C. Welding shall be performed in the shop, unless otherwise indicated. Welds where exposed to view shall be ground down and dressed smooth, so that the shape and profile of the item welded are maintained.

D. Holes shall be cut, drilled, or punched at right angles to the surface of the metal and shall not be made or enlarged by burning. Holes in base or bearing plates shall be drilled. Holes shall be provided in members as required to permit connecting the work of other trades.

E. Metal stairs and railings shall be prefabricated and preassembled in the factory or shop as far as practicable.

2.03 GALVANIZING

A. Where certain components are indicated to be galvanized, comply with galvanizing requirements of these Specifications.

2.04 CLEANING AND PAINTING

A. All surfaces of metal stairs and railings, including surfaces of pan-filled stairs, shall be cleaned and treated to assure maximum paint adherence, prior to application of the shop prime coat, in accordance with SSPC-SP 1, SSPC-SP 3, SSPC-SP 10, and SSPC-SP 11 as applicable for the exposure and application.

B. Ferrous metalwork shall be given a shop coat of rust-inhibitive metal primer as specified in these Specifications, or other ENGINEER-approved rust-inhibitive metal primer standard with the stair manufacturer. All surfaces of stairwork and railings shall be spray-painted.

C. Where galvanized surfaces are indicated to be painted, comply with cleaning and painting requirements of these Specifications.

E. Coordinate with these Specifications, for compatibility of the prime coat and finish coat of paint.

2.05 CONCRETE

A. Concrete for pan-filled stair treads and landings shall be concrete, weighing not less than 120 pounds per cubic foot, with a minimum compressive strength at 28 days of 4,000 psi. Maximum aggregate size shall be 3/8 inch (ASTM C33, Size No. 8). Include a mix of aluminum oxide and silicone carbide grit particles as required to produce non-slip tread surfaces

PART 3 – EXECUTION

3.01 INSTALLATION

A. Stairs and railings shall be installed by the manufacturer or its authorized representative as indicated and in accordance with the approved Shop Drawings and the manufacturer's installation instructions. Stairs and railings shall be installed with all accessories furnished by the manufacturer or fabricator as required for complete and finished stair installations.

B. Installation of stair work shall be true and horizontal or perpendicular as the case may be, level and square, with angles and edges parallel with related lines of the building or structure.

C. Shop fabricated items subject to damage shall be braced and carefully handled to prevent distortions or other damage.

D. Field welding, where required, shall conform with requirements specified for shop fabrication.

E. Bearing plates shall be supported at the proper level by means of adjustment nuts on anchor bolts. Bases and plates shall be set accurately using a high-strength, non-shrink grouting mortar to obtain uniform bearing.

3.02 FIELD PAINTING

A. After installation, exposed painted surfaces, field welds, and other abraded or damaged primed surfaces shall be touched up with an additional coat of the same primer for ferrous surfaces as herein before specified for shop painting. Spray paint all touch-up work.

B. Finish field painting is specified in Sections 09 9700 – Special Coatings, and 09 9100 – Painting.

3.03 CONCRETE WORK

A. Concrete for pan-filled stairs shall be placed, compacted, finished, and cured in accordance with applicable requirements of ACI 301.

B. Treads and landings shall receive a "troweled finish" in combination with a "nonslip finish" with "very flat" tolerances as specified in ACI 301 and ACI 117.

END OF SECTION

SECTION 05 5133 – METAL LADDERS

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish and install handrails in accordance with the Contract Documents.

B. Related Sections: Section 05 50 00 – Metal Fabrications.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 33 00 – Submittal Procedures.
   1. Detail fabrication and erection of each ladder indicated. Include plans, elevations, sections, and details of metal fabrications and their connections.
   2. Provide templates for anchors and bolts specified for installation under other Sections.
   3. Provide reaction loads for each hanger and bracket.

B. Qualification Data:
   1. Refer to Quality Assurance provisions for submittal requirements evidencing experience, certifications and resources.

1.03 QUALITY ASSURANCE

A. Manufacturer Qualifications: A firm experienced in producing aluminum metal ladders similar to those indicated for this Project.
   1. Record of successful in-service performance.
   2. Sufficient production capacity to produce required units.
   3. Professional engineering competent in design and structural analysis to fabricate ladders in compliance with industry standards and local codes.

B. Installer Qualifications: Competent and experienced firm capable of selecting fasteners and installing ladders to attain designed operational and structural performance.

C. Product Qualification: Product design shall comply with OSHA 1910.27 minimum standards for ladders.

1.04 PROJECT CONDITIONS

A. Field Measurements: Verify dimensions by field measurement before fabrication.
   1. Established Dimensions: Where field measurements cannot be made without delaying the Work, indicate established dimensions on shop drawing submittal and proceed with fabrication.

1.05 WARRANTY

A. Manufacturer has responsibility for an extended Corrective Period for work of this Section for a period of 5 years commencing on the shipment date of the product against all the conditions indicated below, and when notified in writing from Owner, manufacturer shall promptly and without inconvenience and cost to Owner correct said deficiencies.
   1. Defects in materials and workmanship.
   2. Deterioration of material and surface performance below minimum OSHA standards as certified by independent third party testing laboratory. Ordinary wear and tear, unusual abuse or neglect excepted.
   3. Within the warranty period, the manufacturer shall, at its option, repair, replace, or refund the purchase price of defective ladder.

B. Manufacturer shall be notified immediately of defective products, and be given a reasonable opportunity to inspect the goods prior to return. Manufacturer will not assume responsibility, or compensation, for unauthorized repairs or labor. Manufacturer makes no other warranty, expressed or implied, to the merchantability, fitness for a particular purpose, design, sale, installation, or use, of the ladder; and shall not be liable for incidental or consequential damages, losses of or expenses, resulting from the use of ladder products.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Okeeffe's, or equal.

2.02 LADDERS

A. Fixed and Cage Ladder Design:
   1. Safety cages are required on ladders over 24 feet
   2. Safety cages are required on all ladders in high or hazardous areas.
   3. Landing platforms are required at 50 feet above the bottom of the ladder.
   4. Rail and harness fall arrest system as alternate to safety cage and landing platforms shall be a permissible manufacturer's option.
      a. Fixed Ladder Bottom Bracket:
      b. Bottom floor supported bracket.
      c. Bottom wall supported bracket.
      d. Bracket as drawn.

B. Fixed Access Ladder:
   1. Heavy Duty Tubular Rail.
      a. Model 501 as manufactured by O'Keeffe's, or equal
   2. Tubular Rail Low Parapet Access Ladder with Roofover Rail Extension.
      a. Model 502 as manufactured by O'Keeffe's, or equal
   3. Tubular Rail Low Parapet Access Ladder with Platform and Return.
      a. Model 503 as manufactured by O'Keeffe's, or equal

C. Cage Ladder:
   1. Cage Ladder with Roof Hatch Rail Extension.
      a. Model 531 as manufactured by O'Keeffe's, or equal
   2. Cage Ladder with High Parapet Access, Platform and Return.
      a. Model 533 as manufactured by O'Keeffe's, or equal

D. Ship Ladder:
   1. Ships Ladder.
      a. Model 520 or 520A as manufactured by O'Keeffe's, or equal
   2. Ship Ladder with Platform.
      a. Model 521 or 521A as manufactured by O'Keeffe's, or equal
   3. Incline:
      a. 60 degree.
      b. 75 degree.
      c. As drawn.

2.03 FINISHES

A. Paint. Urethane over chemically pretreated substrate.
   1. Caution Yellow (RAL 1018).
   2. As scheduled on drawings.

2.04 MATERIALS

A. Aluminum Sheet: Alloy 5005-H34 to comply with ASTM B209.

B. Aluminum Extrusions: Alloy 6063-T6 to comply with ASTM B221.

2.05 FABRICATION

A. Rungs: Not less than 1-1/4 inches in section and 18–3/8 inches long, formed from tubular aluminum extrusions. Squared and deeply serrated on all sides.
   1. Rungs shall withstand a 1,500 pound load without deformation or failure.

B. Channel Side Rails: Not less than 1/8 inch wall thickness by 3 inches wide.

C. Heavy Duty Tubular Side Rails: Assembled from two interlocking aluminum extrusions no less than 1/8 inch wall thickness by 3 inches wide. Construction shall be self-locking stainless steel fasteners, full penetration TIG welds and clean, smooth and burr-free surfaces.

D. Ship Ladders: Not less than 1-1/4 inches high, 4-1/8 inches deep, and 2 feet wide; tread spacing shall be 1 foot on center. Handrails shall be aluminum pipe, not less than 1-1/2 inches in diameter with hemispheric end caps.

E. Walk-Through Rail and Roof Rail Extension: Not less than 3 feet 6 inches above the landing and shall be fitted with deeply serrated, square, tubular grab rails.

F. Landing Platform: 1-1/2 inches or greater diameter, tubular aluminum guardrails and decks of serrated aluminum treads.

G. Security Doors: Formed 1/8 inch thick aluminum sheet. Security panels shall extend on both sides, perpendicular to the door face, to within 2 inches of the wall. Security door shall be furnished with continuous aluminum piano hinge and heavy duty forged steel locking hasps.

H. Ship Ladder Seismic Bottom Support: Manufacturer’s standard; two isolation bearings per stringer.

I. Ladder Safety Post: Retractable hand hold and tie off.

J. Rail and Harness Fall Arrest System: Supplied where specified as alternate to safety cage and landing platforms, in accordance with OSHA regulation 1910.27; permanently mounted to ladder rungs and complete with necessary components.

K. Safety Cages:
   1. Fabricate ladder safety cages to comply with authority having jurisdiction. Assemble by welding. Spacing of primary hoops, secondary hoops and vertical bars shall not exceed that required by code.
   2. Safety cage hoops and vertical bars: 3/16 inch by 2 inches aluminum bar.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Coordinate anchorages. Furnish setting drawings, templates, and anchorage structural loads for fastener resistance.

B. Do not begin installation until supporting structure is complete and ladder installation will not interfere with supporting structure work.

C. If supporting structure is the responsibility of another installer, notify Architect of unsatisfactory supporting work before proceeding.

3.02 INSTALLATION

A. Install in accordance with manufacturer's instructions, and in proper relationship with adjacent construction.

3.03 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 05 5213 – PIPE AND TUBE RAILINGS

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish and install handrails in accordance with these Specifications and Contract Documents.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Rolled Plates and Shapes: ASTM A36

B. Steel Pipe: ASTM A53, Grade B, Type E or S, Schedule 40 unless otherwise noted.

C. Tubing: Cold formed shapes per ASTM A500 or hot-formed shapes per ASTM A501. Wall thickness for either category shall be in accordance with the thickness and tolerances specified in ASTM A501.

D. Bolts: ASTM A307, Grade A, with hexagon heads or nuts where exposed in the finish work, with flat heads for countersinking where flush bolting is specified or required.

E. Plastic Cover: Polyethylene Thermoplastic (HDPE) tubes having ultra-violet resistance and anti-static properties, nominal thickness 0.250 inches. Color shall be OSHA yellow unless otherwise noted. Size covers for pipe diameters.

F. Grout: Non-shrink, nonmetallic type per CE CRD-621 and ASTM C1107. Grout shall be premixed and factory-packaged. Formulation shall be non-staining, noncorrosive, nongaseous properties. Provide grout as recommended by grout manufacturer for interior or exterior application.

G. Anchor Bolts:
   1. Expansion Anchors: Threaded stud type with two independent expansion anchor wedges per Fed. Spec. FF-S-325, Group II, Type 4, Class 1 for concrete expansion anchors. Stud, wedges, washer, and nut shall be zinc-plated steel.
   2. Adhesive Anchor System: Self-contained glass vial containing pre-measured amounts of quartz sand, hardening agent, and polyester resin. Studs shall be threaded rod conforming to ASTM A307 with compatible washers and hexagon nuts furnished by the anchor manufacturer.

H. Concrete: Provide 3,000 psi, 28-day strength concrete unless noted otherwise. ASTM C94, slump of 4 inches ± 1 percent.
   1. Exterior Concrete: Include air-entrainment or 6 percent ± 1 percent.
   2. Cement: ASTM C150, Type 1.
   3. Aggregates: ASTM C33 normal weight, natural coarse aggregate, maximum ¾" diameter.
   4. Water: Potable

2.02 HAND RAIL SYSTEM

A. Structural Performance of Handrails and Railings: Provide handrails and railings capable of withstanding the following structural loads based on 2000 international building code, without exceeding allowable design working stresses of materials for handrails, railings anchors, and connections:
   1. Top Rail of Guards and hand rails: Capable of withstanding the following loads as indicated
      a. Concentrated load of 200 lbf (890 N) applied at any point and in any direction.
      b. Uniform load of 50 lbf/ft: (730 N/m) applied in any direction at the top and to transfer this load through the supports to the structure.
      c. Concentrated and uniform loads above need not be assumed to act concurrently.
   2. Intermediate rails, balusters, and filler panels: Capable of withstanding the following loads applied as indicated:
      a. Applied normal load of 50 pounds (0.22kN) on an area not to exceed 1 square foot including openings and space between rails.
      b. Reactions due to this loading are not required to be superimposed with the proceeding section.

B. Provide Handrail system complying with the following requirements
   1. Sleek system with internal connectors.
      a. Rails and Posts
         1) Extruded Aluminum Pipe ASTM B429, Aluminum alloy 6061-T6. Finish AA M10C22A41. Posts – 1 ½ inch IPS Schedule 80. Rails – 1 ½ inch IPS Schedule 40.
         2) Steel pipe scheduled 40. Posts and rails 1 ¼ inch, with high-density polyethylene thermoplastic coating, nominally 0.125 inch thick.
      b. Mechanical Connectors
         1) Post and handrail connector fittings
         2) Machined from solid aluminum bar stock of alloy 6063-T6 (ASTM B221) or austenitic stainless steel bar stock of alloy 303 (ASTM A582) or machined castings of high tensile aluminum-magnesium alloy 535.0 (ASTM B26) or castings from high purity ingot 535.2 (ASTM B179)
         3) Anodize finish 0.7 mil minimum thickness.
         4) Design – Fittings shall be the type which fastens externally with anodized aluminum, tubular rivet nut with socket head cap screw and stainless steel lock washer. Internal connections by means of an internal double tang, expanded by an internal/external, reverse knurl, cup point, hexagon socket set screw.
      c. Flanges
         1) Sand cast from high tensile aluminum-magnesium alloy 535.0
         2) Supplied with anodize finish – 7-mil minimum thickness.
         3) Design – Fittings shall be the type, which fastens directly to the pipe by means of an internal/external, reverse knurl, cup point, hexagon socket set screw.
         4) All anchoring hardware shall be 300 series stainless steel.
      d. Fasteners
         1) All fasteners to be 302 or 304 stainless steel.

PART 3 - EXECUTION

3.01 INSTALLATION

C. CONTRACTOR shall provide submittals in accordance with Section 01 33 00 -Submittal Procedures showing the layout of the railing where called out in the Contract Documents.

D. Submittal shall indicate where railing shall be cored or plate mounted.

E. Provide 1-inch minimum bearing with maximum erection clearance of ¼-inch all around.

F. Protect all surfaces to be in contact with concrete or dissimilar metals with two (2) coats of Federal Specification TT-V-51F Asphalt Varnish.

END OF SECTION

SECTION 05 5300 – METAL GRATINGS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install metal bar grating (solid top or open) were shown on the Drawings and in accordance with the Contract Documents.

1.02 REFERENCES

A. Design, fabrication, and installation of grating shall be in accordance with Standard Specifications and Voluntary Code of Practice in Metal Bar Grating Manual, 1979 Edition, published by National Association of Architectural Metal Manufacturers, Chicago, IL (ANSI A-202.1).

B. ASTM B210

C. ASTM B221

D. Federal Specification TT-V-51F

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

PART 2 – PRODUCTS

2.01 DESIGN CRITERIA

A. Support minimum uniform live load of 250 psf

B. Deflection not to exceed span of bearing bars (in inches) divided by 240

C. Maximum Fiber Stress: 12,000 psi

2.02 BASIC DESIGN

A. The gratings shall be 2½-inch metal that shall fit into the area shown on the mechanical plan.

B. The gratings shall be secured in place by at least four (4) acceptable removable-type fasteners per grating panel. The ends of each grating section shall be banded with bearing bars.

C. All openings for fixtures or pipes, which require the cutting of three main bars or more, shall be finished in a similar manner as the ends.

D. Gratings in concrete shall have coated aluminum or reinforced fiberglass angle frames with mitered corners and with welded joints ground smooth where exposed. The frames shall have welded anchors and shall be set in the concrete as it is placed.

E. Bearing and cross bars shall be flush at surface.

F. All free and supported bar ends around perimeter and around cutouts shall be banded.

G. Provide removable sections of grating with suitable end bearing where noted on the Drawings or otherwise required.

2.03 MATERIAL

A. Bear Bars: ASTM B221, 6061-T6 or 6063-T6, aluminum

B. Cross Bars: ASTM B221 (extruded) or ASTM B210 (drawn) aluminum

C. Steel Fasteners: Stainless steel, when used with aluminum grating

D. Finish: Aluminum mill finish (as fabricated)

E. Anchors: Stainless Steel Saddle clips of manufacturer's standard design

PART 3 – EXECUTION

3.01 INSTALLATION

A. CONTRACTOR shall provide submittals in accordance with Section 01 33 00 -Submittal Procedures showing the layout of the grating where grating is called out in the Contract Documents:

B. Grating shall be set with full and uniform end bearing to preclude rocking; do not use wedges or shims.

C. Provide 1-inch minimum bearing with maximum erection clearance of ¼-inch all around.

D. Anchor grating with saddle clips in accordance with manufacturer's recommendations or as detailed on the Drawings.

E. Provide cutouts for the passage of pipe, valve and equipment operators, conduit, stems and similar work; cutouts for circular obstructions shall be at least 2 inches larger in diameter than the obstruction.

F. Protect all surfaces of angles and frames to be in contact with concrete or dissimilar metals with two (2) coats of Federal Specification TT-V-51F Asphalt Varnish.

END OF SECTION

SECTION 05 5410 – SAFETY HATCHES

PART 1 -- GENERAL

1.01 THE REQUIREMENT

A. Furnish and install safety hatches in accordance with the Contract Documents.

B. The safety hatches shall be designed to combine covering of the opening, fall through protection per OSHA standard 1910.23 and controlled confine space entry per OSHA standard 1910.146.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

1.03 QUALITY ASSURANCE

A. Warranty: A ten-year warranty protects against defects in materials and workmanship from the date of purchase. Any part that fails in normal use will be furnished at no charge. The warranty is invalid if product is modified, changed, damaged, improperly installed or used in an application for which it is not designed.

PART 2 -- PRODUCTS

2.01 MANUFACTURERS

A. Safety hatch manufacturer shall be:
1. EJ
2. Bilco
3. ENGINEER-approved equal.

2.02 EQUIPMENT

A. Hatches shall be rated for 300 PSF (Pedestrian Rated) at a minimum, unless noted otherwise.

B. Where noted in the Contract Documents, heavy duty H20 traffic rated hatches shall be rated for AASHTO H-20 wheel loads where not subject to high-density traffic. Deflection shall not exceed 1/150th of the span. AASHTO. H-20 requirements dictate a 16,000-lb. load, on a single contact area of 10” x 20”.

C. Where noted in the Contract Documents, extra heavy duty “H30” traffic rated hatches shall have load capacity meeting a proof load of 24,000 lbs. applied to a 9” x 9” contact area. Units not conforming to Proof Load requirement will not be accepted as equal.

D. Each door shall be equipped with a stainless steel hold open arm. Door shall lock open in the 90-degree position. Hold open arm shall be fastened to the frame with a ½-inch grade 316 stainless steel bolt.

E. Covers to be lift assisted must comprise a two piece stainless steel inner and outer tube housing a stainless steel mechanical spring. Covers to rest open at 105˚. H-20 and H-30 rated hatches shall be provided with lift assist mechanism.

F. Angle frame shall be of extruded aluminum with a continuous 1½-inch anchor flange. H-30 frame shall be ductile iron. Exterior of frame (in contact with concrete) shall be supplied with a 3 mil thickness of “Tufcoat 3.5PR” Industrial Coating by Dupont. Application procedure shall be as recommended by Dupont. Isolation coatings shall not be substituted.

G. Hinges shall be of heavy-duty design. Material shall be grade 316 stainless steel. Each hinge shall have a 3/8-inch grade 316 stainless steel pin. Hinges shall be bolted to the

angle frame and diamond plate, with grade 316 stainless steel bolts and ny-lock nuts. Aluminum hinges, or stainless steel hinges not utilizing a 3/8" stainless steel pin shall not be considered equal. Dimensions and quantities for each hatch are provided in the construction plans.

H. Each hatch shall be supplied with a grade 316 stainless steel slam lock, with keyway protected by a threaded aluminum plug. Plug shall be flush with the top of the ¼-inch diamond plate. Slam lock shall be fastened with four grade 316 stainless steel bolts and washers. Slamlocks that fasten with only two grade 316 stainless steel bolts and washers shall not be accepted. Any hinges or cut outs in hatch will be shown in the construction plans.

I. Each hatch shall be equipped with a stainless steel lift handle. The lift handle shall be flush with the top of the ¼-inch diamond plate.

J. The safety grate shall be made of 6061-T6 aluminum and designed per the most current and published edition of "Specifications for Aluminum Structures," by the Aluminum Association, Inc., for "Bridge Type Structures.

K. Where noted in the Contract Documents, for heavy duty hatches, grating shall be designed to withstand an H-20 or H-30 wheel load per AASHTO specifications. Safety Hatch type systems that utilize the H-20/H-30 reinforcement on the cover, and supplied with a 300 PSF (pedestrian rated) grate, as well as a safety net system shall not be acceptable.

L. Grate openings shall allow for visual inspection, limited maintenance, and float adjustments while the safety grate fall through protection is left in place.

M. Design must assure that the fall through protection is in place before the doors can be closed, thereby protecting the next operator.

N. Each grate shall be provided with a separate hold open arm, which will lock the grate in the 90-degree position once opened.

O. Each grate supplied with a locking device (for owner's padlock) that will prevent unauthorized entry to the confined space. The grating system will allow anyone to make visual inspection and float adjustments without entering the confined space.

P. Grate shall be coated with an OSHA type safety orange color, promoting visual awareness of the hazard. The aluminum safety grates shall receive a two-coat powder coat system, applied by the electrostatic spray process. The base coat is a thermosetting epoxy powder coat finish with a minimum thickness of 2 - 4 mils. The top coat is a mar-resistant, TGIC polyester powder coating with a minimum thickness of 2 - 4 mils. Each coat shall be baked at 350°F - 375°F until cured.

Q. Welding shall be in accordance with ANSI/AWS D1.2-90 Structural Welding Code for Aluminum.

2.03 MATERIAL SPECIFICATIONS

A. Aluminum material shall be 6061-T6 aluminum for bars, angles, and extrusions ¼-inch diamond plate shall be 5086 aluminum.

B. H-30 frame and cover shall be manufactured from ductile iron conforming to the requirements of ASTM-A536, and AASHTO M105 and M306. Gray Iron/Gray Cast Iron shall not be accepted as equal.

PART 3 – EXECUTION (NOT USED)

END OF SECTION

SECTION 06 1000 – ROUGH CARPENTRY

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install rough carpentry in accordance with the Contract Documents.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Furnish the ENGINEER with a certificate of inspection from the mill supplying dimension lumber stating that the lumber conforms to the graded specified according to standards set by the WWPA. Each piece of lumber shall have an approved WWPA grade identification stamp as identified in the most recently revised and published Grading Rules for Western Lumber. Regardless of grade stamp or certification, each piece of lumber in place in the structure shall be of the original grade specified or better; grade loss resulting from weathering, handling, storage, resaving, or dividing length, may be cause for rejection.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Carefully store all lumber delivered to the site off the ground in a manner to assure proper drainage, ventilation, and protection from the weather.

B. General:

1. Lumber: For each use, comply with the “American Softwood Lumber Standard” PS 20 by the U.S. Department of Commerce. Nominal sizes are shown or specified; provide actual sizes complying with the minimum size requirements of PS 20 for the moisture content specified for each use. All lumber to be S-Dry.
2. Plywood: Comply for each use, with the requirements of the U.S. Product Standard PS 1 for “Softwood Plywood/Construction and Industrial,” except as otherwise specified herein. Provide plywood of any PS 1 species classification group, except where particular species is shown or specified or where PS 1 limits groups for particular grade specified.

C. Coordination:

1. Obtain measurements and verify dimensions shown and shop drawing detail before proceeding with carpentry work whenever possible.
2. Correlate location of furring, nailers, blocking, grounds and similar supports so that attached work will comply with design requirements.
3. Fit carpentry work to other work. Scribe and cope as required for accurate fit.
4. Time delivery and installation of carpentry work to avoid delaying other trades whose work is dependent on or affected by the carpentry work and to comply with protection and storage requirements.
5. Examine all parts of the supporting structure and the conditions under which the carpentry work is to be installed, and notify the Architect in writing of any conditions detrimental to the proper and timely completion of the work.
6. Keep carpentry materials dry during delivery. Store lumber and plywood in stacks. Protect bottom of stacks against contact with damp or wet surfaces. Protect exposed materials against weather.
7. Do not store dressed or treated lumber or plywood outdoors.
8. Store materials for which maximum moisture content is specified only in areas where relative humidity has been reduced to a level where specified moisture content can be maintained.

PART 2 – PRODUCTS

2.01 MATERIAL

A. Framing Lumber: All framing lumber shall be of a grade and species per General Structural Notes.

B. Miscellaneous Lumber:
   1. Provide wood for support or attachment of other work such as cant strips, bucks, nailers, blocking, furring, grounds, stripping and similar members. Provide lumber of the sizes shown or specified, worked to shapes shown, and as follows:
   2. Moisture Content: 19% maximum for all lumber items not specified to receive wood preservatives treatment.
   3. Grade: Construction grade light framing size lumber of any species or board size lumber, as required. Provide construction grade boards (WCLIB) or No. 2 boards (WWPA).
   4. Concealed plywood interior standard grade, interior type.
   5. Backing panels for electrical or telephone equipment standard grade interior type plywood with exterior glue.

C. Anchorage and Fastening Materials: Select proper type, size, materials, and finish for each application. Comply with the following:
   1. Nails and staples: FS FF-N-105
   2. Wood Screws: ANSI B.18.6.1
   3. Bolts, hexagon and square: ANSI B.18.2.1
   4. Bolts, round head: ANSI B.18.5
   5. Nuts: FS FF-N-836
   6. Washers: FS FF-W-92
   7. Lag Screws or Lag Bolts: FS FF B-561
   8. Expansion Shields, Expansion Nails and Drive Screw Devices: FS FF-B-561
   9. Toggle Bolts: FS FF-B-588
   10. Bar or Strap Anchors: ASTM A625 zinc coated steel, 18-gauge minimum
   11. Metal Framing Connectors: Teco, Simpson or Kant Sag

D. Wood Preservative Treatment:
   1. Treat wood, including lumber and plywood, as specified herein to be treated, to comply with the applicable requirements of the AWPI.
   2. Pressure treat the following items with water borne preservatives for above-ground use, complying with the AWPB LP2:
   3. Wood cants, nailers, blocking stripping and similar members in connection with roofing, flashing, vapor barriers and waterproofing (except plywood sheathing).
   4. Wood sills, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete or below grade. Foundation Grade redwood, grade marked, is acceptable for wood sills in lieu of treated lumber.

E. Fire Retardant Treatment: For all wood members (required by code) (noted) as fire retardant treated provide pressure impregnation with Dricon fire retardant chemicals in accordance with the recommendations and quality control of Koppers Co., Inc., or ENGINEER-approved equal to provide a UL FRS Fire Hazard Classification. All wood shall be identified with a UL label certifying this classification and the FM diamond.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Use only sound, thoroughly seasoned, well manufactured materials of the longest practical lengths and sizes to minimize jointing.

B. Securely attach carpentry work to substrates by anchoring and fastening as shown and as required by recognized standards. Provide washers under bolt heads and nuts in contact with wood.

C. Nail plywood to comply with APA Recommendations.

D. Set carpentry work accurately to required levels and lines with members plumb and true and accurately cut and fitted.

E. Shim with metal or slate for full bearing on concrete or masonry substrates.

F. Attachment and Anchorage: Use common wire nails, except as otherwise shown or specified herein. Do not wax or lubricate fasteners that depend on friction for holding power. Select fasteners of size that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; pre-drill as required. Do not drive threaded friction type fasteners; turn into place. Tighten bolts and lag screws at installation and retighten as required for tight connections prior to closing in or at completion of work.

3.02 WOOD FRAMING INSTALLATION

A. All framing 16-inch o.c. unless otherwise noted.

B. Cut framing square on bearings, closely fit, accurately set to required lines and levels. Secure rigidly in place at bearings and connections. Do not use shims for leveling on wood or metal bearings. Use steel shims with full bearing on masonry or concrete substrates.

C. Anchor sole plates with ½-inch diameter anchor bolts at 48 inches and 72 inches o.c. embedded at least 7 inches into the concrete or reinforced masonry or 15 inches into unreinforced grouted masonry. There shall be a minimum of two (2) bolts per piece with one (1) bolt located within 12 inches of each end of each piece.

D. Frame members for passage of pipes and ducts to avoid cutting structural members. Do not cut, notch, or bore framing members for passage of pipes or conduits without Architect's permission. Reinforce framing members as directed where damaged by cutting. Provide Simpson NS nail stoppers over utilities that penetrate framing members, nailing with 8d nails.

E. Keep framing 2 inches away from chimneys, 4 inches from fireplace back walls. Firestop concealed spaces in framing not shut off by framing members. Use 2-inch-thick accurately fitted wood blocking to fill opening.

F. Joists and beams to be sizes and spacing as indicated. Set crown edge up with 3½ - ½-inch bearing unless otherwise noted. Toe nail joists to wood sills with nails both sides or with metal connectors. Lap and spike joists over supports. Double joists under all partitions. Double joists and rafters to form headers and trimmers at openings over 4 feet and support with metal joist hangers. Provide 3-inch firecut bevel where built into masonry. Provide blocking or suitable edge support between members as necessary to support edges of sheathing or sub-flooring.

G. Cross bridging is required at joists. Bridging to be 1-inch x 3-inch strips, beveled ends, double crossed, secured with 2 - 8d nails each and nailing bottom ends after sub-flooring is installed. Provide one row at spans to 10 feet, 2 rows at spans of 10 feet to 20 feet. Metal bridging such as Simpson NC is acceptable.

H. All studs 2-inch x 4-inch unless otherwise indicated. Provide double cap plates with joints staggered. Double studs at openings and triple at corners and intersections. Double headers with double trimmers over openings. Set studs directly over joists where possible. Provide blocking and backing as necessary. Provide mid-height blocking at all studs.

I. Provide corner bracing of 1-inch x 4-inch let into studs at exterior walls at close to 45-degree angle. Simpson (WB) (CWB) wall bracing may be used in lieu of wood corner bracing.

3.03 WOOD GROUNDS, NAILERS AND BLOCKING

A. Provide wherever shown and where required for screeding or attachment of other work. Form to shapes as shown and cut as required for true line and level of work to be attached.

B. Coordinate location with other work involved; refer to shop drawings of such work.

C. Attach to substrates securely with anchor bolts and other attachment devices as shown and as required to support applied loading. Countersink bolts and nuts flush with surfaces, unless otherwise shown.

D. Set true to line and level, plumb, with intersections true to required angle. Build into masonry as work progresses, cutting to fit masonry unit size involved. Anchor to formwork before concrete placement.

E. Provide grounds of dressed, preservative treated, key-beveled lumber not less than 1 to 1½-inch wide and of the thickness required to bring face of ground to exact thickness to finish material involved. Remove temporary grounds when no longer required.

3.04 WOOD FURRING

A. Install plumb and level with closure strips at all edges and openings. Shim with wood as required.

END OF SECTION

SECTION 07 2100 – THERMAL INSULATION

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Board insulation and integral vapor retarder at cavity wall construction, perimeter foundation wall, underside of floor slabs, over roof deck, over roof sheathing, and exterior wall.

B. Batt insulation and vapor retarder in exterior wall, ceiling, and roof construction.

C. Batt insulation for filling perimeter window and door shim spaces and crevices in exterior wall and roof.

1.02 REFERENCE STANDARDS

ASTM C240	Testing Cellular Glass Insulation Block
ASTM C518	Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus
ASTM C552	Cellular Glass Thermal Insulation
ASTM C578	Rigid, Cellular Polystyrene Thermal Insulation
ASTM C612	Mineral Fiber Block and Board Thermal Insulation
ASTM C665	Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing
ASTM C1289	Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board
ASTM E84	Surface Burning Characteristics of Building Materials
ASTM E96/E96M	Water Vapor Transmission of Materials
ASTM E136	Behavior of Materials in a Vertical Tube Furnace At 750°C
ASTM E2357	Determining Air Leakage of Air Barrier Assemblies
FM DS 1-28	Wind Design; Factory Mutual Research Corporation
NFPA 285	Evaluation of Fire Propagation Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing Combustible Components

1.03 SUBMITTALS

A. See Section 01 3300 – Submittal Procedures, for submittal procedures.

B. Product Data: Provide data on product characteristics, performance criteria, and product limitations.

C. Manufacturer's Installation Instructions: Include information on special environmental conditions required for installation and installation techniques.

D. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.04 FIELD CONDITIONS

A. Do not install insulation adhesives when temperature or weather conditions are detrimental to successful installation.

PART 2 - PRODUCTS

2.01 APPLICATIONS

A. Insulation Under Concrete Slabs: Extruded polystyrene board.

B. Insulation at Perimeter of Foundation: Expanded polystyrene board.

C. Insulation Inside Masonry Cavity Walls: Extruded polystyrene board.

D. Insulation Inside Prefabricated Wall Panels: Extruded polystyrene board.

E. Insulation Over Metal Stud Framed Walls, Continuous: Extruded polystyrene board.

F. Insulation on Inside of Concrete and Masonry Exterior Walls: Fiber board.

G. Insulation in Metal Framed Walls: Batt insulation with integral vapor retarder.

H. Insulation in Wood Framed Walls: Batt insulation with separate vapor retarder.

I. Insulation in Wood Framed Ceiling Structure: Batt insulation with separate vapor retarder.

J. Insulation Above Lay-In Acoustical Ceilings: Batt insulation with no vapor retarder.

K. Insulation Over Roof Deck: Polyisocyanurate board.

2.02 FOAM BOARD INSULATION MATERIALS

A. Expanded Polystyrene (EPS) Board Insulation: ASTM C578, Type XI; with the following characteristics:
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior wall assembly when tested in accordance with NFPA 285.
   4. Board Size: 48 x 96 inch.
   5. Board Thickness: 1-1/2 inches.
   6. Board Edges: Square.
   7. Water Absorption: 4 percent by volume, maximum.
   8. Board Density: 0.7 lb./cu ft.
   9. Compressive Resistance: 5 psi.
   10. Thermal Resistance: R-value of 3.1 per 1 inch at 75°F mean temperature.
   11. Manufacturers:
      a. AFM Corp
      b. Diversifoam Products
      c. Or ENGINEER-approved equal.

B. Termite-Resistant Expanded Polystyrene (EPS) Board Insulation: Complies with ASTM C578 with the following characteristics:
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Board Size: 48 x 96 inches.
   4. Board Thickness: 2-1/2 inches.
   5. Thermal Resistance: R-value of 11, for overall thickness indicated.
   6. Board Edges: Square.
   7. Manufacturers:
      a. Nisus Corporation; Bora Foam
      b. Or ENGINEER-approved equal.

C. Extruded Polystyrene (XPS) Board Insulation: ASTM C578, Type XII; extruded polystyrene board with either natural skin or cut cell surfaces; with the following characteristics:
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior wall assembly when tested in accordance with NFPA 285.
   4. Board Size: 48 x 96 inches.
   5. Board Thickness: 1-1/2 inches.
   6. Board Edges: Square.
   7. Thermal Resistance: R-value of 4.6 per 1 inch at 75°F mean temperature.
   8. Compressive Resistance: 15 psi.
   9. Board Density: 1.20 lb./cu ft.
   10. Water Absorption: 0.3 percent by volume, maximum.
   11. Manufacturers:
      a. Dow Chemical Co: www.dow.com.
      b. Pactiv Building Products: greenguard.pactiv.com.
      c. Or ENGINEER-approved equal.

D. Polyisocyanurate Board Insulation with Facers Both Sides: Rigid cellular foam, complying with ASTM C1289; Type I, aluminum foil both faces; Class 1, non-reinforced foam core.
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior wall assembly when tested in accordance with NFPA 285.
   4. Compressive Strength: 16 psi
   5. Board Size: 48 x 96 inches.
   6. Board Thickness: 1 inch.
   7. Board Edges: Square.
   8. Manufacturers:
      a. Carlisle Coatings & Waterproofing, Inc; R2+ Matte
      b. Dow Chemical Co
      c. GAF
      d. Hunter Panels, LLC; H-Shield
      e. Hunter Panels, LLC; Xci Class A Foil
      f. Johns Manville; AP Foil-Faced
      g. Rmax Inc.; ECOMAXci
      h. Or ENGINEER-approved equal.

E. Composite Polyisocyanurate Board Insulation Faced with Plywood: Rigid cellular foam, complying with ASTM C1289; Type V, fire-retardant-treated plywood one face, glass fiber mat facer one face, Class 3.
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior wall assembly when tested in accordance with NFPA 285.
   4. Compressive Strength: 25 psi
   5. Board Size: 48 x 96 inches.
   6. Plywood Thickness: 5/8-inch.

7. Insulation Board Thickness: 3 inches.
8. Thermal Resistance: R-value of 19.1.
9. Board Edges: Square.
10. Manufacturers:
    a. Hunter Panels, LLC; Xci Ply
    b. Or ENGINEER-approved equal.

F. Composite Ventilated Polyisocyanurate Board Insulation with Wood Spacers and Oriented Strand Board (OSB) or Plywood: Rigid cellular foam with 1-inch wood spacers between foam and OSB or plywood; complying with ASTM C1289, Type II.
1. Top Layer Material: 7/16-inch (11 mm) oriented strand board (OSB).
2. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior assembly when tested in accordance with NFPA 285.
3. Compressive Strength: 20 psi
4. Board Size: 48 x 96 inches.
5. Composite Insulation Board Thickness: 6.0 inch.
6. Thermal Resistance: R-value of 28.1.
7. Board Edges: Square.
8. Manufacturers:
    a. Hunter Panels, LLC; Cool-Vent
    b. Or ENGINEER-approved equal.

G. Composite Polyisocyanurate Board Insulation Faced with Oriented Strand Board (OSB) or Plywood: Rigid cellular foam, complying with ASTM C1289; Type V, oriented strand board (OSB) one face, glass fiber mat face one side, Grade 2.
1. Top Layer Material: 7/16-inch (11 mm) oriented strand board (OSB).
2. Complies with fire-resistance requirements shown on the drawings as part of an exterior non-load-bearing exterior wall assembly when tested in accordance with NFPA 285.
3. Compressive Strength: 20 psi
4. Board Size: 48 x 96 inches nominal.
5. Composite Insulation Board Thickness: 4.5 inch.
6. Thermal Resistance: R-value of 25.6.
7. Board Edges: Square.
8. Manufacturers:
    a. Hunter Panels, LLC; H-Shield NB
    b. Or ENGINEER-approved equal.

H. Cellular Glass Board Insulation: ASTM C552, Type IV; cellular glass board, with the following characteristics:
1. Flame Spread Index: 5 or less, when tested in accordance with ASTM E84.
2. Smoke Developed Index: 0, when tested in accordance with ASTM E84.
3. Board Size: 18 x 24 inches
4. Board Thickness: 2 inches
5. Board Edges: Square.
6. Apparent Thermal Conductivity; K value at 0°F: 0.27.
7. Compressive Strength: Minimum 60 psi.
8. Water Absorption: In accordance with ASTM C240, 0.5 percent by volume maximum.
9. Facing: Factory applied skin of aluminum foil on both faces.

2.03 FIBER BOARD INSULATION MATERIALS

A. Where fiber board insulation is indicated, either glass fiber or mineral fiber board insulation may be used, at Contractor's option.

B. Glass Fiber Board Insulation: Rigid glass fiber, ASTM C612.
   1. Facing: None, unfaced.
   2. Flame Spread Index: 25 or less, when tested with facing, if any, in accordance with ASTM E84.
   3. Smoke Developed Index: 50 or less, when tested with facing, if any, in accordance with ASTM E84.
   4. Board Size: 48 x 48 inches
   5. Board Thickness: 1 inch.
   6. Board Edges: Square.
   7. Thermal Conductivity (k factor): 0.26.
   8. Maximum Density: 8.0 lb/cu ft.
   9. Combustibility: Except for facing, if any, non-combustible when tested in accordance with ASTM E136.
   10. Manufacturers:
      a. CertainTeed Corporation
      b. Johns Manville Corporation
      c. Owens Corning Corp
      d. Or ENGINEER-approved equal.

C. Mineral Fiber Board Insulation: Rigid or semi-rigid mineral fiber, ASTM C612 or C553; unfaced flame spread index of 0 (zero) when tested in accordance with ASTM E84.
   1. Where indicated, provide foil facing on one side; with flame spread index of 25 or less, when tested in accordance with ASTM E84.
   2. Where indicated, provide fiberglass reinforced polypropylene facing on one side; with flame spread index of 25 or less, when tested in accordance with ASTM E84.
   3. Where indicated, provide black, non-woven fiberglass facing on one side; with flame spread index of 25 or less, when tested in accordance with ASTM E84.
   4. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   5. Board Size: 24 by 48 inches.
   6. Board Thickness: 1 inch.
   7. Thermal Resistance (R-value): 4.2°F sq ft/Btu at 75°F, minimum, when tested according to ASTM C518.
   8. Maximum Density: 8.0 lb/cu ft.
   9. Manufacturers:
      a. Johns Manville International, Inc.; MinWool Safing
      b. Thermafiber, Inc
      c. ROXUL, Inc; CavityRock DD
      d. Or ENGINEER-approved equal.

2.04 BATT INSULATION MATERIALS

A. Where batt insulation is indicated, either glass fiber or mineral fiber batt insulation may be used, at Contractor's option.

B. Glass Fiber Batt Insulation: Flexible preformed batt or blanket, complying with ASTM C665; friction fit.
   1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
   2. Smoke Developed Index: 450 or less, when tested in accordance with ASTM E84.
   3. Combustibility: Non-combustible, when tested in accordance with ASTM E136, except for facing, if any.

4. Formaldehyde Content: Zero.
5. Thermal Resistance: per plan
6. Thickness: per plan
7. Facing: Aluminum foil, flame spread 25 rated; one side.
8. Facing: Aluminum foil, one side.
9. Manufacturers:
    a. CertainTeed Corporation
    b. Johns Manville Corporation
    c. Owens Corning Corp
    d. Or ENGINEER-approved equal.

C. Mineral Fiber Batt Insulation: Flexible or semi-rigid preformed batt or blanket, complying with ASTM C665; friction fit; unfaced flame spread index of 0 (zero) when tested in accordance with ASTM E84.
1. Where indicated, provide foil facing on one side; with flame spread index of 25 or less, when tested in accordance with ASTM E84.
2. Smoke Developed Index: 0 (zero), when tested in accordance with ASTM E84.
3. Thermal Resistance: per plan
4. Thickness: per plan
5. Manufacturers:
    a. Johns Manville International, Inc.; MinWool Sound Attenuation Fire Batts
    b. Thermafiber, Inc
    c. ROXUL, Inc; ComfortBatt
    d. ROXUL, Inc; Roxul AFB
    e. Or ENGINEER-approved equal.

2.05 ACCESSORIES

A. Sheet Vapor Retarder: Black polyethylene film for above grade application, 10 mil thick.

B. Tape: Bright aluminum self-adhering type, mesh reinforced, 2 inches wide.

C. Tape joints of rigid insulation in accordance with roofing and insulation manufacturers' instructions.

D. Insulation Fasteners: Impaling clip of unfinished steel with washer retainer and clips, to be adhered to surface to receive insulation, length to suit insulation thickness and substrate, capable of securely and rigidly fastening insulation in place.

E. Insulation Fasteners: Appropriate for purpose intended and approved by roofing manufacturer.
1. Length as required for thickness of insulation material and penetration of deck substrate, with metal washers.

F. Nails or Staples: Steel wire; electroplated or galvanized; type and size to suit application.

G. Wire Mesh: Galvanized steel, hexagonal wire mesh.

H. Protection Board for Below Grade Insulation: Cementitious, ¼-inch thick.

I. Adhesive: Type recommended by insulation manufacturer for application.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that substrate, adjacent materials, and insulation materials are dry and that substrates are ready to receive insulation and adhesive.

B. Verify substrate surfaces are flat, free of honeycomb, fins, irregularities, or materials or substances that may impede adhesive bond.

3.02 BOARD INSTALLATION AT FOUNDATION PERIMETER

A. Adhere a 6-inch-wide strip of polyethylene sheet over construction, control, and expansion joints with double beads of adhesive each side of joint.
   1. Tape seal joints.
   2. Extend sheet full height of joint.

B. Apply adhesive to back of boards:
   1. Three continuous beads per board length.
   2. Full bed 1/8-inch thick.

C. Install boards horizontally on foundation perimeter.
   1. Place boards to maximize adhesive contact.
   2. Install in running bond pattern.
   3. Butt edges and ends tightly to adjacent boards and to protrusions.

D. Extend boards over expansion joints, unbonded to foundation on one side of joint.

E. Cut and fit insulation tightly to protrusions or interruptions to the insulation plane.

F. Immediately following application of board insulation, place protective boards over exposed insulation surfaces.
   1. Apply adhesive in five continuous beads per board length.
   2. Install boards horizontally from base of foundation to top of insulation.
   3. Butt boards tightly, with joints staggered from insulation joints.

3.03 BOARD INSTALLATION AT EXTERIOR WALLS

A. Adhere a 6-inch-wide strip of polyethylene sheet over expansion joints with double beads of adhesive each side of joint.
   1. Tape seal joints between sheets.
   2. Extend sheet full height of joint.

B. Apply adhesive to back of boards:
   1. Three continuous beads per board length.
   2. Full bed 1/8-inch thick.

C. Install rigid insulation directly to steel studs or exterior grade sheathing at 16 inches on center with manufacturer recommended mechanical fasteners. Tape all joints with manufacturer's minimum 4-inch-wide sealant tape; comply with ASTM E2357.

D. Install boards horizontally on walls.
   1. Place boards to maximize adhesive contact.
   2. Install in running bond pattern.
   3. Butt edges and ends tightly to adjacent boards and to protrusions.

E. Extend boards over expansion joints, unbonded to wall on one side of joint.

F. Cut and fit insulation tightly to protrusions or interruptions to the insulation plane.

G. Place 6-inch-wide polyethylene sheet at perimeter of wall openings, from adhesive vapor retarder bed to window and door frames. Tape seal in place to ensure continuity of vapor retarder and air seal.

H. Tape insulation board joints.

3.04 BOARD INSTALLATION AT CAVITY WALLS

A. Secure impale fasteners to substrate at a frequency as follows:

1. 6 per insulation board.

B. Adhere a 6-inch-wide strip of polyethylene sheet over expansion joints with double beads of adhesive each side of joint.
   1. Tape seal joints between sheets.
   2. Extend sheet full height of joint.

C. Install boards to fit snugly between wall ties.
   1. Place membrane surface against adhesive.
   2. Place membrane surface facing out, and tape seal board joints.

D. Install boards horizontally on walls.
   1. Place boards to maximize adhesive contact.
   2. Install in running bond pattern.
   3. Butt edges and ends tightly to adjacent boards and to protrusions.
   4. Place impale fastener locking discs.

E. Cut and fit insulation tightly to protrusions or interruptions to the insulation plane.

F. Place 6 inch wide polyethylene sheet at perimeter of wall openings, from adhesive vapor retarder bed to window and door frames. Tape seal in place to ensure continuity of vapor retarder and air seal.

3.05 BOARD INSTALLATION UNDER CONCRETE SLABS

A. Place insulation under slabs on grade after base for slab has been compacted.

B. Cut and fit insulation tightly to protrusions or interruptions to the insulation plane.

C. Prevent insulation from being displaced or damaged while placing vapor retarder and placing slab.

3.06 BOARD INSTALLATION OVER LOW SLOPE ROOF DECK

A. Board Installation Over Roof Deck, General:
   1. See applicable roofing Specification Section for specific board installation requirements.
   2. Ensure vapor retarder is clean and dry, continuous, and ready for application of roofing system.
   3. Fasten insulation to deck in accordance with roofing manufacturer's written instructions and applicable Factory Mutual requirements.
   4. Do not apply more insulation than can be covered with roofing in same day.

3.07 BATT INSTALLATION

A. Install insulation and vapor retarder in accordance with manufacturer's instructions.

B. Install in exterior wall and roof spaces without gaps or voids. Do not compress insulation.

C. Trim insulation neatly to fit spaces. Insulate miscellaneous gaps and voids.

D. Fit insulation tightly in cavities and tightly to exterior side of mechanical and electrical services within the plane of the insulation.

E. Install with factory applied vapor retarder membrane facing warm side of building spaces. Lap ends and side flanges of membrane over framing members.

F. Staple or nail facing flanges in place at maximum 6 inches on center.

G. Tape insulation batts in place.

H. Retain insulation batts in place with wire mesh secured to framing members.

I. Tape seal butt ends, lapped flanges, and tears or cuts in membrane.

J. At wood framing, place vapor retarder on warm side of insulation by stapling at 6 inches on center. Lap and seal sheet retarder joints over member face.

K. At metal framing, place vapor retarder on warm side of insulation; lap and seal sheet retarder joints over member face.

L. Tape seal tears or cuts in vapor retarder.

M. Extend vapor retarder tightly to full perimeter of adjacent window and door frames and other items interrupting the plane of the membrane. Tape seal in place.

3.08 PROTECTION

A. Do not permit installed insulation to be damaged prior to its concealment.

END OF SECTION

SECTION 07 5400 – THERMOPLASTIC MEMBRANE ROOFING

GENERAL

1.01 SECTION INCLUDES

A. Mechanically attached PVC thermoplastic single-ply roofing system.

B. Fully adhered PVC thermoplastic single-ply roofing system.

C. Roof insulation.

D. Flashing accessories.

E. Edgings and terminations.

   2. UL-790 - Standard Test Method for Fire Tests of Roof Coverings.

1.03 DESIGN CRITERIA

A. Wind Uplift Performance:
   1. Roof system is designed to withstand wind uplift forces as calculated using the current revision of ASCE-7.
   2. Roof system is designed to achieve a FM DS 1-29 Field Wind Uplift of 60 psf, a Perimeter Wind Uplift of 75 psf and a Corner Wind Uplift of 120 psf. See also General Structural Notes.

B. Fire Resistance Performance:
   1. Roof system will achieve a UL Class A rating when tested in accordance with UL-790.

C. Thermal Performance: Roof system will achieve a minimum R value not less than 30.

D. Drainage: Provide a roof system with positive drainage where all standing water dissipates within 48 hours after precipitation ends.

E. Building Codes:
   1. Roof system will meet the requirements of all federal, state and local code bodies having jurisdiction.

1.04 SUBMITTALS

A. Submit under provisions of Section 01 3300 – Submittal Procedures.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Installation methods.

C. Detail Drawings:
   1. Submit approved plan, section, elevation or isometric drawings which detail the appropriate methods for all flashing conditions found on the project.
   2. Coordinate approved drawings with locations found on the Contract Drawings.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: All primary products specified in this section will be supplied by a single manufacturer.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store and dispose of hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of local authorities having jurisdiction.

1.07 PROJECT CONDITIONS

A. Proceed with roofing work only when weather conditions are in compliance with the manufacturer’s recommended limitations, and when conditions will permit the work to proceed in accordance with the manufacturer’s requirements and recommendations.

B. Proceed with work so new roofing materials are not subject to construction traffic. When necessary, new roof sections shall be protected and inspected upon completion for possible damage.

C. Provide protection, such as 3/4 inch thick plywood, for all roof areas exposed to traffic during construction. Plywood must be smooth and free of fasteners and splinters.

D. The surface on which the insulation or roofing membrane is to be applied shall be clean, smooth, dry, and free of projections or contaminants that would prevent proper application of or be incompatible with the new installation, such as fins, sharp edges, foreign materials, oil and grease.

E. New roofing shall be complete and weather tight at the end of the work day.

F. Contaminants such as grease, fats and oils shall not be allowed to come in direct contact with the roofing membrane.

G. When positioning membrane sheets, exercise care to locate all field splices away from low spots and out of drain sumps. All field splices should be shingled to prevent bucking of water.

1.08 WARRANTY

A. At project closeout, provide to Owner or Owners Representative an executed copy of the manufacturer's Total System warranty, outlining its terms, conditions, and exclusions from coverage.

PART 2 -PRODUCTS

2.01 MANUFACTURERS

A. Acceptable Manufacturer: Carlisle SynTec Systems,

B. Or equal

2.02 SCOPE / APPLICATION

A. Roof System: Provide a waterproof roof system, capable of withstanding uplift forces as specified in this section.
   1. Membrane Attachment: Fully Adhered.

B. Insulation: Provide a roof insulation system beneath the finish membrane.

2.03 MEMBRANE ATTACHMENT: FULLY ADHERED

A. Sure-Flex FRS PVC Membrane as manufactured by Carlisle SynTec, or equal
   1. Membrane consists of Fiberglas Reinforced Scrim that is encapsulated between the PVC based top and bottom plies. The combination of the fabric and PVC plies provide Sure-Flex FRS PVC membranes with high breaking strength, tearing strength, and puncture resistance.
   2. Color: White.
   3. Membrane Thickness: 80 mil nominal.
      a. Thickness over Scrim (ASTM D 4434): 0.025 inches (0.635mm) minimum.
      b. Tensile Strength (ASTM D 638): 1500 psi (110.4 MPa) minimum.
      c. Tear Resistance (ASTM D 1004): 10 lbf (45 N) minimum.
      d. Elongation at Break (ASTM D 638): 250 percent minimum machine direction. 220 percent minimum cross machine direction.
      e. Field Sheet Width: 120 inches (3048 mm) maximum.
      f. Length: 65 feet (19.8 m) maximum.

2.04 INSULATION

A. Polyisocyanurate: A foam core insulation board covered on both sides with a medium weight fiber reinforced felt facer meeting ASTM C 1289, Type II, Class 1. Carlisle HP-H.
   1. Compressive Strength: Grade 2 (20 psi) (138 kPa).

2.05 INSULATION ADHESIVE

A. FAST 100 or 100 LV Adhesive: A spray or extruded applied, two-component polyurethane, low-rise expanding foam adhesive used for attaching approved insulations to compatible substrates (concrete, cellular lightweight insulating concrete, gypsum, cementitious wood fiber, wood or steel) or existing smooth or gravel surfaced BUR, modified bitumen or cap sheets.

B. FAST 100 Catalyst: Added to FAST Adhesive (Part B Side) to quicken adhesive reaction time.

C. FAST Dual Cartridge Adhesive: A two-component, polyurethane construction grade, low-rising expanding adhesive designed for bonding insulation to various substrates using a portable applicator.

D. OlyBond 500 BA - A two-component, polyurethane, low-rise expanding adhesive used to bond insulation to various substrates using a mechanical dispenser system.

E. OlyBond Spot Shot - A two-component, polyurethane construction grade, low-rising expanding adhesive designed for bonding insulation to various substrates using a portable applicator.

2.06 FLASHING ACCESSORIES

A. Sure-Flex PVC Inside Corners: Pre-molded corner flashing for inside corners. 80 mil thickness.
   1. Color: White.

B. Sure-Flex PVC Outside Corners: Pre-molded corner flashing for outside corners. 80 mil thickness.
   1. Color: White.

C. Sure-Flex PVC T-Joint Covers: 40 mil thick non-reinforced PVC flashing cut into a 4.5 inch (114mm) diameter circle used to seal step-offs at splice intersections.
   1. Color: White.

D. Sure-Flex PVC Molded Pipe Flashings: A pre-molded flashing and clamping ring used for pipe penetrations. Available for 1 inch to 6 inch (25 to 152mm) diameter pipes.

E. Sure-Flex PVC Split Pipe Seals: Pre-fabricated flashing consisting of 60 mil thick reinforced Sure-Flex Membrane for pipes 1 inch to 6 inch (25 to152mm) in diameter. A split (cut) and overlap tab are incorporated to allow the pipe seal to be opened and wrapped around the pipe when it is not possible to pull a standard pipe flashing over a round penetration.

F. Sure-Flex PVC Square Tubing Wraps: Fabricated flashings made of 60 mil thick reinforced Sure-Flex membrane for square tubing. A split (cut) and overlap tab are incorporated into these parts to allow the seals to be opened and wrapped around a square penetration. Available for 3 inches, 4 inches and 6 inches (76, 102, 152 mm) diameter square tubing.

G. Sure-Flex PVC Molded Sealant Pockets:
   1. Pre-fabricated, interlocking, 2-piece, injection molded, flexible pocket with a rigid polypropylene vertical wall and pre-formed deck flanges.
   2. Use in conjunction with Thermoplastic One-Part Pourable Sealer as specified in this section for waterproofing pipe clusters or other odd shaped penetrations. Forms a 7-1/2 inches by 6 inches (191 x 152mm) oval when completed. Available in white only.

H. PVC Overlayment Strip: Manufacturer's standard PVC overlayment strip.

I. Sure-Flex PVC Non-Reinforced Flashing: 80 mil thick rolls 12 inches (305 mm) and 24 inches 610 mm) wide. Used for inside/outside corners and field fabricated pipe flashings when use of pre-molded accessories is not feasible.

J. PVC Contour Rib Profile: Extruded PVC profile measuring 1-1/4 inches tall and 2-1/8 inches wide (32 mm by 54 mm) including the welding flanges while the vertical profile is 3/8 inch (9.5 mm) thick. Available in 10 feet (3048 mm) lengths.

2.07 CLEANERS, PRIMERS, ADHESIVES AND SEALANTS

A. Low VOC PVC Bonding Adhesive: A high-strength solvent based adhesive that allows bonding of PVC and KEE-enhanced PVC membrane to various porous and non-porous substrates.

B. Sure-Flex PVC Cut Edge Sealant: Free flowing, clear sealant designed for sealing cut edges of Sure-Flex reinforced membrane.

C. Water Cut-Off Mastic: A one-component, low viscosity, self wetting, Butyl blend mastic used as a compression sealing agent between membrane and applicable substrates.

D. White One-Part Pourable Sealer: Manufacturer's recommended product.

E. CCW 702 Primer: Manufacturer's recommended product.

F. Cav-Grip: Manufacturer's recommended product.

G. Universal Single-Ply Sealant: A 100 percent solids, solvent free, one-part polyether sealant that is used as a termination bar sealant. Available in white only.

H. PVC Membrane Cleaner: Clear, solvent-based cleaner used to loosen and remove contaminants from the surface of exposed membrane.

2.08 EDGINGS AND TERMINATIONS

A. SecurEdge 200: A snap-on edge system consisting of a 24 gauge galvanized metal water dam. Finish as noted on the Finish Schedule of the Contract Drawings.

PART 3 -EXECUTION

3.01 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

C. Do not commence Work until all other work trades have completed jobs that require them to traverse the deck on foot or with equipment.

D. A vapor retarder / temporary roof (Carlisle 725 TR Air & Vapor Barrier/Temporary Roof) may be applied to protect the inside of the structure prior to the roof system installation.

3.03 SUBSTRATE PREPARATION

A. Steel Deck:

1. Metal decks shall be a minimum uncoated thickness of 22 gauge and have a G-90 galvanized finish on all panels.
2. Decks must comply with the gauge and span requirements in the current Factory Mutual Approval Guide and be installed in accordance with Loss Prevention Data Sheet 1-28 or specific FM approval.
3. Remove any surface corrosion and repair severely corroded areas. Properly fasten loose or inadequately secured decking.

3.04 INSULATION - SYSTEM DESIGN

A. Base Layer:

1. Type: InsulBase Polyisocyanurate HP-H.
2. Thickness: 4.0 inches.
3. Attachment Method: Fasteners with plates and adhesive.

B. Top Layer:

1. Type: InsulBase Polyisocyanurate HP-H.
2. Thickness: 2.0 inches.
3. Attachment Method: Fasteners with plates and adhesive.

3.05 INSULATION PLACEMENT

A. Install insulation or membrane underlayment over the substrate with boards butted tightly together with no joints or gaps greater than 1/4 inch (6 mm). Stagger joints both horizontally and vertically if multiple layers are provided.

B. Secure insulation to the substrate with the required mechanical fasteners or insulation adhesive in accordance with the manufacturer's current application guidelines.

C. Do not install wet, damaged or warped insulation boards.

D. Stagger joints in one direction unless joints are to be taped. Install insulation boards snug. Gaps between board joints shall not exceed 1/4 inch (6 mm). Fill all gaps in excess of 1/4 inch (6 mm) with same insulation material.

E. Wood nailers must be at least 3 1/2 inches (89 mm) wide or 1 inch (25 mm) wider than adjacent metal flange. Thickness must equal that of insulation but not less than 1 inch (25 mm) thickness.

F. Miter and fill the edges of the insulation boards at ridges, valleys and other changes in

plane to prevent open joints or irregular surfaces. Avoid breaking or crushing of the insulation at the corners.

G. Do not install any more insulation than will be completely waterproofed each day.

3.06 INSULATION ATTACHMENT

A. Securely attach insulation to the roof deck for Adhered or Mechanically Fastened Roofing Systems. Attachment must have been successfully tested to meet or exceed the calculated uplift pressure required by the Building Code or ANSI/SPRI WD-1.

B. Enhance the perimeter and corner areas in accordance with the Building Code or ANSI/SPRI WD-1.

C. Install insulation layers applied with adhesive, coverage rate as necessary to achieve the specified attachment and uplift rating. Press each board firmly into place after adhesive develops strings when touched, typically 1-1/2 to 2 minutes after adhesive was applied, and roll with a weighted roller. Add temporary weight and use relief cuts to ensure boards are well adhered. Stagger the joints of additional layers by a minimum of 6 inches (152 mm).

3.07 MEMBRANE PLACEMENT AND ATTACHMENT (Fully Adhered)

A. Position Sure-Flex membrane over the acceptable substrate. Fold membrane sheet back lengthwise so half the underside of the membrane is exposed.

B. Apply Sure-Flex Bonding Adhesive in accordance with the manufacturer's published instructions, to the exposed underside of the membrane and the corresponding substrate area. Do not apply Bonding Adhesive along the splice edge of the membrane to be hot air welded over the adjoining sheet. Allow the adhesive to dry until it is tacky but will not string or stick to a dry finger touch.

1. Roll the coated membrane into the coated substrate while avoiding wrinkles. Brush down the bonded section of the membrane sheet immediately after rolling the membrane into the adhesive with a soft bristle push broom to achieve maximum contact.
2. Fold back the unbonded half of the sheet lengthwise and repeat the bonding procedures.

C. Position adjoining sheets to allow a minimum overlap of 2 inches (51mm).

D. Hot-air weld the Sure-Flex membrane sheets using the Automatic Hot Air Welding Machine or Hot Air Hand Welder in accordance with the manufacturer's hot air welding procedures.

E. Continue to install adjoining membrane sheets in the same manner, overlapping edges a minimum of 2 inches (51mm) and complete the bonding procedures as stated previously.

3.08 SEAM WELDING

A. Hot-air weld membrane using an Automatic Hot Air Welding Machine or Hot Air Hand Welder in accordance with the manufacturer's current guidelines. At all splice intersections, roll the seam with a silicone roller to ensure a continuous hot air welded seam.

B. Probe all seams once the hot air welds have thoroughly cooled (approximately 30 minutes).

C. Repair all seam deficiencies the same day they are discovered.

D. Apply Cut Edge Sealant on all cut edges of reinforced membrane (where the scrim reinforcement is exposed) after seam probing is complete. Cut Edge Sealant is not required but recommended on flat surfaces and is not required on vertical splices.

3.09 FLASHING

A. Flashing of parapets, curbs, expansion joints and other parts of the roof must be performed using Sure-Flex reinforced membrane. Sure-Flex non-reinforced membrane may be used for flashing pipe penetrations, Sealant Pockets, and scuppers, as well as inside and outside corners, when the use of pre-molded accessories is not feasible.

B. Follow manufacturer's typical flashing procedures for all wall, curb, and penetration flashing including metal edging/coping and roof drain applications.

3.10 DAILY SEALS

A. On phased roofing, when the completion of flashings and terminations is not achieved by the end of the work day, a daily seal must be performed to temporarily close the membrane to prevent water infiltration.

B. Complete an acceptable membrane seal in accordance with the manufacturer's requirements.

3.11 CLEAN UP

A. Perform daily clean-up to collect all wrappings, empty containers, paper, and other debris from the project site. Upon completion, all debris must be disposed of in a legally acceptable manner.

B. Prior to the manufacturer's inspection for warranty, the applicator must perform a pre-inspection to review all work and to verify all flashing has been completed as well as the application of all caulking.

3.12 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 07 6100 – SHEET METAL ROOFING

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Sheet metal roofing, associated flashings, and underlayment.

B. Counterflashings.

C. Gutters and downspouts.

D. Snow guards.

E. Integral fascias.

1.02 REFERENCE STANDARDS

A. American Architectural Manufacturer's Association (AAMA): www.aamanet.org:
   1. AAMA 621 - Voluntary Specifications for High Performance Organic Coatings on Coil Coated Architectural Hot Dipped Galvanized (HDG) & Zinc-Aluminum Coated Steel Substrates.
   2. AAMA 809.2 - Voluntary Specification Non-Drying Sealants.

B. American Society of Civil Engineers (ASCE): www.asce.org/codes-standards:
   1. ASCE 7 - Minimum Design Loads for Buildings and Other Structures.

C. ASTM International (ASTM): www.astm.org:

A653	Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
A755	Steel Sheet, Metallic Coated by the Hot-Dip Process and Prepainted by the Coil-Coating Process for Exterior Exposed Building Products.
A792/A792M	Steel Sheet, 55 % Aluminum-Zinc Alloy-Coated by the Hot-Dip Process.
C645	Nonstructural Steel Framing Members.
C754	Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.
C920	Elastomeric Joint Sealants.
A980	Steel, Sheet, Carbon, Ultra High Strength Cold Rolled.
D1003	Haze and Luminous Transmittance of Transparent Plastics.
D2244	Calculation of Color Differences from Instrumentally Measured Color Coordinates.
D4214	Evaluating Degree of Chalking of Exterior Paint Films.
E283	Determining Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.
E331	Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference
E1646	Water Penetration of Exterior Metal Roof Panel Systems by Uniform Static Air Pressure Difference.
E1680	Rate of Air Leakage Through Exterior Metal Roof Panel Systems.
E1980	Calculating Solar Reflectance Index of Horizontal and Low-Sloped Opaque Surfaces.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting: Convene one week before starting work of this section.

1.04 SUBMITTALS

A. See Section 01 3300 – Submittal Procedures.

B. Shop Drawings: Indicate material profile, jointing pattern, jointing details, fastening methods, flashings, terminations, and installation details.

C. Product Data: Provide data on metal types, finishes, and characteristics.

1.05 QUALITY ASSURANCE

A. Perform work in accordance with SMACNA Architectural Sheet Metal Manual requirements and standard details, except as otherwise noted.
   1. Maintain one copy on project site.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Stack material to prevent twisting, bending, or abrasion, and to provide ventilation. Slope metal sheets to ensure drainage.

B. Prevent contact with materials that could cause discoloration or staining.

1.07 WARRANTY

A. Correct defective Work within a five year period after Date of Substantial Completion. Defective work includes degradation of metal finish.

PART 2 – PRODUCTS

2.01 SHEET MATERIALS

A. PBR Roof Panel
   1. PBR Panel: A through-fastened sidewall panel with 1 1/4 inch (32mm) ribs at 12 inches (305mm) on center. The area between the ribs is reinforced to minimize oil-canning. Reverse roll optional.
   2. Gauge: 26.
   3. Dimensions: 36 inches (915mm) wide by 1 1/4 inch (32mm) high.

B. Standing Seam Metal Roof
   1. Material: Steel conforming to ASTM A792.
      a. 24 Gauge: Yield strength 50,000 psi; with aluminum-zinc alloy coating conforming to ASTM A792, Class AZ50.
   2. Panel Width and Pattern:
      b. 12” or 16” panel width.
   3. Panel Seam Height: 1.25 - 2 inches.
   4. Panel Finish: Provide primer and top finish coat on exposed faces; provide primer and backer coat on concealed faces of panels.
      a. Panel Color: To be selected by Owner
   5. Seam Sealant: The factory applies high-grade butyl mastic sealant within the confines of the panel’s female leg, designed to seal against the adjacent male panel leg.
   6. Clips: Provide clip designed to allow panels to thermally expand and contract. Clip shall incorporate a self-centering feature to allow 1 inch of movement in both directions along panel length. Clip type shall be selected to meet positive and negative pressures as specified. Factory-installed sealant to provide continuity of seal at clip locations

7. Bearing plate, if required, shall be designed with tabs to attached clip base to bearing plate on the ground, prior to installation.
8. Fasteners: As recommended by manufacturer for performance indicated.
9. Trims and Flashings: Material, metal thickness, and finish to match panels. Profiles indicated in Drawings.
    a. Provide manufacturer's standard accessories and other items essential to completeness of standing seam roof installation.
    b. Panel Penetration Flashings: As recommended by panel manufacturer; designed to provide sufficient movement to prevent creation of points of fixity at penetrations.
10. Manufacturer: AEP Span-Lok, ABC Lokseam or approved equal.

2.02 ACCESSORIES

A. Fasteners: Galvanized steel, with soft neoprene washers.

B. Underlayment: Synthetic non-asphaltic sheet, intended by manufacturer for mechanically fastened roofing underlayment without sealed seams.
    1. Type: Woven polypropylene with anti-slip polyolefin coating on both sides.
    2. Minimum Requirements: Comply with requirements of ICC-ES AC188 for non-self-adhesive sheet.
    3. Self Sealability: Passing nail sealability test specified in ASTM D1970.
    4. Flammability: Minimum of Class A, when tested in accordance with ASTM E108.
    5. Ultraviolet Resistance and Weatherability: Approved in writing by manufacturer for exposure to weather for minimum of 12 months.
    6. Low Temperature Flexibility: Passing test specified in ASTM D1970.
    7. Water Vapor Permeance: Vapor retarder; maximum of 0.1 perm, when tested in accordance with ASTM E96/E96M Procedure A (desiccant method).
    8. Fasteners: As specified by manufacturer and building code qualification report or approval, if any.

C. Underlayment: 6 mil polyethylene.

D. Slip Sheet: Rosin sized building paper.

E. Primer: Zinc molybdate type.

F. Protective Backing Paint: Zinc molybdate alkyd.

G. Sealant: As required by manufacturer.

H. Plastic Cement: ASTM D4586, Type I.

I. Eave Protection Sheet: Rubberized asphalt bonded to sheet polyethylene, 40 mil total thicknesses, with strippable treated release paper

J. Reglets: Surface mounted type, same material as roofing sheets; face and ends covered with plastic tape.

K. Solder: ASTM B32; Sn50 (50/50) type.

L. Splash Pads: Precast concrete type, of sizes and profiles indicated; minimum 3000 psi at 28 days, with minimum 5 percent air entrainment.

2.03 FABRICATION

A. Form sections true to shape, accurate in size, square, and free from distortion or defects.

B. Fabricate cleats of same material as sheet, same gage as roofing sheet.

C. Fabricate starter strips, interlockable with sheet.

D. Form pieces in longest practical lengths.

E. Hem exposed edges on underside 1/2 inch; miter and seam corners.

F. Form material with standing seams, except where otherwise indicated. At moving joints, use sealed lapped, bayonet-type or interlocking hooked seams.

G. Tin edges of copper sheet to be soldered. Solder shop formed metal joints. After soldering, remove flux. Wipe and wash solder joints clean. Weather seal joints.

H. Fabricate corners from one piece with minimum 18 inch long legs; seam for rigidity, seal with sealant.

I. Fabricate vertical faces with bottom edge formed outward 1/4 inch and hemmed to form drip.

J. Fabricate flashings to allow toe to extend 2 inches over roofing gravel. Return and brake edges.

K. Fabricate snow guards in accordance with SMACNA.

2.04 FACTORY FINISHING

A. Clear Anodized Finish: AAMA 611 AA-M12C22A41 Class I clear anodic coating not less than 0.7 mils thick.

B. Color Anodized Finish: AAMA 611 AA-M12C22A42/44 Class I integrally or electrolytically colored anodic coating not less than 0.7 mils thick.

C. Modified Silicone Polyester Coating: Pigmented Organic Coating System, AAMA 2603; baked enamel finish system.

D. Fluoropolymer Coating: High Performance Organic Finish, AAMA 2604; multiple coat, thermally cured fluoropolymer finish system.

E. PVDF (Polyvinylidene Fluoride) Coating: Superior Performance Organic Finish, AAMA 2605; multiple coat, thermally cured fluoropolymer finish system.

F. Color: As shown on drawings.

G. Primer Coat: On coated sheets, finish concealed side of sheet with primer compatible with finish system as recommended by finish system manufacturer.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Inspect roof deck to verify deck is clean and smooth, free of depressions, waves, or projections, properly sloped to drains.

B. Verify deck is dry and free of snow or ice. Verify joints in wood deck are solidly supported and fastened.

C. Verify correct placement of wood nailers and insulation positioning between nailers.

D. Verify roof openings, curbs, pipes, sleeves, ducts, or vents through roof are solidly set, reglets are in place, and nailing strips located.

E. Verify roofing termination and base flashings are in place, sealed, and secure.

3.02 PREPARATION

A. Install starter and edge strips, and cleats before starting installation.

B. Install surface mounted reglets true to lines and levels. Seal top of reglets with sealant.

C. Back paint concealed metal surfaces and surfaces in contact with dissimilar metals with protective backing paint to a minimum dry film thickness of 15 mil.

D. Place eave edge metal flashings tight with fascia boards. Weather lap joints 2 inches and seal with plastic cement. Secure flange with nails per plan.

3.03 INSTALLATION - EAVE (ICE DAM) PROTECTION

A. Apply eave protection sheet in accordance with manufacturer's instructions.

B. Apply 4-inch-wide band of plastic cement over deck flange of eave edge flashings, and embed an 18-inch-wide strip of eave protection sheet. Place starter strip with eave edge flush with face of flashings. Secure in place. Lap ends minimum 6 inches.

C. Apply plastic cement at rate of approximately 1-1/4 gal/100 sq ft over starter strip.

D. Starting from lower edge of starter strip, lay additional 36-inch-wide strips of eave protection sheet in plastic cement, to produce a two ply membrane. Weather lap plies minimum 19 inches and nail in place. Lap ends minimum 6 inches. Stagger end joints of each consecutive ply.

E. Extend eave protection sheet minimum 4 feet upslope beyond interior face of exterior wall.

3.04 INSTALLATION - ROOFING

A. Apply underlayment over entire roof area.
   1. Apply in single layer laid perpendicular to slope; weather lap edges 2 inches and nail in place.
   2. Apply in 2 layers; the first layer laid parallel to slope with joints lapped 6 inches, second layer laid perpendicular to slope with 2-inch lapped edges.
   3. Minimize nail quantity.

B. Apply slip sheet in one layer, laid loose.

C. Cleat and seam all joints.

D. Use plastic cement for joints between metal and bitumen and for joints between metal and felts.

E. Provide formed metal pans for protrusions through roof. Fill pans watertight with plastic cement.

F. Provide gutters.

G. Solder lap joints. After soldering, wash metal clean with neutralizing solution, rinse with water.

H. Install snow guards as shown in drawings.

3.05 INSTALLATION – PBR ROOFING

A. Conform to SMACNA Architectural Sheet Metal Manual

B. Roof shall have a minimum pitch of 1/12.

C. Space seams as required.

D. Panel shall begin at gable end of roof opposite the prevailing rain-bearing wind.

E. Panel to be laid square the eave and ridge.

F. If end-lapping is required, the upper panel should lap over the lower panel. Place an overhang 2-3 inches to provide a drip edge (1 inch for gutter).

G. Butyl tape shall be applied above and beneath inside closure.

3.06 INSTALLATION - STANDING SEAM ROOFING

A. Conform to SMACNA Architectural Sheet Metal Manual

B. Space standing seams as required.

C. Lay sheets with long dimension perpendicular to eaves. Apply pans beginning at eaves.

D. Lock cleats into seams and flatten.

E. Stagger transverse joints of roofing sheets.

F. At eaves and gable ends, terminate roofing by hooking over edge strip.

G. Finish standing seams 1 inch high on flat surfaces

H. Finish standing seams 1/2 inch high on curved surfaces.

I. Bend up one side edge 1-1/2 inches and other edge 1-3/4 inches.

J. Make first fold 1/4 inch wide single fold and second fold ½-inch wide, providing locked portion of standing seam, 5 plies in thickness.

K. Fold lower ends of seams at eaves over at 45-degree angle.

L. Terminate standing seams at ridge and hips by turning down with tapered fold.

M. Form valleys of sheets not exceeding 10 feet in length. Lap joints 6 inches in direction of drainage.

N. Extend valley sheet minimum 6 inches under roofing sheets.

O. At valley, double fold valley and roofing sheets and secure with cleats spaced 18 inches on center.

3.07 INSTALLATION - BUILT-IN GUTTERS AND DOWNSPOUTS

A. Conform to SMACNA Architectural Sheet Metal Manual

B. Secure gutter lining to substrate with cleats spaced as shown in drawings.

C. Longitudinal joints not acceptable.

D. At roof edges, extend gutter lining under metal roofing 6 inches minimum and terminate in 3/4 inch folded edge secured by cleats. Hook lower end of roofing into lock strip to form 3/4 inch wide loose-lock seam.

E. Seal gutters watertight. Seal joint of gutter to drain.

F. Connect downspouts to downspout boots as shown in drawings.

G. Set splash pans under downspouts.

3.08 INSTALLATION - FLASHINGS

A. Conform to SMACNA Architectural Sheet Metal Manual

B. Insert flashings into reglets to form tight fit.

1. Secure in place with lead wedges as required. Pack remaining spaces with lead wool.

2. Seal flashings into reglets with sealant.

C. Secure flashings in place using concealed fasteners. Use exposed fasteners only where permitted.

D. Cleat and seam all joints.

E. Apply plastic cement compound between metal flashings and felt flashings.

F. Fit flashings tight in place. Make corners square, surfaces true and straight in planes, and lines accurate to profiles.

G. Seal metal joints watertight.

H. Solder metal joints for full metal surface contact. After soldering, wash metal clean with neutralizing solution and rinse with water.

3.09 PROTECTION

A. Do not permit traffic over unprotected roof surface.

END OF SECTION

SECTION 07 6200 – SHEET METAL FLASHING AND TRIM

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install all formed and/or flat metal 11-gauge and lighter, in accordance with the Contract Documents.

1.02 STANDARDS

A. Except as herein modified, fabricate, and install work in accordance with printed standards of Sheet Metal and Air Conditioning Contractors National Association (SMACNA).

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 33 00 – Submittal Procedures.

B. Indicate type, gauge, and shape of sheet metal items; type, size, location and spacing of all joints, including expansion joints; shop finishes and other required coatings.

1.04 DELIVERY

A. Time deliveries with construction progress. Cooperate with various trades to which sheet metal items are furnished and with those whose progress of work is dependent upon installation of sheet metal items.

1.05 QUALITY ASSURANCE

A. Guarantee sheet metal work for a period of 2 years to be free of water leaks.

B. Guarantee shall include replacement and/or repair of other work damaged by water due to leakage in sheet metal work.

PART 2 – MATERIALS

2.01 SHEET METAL

A. Aluminum Sheet: Plain Sheet: ASTM B209, alloy 3003, 3004, Alclad 3003 or Alclad 3004; appropriate temper, except where temper is specified; mill finish unless otherwise specified.

B. Zinc-Coated (Galvanized) Steel Sheet: ASTM A526, copper bearing. Unless otherwise noted, gauges indicated or specified are Galvanized Sheet Gauge. Zinc coating shall be in accordance with ASTM A525 and shall not be less than coating Class G90.

2.02 FASTENERS

A. General:
   1. Type best suited for intended purposes.
   2. Use aluminum or stainless steel fasteners with aluminum.
   3. Use stainless steel or hot-dip galvanized steel fasteners with zinc-coated steel.
   4. Use only stainless steel fasteners when attaching dissimilar metals.

