18.51.040 ~~Reserved~~ Concomitant Rezone.

A concomitant rezone may be required by the City or proposed by an applicant in conjunction with a zoning map amendment. Concomitant rezones are appropriate where additional limitations or requirements are necessary to ensure consistency with the comprehensive plan; the proposed zoning could allow a range of uses or intensities not appropriate for the specific site; or the City desires to secure specific land uses, development outcomes, or public benefits.

A. The City Council may approve a zoning map amendment subject to a concomitant agreement or ordinance.

   1. The concomitant rezone shall be implemented through a development agreement, recorded covenant, or ordinance.

   2. The provisions of the concomitant rezone shall run with the land and be binding on successors and assigns.

   3. The agreement or ordinance shall be recorded prior to issuance of development permits.

B. Conditions imposed through a concomitant rezone may include, but are not limited to:

   1. Limitations on permitted or conditional uses, including the prohibition of specific uses or the requirement to include specific uses or a mix of uses (e.g., minimum percentages of residential, commercial, or mixed-use development, or required active ground floor uses);

   2. Additional development standards, including but not limited to minimum or maximum densities, floor area ratios, building height, setbacks, lot coverage, site layout, and design requirements;

3. Phasing or timing of development, including sequencing of uses or required improvements;
4. Infrastructure or public facility improvements, including transportation, utilities, open space, or other public amenities;
5. Environmental protection measures, including enhanced critical area protections, tree retention, or low impact development requirements; and
6. Other requirements necessary to ensure consistency with the Comprehensive Plan and compatibility with surrounding development.

C. In addition to the requirements for a zoning map amendment in Section 18.51.025(B), an applicant requesting a concomitant rezone shall provide:

1. A proposed concomitant agreement or a detailed description of proposed conditions;
2. A site concept plan illustrating intended development, including land use distribution, building locations, access, and open space; AND
3. Any supporting studies necessary to demonstrate feasibility and impacts.

D. Development of the property shall comply with the approved concomitant conditions. Where there is a conflict between the underlying zoning and the concomitant conditions, the concomitant conditions shall control.

E. Modification or Removal

1. A concomitant rezone may be modified or removed only through the same procedure required for a zoning map amendment, unless otherwise specified.
2. The applicant shall demonstrate that the modification remains consistent with the comprehensive plan and continues to address site-specific impacts.

F. Enforcement
Failure to comply with the terms of a concomitant rezone shall constitute a violation of this Code and may result in denial, withholding, or revocation of permits or approvals.

18.51.050 Council consideration and decision.

Subsequent to planning commission review and recommendation, the city council shall consider each request for an amendment to the comprehensive plan or zoning code at a public meeting, at which time the applicant will be allowed to make a presentation. Any person submitting a written comment on the proposed change shall also be allowed an opportunity to make a responsive oral presentation. Such opportunities for oral presentation shall be subject to reasonable time limitations established by the council.

A. At minimum, the criteria the city council shall use to make a decision on a proposed amendment are as follows:

1. The application and criteria established therein;
2. The staff report and recommendation;
3. The planning commission recommendation;
4. The public interest.

B. The city council shall make a decision by motion, resolution, or ordinance as appropriate. The city council decision on a planning commission recommendation following a public hearing shall include one of the following actions:

1. Approve as recommended;

2. Approve with additional conditions;
3. Modify, with or without the applicant's concurrence;
4. Deny (resubmittal is not allowed until the next year for comprehensive plan amendments);
5. Remand the proposal back to the planning commission for further proceedings.

(Ord. 2515 § 1 (Exh. A (part)), 2008: Ord. 2443 § 3 (Exh. A (part)), 2006)

(Ord. No. 17-013, § I(Exh. A), 10-2-2017)