B. Material:
   1. Aluminum Fastener Materials: Ally 6061 or 5056.
   2. Stainless Steel Materials: Type 305
   3. Fasteners for Securing Sheet metal to Concrete and Masonry shall be Fastway Extruded Vinyl Anchors, Holub “Hi-Red” plastic screw anchors, “Star” plastic anchors or equal non-ferrous anchors, used with wood or sheet metal screws of specified type material; lead anchors are not acceptable.
   4. Nails for Securing Sheet metal to Wood shall be the specified type material; barbed, annular thread or screw type.

2.03 SOLDER

A. Type and composition best suited for material being soldered.

B. Composition Sn50 for galvanized metal.

C. For aluminum, use solder composition as recommended by metal manufacturer for type alloy to be soldered.

2.04 FLUX

A. Type and composition best suited for material being soldered.

2.05 PRIMERS

A. Asphalt Primer: ASTM D41, brushable.

B. Galvanized Metal Primer: Zinc Dust-zinc Oxide Primer as specified under Section 09 91 00, Painting.

2.06 BUTYL SEALING TAPE PRC

A. Butyl-Lock sealant type: Morrison & Company's CL-50 "Cushion-Lock" sealing tape or equal (3/32-inch x 1-inch).

PART 3 – EXECUTION

3.01 GENERAL

A. Cut edges or joints and abrasions exposing base metal of galvanized sheet metal shall be coated with solder to equivalent thickness of zinc coating before assembling or installing sheet metal items.

B. Wipe all soldered joints clean of flux. Completely neutralize acid fluxes by washing soldered joints with soda.

C. Coat all aluminum surfaces in contact with wood with asphalt primer, and allow to dry before setting in place.

D. Coat all metal surfaces in contact with built-up roofing using asphalt bitumen with asphalt primer, and allow to dry before setting in place.

E. Provide insulation of dissimilar metals from contact with each other with coating of asphalt primer.

F. Finish all sheet metal work straight and true, with miters and joints accurately fitted. Exposed work shall be free of dents. All corners shall be reinforced, and seams soldered or otherwise made waterproof. Exposed edges shall be hemmed or finished smooth.

G. All work shall be made watertight. Expect where provision is required for expansion and contraction, all joints and seams shall be locked or otherwise made mechanically strong. Solder may be used, where appropriated, to make joints and seams watertight, but shall not be considered as providing mechanical strength.

1. Flashing: Flashing throughout shall be 26-gauge galvanized iron or 20-gauge aluminum. Unless otherwise shown, flashing shall be at locations indicated on Drawings and as otherwise required for watertight construction.
2. Downspouts: Downspout sleeves shall be galvanized iron, sizes indicated on Drawings. Miter and solder at change of direction.
3. Gutters: Gutters shall be galvanized iron or aluminum, shaped as shown on Drawings. Miter corners and solder joints. Joints shall be lapped, riveted or soldered. Slip joints, where required, shall have grooves sealed with white butyl sealing tape. Gutter expansion joints shall be located midway between downspout outlets and shall fall on a 4-foot module. The joint shall be of a design, which will provide watertight connection and permit freedom of movement of the gutter lining.

3.02 SHOP PAINTING

A. Galvanized steel, except as otherwise specified, shall be given a shop treatment of copper acetate solution of 6 ounces of copper acetate to one gallon of water, and followed by a brush or spray-coat of galvanized metal primer compatible with finish coat system.

3.03 ASSEMBLIES

A. Fabricate assemblies from materials and of gauges indicated or specified. Where material is not indicated, fabricate from zinc-coated steel not loess that 26-gauge, aluminum not less than 20-gauge.

B. Seal between laps of expansion joints of gutters, flashing, etc., with butyl sealing tape.

C. Cleats supporting bottom edge of edging, etc., shall be continuous, secure and not more than 12-inch centers.

D. Secure deck flanges of edging, etc., on not more than 4-inch centers.

END OF SECTION

SECTION 07 7200 – ROOF ACCESSORIES

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Manufactured curbs, equipment rails, and pedestals.

B. Roof hatches, manual and automatic operation, including smoke vents.

C. Snow guards.

1.02 REFERENCE STANDARDS

A. ASTM A123/A123M - Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel

B. ASTM A153/A153M - Zinc Coating (Hot-Dip) on Iron and Steel Hardware

C. ASTM A653/A653M - Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

D. ASTM A792/A792M - Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process

E. FM P7825 - Approval Guide; Factory Mutual Research Corporation

F. MSS SP-58 - Pipe Hangers and Supports - Materials, Design, Manufacture, Selection, Application, and Installation; Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.

G. UL (BMD) - Building Materials Directory

1.03 SUBMITTALS

A. See Section 01 3300 – Submittal Procedures.

B. Product Data: Manufacturer's data sheets on each product to be used.
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Installation methods.
   4. Maintenance requirements.
   5. For smoke hatches, submit evidence of approval by evaluation agency specified.

C. Shop Drawings: For non-penetrating rooftop supports, submit detailed layout developed for this project, with design calculations for loadings and spacings.

D. Certificate: For smoke hatches, provide certificate of approval from authority having jurisdiction.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store products under cover and elevated above grade.

PART 2 – PRODUCTS

2.01 MANUFACTURED CURBS

A. Manufactured Curbs, Equipment Rails, and Other Roof Mounting Assemblies:
   1. AES Industries Inc.: www.aescurb.com.
   2. The Pate Company: www.patecurbs.com.
   3. Roof Products & Systems (RPS) by Commercial Products Group of Hart & Cooley, Inc: www.rpscurbs.com.

4. Or ENGINEER-approved equal.

B. Manufactured Curbs, Equipment Rails, and Other Roof Mounting Assemblies: Factory-assembled hollow sheet metal construction with fully mitered and welded corners, integral counterflashing, internal reinforcing, and top side and edges formed to shed water.
   1. Sheet Metal: Hot-dip zinc coated steel sheet complying with ASTM A653/A653M, SS Grade 33; G60 coating designation; 18 gauge, 0.048 inch thick.
   2. Roofing Cants: Provide integral sheet metal roofing cants dimensioned to begin slope at top of roofing insulation; 1:1 slope; minimum cant height 4 inches.
   3. Manufacture curb bottom and mounting flanges for installation directly on roof deck, not on insulation; match slope and configuration of roof deck.
   4. Provide the layouts and configurations shown on the drawings.

C. Curbs Adjacent to Roof Openings: Provide curb on all sides of opening, with top of curb horizontal for equipment mounting.
   1. Provide preservative treated wood nailers along top of curb.
   2. Insulate inside curbs with 1-1/2 inch thick fiberglass insulation.
   3. Height Above Finished Roof Surface: 6 inches, minimum.
   4. Height Above Roof Deck: 14 inches, minimum.

D. Equipment Rails: Two-sided curbs in straight lengths, with top horizontal for equipment mounting.
   1. Provide preservative treated wood nailers along top of rails.
   2. Height Above Finished Roof Surface: 6 inches, minimum.
   3. Height Above Roof Deck: 14 inches, minimum.

E. Pipe, Duct, and Conduit Mounting Pedestals: Vertical posts, minimum 8 inches square unless otherwise indicated.
   1. Provide sliding channel welded along top edge with adjustable height steel bracket, manufactured to fit item supported.
   2. Height Above Finished Roof Surface: 6 inches, minimum.
   3. Height Above Roof Deck: 14 inches, minimum.

2.02 ROOF HATCHES, MANUAL AND AUTOMATIC OPERATION

A. Manufacturers - Sound Rated Roof Hatches:
   1. Bilco Co.: www.bilco.com.
   2. Milcor by Commercial Products Group of Hart & Cooley, Inc: www.milcorinc.com.
   3. Or ENGINEER-approved equal.

B. Manufacturers - Roof Hatches:
   1. Acudor Products Inc; Aluminum Roof Hatch: www.acudor.com.
   2. Bilco Company; Type S (ladder access, standard size, solid cover): www.bilco.com.
   3. Dur-Red Products: www.dur-red.com.
   4. Milcor by Commercial Products Group of Hart & Cooley, Inc: www.milcorinc.com.
   5. Or ENGINEER-approved equal.

C. Manufacturers - Smoke Vent Roof Hatches:
   1. Bilco Company; Type DSH (double leaf): www.bilco.com.
   2. Bristolite Daylighting Systems, Inc; Bristol Smoke Vent SVAA: www.bristolite.com.
   3. Sunoptics Prismatic Skylights, a Division of Acuity Brands; Industrial Smoke Vent: www.sunoptics.com.
   4. Or ENGINEER-approved equal.

D. Roof Hatches: Factory-assembled steel frame and cover, complete with operating and release hardware.
   1. Style: Provide flat metal covers unless otherwise indicated.

2. Mounting: Provide frames and curbs suitable for mounting conditions indicated on the drawings.
3. Smoke Hatches: Where "smoke" or "smoke/heat" operation is indicated, provide the following additional features, and omit manual operation for access:
   a. Smoke Release Mechanism: Automatic opening on melting of replaceable UL-listed fusible link at 165°F.
   b. UL-listed as automatically operated smoke and heat vent.
   c. Fire Alarm Connection: Provide separate resettable electrical link release mechanism and connection point for fire alarm system.
4. Sound Rated Hatches: Two sets of double leaf doors with air space between upper and lower doors; upper doors to open upward, lower doors to open downward; minimum STC of 45.
5. Size(s): As indicated on drawings; single-leaf style unless indicated as double-leaf.
6. For Ladder Access: Single leaf; 30 by 36 inches.
7. For Ships Ladder Access: Single leaf; 30 by 54 inches.
8. For Stair Access: Single leaf; 30 by 96 inches.
9. For Equipment Access: Double leaf; 48 by 48 inches.
10. For Smoke Venting Without Access: 24 by 24 inches.

E. Frames/Curbs: One-piece curb and frame with integral cap flashing to receive roof flashings; extended bottom flange to suit mounting.
   1. Material: Galvanized steel, 14 gauge, 0.0747 inch thick.
   2. Finish: Factory prime paint.
   3. Insulation: 1 inch rigid glass fiber, located on outside face of curb.
   4. Curb Height: As indicated on drawings.

F. Metal Covers: Flush, insulated, hollow metal construction.
   1. Capable of supporting 40 psf live load.
   2. Material: Galvanized steel; outer cover 14 gauge, 0.0747 inch thick, liner 22 gauge, 0.03 inch thick.
   3. Material: Mill finished aluminum; outer cover 0.125 inch thick, liner 0.04 inch thick.
   4. Finish: Factory prime paint.
   5. Insulation: 1 inch rigid glass fiber.
   6. Gasket: Neoprene, continuous around cover perimeter.

G. Skylight Covers: Plastic glazed framed cover.
   1. Capable of supporting 40 psf live load.
   2. Glazing Frame: 0.04 inch thick aluminum.
   3. Shape: Convex dome shaped.
   4. Glazing: Single thickness, clear acrylic.
   5. Gasket: Neoprene, continuous around cover perimeter.

H. Hardware: Steel, zinc coated and chromate sealed, unless otherwise indicated or required by manufacturer.
   1. Lifting Mechanisms: Compression or torsion spring operator with shock absorbers that automatically opens upon release of latch; capable of lifting covers despite 10 psf load.
   2. Hinges: Heavy duty pintle type.
   3. Hold open arm with vinyl-coated handle for manual release.
   4. Latch: Upon closing, engage latch automatically and reset manual release.
   5. Manual Release: Pull handle on interior.
   6. Smoke Hatches: Manual release operation not to disturb automatic release mechanisms; easy resetting by OWNER's maintenance personnel; provide latch designed to prevent relatching unless the automatic release mechanism has been properly reset for automatic operation.

7. Locking: Padlock hasp on interior.

2.03 NON-PENETRATING ROOFTOP ASSEMBLIES

A. Manufacturers - Non-Penetrating Rooftop Assemblies:
   1. PHP Systems/Design: www.phpsd.com.
   2. Hart & Cooley, Inc.: www.portalsplus.com.
   3. Or ENGINEER-approved equal.

B. Non-Penetrating Rooftop Assemblies: Manufacturer-engineered and factory-fabricated, with pedestal bases that rest on top of roofing membrane, not requiring any attachment to the roof structure, and not penetrating the roofing assembly.
   1. Design Loadings and Configurations: As required by applicable codes.
   2. Height: Provide minimum clearance of 6 inches under supported items to top of roofing.
   3. Support Spacing and Base Sizes: As required to distribute load sufficiently to prevent indentation of roofing assembly.
   4. Steel Components: Stainless steel, or carbon steel hot-dip galvanized after fabrication in accordance with ASTM A123/A123M.
   5. Hardware, Bolts, Nuts, and Washers: Stainless steel, or carbon steel hot-dip galvanized after fabrication in accordance with ASTM A153/A153M.

C. Walkways, Stairs, and Platforms: Structural steel frame, walking surfaces, and railings.
   1. Dimensions: As indicated on the drawings.
   2. Walking Surfaces and Stair Treads: Steel grating, either formed plank grating or welded bar grating; serrated surface.

D. Pipe Supports: Provide attachment fixtures complying with MSS SP-58 and as indicated.
   1. Attachment/Support Fixtures: As recommended by manufacturer, same type as indicated for equivalent indoor hangers and supports; corrosion resistant material.
   2. See relevant piping system Specification Section for additional requirements.

E. Duct Supports:

F. Conduit and Cable Tray Supports:

G. Non-Penetrating Pedestals: Steel pedestals with square, round, or rectangular bases.
   1. Bases: High density polypropylene.
   2. Base Sizes: As required to distribute load sufficiently to prevent indentation of roofing assembly.
   3. Steel Components: Stainless steel, or carbon steel hot-dip galvanized after fabrication in accordance with ASTM A123/A123M.
   4. Products:
      a. Hart & Cooley, Inc.; Pedestal Plus: www.portalsplus.com.
      b. Or ENGINEER-approved equal.

2.04 SNOW GUARDS

A. Snow Guards:
   1. Berger Building Products: www.bergerbp.com.
   2. Snostop: www.snostop.com.
   3. Sno Gem; Original Polycarbonate: www.snogem.com.
   4. Alpine Snow Guards: www.alpinesnowguards.com.
   5. Or ENGINEER-approved equal.

B. Snow Guards: Individual projecting polycarbonate shapes, set between roofing shingles/tiles, and mechanically fastened to roof deck.
   1. Wire Loops: Copper wire, 0.135 inch diameter, with copper tabs, 16 oz/sq ft, mill finish.

2. Projecting Metal Shapes: Bronze castings, triangular spike design.
3. Projecting Polycarbonate Shapes: Clear polycarbonate plastic with UV stabilizers, semi-circular design.
4. Finish: Mill.
5. Placement: As shown on drawings.

C. Fence Type Snow Guard: Continuous snow guard; tubing set in brackets.
1. Bracket Base Plate: Shaped to fit roof tile.
2. Distance from Eaves: 8 inches.
3. Bracket Spacing: 8 inches.
4. Brackets: Aluminum on matching base plate.
5. Tubing: Aluminum, mill finish.
a. Outside Diameter: 1 inch.
b. Wall Thickness: 1/8 inch.
c. Threaded Couplings: As recommended by manufacturer.
d. End Collars and Caps: Metal to match.

D. Clamps for Standing Seam Roof: Stainless steel clamps attached to standing seams of roof panels; for attachment of snow guard brackets.
1. Seam Profile: Standard.
2. Clamp Spacing: Every panel seam; maximum spacing of 24 inches.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify ENGINEER of unsatisfactory preparation before proceeding.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.03 INSTALLATION

A. Install in accordance with manufacturer's instructions, in manner that maintains roofing weather integrity.

3.04 CLEANING

A. Clean installed work to like-new condition.

3.05 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 07 9200 – JOINT SEALANTS

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish and install caulking and sealing as indicated these Specifications.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Indicate manufacturers and brand names, colors available and locations where each will be used.

1.03 QUALITY ASSURANCE

A. Comply with requirements of the general conditions except as noted below.

B. Guarantee all work of this Section for a period of 2 years.

C. Guarantee all work against water leaks, air infiltration, sagging and pulling loose.

D. Guarantee shall include replacement and/or repair of other work damaged by water leakage in caulking and sealant work.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Deliver sealants in original sealed containers, each bearing manufacturer's name and product designation.

B. Do not retain at the job site material, which has exceeded the shelf life recommended by its manufacturer.

PART 2 - MATERIALS

2.01 SEALANTS

A. Types 1 to 4 Sealants: Polyurethane sealants conforming to Federal Specification TT-S-00227E Type II & ANSI A116.1.
   1. Type 1 Sealant: Two part 30-40 Shore A, non-sag
      a. Manufacture Sikaflex – 2C or ENGINEER-approved equal
   2. Type 2 Sealant: Two part, 35-45 Shore A, self-leveling.
   3. Type 3 Sealant: Two part, 20-35 Shore A, self-leveling.
   4. Type 4 Sealant: Two part, 20-35 Shore A, non-sag.

B. Type 5 Sealant: One component, elastomeric gun grade polyurethane sealant conforming to ASTM C920, Type S, Grade NS, Class 25. Use NT, M, A, G, and I Federal Specifications TT-S-00230C Type 2, Class A.
   1. Manufacturer: Sonneborn Sonolastic NP 1 or ENGINEER-approved equal.

2.02 ACCESSORIES

A. Primers: As specified by sealant manufacturer

B. Backup Materials: Closed cell polyethylene foam

C. Bond Breaker: Polyethylene film.

2.03 COLOR

A. Color for each location of use shall be as selected by OWNER and in accordance with the contract documents. Non-availability of a required color within a particular brand of otherwise approved material shall not act to relieve obligation to furnish material of required color and conforming to specifications.

B. Colors shall be selected to best blend with adjoining materials.

PART 3 - EXECUTION

3.01 LOCATIONS FOR SEALANT TYPES

A. Type 1 Sealant: Use for all interior and exterior construction, expansion joints, etc. associated with sealing the joints in the concrete tanks

B. Type 2 Sealant: Except as hereinafter specified, use for all interior and exterior horizontal joints subject to foot traffic.

C. Type 3 Sealant: Except as hereinafter specified, or where Type 1 sealant is required, use for all exterior horizontal joint.

D. Type 4 Sealant: Use for all exterior vertical surfaces.

E. Type 5 Sealant: Use for all interior work except where Type 1 sealant is required.

F. Caulk and seal all open joints, both interior and exterior; at junction of metal frames and walls; at other locations as noted on drawings.

G. Generally, expansion joints in exterior concreted flatwork on grade, curbs, and gutter for sitework, etc.; joint fillers will not require a joint sealant. Where sealant is noted on drawings for such joints, sealant shall be Type 1 and a bond breaker shall be installed along top of joint filler, full width of joint, to present contact between sealant and joint filler.

3.02 SEALANT AND JOINT DETAILS

A. Joint Sizes:
   1. Types 1, 2, 3 and 4 Sealants:
      a. Minimum joint size: ¼-inch x ¼-inch
      b. Depth to width ration of joint shall be a recommended by sealant manufacturer.
      c. Maximum width: Sealant manufacturer’s recommended maximum.
   2. Type 4 Sealant: Maximum joint size shall be 3/8-inch x ½-inch.

B. Joints deeper than above shall have backup material installed to maintain specified depth.

C. With Types 1, 2, 3 and 4 sealants, a bond breaker shall be installed, unless backup material is used, so that sealant bonds only sides of joints.

3.03 SEALANT INSTALLATION

A. Carefully and thoroughly clean surfaces with cleaner, and in matter recommended by sealant manufacturer.

B. Prime surfaces where recommended by sealant manufacturer.

C. Apply sealants smoothly and uniformly. Mask surfaces each side of joints to protect adjacent surface and to form straight, even edges.

END OF SECTION 07 9200

SECTION 08 1100 – METAL DOORS AND FRAMES

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install steel doors, frames, and related items, complete, operable, including all finish hardware, and all appurtenant work, complete and operable, in accordance with the requirements of the Contract Documents.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Commercial Standards:
   1. ASTM A366 – Specification for Steel, Carbon, Cold-Rolled Sheet, Commercial Quality
   2. ANSI A115 Series – Door and Frame Preparation
   3. UL – Underwriters' Laboratories, Inc.

B. Trade Standards: National Association of Architectural Metal Manufacturers (NAAMM) or Steel Door Institute (SDI).

C. Manufacturers' Standards: In addition to the standards listed above, the steel doors and frames and their installation shall be in accordance with the manufacturer's published recommendations and specifications.

1.03 SUBMITTALS

A. Submittals shall be in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings: Shop drawings shall show details of the products and systems and connections to adjoining materials. Schedules showing sizes, types, and locations of door louvers and glass shall be submitted along with manufacturer's installation instructions.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Doors and frames shall be shipped and stored with temporary stiffeners and spacers in place to prevent distortion.

B. Doors and frames shall be delivered in original, unbroken packages, containers or bundles bearing the name of the manufacturer.

C. Doors and frames shall be carefully stored on wood blocking in an area that is protected from the elements. Storage shall be in a manner that will prevent damage or marring of finish.

PART 2 – PRODUCTS

2.01 MATERIALS AND FABRICATION - GENERAL

A. Shop Fabrication and Assembly: All steel doors and frames shall be shop fabricated and shop assembled, where possible. Temporary stiffeners, spacers, and other accessories necessary to facilitate handling and accurate erection shall be provided. After fabrication, all tool marks and other surface imperfections shall be filled and ground smooth.

B. Fire Rating and Labeling: Doors and frames specified or shown as fire-rated shall bear a UL label indicating the type of rating for which certified. Designs and construction of such products shall have specific UL approval according to current procedures for the specified fire rating, either 3-hour, 1½-hour, ¾-hour or 20-minute as shown. Hollow steel doors and frames for fire-rated openings shall conform to UL listing and shall be UL labeled.

C. Materials for Doors and Frames: All hollow metal doors and frames shall be fabricated entirely from prime quality, commercial grade, cold-rolled steel conforming to ASTM A366, Type II or III.

D. Priming and Painting: Doors and frames shall be chemically treated to ensure maximum paint adhesion and shall have all exposed surfaces painted with a rust-inhibitive primer after fabrication.

E. Hardware: Doors and frames shall be reinforced and drilled or tapped for fully templated hardware; and shall be reinforced with plates for surface-mounted hardware, meeting ANSI A115 Series requirements. Hardware shall be as specified in these Specifications and/or as shown.

2.02 METAL FRAMES

A. Pressed Metal Frames: Pressed steel frames for doors and other openings shall be combination buckled frame and trim of type and sizes as shown. Metal shall not be lighter than 16-gauge steel. Frames shall be of the welded unit type. Special frames, oversized frames and frames with transom shall be provided where shown.

2.03 FRAME ANCHORS

A. Floor Anchors: Floor anchors shall be welded inside each frame jamb head, and holes shall be provided for floor anchorage. Minimum thickness of floor anchors shall be 14-gauge.

B. Anchors for Masonry/Concrete Installations: Frames for installation in masonry and/or concrete walls shall be provided with variable jamb anchors of the T-strap, stirrups and strap or wire type. The number of anchors provided per frame jamb and head shall be as follows:

1. Frames up to 7 feet 6 inches in height: Three (3) anchors.
2. Frames over 7 feet 6 inches to 8 feet 0 inches in height: Four (4) anchors.
3. Frames over 8 feet 0 inches in height: One (1) anchor for each 2 feet 0 inches or fraction in height.
4. Frame head anchors shall be not less than those required in these Specifications.

2.04 SILENCER HOLES

A. Appropriate holes for silencers shall be provided in the doorframes, which are not designated to receive weather stripping, seals, or sound seals.

2.05 STEEL DOORS

A. Design and Construction: Steel doors shall be of hollow metal construction and shall be of full flush design with no visible seams. Face sheets shall be not less than cold-rolled, stretcher-leveled, 18-gauge steel. All doors shall have flush seamless face sheets with continuously and fully welded seam edges. Doors shall be rigid and neat in appearance, and shall be free from warpage or buckle. Corner bends shall be true and straight and shall be of not less than the minimum radius for the gage of metal used. The door top and bottom shall be internally reinforced by steel members welded in place. Tops of exterior doors shall be provided with flush, water and weather tight, top enclosures.

B. Transom Panels: Transom panels shall be provided where shown and shall be of construction same as doors.

C. Door and Transom Cores: Doors and transom cores shall be water-resistant honeycomb with minimum R of four (4) mineral/fiberboard. Fire rated doors shall be solid or mineral fiberboard core doors as required to meet code and Reference Standard’s requirements.

D. Louvers (where applicable): Door louvers for steel doors shall be of steel of the type, which integrally frames the opening and can attach securely. Louvers shall be of the inverted "Y" blade type for exterior use and "V" blade for interior use. Exterior louvered openings shall be provided with removable type insect screens. Door louvers shall be uniformly located in doors and shall be of sizes shown. Louvers at labeled doors shall be equipped with concealed fusible links.

E. Double Doors: Double doors shall be provided with a "T" type steel astragal unless otherwise specified.

F. Manufacturers or ENGINEER-approved Equal:
   1. Forderer Cornice Works
   2. Krieger Steel Products Co.
   3. Overly Manufacturing Co.
   4. Dean Steel Mfg.
   5. Curries

PART 3 – EXECUTION

3.01 CONSTRUCTION

A. General: All work shall be in accordance with manufacturer's published recommendations and specifications.

B. All work shall be coordinated with appropriate related subcontractor’s work to assure a proper installation. Field conditions and dimensions shall be verified prior to fabrication.

3.02 FRAME INSTALLATION

A. Frames shall be set plumb and square in a true plane, and be securely anchored to the adjoining construction. Steel shims shall be provided and shall be set tight and rigidly attached between frame anchors and structure. All finished metal frames shall be strong and rigid; neat in appearance and square, true and free of defects, warp or buckle.

B. Molded members, trims and stops, shall be clean cut, straight and shall be of a uniform profile throughout their lengths.

C. Corner joints shall have all contact edges tightly closed with all trim faces mitered, welded, and finished smooth. The use of gussets will not be permitted.

3.03 DOOR INSTALLATION

A. Doors shall be installed plumb, square, and level. Doors shall operate freely, but not loosely. They shall be free from rattling while in a closed position.

B. The door clearances shall be plus 3/32-inch or minus 1/32-inch and shall not exceed the limits specified in the manufacturers printed recommendations.

C. Any door that becomes warped more than 3/16-inch out-of-plane shall be replaced.

D. Doors and door's finish hardware shall have hardware protected prior to painting as specified.

3.04 FINISH HARDWARE

A. Finish hardware shall be installed in accordance with hardware manufacturer's standard templates and printed instructions. Operable parts shall be adjusted for correct function and operation.

3.05 EXISTING CONSTRUCTION

A. Frames that are dimpled for fasteners required for installation into previously placed (existing) concrete, masonry or steel structures shall have the fasteners and fastener frame dimples filled with auto putty or an ENGINEER-approved equal filler material. The fasteners and fillers at dimple holes shall be ground smooth (non-visible) before painting. Fastener locations shall not be visible after the painting work is finished.

END OF SECTION

SECTION 08 5113 – ALUMINUM WINDOWS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Related Documents: Drawings and general provisions of the Contract, including General and Conditions and these Specifications, apply to this section.

B. This Section includes commercial grade aluminum window units of the performance class indicated. Window types required include:
   1. Fixed windows.
   2. Sliding window (Transaction window)

C. Performance Requirements: Provide windows engineered, fabricated, and installed to withstand normal thermal movement, wind loading, and impact loading without failure, as demonstrated by testing manufacturer's standard window assemblies representing types, grades, classes, and sizes required for Project according to test methods indicated.

D. Testing shall demonstrate compliance with requirements indicated in AAMA 101 for air infiltration, water penetration, and structural performance for type, grade, and performance class of windows required. Where required design pressure exceeds the minimum for the specified window grade, comply with AAMA 101, Section 3, "Optional Performance Classes."

E. Test Criteria: Testing shall be performed by a qualified independent testing agency based on the following criteria:
   1. Design wind velocity at Project site is 70 mph (113 km/h).
   2. Heights of window units above grade at window centerline are indicated on or can be determined from the Drawings. Consult with the Architect, if necessary, to confirm required loading and test pressures.
   3. Test Procedures: Test window units according to ASTM E283 for air infiltration, ASTM E547 for water penetration, and ASTM E330 for structural performance.

F. Submittals: Submit the following:
   1. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.
   2. Product Data for each type of window required, including construction details and fabrication methods; profiles and dimensions of individual components; data on hardware, accessories, and finishes. Include recommendations for maintaining and cleaning exterior surfaces.
   3. Shop Drawings showing fabrication and installation of each type of window required. Include layout and installation details, elevations at ¼-inch = 1 foot (1:50) scale, typical window unit elevations at ¾-inch = 1 foot (1:20) scale, and full-size section details of typical composite members.
   4. Samples for initial color selection on 12-inch- (300-mm-) long sections of window members. Where finishes involve normal color variations, include Sample sets showing the full range of variations expected.
   5. Test reports from a qualified independent testing agency indicating that each type, grade, and size of window unit complies with performance requirements indicated. Test results based on use of down-sized test units will not be accepted.

G. Quality Assurance:
   1. Installer Qualifications: Engage an experienced Installer who has completed installation of aluminum windows similar in design and extent to those required for the project and whose work has resulted in construction with a record of successful in service performance.

2. Standards: Requirements for aluminum windows, terminology and standards of performance, and fabrication workmanship are those specified and recommended in AAMA 101 and applicable general recommendations published by AAMA.
3. Single Source Responsibility: Provide aluminum window units from one source and produced by a single manufacturer.

H. Project Conditions:
1. Field Measurements: Check actual window openings by accurate field measurement before fabrication. Show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.
a. Where necessary, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit of window units.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Manufacturers: The following may be provided:
1. EFCO Corporation
2. Graham Architectural Products Corp.
3. Kawneer Company, Inc.
4. Torrance Aluminum Window Co.
5. Old Castle Glass
6. or ENGINEER-approved equal

B. Aluminum Extrusions: Alloy and temper recommended for strength, corrosion resistance, and application of required finish, but not less than 22,000-psi (150-MPa) ultimate tensile strength and not less than 0.062 inch (1.6 mm) thick at any location for main frame and sash members. The main frame shall be not less than 2" depth.

C. Fasteners: Aluminum, nonmagnetic stainless steel, epoxy adhesive, or other materials warranted to be noncorrosive and compatible with window members, trim, hardware, anchors, and other components.
1. Where fasteners screw anchor into aluminum less than 0.125 inch (3.2 mm) thick, reinforce interior with aluminum or nonmagnetic stainless steel to receive screw threads or provide standard, noncorrosive, pressed-in, splined grommet nuts.
2. Except for application of hardware, do not use exposed fasteners. For application of hardware, use fasteners that match finish of member or hardware being fastened, as appropriate.

D. Anchors, Clips, and Window Accessories: Aluminum, nonmagnetic stainless steel, or zinc-coated steel complying with ASTM B633 and of sufficient strength to withstand design pressure indicated.

E. Hardware: Aluminum, stainless steel, or other corrosion-resistant material compatible with aluminum and of sufficient strength to perform the function for which it is intended.
1. Four-Bar Friction Hinges: Comply with AAMA 904.1.
a. Friction Shoes: Nylon or other nonabrasive, non-staining, noncorrosive, durable material.
2. Limit Device: Manufacturer's standard, concealed friction adjustor, adjustable stay bar, limit device designed to restrict ventilator opening.

F. Accessories: Manufacturer's standard accessories that comply with indicated standards.
1. Weather-stripping: Sliding-type weather-stripping where sash rails slide horizontally or vertically along unit frame. Provide compression-type weather-stripping at perimeter of each operating sash where sliding type is inappropriate.

G. Provide weather stripping locked into extruded grooves in sash.

1. Pole Operators: One pole operator and pole hanger for every room that has operable windows more than 72 inches (1800 mm) above floor. Fabricate pole of tubular-shaped anodized aluminum with rubber cap at lower end and standard push-pull hook at top. Provide sufficient length for window operation without reaching more than 60 inches (1500 mm) above floor.

H. Sliding Transaction Windows: Comply with requirements of AAMA/WDMA/CSA 101/I.S.2/A440 – 05 and manufacturer's standard locking/operating
   1. Hardware: Equipment and operating hardware as follows:
      a. Concealed plunger lock in the meeting rail with a flush mounted actuating handle.
      b. Sash shall ride on steel ball bearing rollers and a raised track, so dirt will not interfere with normal operation.
   2. Deal tray or shelf: 16-gauge stainless steel, pre-drilled for exterior mounting, and match window width dimension.

I. Projected Windows: Comply with requirements of AAMA Rating P-HC65. Window units shall successfully pass hardware load test requirements specified in AAMA 101. Provide tubular vents.
   1. Hardware: Equipment and operating hardware as follows:
      a. Hinges: Concealed 4-bar friction hinges with adjustable slide shoe (2 per ventilator).
      b. Lock: Pole-operated, cam-action, sweep lock handle and keeper.
      c. Limit Device: Stay bar with adjustable hold-open device.

J. Fabrication: Window units to comply with indicated standards. Include a complete system for assembly of components and anchorage of window units.
   1. Provide units that are reglazable without dismantling sash or ventilator framing.
   2. Prepare window sash or ventilators for glazing except where pre-glazing at the factory is indicated.
   3. Weepholes: Provide weepholes and internal passages to conduct infiltrating water to the exterior.
   4. Mullions: Provide mullions and cover plates as shown, matching window units, complete with anchors for support to structure and installation of window units. Allow for erection tolerances and provide for movement of window units due to thermal expansion and building deflections, in the manner indicated.
   5. Compensation channels: Provide compensation channels with anchors for window units as shown, of profile and dimensions indicated but not less than 0.062-inch-(1.6-mm-) thick extruded aluminum. Miter or cope corners, and weld and dress smooth with concealed mechanical joint fasteners. Finish to match window units. Provide compensation channels capable of withstanding design loads of window units.
   6. Glazing Stops: Provide screw applied or snap on glazing stops, coordinated with glass selection and glazing system indicated. Finish glazing stops to match window units.

K. Pre-glazed Fabrication: Pre-glaze window units where possible and practical. Comply with glass and glazing requirements of these Specifications and AAMA 101.

L. Finishes: Comply with NAAMM "Metal Finishes Manual." Finish designations prefixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.

M. Aluminum Finishes:
   1. General: Comply with NAAMM’s “Metal Finishes Manual for Architectural and Metal Products for recommendations relative to applying and designating finishes.

2. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved samples and are assembled or installed to minimize contrast.
3. Finish designations prefixed AA conform to the system established by the Aluminum Association for designating aluminum finishes.
4. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   a. Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermo-cured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
   b. Color and Gloss: As selected by CONTRACTOR from manufacturer's full range.

PART 3 – EXECUTION

3.01 GENERAL

A. Inspection: Inspect openings before installation. Verify that rough opening is correct and sill plate is level.

B. Installation: Comply with manufacturer's recommendations for installing window units, hardware, operators, and other components. Set windows plumb, level, and true to line, without warp or rack of frames or sash. Anchor securely in place.
   1. Separate aluminum and other corrodible surfaces from sources of corrosion or electrolytic action.

C. Set sill members and other members in a bed of sealant or with joint fillers or gaskets to provide weathertight construction. Coordinate installation with wall flashings and other components of the Work.

D. Field Quality Control: Conduct on-site tests with window manufacturer's representative present. The Architect will select units to be tested. Testing shall be performed by a qualified independent testing agency selected by the Architect.
   1. Air-Infiltration Tests: Conduct according to requirements of ASTM E783. Allowable infiltration shall not exceed 1.5 times the amount indicated.
   2. Water-Resistance Tests: Conduct according to requirements of ASTM E1105. No water leakage is permitted.
   3. Window units not meeting specified requirements and units having similar deficiencies shall be corrected at no cost to the Owner.

E. Adjust operating sash and hardware to provide tight fit at contact points and weather-stripping for smooth operation and a weathertight closure.

F. Clean aluminum promptly after installing windows. Avoid damage to finishes. Remove excess glazing and sealant compounds, dirt, and other substances. Lubricate hardware and other moving parts.

G. Clean glass of pre-glazed units promptly after installing windows.

H. Protect installed aluminum windows to ensure that they are without damage or deterioration at the time of Substantial Completion.

END OF SECTION

SECTION 08 7100 – DOOR HARDWARE

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install all finish hardware and appurtenant work, complete and operable, in accordance with the Contract Documents. The CONTRACTOR shall also coordinate final finish hardware selection with the OWNER.

B. The work hereunder shall include all fabrication and mounting templates as needed for fabricators and for control of application of metal items.

C. In addition, provide and install all trim, attachments and fastenings specified or required for proper and complete installation. The work of this Section shall include all hardware that is not specified in other Sections, whether or not such hardware is herein specifically scheduled.

D. Protect the finish hardware from damage during construction, painting, and clean-up.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Codes: All codes, as referenced herein, are specified in Section 01 4219 – Reference Standards.

B. Commercial Standards:
   1. Underwriters' Laboratories, Inc. Requirements and Approvals
   2. Hardware Institute (DHI): "Recommended Procedure for Processing Hardware Schedules and Templates" and "Architectural Hardware Scheduling and Format"
   3. BHMA: Builders Hardware Manufacturers Association

C. Manufacturers Standards: In addition to the standards listed above, the finish hardware and its installation shall be in accordance with the manufacturer's published recommendations and specifications.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Samples: The samples of all items requested shall be furnished by the hardware supplier no later than 10 days after said request is received.

1.04 PROPRIETARY DESIGNATIONS

A. Manufacturer's product names, numbers and models are given herein for the purpose of indicating the requirements for the type, general construction, material, and operation of the specific item, not with the intention of limiting the item to the manufacturer's listed product. Substitution of another manufacturer's product that is fully equivalent in all respects may be made subject to the approval of the ENGINEER. Detailed and complete data shall be supplied as required to facilitate appropriate evaluation of all proposed substitute items.

1.05 PACKING, MARKING AND DELIVERY

A. All locks, exit devices, door closers, overhead door holders, hinges, kick plates, pulls and push plates, thresholds, and other similar items shall be individually packed in separate, suitable, original, containers as furnished by the hardware manufacturers. Each container shall be clearly marked with item numbers, article numbers, and names corresponding to those listed in the hardware schedule.

B. Small miscellaneous items that would not require specific location identifications, such as door stops, coat and hat hooks and door silencers may be quantity packed if properly labeled with item numbers and other identification.

C. Hardware shall be checked upon delivery with the aid of a representative of the hardware supplier's firm. Proper storage of all hardware will be required until ready for application.

PART 2 – PRODUCTS

2.01 GENERAL

A. Finish hardware shall be coordinated with all other work requiring builder's hardware or attaching to it. Copies of schedules, templates, etc., shall be furnished in ample time to avoid fabrication and construction delays. Each item of hardware shall be identified according to the approved list and schedule. All hardware shall be made to template.

B. All hardware furnished in connection with doors bearing UL Labels or where necessary to meet special requirements shall be in strict accordance with conditions established by the authority having jurisdiction and shall be subject to approval of that authority.

C. Hand of lock shall be as shown. If door hand is changed during construction, necessary changes shall be made at no extra cost.

D. Exit doors shall be operable at all times from the inside without the use of key or any special knowledge or effort.

E. Approved shop drawings from those trades with which hardware must be coordinated shall be provided to the hardware supplier. After checking these shop drawings, necessary template information shall promptly be supplied to all concerned as may be required to facilitate the progress of the job. All procedures for template information shall be in accordance with the handbook, "Recommended Procedure for Processing Hardware Schedules and Templates."

F. Finish of all hardware shall be 630-brush stainless steel unless otherwise specified in the hardware schedule.

G. Approved Manufacturers:
   1. Locks: Best, Sargent, Schlage
   2. Exit Devices: Precision, Sargent, Von Duprin
   3. Closers: LCN, Sargent, Norton
   4. Or ENGINEER-approved equal.

PART 3 – EXECUTION

3.01 GENERAL

A. All required items of hardware, including cylinders for locks, and all fitting, adjusting, and securing of each item neatly and firmly in place, shall be in perfect working order. Any work less than this shall form a basis for corrective measures.

B. All finish hardware shall be provided with paint protection prior to painting work. The paint protection shall be removed after completion of the painting work and the finish hardware cleaned and polished.

3.02 HARDWARE SCHEDULE

A. The hardware schedule is arranged for convenience of locating hardware and does not preclude in any way the requirements that all necessary hardware shall be furnished and properly installed. Hardware not specifically called out shall be similar to that required for similar uses.

B. The catalog numbers referred to in the hardware schedule are taken from catalogs of the manufacturers listed. They are used only to establish the quality and type of hardware to be used. Hardware equal in quality and utility will be accepted provided it conforms in operation, quality, weight, size, workmanship, and finish to the products hereinafter described. All component parts of locksets shall be the product of one manufacturer.

3.03 LATCHES AND BOLTS

A. Latches and bolts shall be installed, to automatically engage in keepers, whether activated by closers or by manual push. In no case should additional manual pressure be required to engage latch or bolt in keepers.

3.04 CLOSERS AND HINGES

A. Closers and hinges shall be carefully adjusted to operate the doors noiselessly and evenly, and hinges shall be installed so as not to bind. Closers, closer arms, and hold-open arms shall be attached with sex bolts.

B. Except at exterior doors, closers shall not be mounted on corridor or vestibule side of door.

3.05 WEATHER-STRIPPING AND SEALS

A. All doors shall be provided with weather-stripping or seals unless mutes, product weather-stripping or other special seals are specified. Whenever two types of seals are shown on the Finish Hardware Schedule on a given door they both are to be provided.

3.06 PROTECTIVE TAPE AND COATINGS

A. Strippable coating, removable tape protection or other approved means shall be provided to prevent any damage or staining of hardware during construction. Such protective measures shall be removed prior to final cleaning and the hardware polished before the acceptance of the project.

END OF SECTION

SECTION 08 8000 – GLAZING

PART 1 – GENERAL

1.01 SUMMARY

A. This Section includes glazing for the following products, including those specified in other Sections where glazing requirements are specified by reference to this Section:
   1. Storefront units.
   2. Vision lites and windows.
   3. Entrances and other doors.

B. Related Sections:
   1. Section 08 11 00 - Metal Doors and Frames
   2. Section 08 51 13 - Aluminum Windows

C. Definitions: Manufacturer is used in this Section to refer to a firm that produces primary glass or fabricated glass as defined in the referenced glazing standard.

D. System Performance Requirements:
   1. General: Provide glazing systems that are produced, fabricated, and installed to withstand normal thermal movement, wind loading, and impact loading (where applicable), without failure including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; and other defects in construction.
   2. Glass Design: Glass thicknesses indicated on Drawings are for detailing only. Confirm glass thicknesses by analyzing Project loads and in-service conditions. Provide glass lites for the various size openings in the thicknesses and strengths (annealed or heat-treated) to meet or exceed the following criteria:
      a. Minimum glass thickness, nominally, of lites in exterior walls is 6.0 mm (0.23 inch).
      b. Minimum glass thicknesses of lites, whether composed of annealed or heat-treated glass, are selected so the worst-case probability of failure does not exceed the following:

E. Determine minimum thickness of monolithic annealed glass according to ASTM E 1300. For other than monolithic annealed glass, determine thickness per glass manufacturer's standard method of analysis including applying adjustment factors to ASTM E 1300 based on type of glass.
   1. Normal thermal movement results from the following maximum change (range) in ambient and surface temperatures acting on glass-framing members and glazing components. Base engineering calculation on materials' actual surface temperatures due to both solar heat gain and nighttime sky heat loss.
      a. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

F. Submittals:

   1. Submittals shall be furnished in accordance with Section 01 33 00 – Submittal Procedures.
   2. Product data for each glass product and glazing material indicated.
   3. Samples for verification purposes of 12-inch-square samples of each type of glass indicated except for clear monolithic glass products, and 12-inch-long samples of each color required (except black) for each type of sealant or gasket exposed to view. Install sealant or gasket sample between two strips of material representative in color of the adjoining framing system. If requested.
   4. Product certificates signed by glazing materials manufacturers certifying that their products comply with specified requirements.

a. Separate certifications are not required for glazing materials bearing manufacturer's permanent labels designating type and thickness of glass, provided labels represent a quality control program of a recognized certification agency or independent testing agency acceptable to authorities having jurisdiction.

5. Compatibility and adhesion test reports from sealant manufacturer indicating that glazing materials were tested for compatibility and adhesion with glazing sealants. Include sealant manufacturer's interpretation of test results relative to sealant performance and recommendations for primers and substrate preparation needed for adhesion.
6. Product test reports for each type of glazing sealant and gasket indicated, evidencing compliance with requirements specified.
7. Maintenance data for glass and other glazing materials to include in Operating and Maintenance Manual specified in Division 1.

G. Quality Assurance:
1. Glazing Publications: Comply with CBC Standard No. 54-1 "Glass Standard Specifications." Comply with published recommendations of glass product manufacturers and organizations below, except where more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.
   a. FGMA Publications: "FGMA Glazing Manual."
2. Safety Glass: Products complying with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for Category II materials. Comply with CBC Standard No. 54-2.
   a. Subject to compliance with requirements, provide safety glass permanently marked with certification label of Safety Glazing Certification Council (SGCC) or other certification agency acceptable to authorities having jurisdiction.
3. Fire-Resistive Glazing Products for Door Assemblies: Products identical to those tested per ASTM E 152, labeled and listed by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
4. Fire-Resistive Glazing Products for Window Assemblies: Products identical to those tested per ASTM E 163, labeled and listed by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
5. Glazier Qualifications: Engage an experienced glazier who has completed glazing similar in material, design, and extent to that indicated for Project with a record of successful in-service performance.
6. Single-Source Responsibility for Glass: Obtain glass from one source for each product indicated below:
   a. Primary glass of each (ASTM C 1036) type and class indicated.
   b. Heat-treated glass of each (ASTM C 1048) condition indicated.
7. Single-Source Responsibility for Glazing Accessories: Obtain glazing accessories from one source for each product and installation method indicated.
8. Preconstruction Compatibility and Adhesion Testing: Submit to sealant manufacturers, samples of each glass, gasket, glazing accessory, and glass-framing member that will contact or affect glazing sealants for compatibility and adhesion testing as indicated below:
   a. Use test methods standard with sealant manufacturer to determine if priming and other specific preparation techniques are required for rapid, optimum glazing sealants adhesion to glass and glazing channel substrates.

H. Perform tests under normal environmental conditions during installation.
1. Submit not less than nine pieces of each type and finish of glass-framing members and each type, class, kind, condition, and form of glass (monolithic, laminated, insulating units) for adhesion testing, as well as one sample of each glazing accessory (gaskets, setting blocks and spacers) for compatibility testing.

2. Schedule sufficient time to test and analyze results to prevent delay in the Work.
3. Investigate materials failing compatibility or adhesion tests and get sealant manufacturer's written recommendations for corrective measures, including using special primers.
4. Testing is not required when glazing sealant manufacturer can submit required preparation data that is acceptable to University's Representative and is based on previous testing of current sealant products for adhesion to and compatibility with submitted glazing materials.

I. Delivery, Storage, and Handling: Protect glazing materials to comply with manufacturer's directions and as needed to prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.

J. Project Conditions: Environmental Conditions: Do not proceed with glazing when ambient and substrate temperature conditions are outside the limits permitted by glazing materials manufacturer or when glazing channel substrates are wet from rain, frost, condensation, or other causes.

K. Warranty:
1. General: Warranties specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
2. Manufacturer's Warranty on Coated Glass Products: Submit written warranty signed by coated glass manufacturer agreeing to furnish replacements for those coated glass units that deteriorate as defined in "Definitions" article, f.o.b. point of manufacture, freight allowed Project site, within specified warranty period indicated below. Warranty covers only deterioration due to normal conditions of use and not to handling, installing, and cleaning practices contrary to glass manufacturer's published instructions.
a. Warranty Period: Manufacturer's standard but not less than 5 years after date of Substantial Completion.

PART 2 – PRODUCTS

2.01 GLASS PRODUCTS

A. Tempered Glass: Tempered glass, conforming to CBC Section 2406, shall be of the various types and thicknesses as specified or indicated. Tempered glass shall be cut to shape and size before tempering, and shall not be cut or trimmed after tempering. Lights not of proper shape and size shall not be used. Except for lights having one dimension greater than 72 inches, tong marks shall be on one of the shorter edges. Where holes are required, limiting requirements, as to size and spacing and location in relation to edges and corners, shall be in accordance with recommendation of the glass manufacturer. Edges which shall be exposed in finished work shall be polished; other edges shall be seamed.
1. Heat-Treated Float Glass: ASTM C 1048; Type I (transparent glass, flat); Quality q3 (glazing select).

B. Wire Glass: ASTM C 1036, Type II (patterned and wired glass, flat), Class 1 (clear), Quality q8 (glazing); ¼" thick nominal; of form and mesh pattern indicated below: Wired Glass
1. Polished Wired Glass: Form 1 (wired, polished both sides), and as follows:
a. Mesh m2 (square).
2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering wired glass products that may be incorporated in the Work include the following companies.
a. LOF "Crossweld"

b. Mississippi “Baroque”
c. Or equal.

C. Interior glazing: ¼” thick clear, tempered (wire glass where required).

D. Exterior Glazing: 1/4" thick tinted Solex, tempered where required.

E. Privacy Glazing (at bathrooms): 1/4" thick tempered patterned/obsure lite. Pattern as selected by architect from manufacturer’s standard.
1. Guardian
2. Or equal

F. Mirrored glazing: ¼” thick mirrored glazing. Include ½” wide stainless steel frame, cut and mitered to fit mirror.

G. Ceramic-Coated Spandrel Glass: ASTM C 1048, Condition B (spandrel glass, one-surface ceramic coated), Type I (transparent glass, flat), Quality q3 (glazing select), and complying with other requirements specified.
1. Fallout Resistance: Provide spandrel units identical to those passing the fallout-resistance test for spandrel glass specified in ASTM C 1048.

H. Elastomeric Glazing Sealants:
1. General: Provide products of type indicated, complying with the following requirements:
a. Compatibility: Select glazing sealants and tapes of proven compatibility with other materials they will contact, including glass products, seals of insulating glass units, and glazing channel substrates, under conditions of installation and service, as demonstrated by testing and field experience.
b. Suitability: Comply with sealant and glass manufacturer's recommendations for selecting glazing sealants and tapes that are suitable for applications indicated and conditions existing at time of installation.
c. Colors: Provide color of exposed joint sealants to comply with the following:

I. Provide selections made by University’s Representative from manufacturer's full range of standard colors for products of type indicated.
1. Elastomeric Glazing Sealant Standard: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer indicated that comply with ASTM C 920 requirements indicated on each Elastomeric Glazing Sealant Product Data Sheet at the end of this Section, including those referencing ASTM classifications for Type, Grade, Class and Uses.
a. Additional Movement Capability: Where additional movement capability is specified in Elastomeric Glazing Sealant Product Data Sheet, provide products, when tested for adhesion and cohesion under maximum cyclic movement per ASTM C 719, with the capability to withstand the specified percentage change in the joint width existing at time of installation and remain in compliance with other requirements of ASTM C 920 for uses indicated.
2. Glazing Sealant for Fire-Resistant Glazing Products: Identical to product used in test assembly to obtain fire-resistive rating.

J. Miscellaneous Glazing Materials:
1. General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials involved for glazing application indicated, and with a proven record of compatibility with surfaces contacted in installation.
2. Cleaners, Primers and Sealers: Type recommended by sealant or gasket manufacturer.
3. Setting Blocks: Elastomeric material with a Shore A durometer hardness of 85 plus or minus 5.

4. Spacers: Elastomeric blocks or continuous extrusions with a Shore A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine glass framing, with glazier present, for compliance with the following:
   1. Manufacturing and installation tolerances, including those for size, squareness, offsets at corners.
   2. Presence and functioning of weep system.
   3. Minimum required face or edge clearances.
   4. Effective sealing between joints of glass-framing members.
   5. Do not proceed with glazing until unsatisfactory conditions have been corrected.

B. Preparation: Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings that are not firmly bonded to substrates.

C. Glazing, General:
   1. Comply with combined recommendations of manufacturers of glass, sealants, gaskets, and other glazing materials, except where more stringent requirements are indicated, including those in referenced glazing publications.
   2. Glazing channel dimensions as indicated on Drawings provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
   3. Protect glass from edge damage during handling and installation as follows:
      a. Use a rolling block in rotating glass units to prevent damage to glass corners. Do not impact glass with metal framing. Use suction cups to shift glass units within openings; do not raise or drift glass with a pry bar. Rotate glass lites with flares or bevels on bottom horizontal edges so edges are located at top of opening, unless otherwise indicated by manufacturer's label.
      b. Remove damaged glass from Project site and legally dispose of off site. Damaged glass is glass with edge damage or other imperfections that, when installed, weaken glass and impair performance and appearance.
   4. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.
   5. Install elastomeric setting blocks in sill rabbets, sized and located to comply with referenced glazing standard, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
   6. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
   7. Provide spacers for glass sizes larger than 50 united inches (length plus height) as follows:
      a. Locate spacers inside, outside, and directly opposite each other. Install correct size and spacing to preserve required face clearances, except where gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and comply with system performance requirements.
      b. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
   8. Provide edge blocking to comply with requirements of referenced glazing publications, unless otherwise required by glass manufacturer.
   9. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.

D. Sealant Glazing (Wet):

1. Install continuous spacers between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel weep systems until sealants cure. Secure spacers in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.
2. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.
3. Tool exposed surfaces of sealants to provide a substantial wash away from glass. Install pressurized gaskets to protrude slightly out of channel to eliminate dirt and moisture pockets.

E. Protection and Cleaning:
1. Protect exterior glass from breakage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels, and clean surfaces.
2. Protect glass from contact with contaminating substances resulting from construction operations including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove them immediately as recommended by glass manufacturer.
3. Examine glass surfaces adjacent to or below exterior concrete at frequent intervals during construction, but not less than once a month, for build-up of dirt, scum, alkali deposits, or stains, and remove as recommended by glass manufacturer.
4. Remove and replace glass that is broken, chipped, cracked, abraded, or damaged in any way, including natural causes, accidents and vandalism, during construction period.
5. Wash glass on both faces in each area of Project not more than 4 days prior to date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended by glass manufacturer.

END OF SECTION

SECTION 08 9100 – LOUVERS

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Louvers, frames, and accessories.

1.02 REFERENCE STANDARDS

AAMA 611	Voluntary Specification for Anodized Architectural Aluminum; American Architectural Manufacturers Association
AAMA 2604	Voluntary Specification, Performance Requirements and Test Procedures for High Performance Organic Coatings on Aluminum Extrusions and Panels
AAMA 2605	Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels
AMCA 500-L	Laboratory Methods of Testing Louvers for Rating; Air Movement and Control Association International, Inc.
AMCA 511	Certified Ratings Program Product Rating Manual for Air Control Devices
ASTM A653/A653M	Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
ASTM A666	Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
ASTM B209	Aluminum and Aluminum-Alloy Sheet and Plate
ASTM B209M	Aluminum and Aluminum-Alloy Sheet and Plate [Metric]
ASTM B221	Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
ASTM B221M	Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes [Metric]

1.03 SUBMITTALS

A. See Section 01 3300 – Submittal Procedures.

B. Product Data: Provide data describing design characteristics, maximum recommended air velocity, design free area, materials, and finishes.

C. Shop Drawings: Indicate louver layout plan and elevations, opening and clearance dimensions, tolerances; head, jamb, and sill details; blade configuration, screens, blank-out areas required, and frames.

D. Samples: Submit two samples 2 by 2 inches in size illustrating finish and color of exterior and interior surfaces.

E. Test Reports: Independent agency reports showing compliance with specified performance criteria.

F. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

G. Maintenance Data: Include lubrication schedules, and adjustment requirements.

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this section, with minimum three years of documented experience.

1.05 WARRANTY

A. Provide twenty-year manufacturer warranty against distortion, metal degradation, and failure of connections.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. Wall Louvers:
   1. Airolite Company, LLC
   2. American Warming and Ventilating
   3. Construction Specialties, Inc
   4. Pottorff
   5. Or ENGINEER-approved equal.

2.02 LOUVERS

A. Louvers: Factory fabricated and assembled, complete with frame, mullions, and accessories; AMCA Certified in accordance with AMCA 511.
   1. Wind Load Resistance: Design to resist positive and negative wind load of 25 psf without damage or permanent deformation.
   2. Intake Louvers: Design to allow maximum of 0.01 oz/sq. ft water penetration at calculated intake design velocity based on design air flow and actual free area, when tested in accordance with AMCA 500-L.
   3. Drainable Blades: Continuous rain stop at front or rear of blade aligned with vertical gutter recessed into both jambs of frame.
   4. Screens: Provide insect screens at intake louvers and bird screens at exhaust louvers.
   5. Hinged Units: Provide secondary frame to which louver frame is attached; non-ferrous hinges.

B. Stationary Louvers: Horizontal blade, extruded aluminum construction, with intermediate mullions matching frame.
   1. Free Area: 50 percent, minimum.
   2. Static Pressure Loss: 0.15 inch wg maximum per square foot of free area at velocity of 1000 fpm, when tested in accordance with AMCA 500-L.
   3. Blades: Straight.
   4. Frame: 4 inches deep, channel profile; corner joints mitered and, with continuous recessed caulking channel each side.
   5. Metal Thickness: Frame 0.081 inch; blades 0.081 inch.
   6. Finish: Color anodized; finish welded units after fabrication.
   7. Color: As scheduled.

C. Operable Louvers: Operable horizontal blades, extruded aluminum construction.
   1. Free Area: 50 percent, minimum.
   2. Static Pressure Loss: 0.15 inch wg maximum per square foot of free area at velocity of 1000 fpm, when tested in accordance with AMCA 500-L.
   3. Operation: Gravity balanced, 90-degree opening. with adjustment device to permit setting for varying differential static pressure.
   4. Operation: Actuator provided in HVAC control system.
   5. Movable Blades: Straight, pivoted at, with vinyl, rubber, or polyethylene blade edge and jamb seals; rattle-free linkage.
   6. Fixed Blades: Straight.
   7. Frame: 4 inches deep, channel profile; corner joints mitered and, with continuous recessed caulking channel each side.

8. Metal Thickness: Frame 0.081 inch; blades 0.081 inch.
9. Finish: Color anodized; finish welded units after fabrication.
10. Color: As scheduled.

D. Acoustical Louvers: Horizontal blade, formed aluminum sheet construction.
1. Sound Attenuation: Minimum sound transmission loss of 10 db at 63 Hz, when tested in accordance with ASTM E90.
2. Free Area: 50 percent, minimum.
3. Static Pressure Loss: 0.15 inch wg maximum per square foot of free area at velocity of 1000 fpm, when tested in accordance with AMCA 500-L.
4. Blades: Straight, sloped at 45 degrees, with insulating material in cavity, lower surface covered with perforated sheet metal of same type as blades.
5. Metal Thickness: Frame 0.081 inch; blades 0.081 inch.
6. Finish: Color anodized; finish welded units after fabrication.

2.03 MATERIALS

A. Extruded Aluminum: ASTM B221 (ASTM B221M)
1. Color Anodizing: AAMA 611 Class I, AA-M12C22A42/44.
2. Clear Anodizing: AAMA 611 Class I, AA-M12C22A41.

B. Formed Aluminum: Formed sheet, ASTM B209 (ASTM B209M).
1. Color Anodizing: AAMA 611 Class I, AA-M12C22A42/44.
2. Clear Anodizing: AAMA 611 Class I, AA-M12C22A41.

C. Steel Sheet: Hot-dipped galvanized steel sheet, ASTM A653/A653M, with G90/Z275 coating.

D. Stainless Steel: ASTM A666 Type 304, soft temper, smooth surface, No. 4 finish.

E. Bird Screen: Interwoven wire mesh of steel, 0.063-inch diameter wire, ½-inch open weave, diagonal design.

F. Insect Screen: 18 x 16 size aluminum mesh.

G. Polyvinylidene Fluoride Coating: Minimum 70 percent Kynar 500/Hylar 500 resin, two-coat finish, complying with AAMA 2604.

H. Primer: Zinc chromate, alkyd type.

2.04 ACCESSORIES

A. Blank-Off Panels: Same material as louver, painted black on exterior side; provide where duct connected to louver is smaller than louver frame, sealing off louver area outside duct.

B. Screens: Frame of same material as louver, with reinforced corners; removable, screw attached; installed on inside face of louver frame.

C. Fasteners and Anchors: Galvanized steel.

D. Flashings: Of same material as louver frame, formed to required shape, single length in one piece per location.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Verify that prepared openings and flashings are ready to receive work and opening dimensions are as indicated on shop drawings.

B. Verify that field measurements are as indicated.

3.02 INSTALLATION

A. Install louver assembly in accordance with manufacturer's instructions.

B. Coordinate with installation of flashings by others.

C. Install louvers level and plumb.

D. Align louver assembly to ensure moisture shed from flashings and diversion of moisture to exterior.

E. Secure louver frames in openings with concealed fasteners.

F. Install perimeter sealant and backing rod in accordance with manufacturer’s instructions, unless instructed otherwise.

G. Coordinate with installation of mechanical ductwork.

H. Coordinate with installation of louver actuators.

3.03 ADJUSTING

A. Adjust operable louvers for freedom of movement of control mechanism. Lubricate operating joints.

3.04 CLEANING

A. Strip protective finish coverings.

B. Clean surfaces and components.

3.05 SCHEDULES

A. Aeration Building - South Wall: Intake acoustical louver, hinged bird screen, prefinished to match adjacent window frames.

END OF SECTION

SECTION 09 2200 – SUPPORTS FOR PLASTER AND GYPSUM BOARD

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install furring and lath at Portland Cement plaster, sheet underlayment and related cement plaster and metal accessories in accordance with the Contract Documents.

1.02 RELATED WORK

A. Section 09 29 00 – Gypsum Board

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 33 00 – Submittal Procedures.

B. Product Data: Manufacturer's published literature containing complete description for lath, metal accessories.

C. Samples Metal Accessories: As requested by ENGINEER.

1.04 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements of SFBC Article 25, except as otherwise specified.

B. Industry Standards: Comply with applicable requirements of ASTM C847 and ASTM C1068.

C. The manufacture shall provide a 2-year equipment warranty.

1.05 DELIVERY, STORAGE AND HANDLING

A. Protect metal lath, metal suspension materials and metal accessories from dampness or wetting.

B. Comply with the additional requirements specified in Section 01 62 00 – Product Options.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. Furring and Lathing Materials: Amico, Cemco, United States Gypsum, Western Metal Lath or ENGINEER approved equal.

2.02 METAL COMPONENTS

A. Rib Lath: Expanded galvanized-steel sheets, 3.4 pounds per square yard, with 3/8-inch ribs and Kraft paper backing conforming to FS UU-B-790z, Type I, Grade D.

B. Flat Expanded Lath: ASTM C847; self-furring diamond mesh, 2.4 pounds per square yard. Provide with indentations 3½ inches horizontally and maximum 2 inches vertically, or with ¼-inch self-furring groove rolled lengthwise of sheet at maximum 6 inches on center, to hold mesh ¼-inch away from supporting surface.

C. Reinforcing Lath: Fabricate from copper-bearing steel and weighing not less than 2.5 pounds per square yard.

D. Metal Accessories:

1. General:
   a. Except as otherwise specified, products shall conform to material for accessories of ASTM C1063.
   b. Shapes Used as Grounds: Size and dimension to provide for required plaster thicknesses.

c. Flanges:
   1) Design to permit complete embedment of accessory in plaster thickness.
   2) Provide for alignment and attachment to underlying surface.
d. Provide in maximum possible lengths.
e. Where dimension or profile, is deferred to Drawings and information is not on the Drawings confer with ENGINEER to determine required dimension or profile.
f. Although several manufacturers are listed, endeavor to use products of a single manufacturer to the greatest extent possible.

2. Casing Beads: Model SFC by Stockton Products or ENGINEER approved equal.
3. External Corner Aids: Form from expanded-metal lath with flanges at least 2½ inches wide; "KwickCorner: with "EPKote" by K-Lath, Stockton Products or ENGINEER approved equal. Except where specified do not use corner beads.
4. External Corner Beads: Small, rigid nosed, not exceeding 3/16-inch, with expanded flange at least 2½ inches wide.
5. Control Joints:
   a. Return Lip Type with Removable Tape: No. XJ15-3 by Western Metal Lath or ENGINEER approved equal.
   b. Narrow "V" type, Model NVS by Stockton products or ENGINEER approved equal.
6. Expansion Joints: Variable, 2-piece No. 40 by Western Metal Lath or ENGINEER approved equal.
7. Drip Screed
8. Foundation: No. 7 by Stockton Products or ENGINEER approved equal.
   a. Soffit: No. 5 Drip by Stockton Products or ENGINEER approved equal.
   b. Soffit Vent: Stockton Products or ENGINEER approved equal. Width as indicated on the Drawings.
9. Reveals: As indicated on the Drawings.

E. Fasteners: Powder-driven fasteners and screws as recommended by finish material manufacturer.

F. Provide miscellaneous components required for completion of installation.

G. Protective Finishes: Galvanize all metal lath, furring and ferrous items, unless otherwise indicated.

1. Fabricate metal lath and furring from galvanized sheet steel complying with ASTM A 653.
2. Galvanize inserts, hangers, channels and other similar items by the hot-dip process ASTM A 123.
3. Touch up abraded protective finishes with one (1) coat of rust-inhibitive primer at site before installation.

H. Tie Wire: ASTM A 641 0.0625-inch nominal diameter minimum (No. 16 W&M gauge).

2.03 UNDERLAYMENT AND FLASHING

A. Sheet Underlayment: Asphalt-saturated Kraft paper complying with FS UU-B-790a, Type I, Grade D, Style 2, 60-minute; "Super Jumbo Tex" by Fortifiber Corp. or ENGINEER approved equal.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine supporting structure and conditions under which metal lath and furring will be installed.

B. Verify that support framing is spaced in accordance with code requirements.

3.02 INSTALLATION OF UNDERLAYMENT AND FLASHING

A. Sheet Underlayment:

1. Apply one (1) layer of specified underlayment over sheathing.
   a. Securely staple to substrate.
   b. Apply horizontally over entire surface in shingle fashion, lapping courses minimum 3 inches.
   c. Stagger vertical joints.
2. Install additional layer of underlayment paper in 19-inch-wide strip at internal and external building corners. Saddle over top of parapets and walls.
3. Lap vertical joints minimum 6 inches.
4. Securely staple to substrate.

3.03 INSTALLATION OF METAL LATH

A. General: Comply with requirements of “Plaster and Lathing Systems Manual.”

1. Install furring and lathing in accordance with ASTM C 1063.
2. Install interior furring and lathing in accordance with ASTM C 841.

B. Rib Lath:

1. Install at soffits and similar horizontal surfaces.
2. Secure to framing backup with screws or staples, keeping away from surface of paper underlayment.
3. Stagger ends of lath to avoid continuous joints on same support. Lap ends at supports.
4. Lap at sides at least ½-inch and at ends at least 1-inch.

C. Flat Expanded Lath:

1. Apply lath over underlayment with long dimension at right angles to supports, attaching to each support at 6-inch intervals.
2. Secure with pan-head, noncorrosive screws of sufficient length to penetrate through underlayment if lath is not self-furring.
3. Stagger ends of lat to avoid continuous joints on same support. Lap ends at supports.
4. Lap at sides at least ½-inch and at ends at least 1-inch.

3.04 INSTALLATION OF METAL ACCESSORIES

A. General:

1. Fasten in place using wire ties, galvanized staples or power fasteners as required to prevent dislodging or misalignment by subsequent operations. Corner aid and control and reveal joints shall be wire tied or power fastened.
2. Fasten at both ends and maximum 12 inches on center along sides.
3. Bring grounding edge of accessories to true lines, plumb, level and straight.
4. Install accessories to provide required depth of plaster and to bring plaster surface to required plane.
5. Connect lengths of accessories to assure a continuous line.
6. Where plaster abuts dissimilar materials, terminate with plaster casing bead.

7. Install accessory beads to provide minimum 1/8-inch clearance between structural units and termination point of surface to receive plaster finish.
8. Provide diagonal strip reinforcing at corners of windows and other openings.

B. Control, Expansion and Reveal Joints:

1. Install at locations and at spacing shown on the Drawings by wire tying to metal lath. If not shown, space control joints, as directed by Architect or Engineer, so as to provide plaster panels not exceeding 144 square feet, with no dimension exceeding 18-feet or a length-to-width ratio of 2½:1.
2. Set control joints to serve as grounds for plaster.
3. Expansion Joints: Install double studs. Do not cut underlayment.

C. Cornerite:

1. Install at plastered interior angles where both converging wall surfaces are plastered.
2. Do not install:
   a. Where metal lath continues onto converging surfaces of an angle at least 4 inches.
   b. Where juncture of abutting surfaces is to be unrestrained.
3. Fasten along outer edges of lat only to secure firmly in position.
4. Fasten to lath only not to structural framing.

D. Corner Beads: Provide at plastered external angles where plastered on both sides of angles.

E. External Corner Aids: Provide at external angles where plastered on both sides of angles.

F. Weep Screeds:

1. Install foundation weep screed at bottom of walls.
2. Install soffit weep screed where indicated on the Drawings.

END OF SECTION

SECTION 09 2900 – GYPSUM BOARD

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install all the gypsum wallboard finish complete with related metal components, accessories, and finish surfaces in accordance with the Contract Documents.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Test Reports: Submit copies of fire test report on fire rated wallboard assemblies. Submit copies of evidence of fire hazard classification for wallboard. Certified test reports of other acceptable testing agencies, which perform testing in accordance with ASTM E119, E84 and E90 are acceptable.

C. Certificates: Furnish manufacturer's certification that materials meet or exceed Specification requirements.

D. Manufacturer's Instruction: Furnish manufacturer's printed instructions for installation of assemblies.

E. Samples: Provide sample of texture finishes for Architect's approval.

1.03 QUALITY ASSURANCE

A. Manufacturers: Wallboard components shall be as manufactured by U.S. Gypsum Company, Domtar Gypsum, National Gypsum Company, Georgia-Pacific, or Flintkote Blue Diamond. It is intended that all materials furnished be a part of a single system, whether it be supplied by one or several manufacturers.

B. ASTM C840, C754, and GA216, insofar as any portions are applicable, are hereby made a part of this Specification as though repeated herein. In case of conflicts, the more stringent requirements shall govern.

C. The manufacture shall provide a 2-year equipment warranty.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Deliver wallboard materials in manufacturer's unopened containers, packages or bundles identified with manufacturer's name, brand, type, and grade. Store inside dry areas and protect from dampness and deterioration. Protect redi-mixed products from freezing and protect metal accessories from rusting. Remove damaged or deteriorated materials from the premises.

B. Deliver fire-rated materials bearing testing agency label and required fire classification number.

1.05 JOB CONDITIONS

A. Temperature and humidity conditions: Do not install wallboard unless installation areas comply with the minimum temperature and ventilation requirements recommended by the manufacturer.

B. Protection: Protect work installed by other trades previous to work under this Section. Replace any work damaged without added cost. Provide closures for exterior openings, where required. Room temperature during installation of wallboard shall not be less than 50°F with adequate ventilation maintained to eliminate excessive moisture until joint compound is completely dry. Protect wallboard from wetting and replace any damaged material.

C. Provide ventilation during and following adhesives and joint treatment applications. Use temporary air circulators in enclosed areas lacking natural ventilation. Under slow drying conditions, allow additional drying time between coats of joint treatment. Protect installed materials from drafts during hot, dry weather.

PART 2 – PRODUCTS

2.01 GYPSUM WALLBOARD

A. Regular Wallboard: ASTM C36 or FS SS-L-30, Type III, Grade R, Class I 5/8-inch thickness, tapered edge.

B. Fire Rated Wallboard: ASTM C36, Type X or FS SS-L-30, Type III, Grade X, Class I 5/8-inch thickness, tapered edge.

C. Water Resistant Wallboard: ASTM C630, Type X, Grade R, 5/8-inch thickness, tapered edge.

D. Backing Board: ASTM C442, Type X, Grade R or FS SS-L-30, Type IV, Grade R or X, Class I 5/8-inch thickness, square, tongue and grooved edge.

E. Exterior Wallboard: U.S. Gypsum Company exterior gypsum ceiling board, ½-inch thickness or conforming to ASTM C931.

2.02 GYPSUM ACCESSORIES

A. Corner Bead Reinforcement: ANS CB 114 x 114

B. Metal Edge Reinforcement: ANS L12 or L58; or ANS U12 or U58

C. Control Joint: U.S. Gypsum Company, No. 093

2.03 FASTENERS

A. Nails: Annular ring shank nail GWB 54, ASTM C514:

1. 1¼-inch for ½-inch wallboard
2. 13/8-inch for 5/8-inch wallboard or smooth shank nail
3. 13/8-inch for ½-inch wallboard
4. 1½-inch for 5/8-inch wallboard

B. Screws: Self-drilling, self-tapping, bugle head for use with power driven tool.

1. Type S for application to light gauge metal framing minimum 1-inch
2. Type 9-12 for application to heavy gauge metal framing conforming to ASTM C646
3. Type W for application to wood framing minimum 1½-inch single layer 15/8-inch double layer conforming to ASTM C894
4. Type G for wallboard to wallboard application minimum 1½-inch ASTM C893.

C. Staples: Number 16 USS gauge flattened galvanized wire staples with 7/16-inch wide crown outside measure and divergent point for first ply only of 2-ply gypsum wallboard application.

1. 1-inch long legs for 3/8-inch thick gypsum wallboard
2. 1-inch long legs for ½-inch thick gypsum wallboard
3. 1¼-inch long legs for 5/8-inch thick gypsum wallboard

2.04 LAMINATING ADHESIVES

A. Wallboard to Wood or Metal Framing: U.S. Gypsum Durabond 200 or 300 or conforming to ASTM C557 for wood framing.

B. Wallboard to Wallboard: U.S. Gypsum Durabond 600.

C. Wallboard to Coreboard or Sound Deadening Boards: U.S. Gypsum Durabond 600.

D. Wallboard to Concrete or Masonry: U.S. Gypsum Durabond 500.

2.05 SUSPENDED CEILING COMPONENTS

A. Furring Channels: Type DWC as manufactured by U.S. Gypsum Company or rigid furring channels conforming to ASTM C645.

B. Main Runner Channels: Cold rolled sections 1½-inch formed of No. 16 gauge steel painted with rust inhibiting paint.

C. Hanger Wires: Sizes specified double annealed and galvanized conforming to FS OO-W-461, Type I.

2.06 FINISHING MATERIALS

A. Joint treatment system shall be Perf-A-Tape joint system consisting of:
   1. Perf-A-Tape reinforcement tape
   2. Perf-A-Tape all-purpose ready-mixed compound for embedding, fill and finishing

B. Joint treatment system shall consist of:
   1. Joint tape shall be perforated conforming to ASTM C475 or FS SS-J-570, Type II
   2. Joint compound shall be powdered or ready-mixed conforming to ASTM C475 or FS SS-J-570, Type I. Taping and topping joint compound or all-purpose joint compound may be used.

2.07 TEXTURE FINISH

A. Wall texture material shall be light orange peel finish.

PART 3 – EXECUTION

3.01 INSTALLATION – SUSPENDED CEILINGS

A. Except where otherwise indicated, provide 1½-inch main runner channels spaced on 4-foot centers and metal furring channels spaced on not over 16-inch centers. Neither main runners nor cross furring shall be let into nor come in contact with abutting masonry walls or partitions. Locate a main runner within 6-inch of the wall to support the ends of the furring channels and locate hangers to support the ends of the main runners.

B. Where main runners or furring channels are spliced, overlap the ends not less than 8 inches and securely tie near each end of the splice with two (2) loops of 16-gauge galvanized wire.

C. Suspend main runners from structure above with one No. 9 hanger wire for each 12 square feet of ceiling area. All wire hangers shall be of such length so that the lower ends may be saddle tied or wrapped around the main runners so as to prevent turning or twisting of the runners.

D. At steel beams joists or other steel construction wrap hangers around, inset through or clip or bolt to the supports, so as to develop the full strength of the hangers.

E. For wood construction, inset wire hangers in holes drilled, a minimum of 3 inches above bottom of joists and with the upper end of the hanger in each case, twisted 3 times around itself or attach wire hangers to 30D nails, driven on a downward slant into sides of joists, allowing 3-inch penetration into the wood, driving nails at least 5 inches from bottom edges and not over 36 inches o.c. with the upper end of the hanger in each case twisted 3 times around itself or use four (4) 1½-inch No. 9 gauge wire staples, to secure hangers to the sides of the joists, driving staples horizontally or on a downward slant 3 inches near the upper edge of the loop and the fourth to fasten the loose end.

F. For cast-in-place concrete, install hanger wires in the formwork using double looped hangers. Special insets, at least equivalent in strength to the hangers to which the hangers can later be attached, may be inserted through, or attached to the top of the forms in lieu of anchoring the hangers directly in the concrete.

G. Securely clip metal furring channels to main runners using furring channel clips or saddle tie with 2 strands of 16-gauge tie wire. Install furring channel clips on alternate sides of the main runner channel.

H. Lights or other openings that interrupt the main runner or furring channels reinforce grillage with ¾-inch cold rolled channels, wire tied atop and parallel to the main runner channels.

I. Apply wallboard with long dimension at right angles to the furring channels, with all abutting ends and edges occurring over the web surface of the furring channel. Use wallboard of maximum possible length to minimize end joints. Neatly fit and stagger end joints. Install wallboard with 1-3/8-inch screws spaced 8 inches o.c. in the field of the board, at all bearings and along abutting edges. Install control joints as specified below for walls.

J. Where indicated for wallboard applied direct to bottom chord of steel joist, install rigid furring channels at right angles to joists located on 16-inch centers. Attach using clips or with two strands of 16-gauge tie wire.

3.02 INSTALLATION – WALLS

A. Apply wallboard with long dimension at right angles to framing or furring members with all abutting ends and edges occurring over stud flanges. Use wallboard of the maximum practical length to minimize end joints. Neatly fit and stagger end joints. Arrange joints on opposite sides of the partition so as to occur on different studs. Cut wallboard neatly to fit around all openings. The wallboard is to extend within ¼-inch of the floor.

B. Wherever wallboard terminates against dissimilar materials or where edges of wallboard are exposed, install metal edge reinforcement as specified. At all outside corners, install metal corner bead reinforcement as specified.

C. Install control joint over face of wallboard panels. Cut end joints square, butt together and align to provide neat fit. Attach control joint to wallboard with Bostitch 9/16” Type G Staples spaced not over 6 inches on center in each flange. Locate in accordance with USG Gypsum Construction Handbook, 2nd Edition.

D. At metal studs apply wallboard using screws spaced a maximum of 12 inches o.c. in the field of the board and 12 inches o.c. along the abutting end joints 8 inches o.c. at rated walls.

E. At wood framing, apply wallboard with double nailing method. Apply first nails spaced 12 inches o.c. with the second nails in close proximity (2 inches). Nails shall not be staggered on adjoining edges or ends. While the nails are being driven, hold the wallboard in firm contact with the underlying support. Nail from central portion of the wallboard toward ends and edges. Nails shall be driven home with the heads slightly below the surface of the wallboard, in a dimple formed by the driving tool stubbing the last blow. A nail set shall not be used and care shall be taken to avoid breaking the paper face.

F. Where W/R wallboard is used, coat all cut edges and fastener heads with USG sheetrock W/R sealant. Treat all cut edges, utility holes and joints, including those at angle intersections prior to installation. Treat fastener heads after installation.

G. Remove any excess of sealant or smears as work progresses.

H. Provide perimeter relief where non-load bearing wallboard partitions abut structural decks or ceilings or vertical structural elements. Allow not less than ¼-inch nor more than ½-inch gap between wallboard and structure. Finish edges of wallboard face layer with square nose metal casing head and caulk space between casing bead and structure with continuous sealant bead. Attach wallboard to studs not less than ½-inch below bottom edge of ceiling track flanges and to first stud adjacent to vertical tracks. Do not attach wallboard directly to tracks.

I. Where wallboard partitions intersect masonry walls, provide control joint no less than ¼-inch, nor more than ½-inch wide between wallboard and masonry. Finish exposed edges of wallboard with square nose metal casing bead and caulk space between casing bead and masonry with continuous sealant bead.

J. Install exterior ceiling board allowing 1/16-inch to 3/8-inch space between butt and ends of board. Fasten to supports with screws spaced 12 inches o.c. or nails spaced 8 inches o.c. For metal framing use 1-inch Type S screws. For wood framing use 1¼-inch Type W screws or 1½-inch galvanized box or aluminum nails. Conceal panel joints by installing panels with ends installed into aluminum H moldings. Fasten H moldings to support with screws spaced 12 inches o.c. or nails spaced 8 inches o.c.

3.03 FINISHING

A. Reinforce wall and ceiling angles and inside vertical corner angles with tape folded to conform to the adjoining surface and to form a straight, true angle. Apply a thin uniform layer of compound, approximately 3 inches wide, under and over the tape in the angle joint to be reinforced. Center tape over all joints to be reinforced and seal into the compound, leaving sufficient compound under the tape to provide proper bond. Apply a skim coat of compound immediately after embedding tape. Clean excess compound from the wallboard surface. After drying, cover embedding compounds with an additional coat of compound.

B. Allow joints to dry thoroughly (minimum 24 hours) between each application of compound.

C. All joints shall have tape embedded, filled, and finished using specified compound.

D. Cover fill coat with compound spread evenly over and slightly beyond the tapered edge of the board, feathered at the edges with a smooth uniform slight crown over the joint. All dimples at fastener heads shall receive 3 coats of compound in succession as used in joints.

E. Conceal flanges of all metal corner and edge reinforcing by at least 2 coats of compound. When completed, the compound shall extend approximately 8 inches to 10 inches on either side of the exposed metal nosing.

F. Sand all coats as necessary after each application of compound has dried. The final coat and subsequent sanding shall leave all wallboard and treated areas uniformly smooth and ready to receive the decoration, to the extent that after painting of wallboard there shall be no distinguishable difference in appearance between taped and untapped surface.

G. At areas of Wonderboard, fill all joints and corners with pre-sanded dry set or latex Portland Cement mortar into which embed a 2-inch-wide coated glass fiber tape using a skim coat of mortar.

H. Apply wall texture to all exposed walls, except walls to receive wall coverings and toilets, upon completion of finishing specified above. Surfaces shall be free of dust, dirt, and oil before application. Mix material in a clean power mixer with water in the ratio of 5 gallons per 45-pound bag for a period of 10 minutes. After mixing, add additional water to yield desired consistency. Use as heavy a mixture as practical and avoid over thinning of the material. Apply material using spray equipment capable of developing sufficient pressure to produce a fine sand texture finish.

END OF SECTION

SECTION 09 3000 - CERAMIC TILE

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish and install all ceramic tile and related items, in accordance with the Contract Documents.

B. Color Selection for tile and grout by Owner.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 013300 – Submittals.

B. Furnish Master Grade Certificate for all tile before installation bearing the Certification Mark of the TCA, signed by the manufacturer stating the type and quantity of the material.

C. Furnish manufacturer's printed instructions for use of latex Portland Cement and mortar.

D. Extra stock: Provide 2 cartons of ceramic tile for future use.

1.03 QUALITY ASSURANCE

A. Standards: Materials, preparation and installation shall conform to ANSI Standards as listed and the detailed installation instructions of the material manufacturer insofar as applicable.

B. Installation of Ceramic Tile with Portland Cement Mortar: ANSI A 108.1

C. Installation of Ceramic Tile with Organic Adhesive: ANSI A 108.4

D. Installation of Ceramic Tile with Dry-Set Mortar: ANSI A 108.5

E. Referenced Specifications, insofar as any portions are applicable, are hereby made a direct part of this Specification as though repeated herein.

1.04 PRODUCE DELIVERY, STORAGE AND HANDLING

A. Deliver tile to the job in unopened cartons sealed with a grade seal-bearing name of manufacturer and the words "Standard Grade" printed thereon.

B. Manufactured mortars and grouts shall contain hallmark certifying compliance with referenced standards and be types recommended by tile manufacturer for specific applications.

C. Adhesives shall be in containers labeled with hallmark certifying compliance with referenced standards.

D. Organic adhesive containers to bear hallmark of either adhesive and sealant council or TCA certifying compliance with ANSI A 136.1.

E. Deliver mastic grout ready for use.

F. Delivery dry-set mortar in sealed, moisture proof containers.

G. Store materials under cover in manner to prevent damage or contamination.

1.05 JOB CONDITIONS

A. Set and grout tile in epoxy or Portland cement mortar when surface temperature is at least 50 degrees Fahrenheit and rising.

B. Comply with minimum temperature recommendations of manufacturer's for bonding and grouting materials in other than Portland cement mortar.

C. Protect adjoining work surfaces before tile work begins.

1.06 INSPECTION

A. Inspect surfaces to receive tile before staring installation. Notify the DESIGN/BUILDER in writing of any defects or conditions that will prevent satisfactory tile installation. Starting of work will imply acceptance of surfaces to receive tile.

B. Close areas in which tile is being set to traffic and other work. Keep closed until tile is firmly set, minimum time of 3 days. Protect tile work from damage until acceptance.

PART 2 - PRODUCTS

2.01 MATERIALS

A. All this shall be domestic manufacture, Standard Grade, meeting the requirements of SPR-R-61 of the U.S. Department of Commerce and shall comply with ANS A 137.1. TCA Certification mark shall appear on each carton label.

B. Floor tile shall be Standard Grade, Unglazed Dust Pressed Porcelain Type, not less than ¼-inch thick with cushion edges and in nominal face sizes of 2-inch x 2-inch in colors selected. Tile shall comply with Section 5.1 of ANSI A 137.1. Provide all necessary shapes and trimmers of similar tile as required.

C. Wall tile shall be Standard Grade Glazed Tile not less than 5/16 inches thick with cushion edges, a colored matt glazed finish and in nominal face sizes of 4¼-inch x 4¼-inch. Provide spacer lugs or other similar features on edges of tile. Tile shall comply with Section 6.1 of ANSI A 137.1. Provide a A3401 base member at junction of floor and at internal corners ABL/R 3401 and ACL/4 3401 as applicable. At restrooms, provide contrasting color tile band in accordance with interior elevations.

D. Portland Cement: ASTM C 150, Type I

E. Aggregate: ASTM C 144 for mortar and grout

F. Hydrate Lime: ASTM C 206 or C 207, Type S

G. Water: Potable

H. Reinforcing: 2-inch x 2-inch, 16/6 gauge welded wire mesh

I. Membrane: 15-pound felt or 4-mil polyethylene film, furnish and install under this Section.

J. Glazed Tile Grout: Provide samples

K. Floor Tile Grout: Hydroment colored to match tile or darker than tile as selected from samples by Owner.

L. Dry Set Mortar: ANSI A 118-1

M. Latex Portland Cement Mortar: ANSI A 118.4

N. Organic Adhesive: ANSI A 136.1, Type I

O. Expansion Joints: Includes control, contraction and isolation joints

P. Sealant: Two (2) components complying with ASTM C 920, Type M, Class 25, Grade NS for joints in vertical services; Grade P. Use T for joints in horizontal surfaces.

Q. Back-up: Flexible compressible type of closed cell foam polyethylene or butyl rubber, rounded at surface to contact sealant, as shown in TCA details and as recommended by sealant manufacturer. It shall fit neatly into the joint without compacting and to such a height to allow a sealant depth of ½ the width of the joint. Sealant shall not bond to the back up material.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Floors:

1. Install floors using Portland Cement mortar in accordance with ANSI A 108.1 and TCA methods F-111-85 over precast concrete or F-112-85 over cast-in-place concrete. Membrane is to be furnished and installed as a part of the work of this Section, Method F-111 just prior to tile installation.
2. Install floors using dry set mortar in accordance with ANSI A 108.5 and TCA method F-113-85.
3. Grout tile with specified grout, slightly depressed.
4. Slope floors uniformly to floor drains where required.
5. Provide expansion joints, control joints, contraction joints and isolation joints in accordance with TCA Method EJ-711-85.

B. Walls:

1. Install wall tile in organic adhesive in accordance with ANSI A-108.4 and TCA methods W-242-85 (metal studs) or W-223-85 (masonry and concrete).
2. Align all joints in wall tile vertically and horizontally.
3. Grout all tile with specified grout.
4. Provide expansion joints, control joints, contraction joints and isolation joints in accordance with TCA Method EJ-711-85.
5. Expansion Joints include control, contraction and isolation joints
6. Provide joints in all ceramic tile surfaces in accordance with TCA method EJ-711-85.
7. Joint width shall be ¼-inch minimum. Joints through tile and mortar directly over structural joints in the backing must be at least the width of the structural joints.

C. Installation:

1. Set back up when mortar is placed or utilize removable wood strip to provide space for back up after mortar has cured.
2. Install sealant after tile work and grout are dry. Follow sealant manufacturer's recommendations.

3.02 CLEANING AND PROTECTION

A. Clean tile after grouting and protect from other trades. Cure all ceramic tile floors for a minimum of 72 hours.

END OF SECTION

SECTION 09 5113 – ACOUSTICAL PANEL CEILINGS

PART 1 – GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general conditions of Contract, including General and Supplementary Conditions and Divisions-1 Specification sections apply to work of this section.

1.02 SUMMARY

A. Section Includes:
   1. Acoustical ceiling panels.
   2. Exposed grid suspension system.
   3. Wire hangers, fasteners, main runners, cross tees, and wall angle moldings.

B. Alternates: Submittals which do not provide adequate data for the product evaluation will not be considered. The proposed substitution must meet all requirements of this section, including but not necessarily limited to, the following: Panel design, size, composition, color, and finish; Suspension system component profiles and sizes; Compliance with the referenced standards.

1.03 REFERENCES

A. American Society for Testing and Materials (ASTM):
   1. ASTM A 1008 Standard Specification for Steel, Sheet, Cold Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
   2. ASTM A 641 Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.
   3. ASTM A 653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process.
   4. ASTM C 423 Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
   5. ASTM C 635 Standard Specification for Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.
   6. ASTM C 636 Recommended Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels.
   7. ASTM E 84 Standard Test Method for Surface Burning Characteristics of Building Materials.
   8. ASTM E 1414 Standard Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum.
   9. ASTM E 1111 Standard Test Method for Measuring the Interzone Attenuation of Ceilings Systems.
   10. ASTM E 1264 Classification for Acoustical Ceiling Products.
   11. ASTM E 1477 Standard Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers.
   12. ASTM D 3273 Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber.
   13. ASTM E 119 Standard Test Methods for Fire Tests of Building Construction and Material.

1.04 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 013300 - Submittals.

B. Product Data: Submit manufacturer's technical data for each type of acoustical ceiling unit and suspension system required.

C. Shop Drawings: Layout and details of acoustical ceilings. Show locations of items which are to be coordinated with, or supported by the ceilings.

D. Certifications: Manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards. For acoustical performance, each carton of material must carry an approved independent laboratory classification of NRC, CAC, and AC.

1.05 QUALITY ASSURANCE

A. Single-Source Responsibility: Provide acoustical panel units and grid components by a single manufacturer.

B. Fire Performance Characteristics: Identify acoustical ceiling components with appropriate markings of applicable testing and inspecting organization.
   1. Surface Burning Characteristics: As follows, tested per ASTM E 84 and complying with ASTM E 1264 for Class A products.
      a. Flame Spread: 25 or less
      b. Smoke Developed: 50 or less

C. Handle acoustical ceiling units carefully to avoid chipping edges or damaged units in any way.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver acoustical ceiling units to project site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.

B. Before installing acoustical ceiling units, permit them to reach room temperature and a stabilized moisture content.

C. Handle acoustical ceiling units carefully to avoid chipping edges or damaged units in any way.

1.07 PROJECT CONDITIONS

A. Environmental Requires:
   1. Verify weathertightness of area receiving suspension system prior to installation.
   2. Wet trades work to be thoroughly dry and complete prior to installation.
   3. Installation to begin only when temperature and humidity conditions closely approximate interior conditions which will exist when area is complete and occupied.
   4. Heating and air conditioning systems to be operating prior to, during, and after installation.

1.08 WARRANTY

A. Acoustical Panel: Submit a written warranty executed by the manufacturer, agreeing to repair or replace acoustical panels that fail within the warranty period. Failures include, but are not limited to:
   1. Acoustical Panels: Sagging and warping
   2. Grid System: Rusting and manufacturer's defects

B. Warranty Period:
   1. Acoustical panels: Ten (10) years from date of substantial completion.
   2. Grid: Ten (10) years from date of substantial completion.
   3. Acoustical panels and grid systems with HumiGuard Plus or HumiGuard Max performance supplied by one source manufacturer is fifteen (15) years from date of substantial completion.

C. The Warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with

other warranties made by the CONTRACTOR under the requirements of the Contract Documents.

1.09 MAINTENANCE

A. Extra Materials: Deliver extra materials to Owner. Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.
   1. Acoustical Ceiling Units: Furnish quality of full-size units equal to 5.0 percent of amount installed.
   2. Exposed Suspension System Components: Furnish quantity of each exposed suspension component equal to 2.0 percent of amount installed.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. Ceiling Panels:
   1. Armstrong World Industries, Inc. or equal.

2.02 ACOUSTICAL CEILING UNITS

A. Acoustical Panels Type ACT-1:
   1. Surface Texture: Medium
   2. Composition: Mineral Fiber
   3. Color: White
   4. Size: 48in X 24in X 3/4in or as shown on the plans.
   5. Edge Profile: Square Lay-In for interface with Prelude ML 15/16" Exposed Tee.
   6. Noise Reduction Coefficient (NRC): ASTM C 423; Classified with UL label on product carton, 0.50.
   7. Ceiling Attenuation Class (CAC): ASTM C 1414; Classified with UL label on product carton, 35
   8. Articulation Class (AC): ASTM E 1111; Classified with UL label on product carton N/A.
   9. Flame Spread: ASTM E 1264; Class A (UL)
   10. Light Reflectance (LR): ASTM E 1477; White Panel: Light Reflectance: 0.87.
   11. Dimensional Stability: HumiGuard Plus - temperatures up to 120 degrees F and high humidity excluding only exterior use, use over standing water, and direct contact with moisture .
   12. Mold/Mildew Inhibitor: The front and back of the product have been treated with BioBlock, a paint that contains a special biocide that inhibits or retards the growth of mold or mildew, ASTM D 3273.
   13. Acceptable Product: Armatuff, 860 as manufactured by Armstrong World Industries or equal.

2.03 SUSPENSION SYSTEMS

A. Components: All main beams and cross tees shall be commercial quality hot-dipped galvanized (galvanized steel, aluminum, or stainless steel) as per ASTM A 653. Main beams and cross tees are double-web steel construction with type exposed flange design. Exposed surfaces chemically cleansed, capping pre-finished galvanized steel (aluminum or stainless steel) in baked polyester paint. Main beams and cross tees shall have rotary stitching (exception: extruded aluminum or stainless steel).
   1. Structural Classification: ASTM C 635 Intermediate Duty.
   2. Color: White and match the actual color of the selected ceiling tile, unless noted otherwise.
   3. Acceptable Product: Prelude ML 15/16" Exposed Tee as manufactured by Armstrong World Industries, Inc.

B. High Humidity Finish: Comply with ASTM C 635 requirements for Coating Classification for Severe Environment Performance where high humidity finishes are indicated.
   1. SS Prelude Plus by Armstrong World Industries, Inc. - 100% Type 304 STAINLESS Steel.
   2. AL Prelude Plus by Armstrong World Industries, Inc. - all ALUMINUM
   3. Prelude Plus XL Fire Guard by Armstrong World Industries, Inc., G-60 Hot dipped galvanized /aluminum capping
   4. Structural Classification: ASTM C 635 duty class.
   5. Color: By Architect and Owner

C. Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.

D. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper, pre-stretched, with a yield stress load of at least time three design load, but not less than 12 gauge.

E. Edge Moldings and Trim: Metal or extruded aluminum of types and profiles indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations, including light fixtures, that fit type of edge detail and suspension system indicated. Provide moldings with exposed flange of the same width as exposed runner.

F. Accessories.

PART 3 – EXECUTION

3.01 EXAMINATION

A. Do not proceed with installation until all wet work such as concrete, terrazzo, plastering and painting has been completed and thoroughly dried out, unless expressly permitted by manufacturer's printed recommendations. (Exception: HumiGuard Max Ceilings)

3.02 PREPARATION

A. Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less than half width units at borders, and comply with reflected ceiling plans. Coordinate panel layout with mechanical and electrical fixtures.

B. Coordination: Furnish layouts for preset inserts, clips, and other ceiling anchors whose installation is specified in other sections.
   1. Furnish concrete inserts and similar devices to other trades for installation well in advance of time needed for coordination of other work.

3.03 INSTALLATION

A. Install suspension system and panels in accordance with the manufacturer's instructions, and in compliance with ASTM C 636 and with the authorities having jurisdiction.

B. Suspend main beam from overhead construction with hanger wires spaced 4-0 on center along the length of the main runner. Install hanger wires plumb and straight.

C. Install wall moldings at intersection of suspended ceiling and vertical surfaces. Miter corners where wall moldings intersect or install corner caps.

D. For reveal edge panels: Cut and reveal or rabbet edges of ceiling panels at border areas and vertical surfaces.

E. Install acoustical panels in coordination with suspended system, with edges resting on flanges of main runner and cross tees. Cut and fit panels neatly against abutting surfaces. Support edges by wall moldings.

3.04 ADJUSTING AND CLEANING

A. Replace damaged and broken panels.

B. Clean exposed surfaces of acoustical ceilings, including trim, edge moldings, and suspension members. Comply with manufacturer's instructions for cleaning and touch up of minor finish damage. Remove and replace work that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION

SECTION 09 5300 – ACOUSTICAL CEILING SUSPENSION ASSEMBLIES

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Suspended metal grid ceiling system.

1.03 SUBMITTALS

A. Product Data: Submit manufacturer's specifications listing dimensions, load carrying capacity and compliance with specified standards, with project conditions and materials clearly identified or detailed for each required system.

B. Test and Evaluation Reports: From ICC-ES

C. Manufacturers' Instructions: For installation

D. Qualification Statements: For installer

1.04 QUALITY ASSURANCE

A. Installer's Qualifications: A firm that has successfully completed a minimum of five (5) previous projects similar in nature, size, and extent to this Project; is familiar with special requirements indicated; and has complied with requirements of authorities having jurisdiction

1.05 FIELD CONDITIONS

A. Verify weather tightness of area to receive suspension system prior to installation.

B. Wet trades work to be thoroughly dry and complete prior to installation.

C. Installation to begin only when temperature and humidity conditions closely approximate interior conditions which will exist when area is complete and occupied.

D. Heating and air conditioning systems to be operating prior to, during, and after installation.

PART 2 – PRODUCTS

2.01 MANUFACTURERS Products of following manufacturers form basis for design and quality intended.

1. Armstrong World Industries Inc, Lancaster, PA (ICC-ES ESR-1289). Product: Prelude XL, 15/16.

B. Or equal as approved in accordance with Division 01, General Requirements for substitutions.

2.02 SUSPENSION SYSTEM MATERIALS

A. Grid: ASTM C635, Armstrong Prelude Heavy Duty XL 15/16".
   1. Main Runners:
      a. Armstrong: Heavy Duty Prelude XL 7301, exposed T
   2. Cross Tees – "Stake-on end", Stepped End:
      a. Armstrong: XL7328 (24-inch grid), XL7341 (48 inch grid)
   3. Edge Trim:
      a. Armstrong Angle Molding: 7800, 7/8", Prelude with adapter clip,

2.2.1 REGULATORY REQUIREMENTS

A. Comply with IBC.

B. Nonstructural components permanently attached to buildings, and their supports and attachments, shall be designed and constructed to withstand the effects of earthquake motions in accordance with ASCE/SEI 7 with all the modifications incorporated in IBC Section 1616A. The seismic design category shall be determined in accordance with IBC Section 1613A.

C. Post installed anchors in concrete used for component anchorage shall be pre-qualified for seismic applications in accordance with ACI 355.2 or ICC-ES AC193, except that anchors pre-qualified for seismic applications need not be governed by the steel strength of a ductile steel element.

D. Power actuated fasteners in concrete or steel shall not be used for sustained tension loads or for brace applications in Seismic Design Categories D, E, or F unless approved for seismic loading, except as follows:
   1. Power actuated fasteners may be used in concrete where the service load on any individual fastener does not exceed 90 lbs.
   2. Power actuated fasteners may be used in steel where the service load on any individual fastener does not exceed 250 lbs.

E. Metal suspension systems shall be designed in accordance with ASTM E 580 Section 5.2.8.8 and the requirements of IBC Section 1615A.1.16, 13.5.6.2.1 and 13.5.6.2.2, or be designed in accordance with ASCE/SEI 7 Section 13.2.1.1, or be seismically qualified in accordance with ASCE/SEI 7 Sections 13.2.5 or 13.2.6.

F. Metal suspension systems in Seismic Design Categories D, E, and F shall be designed and installed in accordance with ASTM C 635, ASTM C 636, and ASTM E 580, Section 5 as modified by IBC Section 1615A.1.16, 13.5.6.2.2.
   1. Exit Ways: Ceiling assemblies in exit Ways of hospitals and essential services buildings shall be installed with a main runner or cross runner surrounding all sides of each piece of tile, board or panel and each light fixture or grille. A cross runner that supports another cross runner shall be considered as a main runner for the purpose of structural classification. Splices or intersections of such runners shall be attached with through connectors such as pop rivets, screws, pins, plates with end tabs or other approved connectors.

2. Corridors and Lobbies: Expansion joints shall be provided in the ceiling at intersections of corridors and at junctions of corridors and lobbies or other similar areas.
3. Panels: Panels weighing more than 1/2 pounds per square foot shall be positively attached to the ceiling suspension runners.
4. Lateral force bracing: Lateral force bracing is required for all ceiling areas except that they shall be permitted to be omitted in rooms with floor areas 144 square feet or less when perimeter support in accordance with ASTM E 580 Sections 5.2.2 and 5.2.3 are provided and perimeter walls are designed to carry the ceiling lateral forces.
5. Ceiling fixtures: Fixtures shall be mounted in a manner that will not compromise ceiling performance.
    a. All recessed or drop-in light fixtures and grilles shall be supported directly from the fixture housing to the structure above with a minimum of two 12 gage wires located at diagonally opposite corners. Leveling and positioning of fixtures may be provided by the ceiling grid. Fixture support wires may be slightly loose to allow the fixture to seat in the grid system. Fixtures shall not be supported from main runners or cross runners if the weight of the fixtures causes the total dead load to exceed the deflection capability of the ceiling suspension system.
    b. Fixtures shall not be installed so that the main runners or cross runners will be eccentrically loaded.
    c. Surface-mounted fixtures shall be attached to the main runner with at least two positive clamping devices made of material with a minimum of 14 gage. Rotational spring catches do not comply. A 12 gage suspension wire shall be attached to each clamping device and to the structure above.
6. Partitions: Where the suspended ceiling system is required to provide lateral support for the permanent or relocatable partitions, the connection of the partition to the ceiling system, the ceiling system members and their connections, and the lateral force bracing shall be designed to support the reaction force of the partition from prescribed loads applied perpendicular to the face of the partition. Partition connectors, the suspended ceiling system and the lateral-force bracing shall all be engineered to suit the individual partition application and shall be shown or defined in the drawings or specifications.

2.03 PERFORMANCE CRITERIA

A. Metal suspension systems shall be qualified by current Evaluation Report from ICC-ES under AC368.

B. Main runners shall be classified as heavy duty in accordance with ASTM C 635.

2.04 MATERIALS

A. Steel Sheet: ASTM A 1008, CS Type B

B. Galvanized Steel Sheet: ASTM A 653, CS Type B, not less than G30 coating designation

C. Other Steel: Attachment devices and accessories shall be types and grades of steel as standard with manufacturer, in accordance with ICC-ES Evaluation Reports.

2.05 FABRICATION

A. Main and cross runners shall be inverted T-shape, double web, roll formed from minimum 0.018-inch-thick cold-rolled steel sheet, prepainted, or from galvanized steel sheet.

B. Provide manufacturer's standard edge moldings that fit acoustical panel edge details and suspension systems indicated and that match width and configuration of exposed runners unless otherwise indicated.

1. For edge moldings less than 2 inches wide, provide seismic clips as qualified by ICC ES Reports; Armstrong BERC 2, Chicago 1496, USG Donn ACM7, or approved equal.

C. Provide profiles and colors as noted in plans.

2.06 ACCESSORIES

A. Hanger Wire: ASTM A 641, Class 1 zinc coating, soft temper, size(s) to comply with requirements of ASCE/SEI 7 Section 13.5.6, ASTM C 636, and ASTM E 580, as applicable, but not less than 0.106 inch

B. Anchors: Fabricated from corrosion-resistant materials with holes or loops for attaching wire hangers and capable of sustaining, without failure, a load equal to 5 times that imposed by construction as determined by testing according to ASTM E 488 by an independent testing agency.
   1. Type: Post installed, expansion anchor.

C. Power Actuated Fasteners: Suitable for application indicated, fabricated from corrosion-resistant materials with clips or other devices for attaching hangers of type indicated, and capable of sustaining, without failure, a load equal to 10 times that imposed by construction as determined by testing according to ASTM E 1190 by an independent testing agency
   1. Power actuated fasteners shall be qualified by a current Evaluation Report, from ICC-ES, under AC70.

D. Miscellaneous Accessories: Manufacturer's standard accessory items including, but not limited to, support angles, corner caps, access angles, and moldings required for complete installation

PART 3 - EXECUTION

3.01 EXAMINATION Examine areas and substrates, with Installer present, and including cast-in anchors and structural framing, for compliance with requirements and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install in accordance with ASTM C 636, ASTM E 580 as modified by IBC, and manufacturer's instructions.

B. Install suspension system components in sizes and spacings indicated on Drawings, but not less than those required by referenced installation standards for assembly types and other assembly components indicated.

C. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.
   1. Suspend hangers from building structure as follows:
   2. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
   3. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, counters playing, or other equally effective means.
      a. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
   4. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards.

5. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
6. Do not attach hangers to steel roof deck.
7. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
8. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
9. Do not connect or suspend steel framing from ducts, pipes, or conduit.

D. Seismic Bracing:
1. Provide at a maximum of twelve (12) feet on center in both directions and a maximum of six (6) feet from each wall.
2. Provide four (4) No. 12-gauge wires secured to the main runner within two (2) inches of the cross runner intersection and splayed 90 degrees from each other at an angle not to exceed 45 degrees from the plane of the ceiling.
3. Provide a rigid strut fastened to the main runner at the location of the bracing wires, extended to and fastened to the structural members above.

E. Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

F. Installation Tolerances: Install suspension systems that are level to within 1/8 inch in 12 feet measured lengthwise on each member and transversely between parallel members.

END OF SECTION

SECTION 09 9100 – PAINTING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all labor, materials, equipment, and services required to do all painting (excluding items otherwise listed in the applicable Sections of Division 09 – Finishes), including preparation, priming, and protection of finished surfaces. An extensive and comprehensive painting job will be required and shall include all surfaces which normally are painted.

B. The intent of these Specifications is to obtain the material and workmanship necessary to produce an adequate and acceptable job, and is intended to describe the requirements for both shop and field painting.

C. The intent of this Specification Section is to include all items which are to receive painting and have not been included otherwise in these Specifications.

D. The intent of this Specification shall be to paint all exposed structural steel, miscellaneous ferrous metal, lintels, equipment, piping, all exterior masonry walls, and all other work obviously required or noted to be painted unless otherwise specified (see Section 2.01). The omission of minor items in the schedule of work shall not relieve the obligation to include such items where they come within the general intent of the Specifications as stated herein. All interior surfaces and equipment which have been previously painted shall be repainted or recoated following the proper surface preparation as shown on the Drawings.

E. Review and examine all Divisions and Sections of these Specifications for any additional painting requirements and/or additional surfaces or items to be painted.

F. Apply specified finish coats of paint to all pre-primed work and complete finishing system for unprimed work required to be painted.

G. Backprime, with specified interior first coat material all surfaces of finish trim which will be concealed after installation.

H. Apply specified finish coats of paint to all prepainted surfaces which require only a finish coat. Otherwise, the complete system (as given in Section 2.01) shall be administered.

1.02 RELATED WORK

A. Wherever detailed painting requirements are covered under an equipment or product Specification, the Specifications herein other Sections, govern with respect to surface preparation, paint materials, coats, thicknesses, and coverage.

1.03 ITEMS NOT REQUIRING FIELD PAINTING

A. All new galvanized and stainless steel surfaces (except where noted on Drawings).

B. Valves, fittings, and appurtenances in small diameter plastic piping (less than 3 inches).

C. Prefinished items.

D. Plain copper (except as required for color coding) and stainless steel.

E. Aluminum except where otherwise designated and required to prevent corrosion at contact with dissimilar materials.

F. Concrete floors except where noted.

G. Exterior concrete surfaces except where noted.

H. Finish hardware.

I. Concealed from view items (except where required for color coding) and surfaces, except as specified herein or where previously painted.

J. Packing glands and other adjustable parts and nameplates of mechanical equipment.

K. Mechanical equipment (i.e. pumps, blowers, actuators, etc.)

1.04 DEFINITIONS

A. The term “paint” as used herein includes enamels, epoxy, paints, sealers, fillers, emulsions, and other coatings.

B. MDMTPC = Minimum dry mil thickness per coat.

C. MDFT = Minimum dry film thickness.

D. SSPC = Steel Structures Painting Council.

1.05 QUALITY ASSURANCE

A. Qualification of Painters: All painting shall be done by qualified, skilled, experienced craftsmen. In the acceptance or rejection of completed painting, no allowance will be made for lack of skills on the part of the craftsmen.

B. Paint Labels: Labels on paint containers shall include the following:
   1. Manufacturer's name
   2. Generic type of paint
   3. Manufacturer's stock number
   4. Color
   5. Instructions for thinning where applicable

C. Field Quality Control: Paint film thickness shall be subject to measurement by electrometer, wet film gauge, low or high voltage meter, and/or ENGINEER approved measuring instruments. If dry film thickness is found to be less than specified, or coverage is not uniform, apply additional paint to correct the thickness or appearance at no additional cost to the OWNER.

D. Compatibility:
   1. Compatibility of all paints used is required. A compatible paint will be considered a paint which precludes adverse effects related to bonding, drying delamination, scaling, lifting, and bleeding.
   2. In cases where shop-applied primers and coatings on materials and equipment furnished by suppliers are products different from those described in the Specifications, compatibility shall be verified with the specified field-applied coating system.
   3. Where thinning is necessary, only the products of the manufacturer furnishing the paint, and products for thinning purposes only, will be allowed.

E. Thickness and Spreading Rates:
   1. Minimum dry mil thicknesses per coat (MDMTPC) and/or spreading rates in square feet per gallon shall be governed by the manufacturer's current data sheets or literature containing recommendations or instructions regarding these values. These recommended dry mil thickness and/or spreading rate values will be considered requirements to be met same as if set out herein these Specifications and Contract Documents. Do not exceed manufacturer's recommended coverage rates.
   2. The number of coats to be applied are specified herein and shall govern. Where the total dry film thickness is specified, this thickness shall govern over the MDMTPC.

1.06 PRODUCT DELIVERY, HANDLING AND STORAGE

A. Delivery: All materials shall be brought to the project site in the original sealed and labeled containers of the paint manufacturer. All labels shall be legible and intact at time of use.

B. Manufacturer's Instructions: Paint manufacturer's written instructions for proper surface preparation, mixing, thinning, application and drying shall be furnished with the paint, and strictly followed.

C. Storage of Materials:
   1. Store only acceptable materials on project site.
   2. Store only in a suitable and designated area restricted to the storage of paint materials and related equipment.
   3. Comply with all applicable health and fire regulations regarding the storage of paint materials.
   4. Storage of material shall comply with the manufacturer's specifications; however, storage shall be at a minimum temperature of 50°F.

D. Protection of Materials:
   1. Take all necessary precautions to ensure the safe storage and use of paint materials and the prompt and safe disposal of waste.
   2. Painting wastes shall be properly deposited in containers made for this purpose. Do not use plumbing fixtures for disposing of paints wastes.
   3. Take all necessary precautions to protect paint materials before, during and after application and to protect the finished work.

E. Replacement: In the event of damage to paint materials, immediately make all replacements necessary at no additional cost.

F. Product delivery, handling and storage shall be in accordance with Part 1 of this Specification.

1.07 JOB CONDITIONS

A. Environmental Requirements:
   1. Comply with manufacturer's recommendations as to the environmental conditions under which painting systems can be applied.
   2. Do not apply finish in areas where dust and/or mist is being generated.

B. Climatic Conditions: Paint shall not be applied if:
   1. The ambient temperature or temperature of the surface to be painted is below 50°F or below the temperature recommended by the paint manufacturer.
   2. The relative humidity is above 85 percent.
   3. The relative humidity is such that the paint will not dry properly in accordance with the manufacturer's instructions.

C. Projection:
   1. Protect with drop cloths, masking or other acceptable means all surfaces which could be damaged in function or appearance by paint, including surfaces not being painted concurrently and surfaces not to be painted.
   2. Hardware, accessories, fixtures, and similar items shall be removed and replaced after completion of painting.
   3. Spray painting will not be permitted when it will cause damage to adjacent of otherwise located surfaces.
   4. All paint splatters on glass shall be wiped off immediately.

PART 2 - PRODUCTS

2.01 PAINT SYSTEMS

A. General:
   1. All paints of a system shall be by one (1) manufacturer.
   2. "Lift" tests may be requested on various surfaces to be painted to assure bonding compatibility.
   3. Paints containing lead, or other "dangerous" materials, that surpass federal maximum levels shall not be allowed. Oil shall be pure boiled linseed oil.

2.02 COLORS

A. The manufacturer shall be able to furnish all paints for exposed surfaces in a wide range of colors including lighter and darker shades of these colors which may be selected on various surfaces, if not included in the following codes (also note, the below listed may be included in the requirements of the applicable Sections of Division 09 – Finishes):
   1. Safety Color Codes: Comply with Occupational Safety and Health Administration Standards, as applicable, regarding safety color codes.
   2. Piping Color Codes: Colors for process pipe coding shall be in accordance with these Specifications.

PART 3 - EXECUTION

3.01 INSPECTION

A. Examine surfaces scheduled to receive paint and/or coating finishes for conditions that will adversely affect application, permanence, or quality of work and which cannot be put into an acceptable condition through surface preparation.

B. Do not proceed with surface preparation or painting application until conditions are suitable.

C. If surfaces are not thoroughly dry or if they cannot be put in proper conditions to receive paint by customary cleaning methods, the painting applicators shall notify the ENGINEER in writing, requesting necessary corrections.

D. Review the specified or approved painting systems and bring any questions or doubts as to the proper performance to the ENGINEER. Otherwise, assume the responsibility for providing the desired results.

3.02 ACCEPTANCE OF SURFACES

A. The commencement of painting work in any area or space will be construed as acceptance of the surface as being satisfactory.

3.03 SURFACE PREPARATION

A. General:
   1. All surfaces shall be thoroughly cleaned and free of dust, rust, mill scale, loose paint, or oily materials.
   2. References to SSPC refer to Steel Structures Painting Council specifications.
   3. Surfaces shall be primed and/or treated, as specified, as soon after completion of surface preparation as practical, but in any event before any visible or detrimental corrosion or contamination can occur. A prepared surface, which becomes corroded or contaminated, shall be re-prepared before treating and/or priming.

B. Non-submerged Non-Galvanized Structural Steel: All new non-galvanized structural steel for non-submerged service shall have their surfaces prepared according to SSPC-SP6-63, Commercial Blast Cleaning.

C. Submerged Non-Galvanized Structural Steel: All new non-galvanized structural steel and fabricated metals for submerged service of high temperature service shall have their surfaces prepared according to SSPC-SP10-63T Near White Metal Blast Cleaning.

D. Unprimed Metal Surfaces: All unprimed metal surfaces and miscellaneous fabricated metals (exclusive of structural steel and galvanized metal) to be painted shall be thoroughly cleaned according to SSPC-SP2-63 Hand Tool Cleaning or SSPC-SP3-63 Power Tool Cleaning, unless specifically required elsewhere in these Specifications.

E. Non-Ferrous Metals: Non-ferrous metals surface preparation shall be not less than that required by the paint manufacturer.

F. Concrete and Masonry:
   1. All concrete and masonry surfaces shall be cleaned and free from loose particles.
   2. Concrete floors to be painted shall be etched with a 10 percent solution of muriatic acid. If the concrete surface is exceedingly dense, a greater strength acid or a second etching will be required. After etching for a minimum of 30 minutes, wash thoroughly with water to remove all traces of acid. Allow to thoroughly dry at least 72 hours.
   3. Submerged concrete to be coated shall have their surfaces prepared by a light sandblast (Brush Blast), to remove loose coating and provide a textured surface to enhance adherence of the new coating. No sandblasting shall be done on the job in areas containing pumps, motors or other equipment that could be damaged by infiltration of sand particles.

G. Wood Surfaces: Wood surfaces shall be thoroughly cleaned of all extraneous matter and all cracks, nail holes, and other defects properly filled and smoothed. Wood trim shall be sanded to fine finish and wiped clean of dust.

3.04 SHOP PRIMING

A. Shop priming shall be done with primers that are guaranteed by the equipment manufacturer to be compatible with the finish paints to be used.

B. The CONTRACTOR shall coordinate all paint materials supplied in the shop and field.

3.05 APPLICATION

A. On metal surfaces apply each coat of paint at the rate specified by the manufacturer to achieve the minimum dry mill thickness required. One gallon of paint as originally furnished by the manufacturer shall not cover a greater area when applied by spray gun than when applied un-thinned by brush. Deficiencies of film thickness shall be corrected.

B. On masonry, the application rates will vary according to surface texture; however, in no case shall the manufacturer's stated coverage rate be exceeded.

C. On porous surfaces, it shall be the painter's responsibility to achieve a protective and decorative finish either by decreasing the coverage rate of by applying additional coats of paint.

D. Evenly brush out each finish coat and permit to dry per manufacturer's recommendation before applying any subsequent coats.

E. All paints and catalogs shall be maintained at a minimum manufacturer's application temperature before applying.

F. Successive coats of paint shall be tinted so as to make each coat easily distinguishable from each other with the final undercoat tinted to a darker shade than the finish coat.

G. Finish surfaces shall not show brush marks or other irregularities. Undercoats shall be thoroughly and uniformly sanded with No. 00 sandpaper or equal to remove defects and provide a smooth even surface.

H. Painting shall be continuous and shall be accomplished in an orderly manner so as to facilitate inspection. Materials subject to weathering shall be prime coated as quickly as possible. Surfaces of exposed members that will be inaccessible after erection shall be cleaned and painted before erection.

I. All surfaces to be painted as well as the atmosphere in which painting is to be done shall be maintained at the conditions recommended by manufacturer by heating and ventilating, if necessary, until each coat of paint has hardened. Any defective paint shall be removed and the surface repainted.

J. Perform all required back priming work before items are installed.

3.06 REINSTALLATION OF REMOVED ITEMS

A. Following completion of painting in each space, promptly reinstall all items removed for painting, using only workmen skilled in the particular trade.

3.07 CLEANING

A. During the progress of Work, do not allow the accumulation of empty containers or other excess items except in areas specifically reserved for that purpose.

B. Take all precautions to prevent accidental spillage of paint materials. In the event of spilling, immediately remove all spilled materials and the waste and other equipment used to clean up the spill, and wash surfaces to their original undamaged condition.

C. Touch-up and restore finish where damaged.

D. Remove all trash and accumulated materials of a painting nature from premises at the completion of the Work.

E. Paint spots, oil or stains upon adjacent surfaces shall be removed. Any damage to Work of other trades or equipment caused from painting shall be made good at no additional expense.

F. Do not mark surface finish of items being cleaned.

G. Leave entire job clean (including paint storage space).

3.08 FINAL INSPECTION

A. Protect all painted surfaces against damage until the date of final acceptance of the Work.

B. Conduct a final inspection of all painting work and repaint or retouch any areas or surfaces found deficient in complying with these Specifications.

END OF SECTION

SECTION 09 9700 – SPECIAL COATINGS

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all labor, materials, equipment, and services required for accomplishing special coatings on equipment, tanks, or piping in accordance with these Specifications and Contract Documents.

1.02 SPECIAL NOTICE

A. Because there exists in this project corrosive agents in the liquids and, in certain areas, in the atmosphere, special coatings for protecting the select equipment, structures, and appurtenances are required. The service requirements of the coatings are harsh and only products with an extended history of successful application will be acceptable.

B. Wherever detailed coating/painting requirements are covered under an equipment or product specification, the Specifications herein, shall govern over those coating requirements, with respect to surface preparation, coat materials, coats, thickness, and coverage with the exception of manufacturer's supplied coatings and protection. Determine if the manufacturer's supplied coatings are adequate.

1.03 ACCEPTABLE PRODUCTS

A. Specified products are specified as the standard of quality. Products are listed to establish a minimum standard of quality. Equivalent materials of other manufacturers may be submitted on written approval of the ENGINEER. As part of the proof of quality and performance equivalency, the ENGINEER will require at the cost of the CONTRACTOR, certified test reports from a nationally known, reputable, and independent testing laboratory conducting comparative tests as directed by the ENGINEER between the product specified and the requested substitution.

B. Requests for substitution shall include manufacturer's literature for each product giving name, product number, and generic type, descriptive information, solids by volume, recommended dry film thickness and certified lab test reports showing results to equal the performance criteria of the products specified herein. All materials must meet all local, state, and Federal regulations including and not limited to the Air Quality Management District. In addition, a list of five projects shall be submitted in which each product has been used and rendered satisfactory service.

1.04 ITEMS REQUIRING SPECIAL COATING

A. See Coating Schedules as listed in PART 2 – PRODUCTS.

1.05 ITEMS NOT REQUIRING SPECIAL COATING

A. The metal surfaces of stainless steel, chromium plate, galvanized and aluminum that are not now coated will not require field coating. Do not apply coating over any code-required labels, glass items, gauges, and name plates. It is also important not to coat any moving parts or operating units, valves or stems, or any mechanical and electrical parts such as valve and damper operators, linkages. It is the contactor's responsibility to protect any surface that is not to receive a coating.

1.06 QUALITY ASSURANCE

A. Qualification of Coaters: Qualification of Coaters: All coating shall be done by qualified, skilled, and experienced craftsmen. In the acceptance or rejection of completed coating, no allowance will be made for lack of skills on the part of the craftsmen.
   1. SSPC-QP-1 Certified - Field Application to Complex Industrial and Marine Structures

2. SSPC-QP-3 Certified - Shop Painting Certification

B. Coating Labels: Labels on coating containers shall include the following:
   1. Manufacturer's name
   2. Generic type of coat
   3. Manufacturer's stock number
   4. Color
   5. Instructions for thinning where applicable

C. Field Quality Control: Coating film thickness shall be subject to measurement with electrometer, wet film gauge, low or high voltage meter and/or applicable measuring instruments acceptable to the ENGINEER. If dry film thickness is found to be less than specified, or coverage is not uniform, an additional coating to correct thickness or appearance at no additional cost shall be applied.

D. Compatibility:
   1. Compatibility of all coatings used shall be required. A compatible coating will be considered a coat, which precludes adverse effects related to bonding, drying delamination, scaling, lifting, and bleeding.
   2. In cases where shop-applied primers and coatings on materials and equipment furnished by suppliers are products different from those described in the Specifications, compatibility with the specified field-applied coating system shall be verified by the CONTRACTOR.
   3. Where thinning is necessary, only the products of the manufacturer furnishing the coating, and products for thinning purposes only, will be allowed.

E. Thickness and Spreading Rates:
   1. Minimum dry mil thickness per coat (MDMTPC) and/or spreading rates in square feet per gallon shall be governed by the manufacturer's current data sheets or literature containing recommendations or instructions regarding these values. These recommended dry mil thickness and/or spreading rate values will be considered requirements to be met same as if set out herein; these Do Not exceed manufacturer's recommended coverage rates.
   2. The number of coats to be applied are specified herein and shall govern. Where the total dry film thickness is specified, this thickness shall govern over the MDMTPC.

1.07 PRODUCT DELIVERY, HANDLING AND STORAGE

A. Delivery: All materials shall be brought to the job site in the original sealed and labeled containers of the coating manufacturer. All labels shall be legible and intact at time of use.

B. Manufacturer's Instruction: Coating manufacturer's written instructions for proper surface preparation, mixing, thinning, application and drying shall be furnished with the coating and strictly followed.

C. Storage of Materials:
   1. Store only acceptable materials on project site.
   2. Store only in a suitable and designated area restricted to the storage of coating materials and related equipment.
   3. Comply with all applicable health and fire regulations regarding the storage of coating materials.
   4. Storage of material shall comply with the manufacturer's specifications; however, storage shall be at a minimum temperature of 50°F.

D. Protection of Materials:
   1. Take all necessary precautions to ensure the safe storage and use of coating materials and the prompt and safe disposal of waste.
   2. Coating wastes shall be properly deposited in containers made for this purpose.
   3. Take all necessary precautions to protect coating materials before, during and after application and to protect the finished work.

E. Replacement: In the event of damage to coating materials, immediately make all replacements necessary to the approval of the ENGINEER and at no additional cost.

F. Product delivery, handling and storage shall be in accordance with Part 1 of this Section and the manufacturer's recommendations.

1.08 JOB CONDITIONS

A. Environmental Requirements:
   1. Comply with manufacturer's recommendations as to environmental conditions under which coatings and coating systems can be applied.
   2. Do not apply finish in areas where dust and/or mist is being generated.

B. Climatic Conditions: Coating shall not be applied if:
   1. The ambient temperature or temperature of the surface to be coated is below 50°F or below the temperature recommended by the coating manufacturer.
   2. The relative humidity is above 85 percent.
   3. The relative humidity is such that the coating will not dry properly in accordance with the manufacturer's instructions.

C. Protection:
   1. Protect with drop cloths, masking or other acceptable means all surfaces which could be damaged in function or appearance by coating, including surfaces not being coated concurrently and surfaces not to be coated.
   2. Hardware, accessories, fixtures, and similar items shall be removed and replaced after completion of coating.
   3. Spray coating will not be permitted when it will cause damage to adjacent or otherwise located surfaces.
   4. All coating splatters on glass shall be wiped off immediately.

PART 2 - PRODUCTS

2.01 COATING SYSTEMS FOR STEEL - STRUCTURAL, TANKS, ROOF DECKING, PIPE, AND EQUIPMENT

A. Exterior Exposed:
   1. System Type: Aromatic Urethane Zinc-rich Primer/Epoxy/Polyurethane.
   2. Surface Preparation: SSPC-SP 6.
   3. Primer:
      a. Sherwin Williams Corothane Galvapac 2K @ 3.0 – 5.0 mils DFT 2K 100 for Low VOC
      b. Tnemec Series 90-97 Tneme Zinc @ 2.5-3.5 0 mils DFT. 94 H2O for Low VOC
   4. Intermediate Coat:
      a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. 100 for Low VOC
      b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
   5. Finish Coat:
      a. Sherwin Williams Hi Solids Polyurethane @ 3.0 – 5.0 mils DFT. 250 or 100 for Low VOC

b. Series 1075 Endura-Shield II; 2.5 to 3.5 mils DFT. 1095 for Low VOC

6. Total DFT: 9.5 to 14.5 mils.

B. Interior Exposed:
1. System Type: Epoxy.
2. Surface Preparation: SSPC-SP 6.
3. Primer:
   a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
   b. Tnemec Series N69 Hi-Build Epoxoline II; 3.0 to 5.0 mils DFT. L69 for Low VOC
4. Finish Coat:
   a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
   b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
5. Total DFT: 7.0 to 11.0 mils.

C. Immersion, Potable Water:
1. System Type: Epoxy.
2. Surface Preparation: SSPC-SP 10.
3. Primer:
   a. Sherwin Williams Macropoxy 5500; 4.0 – 8.0 mils DFT.
   b. Tnemec Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
4. Intermediate Coat:
   a. Sherwin Williams Macropoxy 5500; 4.0 – 8.0 mils DFT
   b. Tnemec Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
5. Finish Coat:
   a. Sherwin Williams Macropoxy 5500; 4.0 – 8.0 mils DFT
   b. Tnemec Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
6. Total DFT: 12.0 to 18.0 mils.

Or

1. System Type: Ultra High Solids Epoxy.
2. Surface Preparation: Abrasive blast clean per SSPC-SP10, 2.5 – 4 mil profile
3. Primer:
   a. For stripe coat application to all welds and irregular surfaces.
   b. Sherwin Williams Macropoxy 5500; 4.0 – 6.0 mils DFT
   c. Tnemec Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
4. Finish Coat:
   a. For finish coat application over all surfaces.
   b. Sherwin Williams Sherplate PW or Duraplate UHS; 20.0 – 30.0 mils DFT
   c. Tnemec Series 20 or 22; 20.0 - 30.0 mils DFT.
5. Total DFT: 20.0 to 30.0 mils

D. Interior/Immersion, Severe Exposure to H2S:
1. System Type: Modified Epoxy.
2. Surface Preparation: White Metal Blast SSPC-SP 5 with minimum 3.0-mil profile.
3. Primer/Finish (One or More Coats):
   a. Sherwin Williams Duraplate 6100 or Novaplate 325; 30.0 – 40.0 mils DFT
   b. Tnemec Series 435 Perma-Glaze; 30.0 to 36.0 mils DFT.
4. Total DFT: 30.0 to 36.0 mils.

E. Marginally Prepared Surfaces (Maintenance, Non-Immersion, Interior):
1. System Type: Mastic epoxy, solvent or water based.
2. Surface Preparation: In accordance with manufacturer's instructions.

3. Primer:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Tnemec Series 27 WB Typoxy 4.0 to 6.0 mils DFT.
4. Finish Coat:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Tnemec Series 27 WB Typoxy 4.0 to 6.0 mils DFT.
5. Total DFT: 8.0 to 12.0 mils.

F. Marginally Prepared Surfaces (Maintenance, Non-Immersion, Exterior):
1. System Type: Mastic Epoxy/Polyurethane.
2. Surface Preparation: In accordance with manufacturer's instructions.
3. Primer:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Tnemec Series 27 WB Typoxy 4.0 to 6.0 mils DFT.
4. Finish Coat (Exterior):
    a. Sherwin Williams Hi Solids Polyurethane; 3.0 – 5.0 mils DFT; 250 or 100 for Low VOC
    b. Series 1075 Endura-Shield II; 2.5 to 3.5 mils. DFT 1095 for Low VOC
5. Total DFT: 6.5 to 9.5 mils.

G. Below Ground Pipe (Heat Resistant to 375 F and Corrosion Resistant):
1. System Type: Moisture Cure Urethane Zinc Rich Primer/Inorganic Hybrid water borne Epoxy
2. Surface Preparation: Near White Metal Blast SSPC-SP-10 with an angular anchor profile of 1-2 mils.
3. Primer:
    a. Sherwin Williams Corothane Galvapac 2K; 3.0 – 5.0 mils DFT. 100 for low VOC.
    b. Tnemec Series 90E-92 Tneme Zinc; 2.5 to 3.5 mils DFT.
4. Intermediate Coat:
    a. Sherwin Williams N/A
    b. Tnemec Series 1224 Epoxoline WB @ 4.0 – 8.0 mils DFT
5. Finish Coat:
    a. Sherwin Williams Sherglass FF; 8.0 - 16.0 mils DFT.
    b. Series 1224 Epoxoline WB; 4.0 – 8.0 mils DFT
6. Total DFT: 10.5 to 19.5 mils.

Or

1. System Type: Reinforced Novolac Epoxy
2. Surface Preparation: Near White Metal Blast SSPC-SP-10 with an angular anchor profile of 1-2 mils.
3. Primer:
    a. Sherwin Williams Epo Phen HT Coating; 7.0 - 9.0 mils DFT.
4. Finish Coat:
    b. Sherwin Williams Epo Phen HT Coating; 7.0 - 9.0 mils. DFT
5. Total DFT: 14.0 to 18.0 mils.

2.02 COATING SYSTEMS FOR FACTORY PRIMED STEEL - DOORS, FRAMES, AND MISCELLANEOUS EQUIPMENT

A. Interior Exposed:
1. System Type: Acrylic
2. Surface Preparation: Clean and dry
3. Primer: Factory primed
4. Field Primer:
   a. Sherwin Williams ProCryl Universal Primer; 2.0 - 4.0 mils DFT
   b. Tnemec Series 115 Uni Bond DF; 2.0 to 3.0 mils DFT.
5. Finish Coat:
   a. Sherwin Williams Shercryl HPA; 2.0 – 4.0 mils DFT. Pro Industrial Acrylic for low VOC.
   b. Tnemec Series 1029 Enduratone; 2.0 - 3.0 mils. DFT
6. Total DFT: 4.0 to 6.0 mils (on top of shop primer).

B. Exterior Exposed:
1. System Type: Inorganic Hybrid Water Based Epoxy/Polyurethane
2. Surface Preparation: Clean and dry.
3. Primer: Factory primed.
4. Field Primer:
   a. Sherwin Williams Pro Industrial WB Cat Epoxy B73; 3.0 – 5.0 mils DFT
   b. Tnemec Series 27 Typoxy WB; 3.0 - 5.0 mils DFT.
5. Finish Coat:
   a. Sherwin Williams Pro Industrial WB Acrolon 100 B65; 2.0 – 4.0 mils DFT.
   b. Tnemec Series 1075 Endura-Shield II; 2.5 - 3.5 mils. DFT 1095 for Low VOC
6. Total DFT: 5.5 to 8.5 mils (on top of shop primer).

2.03 COATING SYSTEMS FOR GALVANIZED STEEL AND NONFERROUS METAL - PIPE AND MISCELLANEOUS FABRICATIONS

A. Interior Exposure:
1. System Type: Acrylic
2. Surface Preparation: In accordance with manufacturer’s instructions and ASTM D6386
3. Primer:
   a. Sherwin Williams ProCryl Primer; 2.0 – 3.0 mils DFT
   b. Tnemec Series 115 Uni Bond DF; 2.0 - 3.0 mils DFT
4. Finish Coat:
   a. Sherwin Williams Shercryl HPA; 2.0 – 4.0 mils DFT. Pro Industrial Acrylic for low VOC.
   b. Tnemec Series 1029 Enduratone; 2 .0 - 3 .0 mils DFT.
5. Total DFT: 4 .0 to 6 .0 mils.

B. Exterior Exposure:
1. System Type: Acrylic
2. Surface Preparation: In accordance with manufacturer’s instructions and ASTM D6386
3. Primer:
   a. Sherwin Williams ProCryl Primer; 2.0 – 3.0 mils DFT
   b. Tnemec Series 115 Uni Bond DF; 2 .0 to 3 .0 mils DFT.

4. Finish Coat:
    a. Sherwin Williams Shercryl HPA; 2.0 – 4.0 mils DFT. Pro Industrial Acrylic for low VOC.
    b. Tnemec Series 1029 Enduratone; 2.0 to 3.0 mils. DFT
5. Total DFT: 4.0 to 6.0 mils

2.04 COATING SYSTEMS FOR DUCTILE OR CAST IRON - PIPE, PUMPS, AND VALVES

A. Interior Exposure:
1. System Type: Epoxy
2. Surface Preparation: In accordance with manufacturer's instructions
3. Primer:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
4. Finish Coat:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Series N69 Hi-Build Epoxoline II; 4.0 - 6.0 mils DFT. L69 for Low VOC
5. Total DFT: 8.0 to 12.0 mils.

B. Exterior Exposure:
1. System Type: Epoxy/Polyurethane.
2. Surface Preparation: In accordance with manufacturer's instructions.
3. Primer:
    a. Sherwin Williams Macropoxy 646; 4 – 8 mils DFT. M646 100 for Low VOC
    b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 - 6.0 mils DFT. L69 for Low VOC
4. Finish Coat:
    a. Sherwin Williams Hi Solids Polyurethane; 3.0 – 5.0 mils DFT. 250 or 100 for low VOC.
    b. Series 1075 Endura-Shield II; 2.5 - 3.5 mils DFT. 1095 for Low VOC
5. Total DFT: 6.5 to 9.5 mils

C. Below Ground:
1. System Type: Coal tar epoxy.
2. Surface Preparation: In accordance with manufacturer's instructions.
3. Prime/Finish Coat:
    a. Sherwin Williams Targuard Coal Tar Epoxy; 16 – 32 mils DFT. 100 for low VOC.
    b. Series 46H-413 Hi-Build Tneme-Tar; 14.0 - 20.0 mils DFT. Series 27 WB Typoxy for Low VOC.
4. Total DFT: 14.0 to 20.0 mils

D. Immersion, Potable Water:
1. System Type: Epoxy.
2. Surface Preparation: In accordance with manufacturer's instructions.
3. Primer:
    a. Sherwin Williams Macropoxy 5500; 4.0 – 6.0 mils DFT
    b. Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
4. Intermediate Coat:
    a. Sherwin Williams Macropoxy 5500; 4.0 – 6.0 mils DFT
    b. Series N140 Pota Pox Plus; 4.0 - 6.0 mils DFT. L140 for Low VOC.
5. Finish Coat:
    a. Sherwin Williams Macropoxy 5500; 4.0 – 6.0 mils DFT
    b. N69 Hi-Build Epoxoline II; 4.0 - 6.0 mils DFT. L140 for Low VOC

6. Total DFT: 12.0 to 18.0 mils

Or

1. System Type: Ultra High Solids Epoxy.
2. Surface Preparation: Abrasive blast clean per SSPC-SP10, 2.5 – 4 mil profile
3. Primer:
   a. For stripe coat application to all welds and irregular surfaces.
   b. Sherwin Williams Macropoxy 5500; 4.0 – 6.0 mils DFT
   c. Tnemec Series N140 Pota Pox Plus; 4.0 to 6.0 mils DFT. L140 for Low VOC
4. Finish Coat:
   a. For finish coat application over all surfaces.
   b. Sherwin Williams Sherplate PW or Duraplate UHS; 20.0 – 30.0 mils DFT
   c. Tnemec Series 20 or 22; 20.0 - 30.0 mils DFT.
5. Total DFT: 20.0 to 30.0 mils

E. Immersion, Severe Exposure to H2S:
1. System type: Modified Polyamine Ceramic Epoxy
2. Surface preparation: In accordance with manufacturer's recommendation.
3. Primer/Finish (One or more coats):
   a. Sherwin Williams Duraplate 6100 or Novaplate 325; 30 – 40 mils DFT
   b. Tnemec Series 431 Perma Glaze; 30-40 mils DFT
4. Total DFT: 30-40 mils.

2.05 COATING SYSTEMS FOR PVC

A. Interior Exposure:
1. System Type: Epoxy.
2. Surface Preparation: Scarify
3. Primer:
   a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. M646 100 for Low VOC
   b. Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
4. Finish Coat:
   a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. M646 100 for Low VOC
   b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
5. Total DFT: 8.0 to 12.0 mils.

B. Exterior Exposure:
1. System Type: Epoxy/Polyurethane.
2. Surface Preparation: Scarify.
3. Primer:
   a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. M646 100 for Low VOC
   b. Series N69 Hi-Build Epoxoline II; 4.0 - 6.0 mils DFT. L69 for Low VOC
4. Finish Coat:
   a. Sherwin Williams Hi Solids Polyurethane; 3.0 – 5.0 mils DFT. 250 or 100 for low VOC.
   b. Series 1075 Endura-Shield II; 2.5 to 3.5 mils. DFT. 1095 for Low VOC
5. Coating provided shall contain UV inhibitor.

2.06 COATING SYSTEMS FOR PRECAST CONCRETE AND CAST-IN-PLACE CONCRETE (REQUIRE WHERE INDICATED IN PLANS)

A. Exterior Exposed:
   1. System Type: Acrylic
   2. Surface Preparation: SSPC-SP 13/NACE 6. Clean and dry
   3. Primer:
      a. Sherwin Williams Loxon XP; 4.0 – 8.0 mils DFT
      b. Tnemec Series 180 W.B. Tneme-Crete; 4.0 to 8.0 mils DFT.
   4. Finish Coat:
      a. Sherwin Williams Loxon XP; 4.0 – 8.0 mils DFT
      b. Tnemec Series 180 W.B. Tneme-Crete; 4.0 to 8.0 mils DFT.
   5. Total DFT: 8.0 to 16.0 mils.

B. Below Grade:
   1. System Type: Coal tar
   2. Surface Preparation: SSPC-SP 13/NACE 6. Clean and dry
   3. Primer:
      a. Sherwin Williams Targuard Coal Tar Epoxy; 8.0 – 16.0 mils DFT. 100 for low VOC
      b. Series 46-465 H.B. Tnemecol. DFT 8.0 to 12.0 mils.
   4. Finish Coat:
      a. Sherwin Williams Targuard Coal Tar Epoxy; 8.0 – 16.0 mils DFT. 100 for low VOC
      b. Tnemec Series 46-465 H.B. Tnemecol. DFT 8.0 to 12.0 mils.
   5. Total DFT: 16.0 to 24.0 mils.

C. Interior Exposed:
   1. System Type: Epoxy
   2. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive Blast Cleaning
   3. Patching:
      a. Sherwin Williams Duraplate 2300 (as needed)
      b. Series 218 MortarClad (as needed)
   4. Primer:
      a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. M646 100 for Low VOC
      b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
   5. Finish Coat:
      a. Sherwin Williams Macropoxy 646; 4.0 – 8.0 mils DFT. M646 100 for Low VOC
      b. Tnemec Series N69 Hi-Build Epoxoline II; 4.0 to 6.0 mils DFT. L69 for Low VOC
   6. Total DFT: 8.0 to 12.0 mils.

D. Severe Service – Immersion, H2S Exposure or Chemical Corrosion Protection (Light to Heavy Abrasion):
   1. System I (H2S less than 50 ppm, Light Abrasion)
      a. System Type: Modified Epoxy.
      b. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive blast clean to ICRI 310.2, CSP 4 – 6. Surfacing and Patching:
         1) Sherwin Williams Duraplate 2300; 1/16 inch DFT
         2) Tnemec Series 218 MortarClad; 1/16 inch DFT (nominal 62.5 mils)

c. Primer/Finish (One or More Coats):
   1) Sherwin Williams Duraplate 6100; 1/16 inch DFT
   2) Tnemec Series 435 Perma-Glaze; 20.0 to 30.0 mils DFT

2. System II (H2S less than 100 ppm, Moderate to Heavy Abrasion)
   a. System Type: Modified Epoxy Mortar
   b. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive blast clean to ICRI 310.2, CSP 4 – 6. Patching:
      1) Sherwin Williams Duraplate 2300; As needed
      2) Tnemec Series 218 MortarClad; As Needed
   c. Series 434 Perma-Shield H2S; 1/8 inch DFT (nominal 125 mils)
3. System III (H2S more than 100 ppm, Moderate to Heavy Abrasion)
   a. System Type: Modified Epoxy Mortar.
   b. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive blast clean to ICRI 310.2, CSP 4 – 6. Patching:
      1) Sherwin Williams Duraplate 2300
      2) Tnemec Series 218 MortarClad; As Needed
   c. Mortar:
      1) Sherwin Williams Duraplate 6100; 1/8 inch DFT (nominal 125 mils)
      2) Series 434 Perma-Shield H2S; 1/8 inch DFT (nominal 125 mils)
   d. Finish (One or More Coats):
      1) Sherwin Williams Duraplate 6100; 20.0 – 30.0 mils DFT
      2) Series 435 Perma-Glaze; 20.0 - 30.0 mils DFT
4. System IV (H2S more than 100 ppm, Moderate to Heavy Abrasion)
   a. System Type: Semi Structural Epoxy
   b. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive blast clean to ICRI 310.2, CSP 4 – 6
   c. Surfacing:
      1) Sherwin Williams Duraplate 2300, ¼ inch DFT nominal 250 mils
   d. Finish (One or More Coats):
      1) Sherwin Williams Duraplate 6100; 125.0 – 150.0 mils DFT
5. Chemical Corrosion Protective Coating
   a. Surface Preparation: SSPC-SP 13/NACE 6. Abrasive blast clean to ICRI 310.2, CSP 4 – 6.
   b. Primer:
      1) Sherwin Williams Duraplate 235 PW, Phenalkamine Epoxy; 1-coat @ 4-8 mils DFT
   c. Finish (One or More Coats):
      1) Sherflex Elastomeric Urethane; Aromatic Hybrid Polyurethane; 1-coat @ 60-80 mils DFT

2.07 COATING SYSTEMS FOR CONCRETE BLOCK MASONRY

A. Exposed, indoors and outdoors, as shown.
   1. System: Acrylic, Concrete: High molecular weight acrylic coating material shall have a minimum solids content of 35 percent by volume. Prime coat shall be an acrylic filler and sealer for concrete surfaces.
      a. Prime coat (Filler/sealer), Tnemec 180 Tneme-Crete, Sanitile 100, or ENGINEER-approved equal.
      b. Finish coats (2 or more, DFT = 3 mils), Tnemec 180 Tneme- Crete, Carbocrylic 3359 MC (DFT = 6 mils) or ENGINEER-approved equal.

B. Submerged in wastewater, including all vertical masonry surfaces above waterline as shown.
   1. System: Epoxy Mortar: High-build, 3-componet amine cured epoxy mortar, shall have a solids content of 100 percent by volume, suitable for long-term immersion and atmospheric exposure to wastewater. Filler-resurfacer compound shall be a 3-component epoxy cementitious thin overlay material used to fill voids and rough areas and must feather-edge capable. Epoxy Glaze (finish) coat shall be a 100-percent-solids epoxy suitable for long-term immersion and atmospheric exposure to wastewater.
      a. Filler/Resurfacre thin Overlay (Thickness = minimum 1/16”), Tnemec 218 MortarClad, or ENGINEER-approved equal.
      b. Epoxy Mortar (DFT = 125 mils) Tnemec 434 Perma-Shield, or ENGINEER-approved equal.
      c. Finish coat (DFT = 15-20 mils), Tnemec 435 Perma-Glaze, or ENGINEER-approved equal.

C. Exterior surfaces, above grade.
   1. System: Waterproofing: Two coats of a clear, non-staining, silane-modified-siloxane masonry waterproofing material. The waterproofing system after application shall be provided with not less than a five-year warranty on the performance of the product.
      a. Where EPA Allows Solvents: Chemstop, "WB Heavy Duty”; Rainguard, "XS", Chemprobe / Prime a Pell H2O; or ENGINEER-approved equal.
      b. Where EPA Prohibits Solvents: Chemstop, "WB Regular / Heavy Duty"; Rainguard's "Blok-Lok"; Rainproof's "Chem-Trete #45", Chemprobe / Prime A Pell H2O; or ENGINEER-approved equal.
   2. Surfaces shall be cleaned with a chemical (approved by waterproofing manufacturer) cleaner and power wash. Surfaces shall be clean and dry before application of waterproofing. Method and rate of application shall be in accordance with manufacturer's published instructions. A manufacturer's representative shall be present during applications if necessary for warranty.

PART 3 - EXECUTION

3.01 INSPECTION

A. Examine surfaces scheduled to receive coating for conditions that will adversely affect application, permanence, or quality of work and which cannot be put into an acceptable condition through surface preparation.

B. Do not proceed with surface preparation or coating application until conditions are suitable.

3.02 ACCEPTANCE OF SURFACES

A. The commencement of coating work in any area or space will be construed as acceptance of the surface as being satisfactory.

3.03 PREPARATION AND APPLICATION

A. Preparation and application shall be in accordance with coating systems (PART 2).

3.04 FINAL INSPECTION

A. Protect all coated surfaces against damage until the date of final acceptance.

B. Conduct a final inspection of all coating work and recoat or retouch any areas or surfaces found deficient in complying with these Specifications.

3.05 PIPING IDENTIFICATION

A. All visible piping ¾-inch and greater which is accessible for maintenance and operations shall be color-coded and identified with appropriate identification markers. Direction of flow arrows are to be included with each identification mark unless otherwise specified.

B. Each marker shall be black lettering on a yellow or white background and have a clearly printed legend to identify the contents of the pipe.

C. Locations for pipe markers to be as follows:

1. Adjacent to each valve (except as plumbing fixtures and equipment).
2. At each branch and riser take-off.
3. At each pipe passage through wall, floor, and ceiling construction.
4. At each pipe passage to underground
5. On all horizontal pipe runs, marked every 30 feet.

3.06 PIPE COLOR CODE

A. All piping color coding shall follow the ANSI/ASME A13.1 Labeling guidelines.

END OF SECTION

SECTION 10 1400 – SIGNAGE

PART 1 – GENERAL

1.01 SECTION INCLUDES

A. Cash allowance for signs

B. Room and door signs

C. Interior directional and informational signs

D. Luminous egress path marking and other "glow-in-the-dark" signs

E. Emergency evacuation maps

F. Building identification signs

G. Plaque

H. Traffic signs

1.02 PRICE AND PAYMENT PROCEDURES

A. Room and door signs are not covered by the allowance.

B. Allowance amount covers purchase and delivery but not installation.

1.03 REFERENCE STANDARDS

A. 36 CFR 1191 - Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities; Final Rule; (ADA Standards for Accessible Design)

B. ANSI/ICC A117.1 - American National Standard for Accessible and Usable Buildings and Facilities; International Code Council

C. UL 1994 - Luminous Egress Path Marking Systems

1.04 SUBMITTALS

A. See Section 01 3300 – Submittal Procedures.

B. Product Data: Manufacturer's printed product literature for each type of sign, indicating sign styles, font, foreground and background colors, locations, overall dimensions of each sign.

C. Signage Schedule: Provide information sufficient to completely define each sign for fabrication, including room number, room name, other text to be applied, sign and letter sizes, fonts, and colors.
   1. When room numbers to appear on signs differ from those on the drawings, include the drawing room number on schedule.
   2. When content of signs is indicated to be determined later, request such information from Owner through Engineer at least 2 months prior to start of fabrication; upon request, submit preliminary schedule.
   3. Submit for approval by Owner through Engineer prior to fabrication.

D. Samples: Submit two samples of each type of sign, of size similar to that required for project, illustrating sign style, font, and method of attachment.

E. Selection Samples: Where colors are not specified, submit two sets of color selection charts or chips.

F. Verification Samples: Submit samples showing colors specified.

G. Manufacturer's Installation Instructions: Include installation templates and attachment devices.

H. Maintenance Materials: Furnish the following for Owner's use in maintenance of project.
   1. Curved Sign Media Suction Cups: One for each 100 signs; for removing media.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this section with minimum three years of documented experience.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Package signs as required to prevent damage before installation.

B. Package room and door signs in sequential order of installation, labeled by floor or building.

C. Store tape adhesive at normal room temperature.

1.07 FIELD CONDITIONS

A. Do not install tape adhesive when ambient temperature is lower than recommended by manufacturer.

B. Maintain this minimum temperature during and after installation of signs.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. Flat Signs:
   1. Best Sign Systems, Inc
   2. Cosco Industries (ADA signs); ADA Series 1
   3. Cosco Industries (non-ADA signs); Changeable Message Signs
   4. Inpro; Aspen produced in one-piece photopolymer media
   5. Mohawk Sign Systems, Inc
   6. Seton Identification Products
   7. Or ENGINEER-approved equal

B. Curved Signs:
   1. Vista System
   2. Or ENGINEER-approved equal

C. Dimensional Letter Signs:
   1. Cosco Industries; Cast Aluminum
   2. Inpro; S600-060
   3. Or ENGINEER-approved equal

D. Plaques:
   1. Cosco Industries; Cast Aluminum
   2. Or ENGINEER-approved equal

E. Photoluminescent Marking and Signage:
   1. Ecoglo, Inc; Guidance Strips
   2. Or ENGINEER-approved equal

2.02 SIGNAGE APPLICATIONS

A. Accessibility Compliance: All signs are required to comply with ADA Standards for Accessible Design and ANSI/ICC A 117.1 and applicable building codes, unless otherwise indicated; in the event of conflicting requirements, comply with the most comprehensive and specific requirements.

B. Room and Door Signs: Provide a sign for every doorway, whether it has a door or not, not including corridors, lobbies, and similar open areas.

1. Sign Type: Flat signs with engraved panel media as specified.
2. Provide "tactile" signage, with letters raised minimum 1/32-inch and Grade II braille.
3. Character Height: 1 inch.
4. Sign Height: 2 inches, unless otherwise indicated.
5. Office Doors: Identify with room numbers to be determined later, not the numbers shown on the drawings; in addition, provide "window" section for replaceable occupant name.
6. Conference and Meeting Rooms: Identify with room numbers to be determined later, not the numbers shown on the drawings; in addition, provide "window" section with sliding "In Use/Vacant" indicator.
7. Service Rooms: Identify with room names and numbers to be determined later, not those shown on the drawings.
8. Rest Rooms: Identify with pictograms, the names "MEN", "WOMEN", or “UNISEX” room numbers to be determined later, and braille.

C. Interior Directional and Informational Signs:
1. Sign Type: Same as room and door signs.
2. Sizes: As indicated on the drawings.
3. Allow for 20 signs 4 inches high by 16 inches long.
4. Wording of signs is scheduled on the drawings.
5. Where suspended, ceiling mounted, or projecting from wall signs are indicated, provide two-sided signs with same information on both sides.

D. Luminous Egress Path Marking and Other "Glow-in-the-Dark" Signs: Photoluminescent media.
1. Provide luminous egress path marking as required by local authority having jurisdiction.
2. Allow for total of 100 directional signs, approximately 6 inches square.
3. Allow for 1,000 linear feet of guidance strips.
4. Provide one numbered seat marker for each seat in auditorium and one numbered row marker for each row, each side of aisles.

E. Emergency Evacuation Maps:
1. Allow for one map per elevator lobby.
2. Map content to be provided by Owner.
3. Use clear plastic panel silk-screened on reverse, in brushed aluminum frame, screw-mounted.

F. Recognition/Donor Panels: Engraved panel media; individual name signs attached with magnetic tape to fixed panel.
1. Dimensions and Number of Name Signs: As indicated on the drawings.
2. Provide all name signs whether engraved or not, for uniform overall appearance.
3. Color: Color as selected.
4. Products:
   a. Inpro; S460 Donor Board
   b. Or ENGINEER-approved equal

G. Building Identification Signs:
1. Use individual metal letters.
2. Mount on outside wall in location shown on drawings.

H. Other Dimensional Letter Signs: Wall-mounted.
1. Exterior: Allow for total of 50 letters, 6 inches high, metal.
2. Interior: Allow for total of 50 letters, 6 inches high, metal.

I. Plaque: See Allowance for details.

J. Traffic Signs: To match campus standards; locate where indicated on the drawings.

2.03 SIGN TYPES

A. Flat Signs: Signage media without frame.
   1. Edges: Square.
   2. Corners: Square.
   3. Frame Finish: Natural (clear) anodized.
   4. Clear Cover: For customer produced sign media, provide clear cover of polycarbonate plastic, glossy on back, non-glare on front.
   5. Wall Mounting of One-Sided Signs: Tape adhesive.
   6. Wall and Ceiling Mounting of Two-Sided Signs: Aluminum wall bracket, powder coated, color selected from manufacturer's standard colors, attached with screws in predrilled mounting holes, set in clear silicone sealant.
   7. Suspended Mounting: Stainless steel suspension cables, cable clamps, and ceiling fastener suitable for attachment to ceiling construction indicated.

B. Radius / Curved Signs: One-piece, curved extruded aluminum media holder securing flat, flexible sign media by curved lip on two sides; other two sides closed by end caps; concealed mounting attachment.
   1. Sizes: As indicated on the drawings.
   2. Finish: Natural (clear) anodized.
   3. Sign Orientation: Curved in horizontal section.
   4. End Caps: Aluminum with finish matching frame and stainless steel screw attachment.
   5. End Caps: Plastic, color selected from manufacturer's standard colors, paintable.
   6. Clear Cover: For customer produced sign media, provide clear cover of polycarbonate plastic, glossy on back, non-glare on front.
   7. Wall Mounting of One-Sided Signs: Mechanical anchorage, with predrilled holes, and set in clear silicone sealant.
   8. Wall and Ceiling Mounting of Two-Sided Signs: Aluminum wall bracket, powder coated, color selected from manufacturer's standard colors, attached with screws in predrilled mounting holes, set in clear silicone sealant.
   9. Mounting of Floor Mounted Pylon Signs: Oval shaped steel base anchored to floor.
   10. Suspended Mounting: Stainless steel suspension cables, cable clamps, and ceiling fastener suitable for attachment to ceiling construction indicated.
   11. Directories: For customer-produced media; provide divider strips.

C. Color and Font: Unless otherwise indicated:
   1. Character Font: Helvetica, Arial, or another sans serif font
   2. Character Case: Upper case only
   3. Background Color: Clear
   4. Character Color: Contrasting color

2.04 ACCESSORIES

A. Concealed Screws: Stainless steel, galvanized steel, chrome plated, or other non-corroding metal.

B. Exposed Screws: Chrome plated.

C. Tape Adhesive: Double sided tape, permanent adhesive.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that substrate surfaces are ready to receive work.

3.02 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install neatly, with horizontal edges level.

C. Locate signs where indicated:
   1. Room and Door Signs: Locate on wall at latch side of door with centerline of sign at 60 inches above finished floor.
   2. If no location is indicated obtain Owner's instructions.

D. Protect from damage until Substantial Completion; repair or replace damage items.

END OF SECTION

SECTION 10 2813 – TOILET ACCESSORIES

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. All labor, materials, equipment, and services necessary to furnish and install toilet accessories as indicated or specified.

1.02 SUBSTITUTIONS

A. Substitutions shall be allowed upon Engineer's approval.

1.03 SUBMITTALS

A. Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures for all work under this Section.

1.04 QUALITY ASSURANCE

A. This Specification is based on products as manufactured by Bobrick Dispensers, Inc., Los Angeles, CA., unless otherwise noted. Products equaling or exceeding specification requirements as manufactured by D.J. Alexander Corporation, Charles Parker Company or American Dispenser Company are acceptable for bidding.

1.05 GENERAL REQUIREMENTS

A. Review drawings for locations of toilet accessories and verify dimensional requirements for recessed units. Coordinate location of blocking and built-in anchorage devices.

B. Notify Architect of any conflicts with accessory locations and partition dimensions or piping interference.

C. Use concealed fastening wherever possible.

D. Provide anchors, bolts and other necessary fasteners, and attach accessories securely to walls and partitions in locations as shown or directed.

E. Provide products of the same manufacturer for each type of accessory unit and for units exposed in the same areas, wherever possible.

F. Stamped names or labels on exposed faces of units will not be permitted, except where otherwise specified.

PART 2 – PRODUCTS

2.01 ACCESSORIES

A. Toilet Tissue Dispenser: B-265

B. Combination Paper Towel Dispenser and Disposal: B-39 003

C. Sanitary Napkin Vendor: B-3600 x 225

D. Sanitary Napkin Disposal: B-270

E. Toilet Seat Cover Dispenser: B-274

F. Soap Dispenser: B-822, counter mounted.

G. Grab Bars: B-6806 x 36, B69606 x 42

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install all toilet accessories at locations indicated in strict accordance with manufacturer's printed instructions.

B. Install concealed mounting devices and fasteners fabricated of the same material as the accessories or of galvanized steel.

C. Provide theft-resistant fasteners for all accessory mountings.

D. Secure toilet room accessories to adjacent walls and partitions in accordance with the manufacturer's instructions for each item and each type of substrate construction.

E. Install grab bars in accordance with manufacturer's printed instructions at locations indicated. Install connectors or support angles between studs. Attachment of support angles to studs must be sufficient to withstand a horizontal pull of 300 pounds. Accurately position connector assemblies and tighten to the support angles before wall finish is applied. After wall surface is finished, secure concealed mounting plate to connector assembly using stainless steel machine screws furnished by the manufacturer. Where grab bars installed on toilet compartments make through-bolted connection with specified anchors.

END OF SECTION

SECTION 10 44 16 – FIRE EXTINGUISHERS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide safety equipment as outlined and specified below.

1.02 SUBMITTALS

A. General: Submittals shall be furnished in accordance with Section 0133 00 - Submittals.

PART 2 – PRODUCTS

2.01 FIRE EXTINGUISHERS

A. Fire Extinguisher Requirements: Supply and install fire extinguishers as required by NFPA 820, and local building codes or requirements. The fire extinguishers shall be UL and FM certified for their intended use.

B. Fire Extinguisher Locations: Fire extinguisher locations shall be determined by the Fire Protection System Contractor to be as required by NFPA 820, OSHA and the local building code.

PART 3 – EXECUTION

3.01 SERVICES OF MANUFACTURER

A. Inspection, Startup and Field Adjustment: The proper location and installation of safety equipment shall be verified and approved by the building inspector. Proper fire extinguisher installation and location shall be approved by the local fire authority having jurisdiction.

END OF SECTION

SECTION 11 5300 – LABORATORY EQUIPMENT

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide the following laboratory equipment as specified below.

PART 2 – PRODUCTS

2.01 LIST OF LABORATORY EQUIPMENT TO BE FURNISHED:

A. Compound Microscope (100X magnification w/computer interface)

B. Portable Meter, Chlorine and pH (Hach 5870012)

C. Filter Paper Grade 42 - 15 cm diameter - 100pk 2x (Whatman 1442-150)

D. Graduated Cylinder 50 mL (Kimble 20024-50)

E. Kimble Graduated Beaker 100 mL (Kimble 14000-100)

F. Kimble Graduated Beaker 50 mL (Kimble 14000-50)

PART 3 – EXECUTION (NOT USED)

END OF SECTION

SECTION 12 3553.13 – METAL LABORATORY CASEWORK

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Steel casework
   2. Table frames
   3. Work surfaces
   4. Sinks and outlet
   5. Service fittings
   6. Accessory equipment

1.02 ALTERNATE PROPOSALS

A. Proposals are invited from alternate manufacturers only if they comply with the minimum design requirements and the minimum performance requirements. A notarized letter stating full compliance must be included in alternate proposals signed by an officer of the manufacturer to ensure compliance.

1.03 CASEWORK DESIGN REQUIREMENTS

A. Flush construction: Surfaces of doors, drawers and panel faces shall align with cabinet fronts without overlap of case ends, top or bottom rails. Horizontal and vertical case shell members (panels, top rails, and bottoms) shall meet in the same plane without overlap, cracks or crevices.

B. Slimline styling: Front width of end panels 3/4” and front height of top and bottom members 1".

C. Self-supporting units: Completely welded shell assembly without applied panels at ends, backs, or bottoms, so that cases can be used interchangeably or as a single, stand-alone unit.

D. Interior of case units: Easily cleanable, flush interior. Base cabinets, 30" and wider, with double swinging doors shall provide full access to complete interior without center vertical post.

E. Drawers: Sized on a modular basis for interchange to meet varying storage needs, and designed to be easily removable in field without the use of special tools.

F. Case openings: Rabbeted joints all four sides of case opening for hinged doors and two sides for sliding doors in order to provide dust resistant case.

G. Framed glazed doors: Identical in construction, hardware, and installation to solid panel doors. Design frame glazed doors to be removable for glass replacement.

1.04 CASEWORK PERFORMANCE REQUIREMENTS

A. Structural performance requirements: Casework components shall withstand the following minimum loads without damage or permanent deformation to the component or to the casework operation:
   1. Steel base unit load capacity: 500 lbs. per lineal foot
   2. Suspended units: 300 lbs.
   3. Drawers in a cabinet: 150 lbs.
   4. Utility tables (4 legged): 300 lbs.
   5. Hanging wall cases: 300 lbs.
   6. Load capacity for shelves of base units, wall cases and tall cases: 40 lbs. per square foot, up to 200 lbs.

B. Metal Finish Performance Requirements:
   1. Abrasion resistance: Maximum weight loss of 5.5 mg per 100 cycle when tested on a Taber Abrasion Tester #E40101 with 1000 gm wheel pressure and Calibrase #CS10 wheel.
   2. Hardness: Surface hardness equivalent to 4H pencil.
   3. Humidity resistance: Withstand 1000 hour exposure in saturated humidity at 100°F.
   4. Moisture resistance:
      a. No visible effect to surface finish after boiling water trickled over test panel inclined at 45°F for five minutes.
      b. No visible effect to surface finish following 100 hours of continuous application of a water-soaked cellulose sponge, maintained in a wet condition throughout the test period.
   5. Adhesion: Score finish surface of test panel with razor blade into 100 squares, 1/16" x 1/16", cutting completely through the finish but with minimum penetration of the substrate, and brush away particles with soft brush. Minimum 95 squares shall maintain their finish.
   6. Salt spray: Withstand minimum 200-hour salt spray test.

C. Chemical Resistance Finish Performance Requirements:
   1. See Section 1.05 of this specification section.

1.05 WORK SURFACE PERFORMANCE REQUIREMENTS

A. Test Procedure: Apply five drops of each reagent to surface and cover with 25mm watch glass, convex side down; test volatiles using one-ounce bottle stuffed with saturated cotton. After 24-hour exposure, flush surface, clean, rinse, and wipe dry.

B. Evaluation ratings: Change in surface finish and function shall be described by the following ratings:
   1. No Effect: No detectable change in surface material.
   2. Excellent: Slight detectable change in color or gloss, but no change to the function or life.
   3. Good: Clearly discernable change in color or gloss, but no significant impairment of work surface function or life.
   4. Fair: Objectionable change in appearance due to surface discoloration or etch, possibly resulting in deterioration of function over an extended period.
   5. Poor: Pitting, cratering, or permanently etching of work surface material; obvious and significant deterioration.

6. Test Results – Epoxy Resin Work Surface (Black):

CHEMICAL – ACIDS		RATING
Hydrochloric Acid	20%	No Effect
Hydrochloric Acid	37%	No Effect
Nitric Acid	20%	Excellent
Nitric Acid	70%	Good
Sulfuric Acid	30%	No Effect
Sulfuric Acid	77%	No Effect
Sulfuric Acid	96%	Poor
Phosphoric Acid	85%	No Effect
Perchloric Acid	60%	No Effect
Aqua Regia	--	No Effect
Chromic Acid	60%	Good
Acetic Acid	98%	No Effect
Formic Acid	90%	No Effect
Boric Acid	Sat.	No Effect
Citric Acid	Sat.	No Effect
Oxalic Acid	Sat.	No Effect
Hydrobromic Acid	48%	No Effect
Hydroflouric Acid	48%	Good
Vinegar	--	No Effect

CHEMICAL - BASES		
Ammonium Hydroxide	28%	No Effect
Sodium Hydroxide	10%	No Effect
Sodium Hydroxide	40%	No Effect
Sodium Hydroxide	Flake	No Effect
Potassium Hydroxide	Flake	No Effect

CHEMICAL – SALTS		
Zinc Chloride	Sat.	No Effect
Calcium Hypochlorite	Sat.	No Effect
Clorox Bleach	--	No Effect
Silver Nitrate	10%	No Effect
Sodium Sulfide	Sat.	No Effect
Sodium Chloride	Sat.	No Effect
Iodine, Tincture	--	No Effect
Hydrogen Peroxide	--	No Effect
Phenol	80%	No Effect
Cresol	--	No Effect
Formaldehyde	40%	No Effect
Mineral Oil	100%	No Effect
Glycerin	100%	No Effect

CHEMICAL – SOLVENTS		
Methyl Alcohol	100%	No Effect
Ethyl Alcohol	100%	No Effect
Buty Alcohol	100%	No Effect
Naptha	100%	No Effect
Turpentine	100%	No Effect
Kerosine	100%	No Effect
Haetane	100%	No Effect
Gasoline	100%	No Effect
Benzene	100%	No Effect
Toluene	100%	No Effect
Xylene	100%	No Effect
Acetone	100%	No Effect
Methyl Ethyl Ketone	100%	No Effect
Methyl Isobutyl Ketone	100%	No Effect
Ethyl Acetate	100%	No Effect
Ethyl Ether	100%	No Effect
Chloroform	100%	No Effect
Methyl Chloride	100%	No Effect
Trichlorethylene	100%	No Effect
Carbon Tetrachloride	100%	Excellent
Monochloro Benzene	100%	No Effect
Dioxane	100%	No Effect
Furfural	--	No Effect

CHEMICAL – DYES		
Congo Red	1%	No Effect
Eosin Y	0.5%	No Effect
Gentian Violet	1%	No Effect
Indigo Carmen	0.5%	No Effect
Methyl Green	0.5%	No Effect
Wrights Blood Stain	0.35%	No Effect

1.06 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings: Provide 3/4" = 1'-0" scale elevations of individual and battery of casework units, cross sections, rough-in and anchor placements, tolerances, and clearances. Indicate relation of units to surrounding walls, windows, doors, and other building components. Provide 1/4" = 1'0" rough-in plan drawings for coordination with trades. Rough-in shall show free area.

C. Product Data: Submit manufacturer's data for each component and item of laboratory equipment specified. Include component dimensions, configurations, construction details, joint details, and attachments, utility and service requirements and locations.

D. Product Samples Upon Request: Submit for approval:
   1. Top sample
   2. Finish sample (3" X 5" painted steel)

E. Test Reports: When requested by The Town submit independent, third party, laboratory certified test reports verifying conformance to test performance specified.

1.07 QUALITY ASSURANCE

A. Single source responsibility: Casework, work surfaces, laboratory fume hood and equipment and accessories shall be manufactured or furnished by a single laboratory furniture company.

B. All casework construction and performance characteristics shall be in full compliance with SEFA 8 standards. At the owner’s request, independent, third party testing must be submitted validating compliance and adheres to the architectural specifications.

C. Manufacturer's qualifications: Modern plant with proper tools, dies, fixtures and skilled workmen to produce high quality laboratory casework and equipment, and shall meet the following minimum requirements:
   1. Ten years or more experience in manufacture of laboratory casework and equipment of type specified.
   2. Ten installations of equal or larger size and requirements.

D. Installer's qualifications: Factory trained and/or certified by the manufacturer.

E. Cabinet identification: Cabinets are identified on drawings by manufacturer's catalog numbers. Unless otherwise modified on drawings or in specifications, catalog description constitutes specific requirements for each type of cabinet.

1.08 REFERENCE STANDARDS

A. All casework, worksurface and service fixture construction and performance characteristics shall be in full compliance with SEFA (Scientific Equipment and Furniture Association) standards. At the owner’s request, independent, third party testing must be submitted validating compliance and adheres to the architectural specifications.
   1. SEFA 1.2 – Laboratory Fume Hoods
   2. SEFA 2.3 – Installation of Scientific Laboratory Furniture and Equipment
   3. SEFA 3 – Work Surfaces
   4. SEFA 7 – Laboratory and Hospital Fixtures
   5. SEFA 8 – Laboratory Furniture

1.09 DELIVERY, STORAGE AND HANDLING

A. Schedule delivery of casework and equipment so that spaces are sufficiently complete and material can be installed immediately following delivery.

B. Protect finished surfaces from soiling or damage during handling and installation. Keep covered with polyethylene film or other protective coating.

C. Protect all work surfaces throughout construction period with 1/4" corrugated cardboard completely covering the top and securely taped to edges. Mark cardboard in large lettering "No Standing."

1.10 PROJECT CONDITIONS

A. Do not deliver or install equipment until the following conditions have been met:
   1. Windows and doors are installed; and the building is secure and weather tight.
   2. Ceiling, overhead ductwork and lighting are installed.
   3. All painting is completed and floor tile is installed.

PART 2 – PRODUCTS

2.01 MANUFACTURER

A. Design, materials, construction, and finish of casework specified are the minimum acceptable standard of quality for inset steel laboratory casework. The basis of this product specification is Fisher Hamilton L.L.C., 1316 18th Street, Two Rivers, WI 54241.

2.02 CASEWORK MATERIALS

A. Sheet steel: Mild, cold rolled and leveled unfinished steel

B. Minimum gauges:
   1. 20 gauge: Solid door interior panels, drawer fronts, scribing strips, filler panels, enclosures, drawer bodies, shelves, security panels, and sloping tops.
   2. 18 gauge: Case tops, ends, bottoms, bases, backs, vertical posts, uprights, glazed door members, door exterior panels, and access panels.
   3. 16 gauge: Top front rails, top rear gussets, intermediate horizontal rails, table legs and frames, leg rails, and stretchers.
   4. 14 gauge: Drawer suspensions, door and case hinge reinforcements, and front corner reinforcements.
   5. 11 gauge: Table leg corner brackets and gussets for leveling screws.

C. Glass for glazed sliding doors and unframed doors:
   1. 6mm Clear Float Glass (unframed)

2.03 CASEWORK FABRICATION

A. Base Units and Cases:
   1. Base units and 37"-high wall cases: End panels and back reinforced with internal reinforcing front and rear posts.
   2. Posts: Front post fully closed with full height reinforcing upright. Shelf adjustment holes in front and rear posts shall be perfectly aligned for level setting, adjustable to 1/2" o.c.
   3. Secure intersection of case members with spot and arc welds. Provide gusset reinforcement at front corners.
   4. Base unit backs: Provide drawer units without backs and cupboard units with removable backs for access to services behind units.
   5. Base unit backs: Provide fixed backs at all drawer and cupboard units. No access to services behind.
   6. Bottoms: Base units and 37"-high wall cases shall have one piece bottom with front edge formed into front rail, rabbeted as required for swinging doors and drawers and flush design for sliding doors.
   7. Top rail for base units: Interlock with end panels, flush with front of unit.
   8. Horizontal intermediate rails: Recessed behind doors and drawer fronts.
   9. Base for base units: 4" high x 3" deep with formed steel base and 11 gauge die formed steel gussets at corners. Provide 3/8" diameter leveling screw with integral bottom flange of minimum 0.56 sq. in. area at each corner, accessible through openings in toe space.

B. Drawers: Steel
   1. Drawer fronts: 3/4" thick, double wall construction, pre-painted prior to assembly and sound deadened.
   2. Drawer bodies: Bottom and sides formed into one-piece center section with bottom and sides coved and formed top edges. Front and back panels spot welded to center section.

3. Drawer suspension: Heavy duty coved raceways for both case and drawer with nylon tired, ball bearing rollers; self-centering and self-closing when open to within 3" of the closed position.
4. Provide drawer with rubber bumpers. Friction centering devices are not acceptable.
5. Provide security panels for drawers with keyed different locks.
6. File drawers: Provide with 150 lbs. full extension slides for full access and operation.

C. Drawer suspension:
1. Heavy duty coved raceways for both case and drawer with nylon tired, ball bearing rollers; self-centering and self-closing when open to within 3" of the closed position.
2. Accuride or ENGINEER-approved equal 150-lb. full extension drawer slides. File drawers: Provide with 150# full extension slides for full access and operation.
3. Provide drawer with rubber bumpers. Friction centering devices are not acceptable.

D. Doors: Steel
1. Solid panel doors: 3/4" thick, double wall, telescoping box steel construction with interior prepainted and sound deadened. Reinforce interior of front panel with welded steel hat channels. Hinges with screws to internal 14 gauge reinforcing in case and door. Hinges shall be removable; welding of hinges not acceptable. Doors shall close against rubber bumpers.
2. Unframed sliding glass doors: Glass with edges ground set in extruded aluminum shoe with integral pulls, wheel assemblies and top and bottom extruded aluminum track. Provide rubber bumpers at fully opened and closed door position.

E. Shelves:
1. Form front and back edges down and back 3/4". Form ends down 3/4”.
2. Reinforce shelves over 36" long with welded hat channel reinforcement the full width of shelf.
3. Pull out shelves: Same suspension as specified for drawers.

F. Base molding: 4" high, to be furnished and installed by flooring contractor.

G. Corner base guards: 4" high #304 stainless steel corner guards.

H. Hardware:
1. Drawer and hinged door pulls: Clear anodized extruded aluminum, screw attached on 4" centers.
a. Pull Location
1) Configuration 1
Horizontal at drawers, vertical at doors
Brushed Aluminum rectangular style finger pull
2. Sliding door pulls: Recessed stainless steel, styled as shown and sized to harmonize with drawer pulls.
3. Hinges: Institutional type, five knuckle projecting barrel hinges, minimum 2-1/2" long, type 302 or 304 stainless steel. Provide two hinges for doors up to 36" high; three hinges for doors over 36" high. Drill each leaf for three screw attachment to door and frame.
4. Door catches: Adjustable type, spring actuated nylon roller catches.
5. Elbow catches: Spring type of cadmium plated steel, with strike of suitable design.

2.04 METAL FINISH

A. Metal finish:
1. Preparation: Spray clean metal with a heated cleaner/phosphate solution, pre-treat with iron phosphate spray, water rinse, and neutral final seal. Immediately dry in heated ovens, gradually cooled, prior to application of finish.

2. Application: Electrostatically apply urethane powder coat of selected color and bake in controlled high temperature oven to assure a smooth, hard satin finish. Surfaces shall have a chemical resistant, high grade laboratory furniture quality finish of the following thickness: Liquid, dipped, solvent based finishes are not and will not be acceptable.
3. Color: Chameleon
   a. Exterior and interior exposed surfaces: 1.5 mil average and 1.2 mil min.
   b. Backs of cabinets and other surfaces not exposed to view: 1.2 mil average.

B. Cabinet Surface Finish Tests:

All casework construction and performance characteristics shall be in full compliance with SEFA 8 standards. At the owner's request, independent, third party performance testing must be submitted validating compliance and adheres to the finish specifications.

1. Chemical Spot Test
   a. Purpose of Test
      1) The purpose of the chemical spot test is to evaluate the resistance a finish has to chemical spills.

         Note: Many organic solvents are suspected carcinogens, toxic and/or flammable. Great care should be exercised to protect personnel and the environment from exposure to harmful levels of these materials.

      2) Test Procedure
         (a) Obtain one sample panel measuring 14" x 24" (355.6mm x 609.6mm). The received sample to be tested for chemical resistance as described herein.
         (b) Place panel on a flat surface, clean with soap and water and blot dry. Condition the panel for 48-hours at 73±3°F / 23±2°C and 50±5% relative humidity. Test the panel for chemical resistance using forty-nine different chemical reagents by one of the following methods:
         (c) Method A – Test volatile chemicals by placing a cotton ball saturated with reagent in the mouth of a one-ounce (29.574cc) bottle and inverting the bottle on the surface of the panel.
         (d) Method B – Test volatile chemicals by placing five drops of the reagent on the surface of the panel and covering with a 24mm watch glass, convex side down.
         (e) For both of the above methods, leave the reagents on the panel for a period of one hour. Wash off the panel with water, clean with detergent and naphtha, and rinse with deionized water. Dry with a towel and evaluate after 24-hours at 73±3°F / 23°±2°C and 50±5% relative humidity using the following rating system:
            (1) Level 0: No detectable change
            (2) Level 1: Slight change in color or glos
            (3) Level 2: Slight surface etching or severe staining.
            (4) Level 3: Pitting, cratering, swelling, or erosion of coating. Obvious and significant deterioration.

Test #	Chemical Reagent	Test Method
1	Acetate, Amyl	A
2	Acetate, Ethyl	A
3	Acetic Acid, 98%	B
4	Acetone	A
5	Acid Dichromate, 5%	B
6	Alcohol, Butyl	A

7	Alcohol, Ethyl	A
8	Alcohol, Methyl	A
9	Ammonium Hydroxide, 28%	B
10	Benzene	A
11	Carbon Tetrachloride	A
12	Chloroform	A
13	Chromic Acid, 60%	B
14	Cresol	A
15	Dichlor Acetic Acid	A
16	Dimethylformanide	A
17	Dioxane	A
18	Ethyl Ether	A
19	Formaldehyde, 37%	A
20	Formic Acid, 90%	B
21	Furfural	A
22	Gasoline	A
23	Hydrochloric Acid, 37%	B
24	Hydrochloric Acid, 48%	B
25	Hydrogen Peroxide, 3%	B
26	Iodine, Tincture of	B
27	Methyl Ethyl Ketone	A
28	Methylene Chloride	A
29	Mono Chlorobenzene	A
30	Naphthalene	A
31	Nitric Acid, 20%	B
32	Nitric Acid, 30%	B
33	Nitric Acid, 70%	B
34	Phenol, 90%	A
35	Phosphoric Acid, 85%	B
36	Silver Nitrate, Saturated	B
37	Sodium Hydroxide, 10%	B
38	Sodium Hydroxide, 20%	B
39	Sodium Hydroxide, 40%	B
40	Sodium Hydroxide, Flake	B
41	Sodium Hydroxide, Saturated	B
42	Sulfuric Acid, 33%	B
43	Sulfuric Acid, 77%	B
44	Sulfuric Acid, 96%	B

Test #	Chemical Reagent	Test Method
45	Sulfuric Acid, 77% and Nitric Acid 70%, equal parts	B
46	Toluene	A
47	Trichloroethylene	A
48	Xylene	A
49	Zinc Chloride, Saturated	B

3) Acceptance Level
   (a) Results will vary from manufacturer to manufacturer. Laboratory grade finishes should result in no more than four Level 3 conditions. Suitability for a given application is dependent upon the chemicals used in a given laboratory.

b. Hot Water Test
   1) Purpose of Test
      (a) The purpose of this test is to insure the coating is resistant to hot water.
   2) Test Procedure
      (a) Hot water, 190°F to 205°F (88°C to 96°C), shall be allowed to trickle (with a steady stream and at a rate of not less than 6 ounces (177.44 cc) per minute on the surface, which shall be set at an angle of 45° for a period of five minutes.
   3) Acceptance Level
      (a) After cooling and wiping dry, the finish shall show no visible effect from the hot water.

c. Impact Test
   1) Purpose of Test
      (a) The purpose of this test is to evaluate the ductility of the coating.
   2) Test Procedure
      (a) A one-pound ball approximately 2" (50.8mm) in diameter shall be dropped from a distance of 12" (304.8mm) onto a flat horizontal surface, coated to manufacturer's standard manufacturing method.
   3) Acceptance Level
      There shall be no visible evidence to the naked eye of cracks or checks in the finish due to impact.

d. Paint Adhesion on Steel Test
   1) Purpose of Test
      (a) The paint adhesion test is used to determine the bond of the coating to steel. This does not apply to non-steel products.
   2) Test Procedure
      (a) This test is based on ASTM D2197-86 "Standard Method of Test for Adhesion of Organic Coating". Two sets of eleven parallel lines 1/16" (1.587mm) apart shall be cut with a razor blade to intersect at right angles thus forming a grid of 100 squares. The cuts shall be made just deep enough to go through the coating, but not into the substrate. They shall then be brushed lightly with a soft brush for one minute. Examine under 100-foot candles of illumination.
   3) Acceptance Level
      Ninety or more of the squares shall show finish intact.

e. Paint Hardness on Steel Test
   1) Purpose of Test
      (a) The paint hardness test is used to determine the resistance of the coatings to scratches.
   2) Test Procedure
      (a) Pencils, regardless of their brand, are valued in this way: 8-H is the hardest, and next 11 order of diminishing hardness are 7-H, 6-H, 5-H, 4-H, 3-H, 2-H, H, F, HB, B (soft), 2-B, 3-B, 4-B, 5-B (which are softest).
      (b) The pencils shall be sharpened on emery paper to a wide sharp edge. Pencils of increasing hardness shall be pushed across the paint film in a chisel-like manner until one is found that will cut or scratch the

film. The pencil used before that one, that is the hardest pencil that will not rupture the film, is then used to express or designate the hardness.

3) Acceptance Level
   (a) The paint shall have a hardness of 4-H minimum with no visible puncture of the finish surface.

2.05 EPOXY RESIN WORK SURFACE

A. Material: Chemical and abrasion resistant, durable top of one inch thick cast material of epoxy resins and inert products, cast flat, with a uniform non-glare black matte finish.

B. Backsplash curb: Same material as top, four (4) inches high, butt jointed and cemented to top. Provide where tops abut wall surfaces. Include end curb where top abuts end wall.

2.06 SINKS, DRAINS AND TRAPS

A. Stainless steel sinks: Type 304 stainless steel, No. 4 polish. Provide in 16 gauge material; 14 gauge for sinks with integral fixture ledge, used primarily for hand washing.
   1. Provide ½" radius cove at vertical and horizontal corners and pitch bottom to drain plug.
   2. Seamless joints: Electrically weld, grind and polish smooth all joints rendering joints seamless.
   3. Include crumb cup strainer with tail piece.
   4. Apply heavy mastic type sound deadening coating to underside.
   5. Except for sinks integral with stainless steel top, mount sinks with integral frame; separate frames or mounting rims not acceptable.
   6. Size: 18" x 15" x 10.8" deep or as shown in plans.
   7. Drain Location: Center or as shown in plans.
   8. Fisher Hamilton Model No. D-30c or ENGINEER-approved equal. .

2.07 LABORATORY FITTINGS

A. Water Saver Service Fittings:
   1. Water service faucets and valves shall have renewable unit containing all working parts subject to wear, including replaceable stainless steel seat. Unit shall have serrations for position locking into valve body.
   2. Gooseneck vacuum breakers: Brass forgings integral with gooseneck, with renewable seat and special design valve member for fine flow control.
   3. Goosenecks shall have separate 3/8" IPS coupling securely brazed to gooseneck to provide full thread for attachment of anti-splash outlet fittings, serrated tips and filter pumps.

B. Air, Gas and Vacuum Systems Fittings:
   1. Needle valves: Small pattern needle valve, straightaway type with stainless steel replaceable floating cone and brass seat (non-renewable). Ten serration end is integral with valve body.
   2. Ground key cocks: Straightaway ground key cocks, individually ground and lapped and tested at 100 psi. air under water. Cocks shall have a single arm long easy grip handle with screw-on type index. Ten serrated end is integral with valve body.

C. Handles for service cocks, faucets and remote controls: Four-arm type except ground key cocks. Provide removable screw-on type colored plastic discs with letter stamped on disc in contrasting color as scheduled below:

Gas	Blue/White	Gas
Vacuum	Yellow/Black	Vac.
Compressed Air	Orange/White	C-Air
Cold Water	Green/White	C.W.
Hot Water	Red/White	H.W.
Steam	Black/White	Stm.
Chilled Water	Brown/White	CH.
Distilled Water	White/Black	D.W.

Disk color for special services as determined by the OWNER.

D. Fixture finish: Chrome finish developed by the following sequence of platings over properly prepared brass castings or forgings:

Plating	Minimum Plating Thickness
Chromium (Final)	0.000015 IN.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Casework installation:
   1. Set casework components plumb, square, and straight with no distortion and securely anchored to building structure. Shim as required using concealed shims.
   2. Bolt continuous cabinets together with joints flush, tight and uniform, and with alignment of adjacent units within 1/16" tolerance.
   3. Secure wall cabinets to solid supporting material, not to plaster, lath or gypsum board.
   4. Abut top edge surfaces in one true plane. Provide flush joints not to exceed 1/8" between top units.

B. Work surface installation:
   1. Where required due to field conditions, scribe to abutting surfaces.
   2. Only factory prepared field joints, located per approved shop drawings, shall be permitted. Secure joints in field, where practicable, in the same manner as in factory, with dowels, splines, adhesive or fasteners recommended by manufacturer.
   3. Secure work surfaces to casework and equipment components with material and procedures recommended by the manufacturer.

C. Sink installation: Sinks which were not factory installed shall be set in chemical resistant sealing compound and secured and supported per manufacturer's recommendations.

D. Accessory installation: Install accessories and fittings in accordance with manufacturer's recommendations. Turn screws to seat flat; do not drive.

3.02 ADJUSTING

A. Repair or remove and replace defective work, as directed by The Town upon completion of installation.

B. Adjust doors, drawers, hardware, fixtures and other moving or operating parts to function smoothly.

3.03 CLEANING

A. Clean shop finished casework, touch up as required.

B. Clean countertops with diluted dishwashing liquid and water leaving tops free of all grease and streaks. Use no wax or oils.

3.04 PROTECTION OF FINISHED WORK

A. Provide all necessary protective measures to prevent exposure of casework and equipment from exposure to other construction activity.

B. Advise CONTRACTOR of procedures and precautions for protection of material, installed laboratory casework and fixtures from damage by work of other trades.

END OF SECTION

SECTION 22 0529 – HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide pipe supports, hangers, guides, and anchors, complete, in accordance with these Specifications and the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Submittals shall be in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings shall include the following information:
   1. Drawings of pipe supports, hangers, anchors, and guides
   2. Calculations for special supports and anchors.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

A. Code Compliance: All piping systems and pipe connections to equipment shall be properly anchored and supported to prevent undue deflection, vibration, dislocation due to line pressures, and stresses on piping, equipment, and structures. All supports and parts thereof shall conform to the requirements of ANSI/ASME B31.1 - Power Piping, except as supplemented or modified in the tables within this Specification. Supports for plumbing piping shall be in accordance with the latest edition of the applicable plumbing code or local administration requirements.

B. Structural Members: Wherever possible, pipes shall be supported from structural members. Where it is necessary to frame structural members between existing members, such supplementary members shall be provided. All supplementary members shall be in accordance with the requirements of the building code and the American Institute of Steel Construction.

C. Pipe Hangers: Pipe hangers shall be capable of supporting the pipe in all conditions of operation, allowing free expansion and contraction of the piping, and preventing excessive stress on equipment. All hangers shall have a means of vertical adjustment after erection. Hangers shall be designed to prevent becoming disengaged by any movement of the supported pipe. Hangers subject to shock or thrust imposed by the actuation of safety valves, shall include hydraulic shock suppressors. All hanger rods shall be subject to tensile loading only.

D. Hangers Subject to Horizontal Movements: At hanger locations where lateral or axial movement is anticipated, suitable linkage shall be provided to permit such movement. Where horizontal pipe movement is greater than 1/2-inch, or where the hanger rod deflection from the vertical is greater than 4 degrees from the cold to the hot position of the pipe, the hanger rod and structural attachment shall be offset in such a manner that the rod is vertical in the hot position.

E. Spring-Type Hangers: Spring-type pipe hangers shall be provided for piping subject to vibration or vertical expansion and contraction, such as engine exhausts and similar piping. All spring-type hangers shall be sized to the manufacturer's printed recommendations and the loading conditions encountered. Variable spring supports shall be provided with means to limit misalignment, buckling, eccentric loading, or to prevent overstressing of the spring, and with means to indicate at all times the

compression of the spring. Supports shall be capable of accommodating at least 4 times the maximum travel due to thermal expansion.

F. Thermal Expansion: Wherever expansion and contraction of piping is expected, a sufficient number of expansion loops or joints shall be provided, together with the necessary rolling or sliding supports, anchors, guides, pivots, and restraints permitting the piping to expand and contract freely in directions away from the anchored points. All components shall be structurally suitable to withstand all loads imposed.

G. Heat Transmission: Supports, hangers, anchors, and guides shall be so designed and insulated, that excessive heat will not be transmitted to the structure or to other equipment.

H. Riser Supports: Where practical, risers shall be supported on each floor with riser clamps and lugs, independent of the connected horizontal piping.

I. Freestanding Piping: Free-standing pipe connections to equipment such as chemical feeders and pumps shall be firmly attached to steel frames fabricated from angles, channels, or I-beams anchored to the structure. Exterior, free-standing overhead piping shall be supported on fabricated pipe stands consisting of pipe columns anchored to concrete footings, with horizontal, welded steel angles and U-bolts or clamps securing the pipes.

J. Materials of Construction:
   1. General: All pipe support assemblies, including framing, hardware, and anchors, shall be steel construction, galvanized after fabrication, unless otherwise indicated.
   2. Submerged Supports: All submerged piping, as well as piping, conduits, and equipment in hydraulic structures within 24 inches of the water level, shall be supported with support, assemblies, including framing, hardware, constructed of Type 304 stainless steel, unless otherwise indicated. All bolts and nuts shall be 316 stainless steel conforming to ASTM A193, Grade B8M, for bolts and ASTM A194, Grade 8M, for nuts.

K. Point Loads: Any meters, valves, heavy equipment, and other point loads on PVC, FRP, and other plastic pipes, shall be supported on both sides, according to manufacturer's recommendations to avoid undue pipe stresses and failures. To avoid point loads, all supports on PVC, FRP, and other plastic piping shall be equipped with extra wide pipe saddles or galvanized steel shields.

L. Noise Reduction: To reduce transmission of noise in piping systems, all copper tubes in buildings and structures shall be wrapped with a 2-inch-wide strip of rubber fabric or similar, suitable material at each pipe support, bracket, clip, or hanger.

2.02 SUPPORT SPACING

A. Supports for piping with the longitudinal axis in approximately a horizontal position shall be spaced to prevent excessive sag, bending, and shear stresses in the piping, with special consideration given where components such as flanges and valves impose concentrated loads. Pipe support spacing shall not exceed the maximum spans in the tables on the following pages. For temperatures other than ambient temperatures, or those listed, and for other piping materials or wall thicknesses, the pipe support spacings shall be modified in accordance with the pipe manufacturer's recommendations. Vertical supports shall be provided to prevent the pipe from being overstressed from the combination of all loading effects.

1. Support Spacing for Schedule 40 and Schedule 80 Steel Pipe:

Normal Pipe Diameter (inches)	Maximum Span (feet)
1/2	6
3/4 and 1	8
1 1/4 to 2	10
3	12
4	14
6	17
8 and 10	19
12 and 14	23
16 and 18	25
20 and greater	30

2. Support Spacing for Welded Fabricated Steel Pipe:
The support spacing shall be designed so that the stress on the pipe does not exceed 5,000 psi. Maximum deflection of pipe shall be limited to 1/360th of the span and shall be calculated by using the formula:

$$L = (7500tD/(32t+D))1/2$$

where:

t=Thickness (inches)
D=Diameter (inches)
L=Maximum span (feet)

3. Support Spacing for Ductile-Iron Pipe:

Normal Pipe Diameter (inches)	Maximum Span (feet)
All diameters	Two supports per pipe length or 10 feet (one of the 2 supports located at joint)

4. Support Spacing for Copper Tubing:

Normal Pipe Diameter (inches)	Maximum Span (feet)
1/2 to 1 1/2	6
2 to 4	10
6 and greater	12

5. Support Spacing for Schedule 40 or 80 PVC Pipe:

Normal Pipe Diameter (inches)	Maximum Span (at 100°F) (feet)
1/2	4
3/4	4
1	5
1 1/4	5
1 1/2	5
2	6
3	7
4	8
6	10
8	11
10	12
12	13

2.03 MANUFACTURED SUPPORTS

A. Stock Parts: Where not specifically indicated, designs which are generally accepted as exemplifying good engineering practice and use stock or production parts, shall be utilized wherever possible. Such parts shall be locally available, new, of best commercial quality, designed and rated for the intended purpose.

B. Manufacturers, or ENGINEER-approved equal:
   1. TOLCO Inc.
   2. Bergen-Paterson Pipesupport Corp., Woburn, MA
   3. Grinnell Corp. (Supply Sales Company), Cranston, RI
   4. NPS Products, Inc., Westborough, MA
   5. Power Piping Company, Pittsburgh, PA
   6. ZSI

2.04 COATING

A. Galvanizing: Unless otherwise indicated, all fabricated pipe supports other than stainless steel or non-ferrous supports shall be blast-cleaned after fabrication and hot-dip galvanized in accordance with ASTM A123 - Specifications for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

B. Other Coatings: Other than stainless steel or non-ferrous supports, all supports shall receive protective coatings in accordance with the requirements of applicable Sections in Division 09 – Finishes.

PART 3 - EXECUTION

3.01 INSTALLATION

A. General: All pipe supports, hangers, brackets, anchors, guides, and inserts shall be fabricated and installed in accordance with the manufacturer's printed instructions and ANSI/ASME B31.1 - Power Piping. All concrete inserts for pipe hangers and supports shall be coordinated with the formwork.

B. Appearance: Pipe supports and hangers shall be positioned to produce an orderly, neat piping system. All hanger rods shall be vertical, without offsets, unless noted otherwise. Hangers shall be adjusted to line up groups of pipes at the proper grade for drainage and venting, as close to ceilings or roofs as possible, without interference with other work.

3.02 FABRICATION

A. Quality Control: Pipe hangers and supports shall be fabricated and installed by experienced welders and fitters, using the best welding procedures available. Fabricated supports shall be neat in appearance without sharp corners, burrs, and edges.

END OF SECTION

SECTION 22 1000 – PLUMBING PIPING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish all drainage and vent piping, cleanouts and access panels, floor drains, hot and cold water piping, valves, piping specialties and appurtenances, supports and anchors, and plumbing and piping insulation in accordance with the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

B. Product data to be submitted:
   1. Materials list of items proposed to be provided under this Section.
   2. Manufacturer's specifications, catalog cuts, and other data needed to prove compliance with the specified requirements.
   3. Shop Drawings and other data as required indicating method of installing and attaching equipment, except where such details are fully shown on the Drawings.

C. Sterilization Certificate: Upon completion of water line sterilization, deliver to the ENGINEER two copies of an acceptable "Certificate of Performance" for that activity.

D. Cathodic Protection:
   1. Upon completion of the work of this Section, deliver to the ENGINEER sufficient data to prove that wrapping of steel piping has been tested and meets the specified requirements.
   2. Show date of inspection, voltages used, and name and address of the inspector.

1.03 QUALITY ASSURANCE

A. Use adequate numbers of skilled workmen who are thoroughly trained and experience in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

B. Codes and Regulations:
   1. In additions to complying with the specified requirements, comply with pertinent regulations of governmental agencies having jurisdiction.
   2. In the event of conflict between or among specified requirements and pertinent regulations, the more stringent requirement will govern when so directed by the Engineer.
   3. Plumbing Code Compliance: Comply with applicable portions of the Uniform Plumbing Code pertaining to selection and installation of plumbing materials and products.

PART 2 - MATERIALS

2.01 PIPE MATERIALS

A. Provide pipes and pipe fittings complying with these Specifications and in accordance with the following listings:

B. Cast Iron Soil Pipe and Fittings:
   1. Service weight cast iron conforming to ASTM A74, hubless type, asphaltic coated.
   2. Joints shall be made with cast iron mechanical couplings or stainless-steel sleeves with neoprene gaskets.

C. Galvanized or Black Steel Pipe:
   1. 3 inches and Smaller – ASTM A120. Schedule 40, black or hot-dipped galvanized, welded, or seamless steel pipe, threaded or coupled.
   2. 4 inches and Larger – ASTM A53. Grade A or B, Schedule 40, black or hot dipped galvanized, welded, or seamless steel pipe, threaded.
   3. Fittings: FS WW-P521, 150 psi, malleable iron. Black or hot dipped galvanized ASTM A153.
   4. Unions: FS WW-U-531, Type B, black or hot dipped galvanized, Class 2, 250 psi, malleable iron, ground joint and brass seat.
   5. Sealing Paste or Tape: Teflon.
   6. Corrosion Protective Wrap: Polyvinyl chloride or Polyethylene pressure sensitive tape, 20-mil nominal thickness (one layer 20 mil or two layers 10 mil).
   7. Primer: 3M “Scotchwrap Pipe Primer.”

D. Copper Pipe and Fittings:
   1. Pipe: Underground, ANSI/ASTM B88, Type K, hard temper, seamless water tube.
   2. Fittings: ANSI/ASME B16.22. wrought copper or brass solder-joint fittings.
   3. Solder: Lead-free, silver tin-antimony solder 95-5, or tin-silver solder 96.5-3.5, 95.5, or 94-6, with mildly corrosive liquid or petroleum-based past flux containing chlorides of zinc and ammonium.

E. ABS: (Acrylonitrile Butadiene Styrene) plastic, drain, waste and vent pipe.
   1. Pipe and Fittings: ASTM D2661; ASTM F628; CSA B181.1.
   2. Solvent Cement: As recommended by the pipe manufacturer.

F. Polypropylene Drain, Waste and Vent Pipe:
   1. Flame retardant polypropylene material conforming to ASTM D2146 and flammability based on ASTM D635.
   2. Pipe shall be produced to Schedule 40 Iron Pipe size dimensional standards, including wall
   3. Fitting design shall be based upon the laying length dimensions in ANSI B16-12 for case iron screwed drainage fittings. Fitting wall thicknesses shall be measured in accordance with ASTM D2122, Section 4, and interval diameters shall be measured in accordance with ASTM D2122, Section 7.
   4. In concealed locations, joints shall be made by the electrical fusion method. In exposed or easily accessible locations, mechanical joint polypropylene fittings and joints may be used.
   5. Pipe and fittings shall be GSR Fuseal, manufactured by R & G Sloane Co., or ENGINEER-approved equal.

G. Polyvinyl Chloride (PVC):
   1. General: PVC materials for pipe and fittings shall conform to ASTM D1784, Cell Classification 12454-B. Pipe and fitting materials shall be specially formulated with sufficient UV protection additives to provide for long term outdoor exposure with no deleterious effects. Flanges shall be one-piece solid design or two-part van stone type which utilize the tapered, serrated face and full face gasket technique for joining and are compatible with ANSIN16.5 Class 150 metal flanges. Unions shall be the O-ring type having interchangeable components with true union valves for maximum system versatility.
   2. Schedule 40, 80, and 120: Pipe in accordance with ASTM D1785. Schedule 80 PVC socket type fittings shall conform to ASTM D2467. Schedule 40 PVC fittings shall conform to ASTM D2466. PVC solvent weld cement for socket connections shall meet the requirement of ASTM D2564/ Schedule 80 PVC threaded fittings shall conform to ASTM D2464.

2.02 TRENCH DRAINS

A. Trench Drain Channels:
   1. Trench drain channels shall be made of cast iron. All channels shall interlock with tongue and groove connections with adjoining channels. Each channel shall have horizontal anchoring ribs to mechanically lock the channel into the floor slab or pavement.
   2. Channels shall have available vertical cut outs for 4-inch or 6-inch discharge and available 4-inch or 6-inch horizontal outlet end caps. Channels shall have a built-in bottom slope of 0.6 percent.

B. Channel Grates: Channel grates shall be for heavy duty service made of Vinylester FRP or ENGINEER-approved equal. Grates should be securely locked down with built-in channel lock blocks. Locking mechanism shall be designed so as to provide an obstruction-free trench for maintenance and cleaning as well as to prevent concrete from entering channels during installation. FRP gates should comply with the Contract Documents.

C. Catch Basins: Catch basins shall be pre-cast polymer concrete with FRP grates. Any trench drains entering catch basins shall interlock fully with tongue and groove connections.

D. Joint Sealers: To prevent leakage, joints between channels, catch basin connections, etc., shall be sealed with an adhesive recommended by the manufacturer.

E. Manufacturers: Trench drains shall be as manufactured by Neenah Foundry; or ENGINEER-approved equal.

2.03 PIPE HANGERS

A. Water Piping:
   1. Split ring hangers with supporting rods, Grinnel Fig. 108; Elcen Fig. 10, or ENGINEER-approved equal.
   2. Semco “trisolators” or ENGINEER-approved equal.
   3. Channel mounted clamping system, Cush-A-Clamp per ZSI, or ENGINEER-approved equal.

B. Soil and Waste Piping:
   1. Variable ring hangers with supporting rods, Grinnel Fig. 108; Elcen 10, or ENGINEER-approved equal.
   2. Riser clamps at each floor and as required, Grinnell Fig. 261; Elcen Fig. 39 or ENGINEER-approved equal.
   3. Channel mounted clamping system, Cush-A-Clamp per ZSI, or ENGINEER-approved equal.

C. Gas Piping: Split ring hangers with supporting rods, Grinnel Fig. 108; Elcen Fig. 10, or ENGINEER-approved equal.

2.04 PIPE INSULATION

A. Hot and Cold Water (Exposed to Freezing Conditions): Molded fiberglass insulation jacketed with PVC jacketing. Provide.016 mil embossed aluminum weather protective jacket for outdoor application. Insulation 2-inch thick for pipe sizes less than 6-inch. Flame spread rating of 25 or less and smoke developed ratings of 50 or less per ASTM E84-89a. Manville “Micro-Lok AP”; Owens/Corning Fiberglass “SSL-11,” or ENGINEER-approved equal.

2.05 VALVES: Valves: Isolation valves shall be bronze valves with ends to suit pipe. Valves shall be rated for a working pressure of 150 psi.

A. Bronze Ball Valve: Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following or ENGINEER-approved equal:
      a. American Valve, Inc.
      b. Conbraco Industries, Inc.; Apollo Valves
      c. Hammond Valve
      d. Milwaukee Valve Company
      e. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
   2. Description:
      a. Standard: MSS SP-110.
      b. SWP Rating: 150 psig (1035 kPa).
      c. CWP Rating: 600 psig (4140 kPa).
      d. Body Design: Two piece
      e. Body Material: Bronze
      f. Ends: Suit to pipe
      g. Seats: PTFE or TFE
      h. Stem: Bronze
      i. Ball: Chrome-plated brass
      j. Port: Full

B. Bronze Gate Valves: Class 150, Non-Rising Stem Bronze Gate Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following or ENGINEER-approved equal:
      a. Hammond Valve
      b. Milwaukee Valve Company
      c. Red-White Valve Corporation
      d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
      e. Conbraco Industries, Inc.; Apollo Valves
   2. Description:
      a. Standard: MSS SP-80, Type 1.
      b. CWP Rating: 300 psig (2070 kPa).
      c. Body Material: ASTM B62, bronze with integral seat and union-ring bonnet.
      d. Ends: Suit to pipe
      e. Stem: Bronze
      f. Disc: Solid wedge; bronze
      g. Packing: Asbestos-free
      h. Handwheel: Malleable iron (bronze, or aluminum).

2.06 OTHER MATERIALS

A. Provide other materials, not specifically described but required for a complete and proper installation, subject to the approval of the ENGINEER.

PART 3 - EXECUTION

3.01 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until unsatisfactory conditions are connected.

3.02 PLUMBING SYSTEM LAYOUT

A. Lay out the plumbing system in careful coordination with the Drawings, determining proper elevations for all components of the system and using only the minimum number of bends to produce a satisfactorily functioning system.

B. Follow the general layout shown on the Drawings (where other work may interfere, consult with ENGINEER).

C. Lay out pipes to fall within partition, wall, or roof cavities, and to not require furring other than as shown on the Drawings.

3.03 TRENCHING AND BACKFILLING

A. Perform trenching and backfilling associated with the work of this Section in strict accordance with the provisions of applicable Sections of Division 31 – Earthwork.

B. Cut bottom of trenches to grade. Make trenches 12 inches wider than the greatest dimension of the pipe.

C. Bedding and Backfilling:
   1. Install piping promptly after trenching. Keep trenches open as short a time as practicable.
   2. Under the structures, install pipes on a 6-inch bed of damp sand. Backfill the bottom of slab with damp sand.
   3. Outside of the structures, install underground piping on a 6-inch bed of damp sand. Backfill to within 12-inch of finish grade with damp sand. Backfill remainder with native soil.
   4. Don not backfill until installation has been approved and until Project Record Documents have been properly annotated.

3.04 PIPE SCHEDULE: PIPE SIZES, SCHEDULE, AND MATERIAL TO BE INSTALLED PER DRAWINGS.

A. Interior and Exterior Water Piping and Compressed Air Piping:
   1. Pipe: Underground, ANSI/ASTM B88, Type K, hard temper, seamless copper water tube. Aboveground, ANSI/ASTM B88, Type L, hard drawn, seamless copper water tube.
   2. Fittings: ANSI/ASME B16.22, wrought copper or brass solder joint fittings.
   3. Solder: Lead-free, tin-antimony solder 95-5, or tin-silver solder 96.5-3.5, 95.5-5 or 94-6.

B. Above Ground Facility Drain Piping:
   1. Sizes 3-Inch and Smaller: PVC Schedule 40/80 or standard weight galvanized steel pipe, with black or galvanized cast iron fittings, drainage pattern and screwed joints, or provide service weight cast iron soil pipe and fittings.
   2. Sizes 4-Inch and Smaller: PVC Schedule 40/80 or service weight cast iron soil pipe, conforming to ASTM A74, hubless cast iron soil pipe fittings with cast iron mechanical couplings or stainless-steel sleeves with stainless steel bands and neoprene gaskets.

C. Above Ground Chemical Waste Piping: Schedule 40 flame retardant polypropylene, GSR Fuseal, or ENGINEER-approved equal, with electrical-resistance fusion joints and fittings, except that mechanical joints may be used in exposed or easily accessible location.

D. Vent Piping:
   1. Above Ground: Sizes 2-½ inches and smaller; Schedule 40 PVC or galvanized steel pipe ASTM A53, welded or seamless, with black or galvanized cast iron drainage fittings. Pipe sizes 3 inches or larger: PVC or Cast-iron soil pipe and fittings as specified above.
   2. Underground: PVC or Cast-iron soil pipes and fittings.

E. Underground Facility Drain Piping: Schedule 40/80 PVC or service weight cast iron soil pipe: Conforming to ASTM A74, bell and spigot cast iron soil pipe and cast iron bell and spigot fittings or hubless cast iron pipe with cast iron mechanical couplings or stainless steel sleeves with stainless steel bands and neoprene gaskets.

F. Underground Chemical Waste Piping: Schedule 40 flame retardant polypropylene pipe with electrical-resistance fusion joints, as specified above.

G. Facility Distribution Gas Piping: Schedule 40 black steel pipe with malleable iron threaded fittings.

3.05 INSTALLATION OF PIPING

A. General:
   1. Proceed as rapidly as the facility construction will permit.
   2. Thoroughly clean items before installation. Cap pipe openings to exclude dirt until fixtures are installed and final connections have been made.
   3. Cut pipe accurately and work into place without springing of forcing, properly clearing windows, doors, and other openings. Excessive cutting or other weakening of the structures will not be permitted.
   4. Remove cutting and threading burrs before assembling piping.
   5. Do not install defective piping of fittings. Do not use pipe with threads which are chipped, stripped, or damaged.
   6. Shoe no tool marks or threads on exposed plated, polished, or enameled connections from fixtures. Tape all finished surfaces to prevent damage during construction.
   7. Make changes in directions with fittings; make changes in main sizes with eccentric reducing fittings. Unless otherwise noted, install water supply and return piping with straight side of eccentric fittings at top of the pipe.
   8. Run horizontal sanitary and storm drainage piping at uniform grade of ¼-inch per foot, unless otherwise noted. Run horizontal water piping with an adequate pitch upwards in direction of flow to allow complete drainage.
   9. Provide sufficient swing joint, ball joints, expansion loops, and devices necessary for a flexible pipeline system, whether or not shown on the Drawings.
   10. Support piping independently at pumps, coils, tanks, and similar locations, so that weight of pipe will not be supported by the equipment.
   11. Pipe the drains from pump glands, drip pans, relief valves, air vents, and similar locations, to spill over an open sight drain, floor drain, or other acceptable discharge point, and terminate with a plain and unthreaded pipe 6 inches above the drain.
   12. Securely bolt all equipment, isolators, hangers, and similar items in place.
   13. Support each item independently from other pipes. Do not use wire for hanging or strapping pipes.
   14. Provide complete dielectric isolation between ferrous and non-ferrous metals.
   15. Provide union and shut off valves suitable located to facilitate maintenance and removal of equipment and apparatus.

B. Trapping and Venting of Fixtures:
   1. Trap and vent all plumbing fixtures in accordance with Uniform Plumbing Code adopted by the Western Plumbing Officials Association and local plumbing codes, whether or not shown on the Drawings. Strictly adhere to any local codes. Only exceptions to the above will be those fixtures which are especially noted herein or on the Drawings to be provided with special wastes.
   2. No vent shall intersect another vent at a point less than 6 inches above extreme overflow level of highest fixture served.
   3. Take vents off top half of horizontal runs and grade so as to free vents quickly of any water or condensation.

C. Installation of Compressed Air Piping: Run compressed air piping with pitch as shown, without pockets. Provide glove valve drips at low points. All branches shall be taken off tip of mains.

D. Equipment Access:
   1. Install piping, equipment, and accessories to permit access for maintenance. Relocate items as necessary to provide such access, and without additional cost to the Owner.
   2. Provide access doors where valves, motors, or equipment requiring access to maintenance are located in walls or chases or above ceilings. Coordinate location of access doors with other trades as required.

3.06 PIPE JOINTS

A. Copper Tubing
   1. Cut square, ream cut end and remove burrs, and clean inside of female fitting to a bright finish.
      a. Apply solder flux with brush to tubing.
      b. Apply flux to fitting socket.
      c. Remove internal parts of solder-end valves prior to soldering.
      d. Assemble.
      e. Remove excess flux.
      f. Apply heat and solder. Allow joint to cool.
   2. Provide dielectric unions at points of connection of copper tubing to ferrous piping and equipment.

B. Screwed Piping:
   1. Deburr cuts
      a. Do not ream exceeding internal diameter of the pipe.
      b. Thread to requirements of ANSI B2.1.
   2. Use Teflon tape on male thread prior to cleaning for air and oil piping.

C. Leaky Joints:
   1. Remake with new material.
   2. Remove leaky section and/or fitting as directed.
   3. Do not use thread cement or sealant to tighten joint.

3.07 INSTALLATION OF POLYPROPYLENE AND PVC PIPING

A. Install in strict accordance with the pipe manufacturer’s directions.

3.08 PIPE SUPPORTS

A. Support suspended piping with clevis or trapeze hangers and rods.

B. Space hangers and support for horizontal steel pipes according to the following schedule:

Pipe Size	Maximum Spacing on Centers
1 ¼" and smaller	8'–0"
1 ½" to 3"	10'-0"
4" to 5"	14'-0"

C. Space hangers and supports for horizontal copper tubing according to the following schedule:

Tube Size	Maximum Spacing on Centers
1" and smaller	6'-0"
1 1/2"	7'-0"
2"	8'-0"
2 1/2"	9'-0"
3" and larger	10'-0"

D. Provide sway bracing on hangers longer than 18 inches.

E. Support vertical piping with riser clamps secured to the piping and resting on the structures. Provide at each floor unless otherwise noted.

F. Provide insulation continuous through hangers and rollers. Protect insulation by galvanized steel shields.

G. Arrange pipe supports to prevent excessive deflection, and to avoid excessive bending stress.

H. Support piping from inserts or anchors in concrete slabs. Where practical, provide the inserts under this Section and arrange for the placing per the applicable Sections of Division 03 – Concrete.

I. Hubless Piping:
   1. Provide hangers on the piping at each side of, and within 6 inches of, hubless pipe coupling so the coupling will bear no weight.
   2. Do not provide hangers on couplings.
   3. Provide hangers adequate to maintain alignment and to prevent sagging of the pipe.
   4. Make adequate provision to prevent shearing and twisting of the pipe and the joint.

3.09 SLEEVES AND OPENINGS

A. Provide sleeves in place before concrete is placed.
   1. Set pipe sleeves in place before concrete is placed.
   2. For un-insulated pipe, provide sleeves two pipe sizes larger than the pipe passing through, or provide a minimum of ½-inch clearance between inside and outside of the pipe.
   3. For insulated pipe, provide sleeves of adequate size to accommodate the full thickness of pipe covering, with clearance for packing and caulking.

B. Caulk the space between the sleeve and pipe or pipe covering, using a noncombustible, permanently plastic, waterproof, non-staining compound which leaves a smooth finished appearance, or pack with noncombustible fiberglass packing or fiberglass rope to within ½-incn of both wall faces, and provide the waterproof compound described above.

C. Finish and Escutcheons:
   1. Smooth rough edges around sleeves with plaster or spackling compound.
   2. Provide 1-inch-wide chrome or nickel-plated escutcheons on all pipes exposed to view where passing through walls, floors, partitions, ceiling, and similar locations.
      a. Size the escutcheons to fit pipe and covering.
      b. Hold escutcheons in place with set screw.

3.10 VALVES

A. Provide valves in water, air, and gas systems. Locate and arrange so as to give complete regulation of apparatus, equipment, and fixture.

B. Provide valves in at least the following locations:
   1. In branches and/or headers of water piping serving a group of fixtures.
   2. On both sides of apparatus and equipment.
   3. For shutoff of risers and branch mains.
   4. For flushing and sterilizing the system.
   5. Where shown on Drawings.

C. Locate valves for easy accessibility and maintenance.

3.11 CONCRETE

A. Provide concreted required for the work of this Section in strict accordance with pertinent provisions of Division 03 – Concrete.

3.12 DISINFECTION OF WATER SYSTEMS

1. Disinfect water systems in accordance with these Specifications.
2. Perform disinfection under the Engineer's observation. Notify the ENGINEER at least 48 hours prior to start of the disinfection process.
3. Upon completion of disinfecting, secure and submit the Certificate of Performance required under Article 1.04 of this Section, stating system capacity, disinfectant used, time and rate of disinfectant applied and resultant residuals in ppm at completion.
4. Use disinfectant method approved by the ENGINEER.

3.13 OTHER TESTING AND ADJUSTING

A. Provide personnel and equipment, and arrange for and pay the costs of all required tests and inspections required by governmental agencies having jurisdictions.

B. Where tests show materials or workmanship to be deficient, replace or repair as necessary, and repeat the tests until the specified standards are achieved.

C. Adjust the system to optimum standards of operations.

END OF SECTION

SECTION 23 0000 – VENTILATING, HEATING AND AIR CONDITIONING

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide ventilating, heating, and air conditioning systems, complete and operable, in accordance with the Contract Documents.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. All work and materials shall be in full accordance with the latest rules and regulations or publications of the Health and Safety Rules (Air Conditioning Systems), the local Plumbing Code, the local Building Code, and all other local codes. Nothing in the Contract Documents shall be construed to permit work in violation of the above codes, rules, and regulations. In the absence of applicable codes, the installation and workmanship shall follow the standards set by the American Society of Heating, Refrigeration and Air Conditioning.

1.03 SUBMITTALS

A. Shop Drawings: Shop drawings shall be submitted in accordance with Section 01 3300 – Submittal Procedures.

B. Equipment Numbers: Equipment is identified by assigned numbers for reference and location purposes in the Contract Documents. The appropriate equipment numbers shall be included on the Shop Drawings and on other submittals.

1.04 WARRANTY

A. Air conditioners, and all fans and blowers, shall carry the manufacturer's standard warranty, and all such warranties shall be furnished upon final acceptance of the completed systems. All reciprocating refrigerant compressors shall carry a 5-year warranty by the manufacturers.

PART 2 – PRODUCTS

2.01 GENERAL

A. Quality: All mechanisms or parts shall be amply proportioned for the stresses which may occur during operation or for any other stresses which may occur during fabrication and erection. Individual parts that are alike in all units shall be alike in workmanship, design, and materials and shall be of the manufacturer's top line, industrial-commercial grade.

B. Supports: All equipment and appurtenances shall be firmly anchored or connected to supporting members. All supports required for the proper installation of the equipment, but not forming an integral part of the building structure, shall be provided by the heating and ventilating subcontractor, unless otherwise indicated. Equipment shall be supported on restrained spring-type vibration isolators.

C. Noise/Vibration Control: The system shall be free of any objectionable vibrations and noise. Flexible connections shall be provided in all ducts and piping connections to fans, compressors, and any other vibrating equipment.

D. Electric Motors: Electric motors shall be provided in accordance with Division 26 – Electrical.

2.02 DUCTWORK AND MISCELLANEOUS ACCESSORIES

A. Construction: Sheet metal ducts and plenums shall be constructed with airtight joints and seams in accordance with ASHRAE standards and SMACNA Duct Construction Manual. All joints on concealed ducts shall be taped with pressureless tape and adhesive, except

welded or soldered joints. Ductwork materials shall be galvanized steel or aluminum, unless otherwise indicated. Minimum duct gauges required are as follows:

Maximum Dimension of Duct (inches)	Galvanized Steel U.S Standard Gauge	Aluminum B and S Gauge
12 and less	26	24
13 through 30	24	22
31 through 54	22	20
55 through 84	20	18

B. Supports: Supports for horizontal ducts and plenums shall be galvanized steel angles with hanger rods. Supports for vertical ducts shall be band iron strap or angle bracket type. Inlet ducts shall be amply braced to withstand maximum negative pressure.

C. Insulation: The exterior of all ductwork inside of buildings downstream of air conditioning or heating units, other than ducts located in air conditioned spaces, shall be insulated with 2-inch thick flexible glass fiber insulation with a UL-labeled vapor barrier. All joints shall be taped to provide a continuous vapor seal. The insulation shall be attached to the ducts with adhesive applied in a 50 percent coverage. Insulation also shall be secured to the bottom of rectangular ducts over 24 inches wide with mechanical fasteners spaced 12 inches on centers. Ductwork to be internally lined will not require exterior insulation.

D. Lining: The interior of supply and return ducts and plenums within 10-feet distance from fans and all ductwork exposed to the weather shall be lined. Duct lining shall be 1-inch-thick fiberglass fastened to the inside of the ducts. Fastening shall be 100 percent coverage adhesive and mechanical fasteners 12 inches on center in both directions starting approximately 6 inches from ends of insulation. All exposed edges, ends, and rough surfaces shall be painted with adhesive or taped with 3-inch canvas tape dipped in adhesive.

E. Bird Screens: Removable bird screens shall be provided on all outside air intakes and exhaust air discharges to outside air. Screens shall be secured in frames of same metal as screens. Bird screens shall be ½-inch mesh stainless steel by 14-gauge.

F. Flexible Connectors: Flexible duct connections shall be made with banded or flanged 8-oz canvas, or reinforced plastic, or equal at each point where a blower unit is connected to a duct. A minimum clearance of 3 inches between the duct and source of vibration shall be maintained.

G. Diffusers, Grilles, and Registers: All supply air registers and diffusers, return air, and exhaust grilles shall be constructed with smooth corners, flanges, and sponge rubber gaskets and material as noted on the Diffuser Schedule in the Contract Documents. All supply and return air registers and diffusers shall have individually variable blades and volume control dampers as indicated. All ceiling or duct-mounted outlets shall be off-white. Wall-mounted outlets shall be factory prime-coated. Terminals shall be Titus; Metalaire; Krueger; or ENGINEER-approved equal.

H. Acoustic Louvers: Acoustic louvers shall be provided as indicated. Acoustic louvers shall have a minimum noise reduction of 14 dB at octave band No. 3. The CONTRACTOR shall submit certified data from a laboratory substantiating the acoustical performance. Static pressure drop shall not exceed 0.100 inches W.C. at 750 fpm.

I. Acoustic louvers shall be of galvanized formed steel construction with air foil blades. Frame and blade face shall be of 16 and 18-gauge, respectively. Air-side blades shall have perforations, and blades shall be packed with 3.5 lb. density fiber glass or with inert, vermin-and moisture-proof mineral fiber for better acoustical performance. Louvers shall be flush with exterior wall, with mounting frames caulked to provide weather-tight

connections. All protruding inside edges shall be provided with smooth moldings. Acoustic louvers shall be Ruskin, Industrial Acoustics Company; or ENGINEER-approved equal. Coat louvers in accordance with these Specifications.

J. Turning Vanes: Square-turn elbows shall be fitted with shop-fabricated double-blade turning vanes mounted inside rails. Construction shall be of the same material as the duct work and be rigid enough to prevent vibration at high air flow.

K. Air Extractors: An air extractor shall be provided on each take-off from main supply duct adjacent to any diffuser, register, or grille where a splitter is not used. Air extractors shall be Carnes; Tuttle and Bailey or ENGINEER-approved equal. Extractors shall have synchronized steel curved blades, heavy side rails, and screw operator.

2.03 CONTROLS

A. General: All cooling, ventilating, and air conditioning equipment shall be provided with manual and automatic control systems as indicated. The exhaust fan shall be interlocked with the air conditioner to prevent fan operation while the A/C unit is operating. The exhaust fan shall be controlled from a HAND-OFF-AUTOMATIC switch and line-voltage cooling thermostat, wall-mounted. Individual exhaust fans shall have manual switches for single or 2-speed motors as indicated.

B. Thermostats: Room thermostats shall be of the modulating electric type, except where 2-position action is required. Thermostats shall be located in air-conditioned spaces and shall have a range of 40 to 100°F. All thermostats shall have exposed adjustment dials and a thermometer on the front face. Mounting height shall be 5 feet. An insulating back shall be provided where exterior wall mounting is shown. Guards shall be provided for room thermostats installed in areas other than administrative offices or control rooms.

C. Manufacturers: Control system components and thermostats shall be as manufactured by Honeywell; Johnson Controls Company; General Controls; or ENGINEER-approved equal.

2.04 PIPING

A. Piping in air conditioning systems shall be galvanized steel in accordance with these Specifications. Equipment drains shall be of Type "K" copper tube.

2.05 FANS

A. General: Location, type, capacity, and motor horsepower shall be as indicated. Fans shall be complete with motors, variable motor bases, variable drives, safety cages, belt guards, flexible connections to supply and/or suction ducts, vibration isolators, and necessary accessories. All fans shall be suitable for continuous operation.

B. Performance: Fans shall be guaranteed to deliver the quantities of standard air against the respective static pressure without deviating by more than 5 percent. Every fan wheel, regardless of size, shall be statically and dynamically balanced, and shall be free from objectionable vibration or noises.

2.06 VENTILATION FAN

A. Ventilation fan shall be remote mount, energy conserving type, with no less than 340 cfm as certified by the Home Ventilating Institute (HVI) at 0.2” static pressure in inches water gauge and no more than 1.7 sone as rated by manufacturer at 0.2” static pressure. Power consumption shall be no greater than 100 watts and energy efficiency rating shall be no less than 3.5 cfm/watt. Housing shall be insulated to reduce condensation. Duct diameter shall be no less than 6”. Fan shall be UL listed when used with GFCI branch circuit wiring. Brackets shall be provided for joist, truss, or suspension installations.

2.07 CENTRIFUGAL EXHAUST FAN

A. Exhaust fan shall be direct mounted, direct driven, propeller type. Fan blades shall be fabricated of aluminum. Propellers shall be statically and dynamically balanced in accordance with ACMA standard 204. Motors shall be continuous duty ball bearing design, permanently lubricated, heavy duty type, matched to the fan load and furnished at the specified RPM, voltage, phase, and enclosure. Motor drive frame assemblies and fan panels shall be epoxy painted steel. Drive frame assemblies shall be welded wire or formed channels and fan panels shall have pre-punched mounting holes, formed flanges, and a deep formed inlet venturi. Motor shall meet the requirements of Division 26. Fan shall be certified for air and sound performance in accordance with ACMA.

B. Performance: Fans shall be guaranteed to deliver the quantities of standard air against the respective static pressure without deviating by more than 5 percent. Every fan wheel, regardless of size, shall be statically and dynamically balanced, and shall be free from objectionable vibration or noises. Fan performances indicated in the schedule shall be minimum.

C. Isolation Damper: The dampers shall be positive seal, butterfly isolation type. The blade shall be constructed of aluminum or stainless steel depending on requirements. Blade seal shall occur when the gasket seats against the inside of the housing wall. The damper shall be all weld design. Manual actuator shall be 1/4" turn worm gear with handwheel.

D. Fan manufacturers shall be Dayton, Greenheck, Penn Ventilation or ENGINEER-approved equal. Damper manufacturers shall be Arrow, Ruskin or ENGINEER-approved equal.

2.08 AIR CONDITIONER

A. Air conditioning unit shall be of the packaged, rooftop design as indicated. All air conditioning units shall have direct expansion coils and, where indicated, gas or electric heaters; filter compartments with access door and industrial type disposable filters mounted on steel frames; mixing boxes with return air, fresh air and relief dampers; mounting frame or curb and restrained spring-type vibration isolators. All units shall be controlled from cooling room-thermostats. Unless otherwise indicated, motorized dampers shall be controlled from outside air thermostats. All outdoor air conditioners shall have heavy galvanized or prime-coated steel cabinets of weather resistant design. All drain pans shall have galvanized steel or copper drain lines connected to the nearest floor sink or drain in accordance with the applicable Plumbing Code.

B. Air conditioners shall be as manufactured by Trane, Carrier, York, Lennox, or ENGINEER-approved equal.

2.09 FILTERS

A. All air handling units and air conditioners shall be provided with filter compartments. The filters shall be of the disposable, high efficiency, industrial type, set into galvanized mounting frames with fastening clips for easy removal.

PART 3 – EXECUTION

3.01 GENERAL

A. Roughing-In: It shall be ascertained that all inserts, chassis, shafts, and openings are correctly located; otherwise all new openings shall be cut at no additional expense.

B. Checking: Test and make tight all work, furnish all equipment necessary to carry out the tests and thoroughly clean the system before startup.

C. System Balancing: After completion of all required work, the system, as a whole, shall be checked and balanced. System balancing shall include the following:

1. Adjusting fans, dampers, diffusers, registers, valves, and other devices so that the quantities of air, water, and steam called for on the Drawings are supplied, returned, or exhausted.
2. Measuring and recording at least once the water and air temperatures delivered through each coil on full heating and full cooling: making all necessary adjustments to obtain the required conditions.
3. Measuring and recording current on each fan and motor, and checking for proper operation of all equipment.
4. Adjusting any variable blade registers to the correct setting to obtain the design conditions.

END OF SECTION

SECTION 26 0126 – MAINTENANCE TESTING OF ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. The CONTRACTOR shall provide testing as specified herein.

1.02 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1.03 SUBMITTALS

A. Products shall be submitted for review in accordance with these Specifications and the Contract Documents.

B. Administrative Submittals: Submit 30 days prior to performing inspections or tests:
1. Schedule for performing inspection and tests
   a. Include notification dates for special inspections.
2. List of references to be used for each test
3. Sample copy of equipment and materials inspection form(s)
4. Sample copy of individual device test form
5. Sample copy of individual system test form

C. Quality Control Submittals: Submit within 14 days after completion of test:
1. Test or inspection reports and certificates for each electrical item tested

D. Contract Closeout Submittals:
1. In accordance with Operation & Maintenance requirements specified elsewhere
2. After test of inspection reports and certificates have been reviewed by ENGINEER and returned, insert a copy of each in operation and maintenance manual.

1.04 QUALITY ASSURANCE

A. Testing Firm Qualifications:
1. Independent 3rd party organization functioning as an unbiased testing authority.
2. Professionally independent of manufacturers, suppliers, and installers, of electrical equipment and systems being tested.
3. Employer of engineers and technicians regularly engaged in testing and inspecting of electrical equipment, installations, and systems.
4. Supervising engineer accredited as Certified Electrical Test Technologist by National Institute for Certification of Engineering Technologists (NICET), or International Electrical Testing Association and having a minimum of 5 years testing experience on similar projects.
5. Technicians certified by NICET or NETA.
6. Assistants and apprentices assigned to project at ratio not to exceed two certified to one non-certified assistant or apprentice.
7. Registered Professional Engineer to provide comprehensive project report outlining services performed, results of such services, recommendations, actions taken, and opinions.

8. In compliance with OSHA Title 29, Part 1910.7 criteria for accreditation of testing laboratories.

B. Test equipment shall have an operating accuracy equal to, or greater than, requirements established by NETA ATS. Test instrument calibration shall be in accordance with NETA ATS.

1.05 SEQUENCING AND SCHEDULING

A. Perform inspection and electrical tests after equipment has been installed and certified by equipment manufacturer's representative.

B. Perform tests with apparatus de-energized whenever feasible.

C. Inspection and electrical tests on energized equipment are to be:
   1. Scheduled with OWNER and ENGINEER prior to de-energization.
   2. Minimized to avoid extended period of interruption to the operating equipment.

D. Notify OWNER and ENGINEER at least 72 hours prior to performing tests on energized electrical equipment.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.01 GENERAL

A. Tests specified in this section are to be performed in accordance with the requirements of manufacturer's minimum recommendations, as identified herein, and as detailed in specific equipment specifications.

B. Tests and inspection shall establish that:
   1. Electrical equipment is operational within industry and manufacturer's tolerances.
   2. Installation operates as designed and intended by the equipment manufacturer.
   3. Equipment is suitable for energization.
   4. Installation conforms to requirements of Contract Documents and NFPA 70, NFPA 70E, and ANSI C2.

C. Perform inspection and testing in accordance with NETA ATS, industry standards, and manufacturer's recommendations.

D. Adjust mechanisms and moving parts for free mechanical movement.

E. Adjust adjustable relays and sensors to correspond to operating conditions, or as recommended by manufacturer.

F. Verify nameplate data for conformance to Contract Documents.

G. Realign and shim equipment not properly aligned and correct out of alignment, plumb, or level condition.

H. Properly anchor electrical equipment found to be inadequately anchored.

I. Tighten accessible bolted connections, including wiring connections, with calibrated torque wrench to manufacturer's recommendations, or as otherwise specified.

J. Clean contaminated surfaces with cleaning solvents as recommended by manufacturer.

K. Provide proper lubrication of applicable moving parts.

L. Inform OWNER of working clearances not in accordance with NFPA 70.

M. Investigate and repair or replace:
   1. Electrical items that fail tests.

2. Active components not operating in accordance with manufacturer's instructions.
3. Damaged electrical equipment.

3.02 ELECTRICAL ENCLOSURES

A. Remove foreign material and moisture from enclosure interior.

B. Vacuum and wipe clean enclosure interior.

C. Remove corrosion found on metal surfaces.

D. Repair or replace, as determined by OWNER, door and panel sections having dented surfaces.

E. Repair or replace, as determined by OWNER, poor fitting doors and panel sections.

F. Repair or replace improperly operating latching, locking, or interlocking devices.

G. Replace missing or damaged hardware.

H. Finish:
1. Provide matching paint and touch up scratches and mars.
2. If required due to extensive damage, as determined by OWNER, refinish the entire assembly.

I. Replace fuses and circuit breakers that do not conform to size and type required by the Contract Documents.

J. Grout, caulk, or seal around the base of enclosures to prevent the entrance of moisture, dust, and rodents.

3.03 DRY TYPE TRANSFORMERS

A. Visual and Mechanical inspection:
1. Physical and insulator damage
2. Proper winding connections
3. Bolt torque level in accordance with most recent publication of NETA ATS, unless otherwise specified by manufacturer.
4. Defective wiring
5. Removal of shipping brackets, fixtures, or bracing
6. Free and properly installed resilient mounts
7. Cleanliness and improper blockage of ventilation passages
8. Verify that tap-changer is set at correct ratio for rated output voltage under normal operating conditions.
9. Verify proper secondary voltage phase-to-phase and phase-to-ground after energization and prior to loading.

B. Electrical Tests:
1. Insulation Resistance Tests:
a. Applied megohmmeter in accordance with most recent publication of NETA ATS, for each:
1) Winding-to-winding
2) Winding-to-ground
b. 10-minute test duration with resistances tabulated at 30 seconds, 1 minute, and 10 minutes.
c. Results temperature corrected in accordance with most recent publication of NETA ATS.
d. Temperature corrected insulation resistance values equal to, or greater than, ohmic values established by manufacturer.

e. Insulation resistance test results to compare within 1 percent of adjacent windings.

2. Perform tests and adjustments for fans, controls, and alarm functions as suggested by manufacturer.

3.04 LOW VOLTAGE CABLES, 600 VOLTS MAXIMUM

A. Visual and Mechanical Inspection:

1. Inspect each individual exposed power cable No. 4 and larger for:
   a. Physical damage.
   b. Proper connections in accordance with Contract Drawings and approved submittals.
   c. Cable bends not in conformance with manufacturer's minimum allowable bending radius where applicable.
   d. Color coding conformance with NFPA 70 or specifications.
   e. Proper circuit identification.
2. Mechanical Connections For:
   a. Proper lug type for conductor material.
   b. Proper lug installation.
   c. Bolt torque level in accordance with most recent publication of NETA ATS, unless otherwise specified by manufacturer.
3. Shielded Instrumentation Cables (IC) for:
   a. Proper shield grounding.
   b. Proper terminations.
   c. Proper circuit identification.
4. Control Cables For:
   a. Proper termination.
   b. Proper circuit identification.
5. Cables Terminated Through Window Type CTs: Verify that neutrals and grounds are terminated for correct operation of protective devices.

B. Electrical Tests:

1. Insulation Resistance Tests:
   a. Applied megohmmeter in accordance with most recent publication of NETA ATS.
   b. Phase-to-phase and phase-to-ground for 1 minute on each pole.
   c. Insulation resistance values equal to, or greater than ohmic values established by manufacturer or listed in the most recent publication of NETA ATS.
2. Contact Resistance Tests:
   a. Contact resistance in microhms across each switch blade and fuse holder, 30 amps and larger.
   b. Investigate deviation of 50 percent or more form adjacent poles or similar switches.

3.05 MOLDED CASE CIRCUIT BREAKERS

A. General: Inspection and testing limited to circuit breakers rated 200 amperes and larger.

B. Visual and Mechanical Inspection:

1. Proper mounting
2. Proper conductor size
3. Feeder designation according to nameplate and one-line diagram
4. Cracked casings
5. Connection bolt torque level in accordance with the most recent publication of NETA ATS.

6. Operate frame size and trip setting with circuit breaker schedules or one-line diagram.
7. Compare frame size and trip setting with circuit breaker schedules or one-line diagram.
8. Verify that terminals are suitable for 75 degrees C rated insulated conductors.

C. Electrical Tests:
1. Insulation Resistance Tests:
   a. Utilize 1,000-volt megohmmeter for 480 and 600-volt circuit breakers.
   b. Pole-to-pole and pole-to-ground with breaker contacts opened for 1 minute
   c. Pole-to-pole and pole-to-ground with breaker contacts closed for 1 minute
   d. Test valves to comply with the most recent publication of NETA ATS.
2. Contact Resistance Tests:
   a. Contact resistance in microhms across each pole
   b. Investigate deviation of 50 percent or more from adjacent poles and similar breakers.
3. Primary Current Injection Test to Verify:
   a. Long-time minimum pickup and delay
   b. Short-time pickup and delay
   c. Ground fault pickup and delay
   d. Instantaneous pickup by run-up or pulse method
   e. Trip characteristics of adjustable trip breakers shall be within manufacturer's published time-current characteristic tolerance band, including adjustment factors
   f. Trip times shall be within limits established by the most recent publication of NEMA AB 4.
   g. Instantaneous pickup value shall be within values established by the most recent publication of NEMA AB 4.

3.06 INSTRUMENT TRANSFORMERS

A. Visual and Mechanical Inspection:
1. Visually Check Current, Potential, and Control Transformers For:
   a. Cracked insulation
   b. Broken leads or defective wiring
   c. Proper connections
   d. Adequate clearances between primary and secondary circuit wiring
2. Verify Mechanically that:
   a. Grounding and shorting connections have good contact.
   b. Withdrawal mechanism and grounding operation, when applicable, operate properly.
3. Insulation resistance measurement on instrument transformer shall not be less than that shown in the most recent publication of NETA ATS.

3.07 METERING

A. Visual and Mechanical Inspection:
1. Verify meter connections in accordance with appropriate diagrams.
2. Verify meter multipliers.
3. Verify that meter types and scales conform to Contract Documents.
4. Check calibration of meters at cardinal points.
5. Check calibration of electrical transducers.

3.08 GROUNDING SYSTEMS

A. Visual and Mechanical Inspection:
   1. Equipment and circuit grounds in motor control center and panelboard assemblies for proper connection and tightness.
   2. Ground bus connections in motor control center and panelboard assemblies for proper termination and tightness.
   3. Effective transformer core and equipment grounding.
   4. Accessible connections to grounding electrodes for proper fit and tightness.
   5. Accessible exothermic-weld grounding connections to verify that molds were fully filled and proper bonding was obtained.

3.09 AC INDUCTION MOTORS

A. General: Inspection and testing limited to motors rated 10 hp and larger.
B. Visual and Mechanical Inspection:
   1. Proper electrical and grounding connections.
   2. Shaft alignment.
   3. Blockage of ventilating air passageways.
   4. Operate Motor and Check for:
      a. Excessive mechanical and electrical noise.
      b. Overheating.
      c. Correct rotation.
      d. Check vibration detectors, resistance temperature detectors, or motor inherent protectors for function ability and proper operation.
      e. Excessive vibration.
   5. Check operation of space heaters.

C. Electrical Tests:
   1. Insulation Resistance Tests:
      a. In accordance with IEEE 43:
         1) Motors above 200 hp for 10-minute duration with resistances tabulated at 30 seconds, 1 minute, and 10 minutes.
         2) Motors 200 hp and less for 1-minute duration with resistances tabulated at 30 and 60 seconds.
   2. Insulation resistance values equal to, or greater than, ohmic values established by manufacturers.
   3. Calculate polarization index ratios for motors above 200 hp. Investigate index ratios less than 1.5 for Class A insulation and 2.0 for Class B insulation.
   4. Insulation resistance test on insulated bearings in accordance with manufacturer's instructions.
   5. Measure running current and voltage, and evaluate relative to load conditions and nameplate full-load amperes.
   6. Verify proper operation of motor moisture and winding temperature protection, and other ancillary devices.

3.10 MOTOR CONTROL CENTERS AND MOTOR CONTROLLERS

A. Visual and Mechanical Inspection:
   1. Proper barrier and shutter installation and operation.
   2. Proper operation of indicating and monitoring devices.
   3. Proper overload protection for each motor.
   4. Improper blockage of air-cooling passages.
   5. Proper operation of draw out elements.
   6. Integrity and contamination of insulation system.

7. Check door and device interlocking system by:
   a. Closure attempt of device when door is in OFF or OPEN position.
   b. Opening attempt of door when device is in ON or CLOSED position.
8. Check nameplates for proper identification of:
   a. Equipment title and tag number with latest Contract Drawings and approved submittals
   b. Pushbuttons
   c. Control switches
   d. Pilot lights
   e. Control relays
   f. Circuit breakers
   g. Indicating meters
9. Verify that fuse and circuit breaker sizes and types conform to Contract Documents.
10. Verify that current and potential transformer ratios conform to Contract Documents.
11. Check bus connections for high resistance by low resistance ohmmeter and calibrated torque wrench applied to bolted joints:
    a. Ohmic value to be zero
    b. Bolt torque level in accordance with the most recent publication of NETA ATS, unless otherwise specified by manufacturer.
12. Check operation and sequencing of electrical and mechanical interlock systems by:
    a. Closure attempt for locked open devices.
    b. Opening attempt for locked closed devices.
13. Verify performance of each control device and feature famished as part of the motor control center or motor controller.
14. Control Wiring:
    a. Compare wiring to local and remote control, and protective devices with elementary diagrams.
    b. Check for proper conductor lacing and bundling.
    c. Check for proper conductor identification.
    d. Check for proper conductor lugs and connections.
15. Exercise active components.
16. Inspect contactors for:
    a. Correct mechanical operations.
    b. Correct contact gap, wipe, alignment, and pressure.
    c. Correct torque of all connections.
16. Compare overload rating with full-load current for proper size.
17. Compare fuse, motor protector, and circuit breaker with motor characteristics for proper size.
18. Perform phasing check on double-ended motor control centers to ensure proper bus phasing from each source.

B. Electrical Tests:
   1. Insulation Resistance Tests:
      a. Applied megohmmeter in accordance with the most recent publication of NETA ATS.
      b. Bus section phase-to-phase and phase-to-ground for 1 minute on each phase.
      c. Contactor phase-to-ground and across open contacts for 1 minute on each phase.
      d. Starter section phase-to-phase and phase-to-ground on each phase with starter contacts closed and protective devices open.
      e. Test values to comply with the most recent publication of NETA ATS.

2. Overpotential Tests:
   a. Maximum applied voltage in accordance with manufacturer's published values. If not available, in accordance with the most recent publication of NETA ATS.
   b. Phase-to-phase and phase-to-ground for 1 minute for each phase of each bus section.
   c. Test results evaluated on pass/fail basis.
3. Current Injection Through Overload Unit at 300 Percent of Motor Full-Load Current and Monitor Trip Time:
   a. Trip time in accordance with manufacturer's published data.
   b. Investigate values in excess of 120 seconds.
4. Control Wiring Tests:
   a. Apply secondary voltage to control power and potential circuits.
   b. Check voltage levels at each point on terminal boards and each device terminal.
   c. Insulation resistance test at 1,000 volts on control wiring except that connected to solid state components.
      1) Insulation resistance to be 1 megohm minimum.
5. Operational test by initiating control devices to affect proper operation.

3.11 LOW VOLTAGE SURGE ARRESTORS

A. Visual and Mechanical Inspection:
   1. Adequate clearances between arrestors and enclosures.
   2. Ground connections to ground bus.

B. Electrical Tests:
   1. Varistor Type Arresters:
      a. Clamping voltage test.
      b. Rated RMS voltage test.
      c. Rated voltage test.
      d. Varistor arrester test values in accordance with ANSI C62.33, Sections 4.4 and 4.7.

END OF SECTION

SECTION 26 0500 – COMMON WORK RESULTS FOR ELECTRICAL

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. It is the intent of this part of the Contract Documents to cover the work and materials necessary for erecting a complete electrical system, tested and ready for continuous use. The system shall be constructed in accordance with the Contract Documents, and Federal, State, and Local codes and regulations.

1.02 RELATED WORK

A. The CONTRACTOR shall coordinate the work with other trades, and furnish and install the equipment in accordance with the manufacturers' requirements.

1.03 GENERAL PROVISIONS

A. Minimum sizes of equipment, and electrical devices, are indicated but it is not intended to show every offset and fitting, nor every structural or mechanical difficulty that will be encountered during the installation of the work.

B. Work indicated on the Plans is approximately to scale, but actual dimensions and detailed Plans should be followed as closely as field conditions permit. Field verification of scale dimensions on Plans is governed by field conditions. Installation of systems and equipment is subject to clarification as indicated in reviewed shop drawings and field coordination.

C. Discrepancies indicated on different Plans, between Plans and actual field conditions, or between Plans and Contract Documents shall be promptly brought to the attention of the ENGINEER for clarification, prior to purchasing and installing equipment.

D. The alignment of equipment and conduit shall be adjusted to accommodate architectural changes, or to avoid work of other trades, without extra expense to the OWNER.

E. The CONTRACTOR shall furnish and install the parts and pieces necessary to the installation of equipment, in accordance with the best practice of the trade, and in conformance with the requirements of these Contract Documents.

F. Items not specifically mentioned in these Contract Documents, or noted on the Plans, or indicated on reviewed shop drawings, but which are obviously necessary to make a complete working installation, shall be deemed to be included herein.

G. The CONTRACTOR shall lay out and install electrical work prior to placing floors and walls. Furnish and install sleeves and openings through floors and walls, required for installation of conduits. Sleeves shall be rigidly supported and suitably packed, or sealed, to prevent ingress of wet concrete. Spacers shall be installed in order to prevent conduit movement. Dimensions indicated for electrical equipment and their installation are restrictive dimensions.

H. The CONTRACTOR shall furnish and install inserts and hangers required to support conduits and other electrical equipment. If the inserts, hangers, sleeves, or other mounting hardware are improperly placed, or installed, the CONTRACTOR shall do necessary work, at their own expense, to rectify the errors.

I. Electrical equipment shall be capable of operating successfully at full-rated load, without failure, at an ambient air temperature of 60°C, and specifically rated for the altitude indicated on the Plans. Electrical equipment not rated for operation at that temperature shall be provided with air conditioning to meet the manufacturers' operating temperature.

J. If any contradictions, contrasts, non-homogeneity, or inconsistency appears, the stricter criteria noted and the collective requirements in any and all of the project documents shall apply.

K. The CONTRACTOR shall perform necessary saw cutting, core drilling, excavating, removal, shoring, backfilling, and other work required for the proper installation of conduits, whether inside, or outside of the buildings and structures. The CONTRACTOR shall repair and patch where demolition has taken place in a manner to match existing original structure.

1.04 REGULATIONS, CODES, AND STANDARDS

A. Electrical work, including connection to electrical equipment integral with mechanical equipment, shall be performed in accordance with the latest published regulations, codes, and standards, of the following:
   1. National Electrical Code (NEC)
   2. State and local codes
   3. Institute of Electrical and Electronic Engineers (IEEE)
   4. American National Standards Institute (ANSI)
   5. American Society for Testing and Materials (ASTM)
   6. Insulated Cable Engineers Association (ICEA)
   7. National Electrical Manufacturers Association (NEMA) Standards
   8. Federal Occupational Safety and Health Act (OSHA)
   9. National Fire Protection Association (NFPA)
   10. National Electrical Testing Association (NETA)

B. When applicable, the material used in the performance of the electrical work shall be listed by the Underwriters' Laboratories, Inc. (UL) for the class of service for which they are intended.

1.05 SUBMITTALS

A. It is the obligation of the CONTRACTOR to organize their work, so that a complete electrical, instrumentation, and control system for the facility will be provided, and will be supported by accurate shop and record drawings, and O&M manuals.

B. The CONTRACTOR shall submit detailed shop drawings and data prepared and organized by the suppliers. The quantity of submittal sets required shall be as specified in the Contract Documents.

C. The submittals shall be neatly grouped and organized by specification section number, and sub-section. Related information shall be highlighted, and the specific product shall be marked. All submittals shall be complete, and presented in one package. Incomplete submittals will be returned without review. If a portion of the project requires a fast track schedule, that portion may only be submitted earlier under a separate cover letter. The following shall be submitted to the ENGINEER and returned reviewed to the CONTRACTOR before fabrication is started.
   1. A complete list of the equipment and materials, including the manufacturer's name, product specification, descriptive data, technical literature, performance charts, catalog cuts, installation instructions, and spare part recommendations for each different item of the equipment specified. The above shall clearly show all the specified requirements as described in the Specifications including but not limited to specific UL and NEMA rating, technical capabilities, test result verifications, and acceptance letters.
   2. Drawings containing complete point to point wiring and schematic diagrams, control diagrams, and any other details required to demonstrate that the system has been coordinated and will operate as intended. Drawings for each panel, cabinet, or enclosure shall show a complete Bill of Materials, wire numbers for internal panel and field wiring, terminal block numbers, proposed internal layout with assembly details, anchoring, support, and appurtenances of equipment, and equipment relationship to other parts of the work including clearances for maintenance and operations.
   3. Any exceptions to these specifications, with the reasons for requesting such exceptions, with calculations and drawings for redesign of related components, including detail drawings showing internal and assembly details, with installation instructions. Proposed layout showing any modifications or exceptions to related work made necessary by this work, with

calculations and drawings showing such modifications or exceptions.

D. Upon Project acceptance, the CONTRACTOR shall submit "Record Drawings" of the electrical, control, and instrumentation, along with step-by-step procedure manuals for the installation, operation start-up, and maintenance of the equipment. Each set shall include installation, operating, troubleshooting, and maintenance and overhaul instructions in complete detail. It shall also include possible breakdowns and repairs, and troubleshooting guides, as well as simplified wiring and control diagrams of the system installed. This shall provide the OWNER with comprehensive information on all systems and components to enable operation, service, maintenance and repair. Exploded or other detailed views of all equipment, devices, assemblies, and accessory components shall be included, together with complete parts lists and ordering instructions.

1. Record Drawings:
   a. The CONTRACTOR shall maintain a marked up set of Contract Document Plans showing actual installed circuit numbers, conduit sizes, cable tray routing, number of conductors, conductor sizes (larger than #12 AWG), and all other deviations from the design Plans.
   b. Underground conduit and concealed items shall be dimensioned on the Plans from permanent, visible, building features.
   c. The CONTRACTOR shall provide actual transformer kVA, disconnect switch rating, starter, and overload heater size (if applicable) along with all other protective equipment for all 480, 240, 208 and 120V devices as part of the one-line record drawings.
   d. The CONTRACTOR shall revise all conductor identification and panel schedules to indicate as-built conditions.

PART 2 – PRODUCTS

2.01 GENERAL MATERIALS AND METHODS

A. Materials, equipment, and parts comprising any unit, or part thereof, specified or indicated on the Plans, shall be new and unused, of current manufacture, and of highest grade consistent with the state of the art. Damaged materials, equipment, and parts, are not considered to be new and unused, and will not be accepted.

B. Field verification of scale dimensions on Plans is directed, since actual locations, distances, and levels will be governed by actual field conditions. The CONTRACTOR shall also review architectural, structural, yard, mechanical, and other Plans, and the accepted electrical and mechanical shop drawings, and shall adjust their work to conform to the conditions indicated therein.

C. The fabricator of major components, such as distribution panelboards, switchgear/switchboards, and motor control centers, shall also be the manufacturer of the major devices therein.

D. Refer to various Division sections for individual equipment manufacturers. Indicated manufacturers are subject to strict compliance with the specifications and complete project documents. The reference to a particular manufacturer does not relieve the CONTRACTOR from conforming to the specified requirements.

2.02 NAMEPLATES

A. Where indicated elsewhere in these specifications, or on the Plans, the CONTRACTOR shall furnish and install nameplates, which shall be white laminate with black letters. The nameplates shall be fastened to the various devices with round head stainless steel screws. Each disconnecting means for service, feeder, branch, or equipment conductors, shall have nameplates indicating its purpose.

2.03 EQUIPMENT ASSEMBLIES

A. Equipment assemblies, such as Service Entrance Sections, Switchgear, Switchboards, Control and Distribution Panels, and other custom fabricated electrical enclosures shall bear a UL label as a complete assembly. The UL label on the individual components making up the assembly will not be considered sufficient to meet the present requirement. Whenever a generic UL label does not apply for the assembly, a serialized UL label shall be affixed to the assembly, and the serial number shall be submitted with the assembly record shop drawings.

B. Custom fabricated electrical control panels, and enclosures, shall bear a UL label affixed by a local UL inspector.

PART 3 – EXECUTION

3.01 UTILITY SERVICE AND EQUIPMENT

A. Electrical Utility: The CONTRACTOR shall be responsible for contacting and coordinating the electrical utility work with the electrical utility company:

Arizona Public Service (APS)
M.S. 4714
6672 Corsair Avenue,
Prescott, AZ 86301
(928) 443-6794
www.aps.com

B. The CONTRACTOR shall be responsible for furnishing and installing equipment and material required to bring electrical power service to the service location in conformance with the electrical utility requirements. The CONTRACTOR may have to provide the following for the electrical utility company's primary (from utility power line to the utility transformer) and secondary (from utility transformer to the service) electrical lines in accordance with the electrical utility company's specifications and requirements:

1. Conduits (verify quantity and sizes).
2. Trenching, backfill, and compacting (verify trench size(s), backfill material, and compaction percentage requirements).
3. Concrete pad(s) (for pad mounted transformer(s)).
4. Cable protection along the vertical drop at the utility company's pole (if pole mounted transformer(s).
5. Other items required by the power utility company's specifications.

B. The CONTRACTOR shall also submit copies of service entrance shop Drawings to the utility, per utility submittal requirements, prior to submittal to the ENGINEER. The CONTRACTOR shall obtain written approval from the power utility company that the service entrance equipment is acceptable prior to releasing the order to the supplier for fabrication. A copy of the approval letter from the utility shall be transmitted to the ENGINEER along with the submittal.

C. The CONTRACTOR shall provide trenching, conduit, and backfill for the Telephone Company's communication lines from their main distribution panel to the connection box at this project site, as required by the Telephone Company.

D. Electrical equipment such as switchboard, switchgear, panelboards, industrial control panels, and meter socket shall have an arc flash label in accordance with NEC 110.16(a).

3.02 INSTALLATION OF ELECTRICAL EQUIPMENT

A. Coordinate the installation of electrical equipment with other trades.

1. Arrange for the building-in of equipment during structure construction.
2. Where equipment cannot be built-in during construction, arrange for sleeves, box-outs, and other openings, as required to allow installation of equipment after structure construction is

complete.

B. Verify that equipment will fit support layouts indicated.

C. Equipment Dimensions and Clearances:
   1. Do not use equipment that exceeds the indicated dimensions except as approved in writing by the ENGINEER.
   2. Do not use equipment or arrangements of equipment that reduce required clearances or exceed the space allocation.

D. Install equipment in accordance with the manufacturer's instructions.

E. Equipment Access:
   1. Install equipment so it is readily accessible for operation and maintenance.
   2. Equipment shall not be blocked or concealed.
   3. Do not install electrical equipment such that it interferes with normal maintenance requirements of other equipment.

F. Equipment shall be installed plumb, square and true with the building construction, and shall be securely fastened.

G. Outdoor wall-mounted equipment, and indoor equipment mounted on earth, or water bearing walls, shall be provided with corrosion-resistant spacers to maintain 1/4-inch separation between the equipment and the wall.

H. Screen or seal all openings into outdoor equipment to prevent the entrance of rodents and insects.

I. Equipment fabricated from aluminum shall not be imbedded in earth or concrete.

J. Provide all necessary anchoring devices and supports:
   1. Use supports as detailed on the Plans and as specified.
   2. Supports and anchoring devices shall be rated and sized based on dimensions and weights verified from approved equipment submittals.
   3. Hardware shall be stainless steel.
   4. Do not cut, or weld to, building structural members.
   5. Do not mount safety switches and external equipment to other equipment enclosures, unless enclosure mounting surface is properly braced to accept mounting of external equipment.

K. CONTRACTOR shall verify exact rough-in location and dimensions for connection to electrical items furnished by others.
   1. Shop drawings shall be obtained from those furnishing the equipment.
   2. Proceeding without proper information may require the CONTRACTOR to remove and replace work that does not meet the conditions imposed by the equipment supplied.
   3. Provide sleeves wherever openings are required through new concrete or masonry members. Place sleeves accurately and coordinate locations with the ENGINEER.
   4. Should any cutting and patching be required on account of failure of the CONTRACTOR to coordinate penetrations, such cutting and patching shall be done at the expense of the CONTRACTOR.
      a. The CONTRACTOR shall not endanger the stability of any structural member by cutting, digging, chasing, or drilling and shall not, at any time, cut or alter the work without the ENGINEER's written consent.
         1) Provide additional reinforcing if required.
         2) Cutting shall be done neatly using proper tools and methods.
      b. Subsequent patching to restore walls, ceilings, or floors to their original condition shall be done by the CONTRACTOR.

L. Provide concrete foundations or pads required for electrical equipment as indicated or specified.
   1. Floor-mounted equipment shall be mounted on a 4-inch concrete housekeeping pad. Pad

shall be poured on top of the finished floor or slab.

3.03 TEMPORARY POWER

A. The CONTRACTOR shall furnish, install, and maintain, temporary power and lighting systems needed for construction. This temporary system shall include weatherproof panel(s) for the CONTRACTOR's main breakers and distribution system. Ground fault interrupting equipment shall be installed. Connections shall be watertight, with wiring done with Type SO portable cable. After construction is completed, the CONTRACTOR shall remove temporary power equipment and devices.

3.04 CUTTING AND REPAIRING

A. Where it becomes necessary to cut into existing work for the purpose of making electrical installations, core drills shall be used for making circular holes. Other demolition methods for cutting or removing shall be reviewed by the ENGINEER prior to starting the work.

B. The CONTRACTOR shall repair damage caused by construction, or demolition work, and restore damaged areas to original condition.

3.05 CORROSION PROTECTION

A. Wherever dissimilar metals (except conduit and conduit fittings) come in contact, the CONTRACTOR shall isolate these metals, as required, with neoprene washers, 9 mil polyethylene tape, or gaskets. Where fastening conduit, electro-plated or equivalent fasteners and stainless steel bolts shall be used.

B. Factory finishes damaged during shipping, or construction, shall be restored to original new condition. Rust shall be removed, and bare metal surfaces shall be primed and painted to match the original surrounding finish.

C. Electrical panels, switchgear, motor control centers, and other electrical equipment, shall be shipped in sealed dust and moisture proof plastic sheet enclosures, and the seal maintained until units are installed. Said units shall be new and free of any dirt, dust, water, grease, rust, damaged parts or components. Relays, starters, circuit breakers, switches, contacts, insulators, mechanisms, and buses shall be free of dust, dirt, oil, moisture, metal shavings, and other debris before testing and energizing.

D. Once equipment is installed, it shall be protected at all times with plastic sheet covers until the area is free of dirt, dust, paint spray, water, and other trades. Heat shall be provided to eliminate condensation.

3.06 COORDINATION OF THE ELECTRICAL SYSTEM

A. The CONTRACTOR shall verify actual equipment, and motor full-load, and locked-rotor current ratings. The necessary minimum equipment, wire, and conduit sizes are indicated on the Plans. If the CONTRACTOR furnishes equipment of different ratings, the CONTRACTOR shall coordinate the actual current rating of equipment furnished with the branch circuit conductor size, the overcurrent protection, the controller size, the motor starter, and the branch circuit overcurrent protection. The branch circuit conductors shall have a current carrying capacity of not less than 125 percent of the actual full-load current rating. The size of the branch circuit conductors shall be such that the voltage drop from the overcurrent protection devices, up to the equipment, shall not exceed 3 percent, when the equipment is running at full-load and rated voltage.

3.07 TESTING

A. The electrical work shall be free from improper grounds and short circuits. The correctness of the wiring shall be verified first by visual comparison of the conductor connections with connection diagrams. Next, individual circuit continuity checks shall be made by using electrical circuit testers. Last, the correctness of the wiring shall be verified by the actual electrical operation of the electrical and mechanical devices. Any deviation from the wiring indicated on the Plans, or accepted Drawings, shall be corrected and indicated on the record drawings.

B. Each conductor shall be identified as required by the Contract Documents. This identification shall be indicated on the record drawings to enable rapid and accurate circuit tracing by maintenance personnel.

3.08 SINGLE LINE DIAGRAMS

A. Single line diagrams, as indicated on the Drawings, show circuit voltages, circuit protection rating, and other pertinent data. Where conflicts exist on the Drawings, the single line diagrams shall take precedence. Grounding conductors are not necessarily indicated. See grounding requirements specified elsewhere herein.

END OF SECTION

SECTION 26 0519 – LOW-VOLTAGE ELECTRICAL POWER CABLES

PART 1 – GENERAL

1.01 DESCRIPTION

A. Scope:
1. Provide all labor, materials, equipment, and incidentals shown, specified, and required to furnish, install, test and terminate low-voltage cables.
2. If larger loads than indicated in the plans (such as larger motor horsepower) are required, revise the raceways, conductors, starters, variable speed drives, overload elements, and branch circuit protectors to comply with the national electrical code.
3. Types of cabling required include:
   a. Insulated cable for installation in raceways.

1.02 REFERENCES

A. Standards referenced in this Section are listed below:

ANSI/ NETA ATS	Acceptance Testing Specifications for Electrical Power Equipment and Systems
ASTM B3	Soft or Annealed Copper Wire
ASTM B8	Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard or Soft
ASTM F2160	Solid Wall High Density Polyethylene (HDPE) Conduit Based on Controlled Outside Diameter (OD).
NEMA TC 7	Smooth Wall Coilable Electrical Polyethylene Conduit.
UL 44	Thermoset-Insulated Wires and Cables.
UL 1277	Standard for Electrical Power and Control Tray Cables with Optional Optical-Fiber Members.

1.03 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with the following:
1. NEC Article 300, Wiring Methods.
2. NEC Article 310, Conductors for General Wiring.
3. NEC Article 392, Cable Trays.

1.04 SUBMITTALS

A. Action Submittals: Submit the following:
1. Product Data:
   a. Manufacturer’s literature, specifications, and engineering data for low volt insulated cable proposed for use.
   b. Manufacturer’s cable pulling calculations for all cables (power and control) that are to be pulled through the jack and bore casing. Calculations shall indicate acceptability of the proposed cables with a proposed pulling setup. Calculations shall be made and submitted for review before ductbanks are installed.

B. Informational Submittals: Submit the following:
1. Field Quality Control Submittals:
   a. Written results of field insulation resistance tests.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Insulated Cable in Raceways:
   1. Application: Use for circuits located indoors and outdoors.
   2. Manufacturers: Provide products of one of the following:
      a. Southwire
      b. The Okonite Company
      c. American Insulated Wire
      d. General Cable
      e. Or ENGINEER-approved equal
   3. Material: Single or multiconductor type copper cable complying with ASTM B3 and ASTM B8 with flame-retardant, moisture- and heat-resistant insulation rated for 90°C in dry or wet locations, listed by UL.
   4. Application: Use UL listed type XHHW-2 for AWG No. 12 and larger. Use UL listed type THHN/THWN-2 for AWG No. 12 and smaller.
   5. Wire Sizes: Not smaller than AWG No. 12 for power and lighting and AWG No. 14 for 120-volt control circuits.
   6. Stranding: 600-volt cable shall be stranded, except that solid cable, AWG No. 10 and AWG No. 12 may be used for lighting circuits and receptacle circuits.
   7. Cables in Cable Trays shall be listed for cable tray use and be installed per NEC 392.

B. Cable Connectors, Solderless Type:
   1. Products and Manufacturers: Provide products of one of the following:
      a. T&B Sta-Kon
      b. Burndy Hylug
      c. Or ENGINEER-approved equal
   2. For wire sizes No. 4 AWG and above, use either compression type or bolted type with silver-plated contact faces.
   3. For wire sizes up to and including No. 6 AWG, use compression type. Alarm and control wire shall be terminated using forked type connectors at terminal boards.
   4. For wire sizes No. 250 KCMIL and larger, use connectors with at least two cable clamping elements or compression indents and provision for at least two bolts for joining to apparatus terminal.
   5. Properly size connectors to fit fastening device and wire size. Connectors shall be rated for 90°C, 600 volts.

C. Cable Splices:
   1. Products and Manufacturers:
      a. Compression-Type Splices: Provide one of the following:
         1) Burndy Hylink
         2) T&B Color-Keyed Compression Connectors
         3) Or ENGINEER-approved equal
      b. Spring Connectors: Provide one of the following:
         1) Buchanan B-Cap
         2) T&B Wire Connector
         3) Or ENGINEER-approved equal

2. For wire sizes No. 8 AWG and larger, splices shall be made up with compression type copper splice fittings. Splices shall be taped and covered with materials recommended by cable manufacturer to provide insulation equal to that on conductors.
3. For wire sizes No. 10 AWG and smaller, splices may be made up with pre-insulated spring connectors.
4. For wet locations, splices shall be waterproof. Compression type splices shall be waterproofed by sealant-filled, thick wall, heat shrinkable, thermosetting tubing or by pouring thermosetting resin into mold that surrounds the joined conductor. Spring connector splices shall be waterproofed with sealant filler.
5. Splices shall be suitably sized for cable, rated 90°C, and 600 volts.

D. Wire and Cable Markers:
1. Provide wire and cable markers in accordance with these Specifications.

E. Variable Frequency Drive Symmetrical Type Cable:
1. Power Conductors: Three (3) annealed, tinned, stranded copper per ASTM B8, coated per ASTM B33.
2. Insulation: Black cross-linked polyethylene (XLPE) per UL44.
3. Ground: Three (3) symmetrically placed bare annealed Class B stranded copper conductors per ASTM B3 and B8 whose cross-section areas shall add to equal the cross-section area of the power conductor size. The conductors shall be in direct contact with the shield and may be tinned or untinned.
4. Shield: Overall annealed 5 mil bare copper tape shield, 50% overlap for 100% coverage OR overall tinned copper braided shield and aluminum polymer tape for 100% coverage.
5. Jacket: Polyvinyl Chloride (PVC), oil resistant, per UL1277.
6. Voltage insulation: 2000V.
7. Cable size shall be as indicated on the Drawings.
8. Splices: Splices in VFD cables shall not be permitted.
9. Connections and Termination: cable and shield terminations and connections shall be in complete accordance with VFD, motor and cable manufacturers published requirements.
10. Manufacturers: General Cable CVTC-VFD; Southwire type TC VFD cable; or equal.

2.02 SOURCE QUALITY CONTROL

A. Factory Tests:
1. Factory-test wire and cable in accordance with UL standards

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install cables complete with proper terminations at both ends. Check and correct for proper phase sequence and proper motor rotation.

B. Pulling:
1. Use insulating types of pulling compounds containing no mineral oil.
2. Pulling tension shall be within limits recommended by wire and cable manufacturer.
3. Use dynamometer where mechanical means are used.
4. Cut off section subject to mechanical means.

C. Bending Radius: Limit to minimum of six times cable overall diameter and in accordance with manufacturer requirements.

D. Slack: Provide maximum slack at all terminal points.

E. Splices:
1. Where possible, install cable continuous, without splice, from termination to termination.
2. Where required, splice as shown and also where required for cable installation. Splices below grade, in manholes, handholes, and wet locations shall be waterproof.
3. Splices are not allowed in conduits.
4. Splices are not allowed in VFD cables.

F. Identification:
1. Identify conductors in accordance with applicable Sections of Division 26 – Electrical.
2. Identify power conductors by circuit number and phase at each terminal or splice location.
3. Identify control and status wiring using numeral tagging system.

G. Color-code power cables as follows:
1. No. 8 AWG and Smaller: Provide colored conductors.
2. No. 6 AWG and Larger: Apply general purpose, flame retardant tape at each end, wrapped in overlapping turns to cover an area of at least two inches.
3. Colors: Match color scheme in use at the Site. If the Site does not have an existing color scheme, use the following colors:

System	Conductor	Color
All Systems	Equipment Grounding	Green
240/120 Volts Single-Phase, Three-Wire	Grounded Neutral One Hot Leg Other Hot Leg	White Black Red
208Y/120 Volts Three-Phase, Four-Wire	Grounded Neutral Phase A Phase B Phase C	White Black Red Blue
480Y/277 Volts Three-Phase, Four-Wire	Grounded Neutral Phase A Phase B Phase C	Gray Brown Orange Yellow

3.02 FIELD QUALITY CONTROL

A. Site Tests:
1. Test each electrical circuit after permanent cables are in place, to demonstrate that circuit and equipment are connected properly and will perform satisfactorily, free from improper grounds and short circuits. Document each test performed.
2. Individually test 600-volt cable mechanical connections after installation and before they are put in service, with calibrated torque wrench. Values shall be in accordance with manufacturer's recommendations.
3. Individually test 600-volt cables for insulation resistance between phases and from each phase to ground. Test after cables are installed and before they are put in service, with Megger for one minute at voltage rating recommended by cable manufacturer or in accordance with ANSI/NETA ATS recommendations.
4. Insulation resistance for each conductor shall not be less than value recommended by cable manufacturer. Cables not meeting recommended value or that fail when tested under full load conditions shall be replaced with a new cable for full length.

END OF SECTION

SECTION 26 0523 – INSTRUMENTATION AND COMMUNICATION CABLES

PART 1 – GENERAL

1.01 DESCRIPTION

A. Scope:
1. Provide all labor, materials, equipment, and incidentals shown, specified, and required to furnish and install instrumentation and communication cables.

1.02 REFERENCES

A. Standards referenced in this Section are listed below:

ASTM A510/ A510M	Wire Rods and Coarse Round Wire, Carbon Steel and Alloy Steel
ASTM B633	Electrodeposited Coatings of Zinc on Iron and Steel
ANSI/TIA/ EIA-568	Commercial Building Telecommunications Cabling (requirements and restrictions of Technical Service Bulletins (TSBs) apply.)
RS-485	Electrical Characteristics of Generators and Receivers for Use in Balanced Digital Multipoint Systems (also known as TIA/EIA-485).
UL 13	Power-Limited Circuit Cables
UL 1581	Standard for Electrical Wires, Cables and Flexible Cords
UL VW-1	Vertical Wire Flame Test
UL 1666	Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts

1.03 QUALITY ASSURANCE

A. Regulatory Requirements:
1. NEC 725 – Class 1, Class 2, and Class 3 Remote-Control, Signaling and Power-Limited Circuits
2. NEC 727 – Instrumentation Tray Cable
3. NEC 800 – Communications Circuits

1.04 SUBMITTALS

A. Action Submittals: Submit the following:
1. Product Data: Manufacturer's technical information for instrumentation cables and communications cables proposed.
2. Provide pulling calculations for cables to be installed in the jack and bore ductbank.

B. Informational Submittals: Submit the following:
1. Field Quality Control Submittals: Written report of results of field quality control testing specified in this Section.

PART 2 – PRODUCTS

2.01. MATERIALS

A. Single and Multiple Shielded Pair Instrument Cable:
1. Bare, soft annealed copper, 7 strand, PVC insulated conductors, No. 16 AWG minimum (unless indicated otherwise on the drawings / conduit schedule), twisted with aluminum/mylar shield with 25 percent minimum overlap, stranded tinned 20 AWG copper drain wire and PVC outer jacket. Rated for 600 volts. Temperature rated 90°C in dry installations, rated 75°C in wet locations. UL Type TC, UL listed for cable tray use, sunlight resistant. The abbreviation "STP" or "TSP" is used for shielded twisted pair on the Drawings.

2. Product and Manufacturer: Provide shielded cable of the following:
   a. Alpha Wire Company.
   b. Or ENGINEER-approved equal.
3. Cable shall be plenum rated when all or part of the cable is not encased in conduit.
4. Multi pair instrument cable shall have individual pair shielding and overall shielding.

B. Cable Terminals:
1. Manufacturers: Provide products of one of the following:
   a. T&B Sta-Kon
   b. Burndy Insulug
   c. Or ENGINEER-approved equal
2. Fork type copper compression terminals with nylon insulation for termination of cable at terminal blocks.

C. Single Shielded Triad Instrument Cable:
1. Bare, soft annealed copper, 7-strand, PVC insulated conductors, No. 16 AWG minimum, twisted with aluminum/mylar shield with 25 percent minimum overlap, stranded tinned 20 AWG copper drain wire and PVC outer jacket. Rated for 600 volts. Temperature rated 90°C in dry installations, rated 75°C in wet locations. UL Type TC, UL listed for cable tray use, sunlight resistant. The abbreviation “STT” or “TST” is used for shielded twisted triad on the Drawings.
2. Product and Manufacturer: Provide shielded cable of the following:
   a. Alpha Wire Company.
   b. Or ENGINEER-approved equal
3. Cable shall be plenum rated when all or part of the cable is not encased in conduit.

D. Shielded Ethernet Category 5e Premises Cable:
1. This cabling is for outdoor applications, process control interface (VFDs, PLCs, etc.), lighting control component interconnections, and anywhere network cables will be routed in the same ductbank, manhole, handhole, or other raceway as AC power cabling.
2. Furnish, install, and terminate from each field device to the network switch.
   a. Suitable Applications: Gigabit Ethernet, 100BaseTX, 100MHz Category 5e.
   b. Number of Pairs: 4
   c. Total Number of Conductors: 8
   d. AWG: 24
   e. Stranding: Solid
   f. Conductor Material: Bare Copper
   g. Color Code: EIA 568
   h. Shield: Double-shielded version with 100% coverage aluminum foil tape plus tinned copper braid
   i. Insulation Material: Polyolefin
   j. Outer Jacket Material: PVC, outdoor rated, sunlight resistant, oil resistant
   k. Outer Jacket Color: Blue.
   l. TIA/EIA Specification: 1005, 568B compliant
   m. UL Flame Test: UL 1666 Riser compliant
   n. Manufacturer: Belden, Model 7957A
   o. Use shielded RJ45 strain relief plug systems by L-com (TDS8PC5) with plug-boots (TDS8CVR-BK).

PART 3 – EXECUTION

3.01 INSPECTION

A. Examine conditions under which materials and equipment will be installed and notify OWNER in writing of conditions detrimental to proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions are corrected.

3.02 INSTALLATION

A. General:
   1. Install cables complete with proper terminations at both ends.
   2. Install in conduit separate from power cables, unless shown or indicated otherwise.
   3. Ground shield on shielded cables at the source end (PLC panel, etc.).
   4. Identify conductors in accordance with these Specifications.
   5. Install and terminate Supplier-furnished cable in accordance with equipment manufacturer requirements and cable manufacturer’s recommendations.
   6. Install in accordance with Laws and Regulations, including NEC.
   7. Splicing of instrumentation and communication cables is not permitted unless approved by the ENGINEER of record.

3.03 FIELD QUALITY CONTROL

A. Site Tests:
   1. Test shielded instrumentation cable shields with ohmmeter for continuity along full length of cables, and for shield continuity to ground.
   2. Connect shielded instrumentation cables to calibrated 4 to 20 mA DC signal transmitter and receiver. Test at 4 and 20 mA DC transmitter settings.
   3. Replace with new cables the full length of cables that fail test.
   4. Test equipment shall be provided by CONTRACTOR.
   5. Test all Ethernet cables with a Fluke DSP100 Cable Meter (or equal) testing system. Each cable shall be tested from the connected data jack, control panel, VFD, UPS, etc., to the patch panels. A qualified factory-trained manufacturer's representative shall certify in writing that the network cabling system has been installed, adjusted, and tested in accordance with the cable manufacturer's recommendations and industry standards for performance testing. Certification shall bear the typewritten name and signature of the person responsible for the work. Certification shall state the unit has passed all tests and is ready to be placed into operation. Provide four (4) copies of the manufacturer's representative's certification.

END OF SECTION

SECTION 26 0526 – GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. A ground grid system consisting of the indicated configuration of copper wires, and ground rods, or concrete encased grounding electrodes ("UFERs") shall be provided to minimize station potential gradient irregularities and drain leakage and fault currents to earth.

B. Whether indicated on the Plans or not, neutral conductors, cable shields, metallic conduits, cable terminations, junction boxes, poles, surge arresters, and other non-current-carrying metallic parts of equipment shall be grounded.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with Section 01 3300 – Submittal Procedures, and elsewhere in the Contract Documents prior to installation.

1.03 REFERENCES

A. National Electrical Code (NEC) Article 250

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS

A. A resistance of not greater than 25 ohms shall be provided, unless otherwise specified. Ground resistances shall be measured as herein described. Resistances of systems requiring separate ground rods, rather than a counterpoise, shall be measured separately before bonding below grade. The combined ground resistance of separate systems bonded together below grade may be used to meet the specified ground resistance, but the minimum number of rods indicated must still be provided.

2.02 GROUND RODS

A. Ground rods shall be copper-clad steel conforming to UL 467, 3/4 inch in diameter by 10 feet in length. Unless otherwise indicated, ground rods shall be driven into the ground until tops of rods are approximately 6 inches below finished grade. In counterpoise systems. Tops of ground rods shall be approximately at elevations of counterpoises. Where the specified ground resistance cannot be met with the indicated number of ground rods, additional ground rods, longer ground rods, or deep-driven sectional rods shall be installed and connected until the specified resistance is obtained, except that not more than three additional ground rods shall be required at any one installation. Ground rods shall be spaced as evenly as possible at least 6 feet apart and connected below grade.

2.03 CONNECTIONS

A. Connections above grade shall be made with bolted solderless connectors, and those below grade shall be made by a fusion-welding process. An embossing die code or other standard method shall provide visible indication that a connector has been adequately compressed on the ground wire.

2.04 GROUNDING ELECTRODE CONDUCTOR

A. Service entrance ground wires shall be sized in accordance with the most recent publication of NEC Table 250-66, unless otherwise indicated on the Plans. After being located to provide maximum physical protection, exposed ground wires shall be securely attached to structural supports at not more than 2-foot intervals with suitable fasteners. Bends greater than 45 degrees in ground wires are not permitted. Routing of ground conductors through concrete should be avoided, except where specifically called for in

these Documents. When concrete penetration is necessary, nonmetallic conduit shall be cast flush with the points of concrete entrance and exit, so as to provide an opening for the ground wire. The opening shall be sealed with a suitable compound after installation of the ground wire.

2.05 EQUIPMENT GROUNDING CONDUCTOR

A. Neutral conductors shall be grounded where indicated. Equipment grounding conductors shall be sized in accordance with the most recent publication of NEC Table 250-122, unless otherwise indicated. Ground wires shall be protected by conduit, where such wires run exposed above grade in non-fence-enclosed areas, or are run through concrete construction. Where concrete penetration is necessary, nonmetallic conduit shall be cast flush with the points of concrete entrance and exit, so as to provide an opening for the ground wire. The opening shall be sealed with a suitable compound after installation of the ground wire. Bends greater than 45 degrees in ground wire connections to the ground rods, or counterpoises are not permitted.

2.06 EQUIPMENT GROUNDING

A. Equipment frames of motor housings, metallic tanks, metallic equipment enclosures, metal splicing boxes, chain-link fencing, and other metallic noncurrent-carrying metal items, shall be grounded. Connections to earth shall be made in the same manner as required for system grounding. Equipment or devices operating at less than 750 volts may be connected to secondary neutral grounding electrodes.

2.07 SURGE ARRESTER GROUNDING

A. Surge arresters shall be grounded. Resistance to ground for intermediate-class arresters shall be not more than 10 ohms and for distribution-class arresters shall be not more than 25 ohms. Ground wire connections shall be not less than No. 4 AWG for distribution arresters and No. 1/0 AWG for intermediate arresters. Connections to earth shall be made in the same manner as required for neutral conductors. Surge arrester grounds may use the same ground wires provided for equipment operating at more than 750 volts. Surge arrester and secondary neutral grounds shall be separate from and independent of each other but both grounds shall be bonded together below grade at the ground rods or may utilize a common counterpoise.

2.08 LIGHTING POLE GROUNDING

A. Base of lighting poles shall be connected to an adjacent ground rod as indicated on Plans. A ground connection from poles back to neutral ground points shall also be provided utilizing equipment grounding conductor.

2.09 METALLIC STRUCTURES

A. Metallic structures and buildings shall be grounded per NEC.

2.10 GROUNDING RINGS

A. When required, grounding rings shall be installed using bare copper cable with ground rods at least 25 feet intervals using thermoweld connecting means as indicated on Plans in accordance with NEC requirements.

PART 3 – EXECUTION

3.01 INSTALLATION

A. It is the intent of these Contract Documents that all device and equipment grounds shall be run as a separate conductor in the conduit from the equipment to the ground. Wireways and enclosures shall be properly bonded and grounded, and ground conductors shall be run for all circuits.

B. Equipment cases and devices shall be grounded. Ground rods shall be driven and concrete encased conduits installed before a building or structure is built and ground conductors brought through the concrete to accessible points for grounding equipment. These systems shall be installed at each structure, where transformers, switchboards, panelboards, and MCCs are installed.

C. Duct banks shall contain a concrete encased system bare copper ground conductor. The system ground conductors shall run continuously in duct banks, through handholes and other raceway boxes. The system ground shall be connected to the structure grounding systems to provide a continuous grounding system. Each metallic raceway, panel, switchboard, and other metallic devices associated with the electrical and control systems shall be bonded to this grounding system.

D. Ground rod shall be installed not less than 6 inches below grade. Equipment, neutral, and surge arrester ground wires shall be connected to the ground grid as indicated.

E. Make buried and concrete-encased cable-to-cable and cable-to-ground rod connections using exothermic welds by Cadweld, Thermoweld**,** or ENGINEER-approved equal.

F. Each raceway must have a separate grounding conductor independent from the raceway material.

G. Route the conductors inside the raceway.

H. Interconnect the secondary MCC, switchgear, or panelboard neutral bus to the ground bus in the secondary switchgear compartment only at the service entrance point or after a transformer.

3.02 TESTS

A. Pre-Energization Tests - Pre-energization tests shall include, but shall not be limited to tests that the equipment engineer is required to perform under paragraph "GENERAL REQUIREMENTS." No part of the electrical system shall be energized until all station grounding system components have been tested and demonstrated to comply with the requirements specified, and until associated test reports have been submitted and approved.

B. Operating Test - After the installation is completed, the CONTRACTOR shall conduct an operating test for approval. Equipment shall be demonstrated to operate in accordance with the requirements herein. Tests shall be performed in the presence of the ENGINEER. The CONTRACTOR shall furnish instruments and personnel required for the test.

C. Ground-Resistance Measurements - Ground-resistance measurements of each ground rod shall be taken and certified by the CONTRACTOR to the ENGINEER. No part of the electrical distribution system shall be energized prior to the resistance testing of that system's ground rods and grounding system and submission of test results to the ENGINEER. Test reports shall indicate the location of the ground rod and grounding system and the resistance and the soil conditions at the time the test was performed. When the building water service is used as a ground or part of the grounding system, ground-resistance measurements shall also be made of this connection. Ground-resistance measurements shall be made in normally dry weather, not less than 48 hours after rainfall, and with the ground under test isolated from other grounds. The resistance to ground shall be measured using the fall-of-potential method described in IEEE Std 142 and Std 81.

3.03 TEST RESULTS

A. The CONTRACTOR shall perform the above tests and submit a certified test report prior to energizing the equipment.

END OF SECTION

SECTION 26 0529 – HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 DESCRIPTION

A. This Section outlines the wiring requirements for the electrical work and forms a part of all other Sections of Division 26 unless otherwise specified.

1.02 SUBMITTALS

A. Submit for the OWNER's approval material lists, shop drawings, factory test reports, and technical data to the extent required in these Specifications.

PART 2 – PRODUCTS

2.01 GENERAL

A. Provide basic materials and all wiring installations as indicated, specified, and required.

2.02 SUPPORTS

A. Provide the galvanized and PVC coated metal channels, fittings, stanchions, clamps, hangers, and required hardware to support all conduit and equipment as required.

B. Channels shall be steel and cold rolled. One side of the channel shall have a continuous slot. On both sides of the slot, the edges turn inward and forms a guide for the spring nuts. The fittings shall be fabricated from steel and attached to the channel with bolts and spring nuts. The channel, fittings and hardware shall be hot-dipped galvanized and manufactured by Unistrut, GTE Products Co., Ideal Industries, Josyln Mfg & Supply Co., or ENGINEER-approved equal.

C. One-Hole Clamps shall be malleable iron, galvanized for steel conduits and equipped with clamp-backs. The clamps shall be Efcor, Thomas and Betts, Appleton or ENGINEER-approved equal.

D. Beam Clamps shall be malleable iron, galvanized, right angle and parallel types. The clamps shall be manufactured by Efcor, Thomas and Betts, Appleton or ENGINEER-approved equal.

E. Spacers shall be plastic and provided to support underground conduits for concrete encasements. The spacers shall be Carlon, Johns-Manville, Underground Products or ENGINEER-approved equal.

F. Steel Anchors shall be sleeve and stud types for securing equipment to concrete foundations, floors, and walls. The anchors shall be Phillips "Red Head", Diamond or ENGINEER-approved equal. Concrete foundation to include 4" housekeeping pad.

G. Toggle Bolts shall be steel, spring wing type for securing equipment to hollow walls and ceilings. Toggle bolts shall be Phillips "Red-Head", Diamond or ENGINEER-approved equal.

H. Conduit Hangers shall be heavy gauge formed steel, galvanized, and equipped with carriage bolts, 1/4-inch rods and nuts. The hangers shall be Efcor, Appleton, Ideal Industries, Josyln Mfg & Supply Co. or ENGINEER-approved equal.

I. U-Bolts shall be heavy gauge steel, galvanized and equipped with two hexagon steel nuts. The U-bolts shall be Efcor, Kindorf or ENGINEER-approved equal.

J. Hardware shall be provided to securely attach all equipment and materials.

PART 3 – EXECUTION

3.01 GENERAL

A. A. Provide the required labor and equipment, and all checking, adjusting, and testing operations on the electrical installations.

3.02 SUPPORTS

A. Install the required structural channels, brackets, stanchions, U-bolts, clamps, anchors, hangers, fittings, and other hardware to securely attach and support all the equipment and conduits.

B. Painting. Brackets, stanchions, and other unfinished steel supports shall be painted per requirements of these Specifications.

C. Operation Tests. Perform operation tests and observe that all loads operate satisfactorily.

3.03 CHECKING, ADJUSTING AND TESTING

A. Provide the required labor and equipment, and all checking, adjusting, and testing operations on the electrical installations.

END OF SECTION

SECTION 26 0533.13 – CONDUIT FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. Furnish and install conduits as required, and as shown on the Plans. Materials employed shall be as shown on the Plans.

1.02 SUBMITTALS

A. Submit product literature including manufacturer part number, model number, material, size, and specifications. Material shall not be installed until the ENGINEER has reviewed the submittal data.

B. Shop Drawings shall be submitted for review and acceptance showing routing, conduit size, and number and size of wires in each conduit before installation of conduit and any related work.

C. Proposed routing of conduits buried under floor slabs-on-grade.

D. Identify conduit by tag number of equipment served or by circuit schedule number.

E. Proposed routing and details of construction including conduit and rebar embedded in floor slabs, columns, etc. Identify conduit by tag number of equipment served or by circuit schedule number.

F. Proposed location and details of construction for openings in slabs and walls for raceway runs.

870	Wireways, Auxiliary Gutters, and Associated Fittings
884	Underfloor Raceways and Fittings
886	Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations

PART 2 – PRODUCTS

1.01 RACEWAYS

A. Indoor exposed conduit shall be galvanized rigid steel (GRS) unless specifically indicated otherwise on the Plans. Exposed conduits outdoors or in a wet or corrosive area shall be PVC coated GRS unless otherwise indicated Underground and/or concrete encased conduits shall be PVC, unless otherwise indicated. All wiring, except as otherwise noted, shall be in conduit. Conduit size shall not be less than the National Electrical Code (NEC)

size required for the conductors therein and shall not be smaller than 3/4-inch. No underground conduit shall be less than one inch.

B. Condulet type fittings shall be Form 8, Crouse-Hinds, Appleton, or ENGINEER-approved equal with gasketed covers. All condulets located outdoors or in wet locations shall be weathertight.

C. In unclassified areas, flexible conduit shall be grounding type, weatherproof, corrosion resistant, and watertight. If indicated on the plans, liquidtight flexible conduit shall have an external bonding jumper. Connectors shall be as manufactured by OZ-Gedney, Type 4Q-L, or ENGINEER-approved equal.

D. Couplings, connectors, and fittings shall be standard types specifically designed and manufactured for the purpose. They shall be installed to provide a firm mechanical assembly and electrical conductivity throughout.

E. Expansion fittings shall be OZ type AX with jumper for exposed locations and type DX at structural expansion joints, Spring City, or ENGINEER-approved equal. Conduits shall have expansion fittings in accordance with NEC.

F. The conduits and fittings shall be supported per NEC requirements as a minimum.

1.02 GALVANIZED RIGID STEEL (GRS)

A. Conduit and couplings shall be hot-dipped galvanized with zinc coated threads and outer coating of zinc bichromate, in accordance with ANSI C80.1 standards, as manufactured by Jones & Laughlin Steel Corporation, Allied Tube & Conduit Corporation, Triangle PWC, Republic, Youngstown, or ENGINEER-approved equal.

B. Steel conduit shall not be buried in earth without concrete encasement and additional corrosion protection. A half lapped rapping of 20 mil PVC based corrosion protection tape shall be used.

1.03 PVC COATED GALVANIZED RIGID STEEL (PVC-GRS)

A. PVC coated GRS conduit shall conform to NEMA RN-1 and ANSI C80.1 standards.

B. The zinc surface of the conduit shall remain intact and undisturbed on both the inside and the outside of the conduit throughout the preparation and application processing. A Polyvinyl Chloride (PVC) coating shall be bonded to the galvanized outer surface of the conduit. The bond between the PVC coating and the conduit surface shall be greater than the tensile strength of the plastic. The thickness of the PVC coating shall be a minimum of 0.040-inch (40 mil).

C. A loose coupling shall be furnished with each length of conduit. A PVC coating shall be bonded to the outer surface of the coupling and a PVC sleeve equal to the outside diameter of the uncoated conduit shall extend beyond both ends of the coupling approximately one pipe diameter or 1-1/2 inches, whichever is smaller. The wall thickness of the coating on the coupling and the sleeve shall be a minimum of 0.055-inch (55 mil).

D. A PVC coating shall be bonded to the inner and outer surface of all conduit bodies and fittings and a PVC sleeve shall extend from all hubs. The wall thickness of the coating on conduit bodies and fittings and the sleeve walls shall be identical to those on couplings in length and thickness. The covers on all conduit bodies shall be coated on both sides and shall be designed to be completely interchangeable. The inside of conduit bodies shall remain undisturbed in the processing.

E. Type 316 stainless steel screws shall be furnished and used to attach the cover to the conduit body. All coated material shall be installed and patched according to the

manufacturer's recommended installation and patching instructions.

F. Conduit straps shall be PVC coated or 316 stainless steel.

G. PVC coated conduit and fittings shall be as manufactured by Plasti-Bond, Perma-Cote, Occidental Coating Company, Kor Kap, or ENGINEER-approved equal.

H. PVC coated flexible conduits shall be liquid and vaportight and manufactured in accordance with UL 360 standards.

2.04 RIGID NONMETALLIC - PVC

A. Where specifically indicated on the Plans, or elsewhere specified, conduit may be high density Schedule 40, 90°C, heavy-duty PVC. The conduit shall be manufactured from virgin polyvinyl chloride compound which meets ASTM D1784, NEMA TC-2, and UL 651 standards. Smoke emissions shall be limited to less than 6 grams per 100 grams of material tested.

B. Where conduit concrete encasement is indicated on the Plans, conduit supports shall be installed at five foot intervals. PVC conduit shall be manufactured by Carlon, Triangle Conduit & Cable, or ENGINEER-approved equal.

2.05 LIQUIDTIGHT FLEXIBLE METAL CONDUIT

A. Liquidtight flexible metal conduit shall be liquid and vaportight, oil and ultraviolet ray resistant and manufactured in accordance with UL 360 standards. Liquidtight flexible metal conduit shall be formed of a continuous, spiral wound, galvanized steel core with an extruded PVC jacket. The PVC jacket shall be rated for high ambient heat applications, 90°C.

B. For corrosive locations, liquidtight flexible metal conduit shall be formed of a continuous, spiral wound, aluminum core with an extruded PVC jacket. The PVC jacket shall be impervious to corrosive liquids and vapors.

C. An external bonding conductor shall be required for all flexible conduit connections. Flexible conduit and connectors shall be listed for grounding.

D. Connectors for liquidtight flexible conduit shall be galvanized, furnished with a sealing ring and locknut, and suitable for wet locations.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Conduit runs are schematic only, and shall be modified as required to suit field conditions, subject to review and acceptance by the ENGINEER.

B. Conduit shall run continuously between outlets and shall be provided with junction boxes where connections are made. Couplings, connectors, and fittings shall be acceptable types designed and manufactured for the purpose, and shall provide a firm mechanical assembly, and electrical conductivity throughout.

C. Conduit runs shall be straight and true. Elbows, offsets, and bends shall be uniform and symmetrical. Changes in direction shall be made with long radius bends, or with fittings of the condulet type.

D. Conduit runs in buildings and structures shall be exposed except as specifically noted, or accepted by the ENGINEER.

E. Conduit runs shall not interfere with the proper and safe operation of equipment, and shall not block or interfere with ingress or egress, including equipment removal hatches.

F. Exposed conduits shall be securely fastened with clamps, or straps, intended for conduit use. All exposed conduit shall be run on the walls and ceiling only and shall be parallel to the planes of the walls or ceiling. No diagonal runs will be permitted. Flexible conduit shall be used only for short lengths required to facilitate connections between rigid conduit to motors from junction boxes, or control equipment. The maximum length of flexible conduit shall be 3 feet.

G. Conduit runs on water-bearing walls shall be supported one inch away from the wall on an accepted channel. When channel galvanizing, or other coating, is cut or otherwise damaged, it shall be field coated to original condition. No conduit shall be run in water-bearing walls, unless specifically designated otherwise.

H. Conduit shall be thoroughly reamed to remove burrs. GRS shall be reamed during the threading process, and Rigid Nonmetallic PVC shall be reamed before applying fittings. A zinc rich cold galvanizing shall be used to restore corrosion protection on field cut threads. Bushings and lock nuts or hubs shall be used at conduit terminations. The total number of bends in any run between pull points shall not exceed 360 degrees. Junction boxes and pull boxes shall be installed at points acceptable to the ENGINEER. Conduit ends shall be plugged to prevent the entrance of moisture or debris during construction. All spare conduits shall be adequately capped and shall contain a suitable pull string.

I. Joints shall be set up tight. Hangers and fastenings shall be secure, and of a type appropriate in design, and dimensions, for the particular application.

J. Conduit runs shall be cleaned and internally sized (obstruction tested) so that no foreign objects, or obstructions remain in the conduit prior to pulling in conductors.

K. After installation of complete conduit runs 2 inches and larger, conduits shall be snaked with a conduit cleaner equipped with a cylindrical mandrel of a diameter not less than 85 percent of the nominal diameter of the conduit. Conduits through which the mandrel will not pass shall not be used.

L. Expansion fittings shall be installed across all expansion joints and at other locations where necessary to compensate for thermal expansion and contraction.

M. Provide trenching, backfill, and compaction for conduits installed underground.

N. Each conduit shall be provided with tags as specified on the plan details or with stainless steel identification tags affixed by means of stainless steel wire to the conduit's termination bushing. The minimum size of the identification tags shall be ¾-inch X 2-inches. The identification tag shall be embossed with the conduit number shown in the Plans. The letters and numbers on the tags shall, as a minimum, be 1/4-inch high.

END OF SECTION

SECTION 26 0533.16 – BOXES FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Outlet, pull and junction boxes.

1.02 QUALITY ASSURANCE

A. Referenced Standards: As required in these Specifications.

1.03 SUBMITTALS

A. Shop Drawings: In accordance with Section 01 3300 – Submittal Procedures.

1.04 DELIVERY, STORAGE, AND HANDLING

A. In accordance with these Specifications and Contract Documents.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with the Contract Documents, the following manufacturers are acceptable:
   1. Galvanized steel boxes:
      a. Appleton Electric Co.
      b. Steel City
      c. Raco
      d. Or ENGINEER-approved equal
   2. Sheet metal boxes for non-classified areas:
      a. Hoffman Engineering Co.
      b. Or ENGINEER-approved equal
   3. Corrosion-resistant boxes:
      a. Hoffman Engineering Co.
      b. Crouse-Hinds
      c. Or ENGINEER-approved equal
   4. Hazardous location boxes (Class I, II & Ill):
      a. Appleton Electric Co.
      b. Crouse-Hinds
      c. Killark
      d. O-Z/Gedney
      e. Or ENGINEER-approved equal
   5. Raintight and watertight boxes:
      a. Appleton Electric Co.
      b. Crouse-Hinds
      c. Or ENGINEER-approved equal
   6. Terminal boxes:
      a. Hoffman Engineering Co.
      b. Or ENGINEER-approved equal
   7. Boxes in sidewalk:
      a. Appleton Electric Co.
      b. Crouse-Hinds
      c. O-Z/Gedney

d. Or ENGINEER-approved equal.

8. Boxes in earth:
   a. Carlon Electric Products.
   b. Or ENGINEER-approved equal
9. Exposed switch and receptacle boxes:
   a. Appleton Electric Co.
   b. Crouse-Hinds
   c. Or ENGINEER-approved equal.

2.02 MATERIALS

A. Pull and Junction Boxes for Offices and other Dry Architecturally Finished Areas:
   1. Material: 14 GA, galvanized steel
   2. Concentric knockouts on all four sides
   3. Flat cover fastened with screws
   4. NEMA 1 classification
   5. UL listed

B. Pull and Junction Boxes for General Use Unclassified Areas Suitable for NEMA 12 Enclosures:
   1. Material: 14 GA galvanized steel with seams continuously welded, ground smooth and no knockouts
   2. Zinc-rich coating on all seams
   3. Stainless steel captivated cover screws threaded into sealed wells
   4. Flat door with oil resistant gasket
   5. NEMA 12 classification
   6. UL listed

B. Pull and Junction Boxes for Wet Areas:
   1. Material: 14 GA steel with polyester powder coating inside and out over phosphatized surfaces.
   2. Seams continuously welded, ground smooth, no knockouts
   3. Stainless steel clamps on four sides
   4. Flat cover with oil resistant gasket
   5. NEMA 4X classification
   6. UL listed

D. Pull and Junction Boxes for Corrosive Areas:
   1. Material: 14 GA steel with powdered epoxy resin coating inside and out or fiberglass-reinforced polyester material
   2. Steel boxes:
      a. Seams continuously welded, ground smooth, no knockouts
      b. Rolled lip around all sides
      c. Hinged door
      d. Captivated stainless steel door screws
      e. Flat door with oil-resistant gasket
   3. Fiberglass-reinforced polyester boxes:
      a. Hinged door with latch and lockout
      b. Neoprene door gasket
      c. Grounding bushing(s)
   4. NEMA 4X classification
   5. UL listed

E. Pull and Junction Boxes for Hazardous Areas:
   1. Material: Cast gray iron alloy or copper-free cast aluminum
   2. Drilled and tapped openings or tapered threaded hub equipped
   3. Flat bolted-down or threaded cover with neoprene gasket
   4. Stainless steel hex head screws
   5. Explosion proof, UL listed for Class 1 Groups C and D

F. Pull and Junction Boxes for Sidewalks:
   1. Cast-iron box and cover, hot-dip galvanized
   2. Flange for flush mounting
   3. Checkered cover with neoprene gasket, pry bar slots and stainless steel screws
   4. UL listed
   5. Drilled and tapped holes
   6. Watertight NEMA 4X classification

G. Large Pull and Junction Boxes (100 CU IN and larger):
   1. Located in offices and other dry architecturally finished areas where EMT is utilized:
      a. NEMA 1 gasketed without knockouts
   2. Located in general use areas:
      a. NEMA 12 construction:
         1) Welded steel
         2) Furnished with gray enamel inside and out over phosphatized surfaces
   3. Located in wet and corrosive areas:
      a. NEMA 4X with stainless steel screws.
   4. Constructed of 14 GA steel with seams continuously welded, ground smooth, no knockouts
   5. Rolled lip around all sides
   6. Rigid handles for covers larger than 9 sf or heavier than 25 lbs.
   7. Split covers when heavier than 25 lbs.

H. Terminal Boxes:
   1. Galvanized 16 GA steel box provided with plain blank screw cover, subpanel, and terminal points
   2. Refer to Drawing for dimensions and number of terminals
   3. Terminal blocks shall be screw-post barrier-type, white center marker strip
   4. Rated 20 ampere, minimum 600 V

I. Fiberglass Cable-Pulling Enclosure:
   1. Use: Access points to facilitate pulling of electrical cables in buried conduit runs.
   2. Size and quantity: As shown on Drawings
   3. Type: Rectangular fiberglass composite, suitable for direct burial pedestrian traffic on top, -50°F, chemical, sunlight, and weather resistant.
   4. Provide matching top with "ELECTRIC" logo.

J. Outlet Boxes:
   1. Use: Installation of wiring devices
   2. Boxes for exposed wiring:
      a. Cadmium plated, cast, ferrous metal, with threaded hubs
   3. Boxes for concealed wiring:
      a. Code gauge, hot-dip galvanized steel
      b. Include bar hangers for metal stud partitions
      c. Provide barriers between switches in boxes with 277 V switches on opposite phases

d. Use extension and plaster rings where required
e. Provide grounding screw.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Use locknut and bushing for boxes in non-classified areas.

B. Use cast metal boxes with threaded conduit hubs in hazardous areas.

C. Use Type FS and FD boxes in wet areas and where exposed rigid steel conduit is required.

D. Use epoxy resin coated, stainless steel, cast aluminum or fiberglass boxes for corrosive areas.

E. Fill unused punched-out, tapped, or threaded hub openings with insert plugs.

F. Use outlet boxes sized to accommodate quantity of conductors enclosed.

G. Use boxes sized to accommodate conduit tying into box.

H. Install pull boxes or junction boxes in conduit runs where indicated or required to facilitate pulling of wires or making connections.
   1. Make covers of boxes accessible.

I. Install pull boxes or junction boxes rated for the area classification.

J. Install rigid conduit squarely into boxes which do not have hubs or are drilled and tapped.
   1. Install with locknut on the outside and bushing on inside.

K. Install conduit into boxes with hubs, or that are tapped, using thread lubricant.

L. Do not use back-to-back boxes on this Project.

M. Seal all points of conduit entry into fiberglass cable-pulling enclosures for a waterproof installation.

N. Support outlet boxes for incandescent fixtures and other ceiling-mounted devices in lay-in acoustical tile ceilings by bar hangers anchored to ceiling construction members which do not interfere with tile removal.

END OF SECTION

SECTION 26 0553 – IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. Electrical identification work specified in this section covers the following:
   1. Buried cable warnings
   2. Electrical power, control and communication conductors
   3. Operational instructions and warnings
   4. Danger signs
   5. Equipment/system identification signs

1.02 SUBMITTALS

A. Submittals to the ENGINEER shall include the following:
   1. Manufacturers data on electrical identification materials and products.
   2. Samples of each color, lettering style and other graphic representation required for each identification material or system.

1.03 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering electrical identification products may be incorporated in the work include, but not limited to, the following:
   1. Brady, W.H. Co.
   2. Ideal Industries, Inc.
   3. Panduit Corp.
   4. or ENGINEER-approved equal

1.04 QUALITY COMPLIANCE

A. Comply with applicable requirements of UL Std. 969, "Marking and Labeling Systems", pertaining to electrical identification systems.

B. Comply with applicable requirements of NEMA Std. No's WC-1 and WC-2 pertaining to identification of power and control conductors.

C. Comply with the latest National Electrical Code

PART 2 – PRODUCTS

2.01 GENERAL

A. Except as otherwise indicated, provide manufacturer's standard products of categories and types required for each application. Where more than single type is specified for an application, selection is Installer's option, but provide single selection for each application.

2.02 COLOR CODED CONDUIT MARKERS

A. Provide manufacturer's standard pre-printed, flexible, or semi-rigid, permanent, plastic-sheet conduit markers, extending 360 degrees around conduits; designed for attachment to conduit by adhesive, adhesive lap joint of marker, matching adhesive plastic tape at each end of marker, or pretensioned snap-on. Except as otherwise indicated, provide lettering that indicates voltage of conductor(s) in conduit. Provide 8" minimum length for 2" and smaller conduit, 12" length for larger conduit.

B. Unless otherwise indicated or required by governing regulations, provide white markers with black letters.

C. Conduit identification shall be via stainless-steel tags, and as required in these Specifications.

2.03 CABLE AND CONDUCTOR WIRE MARKERS

A. Cable and conductor wire markers shall be self-laminating vinyl on white background, printed using a Brady TLS2200 printer, Seton printer, or ENGINEER-approved equal. Handwritten wire markers are not acceptable.

2.04 SELF-ADHESIVE PLASTIC SIGNS

A. Provide manufacturer's standard, self-adhesive or pressure-sensitive, pre-printed, flexible vinyl signs for operational instructions or warnings; of sizes suitable for application areas and adequate for visibility, with proper wording for each application, e.g., 208V, EXHAUST FAN, RECTIFIER.

B. Unless otherwise indicated or required by governing regulations, provide white signs with black lettering.

C. Signs shall be attached with stainless-steel screws.

2.05 LETTERING AND GRAPHICS

A. Coordinate names, abbreviations and other designations used in electrical identification work, with corresponding designations shown, specified, or scheduled. Provide numbers, lettering and wording as indicated or, if not otherwise indicated, as recommended by manufacturers, or as required for proper identification and operation/maintenance of electrical systems and equipment. Comply with ANSI A13.1 pertaining to minimum sizes for letters and numbers.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install electrical identification products as indicated, in accordance with manufacturer's written instructions, and requirements of NEC.

B. Where identification is to be applied to surfaces that require finish, install identification after completion of painting.

C. Comply with governing regulations and requests of governing authorities for identification of electrical work.

3.02 CONDUIT IDENTIFICATION

A. Where electrical conduit is exposed in spaces with exposed mechanical piping that is identified by a color-coded method, apply color-coded identification on electrical conduit in a manner similar to piping identification. Except as otherwise indicated, use white as coded color for conduit.

3.03 CABLE/CONDUCTOR IDENTIFICATION

A. Apply cable/conductor identification, including voltage, phase, and feeder number, on each cable/conductor in each box/enclosure/cabinet where wires of more than one circuit or communication/signal system are present, except where another form of identification (such as color-coded conductors) is provided. Match identification with marking system used in panelboards, shop drawings, contract documents, and similar previously established identification for project's electrical work.

3.04 EQUIPMENT/SYSTEM IDENTIFICATION

A. Install engraved plastic-laminate sign on each major unit of electrical equipment in building; including central or master unit of each electrical system including communication-control-signal systems, unless unit is specified with its own self-explanatory identification or signal system. Except as otherwise indicated, provide single line of text, 1/2" high lettering on 1-1/2" high sign (2" high where 2 lines are required),

white lettering in black field. Provide text matching terminology and numbering of the contract documents and shop drawings. Provide signs for each unit of the following categories of electrical work:

1. Panelboards, electrical cabinets, and enclosures.
2. Access panel/doors to electrical facilities.
3. Major electrical switchgear.

B. Install signs at locations indicated or, where not otherwise indicated, at location for best convenience of viewing without interference with operation and maintenance of equipment. Secure to substrate with brass or stainless-steel screws, except use adhesive where screws should not or cannot penetrate the substrate.

C. Identification signs shall be black lettering on a white field to match the Districts' standard.

3.05 CIRCUIT IDENTIFICATION

A. The 3-phase wires shall be identified at the switchgear, panelboards and motor control centers as Phases A, B, and C. At 277/480V, Phase A shall be brown, Phase B shall be orange, and Phase C shall be yellow.

B. In addition to color coding all conductors, each conductor shall be identified in each pull box, manhole, panelboard, cable tray, or termination with circuit identification markers. This identification is applicable to all power, control, alarm, and instrumentation conductors and these markings shall be recorded on the Record Documents. Markers shall be slip-on PVC sleeve type as manufactured by Brady, Seton, or equal.

C. Markers for other cabling shall be B-292 vinyl as manufactured by Brady, Seton, or ENGINEER-approved equal.

D. Exposed medium voltage conduits shall be labeled at 50-foot intervals with f-inch letters stating the voltage - example - "12,470 volts". Labels shall be vinyl plastic as manufactured by Brady, Seton, or ENGINEER-approved equal.

3.06 AUTOMATIC EQUIPMENT WARNING SIGNS

A. Permanent warning signs shall be mounted at all mechanical equipment that may be started automatically or from remote locations. Signs shall be in accordance with OSHA regulations and shall be suitable for exterior use. The warning signs shall be fastened with round head brass screws or bolts, located, and mounted in a manner acceptable to the ENGINEER.

B. Warning signs shall be 7 inches high by 10 inches wide, colored yellow and black, on not less than 18 gauge vitreous enameling stock. Sign shall read:

CAUTION
THIS EQUIPMENT STARTS
AUTOMATICALLY
BY REMOTE CONTROL

3.07 HIGH VOLTAGE WARNING SIGNS

A. Permanent and conspicuous warning signs shall be mounted on all equipment, doorways to equipment rooms, pull boxes, manholes, where the voltage exceeds 600 volts.

B. Signs shall be in accordance with OSHA regulation, and shall be suitable for exterior use. The warning signs shall be fastened with round head brass screws or bolts, located, and mounted in a manner acceptable to the ENGINEER.

C. Signs shall be 7 inches high by 10 inches wide, colored red and white, on not less than 18 gauge vitreous enameling stock. Sign shall read:

WARNING
HIGH VOLTAGE
KEEP OUT

3.08 CONDUCTOR FASTENERS

A. Glue-on type conductor fasteners shall not be used in any panels, panelboards, switchboards, switchgear, motor control centers, or other enclosures containing electrical devices and/or conductors.

END OF SECTION

SECTION 26 0573 – OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 – GENERAL

1.01 DESCRIPTION

A. General:
1. CONTRACTOR shall provide a short circuit analysis and protective device coordination study for the project electrical power source and distribution system.
2. The short circuit and coordination study report shall provide an evaluation of the electrical power system with the model numbers and settings of the protective devices.

B. Scope:
1. Perform and provide a complete short circuit analysis with equipment interrupting or withstand rating evaluation and a protective device coordination study for the electrical power distribution system serving the facility.
2. Include all portions of the electrical power distribution system from the utility primary service drop through and including motor loads 50 HP and greater, loads 50 KVA and larger, and protective devices 100 amperes and larger.
3. Electrical equipment bus impedance shall be assumed to be zero. Short circuit momentary duties and interrupting duties shall be calculated on the basis of maximum available fault current at each project power source or power distribution equipment including switchgear, switchboard, motor control center, and branch circuit panelboards.
4. A protective device coordination study shall be performed to determine proper selection of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated voltage and current transformers, and circuit breaker trip characteristics and settings.
5. The coordination study shall include all voltage classes of equipment from the utility's closest upstream protective device to existing and new equipment including switchgear, switchboards, motor control centers, and 120-volt panelboards main circuit protection.
6. Panelboard branch circuit devices need not be considered. The phase overcurrent and ground-fault protection shall be included, settings for the adjustable protective devices, and electrical metering and monitoring devices.
7. An equipment evaluation study shall be performed to determine the adequacy of existing or proposed electrical equipment by tabulating and comparing the short circuit ratings with the available fault currents.
8. Problem areas or inadequacies in the proposed equipment shall be identified in the report.

1.02 REFERENCES

A. This section contains references to the following documents and they are part of this section as specified and modified. In case of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
IEEE 141	Practice for Electrical Power Distribution for Industrial Plants
IEEE 242	Practice for Protection and Coordination of Industrial and Commercial Power Systems

1.03 SUBMITTAL SCHEDULE

A. The report shall be submitted with the major electrical distribution equipment. and switchgear detailed product submittal.

B. The ENGINEER reviewed report shall be corrected, revised, and resubmitted as required. The report will be reviewed along with the electrical distribution and switchgear product submittal.

C. The CONTRACTOR shall distribute the ENGINEER accepted report to the major electrical distribution equipment and switchgear manufacturers before the electrical distribution equipment and switchgear is manufactured.

D. Provide an electronic copy, on USB Drive, of the protective device coordination study results as generated by the study software.

E. The report specified herein shall be provided in accordance with Contract Documents Specifications.

PART 2 – PRODUCTS

2.01 REPORT

A. The report shall be sealed and signed by the responsible electrical engineer, summarize the short circuit analysis, protective device coordination study, potential problem issues, conclusions, and recommendations that may affect the integrity of the project power distribution system. As a minimum, the report shall include the following.

1. The equipment manufacturer's information used to prepare the study.
2. Assumptions made during the study.
3. Short circuit calculations listing short circuit levels at each bus.
4. Simplified single line diagrams generated by the study software.
5. Coordination study time-current curves including the instrument transformer ratios, model numbers of the protective relays, relay settings, and trip unit settings associated with each breaker.
6. Comparison of short circuit duties of each bus to the withstand and interrupting capacity of the equipment protecting that bus.
7. Data used as input to the report including cable impedance, source impedance, equipment ratings, equipment time-current curves etc.

PART 3 – EXECUTION

3.01 GENERAL

A. Provide the short circuit analysis and the coordination study for the electrical power distribution system using SKM System Analysis, Inc. Power Tools, or equal.

B. The studies shall be performed in accordance with IEEE Standards 141 and 242 and shall utilize the ANSI; method of short circuit analysis in accordance with ANSI C37.010.

C. The studies shall be performed using actual equipment data for the new equipment. The analysis and study shall use the equipment and protective device data provided by the electrical distribution equipment manufacturer for the project.

3.02 SHORT CIRCUIT ANALYSIS

A. The short circuit analysis and report shall include the following:

1. One-Line Diagram:
    a. Location and function of each protective device in the system, such as relays, direct-acting trips, fuses, etc.
    b. Type designation, current rating, range or adjustment, manufacturer's style and catalog number for all protective devices.
    c. Power, voltage ratings, impedance, primary and secondary connections of all transformers.
    d. Type, manufacturer, and ratio of all instrument transformers energizing each

relay.

e. Sources of short circuit currents such as utility ties, generators, synchronous motors, and induction motors.

2. Impedance Diagram:
   a. Available MVA or impedance from the power utility company.
   b. Local generated capacity impedance.
   c. Bus impedance.
   d. Transformer and/or reactor impedance.
   e. Cable impedance.
   f. Equipment impedance.
   g. System voltages.
   h. Grounding scheme (resistance grounding, solid grounding, or no grounding).
3. Calculations:
   a. Determine the paths and situations where short circuit currents are the greatest.
   b. Assume bolted faults and calculate the 3-Phase and line-to-ground short circuits of each case.
   c. Calculate the maximum and minimum fault currents.

3.03 PROTECTIVE DEVICE COORDINATION STUDY

A. The time-current characteristics of the specified and indicated protective devices shall be plotted on 5-cycle, log-log graph paper with a maximum of eight protective devices per plot. The coordination study time-current plots shall, at a minimum, include the following:
   1. Time-current for each protective relay or fuse showing graphically that the settings will provide protection and selectivity within industry standards. Each curve shall be identified, and the tap and time settings shall be specified.
   2. Time-current curves for each device shall be positioned to provide for maximum selectivity to minimize system disturbances during fault clearing. Reasonable coordination intervals and separation of characteristic curves shall be maintained.
   3. Where selectivity cannot be achieved, the report shall indicate the cause and recommend alternative solutions. Time-current curves and points for cable and equipment damage and symmetrical and asymmetrical fault currents.
   4. Circuit interrupting device operating and interrupting times.
   5. Indicate maximum fault values on the graph.
   6. Sketch of bus and breaker arrangement.

3.04 STUDY FIRM

A. The report for the short circuit analysis and protective device coordination study indicating results shall be performed, stamped, and signed by an Electrical Engineer registered in the State where the Project is located.

B. The CONTRACTOR shall provide the ENGINEER with submittal information for the electrical products used for the Project.

C. The Electrical Engineer performing the study must visit the project site after equipment is installed and modify the study as required, and resubmit the study.

END OF SECTION

SECTION 26 0583 – WIRING CONNECTIONS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. This section covers terminal blocks for control and other wiring.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with these Specifications and elsewhere in the Contract Documents prior to installation.

1.03 MANUFACTURERS

A. Terminal blocks shall be Entrelec, Phoenix Contact, Weidmuller, or ENGINEER-approved equal.

B. Surge protection blocks shall be TELEMATIC, series SD, or ENGINEER-approved equal.

C. Power distribution blocks shall be Ilsco Corporation, or ENGINEER-approved equal.

PART 2 – PRODUCTS

2.01 TERMINAL BLOCKS

A. Terminal blocks shall mount on standard DIN rail, and be of the size required for conductors therein. A minimum of 25 percent spares shall be provided in each terminal box. No more than 2 conductors shall be allowed per termination. Jumper bar assemblies shall be installed for interconnecting terminal blocks, distributing power and signal commons. Terminal blocks shall be UL-rated for 600 Volts, and 30 Amps, minimum.

B. Grounding terminal blocks shall be provided for instrumentation cable shields. The terminal blocks shall have distinctive 2-color bodies, and shall be mounted to the DIN rail with metal screw down type clamps, providing a positive ground connection. One grounding terminal block shall be installed for every 2 instrument cables terminated. Grounding terminal blocks shall be UL-rated for 600 Volts, and 20 Amps, minimum.

C. Terminal blocks shall be available in a variety of colors, including red, green, blue, gray, black, yellow, and orange.

D. DIN mount fuse holders shall have blown fuse indicators for DC and AC circuits. Fuse holders shall be of the compression clamp type. Fuse holders shall be UL listed, and rated for 600 Volts. Fuse sizes shall not exceed the UL current rating for the fuse holders.

E. DIN rail shall be pre-punched, zinc bichromate plated steel. Symmetrical DIN rail shall be 35mm X 7.5mm, minimum.

F. Terminal blocks for 4 to 20 milliamp signals shall have knife disconnect switches, and accessible test points for testing and measurement of current loop signals, without the need for removing wire terminations.

2.02 SURGE PROTECTION BLOCKS (SPB)

A. Analog inputs and outputs shall be terminated at surge protection blocks (SPB). The SPBs shall be designed for a working voltage of 32 volts, and shall be fused.

B. SPBs shall provide full hybrid line to line protection, and shall have a GDT rating of 10,000 A.

C. SPBs shall be UL94 V-2 listed.

2.03 POWER DISTRIBUTION BLOCKS (PDB)

A. PDBs shall be Electro tin-plated and manufactured from high strength 6061-T6 aluminum alloy.

B. PDBs shall be UL Recognized, rated 90°C, and CSA Certified.

C. PDBs shall provide flexibility in using the connector as an in-line splice or to reduce conductor size for taps.

D. PDBs shall be rated for 600 Volts and dual rated for Copper and Aluminum Conductors.

E. PDBs shall have the sizes and ratings as shown on the Plans.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Each terminal block and fuse holder shall be identified with the circuit number, or conductor number, corresponding to the identification appearing on the shop Drawings for the equipment, or system.

B. Terminal block and fuse holder markers shall be computer printed plastic-type, with permanent markings.

C. End clamps and end sections shall be installed on each terminal block and fuse holder assembly.

D. Terminal blocks for DC voltages shall be blue, and AC voltages shall be gray**.**

END OF SECTION

SECTION 26 0916 – ELECTRICAL CONTROLS AND RELAYS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. This Section includes the following:
   1. Pushbutton and Selector Switches
   2. Relays
   3. Alarms
   4. Intrinsic Safety Barriers
   5. Wireways
   6. Watthour Transducers
   7. Elapsed Time Meters and Time Clocks

1.02 REFERENCES

A. NEMA ICS 1: General Standards for Industrial Control Systems.

B. NEMA ICS 2: Standards for Industrial Control Devices, Controllers and Assemblies.

C. NEMA ICS 6: Enclosures for Industrial Controls and Systems.

D. NEMA ST 1: Standard for Specialty Transformers (Except General purpose Type).

1.03 SUBMITTALS

A. Data: A complete list of equipment and material including manufacturer's descriptive data and technical literature, performance charts, catalog cuts and installation instructions, spare parts data for each different item of equipment specified. The data shall include a complete Bill of Materials.

B. Drawings: Containing complete wiring and schematic diagrams, control diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout, anchorage, support and appurtenances of equipment and equipment relationship to other parts of the work including clearances for maintenance and operations.

C. Submit shop drawings in accordance with the Contract Documents, and NEMA ICS 1 specifications indicating control panel layouts, wiring connections and diagrams, dimensions, support points.

1.04 PROJECT RECORD DOCUMENTS

A. Submit record documents in accordance with the Contract Documents.

B. Accurately record actual locations of control equipment. Revise diagrams included in Drawings to reflect actual control device connections.

1.05 OPERATION AND MAINTENANCE DATA

A. Submit operation data in accordance with the Contract Documents.

B. Include instructions for adjusting and resetting time delay relays, timers, and counters.

C. Submit maintenance data in accordance with the Contract Documents.

D. Include recommended preventative maintenance procedures and materials.

PART 2 – PRODUCTS

2.01 PUSHBUTTONS AND SELECTOR SWITCHES

A. Pushbuttons, pilot lights and selector switches shall be of the full size, heavy-duty industrial, oil tight, 120 volts, with interchangeable pilot lights, plug-in construction, double break silver contacts, chrome plated lock rings, with modular contacts, and NEMA rating equal to that of the enclosure on which devices are installed. All components shall be flush mounted on front of panel, unless otherwise noted.

B. Provide individual legend plates for indication of switch, pushbutton, and light function (e.g., Open, Closed, Hand-Off-Auto). A list shall be submitted for review and approval

C. Pilot lights shall be high intensity LED type. Pilot lights shall have clear lenses and LED lamps colored as shown on the Plans. Common, remote push-to-test circuitry shall be provided for each control panel to simultaneously test all indicating lights on the panel using a single pushbutton when there are 10 or more lights on the panel. Control panels with less than 10 lights shall utilize individual push-to-test lights and control circuitry.

D. Pushbuttons shall be maintained or momentary as required and as shown on the Drawings. Provide extended head pushbutton for all stop functions, mushroom head for emergency stop functions, and flush head pushbuttons for all other functions. Where indicated on the Drawings pushbuttons shall be illuminated type. Provide locking mechanism for all lock out functions. Selector switches shall have black knob operator, be maintained contact type unless noted otherwise, number and arrangement as required to perform intended functions specified but not less than one double pole, double throw, double break contact per switch. Contact rating shall be compatible with AC or DC throughput current of devices simultaneously operated by the switch contact but not less than 10 amperes resistive at 120 volts AC or DC continuous.

E. Potentiometers shall be provided with operators and resistive elements of the type and quantity indicated on the Drawings and as required with legend plates indicating percent of span.

F. The above devices shall be manufactured by Allen Bradley, General Electric, or ENGINEER-approved equal.

2.02 RELAYS

A. Timing relays shall be heavy duty, 120V AC, 10 amps, solid state design, poles as required per application, -10°C to +60°C, have timing repeatability of ±2.0% of setting, and be UL listed. The range shall be determined from the control descriptions and or schematic drawings. Provide mounting accessories, as required. The timing relays shall be manufactured by Allen Bradley, Cutler Hammer, or ENGINEER-approved equal.

B. Control relays shall be of the plug-in socket base type with dust-proof plastic enclosures, with silver-cadmium oxide contacts rated 120V AC, 10 amperes, with contact arrangement and operating coils of the proper voltage as required by the control circuit sequence. Relays shall have indicating lamp to show energized state. Each relay shall have a minimum of two double pole, double throw contacts, or as required. Control relays shall be Allen Bradley, Cutler Hammer, or ENGINEER-approved equal.

C. Alternating relays shall be UL listed, 120V AC, with contacts rated for 10 amperes at 120V AC, life expectancy of 100,000 operations, load indicating LEDs, and switch for load locking and load selecting options. Alternating relays shall be manufactured by TimeMark models 261, 271, and 471, and Diversified Electronics model ARA for duplex, triplex, and quadplex alternators, or ENGINEER-approved equal.

2.03 ALARMS

A. Audible alarms shall be UL listed, 120V AC, with solid state circuitry, vibrating horn, non-metallic corrosion resistant housing, with required mounting hardware, suitable for outdoor use capable of producing 100 dB at 10 feet. The audible alarm shall be manufactured by Federal Signal model 350, Edwards model 870-EX, or ENGINEER-approved equal.

B. Beacons for interior and/or exterior locations shall be rated NEMA 4X, flashing type (90 times per minute, minimum) with a red lens. Beacons shall be as manufactured by Federal Signal, Model 225XL, or ENGINEER-approved equal.

2.04 INTRINSIC SAFETY BARRIERS

A. Intrinsic safety barriers shall permit connection of devices located in a hazardous area to other devices located in a safe area. Intrinsic safety barriers shall be EMC compliant, 10 to 35V DC, 35 mA output current, hazardous area terminals identified by blue labels, terminals accommodating conductors up to 12 AWG, ambient temperature rating of -20°C to +60°C. The intrinsic safety barriers shall be manufactured by Allen-Bradley Bulletin 937, or ENGINEER-approved equal.

2.05 WIREWAYS

A. Wireways shall be PVC, snap-in slot design, with non-slip cover. Safe area wireways shall be light gray and marked "Safe Area Wiring." Hazardous area wireways shall be intrinsic blue and marked "Hazardous Area Wiring." The wireways shall be manufactured by Panduit Corporation, or ENGINEER-approved equal.

2.06 WATTHOUR TRANSDUCERS

A. Watthour transducers for active or reactive power shall be DIN rail and surface mount, single-phase or three-phase with balanced or unbalanced load, electrically isolated input and output signals, 4 to 20 mA output signal, 0-10 mA to 0-10 A input current, 0-10 V to 0-600 VAC input voltage, 16-500 Hz selectable frequency. The watthour transducers shall be manufactured by Sineax model PQ502, or ENGINEER-approved equal.

2.07 ELAPSED TIME METERS AND TIME CLOCKS

A. Elapsed time meters shall be self-powered, non-reset, solid state counter which provides silent, accurate and noise immune operation. Elapsed time meters shall require no external power, five-year minimum battery life, rated for 120V AC power, accessories for panel mounting, nameplate below LCD display reading "HOURS", liquid crystal display with 6 digits approximately 2 inches high with 50,000-hour minimum display life and indication of sufficient battery power. The elapsed time meters shall be manufactured by Durant, Automatic Timing and Controls, or ENGINEER-approved equal.

B. Time clocks shall be microprocessor based, have 24-hour time control, up to 24 operations per day, programmable from panel face keys, skip-a-day feature allowing schedule to be skipped for one to seven days, SPDT switch contact rated at 15 amps at 120V AC, with battery carryover to maintain time and program during power outage for 275 hours. The time clocks shall be manufactured by Tork, Paragon Electric Company, or ENGINEER-approved equal.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Fasteners shall be type 316 stainless steel.

B. Install devices in strict accordance with NEC requirements and per manufacturers recommendation.

C. Coordinate with other trades as necessary during installation of these devices.

3.02 ACCEPTANCE

A. All installations are subject to evaluation in accordance with NEC requirements and manufacturers recommendations. CONTRACTOR shall remove the unacceptable work and correct work at no charge to OWNER.

END OF SECTION

SECTION 26 2200 – LOW VOLTAGE TRANSFORMERS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. This section covers dry type transformers used for low voltage, single and three phase, power distribution and lighting.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with these Specifications and the Contract Documents prior to installation.

1.03 QUALITY ASSURANCE

A. IEEE C57.12.01, General Requirements for Dry-Type Distribution and Power Transformers

B. NEMA ST 20, Dry-Type Transformers for General Applications

C. UL 506, Standard for Specialty Transformers

PART 2 – PRODUCTS

2.01 DISTRIBUTION - LOW VOLTAGE LIGHTING AND POWER

D. Transformers shall be premium high efficiency quiet type, and shall be installed where indicated on the Plans. The primary winding of the transformers shall have two 2.5% taps above, and below normal.

E. The transformers shall have a BIL of 10 KV with a temperature class of 185°C for transformers up to 25 KVA, and a temperature class of 220°C for larger transformers.

F. The sound level shall not exceed 44 dBa measured at 5 feet from the transformer after installation. Core and coil assemblies 30 KVA and larger, shall be mounted on rubber vibration isolators, designed to reduce harmonics generated noise.

G. Transformers shall include primary and secondary circuit protection.

H. Transformers shall be types manufactured by Square-D, Eaton, ACME, or ENGINEER-approved equal.

2.02 FERRO RESONANT ISOLATION TRANSFORMERS

A. Ferro resonant isolation transformers shall be provided where indicated on the Plans. Regulation shall be +3 percent for an input range of +10 percent. Common mode noise rejection shall be better than 120 dB with transverse mode noise rejection better than 60 dB. Voltage spike attenuation shall be better than 250:1.

B. Isolation transformers shall be as manufactured by Shape Magnetronics, Control Concepts, Inc., or ENGINEER-approved equal.

C. Transformers 15 kVA and larger must meet the energy requirements of NEMA TP-1.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Transformers shall be installed as indicated on the Plans, and in accordance with the manufacturer's instructions and recommendations. CONTRACTOR shall provide painted metal wall brackets, when required.

B. Grounding shall be provided per NEC, and these Specifications.

C. A sign with 2” high black letters on a white background shall indicate the exact (not the general) location of the transformer’s primary circuit disconnect switch.

END OF SECTION

SECTION 26 2413 – SWITCHBOARDS

PART 1 - GENERAL

1.01 SCOPE

A. The CONTRACTOR shall furnish and install, where indicated, a free-standing, dead-front type low-voltage distribution switchboard, utilizing group mounted circuit protective devices as specified herein, and as shown on the contract drawings.

1.02 REFERENCES

A. The low voltage distribution switchboards and all components shall be designed, manufactured and tested in accordance with the latest applicable following standards:
   1. NEMA PB-2
   2. UL Standard 891

1.03 SUBMITTALS

A. The following information shall be submitted to the ENGINEER for review:
   1. Master drawing index
   2. Front view elevation
   3. Floor plan
   4. Top view
   5. Single line
   6. Schematic diagram
   7. Nameplate schedule
   8. Component list
   9. Conduit entry/exit locations
   10. Assembly ratings including:
      a. Short-circuit rating
      b. Continuous current
      c. Voltage
   11. Major component ratings including:
      a. Voltage
      b. Continuous current
      c. Interrupting ratings
   12. Cable terminal sizes.
   13. Busway connection
   14. Connection details between close-coupled assemblies
   15. Composite floor plan of close-coupled assemblies
   16. Key interlock scheme drawing and sequence of operations.
   17. Calculation of flash protection boundary and require personal protective equipment

B. Submit copies of the following information for record purposes:
   1. Final as-built drawings and information for items listed in Section 01 3300 Submittal Procedures.
   2. Wiring diagrams
   3. Certified production test reports
   4. Installation information
   5. Seismic certification and equipment anchorage details

C. The CONTRACTOR or the equipment manufacturer shall determine and submit the calculation to the OWNER the Arc Flash Protection Boundary (FPB) and the recommended Personal Protective Equipment (PPE). Correct arch flash hazard labels shall be provided on all equipment.

1.04 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the circuit protective devices within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9000, 9001, or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the ENGINEER, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

1.05 REGULATORY REQUIREMENTS

A. The low-voltage switchboard shall be UL labeled.

1.06 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

1.07 OPERATION AND MAINTENANCE MANUALS

A. Copies of the equipment operation and maintenance manuals shall be provided. Operation and maintenance manuals shall include the following information:
   1. Instruction books and/or leaflets
   2. Recommended renewal parts list
   3. Drawings and information required by section 1.04.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Cutler-Hammer

B. General Electric

C. ENGINEER-approved equal

2.02 RATINGS

A. The assembly shall be rated to withstand mechanical forces exerted during short-circuit rating as indicated on the Plans.

B. Voltage rating to be as indicated on the Plans.

2.03 CONSTRUCTION

A. Switchboard shall consist of the required number of vertical sections bolted together to form a rigid assembly. The sides and rear shall be covered with removable bolt-on covers. All edges of front covers or hinged front panels shall be formed. Provide adequate ventilation within the enclosure.

B. All sections of the switchboard shall be rear aligned with depth as shown on the drawings. All protective devices shall be group mounted. Devices shall be front removable and load connections front accessible enabling switchboard to be mounted against a wall.

C. The assembly shall be provided with adequate lifting means.

D. The switchboard shall be equal to Cutler-Hammer type Pow-R-Line C utilizing the components herein specified and as shown on the drawings.

E. The manufacturer shall determine and label the Flash Protection Boundary (FPB) and required Personal Protective Equipment (PPE).

2.04 BUS

A. All bus bars shall be silver-plated copper. Main horizontal bus bars shall be mounted with all three phases arranged in the same vertical plane. Bus sizing shall be based on NEMA standard current density of 1000 amps per square inch.

B. Provide a full capacity neutral bus where a neutral bus is indicated on the drawings.

C. A copper ground bus (minimum ¼-inch x 2 inches), shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchboard.

D. All hardware used on conductors shall be high-tensile strength and zinc-plated. All bus joints shall be provided with conical spring type washers.

2.05 WIRING/TERMINATIONS

A. Small wiring, necessary fuse blocks and terminal blocks within the switchboard shall be furnished as required. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturers wiring diagrams. Wiring diagrams shall contain terminal and wire numbers.

B. Mechanical-type terminals shall be provided for all line and load terminations suitable for copper or aluminum cable rated for 75°C of the size as indicated on the Plans.

C. Lugs shall be provided in the incoming line section for connection of the main grounding conductor. Additional lugs for connection of other grounding conductors shall be provided as indicated on the Plans.

D. All control wire shall be type SIS, bundled and secured with nylon ties. Insulated locking spade terminals shall be provided for all control connections, except where saddle type terminals are provided integral to a device. All current transformer secondary leads shall first be connected to conveniently accessible short-circuit terminal blocks before connecting to any other device. All groups of control wires leaving the switchboard shall be provided with terminals blocks with suitable numbering strips. Provide wire markers at each end of all control wiring.

2.06 MOLDED CASE PROTECTIVE DEVICES

A. Main and feeder protective devices shall be molded case circuit breakers with inverse time and instantaneous tripping characteristics and shall have ground fault protection where indicated, or as required by NEC.

B. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make/quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position. Contacts shall be non-welding silver alloy, and arc extinction shall be accomplished by means of DE-ION arc chutes. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.

C. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the Drawings.

D. Where indicated on the Drawings, circuit breakers shall be UL listed for series application.

E. Where indicated on the Drawings, circuit breakers shall be current limiting.

F. Circuit breakers 400 ampere frame and below shall be thermal-magnetic trip units and inverse time-current characteristics. Circuit breakers 600-ampere through 1200-ampere frame shall be microprocessor-based RMS sensing trip units. Circuit breakers 1600-ampere through 2500-ampere frame shall be microprocessor-based RMS sensing trip units.

G. On circuit breakers 800 amps and larger, a trip button and integral current reading display shall be provided

H. Where indicated, provide circuit breakers UL listed for application at 100% of their continuous ampere rating in their intended enclosure.

I. Provide Lamicoid labels for feeder circuit breakers that provide a descriptive name, as identified on the Drawings, of the load being served. Include circuit number and circuit breaker trip rating.

2.07 ACCESSORIES

A. Provide shunt trips, bell alarms and auxiliary switches as shown on the contract drawings.

B. Circuit Breaker Energy Monitoring.

C. Centralized Local Monitoring.

D. Provide transient voltage surge suppression as required in these Specifications and indicated on the Plans.

2.08 MISCELLANEOUS DEVICES

A. Key interlocks shall be provided as indicated on the Plans or required for safe equipment operation.

B. Control power transformers with primary and secondary protection shall be provided, as indicated on the Plans, or as required for proper operation of the equipment.

C. Each section of the switchboard shall be provided with a space heater, thermostatically controlled. Power for the space heaters shall be obtained from a control power transformer within the switchboard. Supply voltage shall be 120 volts AC.

2.09 ENCLOSURES

A. Indoor NEMA 1 Enclosure

B. Outdoor NEMA 3R Enclosure
   1. Outdoor enclosure shall be non-walk-in and meet applicable NEMA 3R UL requirements.
   2. Enclosure shall have flat roof sloping roof downward toward rear.
   3. Outer sections shall be the same widths as indoor structures, except each end of the outdoor assembly shall have an end trim.
   4. The enclosure shall be provided with bolt-on rear covers for each section.
   5. Doors shall have provisions for padlocking.
   6. Ventilating openings shall be provided complete with replaceable fiber glass air filters.
   7. Provide space heaters thermostatically controlled for each structure with adequate wattage to prevent the accumulation of moisture.
   8. Power for space heaters, lights and receptacles shall be obtained from a control power transformer within the switchboard. Supply voltage shall be 120 volts AC.

2.10 NAMEPLATES

A. Engraved nameplates, mounted on the face of the assembly, shall be furnished for all main and feeder circuits as indicated on the Plans. Nameplates shall be laminated plastic, black characters on white background. Characters shall be 1/2 inches high, minimum. Nameplates shall give item designation and circuit number as well as frame ampere size and appropriate trip rating. Furnish master nameplate giving switchboard designation, voltage ampere rating, short-circuit rating, manufacturer's name, general order number, and item number.

B. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer's wiring diagrams.

2.11 FINISH

A. All exterior and interior steel surfaces of the switchboard shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchboard shall be ANSI 61 light gray.

PART 3 - EXECUTION

3.01 FACTORY TESTING

A. The following standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with the latest version of ANSI and NEMA standards.

1. The switchboard shall be completely assembled, wired, adjusted, and tested at the factory. After assembly, the complete switchboard will be tested for operation under simulated service conditions to assure the accuracy of the wiring and the functioning of all equipment. The main circuits shall be given a dielectric test of 2,200 volts for one (1) minute between live parts and ground, and between opposite polarities. The wiring and control circuits shall be given a dielectric test of 1,500 volts for one (1) minute between live parts and ground.

B. The manufacturer shall provide certified copies of factory test reports.

3.02 INSTALLATION

A. The CONTRACTOR shall install all equipment per the MANUFACTURER'S instructions, Contract Documents, and National Electrical Code.

B. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to the floor without the use of floor sills provided the floor is level to 1/8-inch per 3-foot distance in any direction. All necessary hardware to secure the assembly in place shall be provided by the CONTRACTOR.

3.03 FIELD INSPECTION AND TESTS

A. Provide the services of an authorized representative of the equipment manufacturer to make site visits to supervise the field testing and installation to be performed by the CONTRACTOR. The manufacturer’s representative shall state in writing that the equipment has been correctly installed and tested.

B. Perform the following minimum tests and checks before energizing equipment:

1. Megger terminals and busses for grounds after disconnecting devices sensitive to megger voltage.
2. Inspect all mechanical and electrical interlocks for proper operation.

C. Perform any other tests recommended by the equipment manufacturer and other tests as

described in this specification.

D. The manufacturer's representative shall supply results of all factory and field tests in writing for submittal to the ENGINEER.

E. The manufacturer shall supply test results to confirm that the assembly design has been tested to substantiate conformance with the applicable ANSI and NEMA Standards.

F. Touch-up paint all chips and scratches with manufacturer supplied paint and leave remaining paint with OWNER.

G. The CONTRACTOR shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. Necessary field settings of devices, adjustments, and minor modifications to equipment to accomplish operational condition shall be carried out by the CONTRACTOR at no additional cost to the OWNER.

END OF SECTION

SECTION 26 2416 – PANELBOARDS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. This section covers electrical panelboards.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with these Specifications and the Contract Documents prior to installation.

B. Panelboard submittal shall include:
1. Layout and dimensions with alphanumeric designation
2. Branch circuit breaker sizes and types
3. AIC rating
4. Bus sizes and ratings
5. Cable terminal sizes
6. Product sheets
7. Installation information
8. Seismic certification and equipment anchorage details

1.03 QUALITY ASSURANCE

A. NEMA PB-1, Panelboards

B. NEC

C. UL67, Panelboards

PART 2 – PRODUCTS

2.01 PANELBOARDS

A. Dead-front panelboards, including lighting distribution and control panels, shall be furnished and installed as indicated on the Plans. Buses shall be copper. Mounting and type of enclosures shall be as indicated on the Plans. Where not indicated, indoor enclosures shall be NEMA 12 and outdoor enclosures shall be NEMA 3R. The minimum interrupting capacity of any device shall be as indicated on the Plans.

B. Protective devices shall be replaceable without disturbing adjacent units. Wire connectors shall be suitable for wire sizes indicated. Branch circuits shall be numbered as indicated on the Plans, and a complete typed circuit schedule shall be furnished under a transparent cover, and affixed to the panel. Phase busing shall be full height without reduction. Full size neutral bars shall be included, and shall have suitable lug for each outgoing circuit requiring neutral connection. Spaces for future protective devices provided in lighting panels shall be bused for the maximum device that can be fitted into them.

C. Panelboards shall be finished with a primer, rust resistant phosphate undercoat and two coats of oven baked enamel with finish ANSI grey. Doors shall not uncover any live parts, and shall be hinged and have latches that require no tool to operate. Panelboard doors shall be lockable. Lock and two keys shall be furnished.

D. Each panelboard shall have, on the outside of the door, a lamicoid nameplate with ¾-inch letters as specified elsewhere in these Contract Documents.

E. Panelboards shall be manufactured by Cutler Hammer, General Electric, or ENGINEER-approved equal.

F. Panelboards shall be service entrance rated where required, and as shown on the Plans.

G. Panelboards shall be bolt-on type and provided with spare breakers as indicated on the Plans.

H. Panelboards shall include a typed circuit directory located inside the panel.

I. Surge Protective Devices (SPD)
   1. The SPD shall be per these Specifications.
   2. Surge Protective Devices (SPD) shall be designed to provide transient voltage protection for a service entrance panelboard.
   3. SPD shall be rated for the voltage and phase service of the panel at 120 kA per phase.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Panelboards shall be installed as indicated on the plans and according to manufacturer's instructions.

B. Provide grounding per NEC and these Specifications.

C. CONTRACTOR shall verify all NEC clearance requirements prior to installation.

END OF SECTION

SECTION 26 2726 – WIRING DEVICES

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Light switches, receptacles, device plates, dimmers, plug-in strips, and tele-power poles.

1.02 QUALITY ASSURANCE

A. Device shall be UL-rated when applicable

1.03 SUBMITTALS

A. Shop Drawings: Refer to the Contract Documents and these Specifications.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with the Contract Documents, the following manufacturers are acceptable:
   1. Light switches (except explosion proof):
      a. Hubbell
      b. Slater
      c. P&S
      d. Arrow Hart
      e. General Electric
      f. Leviton
      g. Or ENGINEER-approved equal
   2. Explosion proof light switches:
      a. Crouse-Hinds
      b. Appleton Electric Co.
      c. Killark
      d. Or ENGINEER-approved equal
   3. Door switches:
      a. General Electric
      b. Slater
      c. P&S
      d. Arrow Hart
      e. Micro-switch
      f. Or ENGINEER-approved equal
   4. Receptacles (except explosion proof):
      a. Hubbell
      b. Slater
      c. P&S
      d. Arrow Hart
      e. General Electric
      f. Leviton
      g. Or ENGINEER-approved equal
   5. Explosion proof receptacles:
      a. Crouse-Hinds
      b. Appleton Electric Co.

c. Killark
d. Or ENGINEER-approved equal

6. Welding receptacles:
   a. Crouse-Hinds
   b. Appleton Electric Co.
   c. Or ENGINEER-approved equal
7. Tele-power poles:
   a. Wiremold
   b. Walker
   c. Or ENGINEER-approved equal
8. Dimmers:
   a. Lutron
   b. General Electric
   c. P&S
   d. Or ENGINEER-approved equal
9. Plug-in strip:
   a. Wiremold
   b. Walker
   c. Or ENGINEER-approved equal

2.02 MATERIALS

A. Light Switches for Unclassified Areas:
   1. Toggle type, quiet action, specification grade with grounding terminal
   2. Back and side wired
   3. Solid silver cadmium oxide contacts
   4. One-piece switch arm rated 20 A, 120/277 V AC
   5. UL listed
   6. Color: Ivory
   7. Wall plate: Type 304 stainless steel
   8. Type: As indicated on Drawings

B. Receptacles for Unclassified Areas:
   1. Straight blade, grounding type, specification grade
   2. Back and side wired with wrap-around bridge
   3. Rated 20 A, 125 V AC
   4. UL listed
   5. Color:
      a. For use on normal power: Ivory
      b. For use on UPS systems: Red
      c. For use on isolated ground systems: Orange
   6. Wall plate: Type 304 stainless steel
   7. Type: As indicated on Drawings

C. Light Switches for Wet Areas:
   1. Presswitch type, quiet action, specification grade, with grounding terminal
   2. Back and side wired
   3. Solid silver cadmium oxide contacts
   4. One-piece switch arm rated 20 A, 120/277 V AC
   5. UL listed
   6. Color: Ivory
   7. Wall plate: Gray weatherproof presswitch type
   8. Type: As indicated on Drawings

D. Receptacles for Wet Areas:
   1. Straight blade, grounding type, specification grade
   2. Back and side wired with wrap around bridge
   3. Rated 20 A, 125 V AC
   4. UL listed
   5. Color: Ivory
   6. Wall plate: Weatherproof, cast aluminum, UL listed, WDL open and closed
   7. Type: As indicated on Drawings

E. Ground Fault Circuit Interrupter Receptacles:
   1. Straight blade, grounding type, specification grade
   2. Rated 20 A, 125 V AC
   3. UL listed
   4. Test and reset buttons
   5. Wall plate: Indoor or weatherproof as required
   6. Feed-through type

F. Light Switches for Corrosive Areas:
   1. Corrosion-resistant NEMA 4X enclosure with switch consisting of:
      a. Fiberglass reinforced polyester enclosure
      b. Fiberglass reinforced polyester gasketed wall plate with built-in toggle lever switch with stainless steel shaft
      c. Grounding bushing
      d. Rated 20 A, 125 V AC
      e. UL listed
      f. Type: As indicated on Drawings
      g. Color: Yellow
   2. Optional: Corrosion-resistant enclosure and switch consisting of:
      a. Cast copper-free aluminum "FS" or "FD" ridge type hub box
      b. Toggle type, quiet action, specification grade with grounding terminal
      c. Rated 20 A, 125 V AC with solid silver cadmium oxide contacts
      d. UL listed
      e. Neoprene gasket
      f. Cast aluminum cover with stainless steel screws and lever to activate switch
      g. Type: As indicated on Drawings
      h. Color: Yellow

G. Receptacles for Corrosive Areas:
   1. Corrosion-resistant straight blade, grounding type, specification grade
   2. Back and side wired with wrap-around bridge
   3. Rated 20 A, 125 V AC
   4. UL listed
   5. Color: Yellow
   6. Box: "FS" or "FD" ridge type cast hub box of copper-free aluminum
   7. Gasket: Neoprene
   8. Wall plate: Weatherproof, cast aluminum, UL listed, WDL open or closed
   9. Type: As indicated on Drawings

H. Explosion proof Light Switches for Use in Hazardous Areas:
   1. Explosion proof, UL listed for Class I, Division 1 and 2, Groups B, C, and D; and Class II, Division 1 and 2 areas, Groups E, F, and G.
   2. EDS factory sealed
   3. Malleable iron body and cover

4. Aluminum sealing chamber
5. Front operated handle with stainless steel shaft
6. Rated 20 A, 125 V AC
7. With grounding screw
8. Type: As indicated on Drawings

I. Explosion proof Receptacles for Use in Hazardous Areas:
1. Explosion-proof, UL listed for Class I, Division 1 and 2, Groups B, C, and D; and Class II, Division 1 and 2, Groups F and G.
2. Factory-sealed malleable iron receptacle with spring-loaded cover
3. Malleable iron mounting box
4. Rated 20 A, 125 V AC
5. "Dead-front" construction requiring plug to be inserted and rotated to activate receptacle
6. Type: As indicated on Drawings.

J. Welding Receptacles: 60 A, 480 V, 3 pole, 4 wire, grounding type

K. Plug-In Strip: Surface steel raceway plug-in strip with single 15 A, 125 V, 3 wire grounding-type receptacles spaced 18 IN on center.
1. Prewired with two #12 TW and one #12 TW green insulated ground
2. Minimum 1-1/4 IN wide x 3/4 IN deep
3. Suitable fittings and snap-in cover
4. Finish:
   a. Stainless steel
5. Receptacle color:
   a. For use on normal power: Ivory
   b. For use on UPS systems: Red
   c. For use on isolated ground systems: Orange

PART 3 – EXECUTION

3.01 INSTALLATION

A. Mount devices where indicated on the Drawings and as scheduled in these Specifications.

B. Surface mount receptacles and light switches in concrete construction.

C. In masonry and metal stud construction, recess mount receptacles and light switches unless device precludes recessed mounting or unless otherwise noted on the Drawings.

D. Where more than one receptacle is installed in a room, they shall be symmetrically arranged.

E. Set switches and receptacles plumb and vertical to the floor.

F. Set recess-mounted switches and receptacles flush with face of walls.

G. Do not connect dimmers to loads in excess of 80 percent of the rating of the dimmer.

H. Provide blank plates for empty outlets.

END OF SECTION

SECTION 26 2733 – POWER DISTRIBUTION UNITS

PART 1 - GENERAL

1.01 DESCRIPTION

A. This Section outlines the electrical work for underground or overhead power service and power distribution.

B. Power Service: The underground or overhead service shall be complete and as shown on the Drawings. The service installation shall conform with the power company service requirements.

C. Distribution: The power distribution system shall include equipment installations and underground or overhead wiring installations as shown on the Drawings.

1.02 SUBMITTALS

A. Submit for the ENGINEER's approval material lists, shop drawings, factory test reports, and technical data to the extent required in these Specifications and contract documents.

PART 2 - PRODUCTS

2.01 GENERAL

A. Provide all the equipment and materials, and complete all of the power service, power distribution and grounding installations as indicated, specified and required. Sizes of equipment shown on the Drawings and space allowed for the equipment are based on equipment manufactured by only one of the listed acceptable manufacturers. The manufacturers and models listed in this Section of the Specifications are acceptable providing they conform to the Specifications and that the equipment and materials provided fit properly in the available space.

2.02 SERVICE EQUIPMENT

A. Provide the metal enclosed, service equipment as shown on the Drawings, and in accordance with the power company service requirements. The low voltage equipment shall be manufactured by Square D, Cutler Hammer, General Electric, Siemens, Allen Bradley, or ENGINEER-approved equal. Service equipment shall be part of the distribution panelboard as shown on the Drawings. All sections must meet Local Power Utility requirements.

B. Metering Section shall be full height, free standing and equipped with meter sockets, copper busses, main circuit breaker and ground fault protection as indicated. The meter sockets shall be provided for the power company self contained meter or meters that shall be connected to instrument transformers as required. Must meet Local Power Utility requirements.

C. Pull Section shall be totally metal enclosed, full height, free standing and equipped with copper buses and connectors for the underground service conductors. Must meet Local Power Utility requirements.

D. A main circuit breaker shall be used as a service disconnect in the service equipment as shown on the Drawings.

E. Nameplates shall be provided for the service equipment as required in these Specifications.

F. Double hasp shall be attached on a gasketed hinged door of outdoor equipment for two padlocks.

G. Grounding shall meet the requirements of these Specifications.

H. Service equipment shall be labeled with available fault current in accordance with NEC 110.24(a).

PART 3 - EXECUTION

3.01 GENERAL

A. Provide all the equipment installations and wiring installations including connections and interconnections for the power service and distribution as indicated, specified and required. Assure proper fits for all equipment and materials in the spaces shown on the Drawings.

B. Earthwork, Concrete and Painting: The required work for excavations, backfills, concrete and painting shall be provided for the electrical installations.
   1. Earthwork shall be performed for handholes, pull boxes, underground conduits, poles, guys, grounding, equipment foundations and supports as indicated and specified.
   2. Concrete shall be provided for electrical equipment foundations and supports, and conduit encasements as indicated and specified in these Specifications.
   3. Painting shall be provided for all installations having unfinished surfaces as specified in. Field damaged factory finishes on equipment shall be touched-up with paint that is equal in quality and color to the original factory finish.

C. Handholes and Pull Boxes: Precast concrete handholes and pull boxes shall be installed in excavations as shown on the Drawings and as required.
   1. Accessories shall be installed, which include pull eyes and required hardware.
   2. Covers shall be installed on all handholes and pull boxes.

D. Service Equipment: Install the metal enclosed service equipment and wiring as indicated, specified and required.
   1. Equipment shall be installed level and securely attached to the concrete foundation with anchor bolts. The sections shall be joined together with bolts, washers and nuts to form a unit assembly.
   2. Wiring installations shall be complete and in accordance with the power company service requirements.
   3. Nameplates shall be laminated plastic and attached to clean surfaces of the metal enclosures with an adhesive or equal.

E. Grounding: Install all the equipment, materials and wiring to complete the equipment, structural, lightning and system grounding installations as shown on the Drawings, specified and required.

F. Panelboards and Switchboards: Install the metal enclosed panelboards and distribution switchboards as indicated, specified and required.
   1. Equipment shall be installed level and securely attached to the concrete foundations, floors and walls with anchor bolts.
   2. Wiring installations shall be complete, including all connections.
   3. Nameplates shall be laminated plastic, and attached to clean surfaces of the metal enclosures with an adhesive.

G. Automatic Transfer Switch: The Automatic Transfer Switch described in Specification Section 26 3600 shall be supplied with the Service Entrance equipment.

H. Checking, Adjusting and Testing: Provide all checking, adjusting and testing operations on equipment and complete installations as specified in these Specifications.

END OF SECTION

SECTION 26 2813 – FUSES

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. This section covers the requirements for protective fusing on this project. The CONTRACTOR shall furnish and install fuses and fuse holders per the Drawings and equipment manufacturers recommendations.

B. This specification includes the general requirements for various types of fuses whether they are shown on the Drawings or not. If fusing is required by codes or manufacturers recommendations, but not shown on the Drawings, this specification shall apply to the type of fusing provided by the CONTRACTOR.

C. Types of fuses specified in this section include the following:
   1. Class L time-delay
   2. Class L fast-acting
   3. Class RK1 time-delay
   4. Class RK1 and Class J current-limiting
   5. Class RK5 time-delay
   6. Class K5 time-delay, noncurrent-limiting
   7. Class T current-limiting

1.02 QUALITY ASSURANCE

A. The fuse manufacturer's facilities shall be ISO 9001 certified.

1.03 CODES AND STANDARDS

A. UL Compliance and Labeling: Comply with applicable provisions of UL 198D, "High-Interrupting-Capacity Class K Fuses". Provide over-current protective devices which are UL-listed and labeled.

B. NEC Compliance: Comply with NEC as applicable to construction and installation of fusible devices.

C. ANSI Compliance: Comply with applicable requirements of ANSI C97.1 "Low-Voltage Cartridge Fuses 600 Volts or Less".

1.04 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data on fuses, including specifications, electrical characteristics, installation instructions, furnished specialties and accessories in accordance with these Specifications and the Contract Documents. In addition, include voltages and current ratings, interrupting ratings, current limitation ratings, time-current trip characteristic curves, and mounting requirements.

1.05 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering fusible devices which may be incorporated in the work include, but are not limited to, the following: Bussmann, Gould-Shawmut, Reliance, or ENGINEER-approved equal.

PART 2 – PRODUCTS

2.01 GENERAL

A. Except as otherwise indicated, provide fuses of types, sizes, ratings, and average time-current and peak let-through current characteristics indicated, which comply with manufacturer's standard design, materials, and constructed in accordance with published

product information, and with industry standards and configurations.

2.02 CLASS L TIME-DELAY FUSES

A. Provide UL Class L time-delay fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting transformers, motors, and circuit-breakers.

2.03 CLASS L FAST-ACTING FUSES

A. Provide UL Class L fast-acting fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting service entrances and main feeder circuit-breakers.

2.04 CLASS RK1 TIME-DELAY FUSES

A. Provide UL Class RK1 time-delay fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting motors and circuit-breakers.

2.05 CLASS RK1 CURRENT-LIMITING FUSES

A. Provide UL Class RK1 current-limiting fuses rated 250 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting circuit-breakers.

2.06 CLASS J CURRENT LIMITING FUSES

A. Provide UL Class J current-limiting fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating.

2.07 CLASS RK5 TIME-DELAY FUSES

A. Provide UL Class RK5 time-delay fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting motors.

2.08 CLASS K5 ONE-TIME FUSES

A. Provide UL Class K5 one-time fuses rated 250 volts, 60 Hz, with 100,000 RMS symmetrical interrupting current rating for protecting non-inductive loads.

2.09 CLASS T FUSES

A. Provide UL Class T fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protection of physically small devices.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Fuse types and sizes shall be as indicated on the Plans. Fuses shall be installed in accordance with the National Electric Code (NEC) requirements and the manufacturer's written instructions.

B. Install fuses in proper fuse holders.

C. Where fuses are installed in the motor starters, fuses shall be sized to match the actual motor full load current.

D. Where fuses are installed in disconnect switches at HVAC units, the fuse sizes shall be sized to meet the HVAC manufacturer's requirements.

E. Fuses for control transformers shall be sized in accordance with the National Electrical Code.

F. Fuses shall be installed with the labels clearly visible.

3.02 FIELD QUALITY CONTROL

A. Prior to energizing fusible devices, test devices for circuit continuity and for short-circuits.

3.03 SPARE PARTS

B. Furnish 3 spare fuses of each size and type.

END OF SECTION

SECTION 26 2816 – ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. The CONTRACTOR shall furnish and install, low voltage circuit breakers and enclosed disconnect switches, as indicated on the Drawings, and specified herein.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with these Specifications and elsewhere in the Contract Documents prior to installation.

1.03 QUALITY ASSURANCE

A. The breaker manufacturer's facilities shall be ISO 9001 certified.

PART 2 – PRODUCTS

2.01 GENERAL

A. Circuit breakers shall be manufactured by Cutler-Hammer, Allen-Bradley, General Electric, or ENGINEER-approved equal.

B. Circuit breaker frame, trip, short circuit, and interruption ratings shall be as indicated on the Drawings, except that they shall be coordinated with the ratings of the equipment actually furnished, and shall be modified where necessary to suit the equipment. Circuit breakers to be used in motor control centers shall be as indicated on the Drawings. Where no indication of type is given on the Drawings circuit breakers protecting motors shall be motor circuit protectors, and other circuit breakers shall be molded case type.

C. Circuit breaker for mounting in motor control centers, or for separate mounting shall be of the air-break type, quick-make and quick-break, 600 volt, with number of poles as indicated on the Drawings.

D. Each pole of the circuit breaker shall provide inverse time delay, and instantaneous circuit protection.

E. The breakers shall be operated by a handle, and shall have a switching mechanism that is mechanically trip free from the handle, so that the contacts cannot be held closed against short circuits, and abnormal currents. Tripping due to overload, or short circuit shall be clearly indicated by the handle automatically assuming a position between the manual ON and OFF positions. Latch surfaces shall be ground and polished. Poles shall be constructed so that they open, close, and trip simultaneously.

F. Breakers must be completely enclosed in a molded case. Non-interchangeable trip breakers shall have their covers sealed; interchangeable trip breakers shall have the trip unit sealed to prevent tampering. Ampere ratings shall be clearly visible. Contacts shall be non-welding silver alloy. Arc extinction must be accomplished by means of arc chutes. The minimum interrupting ratings of the circuit breakers shall be at least equal to the available short circuit current at the line terminals.

G. Circuit breakers shall conform to the applicable requirements of NEMA Standards Publication No. AB1.

H. Molded case circuit breakers shall be ambient temperature compensating that provides inverse time delay overload and instantaneous short circuit protection by means of a thermal-magnetic element. Compensation shall be accomplished by a secondary bi-metal that will allow the breaker to carry rated current between 25°C and 50°C with tripping characteristics that are approximately the same throughout this temperature range.

I. On breakers with interchangeable, thermal, adjustable magnetic trip, the accessibility and position of the adjustment knob shall not be changed from those on the standard breaker.

J. Unless mounted in a switchboard, or panelboard, circuit breakers shall be housed in a NEMA rated enclosure as described elsewhere in these specifications.

K. Provide circuit breakers with shunt trip mechanisms where shown on the Drawings.

2.02 DISCONNECT SWITCHES

A. Disconnect switches shall be heavy-duty safety switches with a quick-make, quick-break operating mechanism, full cover interlock, and indicator handle. Disconnect switches shall be furnished with fuses of the size indicated on the Plans. One set of spare fuses shall be furnished for each fused disconnect switch. Disconnect switches shall be NEMA type HD heavy duty construction, UL 98 listed.

B. Enclosures shall be rated NEMA 12 for indoor use, NEMA 4X for corrosive areas and for outdoor use, unless otherwise indicated on the Plans.

C. Disconnect switch handle shall be padlockable.

D. Disconnect switches in corrosive areas as indicated on the Plans, shall be NEMA 4X, 316 stainless steel.

E. Disconnect switches shall be manufactured by Square D, Cutler Hammer, Allen-Bradley, General Electric, Eaton, or equal.

F. Disconnect switches for motors shall be rated for 125% of the motor HP or as indicated on the plans.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Circuit breakers and disconnect switches shall be installed as indicated on the Drawings and per manufacturer's instructions.

END OF SECTION

SECTION 26 2913 – ENCLOSED MOTOR CONTROLLERS

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. A motor controller is any device or group of devices normally used to start and stop a motor by making and breaking the motor circuit current. The motor controller and devices that make up the motor controller shall be governed by items indicated on the Plans, or elsewhere within these specifications.

B. Types of motor controllers specified in this section include the following:
   1. Combination.
   2. Fractional HP manual.
   3. Solid-state reduced voltage starter (SSS)

C. This section applies to motor controllers rated 480 V and below.

1.02 CODE AND STANDARDS

A. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction and NEC Articles 220, 250, and 430, as applicable to installation, and construction of motor controllers.

B. NFPA Compliance: Comply with applicable requirements of NFPA 70E, "Standard for Electrical Safety in the Workplace."

C. UL Compliance: Comply with applicable requirements of UL 486A and B, and UL 508, pertaining to installation of motor controllers. Provide controllers and components which are UL-listed and labeled.

D. NEMA Compliance: Comply with applicable requirements of NEMA Standard ICS 2, "Controllers, Contactors and Overload Relays" and Pub No. 250, "Enclosures for Electrical Equipment (1000 Volts Maximum)," pertaining to motor controllers and enclosures.

1.03 MAINTENANCE DATA

A. Submit maintenance data and parts list for each motor controller and component; including troubleshooting maintenance guide. Also, provide product data and shop drawings in a maintenance manual, in accordance with requirements of these Specifications and the Contract Documents.

1.04 SUBMITTALS

A. Product Data: Submit manufacturer’s data and installation instructions on motor controllers.

B. Shop Drawings: Submit shop drawings of motor controllers showing accurately scaled equipment locations and spatial relationships to associated motors and equipment.

C. Wiring Diagrams: Submit power and control wiring diagrams for motor controllers showing connections to electrical power panels, feeders, and equipment.

D. Submittal documents shall be provided in accordance with these Specifications and other requirements of the Contract Documents.

PART 2 - PRODUCTS

2.01 GENERAL

A. Except as otherwise indicated, provide motor controllers and ancillary components that comply with manufacturer's standard materials, design, and construction in accordance with published product information, and as required for a complete installation.

2.02 ELECTRONIC OVERLOAD RELAYS

A. Electronic overload relays shall be provided with the motor starters. The overload relay shall be a 3-pole solid state device that monitors all 3 phases of the motor current. The unit shall detect overcurrent, phase current imbalance, phase loss, and trip after an adjustable time from 3 seconds to 30 seconds.

B. The overload relays shall be field selectable to Class 10, 20 or 30, ambient temperature compensated, and shall have an LED trip indicator. The unit shall have a manual and automatic reset feature, and a normally closed contact for control.

C. Each module shall provide individual trip indication and reset for each trip condition, visible without opening the distribution panelboard compartment door. Provide a normally open auxiliary contact for remote trip indication.

D. Solid state circuits shall be completely protected from damage arising from line transients and voltage spikes.

E. Electronic Overload Relays shall be as manufactured by Allen-Bradley, Cutler Hammer, General Electric, or ENGINEER-approved equal.

2.03 MAGNETIC MOTOR STARTERS

A. Starters, Size 2 and larger, shall have arc quenchers on all load breaking contacts. Starters shall be suitable for the horsepower ratings specified. The CONTRACTOR shall verify the motor ratings, and coordinate the starter and overload trip ratings with the actual horsepower ratings of the motors installed. Extended overload reset buttons shall be mounted so as to be accessible for operation without opening the door of the enclosure.

B. Magnetic contactors shall be factory adjusted and shall be chatter free. Overload relays shall be electronic, as specified herein.

C. Starters shall be furnished complete with a 120-volt secondary control power transformer. Control circuit fuses shall be furnished both on the primary and secondary of the control circuit transformer. If there is no transformer, all live control power supply wires shall be fused.

D. Starters shall be designed to operate in ambient temperatures up to 60 C.

E. The minimum size starter shall be NEMA Size 1.

F. Magnetic Motor Starters shall be manufactured by Allen-Bradley, Square D, Cutler Hammer, General Electric, or ENGINEER-approved equal.

2.04 MANUAL STARTERS

A. Manual starters shall be rated for the motor load, and shall be equipped with built-in overloads.

B. Manual starters shall be provided with enclosures as indicated on the Plans, lockable handles that clearly indicate ON, OFF, and TRIPPED positions, pilot light, and positive, quick-make, quick break mechanisms.

C. Manual Starters shall be manufactured by Allen-Bradley, Cutler Hammer, General Electric, or ENGINEER-approved equal.

2.05 MOTOR PHASE FAILURE RELAY

A. The relay shall detect voltage values below an adjustable value, loss of phase, and phase reversal. The unit shall automatically de-energize the control circuits of the motors to be protected, when one or all three phase voltages drop below the set point. The unit shall have a nominal trip delay time of two seconds and a reset time of two seconds. The relay shall automatically reset upon restoration of the line voltage. Relays shall be MotorSaver,

Time Mark Corporation, or ENGINEER-approved equal.

2.06 MOTOR PROTECTION RELAY

A. The motor protection relay shall be capable of the following as a minimum:
   1. Phase loss
   2. Low voltage (adjustable)
   3. Phase reversal
   4. Phase unbalance

B. The motor protection relay shall be equipped with the following as a minimum:
   1. Adjustable trip delay (2 to 20 seconds)
   2. Automatic reset
   3. Transient protection (2500 volts for 10 ms)

C. Motor protection relays shall be set during the project startup according to the individual motor characteristics and application parameters. The motor protection relays for the motors with variable frequency drives shall be set as to prevent low voltage tripping.

D. The motor protection relays shall be MotorSaver Model 350, Time Mark Model 264, or ENGINEER-approved equal.

2.07 SOLID STATE REDUCED VOLTAGE STARTER

A. Furnish and install a solid-state reduced voltage starter (SSS) to provide motor soft start and soft stop, where indicated on the Plans. The starter shall be capable of operating with any standard NEMA design motor of the specified horsepower. The unit shall be self-contained, house the logic board, power switches, heat sinks, motor overload protection, control power transformer, and applicable disconnect means in one enclosure.

B. Voltage rating to be 460V, 60Hz, 3 phase, +1- 20%.

C. SSS shall be supplied with a fused disconnect switch with the ability to be lockable in the open position.

D. Operating temperature shall be 0°C to 50°C, 5% to 95% relative humidity, non-condensing. De-rate 33% for each 10°C over 50°C to a maximum of 70°C.

E. Built in overload protection shall shut down and disable the starter until reset.

F. There shall be three pairs of inverse parallel SCRs. Each SCR shall be rated to block 2.5 times the nominal line to line voltage. The SCRs shall be sized to handle locked rotor current: 6 times full load current for 10 seconds on a cold start at 50°C.

G. The starter shall be installed as indicted on the Plans, and shall be supplied with properly sized input and bypass contactors, and controls as shown on the Plans.

H. Adjustments and indicators shall be accessible from a digital keypad with LCD panel. Indications shall include control power on, motor on, motor starting, overload, motor on bypass, and current.

I. Power poles and logic assemblies to be removable as one piece assemblies. One logic assembly shall work in any size unit of a given line voltage. The logic assembly shall be conformal coated. The gate drive circuit shall be optically coupled for noise immunity and long life. The logic assembly and SCRs shall be noise immune per NEMA showering arc test for solid-state contactors.

J. The soft start unit shall be capable of voltage or current control. The voltage limit shall be adjustable from 30% to 80% of line voltage and the current control shall be adjustable from 200% to 600% of FLA. In the voltage control mode, the ramp time shall be adjustable from 1 to 30 seconds, and the unit shall also have a soft stop feature.

K. The soft start shall have dry contact, form C, outputs available for internal faults, bypass contactor control, and run status.

L. Solid State reduced voltage starters shall be UL listed under UL508, and manufactured by Allen Bradley, Square D, Eaton, or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install motor controllers in accordance with equipment manufacturer's written instructions, and with recognized industry practices. Comply with applicable requirements of NEC, UL, and NEMA standards, to ensure that products fulfill requirements.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standards 486A and B, and the National Electrical Code.

C. Install fuses, of sizes indicated, in each fusible disconnect switch, if any. The type and sizes of the fuses for SSS must be per the manufacturer’s recommendation.

D. Prior to energizing motor controller equipment, check with ground resistance tester, phase-to phase and phase-to-ground insulation resistance levels to ensure requirements are fulfilled.

E. Prior to energizing, check circuitry for electrical continuity.

F. Check rotation of each motor for proper direction.

G. Upon completion of installation of motor controller equipment and electrical circuitry, energize controller circuitry and demonstrate functioning of equipment in accordance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and retest to demonstrate compliance.

END OF SECTION

SECTION 26 3213 – GENERATOR SET - DIESEL

PART 1 – GENERAL

1.01 SCOPE

A. Provide complete factory assembled generator set equipment with digital (microprocessor-based) electronic generator set controls, digital governor, and digital voltage regulator, as well as additional equipment as included in the project drawings.

B. Provide factory test, startup by a supplier authorized by the equipment manufacturer(s), and on-site testing of the system.

C. The generator set manufacturer shall warrant all equipment provided under this section, whether or not it is manufactured by the generator set manufacturer, so that there is one source for warranty and product service. Technicians specifically trained and certified by the manufacturer to support the product and employed by the generator set supplier shall service the generator sets.

D. The generator set supplier shall be responsible for complete compliance to all specification requirements for the entire on-site power supply system, including generator set.

E. Prototype testing, factory testing, site testing.

1.02 CODES AND STANDARDS

A. The generator set installation and on-site testing shall conform to the requirements of the following codes and standards, as applicable. The generator set shall include necessary features to meet the requirements of these standards.

1. ANSI S1.13 – Measurement of Sound Pressure Levels in Air
2. CSA 282, Emergency Electrical Power Supply for Buildings
3. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
4. NFPA 30 – Flammable and Combustible Liquids
5. NFPA 37 – Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines
6. NFPA 70 – National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702.
7. NFPA 99 – Essential Electrical Systems for Health Care Facilities
8. NFPA 110 – Emergency and Standby Power Systems. The generator set shall meet all requirements for Level 1 systems. Level 1 prototype tests required by this standard shall have been performed on a complete and functional unit, component level type tests will not substitute for this requirement.
9. IBC Certified for the jobsite installation requirements, and IBC 2000, 2003, 2006, 2009, and 2012.

B. The generator set and supplied accessories shall meet the requirements of the following standards:

1. NEMA MG1-1998 part 32. Alternator shall comply with the requirements of this standard.
2. UL1236 – Battery Chargers
3. UL2200. The generator set shall be listed to UL2200 or submit to an independent third-party certification process to verify compliance as installed.

C. The control system for the generator set shall comply with the following requirements.
   1. EN50082-2, Electromagnetic Compatibility – Generic Immunity Requirements, Part 2: Industrial.
   2. EN55011, Limits and Methods of Measurement of Radio Interference Characteristics of Industrial, Scientific and Medical Equipment.
   3. FCC Part 15, Subpart B.
   4. IEC8528 part 4. Control Systems for Generator Sets

D. The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

1.03 ACCEPTABLE MANUFACTURERS

A. Equipment specifications for this project are based on microprocessor-based generator sets manufactured by Caterpillar, Cummins or ENGINEER-approved equal. Equipment by other suppliers that meets the requirement of this specification are acceptable, if approved. Proposals must include a line by line compliance statement based on this specification. Modifications to the design resulting from equal equipment not specified shall be the responsibility of the Contractor.

1.04 SUBMITTALS

A. Shop drawings shall be submitted as specified in these Specifications and include the following:
   1. Installation Instructions
   2. Outline drawings of assembly
   3. One-line diagrams and wiring diagrams for assembly and components
   4. Interconnection wiring diagrams
   5. Submit names, experience level, training certifications, and locations for technicians that will be responsible for servicing equipment at this site.

B. Product data:
   1. Technical data on all major components. Technical data must include an alternator thermal damage curve, description and operating characteristics of the alternator protection device demonstrating alternator protection, and an alternator reactive capability curve.
   2. Certification of the emissions performance of the generator set engine by the engine manufacturer
   3. Seismic certification, demonstrating compliance to local requirement
   4. Sound test data, based on a free field requirement.
   5. Submit statement of compliance which states the proposed product is certified to the emission standards required by the location for EPA, stationary emergency application.

C. Project information:
   1. Test reports and certifications
   2. Factory test procedures

D. Contract closeout information:
   1. Operating and maintenance data

1.05 QUALIFICATIONS

A. The generation set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

B. The manufacturer of this equipment shall have produced similar equipment for a minimum period of ten years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

1.06 REGULATORY REQUIREMENTS

A. The generator set shall be UL2200 listed and labeled.

B. The generator set overcurrent protection shall be UL listed as a utility grade protective device under UL category NRGU or CSA equivalent.

C. The generator set engine shall be EPA certified, in compliance with the codes and regulations of the local Air Quality Management District (AQMD), and shall comply will all applicable emissions standards at the date of installation, or per the requirements of the Air District Permit, whichever governs.

1.07 WARRANTY

A. The manufacturer shall warrant the material and workmanship of the generator set for a minimum of two (2) years from registered commissioning and start-up.

B. The warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, etc. shall be allowed during the minimum noted warranty period described in paragraph A above.

PART 2 – PRODUCTS

2.01 GENERATOR SET

A. Ratings

1. The generator set shall operate at a voltage of 480/277V, 3-Phase, 4-wire, 60 Hz.
2. The complete generator set shall be rated per ISO8528 at 125 KW at 0.8 PF standby rating, based on site conditions of: Altitude of 700 feet, max ambient temperature of 120°F, and relative humidity of 0-30 percent.
3. The generator set rating shall be based on emergency/standby service and marked as such per NFPA110.

B. Performance

1. Voltage regulation shall not exceed one percent for any constant load between no load and rated load for both parallel and non-parallel applications. Random voltage variation with any steady load from no load to full load shall not exceed plus or minus 0.5 percent.
2. Frequency regulation shall be isochronous from steady state no load to steady state rated load. Random frequency variation with any steady load from no load to full load shall not exceed plus or minus 0.25%.
3. Generator sets shall be designed to allow operation at full rated load in an ambient temperature under site conditions, based on highest ambient condition. Ambient temperature shall be as measured at the air inlet to the generator set for enclosed generator sets, and at the control of the generator set for machines installed in equipment rooms.
4. The engine-generator set shall be capable of single step load pick up of 100% nameplate kW and power factor, less applicable derating factors, with the engine-generator set at operating temperature.
5. The generator shall be capable of sustaining line to neutral short circuit 300% of the rated current for 10 seconds without externally mounted devices.

6. The alternator shall produce a clean AC voltage waveform, with not more than 5% total harmonic distortion at full linear load, when measured from line to neutral, and with not more than 3% in any single harmonic, and no 3rd order harmonics or their multiples. Telephone influence factor shall be less than 40.
7. The generator set shall be certified by the engine manufacturer to be suitable for use at the installed location and rating, and shall meet all applicable exhaust emission requirements.
8. The generator set shall be tested by the manufacturer per ANSI S1.13. Data documenting performance shall be provided with submittal documentation.

C. Construction
1. The engine-generator set shall be mounted on a heavy-duty steel base to maintain alignment between components.
2. All switches, lamps, and meters in the control system shall be oil-tight and dust-tight. There shall be no exposed points in the control (with the door open) that operate in excess of 50 volts.
3. Rigging Information: Indicate location of each lifting attachment, generator-set center of gravity, and total package weight in submittal drawings

D. Connections
1. The generator set load connections shall be composed of silver or tin plated copper bus bars, drilled to accept mechanical or compression terminations of the number and type as shown on the drawings. Sufficient lug space shall be provided for use with cables of the number and size as shown on the drawings.
2. Power connections to auxiliary devices shall be made at the devices, with required protection located at a wall-mounted common distribution panel.
3. Generator set control interfaces to other system components shall be made on a common, permanently labeled terminal block assembly.

2.02 ENGINE AND ENGINE EQUIPMENT

A. The engine shall be diesel, radiator and fan cooled. Minimum displacement and number of cylinders shall be the same or greater than the equivalent rated unit by the manufacturer specified in Section 1.03. The horsepower rating of the engine at its minimum tolerance level shall be sufficient to drive the alternator and all connected accessories. Two cycle engines are not acceptable. Engine accessories and features shall include:
1. An electronic governor system shall provide automatic isochronous frequency regulation. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate and excitation as appropriate to the state of the generator set. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed, and operating in various isochronous states.
2. Skid-mounted radiator and cooling system rated for full load operation in 40°C ambient as measured at the generator air inlet, based on 0.5 in H2O external static head. Radiator shall be sized based on a core temperature which is 10°C higher than the rated operation temperature, or prototype tested to verify cooling performance of the engine/radiator/fan operation in a controlled environment. Radiator shall be provided with a duct adapter flange. The cooling system shall be filled with a 50/50-ethylene glycol/water mixture by the equipment manufacturer. Rotating parts shall be guarded against accidental contact.
3. Electric starter capable of three complete cranking cycles without overheating.
4. Positive displacement, mechanical, full pressure, lubrication oil pump.

5. Full flow lubrication oil filters with replaceable spin-on canister elements and dipstick oil level indicator.
6. Diesel engines shall include an engine driven, mechanical, positive displacement fuel pump and fuel filter(s) with replaceable spin-on canister element(s). Fuel cooler, suitable for operation of the generator set at full rated load in the ambient temperature specified shall be provided if required for operation due to the design of the engine and the installation.
7. Replaceable dry element air cleaner with restriction indicator.
8. Flexible supply and return fuel lines.
9. Engine mounted battery charging alternator, 35-ampere minimum, and solid-state voltage regulator.

B. Coolant heater
1. Engine mounted, thermostatically controlled, coolant heater(s) for each engine. Heater voltage shall be as shown on the project drawings. The coolant heater shall be UL499 listed and labeled.
2. The coolant heater shall be installed on the engine with SAEJ20 compliant materials. Steel tubing shall be used for connections into the engine coolant system wherever the length of pipe run exceeds 12 inches. The coolant heater installation shall be specifically designed to provide proper venting of the system. The coolant heaters shall be installed using isolation valves to isolate the heater for replacement of the heater element.
3. The coolant heater shall be provided with a 24VDC thermostat, installed at the engine thermostat housing. An AC power connection shall be provided for a single AC power connection to the coolant heater system.
4. The coolant heater(s) shall be sized as recommended by the engine manufacturer to warm the engine to a minimum of 40°C in a 15°C ambient, as a minimum, or the temperature required for starting and load pickup requirements of this specification.

C. Provide vibration isolators, spring type, EQ Certified, rating and quantity as recommended by the generator set manufacturer to be compatible with genset manufacturers CBC Seismic Certification. Isolators shall include seismic restraints as required by site location.

D. Starting and Control Batteries shall be lead acid type, 24 volt DC, sized as recommended by the engine manufacturer for compliance to NFPA110 starting requirements, complete with battery cables, connectors, and rack.

E. Provide flex connection for engine of size and type as recommended by the generator set manufacturer and connect to existing exhaust silencer. Utilize existing exhaust system installed in the facility by others according to the engine manufacturer's recommendations and applicable codes and standards.

F. Provide fully regulated, constant voltage, current limited, battery charger for each battery bank charger. The chargers shall be designed for heavy-duty industrial service, primarily to quickly recharge and maintain batteries that start internal combustion engines. Charger shall be rated a minimum of 10 amps, and be capable of operating in parallel with another like charger for reliability and added charging capacity.
1. Charger shall provide 4 distinct charge states: "dead battery", "bulk charge", "absorption", and "float". Charge rate shall be temperature compensated to provide proper charging in ambient conditions from –20°C to +55°C.
2. Provider LED indication of general charger condition, including charging, fault, and equalize. Provide a 2-line LCD display to indicate charge rate, battery voltage, faults, and provide for charger set up. Charger shall provide relay contacts for fault conditions as required by NFPA110.

3. The charger shall operate properly during fault conditions, including battery disconnection while charging, reversed battery polarity connections, and shorted battery.
4. The charger shall be compliant to the same RFI/EMI and voltage surge performance as are specified for the genset control.

2.03 LOW VOLTAGE AC ALTERNATOR

A. The AC alternator shall be; synchronous, four pole, 2/3 pitch, brushless, revolving field, drip-proof construction, single pre-lubricated sealed bearing, air cooled by a direct drive centrifugal blower fan, and directly connected to the engine with flexible drive disc. The alternator design shall prevent shaft current from flowing and eliminate the need for insulated bearings. All insulation system components shall meet NEMA MG1 requirements for Class H insulation systems. Actual temperature rise measured by resistance method at full load shall not exceed 125ºC in a 40°C ambient. Alternator shall be provided with protection to prevent damage due to any external fault or overload condition, including short circuit, ground fault, or overload.

B. The alternator shall be capable of delivering rated output (kVA) at rated frequency and power factor, at any voltage up to 5 percent above or below rated voltage.

C. The alternator shall be supplied with a dedicated, independent power source for the voltage regulation system, which provides sufficient excitation for the alternator to supply 300% of rated output current for 10 seconds.

D. The subtransient reactance of the alternator shall not exceed 12 percent based on the standby rating of the generator set.

E. Provide an anti-condensation heater for the alternator for generator sets installed outdoors or in unheated environments or in coastal environments.

2.04 GENERATOR SET CONTROL AND PROTECTION

A. Generator
1. The generator set shall be provided with a microprocessor-based control system that is designed to provide automatic starting, monitoring, protection, and control functions for the generator set. The control system shall also be designed to allow local monitoring and control of the generator set, and remote monitoring and control as described in this specification.
2. The generator set shall be supplied with a disconnecting means sized per the Plans and supplied by the generator manufacturer. Disconnecting means shall be lockable in the open position in accordance with NEC 445.18(A).
3. The control shall be mounted on the generator set. The control shall be vibration isolated and prototype tested to verify the durability of all components in the system under the vibration conditions encountered.
4. The generator set mounted control shall include the following features and functions:

B. Circuit Breaker
1. The generator shall be equipped with a circuit breaker from the manufacturer. The circuit breaker's type, size, and rating shall be per the manufacturer’s recommendations. The generator shall be protected per the NFPA 70 requirements.

C. Control Switches
1. Mode Select Switch. The mode select switch shall initiate the following control modes. When in the RUN or Manual position the generator set shall start, and accelerate to rated speed and voltage as directed by the operator. In the OFF position the generator set shall immediately stop, bypassing all time delays. In the AUTO position the generator set shall be ready to accept a signal from a remote device to start and accelerate to rated speed and voltage.

2. EMERGENCY STOP switch. Switch shall be Red "mushroom-head" push-button. Depressing the emergency stop switch shall cause the generator set to immediately shut down, and be locked out from automatic restarting. The switch shall include a lockout provision for use in safely disabling the generator set for necessary service.
3. RESET switch. The RESET switch shall be used to clear a fault and allow restarting the generator set after it has shut down for any fault condition.
4. PANEL LAMP switch. Operating the panel lamp switch shall cause the entire panel to be lighted with DC control power. The panel lamps shall automatically be switched off 10 minutes after the switch is operated, or after the switch is operated a second time.

D. Generator Set AC Output Metering. The generator set shall be provided with a metering set including the following features and functions:
1. Analog voltmeter, ammeter, frequency meter, and kilowatt (KW) meter. Voltmeter and ammeter shall display all three phases. Ammeter and KW meter scales shall be color coded in the following fashion: readings from 0-90% of generator set standby rating: green; readings from 90%-100% of standby rating: amber; readings in excess of 100%: red.
2. Digital metering set, 0.5% accuracy, to indicate generator RMS voltage and current, frequency, output current, output KW, KW-hours, and power factor. Generator output voltage shall be available in line-to-line and line-to-neutral voltages, and shall display all three phase voltages (line to neutral or line to line) simultaneously.
3. Both analog and digital metering are required. The analog and digital metering equipment shall be driven by a single microprocessor, to provide consistent readings and performance.

E. Generator Set Alarm and Status Display.
1. The generator set shall be provided with alarm and status indicating lamps to indicate non-automatic generator status, and existing warning and shutdown conditions. The lamps shall be high-intensity LED type. The lamp condition shall be clearly apparent under bright room lighting conditions. The generator set control shall indicate the existence of all alarm, shutdown, and status conditions associated with the generator set, including all paralleling control functions and the engine ECM on an alphanumerical display on the genset. The following alarm, shutdown, and status conditions are required, as a minimum:

Low Oil Pressure	Alarm
Low Oil Pressure	Shutdown
Oil Pressure Sender Failure	Alarm
Low Coolant Temperature	Alarm
High Coolant Temperature	Alarm
High Coolant Temperature	Shutdown
Engine Temperature Sender Failure	Alarm
Low Coolant Level	Alarm or shutdown-selectable
Fail to Crank	Shutdown
Fail to Start/Over-crank	Shutdown
Overspeed	Shutdown
Low DC Voltage	Alarm
High DC Voltage	Alarm
Weak Battery	Alarm
Low Fuel-Day tank	Alarm

High AC Voltage	Shutdown
Low AC Voltage	Shutdown
Under Frequency	Shutdown
Over Current	Shutdown
Over Current	Shutdown
Short Circuit	Shutdown
Over Load	Alarm
Emergency Stop	Shutdown

2. The generator set control shall annunciate all alarm and shutdown conditions from the engine electronic control.
3. Provisions shall be made for indication of four customer-specified alarm or shutdown conditions. Labeling of the customer-specified alarm or shutdown conditions shall be of the same type and quality as the above specified conditions. The non-automatic indicating lamp shall be red, and shall flash to indicate that the generator set is not able to automatically respond to a command to start from a remote location.

F. Engine Status Monitoring.
1. The following information shall be available from a digital status panel on the generator set control:
   Engine Oil Pressure (psi or KPA)
   Engine Coolant Temperature (Degrees F or C)
   Engine Oil Temperature (Degrees F or C)
   Engine Speed (RPM)
   Number of Hours of Operation (Hours)
   Number of Start Attempts
   Battery Voltage (DC Volts)
2. The control system shall also incorporate a data logging and display provision to allow logging of a minimum of the last 20 warning or shutdown indications on the generator set, the time of the last fault of each type, and the number of faults of each type, and total time of operation at various loads as a percent of the standby rating of the generator set.

G. Engine Control Functions.
1. The control system provided shall include a cycle cranking system, which allows for user selected crank time, rest time, and # of cycles. Initial settings shall be for 3 cranking periods of 15 seconds each, with 15-second rest period between cranking periods.
2. The control system shall include an engine governor control, which functions to provide steady state frequency regulation as noted elsewhere in this specification. The governor control shall include adjustments for gain, damping, and a ramping function to control engine speed and limit exhaust smoke while the unit is starting. The governor control shall be suitable for use in paralleling applications without component changes.
3. The control system shall include time delay start (adjustable 0-300 seconds) and time delay stop (adjustable 0-600 seconds) functions.
4. The control system shall include sender failure monitoring logic for oil pressure and engine temperature, which is capable of discriminating between failed sender or wiring components, and an actual failure condition.

5. The control system shall include all interfaces necessary for proper operation with the paralleling equipment provided under this contract.

H. Alternator Control Functions:

1. The generator set shall include a full wave rectified automatic digital voltage regulation system that is matched and prototype tested by the engine manufacturer with the governing system provided. It shall be immune from mis-operation due to load-induced voltage waveform distortion and provide a pulse width modulated output to the alternator exciter. The voltage regulation system shall be equipped with three-phase line to neutral RMS sensing and shall control buildup of AC generator voltage to provide a linear rise and limit overshoot. The system shall include a torque-matching characteristic, which shall reduce output voltage in proportion to frequency below an adjustable frequency threshold. Torque matching characteristic shall be adjustable for roll-off frequency and rate, and be capable of being curve-matched to the engine torque curve with adjustments in the field. The voltage regulator shall include adjustments for gain, damping, and frequency roll-off. Adjustments shall be broad range, and made via digital raise-lower switches, with an alphanumeric LED readout to indicate setting level. Rotary potentiometers for system adjustments are not acceptable.
2. Controls shall be provided to monitor the output current of the generator set and initiate an alarm (over current warning) when load current exceeds 110% of the rated current of the generator set on any phase for more than 60 seconds.
3. Controls shall be provided to individually monitor all three phases of the output current for 1-, 2-, or 3-phase short circuit conditions. The control/protection system shall monitor the current level and voltage. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (short circuit shutdown). This function shall be provided by equipment which is listed under UL category NRGU, or equivalent equipment that is CSA listed for applications installed in Canada.
4. Controls shall be provided to monitor the KW load on the generator set, and initiate an alarm condition (over load) when total load on the generator set exceeds the generator set rating for in excess of 5 seconds. Controls shall include a load shed control, to operate a set of dry contacts (for use in shedding customer load devices) when the generator set is overloaded.
5. An AC over/under voltage monitoring system that responds only to true RMS voltage conditions shall be provided. The system shall initiate shutdown of the generator set when alternator output voltage exceeds 110% of the operator-set voltage level for more than 10 seconds, or with no intentional delay when voltage exceeds 130%. Under voltage shutdown shall occur when the output voltage of the alternator is less than 85% for more than 10 seconds.
6. A battery monitoring system shall be provided which initiates alarms when the DC control and starting voltage is less than 16 VDC or more than 32 VDC (24 VDC nominal) or less than 8 VDC or more than 16 VDC (12VDC nominal). During engine cranking (starter engaged), the low voltage limit shall be disabled, and if DC voltage drops to less than 14.4 volts for more than two seconds a "weak battery" alarm shall be initiated.

I. The generator set shall be provided with a network communication module to allow real time communication with the generator set control by remote devices. The control shall communicate all engine and alternator data; alarm, shutdown, and status conditions; and allow starting and stopping of the generator set via the network in both test and emergency modes.

J. Control Interfaces for Remote Monitoring:

1. No field connections for control devices shall be made in the AC power output enclosure. Provide the following features in the control system:
2. Form "C" dry contact set rated 2A @ 30 VDC to indicate existence of any alarm or shutdown condition on the generator set.
3. One set of contacts rated 2A @ 30 VDC to indicate generator set is ready to load. The contacts shall operate when voltage and frequency are greater than 90% of rated condition.
4. A fused 10 amp switched 24 VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit whenever the generator set is running.
5. A fused 20 amp 24 VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit at all times from the engine starting/control batteries.
6. The control shall be provided with a direct serial communication link for the communication network interface as described elsewhere in this specification and shown on the drawings.

2.05 SOUND/WEATHER ENCLOSURE

A. The complete diesel engine generator set, including generator control panel, engine starting batteries and fuel oil tank, shall be enclosed in a factory assembled, sound attenuated enclosure mounted on the integral sub-base fuel tank. The sound attenuated enclosure shall be weather resistant to withstand outdoor exposure.

B. A sound attenuated enclosure of steel with electrostatically applied powder coated baked polyester paint. It shall consist of a roof, side walls, and end walls. Fasteners shall be either zinc plated or stainless steel. Handles shall be key lockable, all doors keyed alike, and hinges shall be zinc die cast or stainless steel. Access doors shall be hinged and can be lifted off after opening 90 degrees. Intake openings shall be screened to prevent the entrance of rodents or pests.

C. The sound enclosure shall meet Level III requirements listed below, unless noted otherwise on the plans (as measured at a distance of 7 meters).
Level I – Generator operates at 70 to 89 d(B)A
Level II – Generator operates at 63 to 78 d(B)A
Level III – Generator operates at 68 to 72 d(B)A

2.06 SUBBASE FUEL TANK

A. The package shall include a sub base fuel tank with a minimum of 12 hours of fuel storage while operating at full load. The fuel tank shall be constructed of heavy gauge welded steel and shall be double walled with a sealed, separately vented, integral fuel containment basin.

B. The fuel tank shall include a low fuel level switch and a leak detection rupture basin switch. The fuel tank shall be UL 142 listed, ULC-S601-07 listed and NFPA 37 compliant

C. The package shall include the manufacturer’s standard accessory kit.

PART 3 - EXECUTION

3.01 PROTOTYPE TESTING

A. Submit evidence of prototype testing; manufacturer’s certificate, etc.

3.02 SUBMITTALS

A. For equals, within 10 days after award of contract, provide six sets of the following information for review:

1. Manufacturer’s product literature and performance data, sufficient to verify compliance to specification requirements.
2. A paragraph by paragraph specification compliance statement, describing the differences between the specified and the proposed equipment.
3. Manufacturer's certification of prototype testing.
4. Manufacturer's published warranty documents.
5. Shop drawings showing plan and elevation views with certified overall dimensions, as well as wiring interconnection details.
6. Interconnection wiring diagrams showing all external connections required; with field wiring terminals marked in a consistent point to point manner.
7. Manufacturer’s installation instructions.

3.03 FACTORY TESTING

A. The generator set manufacturer shall perform a complete operational test on the generator set prior to shipping from the factory. A certified test report shall be provided. All testing shall be performed with calibrated metering.

B. Generator set factory tests on the equipment shall be performed at rated load and rated power factor, as well as 1.0 power factor. Generator sets that have not been factory tested at rated power factor will not be acceptable. Tests shall include: run at full load, maximum power, voltage regulation, transient and steady-state governing, single step load pickup, and function of safety shutdowns.

C. A certified test report shall be provided documenting the results of these tests.

3.04 INSTALLATION

A. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

B. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

C. Equipment shall be installed on concrete housekeeping pads or as indicated in the plans. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

D. Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the consulting engineer.

E. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

F. On completion of the installation by the electrical contractor, the generator set supplier shall conduct a site evaluation to verify that the equipment is installed per manufacturer’s recommended practice.

3.1 ON-SITE ACCEPTANCE TEST

A. The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by

Contractor. The Engineer shall be notified in advance and shall have the option to witness the tests. The generator set manufacturer shall provide a site test specification covering the entire system. Tests shall include:

B. Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque.

C. Installation acceptance tests to be conducted on-site shall include a "cold start" test, a two hour full load (resistive) test, and a one-step rated load pickup test in accordance with NFPA 110. Provide a resistive load bank and make temporary connections for full load test, if necessary.

D. Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 2 hours. Coordinate timing and obtain approval for start of test with site personnel.

3.05 TRAINING

A. The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided. The training program shall be not less than 4 hours in duration and the class size shall be limited to 5 persons. Training date shall be coordinated with the facility owner.

3.06 SERVICE AND SUPPORT

A. The generator set supplier shall maintain service parts inventory for the entire power system at a central location which is accessible to the service location 24 hours per day, 365 days per year. The inventory shall have a commercial value of $3 million or more. The manufacturer of the generator set shall maintain a central parts inventory to support the supplier, covering all the major components of the power system, including engines, alternators, control systems, paralleling electronics, and power transfer equipment.

B. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical power system replacement parts in the local service location. Service vehicles shall be stocked with critical replacement parts. The service organization shall be on call 24 hours per day, 365 days per year. The service organization shall be physically located within 40 miles of the site.

C. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

END OF SECTION

SECTION 26 3353 – STATIC UNINTERRUPTIBLE POWER SUPPLY

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. This section covers the requirements for uninterruptable power supplies (UPSs) to be provided as shown on the Plans.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with these Specifications and the Contract Documents prior to installation.

1.03 REFERENCES

A. National Electrical Code (NEC) Article 250

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

A. The UPS equipment shall be manufactured by Powerware, or equal.

B. The UPS shall be sized for a minimum of 30 minutes of backup power for its rated load. The rated load shall be equal to or greater than the connected load.

C. The UPS shall be a line-interactive type, consisting of a ferroresonant or linear transformer, battery charger, batteries, inverter, and microprocessor control. The batteries shall be maintenance free, premium type.

D. The UPS shall pass lightning and surge protection ANSI/IEEE C62.41 standards, Category A and B. The UPS shall be UL 1449 listed.

E. The output waveform shall be a pure sine-wave with less than 5% total harmonic distortion on the inverter.

F. The UPS shall have a digital display for load-dependent runtime, volts in, volts out, battery voltage, percent loading, and alarm codes.

G. The UPS shall operate between 0 and 50°C, at a minimum of 95% efficiency on-line.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install the UPS equipment in accordance with the manufacturers' recommendations.

B. The UPS shall be provided with a 2-year parts and factory service warranty.

END OF SECTION

SECTION 26 3600 – AUTOMATIC TRANSFER

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. Automatic transfer switch shall be furnished and installed, as indicated on the Drawings, with full load current and voltage ratings as indicated on the Drawings. The switch shall be capable of switching all classes of load, and shall be rated for continuous duty when installed in a non-ventilated enclosure. Withstand current rating shall be as indicated on the Drawings.

1.02 SUBMITTALS

A. CONTRACTOR shall submit shop drawings, manufacturer's data sheets, and a complete wiring diagram detailing all connections to the electrical system in accordance with these Specifications and other requirements of the Contract Documents.

PART 2 – PRODUCTS

2.01 AUTOMATIC TRANSFER SWITCH

A. The automatic transfer switch shall be of the time delay neutral, delayed transition, break-before-make type. The automatic transfer switch shall have the following capabilities:
   1. Adjustable time delay for generator start
   2. Adjustable time delay transfer to generator
   3. Adjustable time delay in "off" position
   4. Re-transfer to normal power position inhibit
   5. Adjustable time delay for generator stop
   6. The switches shall be capable of transferring successfully in either direction with 70 percent of rated voltage applied to the terminals.

B. The normal and standby contacts shall be positively interlocked mechanically and electrically to prevent simultaneous closing. Main contacts shall be mechanically locked in position in both the normal and standby positions without the use of hooks, latches, or magnets, and shall be silver alloy protected by arcing contacts, with magnetic blowouts on each pole. Parallel main contacts are not acceptable.

C. The transfer switch shall be equipped with a manual operator that is designed to prevent injury to personnel if the electrical operator should become energized during manual transfer.

D. The transfer switch, complete with all accessories, shall be listed by UL. Transfer switches installed outdoors shall be rated NEMA 3R unless noted otherwise in Plans. Transfer switches installed indoors shall be rated NEMA 1 unless noted otherwise in Plans.

E. The transfer switch shall be compatible with the standby generator, and shall be supplied with the generator.

F. The transfer switch operation shall be selectable by the Operator. In Manual mode, the Operator shall be able to transfer the load to the generator using a selector, toggle, or pushbutton switch. In Automatic mode, the internal logic shall sense loss or presence of utility power, and transfer the load to or from the generator.

G. Transfer switches shall be manufactured by CAT, ASCO, Zenith, Russelectric, or ENGINEER-approved equal.

2.02 ACCESSORIES

A. The transfer switch shall be equipped with the following:
   1. Nominal 0.5 to 6 second time delay to override momentary outages.
   2. Field adjustable 0 to 31 minutes time delay to retransfer to normal source with 5-minute unloaded running time of standby plant. A switch shall be provided to bypass this feature with transfer to normal source made manually. Time delay shall be nullified if standby power fails and normal power is available.
   3. Differential protection on 3 phases. Dropout and pickup.
   4. Test switch.
   5. Auxiliary contacts which close in normal position. Two sets of Form C contacts shall be provided.
   6. Auxiliary contacts which close with normal power available. Two sets of Form C contacts shall be provided.
   7. Auxiliary contacts which close in standby position. Two sets of Form C contacts shall be provided.
   8. Auxiliary contacts which close with standby power available. Two sets of Form C contacts shall be provided.
   9. Pilot lights: indicating normal and standby switch position.
   10. Manual and automatic selector switch.
   11. Manual and automatic pilot lights with push-to-test.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Transfer switch shall be installed, in accordance with the manufacturer's recommendations.

3.02 MANUFACTURER TESTING

A. When conducting temperature rise tests in accordance with UL, the manufacturer shall include post-endurance temperature rise tests to verify the ability of the switches to carry full rated current after completing the overload and endurance tests.

B. On completion of the installation, start-up shall be performed by a factory-trained service representative in the presence of the OWNER and the ENGINEER.

3.03 TESTING AND TRAINING

A. Testing and training for this equipment shall be provided in accordance with the Contract Documents. Installation and performance testing shall be conducted as part of the standby generator tests.

B. Four (4) hours of training shall be provided for the OWNER's Operations and Maintenance Staff. Training shall be certified on forms provided in the Contract Documents. Training shall cover theory of operation, features and functions available, normal operation, troubleshooting, and routine maintenance. The CONTRACTOR shall submit a syllabus for the training session for approval, within 3 weeks of conducting the class. Provide each attendee with a class syllabus detailing each topic to be discussed.

END OF SECTION

SECTION 26 4100 – FACILITY LIGHTNING PROTECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Air terminals, interconnecting conductors, grounding, and bonding for lightning protection.

1.02 SYSTEM DESCRIPTION

A. Description: Conductor system protecting Treatment Building.

1.03 SUBMITTALS

A. Shop Drawings: Indicate layout of air terminals, grounding electrodes, and bonding connections to structure and other metal objects. Include terminal, electrode, and conductor sizes, and connection and termination details.

B. Product Data: Show dimensions and materials of each component, and include indication of listing according to UL 96

C. Test Reports: Indicate procedures and results for specified factory and field testing and inspection.

D. Manufacturer's Certificate: Products meet or exceed specified requirements.

E. Certificate of Compliance: From AHJ/inspector indicating approval of lightning protection systems.

1.04 CLOSEOUT SUBMITTALS

A. Project Record Documents: Record actual locations of air terminals, grounding electrodes, bonding connections, and routing of system conductors.

1.05 QUALITY ASSURANCE

A. Perform Work according to NFPA 780.

B. Perform Work according to UL 96A.

C. Perform Work according to LPI-175.

D. Manufacturer: Company specializing in lightning protection equipment with three years' experience and member of Lightning Protection Institute.

E. Installer: Authorized installer of manufacturer with three years' experience.

F. Inspection Agency: UL Lightning Protection Institute, Inc. (LPI) Electrical Testing Laboratories, Inc., or ENGINEER-approved equal.

1.06 FIELD MEASUREMENTS

A. Verify field measurements prior to fabrication, and indicate on Shop Drawings.

1.07 COORDINATION

A. Coordinate Work with roofing and exterior and interior finish installations.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Manufacturers:
   1. ABB, Eaton, Erico or ENGINEER-approved equal

B. Product Listing:
   1. UL 96.

C. Air Terminals:
   1. Material: Copper.
   2. Configuration: Solid.
   3. Use adhesive base for single-ply roof installations.
   4. Air Terminal for Chimney: Lead-coated copper.
   5. Decorations: Ball.
   6. Grounding Rods: Solid copper.
   7. Ground Plate: Copper.
   8. Conductors:
      Material: Copper.
      Configuration: Cable.

D. Connectors and Splicers: Bronze

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install according to NFPA 780, UL 96A, and LPI-175.

B. Connect conductors using exothermic welding process. Protect adjacent construction elements and finishes from damage.

C. Conceal interior conductors within building finishes. Conceal exterior conductors where practical.

D. Bond exterior metal bodies on building to lightning protection system.

3.02 FIELD QUALITY CONTROL

A. Perform inspection and testing according to UL 96A.

END OF SECTION

SECTION 26 4313 – SURGE PROTECTIVE DEVICES FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 - GENERAL

1.01 APPLICABLE STANDARDS AND TESTING

A. UL 1449 – Surge Protective Devices

B. UL 1283 – Electromagnetic Interference Filters

C. UL 67 – Panelboards (UL 67 listing for internal panelboard SPD)

D. NEC 2020 – (NEC Article 242 SPD Installation practice/NEC Article 250.53 Grounding)

E. NFPA 78 – Guide on Electrical Inspections

F. ISO 9001:2015 – Quality standard

G. IEEE C62.41.1 and C62.41.2 - (System shall be designed to meet American National Standards Institute/Institute of Electrical and Electronic Engineering Inc. C62.41)

H. IEEE C62.45 2002. – (System shall be tested to meet the C62.45)

I. Category A & B – (0.5 μSEC x 100 kHz Ring Wave)

J. Category B3 Biwave – (8 x 20 μSEC at 3,000 Amperes and 1.2 x 50 μSEC at 6,000 Volts)

K. Category C3 Biwave – (8 x 20 μSEC at 10,000 Amperes and 1.2 x 50 μSEC at 20,000 Volts)

L. The fusing elements must be capable of allowing the SPD's rated single impulse current to pass through the SPD at least one time without failure. The system shall be tested to 1,000 sequential ANSI/IEEE C62.41.1 and C62.41.2 Category C3 combination wave transients. The Category C3 combination wave is defined as a 1.2 x 50 microsecond wave at 20,000-volt open circuit voltage waveform and 8 x 20 microsecond wave at 10,000-ampere short circuit current waveform. In addition, the system components shall be tested repetitively 1,000 times testing based on an IEEE C62.33 (MOV test) and C62.35 (SAD test) without failure or degradation exceeding ±10%.

M. CBEMA (ITIC) and IEC - (Computer Business Equipment Manufacturers Association or Information Technology Industry Council and International Electrotechnical Commission define clamping voltage tolerance guidelines for sensitive equipment)

1.02 SUBMITTALS

A. Must have approval fifteen days prior to bidding on project. Request for submittal must be in writing with the following items.

B. Drawings: Electrical and mechanical drawings shall be provided by the manufacturer which show unit dimensions, weights, mounting provisions, connection notes, wire size and wiring diagram.

C. Equipment Manual: The manufacturer shall furnish an installation manual with installation notes, start-up, and operating instructions for the specified system. Installation instructions shall clearly state whether the system requires an external overcurrent device to maintain the system's UL 1449 listing.

D. National Electrical Code (NEC) 242 - Installation requirements for SPD.
   1. Section 242.8, An SPD shall be a listed device (UL 1449).
   2. Section 242.10, SPD shall be marked with a short-circuit current rating and shall not be installed at a point on the system (ex. service, distribution, or branch panels) where the available fault current (AIC rating) is in excess of that rating.

E. UL 1449 stipulation for fused SPD - The manufacturer's authorized representative is required to submit the following:
   1. Certify that the SPD system is UL 1449 listed (UL Card).
   2. Indicate the type of internal or external fusing that is incorporated in the SPD system and what impact the fusing has on the performance of the device with respect to surge capacity and clamping levels.

F. CBEMA (ITIC) & IEC - SVRS must meet voltage tolerance guidelines:
   1. SVR clamp levels for wye and single phase (L-N, L-G and N-G):
      a. 400-600V for 120V systems, 800-1200V for 277V systems and 1200-1500V for 347V systems
   2. SVR clamp levels for delta circuits (L-L and L-G):
      a. 1000-1200V for 240V systems, 1500-1800V for 480V systems and 1800-2000V for 600V systems

PART 2 - PRODUCTS

2.01 SERVICE ENTRANCE/SWITCHBOARD/SWITCHGEAR

A. Acceptable Manufacturers:
   1. Current Technology
   2. LEA International Inc.
   3. Liebert
   4. Phoenix Contact
   5. General Electric
   6. OR ENGINEER-approved equal

B. Equipment shall be a multi-stage parallel protector rated for 277/480VAC, 3 PHASE, 4 WIRE, plus ground. The equipment's minimum surge current capacity shall be 400 kA per phase (L-N plus L-G) and 200 kA per mode (L-N, L-G, L-L and N-G).

C. The system protection modules shall contain a technology that utilizes a symmetrical array of balanced metal oxide varistors (MOV). Each MOV will be individually coordinated to pass UL 1449.

D. All primary transient paths shall utilize copper wire, copper bus bar and lugs of equivalent capacity to provide equal impedance interconnection between phases. No plug-in module or components shall be used in surge carrying paths.

E. Each protection module shall have a visual indicator that signifies that the protection circuitry is on line. The unit shall not be taken off line to verify integrity of system. Redundant status indicators shall be mounted on the front of the door that monitors the system protection circuitry.

F. The system shall be modular with field replaceable modules. Modular units shall contain a minimum of one module per phase.

G. Each protection module shall have a capacitive filtering system connected in each Line to Neutral (L→N)(Wye) mode or Line to Line (L→L)(Delta) mode to provide EMI/RFI noise attenuation (UL 1283).

H. Protection modes: The SPD shall provide Line to Neutral (L→N)(Wye), Line to Ground (L→G)(Wye or Delta), Line to Line (L→L)(Delta) and Neutral to Ground (N→G)(Wye) protection.

I. Service Conditions: Rate surge protective device for continuous operation under the following conditions, unless otherwise indicated:
   1. MCOV: Maximum Continuous Operating Voltage of 125% or greater
   2. Operating Temperature: 30°F to 120°F
   3. Humidity: 0 to 85 percent, noncondensing
   4. Altitude: Less than 20,000 feet above sea level

2.02 BRANCH PANEL PROTECTION

A. Acceptable Manufacturers:
   1. Current Technology
   2. LEA International Inc.
   3. Liebert
   4. Phoenix Contact
   5. General Electric
   6. OR ENGINEER-approved equal

B. Device shall meet all specification requirements in section 2.1 except as follows:
   1. Equipment shall be a multi-stage parallel protector rated for 277/480VAC, 3 PHASE, 4 WIRE, plus ground. The equipment's minimum surge current capacity shall be 120 kA per phase (L-N plus L-G) and 200 kA per mode (L-N, L-G, L-L and N-G).

C. The system protection modules shall contain a technology that utilizes a symmetrical array of balanced metal oxide varistors (MOV). Each MOV will be individually coordinated to pass UL 1449.

PART 3 - EXECUTION

3.01 INSTALLATION

A. The specified service entrance/switchboard/switchgear system shall be installed with the shortest lead length possible not to exceed five (5) electrical feet from the power conductor(s) it is protecting, must have a grounding of 25 Ohms (per NEC Article 250.53(A)(2) Exception) or less and shall avoid any unnecessary or sharp bends. Utilize a 3-pole 15-amp breaker for connection means.

B. The specified branch panelboard system shall be installed with the shortest lead length possible not to exceed a foot and half (1.5) electrical feet from the power conductor(s) it is protecting, must have a grounding of 25 Ohms (per NEC Article 250.53(A)(2) Exception) or less and shall avoid any unnecessary or sharp bends.

3.02 WARRANTY AND QUALITY ASSURANCE

A. Manufacturer shall provide a product warranty for a period of not less than five (5) years from date of installation. Warranty shall cover unlimited replacement of SPD modules during the warranty period. Those firms responding to this specification shall provide proof that they have been regularly engaged in the design, manufacturing and testing of SPD for not less than twenty-five (25) years. Utilize a 3-pole 15-amp breaker for connection means.

3.03 ACCEPTANCE

A. Manufacturer's representative shall visit site, verify installation, and submit to Contracting Officer a letter stating that equipment and installation meets intent of Contract Documents and manufacturer's warranties and that guarantees are in effect.

END OF SECTION

SECTION 26 5000 – LIGHTING

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes: Luminaires, ballasts, poles and lamps.

1.02 SUBMITTALS

B. Submit manufacturer's data for the following:
   1. Luminaires with designation as indicated on the Drawings, for each one proposed.
   2. Luminaire ballasts, for each one proposed.
   3. Lamps (type, color, wattage, etc.), for each one proposed.
   4. Light pole with accessories, including foundation details. Area light pole foundations must be designed for 80mph wind loading with 100mph wind gusts.

C. Submit manufacturer's data demonstrating compliance with Specifications and the luminaires as indicated on the Drawings.

1.03 QUALITY ASSURANCE

D. Comply with the following Codes and Standards, as well as these Specifications and Contract Documents:
   1. UL-listed and -labeled
   2. NEMA
   3. NFPA 70 (NEC)
   4. IES

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. See Plans.

2.02 MATERIALS

A. Luminaires shall be:
   1. Furnished with proper outlet boxes, hangers, hardware, supports, canopy extensions, etc. Wall mounted exterior luminaires shall be furnished with a flush {surface} mounted weatherproof box and be rated for outdoor use in wet locations.
   2. Furnished complete with lamps with wattage and voltage as indicated on the Drawings.
   3. Furnished complete with plaster frames and light tight gaskets when recessed in drywall or plaster ceilings or overhangs.
   4. Of the specified finishes and color.

B. Ballasts for luminaires with high pressure sodium lamps shall be:
   1. Autoregulator, constant wattage type (CWA) 90% pf, 18 percent maximum loss, low starting current).
   2. LPA "Peak Lead" auto transformer type, 90 percent pf, 20 percent loss, for two lamp fixtures, metallic vapor.
   3. UL listed and labeled for application.
   4. Sound rated 20 to 24db (free if magnetic hum).
   5. Isolated for vibration.
   6. Not exceed 90ºC operating temperature.

7. Meet NEMA standards and be labeled.

C. Lighting contactors:
   1. Lighting contactors shall be heavy-duty type with a 120 VAC operating coil.
   2. Unless otherwise indicated, the lighting contactor shall have a minimum of three 600V contacts with amperage rating no less than the maximum lighting circuit passing through the contactor.

D. Photocells:
   1. Photocells shall operate on 120VAC unless otherwise indicated and housed in a heavy-duty, weatherproof housing.
   2. Normally open contacts shall close at approximately 3 foot-candles and open at approximately 12 foot-candles.

E. Time clocks:
   1. Time clocks shall be 24-hour, electromechanical type with a synchronous motor and spring-driven reserve power. Power for the timeclock shall be 120VAC or as indicated on the Drawings. Contacts shall be rated 40A at 120VAC.

F. Area Lighting:
   1. Pole mounted area lights shall be furnished complete with pole, handhole, receptacle, gaskets, welded ground lug opposite the handhole, luminaire labeled approved for wet location. Luminaires shall have lamp bases coated with an inhibitor to prevent base from corroding to the socket and be solidly grounded.
   2. Where indicated, luminaires shall include a factory-installed photocell with the following features.
      a. Photocells shall operate on 120VAC unless otherwise indicated and housed in a heavy-duty, weatherproof housing.
      b. Normally open contacts shall close at approximately 3 foot-candles and open at approximately 12 foot-candles.

G. Light Poles:
   1. Light poles shall be constructed of square aluminum tubing with a flush-mounted receptacle and hinged pole base as indicated on the Drawings.

H. Exterior Lighting:
   1. Exterior luminaires shall be furnished complete with gaskets, cast aluminum weatherproof outlet boxes, labeled approved for outdoor locations, have lamp bases coated with an inhibitor to prevent base from corroding to the socket and be solidly grounded.

PART 3 - EXECUTION

3.01 INTERFERENCES

A. Contractor shall carefully examine the complete areas as well as each individual room where luminaires are to be installed, for interference with piping and other trades. Where such interferences occur, provide luminaires with proper type suspension to overcome such interferences.

3.02 INSTALLATION

A. Luminaires shall be installed parallel with walls and ground for a neat appearance. Where luminaires are indicated to be mounted on a perimeter wall, luminaires shall be installed on a flush mounted box at an elevation such that the top of fixture is flush with the top of wall.

B. Operate luminaires after installation and connection. Check for proper operation. Re-lamp luminaires that have failed lamps.

3.03 OPERATION

A. Area lights shall be controlled by a 3-position selector switch (On-Off-PC) located on the outdoor lighting control panel door.

B. Shade canopy lights shall be controlled by a light switch, location as indicated on the Drawings.

C. Lighting shall be controlled as indicated on the Drawings.

END OF SECTION

SECTION 28 3146 – FIRE DETECTION AND ALARM

PART 1 – GENERAL

1.01 SCOPE OF WORK

A. The CONTRACTOR shall furnish and install, smoke detectors, as indicated on the Drawings and specified herein.

1.02 SUBMITTALS

A. Products shall be submitted in accordance with Section 01 3300 – Submittal Procedures, and elsewhere in these Specifications and Contract Documents prior to installation.

1.03 QUALITY ASSURANCE

A. The smoke detector manufacturer's facilities shall be ISO 9001 certified.

B. All smoke detection equipment shall be listed by CSFM (California State Fire Marshall).

PART 2 – PRODUCTS

2.01 GENERAL

A. The smoke detectors shall be designed to facilitate faultless operation to minimize occurrences of false alarms due to faulty equipment, electrical transients, device faults etc.

B. Smoke detectors shall be manufactured by ADT, First Alert, Kidde, BRK or an approved equal.

C. Detectors shall be commercial grade, 120-volt powered with backup batteries.

D. Each detector shall be equipped with adjustable sensitivity.

E. Individual detectors shall be capable of being inter-connected to form a detection system as indicated on the Drawings. Vendor shall state the maximum number of devices which can be inter-connected. The detectors will be loop wired and loop signaled and provided with built-in short circuit isolation. The sounders will have the synchronization feature to ensure that all the sounders give alert.

F. Detectors shall be dual function capable of embracing both photoelectric and ionization chamber technologies.

G. Detectors shall be equipped with both visual (LED) and audible type alarm indicators.

H. Detectors shall have “inside duct” mounting capabilities.

I. Detectors shall be equipped with a cancel fault buzzer.

J. Detectors shall be equipped with fire, fault, warning, and power on lamps.

K. Detectors shall be tamper-proof.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Detectors shall be installed as indicated on the Drawings and per manufacturer's instructions.

B. When required Contractor will train and instruct client's personnel in the correct use, operation, and supervision of the system, prior to the handing over of the project.

3.02 OPERATION

A. The sounders shall have a synchronization feature to ensure that all the sounders give alert. If a fire condition is reported from a smoke detector all detectors shall annunciate the condition alarm simultaneously.

END OF SECTION

SECTION 31 0000 – EARTHWORK

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Perform all earthwork indicated and required for construction of the WORK, complete and operable in accordance with the Contract Documents and the latest Geotechnical Evaluation and or Soils Report.

1.02 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.
   1. Excavation Plan and stock pile storage sites.
   2. Backfill Plan

PART 2 - PRODUCTS

2.01 SUITABLE FILL AND BACKFILL MATERIAL REQUIREMENTS

A. General: All excavation or backfill shall conform to the requirements of the Geotechnical Engineer. Fill, backfill, and embankment materials shall be suitable selected or processed clean, fine earth, rock, or sand, free from grass, roots, brush, or other vegetation and approved by the Geotechnical Engineer.

B. Fill and backfill materials to be placed within 6 inches of any structure or pipe shall be free of rocks or unbroken masses of earth materials having a maximum dimension larger than 3 inches.

C. Suitable Materials: Materials not defined as unsuitable in the following Sections are defined as suitable materials and may be used in fills, backfilling and embankment construction subject to the indicated limitations. In addition, when acceptable to the ENGINEER, some of the material listed as unsuitable may be used when thoroughly mixed with suitable material to form a stable composite.

D. Suitable materials may be obtained from on-site excavations, or may be processed on-site materials. If the Geotechnical Engineer determines that excavated material is not suitable then additional compensation may be allowed on site processing or for import materials.

E. The following types of suitable materials are defined, unless otherwise specified in the project Geotechnical Evaluation and or Soils Report.
   1. Type A: Native soil excavated from the site after the site is stripped in accordance with these Specifications. This soil must be approved by the Geotechnical Engineer.
   2. Type B (sand backfill): Sand with 100% passing a 3/8-inch sieve, at least 90% passing a Number 4-sieve, and a sand equivalent value not less than 30.
   3. Type C (crushed rock): Crushed rock shall be imported material that consists of durable rock and gravel that is free of deleterious material and free from slaking or decomposition under the action of alternate wetting and drying. Crushed rock shall meet the following gradation requirements.

Sieve Size	Percentage Passing
1-inch	100
3/4 inch	90 - 100
No. 4	0 - 10
No. 200	0 - 2

These materials should have a durability index of not less than 40.

4. Type D (pea gravel or chat backfill): Crushed rock or gravel with 100% passing a ½-inch sieve and not more than 10% passing a Number 4-sieve.
5. Type E (coarse drain rock): Crushed rock or gravel with a Durability Index of not less than 40 meeting the following gradation requirements:

Sieve Size	Percentage Passing
2-inch	100
1½–inch	90 - 100
1-Inch	20 - 55
¾-inch	0 - 15
No. 200	0 - 3

6. Type F (aggregate base): Crushed rock/gravel aggregate base material shall be in accordance with MAG Standard Specification Section 702. Crushed rock and gravel shall conform to the following gradation as listed in MAG Standard Specification 702, Table 702-1:

Percentage by Weight Passing Sieve			
Select Material			
Sieve Size (Square Opening)	Type A	Type B	Aggregate Base
3-inch	100	-	-
1½–inch	-	100	-
1 1/4–inch	-	-	100
30-75	30-70	38-65	
20-60	20-60	25-60	
No. 30	10-40	10-40	10-40
No. 200	0-12	0-12	3-12

7. Type G (topsoil): Shall not be used.
8. Type H (cement-treated backfill): Material which consists of Type E material, which has been cement-treated so that the cement content of the material is not less than 5% by weight when tested in accordance with ASTM D2901 - Cement Content of Freshly Mixed Soil Cement. The ultimate compressive strength at 28 days shall be not less than 400 psi when tested in accordance with ASTM D1633 - Compressive Strength of Molded Soil - Cement Cylinders.
9. Type I (trench plug): Low permeable fill material, a non-dispersible clay material having a minimum plasticity index of 10.

2.02 UNSUITABLE MATERIAL

A. Unsuitable materials include the materials listed below:
   1. Soils defined as unsuitable in the Geotechnical Evaluation and or Soils Report or by the Geotechnical Engineer.
   2. Soils which, when classified under ASTM D2487 - Soils for Engineering Purposes (Unified Soil Classification System), fall in the Classifications of PT, OH, CH, MH or OL.
   3. Soils, which cannot be compacted sufficiently to achieve the density specified for the intended use.
   4. Materials that contain hazardous or designated waste materials including petroleum hydrocarbons, pesticides, heavy metals, and any material which may be classified as hazardous or toxic according to applicable regulations.

5. Soils that contain greater concentrations of chloride or sulfate ions, or have a soil resistivity or pH less than the existing on-site soils.
6. Topsoil, except as allowed below.

2.03 USE OF FILL, BACKFILL AND EMBANKMENT MATERIAL TYPES

A. The types of materials as designated herein for all required fill, backfill and embankment construction hereunder shall be used.

B. Where these Specifications conflict with the requirements of any local agency having jurisdiction or with the requirements of a pipe material manufacturer, the ENGINEER shall be immediately notified. In case of conflict between types of pipe embedment backfills, the agency-specified backfill material if that material provides a greater degree of structural support to the pipe shall be used. In case of conflict between types of trench or final backfill types, the agency-specified backfill material, if that material provides the greater in-place density after compaction shall be used.

C. Fill and backfill types shall be used in accordance with the following provisions as approved by the Geotechnical Engineer:
   1. Embankment fills shall be constructed of Type A materials, as defined herein, or of primarily Type I mixed with lesser amounts of Type A through Type H materials.
   2. Pipe zone backfill, as defined in these Specifications.
   3. Aggregate base materials under pavements shall be Type F material constructed to the thicknesses indicated. For aggregate sub-base shall be Type H material.
   4. Backfill around structures shall be Type I material or Types F or H where indicated on the plans.
   5. Backfill materials beneath structures shall be defined by the Geotechnical Engineer or as follows:
      a. Drain rock materials under hydraulic structures or other water retaining structures with underdrain systems shall be Type C material or where shown.
      b. Under concrete hydraulic structures or other water retaining structures without underdrain systems, Types C or E shall be used. Undisturbed subgrade.
      c. Under structures where groundwater must be removed to allow placement of concrete, Type E material shall be used. Before the Type E material is placed, filter fabric shall be placed over the exposed foundation.
      d. Under all other structures, Type A or F materials shall be used.
   6. Filter fabric, if not specified on the plans, shall be Mirafi 140 N, Mirafi 700X or ENGINEER-approved equal.

2.04 MATERIALS TESTING

A. All soils testing of samples submitted will be done by a testing laboratory with the ENGINEER's approval and at no additional expense. At its discretion, the ENGINEER may request that samples for testing of any material used in the work be supplied.

B. Particle size analysis of soils and aggregates will be performed using ASTM D422 - Particle-Size Analysis of Soils.

C. Determination of sand equivalent value will be performed using ASTM D2419 - Sand Equivalent Value of Soils and Fine Aggregate.

D. Unified Soil Classification System: References in this Section to soil classification types and standards shall have the meanings and definitions indicated in ASTM D2487. ASTM D2487 in the interpretation of soil classifications shall bind all applicable provisions.

PART 3 - EXECUTION

3.01 EXCAVATION

A. General: Except when specifically provided to the contrary, excavation shall include the removal of all materials of whatever nature encountered, including all obstructions of any nature that would interfere with the proper execution and completion of the WORK. The removal of said materials shall conform to the lines and grades indicated or ordered. Unless otherwise indicated, the entire construction site shall be stripped of all vegetation and debris, and such material shall be removed from the site prior to performing any excavation or placing any fill. All supports and shoring that may be required for the sides of the excavations shall be furnished, placed and maintained. Excavations shall be sloped or otherwise supported in a safe manner in accordance with applicable State and OSHA safety requirements and the requirements of OSHA Safety and Health Standards for Construction (29CFR1926).

B. Removal and Exclusion of Water: Remove and exclude water, including stormwater, groundwater, irrigation water and wastewater, from all excavations as defined in the contract.

3.02 STRUCTURE, ROADWAY, AND EMBANKMENT EXCAVATION

A. Excavation Beneath Structures and Embankments: Except where otherwise indicated for a particular structure, excavation shall be carried to the grade of the bottom of the footing or slab and prepared in accordance with the Geotechnical Evaluation and or Soils Report.

B. Excavation Beneath Paved Areas: Excavation under areas to be paved shall extend to the bottom of the aggregate base and prepared in accordance with the Geotechnical Evaluation and or Soils Report.

3.03 PIPELINE AND UTILITY TRENCH EXCAVATION

A. As referenced in these Specifications.

3.04 OVER-EXCAVATION NOT ORDERED OR INDICATED

A. Any over-excavation carried below the grade ordered or indicated, shall be backfilled and compacted to the required grade with the indicated material, in accordance with the Geotechnical Engineer’s requirements.

3.05 DISPOSAL OF EXCESS EXCAVATED MATERIAL

A. Obtain OWNER approvals for disposal of excess excavated material in a designated wasting area, as defined in the contract.

3.06 BACKFILL - GENERAL

A. Backfill shall not be dropped directly upon any structure or pipe. Backfill shall not be placed around or upon any structure until the concrete has attained sufficient strength to withstand the loads imposed.

B. Except for drainrock materials being placed in over-excavated areas or trenches, backfill shall be placed after all water is removed from the excavation and the trench sidewalls and bottom have been dried to moisture content suitable for compaction.

C. Immediately prior to placement of backfill materials, the bottoms and sidewalls of trenches and structure excavations shall have all loose sloughing, or caving soil and rock materials removed. Trench sidewalls shall consist of excavated surfaces that are in a relatively undisturbed condition before placement of backfill materials.

3.07 PLACING AND SPREADING OF BACKFILL MATERIALS

A. Backfill materials shall be placed and spread evenly in layers. When compaction is achieved using mechanical equipment, the layers shall be evenly spread so that when each layer compacted shall not exceed 6 inches in thickness. The compaction lift depth may be adjusted at the direction of the Geotechnical Engineer.

B. During spreading, each layer shall be thoroughly mixed as necessary to promote uniformity of material in each layer. Pipe zone backfill materials shall be manually spread around the pipe so when compacted the pipe zone backfill will provide uniform bearing and side support.

C. Backfill should be compacted within a water content range of 3 percent below to 3 percent above optimum.

3.08 COMPACTION OF FILL, BACKFILL AND EMBANKMENT MATERIALS

A. Each layer of Types A, B, F and G, backfill materials as defined herein, where the material is graded such that at least 10% passes a No. 4 sieve, shall be mechanically compacted to the indicated percentage of density. Equipment that is consistently capable of achieving the required degree of compaction shall be used and each layer shall be compacted over its entire area while the material is at the required moisture content.

B. Each layer of Type C, D and E backfill materials shall be compacted by means of at least 2 passes from a flat plate vibratory compactor. When such materials are used for pipe zone backfill, vibratory compaction shall be used at the top of the pipe zone or at vertical intervals of 24 inches, whichever is the least distance from the sub-grade.

C. Flooding, pending or jetting shall not be permitted.

D. Equipment weighing more than 10,000 pounds shall not be used closer to walls than a horizontal distance equal to the depth of the fill at that time. Hand operated power compaction equipment shall be used where use of heavier equipment is impractical or restricted due to weight limitations. Exception: With the written approval of the Structural Engineer.

E. Backfill around and over pipelines that is mechanically compacted shall be compacted using light, hand operated, vibratory compactors and rollers. After completion of at least 2 feet of compacted backfill over the top of pipeline, compaction equipment weighing no more than 8,000 pounds may be used to complete the trench backfill.

F. Compaction Requirements: The following compaction test requirements shall be in accordance with ASTM D1557 - Laboratory Compaction Characteristics of Soils Using Modified Effort (56,000 ft - lbf/ft3) (2,700 kN-m/m3) for Type A, B, C, E, F, and G materials and in accordance with ASTM D4253 - Maximum Index Density and Unit Weight of Soils Using a Vibratory Table, and D4254 - Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density, for Type C, D, E and H materials. Where agency, utility company, or Geotechnical Evaluation and or Soils Report requirements govern, the highest compaction standards shall apply.

Location or Use of Fill	**Percentage of Maximum Density**
Final backfill, beneath paved areas or structures	95
Final backfill, not beneath paved areas or structures	90
Embankments and fills	90
Embankments and fills beneath paved areas or structures	90
Backfill beneath structures and hydraulic structures	95
Backfill and fill around structures on reservoir or structure roof	90
Topsoil (Type G material)	80

Aggregate base or sub-base (Type F or H material)	95

3.09 FILL AND EMBANKMENT CONSTRUCTION

A. The area where a fill or embankment is to be constructed shall be cleared, grubbed, and stripped in accordance with these Specifications. Embankment and fill material shall be placed and spread evenly in approximately horizontal layers. Each layer shall be thoroughly mixed and moisture conditioned, as necessary. Unless otherwise approved by the ENGINEER, each layer shall not exceed 6 inches of compacted thickness.

B. Base keys shall be provided at the toes of all fill slopes more than 5 feet high. The keys shall be cut into underlying undisturbed soil. Keys shall be a minimum of 12 feet wide and 4 feet deep measured at the downslope side of the key. Keys shall be sloped back toward the fill slope at a gradient of no less than 2%.

C. When an embankment or fill is to be made and compacted against hillsides or slopes steeper than 4:1, the slopes shall be horizontally benched to key the embankment or fill to the underlying ground. A minimum of 12 inches normal to the slope shall be removed and re-compacted as the embankment or fill is brought up in layers. Material thus cut shall be re-compacted along with the new material. Hillside or fill slopes 4:1 or flatter shall be prepared in accordance with Paragraph A, above.

D. Where embankment or structure fills are constructed over pipelines, the first 4 feet of fill over the pipe shall be constructed using light placement and compaction equipment that does not damage the pipe. Heavy construction equipment shall maintain a minimum distance from the edge of the trench equal to the depth of the trench until at least 4 feet of fill over the pipe has been completed.

E. All permanent fill slopes shall be overbuilt by at least 1 foot and then cut to final grade to provide adequate compaction.

3.10 GRADING

A. General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross-sections, lines, and elevations indicated.
   1. Provide a smooth transition between adjacent existing grades and new grades.
   2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.

B. Site Grading: Slope grades to direct water away from buildings/structures and to prevent ponding. Finish subgrades to required elevations within the following tolerances:
   1. Lawn or Unpaved Areas: Plus or minus 1 inch
   2. Walks: Plus or minus 1 inch
   3. Pavements: Plus or minus ½-inch

3.11 FIELD TESTING

A. General: All field soils testing shall be done by a testing laboratory as specified in the Contract Documents.

B. Where soil material is required to be compacted to a percentage of maximum density, the maximum density at optimum moisture content will be determined in accordance with Method C of ASTM D1557. Where cohesionless, free draining soil material is required to be compacted to a percentage of relative density, the calculation of relative density will be determined in accordance with ASTM D4253 and D4254. Field density in-place tests will be performed in accordance with ASTM D1556 - Density and Unit Weight of Soil in Place by the Sand-Cone Method, ASTM D2922 - Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth), or by such other means acceptable to the ENGINEER.

C. In case the test of the fill or backfill show non-compliance with the required density, a remedy as may be required to insure compliance shall be accomplished. Subsequent testing to show compliance shall be performed by a testing laboratory.

D. Provide test trenches and excavations including excavation, trench support and groundwater removal for the ENGINEER's field soils testing operations. The trenches and excavations shall be provided at the locations and to the depths required by the ENGINEER.

END OF SECTION

SECTION 31 0519.16 – GEOMEMBRANE FOR EARTHWORK

PART 1 – GENERAL

1.01 REQUIREMENT

A. Furnish and install geomembrane liner with associated appurtenances in accordance with the Contract Documents.

B. Soils Report: This work shall conform to the requirements of the latest Geotechnical Evaluation and or Soils Report.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. The supply and installation of this liner shall be in accordance with the following references:

B. ASTM Standards

D413	Rubber Property – Adhesion to Flexible Substrate
D638	Tensile Properties of Plastics
D698	Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbf/ft3 (600 kN-m/m3))
D751	Coated Fabrics
D1004	Initial Tear Resistance of Plastics Film and Sheeting
D1204	Linear Dimensional Changes of Nonrigid Thermoplastic Sheeting or Film at Elevated Temperature
D1790	Brittleness Temperature of Plastic Sheeting by Impact
D2136	Coated Fabrics Low Temperature Bend Test
D4545	Determining the Integrity of Factory Seams Used in Joining Manufactured Flexible Sheet Geomembranes
D4833	Index Puncture Resistance of Geotextiles, Geomembranes and Related Products
D5199	Measuring Nominal Thickness of Geotextiles and Geomembranes
D5641	Geomembrane Seam Evaluation by Vacuum Chamber
D5721	Air-Oven Aging of Polyolefin Geomembranes
D5820	Pressurized Air Channel Evaluation of Dual Seamed Geomembranes
D5884	Determining Tearing Strength of Internally Reinforced Geomembranes
D6392	Determining the Integrity of Nonreinforced Geomembrane Seams Produced Using Thermo-Fusion Methods

C. GRI Standards:
1. GM 10 Specification for the Stress Crack Resistance of Geomembrane Sheet
2. GM 11 Accelerated Weathering of Geomembranes using a Fluorescent UVA Condensation Exposure Device
3. GM 12 Measurement of the Asperity Height of Geomembranes Using a Depth Gage

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 33 00 – Submittal Procedures.

B. Submit a panel layout indicating the containment area arrangement, fabricated seam orientation, field seam location (if applicable), anchor trench locations, wall or concrete attachments and pipe and pile locations.

1.04 QUALITY ASSURANCE

A. The manufacturer shall provide a 5-year warranty at a minimum.

PART 2 – PRODUCTS

2.01 GENERAL CHARACTERISTICS

A. The geomembrane shall be a 45 mil reinforced polypropylene material resistant to tears, UV radiation, and consistent with site climatological conditions.

B. Material Properties:

Style	**Polypropylene**	
	ASTM	Quantity
Minimum Thickness (Nominal)	D5199	45 mil
Breaking Strength (lbs) (grab tensile at strain rate of 12 in./min.)	D751	200 min 260 typ
Elongation	D751	25%
Tear Resistance (min. Ave.) lbs	D5884	100 (160)
Puncture Resistance (min. Ave.) lbs	D4833	85 (110)
Low Temperature Impact Resistance	D2136	-40°F
Linear Dimensional Change	D1204	1.0%
Hydrostatic Resistance (psi)	D751	450 typ

C. Field Seam Properties:

Style	**Polypropylene**	
	ASTM	Quantity
Bonded Seam Strength (lbs)	D751	200
Peel Adhesion (lbs)	D413	20

D. Non-Woven Geotextile: Geotextile shall be made of staple filaments of polypropylene fiber and shall be needle-punched and heat set. The geotextile shall be heavyweight with minimum weight of 16 oz/ square yard.

PART 3 – EXECUTION

3.01 SURFACE PREPARATION

A. The contractor shall be responsible for preparing and maintaining the subgrade surface and anchor trenches in good condition suitable for laying of the geomembrane. Prepared surfaces shall be smooth and free of sharp objects, rocks, and organics (roots). If a suitable subgrade is not available then a cushion layer consisting of 100 mm (4 inches) of clean sand or a non-woven geotextile shall be placed prior to liner placement. For membrane installed on top of concrete or hard surfaces, non-woven geotextile shall be placed between the concrete/ hard surface and the membrane. Geotextile shall be per manufacturer requirements or recommendations in order to conform with the membrane's warranty.

B. The prepared subgrade should be compacted to a minimum 95% of maximum dry density according to the Standard Proctor test (ASTM D698) or as designated in the Geotechnical Evaluation and or Soils Report. The subgrade shall be firm and unyielding, and shall be compacted to a level that permits the movement of construction equipment, liner deployment equipment, and other related traffic without causing rutting and/or deformation of the surface.

C. The surface shall be leveled and prepared to a uniform finish free of abrupt or sharp changes in grade. The surface shall not include pockets or voids of any kind and should not be rutted or contain soil windrows along the surface. In addition, the surface should

be free of frost lumps and ice. The prepared subgrade should also be shaped and graded to facilitate surface drainage both prior to, and during the installation of the lining system.

D. All concrete surfaces to which the liner will attach shall have a “smooth trowel” finish and shall be level, smooth, and have all corners radiused to a minimum 25 mm (1 inch).

3.02 INSTALLATION

A. Installations shall be performed in a logical sequence by a contractor/installer experienced in this type of work.

B. The liner panels shall be installed in accordance with the manufacturer’s instructions.

END OF SECTION

SECTION 31 1000 – SITE CLEARING AND GRUBBING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The WORK of this Section as defined in the Contract includes all work necessary to satisfactorily prepare the site as shown on the accepted drawings and as specified herein. Following this preparation, the site shall be in such a condition as to easily continue with the next operation whether it be excavating, backfilling, or any other operations that are a part of the project. Site preparation includes clearing, grubbing, grading, tree and shrub removal, native grass stripping and removing and disposing of all debris within the limits of the project and such other areas as may be indicated on the plans or required work, except such objects as are designated to remain or are to be removed in accordance with the plans. This work shall also include the preservation from injury or defacement of all vegetation and objects designated to remain.

1.02 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 33 00 – Submittal Procedures.

B. Shop Drawings: Submit clearing limits, staging, and site access plans and limits.

1.03 SITE SURVEY AND LAYOUT

A. The CONTRACTOR shall establish construction, and clearing limits by providing the initial site survey and field staking. The initial staking will include property line limits, casements and access points and structure locations with 100 ft offsets. The OWNER shall provide the contractor the survey data for the project to include the survey control points, hubs, etc. and benchmarks for the site. The contractor shall layout required construction staking as defined in these Specifications.

1.04 PERMITS

A. Verify all required permits have been secured for this work. Comply with applicable local Air Pollution Control requirements. In the absence of specific ordinances, periodic watering shall be done to control dust throughout the work. Make all necessary arrangements for water required for this work.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.01 PRIMARY SITE ACCESS

A. The CONTRACTOR shall provide clearing, grubbing, and stripping as defined in the contract.

B. The CONTRACTOR shall develop any necessary access to the Site, including access entrance barriers to prohibit entry of unauthorized persons as defined in the Contract. The contractor shall provide at the project site access barriers to prohibit entry of unauthorized persons as defined in the Contract.

C. Adequately support existing structures, sidewalks, slabs, pavements, utilities, and other facilities that may be affected by the proposed construction as defined in the Contract.

D. Utility Interference: Where existing utilities interfere with the WORK, notify the utility owner before proceeding in accordance with the General Conditions.

3.02 CLEARING, GRUBBING AND STRIPPING

A. Areas to be developed should be cleared of all surface and subsurface deleterious materials including debris, shrubs, and associated roots. Excavations extending below the planned finished site grades should be cleaned and backfilled with suitable material compacted to the recommendations stated in these Specifications.

B. Following clearing, the site should be striped to remove surface organic materials. Organics should be stripped from the ground surface to a depth of at least 2 to 3 inches below the surface of the organics. It may be acceptable to disk the near surface organics and blend them with the onsite soils. A geotechnical engineer should be retained to review the surface conditions prior to site grading.

C. Site should be cleared of structures, pavement, sidewalks, concrete or masonry debris, trees, logs, upturned stumps, loose boulders, and any other objectionable material of any kind which would interfere with the performance or completion of the WORK, create a hazard to safety, impair the subsequent usefulness of the WORK, or obstruct its operation. Trees and other natural vegetation outside the actual lines of construction shall be protected from damage during construction.

D. Septic tanks, drain fields, connection lines, and any other underground structures, debris, or waste shall be removed if found on the Site. All objectionable material from the clearing and grubbing process shall be removed from the Site and wasted in approved safe locations.

E. Geotechnical engineer shall be retained to view the surface conditions prior to the site grading.

3.03 OVER-EXCAVATION, REGRADING, AND BACKFILL UNDER FILL AREAS

A. All grading and excavation shall conform to the requirements of these Specifications.

3.04 EXISTING UTILITY SERVICES

A. At start of work, CONTRACTOR shall locate and identify all utility services located within the construction limits (both underground and overhead). Utilize Blue Stake services and private location services as required, including potholing as may be necessary.

B. CONTRACTOR shall disconnect or reroute all existing services, where such services will be affected by construction operations. Comply with all instructions issued during the pre-construction conference regarding coordination, advance notice, emergency repairs, etc.

C. All disconnections or terminations shall be performed in a safe manner, in accordance with applicable codes and regulations. Provide any disconnect switches, valves, plugs, tees, etc., as required for the various locations.

END OF SECTION

SECTION 31 2319 – DEWATERING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall dewater all excavations, as required to complete the work in accordance with the Contract Documents. The CONTRACTOR shall secure all necessary permits to complete the requirements of this Section of the Specifications and any and all Federal, State, or local applicable requirements.

B. Soils Report: This work shall conform to the requirements of the latest Geotechnical Evaluation and Groundwater Hydrogeological Reports.

1.02 CONTRACTOR SUBMITTALS

A. Prior to commencement of excavation, the CONTRACTOR shall submit a detailed plan and operation schedule for dewatering of excavations. The CONTRACTOR may be required to demonstrate the system proposed and to verify that adequate equipment, personnel, and materials are provided to dewater the excavations at all locations and times. The CONTRACTOR's dewatering plan is subject to review by the ENGINEER. This includes all means, methods and required approval of the disposal of the water being removed.

1.03 QUALITY CONTROL

A. It shall be the sole responsibility of the CONTRACTOR to control the rate and effect of the dewatering in such a manner as to avoid all objectionable settlement and subsidence.

B. All dewatering operations shall be adequate to assure the integrity of the finished project and shall be the responsibility of the CONTRACTOR.

C. Where critical structures or facilities exist immediately adjacent to areas of proposed dewatering, reference points shall be established and observed at frequent intervals to detect any settlement that may develop. The responsibility for conducting the dewatering operation in a manner that will protect adjacent structures and facilities rests solely with the CONTRACTOR. The cost of repairing any damage to adjacent structures and restoration of facilities shall be the responsibility of the CONTRACTOR.

PART 2 - PRODUCTS

2.01 EQUIPMENT

A. Dewatering, where required, may include the use of well points, sump pumps, temporary pipelines for water disposal, rock or gravel placement, and other means. Standby pumping equipment shall be maintained on the jobsite.

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS

A. The CONTRACTOR shall provide all permits and equipment necessary for dewatering. It shall have on hand, at all times, sufficient pumping equipment and machinery in good working condition and shall have available, at all times, competent workmen for the operation of the pumping equipment. Adequate standby equipment shall be kept available at all times to insure efficient dewatering and maintenance of dewatering operation during power failure.

B. Dewatering for pipelines shall commence when groundwater is first encountered, and shall be continuous until such times as water can be allowed to rise in accordance with the provisions of this Section or other requirements.

C. At all times, site grading shall promote drainage. Surface runoff shall be diverted from excavations. Water entering the excavation from surface runoff shall be collected in shallow ditches around the perimeter of the excavation, drained to sumps, and be pumped or drained by gravity from the excavation to maintain a bottom free from standing water.

D. Dewatering shall at all times be conducted in such a manner as to preserve the undisturbed bearing capacity of the subgrade soils at proposed bottom of excavation.

E. If foundation soils are disturbed or loosened by the upward seepage of water or an uncontrolled flow of water, the affected areas shall be excavated and replaced with drain rock (Type E).

F. The CONTRACTOR shall maintain the water level below the bottom of excavation in all work areas where groundwater occurs during excavation construction, backfilling, and up to acceptance.

G. The CONTRACTOR shall prevent flotation by maintaining a positive and continuous removal of water. The CONTRACTOR shall be fully responsible and liable for all damages that may result from failure to adequately keep excavations dewatered.

H. If well points or wells are used, they shall be adequately spaced to provide the necessary dewatering and shall be sand-packed and/or other means used to prevent pumping of fine sands or silts from the subsurface. A continual check by the CONTRACTOR shall be maintained to ensure that the subsurface soil is not being removed by the dewatering operation.

I. The CONTRACTOR shall dispose of water from the WORK in a suitable manner without damage to adjacent property. CONTRACTOR shall be responsible for obtaining any permits that may be necessary to dispose of water. No water shall be drained into work built or under construction without prior consent of the OWNER and ENGINEER. Water shall be filtered using an approved method to remove sand and fine-sized soil particles before disposal into any drainage system.

J. The release of groundwater to its static level shall be performed in such a manner as to maintain the undisturbed state of the natural foundation soils, prevent disturbance of compacted backfill and prevent flotation or movement of structures, pipelines, and sewers.

K. All temporary dewatering measures shall be removed when they are no longer needed.

END OF SECTION

SECTION 31 2333 – TRENCHING AND BACKFILLING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Section Includes: Trench excavation, fine grading, pipe bedding, backfilling, and compaction for the following, including requirements for ditch crossings:
   1. Pipe and electrical conduits.
   2. Manholes, valves, or other accessories.
   3. Potable and non-potable water pipe appurtenances.

B. Soils Report: This work shall conform to the requirements of the latest Geotechnical Evaluation.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Products Data: For all proposed bedding and backfill materials as defined in these Specifications.
   1. Material source
   2. Gradation
   3. Testing data

PART 2 - PRODUCTS

2.01 MATERIALS

A. General:
   1. The following types of suitable materials are defined, unless otherwise specified by the Geotechnical Evaluation.
   2. Provide material having maximum particle size not exceeding 2 inches and that is free of leaves, grass, roots, stumps, and other organic matter.
   3. Materials derived from processing demolished or removed asphalt concrete are not acceptable.

2.02 UNSUITABLE MATERIAL

A. Unsuitable materials include the materials listed below:
   1. Soils as defined unsuitable in the Geotechnical Evaluation or by the Geotechnical Engineer.
   2. Soils which, when classified under ASTM D2487 - Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System), fall in the Classifications of PT, OH, CH, MH or OL.
   3. Soils, which cannot be compacted sufficiently to achieve the density specified for the intended use.
   4. Materials that contain hazardous or designated waste materials including petroleum hydrocarbons, pesticides, heavy metals, and any material which may be classified as hazardous or toxic according to applicable regulations.
   5. Soils that contain greater concentrations of chloride or sulfate ions, or have a soil resistivity or pH less than the existing on-site soils.
   6. Topsoil, except as allowed below.

2.03 USE OF FILL, BACKFILL

A. Where these Specifications conflict with the requirements of any local agency having jurisdiction or with the requirements of a pipe material manufacturer, the ENGINEER shall be immediately notified. In case of conflict between types of pipe embedment backfills, the agency-specified backfill material if that material provides a greater degree of structural support to the pipe shall be used. In case of conflict between types of trench or final backfill types, the agency-specified backfill material, if that material provides the greater in-place density after compaction shall be used.

B. Fill and backfill types shall be used in accordance with the following provisions:
   1. Pipe zone backfill shall consist of the following materials for each pipe material listed below.
      a. Mortar coated pipe, concrete pipe and un-coated ductile iron pipe shall be provided Type C or D pipe bedding and embedment backfill material.
      b. Coal tar enamel coated pipe, polyethylene encased pipe, tape wrapped pipe and other non-mortar coated pipe shall be backfilled with Type B bedding and embedment zone backfill material.
      c. Plastic pipe shall be backfilled with Type B, C, or D bedding and embedment zone backfill material.
      d. Where pipelines are installed on grades exceeding 4%, and where backfill materials are graded such that there is less than 10% passing a Number 4 sieve, trench plugs of Type H or I material shall be provided at maximum intervals of 200 feet unless indicated otherwise.
   2. Allowable trench backfill materials for pipelines as defined under the MAG Standards and Specifications.

2.04 MATERIALS TESTING

A. As defined in these Specifications.

PART 3 - EXECUTION

3.01 PREPARATION

A. General:
   1. All utility piping shall be field surveyed for location of pipe runs and joints prior to backfilling.
   2. Before laying pipes or electrical conduits in fill, place fill and compact it to not less than 1 ft above top of pipe or conduit.

3. After placing and compacting fill, excavate through fill and fine grade as required in this Section.

B. Protection: Stabilize excavation as required by OSHA or local standards, whichever is more stringent.

3.02 EXCAVATION AND GRADING

A. Exploratory Excavation:
   1. Excavate and expose buried points of connection to existing utilities where indicated on the Drawings. Excavation shall be performed prior to preparation of Shop Drawings for connections and before fabrication of pipe, and the data obtained shall be used in preparing Shop Drawings.
   2. Data, including dates, locations excavated, and sketches, shall be submitted to the ENGINEER within one week of excavation.
   3. Damage to utilities from excavation activities shall be repaired at the CONTRACTOR's expense.

B. Trench Excavation:
   1. General Requirements:
      a. If, because of soil conditions, safety requirements or other reasons, trench width at top of pipe is increased beyond width specified in the MAG Standards and Specifications, upgrade laying conditions or install stronger pipe designed in conformance with the appropriate pipe specification section for the increased trench width, without additional cost.
      b. Pipe and Electrical Conduits:
         1) Lay pipe or electrical conduits in open trench.
         2) If bottom of excavation is found to consist of rock or any material that by reason of its hardness cannot be excavated to provide uniform bearing surface, remove such rock or other material to a depth of not less than 4 inches below bottom of pipe and refill to grade with aggregate base course material or sand placed at uniform density, with minimum possible compaction, at no additional cost.
         3) If bottom of excavation is found to consist of soft or unstable material which is incapable of properly supporting pipe, remove such material to a depth and for the length required, as determined by the ENGINEER, and then refill trench to grade with aggregate base course or sand, compacted to 90 percent of maximum density.
         4) Where indicated on the Drawings, cradle pipe in concrete.
      c. For Manholes, Valves, or Other Accessories:
         1) Provide excavations sufficient to leave at least 12 inches clear between their outer surfaces and embankment or shoring which may be used to hold banks and protect them.
         2) Do not backfill with earth under manholes, vaults, tanks, or valves.
         3) Fill any unauthorized excess excavation below elevation indicated on the Drawings for foundation of any structure with sand, aggregate base material, bedding material, or concrete at no additional cost.
         4) Backfilling of Manhole Excavation: Conform to backfilling requirements as specified for pipe and utility trench backfill in this Section.
      d. Potable and Non-Potable Water Pipe Appurtenances:
         1) Lay in trenches separate from those used for sewers.
         2) Unless otherwise specified or indicated on the Drawings, lay in trenches having cover of not less than 3 feet below surface of ground and located at distance of not less than 6 feet from any parallel sewer trench, or as required by local requirements.

e. At Road Crossings or Existing Driveways:
   1) Make provision for trench crossings at these points, either by means of backfills, tunnels, or temporary bridges.

C. Trench Fine Grading:
   1. For Pipes 16 Inches in Nominal Diameter and Under:
      a. Unless otherwise specified, accurately grade bottom of trench to provide uniform bearing and support for each section of pipe, on undisturbed soil at every point along pipe's entire length, except for portions of pipe where it is necessary to excavate for bells and for proper sealing of pipe joints.
   2. For Pipe over 16 Inches in Diameter:
      a. Over-excavate bottom of trench by at least 4 inches, or 1/12 outside diameter of pipe, whichever is greater.
      b. Fill overcut with bedding material specified herein, and fine graded as specified above.
      c. Place bedding material at uniform density, with minimum possible compaction.
      d. Where trench excavation is below grade of bedding material, restore trench bottom to proper grade by backfilling and compacting backfill to 95 percent of maximum density, at no additional cost. Use bedding material as specified in this Section.
   3. Bell or Coupling Holes:
      a. Dig holes after trench bottom has been graded.
      b. Provide holes of sufficient width to provide ample room for grouting, banding, or welding.
      c. Excavate holes only as necessary in making joints and to ensure that pipe rests upon prepared trench bottom and not supported by any portion of the joint.
   4. Depressions for Joints, Other than Bell and spigot:
      a. Make in accordance with recommendations of joint manufacturer for particular joint used.

3.03 DISPOSAL OF EXCESS EXCAVATED MATERIAL

A. Obtain OWNER approvals for disposal of excess excavated material in designated wasting area, as defined in the contract.

3.04 BACKFILL - GENERAL

A. Backfill shall not be dropped directly upon any pipe. Backfill shall not be placed around or upon any structure until the concrete has attained sufficient strength to withstand the loads imposed.

B. Except for drainrock materials being placed in over-excavated areas or trenches, backfill shall be placed after all water is removed from the excavation and the trench sidewalls and bottom have been dried to moisture content suitable for compaction.

C. If a moveable trench shield is used during excavation, pipe installation and backfill operations, the shield shall be moved by lifting the shield free of the trench bottom or backfill and then moving the shield horizontally. No trench shields shall be dragged along the trench causing damage or displacement to the trench sidewalls, the pipe, or the bedding and backfill.

D. Immediately prior to placement of backfill materials, the bottoms and sidewalls of trenches and structure excavations shall have all loose sloughing, or caving soil and rock materials removed. Trench sidewalls shall consist of excavated surfaces that are in a relatively undisturbed condition before placement of backfill materials.

3.05 PLACING AND SPREADING OF BACKFILL MATERIALS

A. During spreading, each layer shall be thoroughly mixed as necessary to promote uniformity of material in each layer. Pipe zone backfill materials shall be manually spread

around the pipe so when compacted the pipe zone backfill will provide uniform bearing and side support.

B. Where the backfill material moisture content is below the optimum moisture content, water shall be added before or during spreading until the moisture content is between optimum and 3% over the optimum.

C. Where the backfill material moisture content is too high to permit the specified degree of compaction the material shall be dried until the moisture content is between optimum and 3% over the optimum.

3.06 COMPACTION OF FILL, BACKFILL AND EMBANKMENT MATERIALS

A. Compaction Requirements: Backfill compaction requirements shall be per the Geotechnical Evaluation and or Soils Report and per MAG Standards and Specifications.

3.07 PIPE AND UTILITY TRENCH BACKFILL

A. Pipe Zone Backfill:
   1. The pipe zone is defined as that portion of the vertical trench cross-section lying between a plane below the bottom surface of the pipe and a plane at a point above the top surface of the pipe. The bedding is defined as that portion of pipe zone backfill material between the trench sub-grade and the bottom of the pipe. The embedment is defined as that portion of the pipe zone backfill material between the bedding and a level line.
   2. After compacting the bedding, perform a final trim using a laser or approved method for establishing grade, such that each pipe section when first laid will be continually in contact with the bedding along the extreme bottom of the pipe. Excavation for pipe bells and welding shall be made as required.
   3. The pipe zone shall be backfilled with the indicated backfill material. Care to prevent damage to the pipeline coating, cathodic bonds, and the pipe itself during the installation and backfill operations shall be exercised.
   4. If a moveable trench shield is used during backfill operations, the shield shall be lifted to a location above each layer of backfill material prior to compaction of the layer. The pipe or backfill shall not be displaced while the shield is being moved.

B. Trench Zone Backfill: After the pipe zone backfills have been placed, backfilling of the trench zone may proceed. The trench zone is defined as that portion of the vertical trench cross-section lying as indicated between a plane above the top surface of the pipe and a plane at a point, 18 inches below the finished surface grade, or if the trench is under pavement, 18 inches below the roadway sub-grade.

C. Final Backfill: Final backfill is all backfill in the trench cross-sectional area within 18 inches of finished grade, or if the trench is under pavement, all backfill within 18 inches of the roadway sub-grade.

3.08 FIELD QUALITY CONTROL

A. Tests:
   1. Confirmation Tests:
      a. CONTRACTOR’s Responsibilities:
         1) Accomplish specified compaction of trench backfill.
         2) Control operations by confirmation tests to verify and confirm that compaction work complies, and is complying at all times, with requirements specified in this Section concerning compaction, control, and testing.
         3) All field soils testing will be done by a testing laboratory as specified in the Contract Documents.
         4) Copies of Confirmation Test Reports: Submit promptly to the ENGINEER.
      b. Frequency of Confirmation Testing:

1) Perform testing not less than as follows:
   a) For Trenches: At each test location include tests for each type or class of backfill from bedding to finish grade.
   b) In Open Fields: Two every 1,000 linear feet.
   c) Along Dirt or Gravel Road or off Traveled Right-of-way: Two every 500 linear feet.
   d) Crossing Paved Roads: Two locations along each crossing.
   e) Under Pavement Cuts or Within 2 Feet of Pavement Edges: one location every 400 linear feet.

2. Compliance Tests:
   a. Frequency of Testing: Periodic compliance tests will be made by the
      1) ENGINEER to verify that compaction is meeting requirements previously specified.
   b. If Compaction Fails to Meet Specified Requirements: Perform remedial work by one of the following methods:
      1) Remove and replace backfill at proper density.
      2) Bring density up to specified level by other means acceptable to the ENGINEER.
   c. Retesting:
      1) Costs of Retesting: Costs of retesting required to confirm and verify that remedial work has brought compaction within specified requirements shall be borne by the CONTRACTOR.
      2) CONTRACTOR's Confirmation Tests During Performance of Remedial Work:
         a) Performance: Perform tests in manner acceptable to the ENGINEER.
         b) Frequency: Double amount specified for initial confirmation tests.

2. Leak Testing Pipe:
   a. After Bedding the Pipe, CONTRACTOR Has the Following Option To:
      1) Leak-test pipe.
      2) Backfill to surface, at his own risk, before leak water-testing pipe. If pipe does not pass test, uncover pipe, locate leaks, repair, and retest, repeating until pipe section under test passes.

END OF SECTION

SECTION 31 2524 – ROCKFALL BARRIER

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall furnish all labor, materials, equipment, and supervision necessary to provide and install a 10 ft high rockfall barrier at the locations shown in the Contract Documents. The barrier shall be designed to stop a 3 ft diameter boulder under the site specific geological and slope conditions.

B. Soils Report: This work shall conform to the requirements of the latest Geotechnical Evaluation.

C. Acceptable manufacturers include Geobrugg, Walcoom, or Engineer Approved Equal.

1.02 CONTRACTOR SUBMITTALS

A. The CONTRACTOR shall submit a complete design package for the proposed rockfall barrier system including design calculations, manufacturer data sheets, structural details, connection hardware, post embedment details, anchor layout, foundation requirements, installation procedures, and certification by a licensed professional engineer registered in the State of Arizona.

B. Shop drawings shall include plan view, elevation view, barrier height, net type, mesh size, post spacing, anchorage components, energy absorption rating, and all appurtenances.

C. The CONTRACTOR shall provide product certification that the barrier system meets or exceeds the required impact-energy performance and dimensional requirements.

1.03 QUALITY CONTROL

A. The CONTRACTOR shall be responsible for ensuring all barrier materials and installation procedures comply with manufacturer requirements and project specifications.

B. Anchorage drilling, grouting, foundation preparation, post installation, mesh tensioning, and all associated work shall be performed by personnel familiar with the installation.

C. All barrier components shall be inspected prior to installation. Damaged or defective materials shall not be incorporated into the WORK.

PART 2 - PRODUCTS

2.01 GENERAL

A. The rockfall barrier system shall be a modular, engineered, flexible net barrier consisting of vertical support posts, base plates or footings, mesh panels, lateral support cables, top and bottom support cables, and anchor assemblies.

B. The system shall be capable of resisting the required impact energy determined from site conditions and the design boulder size.

C. Barrier height shall be 10 ft measured from finished grade at the base of the posts.

D. Mesh shall be high tensile steel wire rope mesh, ring net, or equivalent system approved by the ENGINEER. Mesh shall be corrosion resistant and shall include all required connection and fastening components.

E. Concrete for footings, if required, shall conform to Section 03 30 00.

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS

A. The CONTRACTOR shall verify all field conditions, including grades, slope geometry, obstructions, and subsurface conditions prior to installation. Any discrepancies shall be reported to the ENGINEER.

B. Install rockfall barrier components in accordance with manufacturer instructions and the approved submittals.

C. All disturbed areas shall be restored to preconstruction conditions.

END OF SECTION

SECTION 31 3700 – RIP-RAP

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The WORK includes excavation, grading, and installation of riprap, boulders, soil riprap, and bedding placed at the locations shown on the DRAWINGS. The materials to be used and the construction of such structures shall be as specified herein.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Reference Standards:
   1. American Association of State Highway and Transportation Officials (AASHTO):
      a. T85, Standard Method of Test for Specific Gravity and Absorption of Coarse Aggregate.
      b. T96, Standard Method of Test for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
      c. T103, Standard Method of Test for Soundness of Aggregates by Freezing and Thawing.
      d. T104, Standard Method of Test for Soundness of Aggregate by Use of Sodium Sulfate or Magnesium Sulfate.
      e. T248, Reducing Field Samples of Aggregate Test Size.
   2. ASTM International (ASTM): D698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbf/ft3 (600 kN-m/m3)).

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. CONTRACTOR shall submit certified laboratory test certificates for all items required in this section.

PART 2 – PRODUCTS

2.01 MATERIALS

A. Riprap
   1. Riprap used shall be the type designated on the drawings and shall conform to the following:

Riprap Designation	% Smaller than Given Size by Weight	Intermediate Rock Dimension (inches)	d_{50}* (inches)
Type VL	70 - 100 50 - 70 35 - 50 2 - 10	12 9 6 2	6**
Type L	70 - 100 50 - 70 35 - 50 2 - 10	15 12 9 3	9**
Type M	70 - 100 50 - 70 35 - 50 2 - 10	21 18 12 4	12**

Riprap Designation	% Smaller than Given Size by Weight	Intermediate Rock Dimension (inches)	d_{50}* (inches)
Type H	70 - 100 50 - 70 35 - 50 2 - 10	30 24 18 6	18
Type VH	70 - 100 50 - 70 35 - 50 2 - 10	41 33 24 9	24

*d_{50} = Mean Particle Size
**Mix VL, L and M riprap with 35% topsoil (by volume) and bury it with 4 to 6 inches of topsoil, all vibration compacted, and revegetate.

2. The riprap minimum thickness shall be 1.5 times the maximum aggregate diameter for d_{50} of 15 inches or less; 1.2 times the maximum aggregate size for d_{50} greater than 15 inches.

D_{50} (in)	D_{max} (in)	Minimum Blanket Thickness (in)
4	6	9
6	9	14
9	14	20
12	18	27
15	22	32
18	27	32
21	32	38
24	36	43

3. Neither width nor thickness of a single stone of riprap shall be less than one-third (1/3) of its length.
4. The specific gravity of the riprap shall be two and one-half (2.5) or greater.
5. Riprap specific gravity shall be according to the bulk-saturated, surface-dry basis, in accordance with AASHTO T85.
6. The bulk density for the riprap shall be 1.3 ton/cy or greater.
7. The riprap shall have a percentage loss of not more than forty percent (40%) after five hundred (500) revolutions when tested in accordance with AASHTO T96.
8. The riprap shall have a percentage loss of not more than ten percent (10%) after five (5) cycles when tested in accordance with AASHTO T104 for ledge rock using sodium sulfate.
9. The riprap shall have a percentage loss of not more than ten percent (10%) after twelve (12) cycles of freezing and thawing when tested in accordance with AASHTO T103 for ledge rock, procedure A.
10. Rock shall be free of calcite intrusions.
11. Gradation:
    a. Each load of riprap shall be reasonably well graded from the smallest to the largest size specified.
    b. Stones smaller than the two to ten percent (2 to 10%) size will not be permitted in an amount exceeding ten percent (10%) by weight of each load.
    c. Control of gradation shall be by visual inspection. However in the event ENGINEER determines the riprap to be unacceptable, ENGINEER shall pick two (2) random truckloads to be dumped and checked for gradation.
        1) Mechanical equipment and labor needed to assist in checking gradation shall be provided by CONTRACTOR at no additional cost.

12. Color:
    a. The color of the riprap shall be gray with gray/blue hues or other acceptable colors approved by ENGINEER prior to delivery to the PROJECT site.
    b. Color shall be consistent on the entire PROJECT and shall match the color of rock to be used for all other portions of the WORK.
13. Broken concrete or asphalt pavement shall not be acceptable for use in the WORK.

B. BOULDERS

1. Boulders used shall be the type designated on the DRAWINGS and shall conform to the following:

Boulder Classification	Nominal Size (inches)	Range in Smallest Dimension of Individual Rock Boulders (inches)	Maximum Ratio of Largest to Smallest Rock Dimension of Individual Boulders
B18	18	17-20	1.50
B24	24	22-26	1.50
B30	30	28-32	1.50
B36	36	34-38	1.50
B42	42	40-44	1.50
B48	48	45-51	1.50

2. The specific gravity of the boulders shall be two and one-half (2.5) or greater.
3. Boulder specific gravity shall be according to the bulk-saturated, surface-dry basis, in accordance with AASHTO T85.
4. The bulk density for the boulder shall be 1.3 ton/cy or greater.
5. The boulders shall have a percentage loss of not more than forty percent (40%) after five hundred (500) revolutions when tested in accordance with AASHTO T96.
6. The boulders shall have a percentage loss of not more than ten percent (10%) after five (5) cycles when tested in accordance with AASHTO T104 for ledge rock using sodium sulfate.
7. The boulders shall have a percentage loss of not more than ten percent (10%) after twelve (12) cycles of freezing and thawing when tested in accordance with AASHTO T103 for ledge rock, procedure A.
8. Rock shall be free of calcite intrusions.
9. Color:
    a. The color of the boulders shall be gray with gray/blue hues or other acceptable colors approved by ENGINEER prior to delivery to the PROJECT site.
    b. Color shall be consistent on the entire PROJECT and shall match the color of rock to be used for all other portions of the WORK.

C. SOIL RIPRAP

1. Rock requirements are to comply with riprap as specified in Article Materials.
2. The soil material shall be native or topsoil and mixed with sixty-five percent (65%) riprap and thirty five percent (35%) soil by volume.
3. Soil riprap shall consist of a uniform mixture of soil and riprap without voids.

D. BEDDING:

1. Gradation for Granular Bedding:

Percent by Weight Passing Square-Mesh Sieves		
U.S. Standard Sieve Size	**Type I**	**Type II**
3 inches	-	90-100
1 ½ inches	-	-
¾ inches	-	20-90
3/8 inches	100	-
No. 4	95-100	0-20
No. 16	45-80	-
No. 50	10-30	-
No. 100	2-10	-
No. 200	0-2	0-3

2. Granular bedding designation and total thickness of bedding shall be as follows.

	Minimum Bedding Thickness (in)		
	Fine Grained Soils		**Course Grained Soils**
Rip-rap Designation	**Type I**	**Type II**	**Type II**
VL, L	4	4	6
M	4	4	6
H	4	6	8
VH	4	6	8

May substitute one 12-inch layer of Type II bedding.

Fifty percent or more by weight retained on the #40 sieve.

[3] Granular bedding shall meet the same requirements for specific gravity, absorption, abrasion, sodium sulfate soundness, calcite intrusion, and freeze-thaw durability as required for riprap.

a. Broken concrete asphalt pavement or sledge, shall not be acceptable for use in the WORK. Rounded river rock is not acceptable unless specifically designated on the DRAWINGS.
b. The requirements for the wear test in AASHTO T96 shall not apply.

E. FEATURE BOULDERS:

1. Feature Boulders shall consist of the same material as boulders, differing only by size.
2. Feature Boulders shall meet the same requirements for specific gravity, absorption, abrasion, sodium sulfate soundness, calcite intrusion, and freeze-thaw durability as required for boulders
3. Feature Boulders shall have a minimum dimension of four (4) feet, or as shown on the DRAWINGS.

F. NON-WOVEN GEOTEXTILE FILTER:

1. Where called out in the DRAWINGS, A nonwoven geotextile filter (aka Filter fabric, geotextile liner, filter cloth) shall be installed according to manufacturer's requirements and shall have properties as identified below:

Aggregate Size (In)	Grab Tensile Strength (min) ASTM D4632 (lbs)	Trapezoidal Tear Strength (min) ASTM D4533 (lbs)	Puncture Strength (min) ASTM D4833 (lbs)	Mullen Burst Strength (min) ASTM D4833 (lbs)	Permittivity ASTM D4491 (1/s)	Apparent Opening Size (max) ASTM D4751 (mm)
<16	200	75	75	200	0.5	0.21
16-24	270	100	100	400	0.5	0.21
>24	AS DIRECTED BY ENGINEER					

G. GABION:

1. Gabions shall be made of hexagonal triple twist mesh with heavily galvanized steel wire. The maximum linear dimension of the mesh opening shall not exceed 4 ½ inches and the area of the mesh opening shall not exceed 10 square inches.
2. Gabions shall be fabricated in such a manner that the sides, ends, and lid can be assembled at the construction site into a rectangular basket of the specified sizes. Gabions shall be of single unit construction and shall be installed according to manufacturer's recommendations.
3. The area on which the gabion is to be installed shall be graded as shown on the drawings. Foundation conditions shall be the same as for placing rock riprap, and filter cloth shall be placed under all gabions. Where necessary, key, or tie, the structure into the bank to prevent undermining of the main gabion structure.

PART 3 – EXECUTION

3.01 PREPARATION

A. Channel slope, bottom, or other areas that are to be protected with riprap, boulders or soil riprap shall be free of brush, trees, stumps, and other objectionable material and be graded to a smooth compacted surface as shown on the DRAWINGS.

B. CONTRACTOR shall excavate areas to receive riprap to the subgrade as shown on the DRAWINGS accounting for granular bedding.

C. CONTRACTOR shall excavate areas to receive boulders or soil riprap to the specified depth (bedding material is not required for boulders and soil riprap).

D. Subgrade Materials:

1. The subgrade materials shall be stable.
2. If unsuitable materials are encountered, they shall be removed and replaced in accordance with Section 02200 – Earthwork, for subgrade that has been excavated in undisturbed soil.

E. Additional Compaction:

1. Additional compaction shall not be required unless specified by ENGINEER.
2. When subgrade is built up with embankment material it shall be compacted to ninety five percent (95%) maximum density (ASTM D698).

F. Bedding:

1. After an acceptable subgrade is established, bedding shall be immediately placed and leveled to the specified elevation on the DRAWINGS.

2. Immediately following the placement of the bedding material, the riprap shall be placed.
3. If bedding material is disturbed for any reason, it shall be replaced and graded at CONTRACTOR's expense.
4. Contamination:
   a. In-place bedding materials shall not be contaminated with soils, debris or vegetation before the riprap is placed.
   b. If contaminated, the bedding material shall be removed and replaced at CONTRACTOR's expense.

3.02 PLACEMENT

A. RIPRAP

1. Following acceptable placement of granular bedding, riprap placement shall commence as follows:
   a. Machine Placed Riprap:
      1) Riprap shall be placed on the prepared slope or channel bottom areas in a manner which will produce a reasonably well graded mass of stone with the minimum practicable percentage of voids.
      2) Riprap shall be machine placed, unless otherwise stipulated in the DRAWINGS or SPECIFICATIONS.
      3) It is the intent of these SPECIFICATIONS to produce a fairly compact riprap protection in which all sizes of material are placed in their proper proportions. Unless otherwise authorized by ENGINEER, the riprap protection shall be placed in conjunction with the construction of embankment or channel bottom with only sufficient delay in construction of the riprap protection, as may be necessary, to allow for proper construction of the portion of the embankment and channel bottom which is to be protected.
   b. Slope Placement:
      1) When riprap is placed on slope, placement shall commence at the bottom of the slope working up the slope.
   c. The entire mass of riprap shall be placed on either channel slope or bottom so as to be in conformance with the required gradation mixture and to line, grade, and thickness shown on the DRAWINGS.
   d. Riprap shall be placed to full course thickness at one operation and in such a manner as to avoid displacing the underlying bedding material. Placing of riprap in layers, or by dumping into chutes, or by similar methods shall not be permitted.
   e. All material used for riprap protection for channel slope or bottom shall be placed and distributed such that there shall be no large accumulations of either the larger or smaller sizes of stone. Some hand placement may be required to achieve this distribution.
   f. The basic procedure shall result in larger materials flush to the top surface with faces and shapes arranged to minimize voids, and smaller material below and between larger materials.
   g. Surface grade shall be a plane or as indicated, but projections above or depressions under the finished design grade by more than ten percent (10%) of the rock layer thickness shall not be allowed.
   h. Smaller rock shall be securely locked between the larger stone. It is essential that the material between the larger stones not be loose or easily displaced by flow or by vandalism.
   i. The stone shall be consolidated by the bucket of the backhoe or other means that will cause interlocking of the material.
   j. All rock is to be placed in a dewatered condition beginning at the toe of the slope or other lowest point.

k. CONTRACTOR shall maintain the riprap protection until accepted. Any material displaced for any reason shall be replaced to the lines and grades shown on the DRAWINGS at no additional cost to OWNER. If the bedding materials are removed or disturbed, such material shall be replaced prior to replacing the displaced riprap.

2. Hand Placed Riprap:
   a. Hand placed riprap shall be performed during machine placement of riprap and shall conform to all the requirements of PART 2, above.
   b. Hand placed riprap shall also be required when the depth of riprap is less than two (2) times the nominal stone size, or when required by the DRAWINGS or SPECIFICATIONS.
   c. After the riprap has been placed, hand placing or rearranging of individual stones by mechanical equipment shall be required to the extent necessary to secure a flat uniform surface and the specified depth of riprap, to the lines and grades as shown on the DRAWINGS.
3. Soil Replacement Over Riprap:
   a. Where riprap is designated to be buried, place onsite excavated material that is free from trash and organic matter in riprap voids by washing and rodding.
   b. Prevent excessive washing of material into stream.
   c. When voids are filled and the surface accepted by ENGINEER, place a nominal six (6) inches of topsoil over the area, or as designated on the DRAWINGS.
   d. Fine grade, seed, and mulch per the SPECIFICATIONS.

B. BOULDERS
1. Following excavation and acceptance of subgrade by ENGINEER Boulder placement shall commence as follows:
   a. Boulders shall be placed on the prepared subgrade in a manner which will minimize voids.
   b. Voids between boulders exceeding 4" shall be chinked.

C. SOIL RIPRAP
1. Adjacent stockpiles of riprap and soil shall be created and mixing done at the stockpile location, not at the location where soil riprap is to be placed.
2. Mix thirty-five percent (35%) soil by volume with stockpiled riprap, using additional moisture and control procedures that ensure a homogenous mixture; where the soil fills the inherent voids in the riprap without displacing riprap.
3. With prior approval of ENGINEER, layering the riprap and soil instead of premixing may be allowed if the native soil is granular.
4. Place a first layer of smaller soil riprap of approximate d50 thickness. Then place the top layer with surface rocks that are largely d50 or greater, filling voids as necessary with smaller planted riprap. Create a smooth plane as described in Paragraph A.
5. The mixture shall be consolidated by large vibratory equipment or backhoe bucket to create a tight, dense interlocking mass.
6. The soil shall be further wetted to encourage void filling with soil.
7. Any large voids shall be filled with rock and small voids filled with soil.
8. Excessively thick zones of soil prone to washing away shall not be created (for example, no thicknesses greater than six (6) inches).
9. For buried soil riprap, the top surface shall be covered with four (4) inches of topsoil such that no rock points are protruding.
10. The final surface shall be thoroughly wetted for good compaction, smoothed and compacted by vibrating equipment; the surface shall then be hand raked to receive planting or seeding.

D. FEATURE BOULDERS
   1. Feature Boulders serve an aesthetic function and as such shall be placed and rotated into final position as directed by ENGINEER in order to achieve the desired result.

3.03 REJECTION OF WORK AND MATERIALS:

A. ENGINEER will reject placed riprap, boulders, soil riprap and bedding that do not conform to this section. CONTRACTOR shall immediately remove and re-lay the riprap, boulders, soil riprap and bedding to conform to SPECIFICATIONS.

B. Riprap, boulders, soil riprap and bedding shall be rejected, which is either delivered to the job site or placed, that does not conform to this section.

C. Rejected riprap, boulders, soil riprap and bedding shall be removed from the PROJECT site by CONTRACTOR at CONTRACTOR's expense.

END OF SECTION

SECTION 32 1216 – ASPHALT PAVING

PART 1 – GENERAL

1.01 SUMMARY

A. Section includes finished construction and placement of asphalt paving, including materials, accessories, subgrade preparation, and finishing.

1.02 REFERENCES

A. MAG Standard Detail 321 – Placement and Construction of Asphalt Concrete Pavement

B. MAG Standard Detail 710 – Asphalt Concrete

PART 2 – PRODUCTS

2.01 ASPHALT BINDER

A. The asphalt binder shall be designed for use in desert climate conditions as specified in MAG Standard Detail 710 – Asphalt Concrete.

2.02 AGGREGATE

A. Coarse and fine aggregates shall conform to the requirements of MAG Standard Detail 710 – Asphalt Concrete.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation, placement, compaction, and testing shall be in accordance with MAG Standard Detail 321 – Placement and Construction of Asphalt Concrete Pavement.

END OF SECTION

SECTION 32 1313 – CONCRETE PAVING

PART 1 – GENERAL

1.01 SUMMARY

A. Section includes finished pavement of constructed cement concrete, including materials and accessories, formwork, subgrade preparation, joints, and finishing.

1.02 REFERENCES

A. MAG Standard Detail 324 – Portland Cement Concrete Pavement

B. MAG Standard Detail 725 – Portland Cement Concrete

C. MAG Standard Detail 726 – Concrete Curing Materials

D. MAG Standard Detail 727 – Steel Reinforcement

E. MAG Standard Detail 729 – Expansion Joint Filler

F. ASTM A615/A615M – Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

1.03 SUBMITTALS

A. Submittals shall be in accordance with Section 01 3300 – Submittal Procedures.

B. Samples: Submit samples when requested.

C. Shop Drawings:
   1. Submit drawings indicating the locations of all joints in concrete, including construction joints, expansion joints, isolation joints, and weakened plane or contraction joints.
   2. Submit drawings of reinforcing steel, tie bars, and connecting dowels.

PART 2 – PRODUCTS

2.01 CONCRETE MATERIALS

A. General: Concrete materials, additives, and accessories required for the Work shall be in accordance with MAG Standard Detail 725 – Portland Cement Concrete.

B. Cementitious Material: ASTM C150, Type III.

C. Aggregates: ASTM C33.
   1. Aggregates shall be provided from a single source.

D. Water: Potable water meeting the requirements of ASTM C1602.

E. Admixtures and Additives: Admixtures and additives shall not be used unless identified in the approved mix design or authorized by the Engineer.

2.02 CONCRETE MIXTURES

A. Concrete mix design shall comply with Table 725-1, Class AA, 4000 psi compressive strength, as outlined in MAG Standard Detail 725 – Portland Cement Concrete.

2.03 STEEL REINFORCEMENT

A. Reinforcing bars: ASTM A614/A615M, Grade 60, deformed.

B. Steel reinforcing materials shall be in accordance with MAG Standard Detail 727 – Steel Reinforcement and these Specifications.

2.04 CURING MATERIALS

A. Curing materials shall consist of curing paper, polyethylene film, or liquid membrane forming compounds which inhibit moisture loss and reduce temperature rise.

B. Curing materials shall conform to the requirements of MAG Standard Detail 726 – Concrete Curing Materials.

2.05 JOINT MATERIALS

A. Joint sealant shall be poured-type and shall conform to the requirements of MAG Standard Detail 729 – Expansion Joint Filler. Deviations from the standard detail shall be approved by the Engineer.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Installation, shaping, forming, finishing, curing, and testing of concrete paving shall be in accordance with MAG Standard Detail 324 – Portland Cement Concrete Paving.

3.02 SUBGRADE PREPARATION

A. In accordance with MAG Standard Detail 324 – Portland Cement Concrete Paving.

3.03 PROTECTION OF PAVEMENT

A. Contractor shall be responsible for taking adequate steps to protect concrete placed during inclement weather, such as rain or hot or cold weather. Any damage resulting from exposure to rain or extreme temperatures shall be removed and replaced at the Contractor's expense.

B. No traffic or equipment shall be permitted on the pavement until the concrete has reached a compressive strength of 3500 psi.

END OF SECTION

SECTION 32 1600 – CURBS, GUTTERS, SIDEWALKS, AND DRIVEWAYS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Concrete curbs, gutters, sidewalks, valley gutters, driveways, access ramps, and alley intersections.

1.02 SYSTEM DESCRIPTION

A. Performance Requirements: Construct various types of concrete curb, gutter, sidewalk, driveways, and alley intersections to dimensions and details indicated on the Drawings.

1.02 REFERENCES

A. MAG Standard Detail 324 – Portland Cement Concrete Pavement

B. MAG Standard Detail 725 – Portland Cement Concrete

C. MAG Standard Detail 726 – Concrete Curing Materials

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. Product Data: Submit data completely describing products.

C. Samples: Submit samples when requested.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Concrete: 4000 psi, conforming to the applicable requirements of these Specifications.

B. Curb Finishing Mortar: 1 part Portland cement to two parts sand.

C. Form Release Material: Light oil or other releasing agent of type which does not discolor concrete or interfere with the application of finishing mortar to curb tops and faces.

D. Joint Materials:
   1. Expansion: Comply with requirements as specified in these Specifications.
   2. Construction: Steel dividers or plastic inserts.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verification of Conditions: Verify field conditions, including subgrade condition and interferences, before beginning construction.

3.02 PREPARATION

A. Surface Preparation:
   1. Subgrade:
      a. Construct and compact true to grades and lines indicated on the Drawings and requirements as specified in these Specifications.
      b. Remove soft or unsuitable material to depth of not less than 6 inches below subgrade elevation and replace with satisfactory material.
   2. Forms and Subgrade: Water immediately in advance of placing concrete.

3.03 INSTALLATION

A. Special Techniques:
   1. CONTRACTOR's Option:
      a. Construct concrete curbs and gutters by conventional use of forms, or by means of curb and gutter machine when acceptable to the ENGINEER.
      b. When use of machines designed specifically for work of this Section are accepted by the ENGINEER, results must be equal to or better than those produced by use of forms.
      c. Applicable requirements of construction that apply to use of forms also apply to use of machines.
      d. Discontinue use of machines when results are not satisfactory to the ENGINEER.

B. Forms:
   1. Carefully set to line and grade and securely stake in position forms conforming to dimensions of items to be constructed.
   2. Thoroughly clean prior to each use and coat with form releasing material.

C. Expansion and Contraction Joints:
   1. Expansion Joints:
      a. Construct vertically, and at right angles to centerline of street and match joints in adjacent pavement or sidewalks.
      b. Constructed at radius points, driveways, alley entrances, and at adjoining structures.
      c. Fill joints with expansion joint filler material.
   2. Contraction Joints:
      a. Constructed not more than 15 feet apart.
      b. Make joints of construction joint material, scoring or saw cutting to depth of not less than 1-1/2 inches, and matching joints in adjacent pavement or sidewalk.

D. Concrete:
   1. Placing:
      a. Thoroughly spade concrete away from forms so that no rock pockets exist next to forms and so that no coarse aggregate will show when forms are removed.
   2. Compacting:
      a. Compact by mechanical vibrators accepted by the ENGINEER.
      b. Continue tamping or vibrating until mortar flushes to surface and coarse aggregate is below concrete surface.
   3. Form Removal:
      a. Front Form Faces: Do not remove before concrete has taken initial set and has sufficient strength to carry its own weight.
      b. Gutter and Rear Forms: Do not remove until concrete has hardened sufficiently to prevent damage to edges. Take special care to prevent damage.
   4. Finishing and Curing: Comply with requirements of these Specifications, except as modified here:
      a. As soon as curb face forms are stripped, apply finishing mortar to the top and face of curb and trowel to a smooth, even finish. Finish with fine haired broom in direction of work.
      b. Where curb is installed without integral gutter, extend finish 2 inches below grade.
      c. Edge concrete at expansion joints to 1/4-inch radius.

d. Flow lines of gutters shall be troweled smooth 4 inches out from curb face for integral curb and gutter and 4 inches on both sides of flowline for gutters without curbs.

E. Backfilling: Unless otherwise specified, backfill behind curbs, gutters, or sidewalks with soil native to area and to lines and grades indicated on the Drawings.

3.04 FIELD QUALITY CONTROL

A. Tests:
1. Curbs, Gutters, and Valley Gutters:
a. Test face, top, back, and flow line with 10-foot straight edge or curve template longitudinally along surface.
b. Correct deviations in excess of ¼-inch.
2. Gutters:
a. Frequency of Testing: When required by the ENGINEER, where gutters have slope of 0.8 foot per hundred feet or less, or where unusual or special conditions cast doubt on capability of gutters to drain.
b. Test Method: Establish flow in length of gutter to be tested by supplying water from hydrant, tank truck, or other source.
c. Required Results:
1) 1 hour after supply of water is shut off, inspect gutter for evidence of ponding or improper shape.
2) In event water is found ponded in gutter to depth greater than 1/2 inch, or on adjacent asphalt pavement, correct defect or defects in manner acceptable to the ENGINEER without additional cost to the Contract.

3.05 ADJUSTING

A. Repair portions of concrete damaged while stripping forms or, when damage is severe, replace such work at no additional cost to the Contract. Evidence of repairs shall not be noticeable in the finished product.

B. Remove and replace sections of work deficient in depth or not conforming to requirements indicated on the Drawings and specified in the Specifications at no additional cost to the Contract. Removal and replacement shall be the complete section between two joints.

END OF SECTION

SECTION 32 3113 – CHAIN LINK FENCES AND GATES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the WORK as indicated on the Drawings and specified herein.

B. This Section covers the work necessary for the chain link fence and gate(s), including removal of a portion of existing fence and reinstalling the chain link fence and gate(s) as shown on the Drawings and specified in the Contract Documents.

C. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Reference MAG Standard Details and Specifications.

B. All Work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these Specifications.

C. Comply with the applicable editions of the following codes, regulations and standards.
   1. Industry Standards:
      a. ASTM F567: Installation of Chain-Link Fence
      b. SSPWC Section 206-6 “Green Book”: Standard Specifications for Public Works Construction, Chain Link Fence
      c. SSPWC Section 304-3 “Green Book”: Standard Specifications for Public Works Construction, Chain Link Fence

D. Comply with the MAG Standard Details and Specifications, SPPWC, Standard Plans for Public Works Construction, as referenced in this Specification.

1.03 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the Section 01 3300 – Submittal Procedures.

1.04 QUALITY ASSURANCE

A. General
   1. Comply with the requirements specified herein and the applicable reference Specifications of the General Requirements.
   2. Contractor shall adhere to OSHA, state, and local safety guidelines, laws, rules, and regulations.

1.05 WARRANTY

A. Provide a minimum of a five-year warranty.

PART 2 - PRODUCTS

2.01 GENERAL

A. All materials and fittings shall be in conformance with MAG Standard Detail 160 and Specification Section 420, SSPWC Section 206-6 Chain Link Fence, or as otherwise shown on the Drawings.

B. Salvaged material from the existing fence shall be undamaged and acceptable to the ENGINEER prior to reuse or reinstallation. Any material not reused shall be removed as directed by the ENGINEER.

C. Like items of materials provided hereunder shall be the end products of one manufacturer in order to achieve standardization for appearance, maintenance, and replacement.

2.02 FABRIC

A. Galvanized Fabric:
   1. Chain link fabric shall conform to the requirements of SSPWC Section 206-6.3.1.

B. Polyvinyl Chloride (PVC)-Coated Fabric:
   1. PVC-coated chain link fabric shall be in conformance with SSPWC Section 206-6.3.2.

2.03 POSTS, RAILS AND BRACES

A. The materials for posts, rails, and braces shall be in conformance with SSPWC Section 206-6.2.

2.04 TENSION WIRES AND FABRIC TIES

A. Tension wires and ties used to fasten the fabric to posts, rails, and gate framed shall be in conformance with SSPWC Section 206-6.4.

2.05 TRUSS OR TENSION RODS

A. Truss or tension rod used in construction shall be in conformance with SSPWC Section 206-6.5.

2.06 FITTINGS

A. All required fittings and hardware shall be galvanized and in conformance with SSPWC Section 206-6.6.

2.07 BARBED WIRE

A. Barbed wire shall be in conformance with SSPWC Section 206-6.7.

2.08 REPAIR OF DAMAGED COATINGS

A. Repairs to abraded or otherwise damaged zinc coating shall be made in conformance with SSPWC Section 206-6.8.

2.09 GATES

A. Gates shall be swing or sliding as indicated, complete with latches, stops, keepers, hinges, or rollers and roller tracks.

B. Gate frames shall be constructed of tubular members welded at all corners or assembled with fittings. On steel, welds shall be painted with zinc-based paint. Where corner fittings are used, gates shall have truss rods of 5/16-inch minimum nominal diameter to prevent sag or twist. Gate leaves shall have vertical intermediate bracing as required, spaced so that no members are more than 8 feet apart. Gate leaves 10 feet or over shall have a horizontal brace or one 5/16-inch minimum diagonal truss rod. When fence has barbed wire top, the end members of the gate frames shall be extended 1 foot above the top horizontal member to which three strands of barbed wire, uniformly spaced, shall be attached by use of bands, clips, or hook bolts.

C. Fabricate frames of standard weight pipe 1.90 inches outside diameter, weight 2.72 pounds per linear foot.

D. Gate fabric shall be the same type as used in the fence construction. The fabric shall be attached securely to the gate frame at intervals not exceeding 15 inches.

E. Gate hinges shall be of adequate strength for gate and with large bearing surfaces for clamping in position. The hinges shall not twist or turn under the action of the gate. The gates shall be capable of being opened and closed easily by one person.

F. Gate latches, stops, and keepers shall be provided for all gates. Latches shall have a plunger-bar arranged to engage the center stop, except that for single gates of openings less than 10 feet wide a forked latch may be provided. Latches shall be arranged for locking with padlocks. Center stops shall consist of a device arranged to be set in concrete and to engage a plunger-bar of the latch of double gates. No stop is required for single gates. Keepers shall consist of a mechanical device for securing the free end of the gate when in the full open position.

1. Double Gates: Size and configuration shall be as indicated. Provide gate stops for all double gates, consisting of mushroom type or flush plate with anchors. Set in concrete to engage the center drop rod or plunger bar. Provide locking device and padlock eyes as an integral part of the latch, requiring one padlock for locking both gate leaves.
2. Sliding Gates: Provide manufacturer's standard heavy-duty track, ball-bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required. All sliding gates shall be rolling, cantilever slide, or overhead (top) suspended, as indicated on Drawings.

G. Rolling gate track rollers shall be malleable iron or heavy pressed steel construction, with provision for regular grease lubrication. Ground rollers shall have malleable iron or heavy pressed-steel hubs with similar provision for lubrication. Gate track shall be Schedule 40 pipe, firmly attached to support posts on 7-foot-maximum centers. Gates more than 8 feet in height shall have three tracks. Rolling gate frames shall be constructed similar to swing gates except diagonal bracing shall reflect different support type.

H. Cantilever gate rollers shall have heavy malleable rollers, needle or ball bearings with fittings for regular lubrication. Maximum spacing of support posts is 10 feet. Additional weight-supporting posts with lower roller shall be provided on 10-foot-maximum centers. Support posts shall be 4 inches in diameter, Schedule 40, set at 36 inches minimum depth. Top and lower rails of gate shall be 2-3/8 inches in OD, Schedule 40 pipe. Vertical support posts shall be on 6-foot maximum spacing, 1-7/8-inch OD, Schedule 40 pipe, all diagonal bracing 1-5/8-inch OD, Schedule 40 pipe, all connections welded and painted.

I. Keeper: Provide keeper for all vehicle gates that automatically engages the gate leaf and holds it in the OPEN position until manually released.

2.10 REMOVABLE FENCE PANELS

A. Removable fence panels shall be provided as indicated on the Drawings. The total length of any removable fence section shall be divided into equal removable fence panels with panel length not to exceed 10 feet. The posts on either side of removable fence panels shall be hot-dip galvanized pipe, 3 inches OD, 5.71 pounds per linear foot.

2.11 CONCRETE

A. Materials as specified in these Specifications. Proportions shall be 1:2:4. Compressive strength shall not be less than 2,000 psi at 28 days.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Installation of fencing shall meet the requirements of ASTM F567.

B. Fence construction shall be in conformance with MAG Standard Detail 160 and Specification Section 420, SSPWC Section 304-3.2

C. Installation of gates shall be in conformance with the manufacturer’s installation instructions, MAG Standard Detail 160 and Specification Section 420, and SSPWC Section 304-3.3.

3.02 REMOVAL AND RESETTING OF EXISTING FENCE

A. All accessories shall be removed carefully and all materials stored in a safe place until required for resetting. The CONTRACTOR shall provide all new material necessary to replace lost or damaged material and as required for a complete and satisfactory installation. In general, the salvaged fencing shall be reinstalled as specified for new material. All concrete shall be removed from posts before they are reset. The CONTRACTOR may furnish all new materials, rather than salvage and reuse the existing fence.

3.03 CLEANUP

A. Upon completion of the fence installation, clean up all waste material resulting from the operation. The clean-up shall be subject to acceptance by the ENGINEER.

END OF SECTION

SECTION 33 0505.31 – HYDROSTATIC TESTING

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall clean, flush, and test hydraulic structures and appurtenant piping, in accordance with ACI 350.1/350.1R Tightness Testing of Environmental Concrete Structures. However, if any local or state ordinances/regulations exist regarding this test procedure the ENGINEER should be notified immediately. The ENGINEER shall review the regulation and determine if it is applicable to the project prior to commencement of construction. Following the review, the most stringent will govern.

B. The ACI 350.1/350.1R standard hydrostatic test (HST) criteria for these hydraulic structures are expressed as the maximum allowable percent loss per day of the test water volume. The designation for these structures is HST-050 or 0.050% per day of volume loss for all the structures.

C. It is the intent of this specifications Section to compliment the requirements of ACI 350.1/350.1R not to override them. All testing requirements shall be per section 1.01A.

1.02 SUBMITTALS

A. Furnish per Section 01 3300 – Submittal Procedures

B. Testing Plan, Methods, and Schedule for preliminary and final testing

C. Testing Documentation Recording Forms for preliminary and final testing

D. Methods of leak repair and product information

E. Upon completion of the test submit the completed Testing Documentation Recording Form showing results of test, dates etc. as required by the form for preliminary and final testing.

PART 2 – PRODUCTS

2.01 MATERIALS REQUIREMENTS

A. Temporary valves, bulkheads, or other water control equipment and materials shall be as determined by the CONTRACTOR subject to the ENGINEER's review. No materials shall be used which would be injurious to the facility or its future function.

PART 3 – EXECUTION

3.01 GENERAL

A. The CONTRACTOR shall develop and submit for review a form that will be used to record and document the testing as required in this Section. At a minimum, the form shall include the project name, tank description, tank size, width, height, max operating depth, total volume in gallons of water required for testing, calculating allowable loss without evaporation, recorded readings with applicable reading dates, daily weather conditions, water temperature at 18 inches, recorded evaporations and signature and date blocks for the person recording the readings and a witness. In addition, the preliminary testing form shall include space for documentation of the visual inspection of each tank wall, which shall describe any leaks. The description of the leaks shall define the type of leak and methods of resolution.

B. Water for testing will be furnished by the OWNER; however, the CONTRACTOR shall make all necessary provisions for conveying the water from the OWNER designated source to the points of use as per the Contract.

C. The initial filling of a new tank shall not exceed a rate of 4ft/hr. Filling shall be continued until the water surface is at the design maximum liquid level or 4 inches below any fixed overflow level, whichever is lower.

D. All hydraulic structures and appurtenant pressure piping shall be tested; those for potable water shall also be disinfected. Disinfection shall be accomplished by chlorination. All chlorinating and testing operations shall be done in the presence of the ENGINEER.

E. If industrial paint finishes or other protective coatings are to be applied to the interior surfaces of the hydraulic structure, such coatings shall be applied after all testing operations have been completed, unless approved by the ENGINEER. However, all construction joints in the tanks shall be caulked as per these Specifications.

3.02 TESTING OF HYDRAULIC STRUCTURES

A. General: Testing shall conform to American Concrete Institute (ACI) Standard 350.1/350.1R Tightness Testing of Environmental Engineering Concrete Structures. Tank structure testing and backfilling shall not be performed sooner than 14 days after all associated tank structural roof systems have been completed or at least 85% of design strength for all concrete elements. All pressure relief valves and wall penetrations shall be properly plugged prior to the hydrostatic test as to prevent leakage through the valve during testing. The test shall consist of filling the structure with water to the maximum operating water surface.

B. Leakage Test and Repairs:

1. After the structure has been filled to the test level, the water loss leakage test shall be performed as follows: an initial water level reading shall be made and recorded every 24 hours until the test has been completed. Concrete will be allowed to saturate for three days. After which the actual test shall begin. Measurements shall be taken every 24 hours at 2 separate locations if possible. The test period shall be at least the theoretical time required to lower the water surface 3/8-inches. assuming a loss of water at the maximum allowable rate. The test period need not be longer than five days. In uncovered or well-ventilated covered tanks evaporation and precipitation shall be measured. At the end of the test period, the water surface, temperature, evaporation, and precipitation measurements shall be recorded at the previous locations. The structure shall be considered to have passed the test if the calculated change in water volume in the tank is less that or equal to the HST-050 criteria or 0.05% of the total volume of the tank. The volume loss if necessary can be corrected for evaporation, precipitation, and temperature. The tank has failed if the loss is greater that the required criteria.
2. A restart of the test shall be required when test measurement become unreliable due to unusual precipitation or other external factors.
3. The CONTRACTOR shall be permitted to immediately retest a tank failing the test when no visible leakage is exhibited. If the tank fails the second time then the CONTRACTOR shall take other methods to determine the probable area(s) of leakage. The tank shall only be retested after the most probable area(s) of leakage are repaired. Any cracks shall be repaired before each test in accordance with applicable Sections of Division 03 – Concrete. The tanks shall be retested until they meet the required criterion.

3.03 TESTING OF APPURTENANT PIPING

A. Piping appurtenant to hydraulic structures shall be tested as specified in pertinent Sections of these Specifications and Contract Documents.

END OF SECTION

SECTION 33 0130.13 – SEWER AND MANHOLE TESTING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Perform all pipeline flushing and testing, complete, for sanitary sewer and storm drainage system piping as specified herein and in accordance with the requirements of the Contract Documents.

B. Be responsible for providing conveyance of test water to the point of usage and also for disposal, as required, of water used in the testing operations.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Commercial Standards:

B. ASTM A746 Ductile Iron Gravity Sewer Pipe

C. ASTM F1417 Standard Test Method for Installation Acceptance of Plastic Gravity Sewer Lines Using Low-Pressure Air

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. Proposed plans for testing of the sanitary sewer system. The methods used may be air or water as described herein. If water method is used then provide the water conveyance, control, and disposal. Advance written notice of its proposed testing schedule for review and concurrence of the ENGINEER shall be submitted.

PART 2 - PRODUCTS

2.01 MATERIALS REQUIREMENTS

A. Temporary valves, plugs, bulkheads, and other air pressure testing and water control equipment and materials shall be provided, subject to the ENGINEER's review. No materials shall be used which would be injurious to pipeline structure and future function. Air test gauges shall be laboratory-calibrated test gauges and shall be recalibrated by a certified laboratory at the Contractor’s expense prior to the leakage test, if required by the ENGINEER.

PART 3 - EXECUTION

3.01 GENERAL

A. Unless otherwise specified, water for testing will be furnished by OWNER; however, all necessary provisions for conveying the water from the designated source to the points of use shall be made by the CONTRACTOR.

B. Release of water from pipelines, after testing has been completed, shall be performed as reviewed by the ENGINEER.

C. All testing operations shall be performed in the presence of the ENGINEER.

3.02 TESTING OF PIPING

A. General: All gravity sewer pipes and service laterals shall be tested for exfiltration and/or infiltration and deflection, as specified. All manholes shall be tested for leakage, as specified. Manholes shall be tested prior to backfill placement. Reference applicable Sections of Division 31 – Earthwork, for pipe leak testing prior to backfill placement. All leakage tests shall be completed and approved prior to placing of permanent resurfacing. When leakage or infiltration exceeds the amount allowed by the Specifications, locate the

leaks, and make the necessary repairs or replacements in accordance with the Specifications to reduce the leakage or infiltration to the specified limits. Any individually detectable leaks shall be repaired, regardless of the results of the tests.

B. Leakage Tests: Sanitary sewer systems shall be tested for leakage as follows:
   1. Gravity sewers 24 inches or less in diameter, where difference in elevation between inverts of adjacent manholes is 10 feet or less; water exfiltration test or water infiltration test as approved. The ENGINEER may allow substitution of an air pressure test for the water exfiltration test.
   2. Gravity sewers 24 inches or less in diameter, where difference in elevation between inverts of adjacent manholes is greater than 10 feet: air pressure test or water infiltration test, or as approved.
   3. Gravity sewers greater than 24 inches in diameter: air pressure test or water infiltration test, or as approved.
   4. Pressure sewers (force mains): water pressure test at 120% of maximum operating pressure, measured at the lowest point of the pipeline section being tested.

C. Water Exfiltration Test: Each section of sewer shall be tested between successive manholes by closing the lower end of the sewer to be tested and the inlet sewer of the upper manhole with stoppers. The pipe and manhole shall be filled with water to a point 4 feet above the centerline of the sewer at the center of the upper manhole; or if ground water is present, 4 feet above the average adjacent ground water level, whichever is higher.
   1. The allowable leakage will be computed by the formula:

		$E = 0.000012\ LD\ (H)^{1/2}$
in which	E =	Allowable leakage in gallon per hour of sewer tested
	L =	Length of sewer and lateral connections tested, in feet
	D =	Internal diameter of the pipe in inches
	H =	Difference in elevation between the water surface in the upper manhole and the centerline of the pipe at the lower manhole; or if ground water is present above the centerline of the pipe in the lower manhole, the difference in elevation between the water surface in the upper manhole and ground water at the lower manhole.

D. Water Infiltration Test: If, in the opinion of the ENGINEER, excessive ground water is encountered in the construction of a section of the sewer, the exfiltration test for leakage shall not be used.
   1. The end of the sewer at the upper structure shall be closed sufficiently to prevent the entrance of water, and pumping of ground water shall be discontinued for at least 3 days, after which the section shall be tested for infiltration.
   2. The infiltration into each individual reach of sewer between adjoining manholes shall not exceed that allowed by the formula above, where H is the difference in the elevation between the ground water surface and the invert of the sewer at the downstream manhole.
   3. Unless otherwise specified, infiltration will be measured using measuring devices approved by the ENGINEER.

E. Water Pressure Test: Preparatory to testing, the section of the pipeline to be tested shall be filled with water and placed under a slight pressure for at least 48 hours. The pipeline shall then be brought up to the test pressure specified and maintained on the section under test for a period of not less than 4 hours.
   1. Accurate means shall be provided for measuring the quantity of water required to maintain full pressure on the line for the test period, which volume shall not exceed:

		$L = \frac{CN\ D\ (P)^{1/2}}{1850}$
in which	L =	Maximum allowable leakage in gallons per hour for the section of pipeline tested
	N =	Number of joints in length tested
	D =	Diameter of pipe in inches
	P =	Test pressure in psi
	C =	1.0 for reinforced concrete pressure pipe with rubber ring joints, cylinder type
	C =	3.0 for reinforced concrete pressure pipe with rubber joints, non-cylinder type
	C =	0.50 for cast iron pipe with mechanical or rubber gasket joints and asbestos-cement pipe
	C =	1.0 for other type of cast iron joints (calked) and other types of pipe

F. Deflection Test: All flexible and semi-rigid main line pipe shall be tested for deflection, joint displacement, or other obstruction by passing a rigid mandrel through the pipe by hand, not less than 30 days after completion of the trench backfill, but prior to permanent resurfacing. The mandrel shall be a full circle, solid cylinder, or a rigid, non-adjustable, odd-numbered leg (9-leg minimum) steel cylinder, approved by the ENGINEER as to design and manufacture. The circular cross section of the mandrel shall have a diameter of at least 95% of the specified average inside pipe diameter of the pipe and the minimum length of the circular portion of the mandrel shall be equal to the nominal diameter of the pipe. Obstructions encountered by the mandrel shall be corrected.

3.03 TESTING OF MANHOLES

A. All sewer manholes shall be hydrostatically tested for leakage after installation, but prior to being backfilled. Prior to hydrostatic testing, all manholes shall be visually inspected for leaks. All leaks or cracks shall be repaired, prior to hydrostatic testing, to the satisfaction of the ENGINEER. All pipes entering the manhole shall be sealed at a point outside the manhole walls so as to include testing of the pipe/manhole joints. The manhole shall be filled with water to a level 2 inches below the top of the frame. Safety lines shall be secured to all plugs utilized. After a period of at least one hour to allow the water level to stabilize, the manhole shall be refilled and the water level shall be checked. The water level shall again be checked after a period of 4 hours. If the water level is reduced by more than ¼-inch, the leakage shall be considered excessive, the required repairs shall be made and the manhole retested. The exterior of the manhole shall be inspected during this period for visible evidence of leakage. Visible moisture, sweating, or beads of water on the exterior of the manhole shall not be considered leakage, but any water running across the surface will be considered leakage and shall be repaired to the satisfaction of the ENGINEER regardless of the volume of water lost.

END OF SECTION

SECTION 33 0519 – DUCTILE IRON PIPE

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide ductile iron pipe and perform all appurtenant work, complete in place, in accordance with the Contract Documents.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Commercial Standards:

ANSI/AWWA	
C104/A21.4	Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
C105/A21.5	Polyethylene Encasement for Ductile-Iron Piping for Water and Other Liquids
C110/A21.10	Ductile-Iron and Gray-Iron Fittings, 3 inches through 48 inches for Water and Other Liquids
C111/A21.11	Rubber-Gasket Joints for Ductile-Iron and Gray-Iron Pressure Pipe and Fittings
C115/A21.15	Flanged Ductile-Iron and Gray-Iron Pipe with Threaded Flanges
C150/A21.50	Thickness Design of Ductile-Iron Pipe
C151/A21.51	Ductile-Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for Water or Other Liquids
C153/A21.53	Ductile-Iron Compact Fittings, 3 inches through 12 inches for Water and Other Liquids
AWWA	
C209	Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines
C214	Tape Coating Systems for the Exterior of Steel Water Pipelines
C600	Installation of Ductile Iron Water Mains and Their Appurtenances
ASTM	
A746	Ductile Iron Gravity Sewer Pipe
C150	Specification for Portland Cement

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings: Submit shop drawings of pipe and fittings in accordance with the requirements in Section 01 3300 – Submittal Procedures, the requirements of the referenced standards, and the following supplemental requirements as applicable:

1. Dimensional drawings of all valves, fittings, and appurtenances.
2. For pipe 24 inches in diameter and larger, line layout and marking diagrams which indicate the specific number of each fitting and the location and the direction of each fitting in the completed line. In addition, the line layouts shall include: the pipe station and invert elevation at all changes in grade or horizontal alignment; all elements of curves and bends, both in horizontal and vertical alignment; and the limits of each reach of restrained joints, or of concrete encasement.

1.04 QUALITY ASSURANCE

A. All pipe shall be subject to inspection at the place of manufacture in accordance with the provisions of the referenced standards, as supplemented by the requirements herein.

B. During the manufacture of the pipe, the ENGINEER shall be given access to all areas where manufacturing is in process and shall be permitted to make all inspections necessary to confirm compliance with the Specifications.

PART 2 - PRODUCTS

2.01 GENERAL

A. Mortar-lined ductile iron pipe shall conform to ANSI/AWWA C151, C104 and C105, subject to the following supplemental requirements. The pipe shall be of the diameter and class noted in the Contract Documents. The pipe shall be furnished complete with rubber gaskets, with all specials and fittings provided as required under the Contract Documents.

B. Markings: Legibly mark specials 24 inches in diameter and larger in accordance with the laying schedule and marking diagram. All fittings shall be marked at each end with top field centerline.

C. Handling and Storage: The pipe shall be handled by devices acceptable to the ENGINEER, designed and constructed to prevent damage to the pipe coating/exterior. The use of equipment that might injure the pipe coating/exterior will not be permitted. Stockpiled pipe shall be suitably supported and shall be secured to prevent accidental rolling. All other pipe handling equipment and methods shall be acceptable to the ENGINEER.

D. Laying Lengths: Maximum pipe laying lengths shall be 20 feet with shorter lengths provided as required by the Drawings.

E. Finish: The pipe shall have smooth, dense interior surfaces, and shall be free from fractures, excessive interior surface crazing, and roughness.

F. Closures and Correction Pieces: Closures and correction pieces shall be provided as required so that closures may be made due to different headings in the pipe laying operation and so corrections may be made to adjust the pipe laying to conform to pipe stationing shown on the Drawings. The locations of correction pieces and closure assemblies are shown on the Drawings. Any change in location or number of said items shall be acceptable to the ENGINEER.

2.02 PIPE DESIGN CRITERIA

A. General: Ductile iron pipe shall be designed in accordance with the requirements of ANSI/AWWA C150 as applicable and as modified in this Section.

B. Pipe Wall Thickness for Internal Pressure: The pipe shall be designed with a net thickness to withstand the design pressure in accordance with the hoop stress formula.

C. Pipe Wall Thickness for External Load: The pipe shall also be designed with a net thickness to withstand external loads using ANSI/AWWA C150 Design Equation (2) with the appropriate bending moment and deflection coefficients for Laying Condition Types 4 and 5 as applicable.

D. The pipe deflection shall be checked using ANSI/AWWA C150 Design Equation (3) and the coefficients stated above. The allowable deflection shall not exceed the manufacturer’s recommended amount.

E. In lieu of ANSI/AWWA C150 Design Equation (4), the earth loads will be computed using the following 2 equations for trench or embankment loading as applicable:

1. Trench Condition:

$$W_d = C_d w B_d^2$$

Where:
- W_d = Earth Load in pounds per linear foot
- C_d = Calculation Coefficient
- Ku' = [0.13]
- w = [120] lb/ft^3
- B_d = Trench width at top of pipe, feet

2. Positive Projecting Embankment Condition:

$$W_c = C_c w B_c^2$$

Where:
- W_c = Earth Load in pounds per linear foot
- C_c = Calculation Coefficient (based on r_{sd}P of 0.25)
- Ku = [0.19]
- w = [120] lb/ft^3
- B_c = Outside diameter of pipe, feet

F. The above 2 formulas are based on a depth of cover of 10 feet or greater. For depths of cover of less than 10 feet, HS-20 live load shall be included. For depths of cover of 3 feet or less, HS-20 live load plus impact shall be included. The determination of live load and impact factors shall be as recommended by AASHTO in "Standard Specifications for Highway Bridges."

G. If the calculated deflection exceeds 0.0225 times the nominal diameter, the pipe class shall be increased.

H. Minimum Pipe Wall Thickness: In addition to the requirements of this Section, the minimum wall thickness shall be in accordance with Table 50.5 of ANSI/AWWA C150.

2.03 MATERIALS

A. Ductile Iron Pipe: Pipe materials shall conform to the requirements of ANSI/AWWA C151.

B. Cement: Cement for mortar lining shall conform to the requirements of ANSI/AWWA C104, provided, that cement for mortar lining shall be Type II or V. Cement shall not originate from kilns that burn metal-rich hazardous waste fuel, nor shall a fly ash or pozzolan be used as a cement replacement.

2.04 SPECIALS AND FITTINGS

A. Fittings for ductile iron pipe shall conform to the requirements of ANSI/AWWA C153/A21.53 for diameters 3 inches through 24 inches and shall have a minimum pressure rating of 350 psi. Ductile iron fittings larger than 24 inches shall conform to the above referenced standard with the necessary modifications for the larger size.

2.05 DESIGN OF PIPE

A. General: The pipe furnished shall be ductile iron pipe, with rubber-gasketed joints or as specified on the plans.

B. The pipe shall be designed, manufactured, tested, inspected, and marked according to applicable requirements previously stated and except as hereinafter modified, shall conform to ANSI/AWWA C151.

C. Pipe Dimensions: The pipe shall be of the diameter and class shown. The minimum wall thickness for each pipe size shall be as specified or shown.

D. Fitting Dimensions: The fittings shall be of the diameter and class shown.

E. Joint Design: Ductile iron pipe and fittings shall be furnished with mechanical joints, push-on joints, flanged joints, and restrained joints as required.
   1. Mechanical and push-on joints shall conform to ANSI/AWWA C111/A21.11.
   2. Mechanical and push on joints gaskets shall be “fast Grip” Gaskets by American Ductile Iron Pipe, or “Field Locks” Gaskets by U.S. Pipe, or equal.
   3. Restrained joints shall be "Lok-Ring" Restrained Joint by American Ductile Iron Pipe, "TR FLEX" Restrained Joint by U.S. Pipe, or ENGINEER-approved equal. Provide as indicated on the plans.
   4. Flanged joints shall conform to ANSI/AWWA C115/A21.15. Special ductile iron flanges to match up to 250 psi valve and equipment flanges shall meet ANSI/AWWA C110 and be specially drilled to ANSI/ASME B16.1 Class 250 standard dimensions with raised face.

F. For bell-and-spigot ends with rubber gaskets, the clearance between the bells and spigots shall be such that when combined with the gasket groove configuration and the gasket itself, will provide watertight joints under all operating conditions when properly installed. Require the pipe manufacturer to submit details complete with significant dimensions and tolerances and to submit performance data indicating that the proposed joint has performed satisfactorily under similar conditions. In the absence of a history of field performance, the results of a test program shall be submitted.

G. Shop-applied interior linings and exterior coatings shall be held back from the ends of the pipe as shown or as otherwise acceptable to the ENGINEER.

2.06 CEMENT-MORTAR LINING

A. Cement-Mortar Lining for Shop Application: Except as otherwise provided herein, interior surfaces of all ductile iron pipe, fittings and specials shown on the plans shall be cleaned and lined in the shop with cement-mortar lining applied centrifugally in conformity with ANSI/AWWA C104. During the lining operation and thereafter, the pipe shall be maintained in a round condition by suitable bracing or strutting. The lining machines shall be of a type that has been used successfully for similar work. Every precaution shall be taken to prevent damage to the lining. If lining is damaged or found faulty at delivery site, the damaged or unsatisfactory portions shall be replaced with lining conforming to these Specifications.

B. The minimum lining thickness shall be as follows:

Nominal Pipe Diameter (inches)	**Minimum Lining Thickness (inches)**
3 - 12	$^{1}/_{8}$
14 - 24	$^{3}/_{16}$
30 - 54	$^{1}/_{4}$

C. Protection of Pipe Lining/Interior: All shop-applied cement mortar lining shall be given a seal coat of asphaltic material in conformance with ANSI/AWWA C104.

2.07 EXTERIOR COATING OF PIPE

A. Exterior Coating of Exposed Piping: The exterior surfaces of pipe which will be exposed to the atmosphere inside structures or above ground shall be thoroughly cleaned and then given a shop coat of rust-inhibitive primer conforming to the requirements of these Specifications.

B. Exterior Coating of Buried Piping: The exterior coating shall be an asphaltic coating approximately 1mil thick. Where noted as required by the ENGINEER, pipe will be encased in polyethylene sleeves.

PART 3 - EXECUTION

3.01 INSTALLATION OF PIPE

A. Handling and Storage: All pipe, fittings, etc., shall be carefully handled and protected against damage, impact shocks, and free fall. All pipe handling equipment shall be acceptable to the ENGINEER. Pipe shall not be placed directly on rough ground but shall be supported in a manner that will protect the pipe against injury whenever stored at the trench site or elsewhere. No pipe shall be installed where the lining or coating show defects that may be harmful as determined by the ENGINEER. Such damaged lining or coating shall be repaired, or a new undamaged pipe shall be furnished and installed.

B. All pipe that is damaged prior to Substantial Completion shall be repaired or replaced.

C. Inspect each pipe and fitting prior to installation to ensure that there are no damaged portions of the pipe.

D. Before placement of pipe in the trench, each pipe or fitting shall be thoroughly cleaned of any foreign substance, which may have collected thereon, and shall be kept clean at all times thereafter. For this purpose, the openings of all pipes and fittings in the trench shall be closed during any interruption to the WORK.

E. Pipe Laying: The pipe shall be installed in accordance with ANSI/AWWA C600.

F. Pipe shall be laid directly on the bedding material. No blocking will be permitted, and the bedding shall be such that it forms a continuous, solid bearing for the full length of the pipe. Excavations shall be made as needed to facilitate removal of handling devices after the pipe is laid. Bell holes shall be formed at the ends of the pipe to prevent point loading at the bells or couplings. Excavation shall be made as needed outside the normal trench section at field joints to permit adequate access to the joints for field connection operations and for application of coating on field joints.

G. Each section of pipes 24 inches in diameter and larger shall be laid in the order and position shown on the laying schedule. In laying pipe, it shall be laid to the setline and grade, within approximately one inch plus or minus. On grades of zero slopes, the intent is to lay to grade.

H. Where necessary to raise or lower the pipe due to unforeseen obstructions or other causes, the ENGINEER may change the alignment and/or the grades. Such change shall be made by the deflection of joints, by the use of bevel adapters, or by the use of additional fittings. However, in no case shall the deflection in the joint exceed the maximum deflection recommended by the pipe manufacturer. No joint shall be misfit any amount that will be detrimental to the strength and water tightness of the finished joint.

I. Except for short runs that may be permitted by the ENGINEER, pipes shall be laid uphill on grades exceeding 10%. Pipe that is laid on a downhill grade shall be blocked and held in place until sufficient support is furnished by the following pipe to prevent movement. All bends shall be properly installed as shown.

J. Shallow buried pipes and pipes underneath structures shall be concrete encased where noted in the Contract Documents.

K. Cold Weather Protection: No pipe shall be installed upon a foundation into which frost has penetrated or at any time that there is a danger of the formation of ice or penetration of frost at the bottom of the excavation. No pipe shall be laid unless it can be established that the trench will be backfilled before the formation of ice and frost occurs.

L. Pipe and Specials Protection: The openings of all pipe and specials shall be protected with suitable bulkheads to prevent unauthorized access by persons, animals, water, or any undesirable substance. At all times, means shall be provided to prevent the pipe from floating.

M. Pipe Cleanup: As pipe laying progresses, the pipe interior shall be kept free of all debris. Completely clean the interior of the pipe of all sand, dirt, mortar splatter and any other debris following completion of pipe laying, pointing of joints and any necessary interior repairs prior to testing and disinfecting the completed pipeline.

3.02 RUBBER GASKETED JOINTS

A. Rubber Gasketed Joints: Immediately before jointing pipe, the bell end of the pipe shall be thoroughly cleaned, and a clean rubber gasket lubricated with an approved vegetable-based lubricant shall be placed in the bell groove. The spigot end of the pipe shall be carefully cleaned and lubricated with a vegetable-based lubricant. The spigot end of the pipe section shall then be inserted into the bell of the previously laid joint and telescoped into its proper position. Tilting of the pipe to insert the spigot into the bell will not be permitted.

3.03 INSTALLATION OF PIPE APPURTENANCES

A. Protection of Appurtenances: Where the joining pipe is tape-coated, buried appurtenances shall be coated with cold-applied tape in accordance with ANSI/AWWA C209, Type II. Where pipe is encased in polyethylene sleeves, buried appurtenances shall also be encased in polyethylene.

B. Installation of Valves: All valves shall be handled in a manner to prevent any injury or damage to any part of the valve. All joints shall be thoroughly cleaned and prepared prior to installation. Adjust all stem packing and operate each valve prior to installation to insure proper operation.

C. All valves shall be installed so that the valve stems are plumb and, in the location, shown.

END OF SECTION

SECTION 33 0524.13 – STEEL PIPE AND TUBING FOR AIR AND GAS SERVICE

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall provide steel pipe and appurtenances, complete and in place, in accordance with the Contract Documents.

B. The requirements of Section 22 1000 – Plumbing Piping shall apply to the WORK of this Section.

PART 2 - PRODUCTS

2.01 PIPE MATERIAL

A. **Water, Air, Fuel Gas, Oil, Steam, and Waste Service:** Unless otherwise indicated, galvanized and black steel pipe shall conform to ASTM A53 – Specification for Pipe, Steel Black and Hot-Dipped, Zinc-Coated, Welded and Seamless or ASTM A106 – Specification for Seamless Carbon Steel Pipe for High Temperature Service, Grade B, and shall be Schedule 10 or 40 as indicated in the Plans. Galvanized steel pipe shall not be cement mortar lined unless indicated otherwise in the Plans.

2.02 PIPE JOINTS

A. Black steel pipe for general service shall have screwed ends with NPT threads, welded joints, or flanged joints. Screwed joints shall be made up with Teflon tape and welded joints may have butt-weld fittings, socket-weld fittings, or flanges. Where indicated, black steel pipe shall have grooved ends for shouldered couplings or plain ends for sleeve-type couplings.

B. Black steel pipe for chlorine or sulfur dioxide pressure service shall be socket-welded except where required to match mating fittings of vacuum regulator check units, gas filters, valves, diaphragm units, gauges, and switches.

C. Galvanized steel pipe shall have screwed ends with NPT threads made up with Teflon tape. Where indicated, galvanized steel pipe shall have grooved ends for shouldered couplings or plain ends for sleeve-type couplings.

D. Where pressure conditions permit, black and galvanized steel pipe may have push-on joints for compression type fittings. For high-pressure service these joints shall be harnessed.

2.03 FITTINGS

A. **Common Use:** The following fittings shall be provided for galvanized or black steel pipe, as indicated in the Piping Schedule:

1. Threaded malleable iron fittings conforming to ANSI-ASME B16.3 – Malleable-Iron Threaded Fittings, Classes 150 and 300.
2. Threaded cast iron fittings conforming to ANSI/ASME B 16.4 - Cast Iron Threaded Fittings, Class 125 and 250.
3. Forged steel socket welded fittings conforming to ANSI/ASME B 16.11 - Forged Fittings, Socket - Welding and Threaded.
4. Butt welding fittings conforming to ANSI/ASME B 16.9 - Factory-Made Wrought Steel Butt Welding Fittings, Schedule 40 or 80, as indicated.
5. Threaded cast iron drainage fittings conforming to ANSI/ASME 16.12 - Cast Iron Threaded Drainage Fittings.

6. Flanged cast iron fittings conforming to ANSI/ASME B 16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800.
7. Flanged steel fittings conforming to ANSI/ASME B 16.5 - Pipe Flanges and Flanged Fittings, Steel Nickel Alloy and Other Special Alloys.
8. Grooved ductile iron fittings with grooving dimensions conforming to ANSI/AWWA C 606 - Joints, Grooved and Shouldered Type.
9. Compression-type steel fittings with armored Buna S gaskets for plain end pipe.

PART 3 - EXECUTION

3.01 INSTALLATION

A. **General:** All steel pipes shall be installed in a neat and workmanlike manner, properly aligned and cut from measurements taken at the site to avoid interferences with structural members, architectural features, openings, and equipment. Exposed pipes shall afford maximum headroom and access to equipment. Where necessary, all piping shall be installed with sufficient slopes for venting or drainage of liquids and condensate to low points.

B. **Supports and Anchors:** All piping shall be firmly supported with fabricated or commercial hangers or supports in accordance with Section 22 0529 – Hangers and Supports for Plumbing Piping and Equipment.

C. **Valves and Unions:** Water, steam, condensate gas, vacuum, and air supply piping to fixtures, groups of fixtures, and equipment shall be provided with a shutoff valve and union, unless the valve has flanged ends. Low points in water systems and driplegs in steam, gas and air systems shall have drainage valves. Unions shall be provided at threaded valves, equipment, and other devices requiring occasional removal or disconnection.

D. **Branch Connections:** Branch connections in horizontal runs of air and gas piping shall be made from the top of the pipe to avoid drainage of condensate into the equipment.

3.02 PIPE PREPARATION

A. Prior to installation, each pipe length shall be carefully inspected, be flushed clean of any debris or dust and be straightened if not true. Ends of threaded pipes shall be reamed and filed smooth. All pipe fittings shall be equally cleaned before assemblage.

3.03 PIPE JOINTS

A. **Threaded Joints:** Pipe threads shall conform to ANSI/ASME B1.20.1 – Pipe Threads, General Purpose (inch), and shall be full and cleanly cut with sharp dies. Not more than three threads shall remain exposed after installation.

B. **Welded Joints:** Welded joints shall conform to the specifications and recommendations of ANSI/ASME B 31.1 – Power Piping. All welding shall be done by skilled and qualified welders.

C. **Grooved Joints:** Grooves for grooved couplings and fittings shall be made with specially designed grooving tools to the Manufacturer’s recommendations and conform to ANSI/AWWA C606. All grooves shall be clean and sharp without flaws. The pipe ends shall be accurately cut at 90 degrees to the pipe axis.

D. **Push-On-Joints:** Push on joints and gasket installation shall be in accordance with the Manufacturer’s recommendations and lubricants. Pipe ends shall be beveled to

facilitate assembly. Lubricants shall be suitable for potable water service and shall be kept clean in closed containers.

3.04 INSPECTION AND FIELD TESTING

A. **Inspection:** All finished installations shall be carefully inspected for proper supports, anchoring, interferences, and damage to pipe, fittings, and coating. Any damage shall be repaired.

B. **Field Testing:** Prior to enclosure or burying, all piping systems shall be pressure tested as required for a period of not less than one hour, without exceeding the tolerances listed. Where no pressures are indicated, the pipes shall be subject to 1-1/2 times the maximum working pressure. All test equipment, labor, materials, and devices shall be furnished at the Contractor's expense.

1. Leakage may be determined by loss of pressure, soap solution, chemical indicator, or other positive and accurate methods. All fixtures, devices, or other accessories which are to be connected to the lines and which would be damaged if subjected to the test pressure shall be disconnected and ends of the branch lines plugged or capped as required during the testing procedures.

2. All leaks shall be repaired and the system shall be re-tested until no leaks are found.

END OF SECTION

SECTION 33 0531 – POLYVINYL CHLORIDE (PVC) PIPE

PART 1 – GENERAL

1.01 REQUIREMENT

A. Polyvinyl chloride pressure pipe for water distribution, in nominal diameters 4 inches through 60 inches.

B. Polyvinyl chloride sewer pipe for gravity sewers in nominal diameters 4 inches through 48 inches.

C. Polyvinyl chloride pressure pipe for sewers force mains in nominal diameters 4 inches through 60 inches.

D. Pipe 3 inch or smaller: Shall comply with these Specifications.

1.02 REFERENCES

A. **Commercial Standards:**

AWWA C909	Molecularly-Oriented Polyvinyl Chloride (PVCO) Pressure Pipe, 4 Inches through 12 Inches (100mm through 300 mm), for Water Distribution.

PPI TR3	Developing Recommended Hydrostatic Design Stresses for Thermoplastic Pipe Materials.
UNI-B-13	Joint Restraint Devices for Use with Polyvinyl Chloride Pipe.

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. Submit shop drawings showing design of new pipe and fittings indicating alignment and grade, laying dimensions, fabrication, fittings, flanges, and special details.

1.04 QUALITY CONTROL

A. Submit manufacturer's certifications that PVC pipe and fittings meet requirements of this Section and AWWA C900 and AWWA C909 for pressure pipe applications, or appropriate ASTM standard specified for gravity sewer pipe.

B. Submit manufacturer's certification that PVC pressure pipe for water lines and force mains has been hydrostatically tested at factory in accordance with AWWA C900, AWWA C909, and this Section.

C. When foreign manufactured material is proposed for use, have material tested for conformance to applicable ASTM requirements by certified independent testing laboratory located in United States. Certification from another source is not acceptable. Furnish copies of test reports to ENGINEER for review. Cost of testing paid by CONTRACTOR.

PART 2 – PRODUCTS

2.01 MATERIAL

A. Use PVC compounds in manufacture of pipe that contain no ingredient in amount that has been demonstrated to migrate into water in quantities considered to be toxic.

B. Furnish PVC pressure pipe manufactured from Class 12454-A or Class 12454-B virgin PVC compounds as defined in ASTM D1784. Use compounds pre-qualified for a 4,000 psi hydrostatic design basis, and a maximum hydrostatic design stress of 2,000 psi for water at 73°F per requirements of PPI TR3. Provide pipe which is homogeneous throughout, free of voids, cracks, inclusions, and other defects, uniform as commercially practical in color, density, and other physical properties. Deliver pipe with surfaces free from nicks and scratches with joining surfaces of spigots and joints free from gouges and imperfections which could cause leakage.

C. PVC Solvent Weld Schedule Pipe shall meet:
1. PVC Schedule 40 and 80: ASTM D1785/ D2665/ D2241
2. Cellular Core PVC Sch 40: ASTM F891
3. PVC Schedule 30: ASTM D2949
4. PVC Perforated Drain Pipe: ASTM D2729
5. ABS Sch 40: ASTM D2661
6. Cellular Core ABS Sch 40: ASTM F628

D. Standard PVC laying length shall be 14 or 20 ft +/- 1”. Solvent Weld Pipe shall be manufactured in standard laying length of 10 ft and 20 ft.

E. Do not use PVC for offset sections with depth of cover greater than 20 feet or less than 4 feet, unless acceptable by manufacturer. Do not use PVC in potentially petroleum-contaminated areas.

F. PVC in areas exposed to direct sunlight shall be protected with UV-inhibitor coating.

2.02 Pipe Class and Working Pressures:

A. Pipe Pressure Class shall be as noted per plan and shall meet the requirements in the

following Table 1.

Table 1 – Pipe Pressure Class

APPLICATION	ASTM or AWWA DESIGNATION	SDR (Max.)/ STIFFNESS (MIN.)	DIAMETER SIZE RANGE
PRESSURE/ GRAVITY	C900 C900 C900	DR 25/ Class 165 psi DR 18/ Class 235 psi DR 14/ Class 305 psi	4" to 60” 4" to 42 4” to 30”
GRAVITY	D3034 D3034	SDR 35/ 46 psi SDR 26/ 115 psi	4" to 15" 4" to 15"
GRAVITY	F679 F679	PS46/ 46 psi PS 115/ 115 psi	18” to 48” 18" to 48"
CORRUGATED GRAVITY	F949 F949	N/A / 46 psi N/A / 115 psi	4" to 48" 4" to 48"
CORRUGATED GRAVITY	F794 F794	N/A / 46 psi N/A / 115 psi	4" to 48" 8" to 15"

2.03 PRESSURE SERVICE PIPE

A. All potable water pipe shall bear National Sanitation Foundation Seal of Approval (NSF-PW) and meet the requirements of AWWA C900, ANSI/ NSF 61.

B. For PVC C900, pipeline curves and bend can be made by deflecting joints by no more than 1.5 deg. Do not exceed maximum deflection recommended by pipe and fitting manufacturer. Submit details of other methods of providing curves and bends for review by ENGINEER.

C. For PVC Solvent Weld Pipe (12” and smaller), pipeline curves can be made by bending the pipe within the limits of pipe curvature found in Table 2 below.

2.04 GRAVITY SEWER PIPE

A. When solid wall PVC pipe 18 inches to 27 inches in diameter is required in SDR 26, provide pipe conforming to ASTM F679, except provide wall thickness as required for SDR 26 and pipe strength of 115 psi.

B. No deflection at joint shall be allowed for pipe sizes 12” or smaller. Pipeline curves shall be accomplished through bending of the pipe within the limits of pipe curvature as shown in the following Table:

Table 2 – Pipe Bend Curvature

PIPE SIZE (IN)	MIN RADIUS (FT)	OFFSET/ 20 FT (IN)	OFFSET/ 14 FT (IN)
4	100	23.9	11.7
6	150	16	7.8
8	200	12	5.9
10	250	9.6	4.7
12	300	8	3.9

C. For pipes 15” – 36” maximum angular deflection at joint shall be 1.5 degrees or as approved by pipe manufacturer.

D. For sewers up to 12 inches in diameter crossing over water lines, or crossing under water lines with less than 2 feet separation, provide minimum 150 psi pressure-rated pipe conforming to ASTM D2241 with suitable PVC adapter couplings. Pipes shall be encased in concrete, unless noted otherwise.

2.05 GASKETS

A. For pressure pipe, integral gasket bell and spigot “push-on” joint shall conform to ASTM D3139.

B. For gravity pipe, locked-in gaskets joints shall meet ASTM D3212 for joint tightness (22” Hg vacuum and a 25-ft head pressure test)

C. Gaskets shall meet the requirements of ASTM F477.

D. Flat Face Mating Flange: Full faces 1/8-inch-thick ethylene propylene (EPR) rubber.

E. Raised Face Mating Flange: Flat ring 1/8-inch ethylene propylene (EDR) rubber, with filler gasket between OD of raised face and flange OD to protect flange from bolting moment.

F. Lubricant for rubber-gasketed joints: Water soluble, non-toxic, non-objectionable in taste and odor imparted to fluid, non-supporting of bacteria growth, having no deteriorating effect on PVC or rubber gaskets.

G. Manufacturer shall test sample from each batch conforming to requirements ASTM D2444.

2.06 JOINTS AND FITTINGS:

A. Flanged or bolted mechanical joint or push-on joint ductile or gray iron fittings shall conform to ANSI/AWWA C110/A21.10 or C153/A21.53 and ANSI/ AWWA C111/A21.11. All iron fittings shall be cement mortar lined and tar (seal) coated in accordance with ANSI/AWWA C104/A21.4

B. PVC pipe fittings shall be full-bodied, either injection molded or factory fabricated, and shall meet AWWA C907. Saddle-type tee or wye fittings are not acceptable, unless noted otherwise.

C. Fusible PVC pipe lengths shall be assembled in the field with butt-fused joints. The Contractor shall follow the pipe supplier’s written guidelines for this procedure.

D. Solvent Weld PVC pipes shall utilize solvent weld on bell end, plain end, and socket type fittings and shall meet ASTM D2564.

E. Provide approved restrained joint fittings as required and as shown on plans. Restraining devices shall meet or exceed the requirements of ASTM F1674 or UNI-Bell B-13 "Recommended Standard Performance Specification for Joint Restrainers for Use with PVC Pipe."

F. Exterior Protection: Provide polyethylene wrapping of ductile-iron fittings.

2.07 Hydrostatic Test: AWWA C900, AWWA C909, ANSI A21.10 (AWWA C110); at point of manufacture; submit manufacturer's written certification.

PART 3 – EXECUTION

3.01 PROTECTION

A. Store pipe under cover out of direct sunlight and protect from excessive heat or harmful chemicals in accordance with manufacturer's recommendations.

3.02 INSTALLATION

A. Install PVC pipe in accordance with these Specifications, ASTM D2321 for Sewer Pipe, and manufacturer's recommendations.

B. Install PVC water service pipe to clear utility lines and have minimum depth of cover 48” below major streets, unless otherwise required by Drawings.

C. Avoid imposing strains that will overstress or buckle pipe when lowering pipe into trench.

D. Hand shovel pipe bedding under pipe haunches and along sides of pipe barrel and compact to eliminate voids and ensure side support.

F. Allow PVC pipe to cool to ground temperature before backfilling when assembled out of trench to prevent pullout due to thermal contraction.

3.03 PVC RESTRAINED MECHANISM

A. Do not apply lubricant to spline or pipe or coupling spline grooves.

B. Do not use excessive force while inserting the spline through coupling.

C. Insert spline until it is fully seated around circumference of pipe.

D. Field Cutting of Pipe Ends:
   1. Perform by workers certified by manufacturer.
   2. Use a PVC pipe cutter and provide square ends.
   3. Use manufacturer approved power routing and grooving tool to field fabricate required pipe groove.

END OF SECTION

SECTION 33 0531.19 – FUSIBLE POLYVINYL CHLORIDE (FPVC) PIPE

PART 1 – GENERAL

1.01 REQUIREMENT

A. Fusible polyvinyl chloride sewer pipe for gravity sewers in nominal diameters 4 inches through 48 inches.

1.02 REFERENCES

PPI TR3	Developing Recommended Hydrostatic Design Stresses for Thermoplastic Pipe Materials.
UNI-B-13	Joint Restraint Devices for Use with Polyvinyl Chloride Pipe.

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. Submit shop drawings showing design of new pipe and fittings indicating alignment and grade, laying dimensions, fabrication, fittings, flanges, and special details.

C. Post-Construction Submittals: The following is required from the contractor and/or fusion provider to Owner or pipe supplier upon request:
   1. Fusion machine make, model, and serial number;
   2. Fusion technician identification and qualification level;
   3. Fusion joint number;
   4. Fusion, heating, and drag pressure settings;
   5. Heat plate temperature;
   6. Fusion heating time and cool down time;
   7. Ambient temperature and weather conditions.

1.04 QUALITY CONTROL

A. Submit manufacturer's certifications that PVC pipe and fittings meet requirements of this Section and AWWA C900 and AWWA C909 for pressure pipe applications, or appropriate ASTM standard specified for gravity sewer pipe.

B. Submit manufacturer's certification that PVC pressure pipe for water lines and force mains has been hydrostatically tested at factory in accordance with AWWA C900, AWWA C909, and this Section.

C. When foreign manufactured material is proposed for use, have material tested for conformance to applicable ASTM requirements by certified independent testing laboratory located in United States. Certification from another source is not acceptable. Furnish copies of test reports to ENGINEER for review. Cost of testing paid by CONTRACTOR.

PART 2 – PRODUCTS

2.01 MATERIAL

A. Use PVC compounds in manufacture of pipe that contain no ingredient in amount that has been demonstrated to migrate into water in quantities considered to be toxic.

B. Furnish PVC pressure pipe manufactured from Class 12454-A or Class 12454-B virgin PVC compounds as defined in ASTM D1784. Use compounds pre-qualified for a 4,000 psi hydrostatic design basis, and a maximum hydrostatic design stress of 2,000 psi for water at 73°F per requirements of PPI TR3. Provide pipe which is homogeneous throughout, free of voids, cracks, inclusions, and other defects, uniform as commercially practical in color, density, and other physical properties. Deliver pipe with surfaces free from nicks and scratches with joining surfaces of spigots and joints free from gouges and imperfections which could cause leakage.

C. Fusible PVC pipes shall meet ASTM D2241/ D1785, CSA B137.3, AWWA C900, NFS 61 (potable water), and ASTM Cell Classification 12454.

D. PVC Solvent Weld Schedule Pipe shall meet:
   1. PVC Schedule 40 and 80: ASTM D1785/ D2665/ D2241
   2. Cellular Core PVC Sch 40: ASTM F891
   3. PVC Schedule 30: ASTM D2949
   4. PVC Perforated Drain Pipe: ASTM D2729
   5. ABS Sch 40: ASTM D2661
   6. Cellular Core ABS Sch 40: ASTM F628

E. Fusible PVC pipe shall be manufactured in a standard 40’ nominal length, or custom

lengths as specified in the plans. Solvent Weld Pipe shall be manufactured in standard laying length of 10 ft and 20 ft.

F. Do not use PVC for offset sections with depth of cover greater than 20 feet or less than 4 feet, unless acceptable by manufacturer. Do not use PVC in potentially petroleum-contaminated areas.

G. PVC in areas exposed to direct sunlight shall be protected with UV-inhibitor coating.

2.02 Pipe Class and Working Pressures:

A. Pipe Pressure Class shall be as noted per plan and shall meet the requirements in the following Table 1.

Table 1 – Pipe Pressure Class

APPLICATION	ASTM or AWWA DESIGNATION	SDR (Max.)/ STIFFNESS (MIN.)	DIAMETER SIZE RANGE
PRESSURE/ GRAVITY	C900 C900 C900	DR 25/ Class 165 psi DR 18/ Class 235 psi DR 14/ Class 305 psi	4" to 60” 4" to 42 4” to 30”
GRAVITY	D3034 D3034	SDR 35/ 46 psi SDR 26/ 115 psi	4" to 15" 4" to 15"
GRAVITY	F679 F679	PS46/ 46 psi PS 115/ 115 psi	18” to 48” 18" to 48"
CORRUGATED GRAVITY	F949 F949	N/A / 46 psi N/A / 115 psi	4" to 48" 4" to 48"
CORRUGATED GRAVITY	F794 F794	N/A / 46 psi N/A / 115 psi	4" to 48" 8" to 15"

2.03 PRESSURE SERVICE PIPE

A. All potable water pipe shall bear National Sanitation Foundation Seal of Approval (NSF-PW) and meet the requirements of AWWA C900, ANSI/ NSF 61.

B. For PVC C900, pipeline curves and bend can be made by deflecting joints by no more than 1.5 deg. Do not exceed maximum deflection recommended by pipe and fitting manufacturer. Submit details of other methods of providing curves and bends for review by ENGINEER.

C. For PVC Solvent Weld Pipe (12” and smaller), pipeline curves can be made by bending the pipe within the limits of pipe curvature found in Table 2 below.

2.04 GRAVITY SEWER PIPE

A. When solid wall PVC pipe 18 inches to 27 inches in diameter is required in SDR 26, provide pipe conforming to ASTM F679, except provide wall thickness as required for SDR 26 and pipe strength of 115 psi.

B. No deflection at joint shall be allowed for pipe sizes 12” or smaller. Pipeline curves shall be accomplished through bending of the pipe within the limits of pipe curvature as shown in the following Table:

Table 2 – Pipe Bend Curvature

PIPE SIZE (IN)	MIN RADIUS (FT)	OFFSET/ 20 FT (IN)	OFFSET/ 14 FT (IN)
4	100	23.9	11.7
6	150	16	7.8
8	200	12	5.9
10	250	9.6	4.7
12	300	8	3.9

C. For pipes 15” – 36” maximum angular deflection at joint shall be 1.5 degrees or as approved by pipe manufacturer.

D. For sewers up to 12 inches in diameter crossing over water lines, or crossing under water lines with less than 2 feet separation, provide minimum 150 psi pressure-rated pipe conforming to ASTM D2241 with suitable PVC adapter couplings. Pipes shall be encased in concrete, unless noted otherwise.

2.05 FUSIBLE PVC PIPE FOR GRAVITY SEWER

A. Fusible PVC pipe shall conform to AWWA C900, ASTM D2241 or ASTM D1785 for standard dimensionality, as applicable. Testing shall be in accordance with the referenced AWWA standard.

B. Fusible PVC pipe shall be extruded with plain ends. The ends shall be square to the pipe and free of any bevel or chamfer. There shall be no bell or spigot of any kind incorporated into the pipe.

C. Fusible PVC pipe shall be manufactured in a standard 40’ nominal length, or custom lengths as specified.

D. Fusible PVC pipe shall be green in color for wastewater use.

E. Fusible PVC pipe shall be connected to manholes and other structures to provide a leak-free, properly graded flow into or out of the manhole or structure. Connections to a new manhole or structure shall be as indicated in the construction documents.

1. A flexible, watertight gasket per ASTM C923 shall be cast integrally with riser section(s) for all precast manholes and structures.
2. Drop connections shall be required where shown on drawings.
3. Grout internal joint space with non-shrink grout.

F. Adhere to the following data regarding radius of curvature for fusible PVC pipe. The confirmation of proposed radius of each section has to be part of the required submittal prior to construction.

Pipe Diameter (in)	DIPS Series	
	Critical Bucking Pressure (lbs)	Minimum Allowable Bending (ft)
4	426	100
6	426	144
8	425	189
10	426	231
12	426	275

G. Unless otherwise specified, fusible PVC pipe lengths shall be assembled in the field with butt-fused joints. The Contractor shall follow the Manufacturer's written guidelines.

H. Fusible PVC sweeps or bends shall have at least 2 feet of straight section on either end of the sweep or bend to allow for fusion of the sweep or bend to the pip. Unless otherwise specified, there shall be no gasketed connections utilized with a fusible PVC sweep.

I. Standard fusible PVC sweep or bend angles shall not be greater than 22.5 degrees and shall be used with fusible PVC pipe with nominal diameters 4-inch through 16-inch, unless otherwise specified.

2.06 FUSION JOINTS

A. Unless otherwise specified, fusible PVC pipe lengths shall be assembled in the field with butt-fused joints. The Contractor shall follow the pipe supplier's written guidelines for this procedure. All fusion joints shall be completed as described in this specification.

PART 3 – EXECUTION

3.01 PROTECTION

A. Store pipe under cover out of direct sunlight and protect from excessive heat or harmful chemicals in accordance with manufacturer's recommendations.

3.02 INSTALLATION

A. Install PVC pipe in accordance with these Specifications, ASTM D2321 for Sewer Pipe, and manufacturer's recommendations.

B. Install PVC water service pipe to clear utility lines and have minimum depth of cover 48" below major streets, unless otherwise required by Drawings.

C. Avoid imposing strains that will overstress or buckle pipe when lowering pipe into trench.

D. Hand shovel pipe bedding under pipe haunches and along sides of pipe barrel and compact to eliminate voids and ensure side support.

F. Allow PVC pipe to cool to ground temperature before backfilling when assembled out of trench to prevent pullout due to thermal contraction.

3.03 PVC RESTRAINED MECHANISM

A. Do not apply lubricant to spline or pipe or coupling spline grooves.

B. Do not use excessive force while inserting the spline through coupling.

C. Insert spline until it is fully seated around circumference of pipe.

D. Field Cutting of Pipe Ends:
   1. Perform by workers certified by manufacturer.
   2. Use a PVC pipe cutter and provide square ends.
   3. Use manufacturer approved power routing and grooving tool to field fabricate required pipe groove.

3.04 FUSION PROCESS FOR FUSIBLE PVC

A. Fusible PVC pipe shall be handled in a safe manner before, during, and after the fusion process and in accordance with this specification and the pipe supplier's guidelines.

B. Fusible PVC pipe shall be fused by qualified fusion technicians, as documented by the pipe supplier.

C. Only appropriately sized and outfitted fusion machines that have been approved by the pipe supplier shall be used for the fusion process. Fusion machines must incorporate the following elements:

1. Heat Plate – Heat plates shall be in good condition with no deep gouges or scratches. Plates shall be kept clean and free of any debris or contamination. Heater controls shall function properly; cord and plug shall be in good condition. The appropriately sized heat plate shall be capable of maintaining a uniform and consistent heat profile and temperature for the size of pipe being fused, per the pipe supplier's guidelines.
2. Carriage – Carriages shall travel smoothly with no binding at low pressure. Jaws shall be in good condition with proper and clean inserts for the pipe size being fused. Insert pins shall be installed with no interference to carriage travel.
3. General Machine – All fusion machines shall be inspected for obvious defects, missing parts, hydraulic leaks, or potential safety issues prior to fusion.
4. Data Logging Device – An approved, fully functional datalogging device, with the current version of the pipe supplier's software, shall be used. Datalogging device operations and maintenance manual shall be kept with the unit at all times. If fusing for extended periods of time, an independent 110V power source shall be available to extend battery life.
5. Other equipment specifically required for the fusion process shall include the following:
    a) Pipe rollers shall be used for pipe support to either side of the machine.
    b) An infrared (IR) pyrometer with an accuracy of 1% or better, shall be used to check pipe and heat plate temperatures.
    c) Fusion machine operations and maintenance manual shall be kept with the fusion machine at all times.
    d) Facing blades specifically designed for cutting fusible PVC pipe shall be used.
    e) For fusion in inclement weather and/or windy conditions, a weather protection canopy with sides that allows full machine motion of the heat plate, fusion assembly and carriage shall be provided per the pipe supplier's recommendations. When the pipe temperature is below 40ºF, the pipe supplier's cold weather operating procedures shall be followed.

D. Joint Recording: Each fusion joint shall be logged by an approved electronic monitoring device (Data logger) connected to the fusion machine hydraulic system. The fusion data logging report shall be generated by software developed specifically for the butt-fusion of fusible PVC pipe. The software shall register and/or record the parameter required by the pip supplier and these specifications. Required data not logged by the data logger shall be logged manually and included in the fusion technician's joint report.

3.05 LEAKAGE TESTING FOR NON-PRESSURE FUSIBLE PVC

A. Gravity sanitary sewer leakage testing may include appropriate water or low-pressure air testing and shall be in accordance with MAG Standard Detail 611 and ASTM F1417.

END OF SECTION

SECTION 33 0561 – CONCRETE MANHOLES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Manholes for sanitary sewer system assemblies.

1.02 REFERENCES

A. Soils Report: This work shall conform to the requirements of the latest Geotechnical Evaluation.

B. American National Standards Institute (ANSI)

C. AASHTO: American Association of State Highway and Transportation Officials Standard Specification for Highway Bridges

D. American Society for Testing and Materials (ASTM):

A48	Gray Iron Castings
A193	Alloy Steel and Stainless Steel Bolting Materials for High-Temperature Service.
A615	Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
C14	Concrete Sewer, Storm Drain, and Culvert Pipe.
C387	Packaged, Dry, Combined Materials for Mortar and Concrete.
C478	Precast Reinforced Concrete Manhole Sections.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings:
1. Submit drawing of each manhole with plan and sections showing manhole dimensions and actual installation.
2. Submit testing plan, documentation methods, and proposed schedule.

PART 2 - PRODUCTS

2.01 MANHOLES

A. Manhole Bases: The base of all manholes shall be either cast-in-place concrete or precast concrete, except for manholes housing air and vacuum release valve assemblies.
1. Precast concrete bases shall have the base slab integral with the sidewalls. The base slab shall be 6 inches minimum thickness with No. 4 reinforcement steel bars at 8 inches on centers each way in the center of the slab. The base reinforcement steel shall be tied to the wall steel.
2. Bases for manholes housing air and vacuum release valve assemblies shall consist of a drain gravel base and precast or cast-in-place concrete ring foundation.

B. Precast Manhole Sections: Precast manhole sections conforming to ASTM C478 shall be either 48-inch, 60-inch, 72-inch, or 84-inch internal diameter with 5-inch minimum walls or as otherwise shown for special purposes. The top and bottom of all sections shall be parallel.

C. Eccentric Sections: Eccentric cones shall be provided for all manholes except as otherwise shown on the Drawings. Cones shall have the same wall thickness and reinforcement as the precast manhole section.

D. Manhole Grade Rings:
1. Manhole grade rings for extensions shall be a maximum 6 inches high. Extensions will be limited to 15 inches.

2. Finish grade for solid covers shall be ½-inch below flush in concrete or asphalt concrete paved areas, and 6 inches above finish grade in unpaved areas, except flush where gated covers are specified.
3. Grade rings shall have anchor bolt holes for bolt-down frames and covers.
4. Finish installation in accordance with MAG standard Detail 420-2

E. Factory Testing: Prior to delivery of precast manhole sections, yard tests shall be conducted at the point of manufacture. Precast sections to be tested shall be selected at random from stockpiled material to be supplied for the job. All test specimens shall be mat tested, and shall meet the permeability test requirements of ASTM C14.

F. Joints of Manhole Sections: Tongue-and-groove type sealed with either mortar or preformed plastic joint material.
1. Mortar: Standard premixed mortar conforming to ASTM C387 or proportion 1 part portland cement to 2 parts clean, well-graded sand which will pass a 1/8-inch screen. Admixtures may be used not exceeding the following percentages of weight of cement: Hydrated lime, 10 percent; diatomaceous earth or other inert materials, 5 percent. Consistency of mortar shall be such that it will readily adhere to the manhole section if using the standard tongue-and-groove type joint. Mortar mixed for longer than 30 minutes shall not be used.
2. Preformed Plastic Gaskets: Preformed plastic gaskets may be used in lieu of mortar type joints.
   a. Manufacturers:
      1) Kent-Seal No. 2, Hamilton Kent Manufacturing Company, Box 178, Kent, OH 44240;
      2) Ram-Nek, K. T. Snyder Company, Inc., Central National Bank Building, Houston, TX 77002;
      3) or ENGINEER-approved equal, meeting all requirements of Federal Specification SS-S-00210.

G. Pipe connections to manholes shall be as specified by the pipe manufacturer. Inlet and outlet pipes shall extend through the walls of the structures for a sufficient distance beyond the outside surface to allow for connections, but shall be cut off flush with the wall on the inside surface. For concrete structures, the mortar shall be placed around these pipes so as to form a tight, neat connection.

H. Manhole frames and covers shall be cast iron as detailed on the Drawings and elsewhere in these Specifications and Contract Documents.

1. Use castings for frames, grates, rings, and covers conforming to ASTM A48, Class 35B. Provide locking covers if indicated on Drawings.

2. Use clean castings capable of withstanding application of AASHTO M306 - 40,000-pound proof loading without detrimental permanent deformation.

3. Fabricate castings to conform to shapes, dimensions, and with wording or logos shown on Drawings. Standard dimensions for manhole covers are 32 inches in diameter.

4. Cast iron castings shall be tough, close-grained gray iron, sound, smooth, clean, free from blisters, blowholes, shrinkage, cold shuts, and all defects, and shall conform to ASTM A48, Class 30B. Plane or grind bearing surfaces to ensure flat, true surfaces.

5. Bolt-down covers shall be used on all electrical vaults and where indicated on Drawings.

6. Capscrews and washers shall be Type 316 stainless steel conforming to ASTM A193. Countersink bolt holes in cover so that the top of the capscrews are below the top plane of the cover. Frames for bolt-down covers shall be supplied with four ¾-inch-diameter Type 316 stainless steel anchor bolts, nuts, and washer as detailed on the Drawings.
7. Nominal inside opening of the frame shall be 24 inches, unless noted otherwise. Provide a blind pick hole or lifting lug in the cover. Do not provide lifting rings or vent holes in covers unless specifically required.

2.02 CLEANOUTS

A. Covers shall be true and seat within frame at all points.

B. Cleanout frames and covers shall be Pinkerton Foundry No. A-469 or D&L Supply No. H-8024, or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Manholes:
1. Concrete Base: Vibrate to densify poured in-place concrete and screed so that the first precast manhole section to be placed has a level, uniform bearing for the full circumference.
2. Deposit sufficient mortar on base to assure watertight seal between base and manhole wall or place the first precast section of manhole in concrete base before concrete has set. First section shall be properly located and plumb.
3. Carefully inspect precast manhole sections to be joined. Sections with chips or cracks in the tongue shall not be used. Clean ends of sections before assembly. Align manhole steps vertically.
4. Joints with preformed plastic gaskets shall be installed in strict conformance with the manufacturer's recommendations. Only pipe primer furnished by the gasket manufacturer will be approved.
5. For mortar joints, thoroughly wet joint with water prior to placing mortar. Place mortar on groove of lower section. Set next section in place. Fill joint completely with mortar of the proper consistency. Trowel interior and exterior surfaces smooth on standard tongue-and-groove joints. Prevent mortar from drying out, and cure by applying an approved curing compound or comparable approved method. Chip out and replace all cracked or defective mortar.

B. Construct manhole inverts with smooth transitions to ensure an unobstructed flow through manhole. Remove all sharp edges or rough sections which tend to obstruct flow. Do not lay pipe through manholes. Trowel all mortar surfaces smooth.

C. Install frames and covers. Frames shall be set in a bed of mortar with the mortar carried over the flange of the ring. Install bolt-down manholes as shown or as recommended by manufacturer. Provide a minimum of one 6-inch-high grade ring under the frame and cover. Extend anchor bolts through the grade ring to the frame. Hook the anchor bolt under the grade ring.

D. Manholes shall be tested as required by these Specifications and Contract Documents.

3.02 CLEANOUTS AND VAULTS

A. Construct in accordance with details as indicated on the Drawings.

3.03 CLEANING

A. Construction debris and other foreign matter shall be removed to the satisfaction of the ENGINEER.

B. Install cover drain pipe to minimum 12” x 12” x 12” drain rock approximately 10 feet from manhole on down slope.

C. Install top of manholes at 6 inches above finish grade or surface. Install surveyor markings to establish finish grade.

END OF SECTION

SECTION 33 3216 – PACKAGED WASTEWATER GRINDER PUMP ASSEMBLIES

PART 1 - GENERAL

1.01 GENERAL DESCRIPTION: The Contractor shall furnish complete factory-built and tested grinder pump unit(s), each consisting of a grinder pump core suitably mounted on an integral stand of stainless steel, special polyethylene tank, electrical quick disconnect (NEMA 6P), pump removal harness, discharge assembly/shut-off valve, anti-siphon valve/check valve assembly, electrical alarm assembly and all necessary internal wiring and controls. For ease of serviceability, all pump motor/grinder units shall be of like type and horsepower throughout the system.

1.02 SUBMITTALS:

A. Submittals shall be furnished in accordance with Sections 01 3300 – Submittal Procedures and applicable Sections of these Specifications and Contract Documents.

B. The MANUFACTURER shall supply four copies of Operation and Maintenance Manuals to the OWNER, and one copy of the same to the ENGINEER.

1.03 MANUFACTURER: Grinder pump stations, complete with all appurtenances, form an integral system, and as such, shall be supplied by one grinder pump station manufacturer. The CONTRACTOR shall be responsible for the satisfactory operation of the entire system. The equipment specified shall be a product of a company experienced in the design and manufacture of grinder pumps for specific use in low pressure sewage systems. The company shall submit detailed installation and user instructions for its product, submit evidence of an established service program including complete parts and service manuals, and be responsible for maintaining a continuing inventory of grinder pump replacement parts. The MANUFACTURER shall provide, upon request, a reference and contact list from ten of its largest contiguous grinder pump installations of the type of grinder pumps described within this specification.

The MANUFACTURER of the grinder pump station shall be Environment One Corporation, Sierra Peak, or ENGINEER approved equal.

Attention is directed to the fact that the drawings and overall system design are based on a particular piece of equipment from a particular manufacturer. These specifications are intended to provide guidelines for standard equipment of a recognized manufacturer who already meets all the requirements of this specification.

1.04 EXPERIENCE CLAUSE: The equipment furnished hereunder shall be the product of a company experienced in the design and manufacture of grinder pumps specifically designed for use in low pressure systems. All manufacturers proposing equipment for this project shall have at least 10 years of experience in the design and manufacture of units of identical size(s) and performance to the specified units. All manufacturers proposing equipment for this project must also have not less than 500 successful installations of low-pressure sewer systems utilizing grinder pumps of like type to the grinder pumps specified herein. An installation is defined as a minimum of 25 pumps discharging into a common force main which forms a low pressure sewer system. The contractor (supplier) proposing alternate equipment shall also submit, as part of the bid schedule, an installation list with contact person(s), phone number(s) and date(s) of at least 10 installations of the type of pump specified herein that have been in operation for at least 10 years.

In lieu of this experience clause, the contractor (supplier) of alternate equipment will be required to submit a 5-year performance bond for 100 percent of the stipulated cost of the equipment as bid and as shown in the Bid Schedule. This performance bond will be

used to guarantee the replacement of the equipment in the event that it fails within the bond period.

1.05 OPERATING CONDITIONS: The pumps shall be capable of delivering 31 GPM against a rated total dynamic head of 82 feet (35 PSIG). The pump(s) must also be capable of operating at negative total dynamic head without overloading the motor(s). Under no conditions shall in-line piping or valving be allowed to create a false apparent head.

1.06 WARRANTY: The grinder pump MANUFACTURER shall provide a part(s) and labor warranty on the complete station and accessories, including, but not limited to, the panel for a period of 36 months after receipt of shipment. Any manufacturing defects found during the warranty period will be reported to the MANUFACTURER by the OWNER and will be corrected by the MANUFACTURER at no cost to the OWNER.

1.07 WARRANTY PERFORMANCE CERTIFICATION: As a bid certification requirement, each bidder shall provide with their bid schedule a Warranty Performance Certification statement executed by the most senior executive officer of the grinder pump MANUFACTURER, which certifies a minimum of a 36-month warranty. They must further detail any exclusions from the warranty or additional cost items required to maintain the equipment in warrantable condition, including all associated labor and shipping fees, and certify that the MANUFACTURER will bear all costs to correct any original equipment deficiency for the effective period of the warranty. All preventive maintenance type requirements shall be included in this form as exclusions. These requirements include, but are not limited to, unjamming of grinder mechanism, periodic motor maintenance, and periodic cleaning of liquid level controls. Should the CONTRACTOR (supplier) elect to submit a performance bond in lieu of the experience clause outlined above, this Warranty Performance Certification shall also be used as a criterion to evaluate the CONTRACTOR'S (supplier's) performance over the warranty period. A Warranty Performance Certification form is included with the bid schedule and must be completed and submitted as part of the bid package. Bids with incomplete forms or missing forms will be considered nonresponsive.

PART 2 - PRODUCTS

2.01 TANK: The dimensions of the basin shall be based on the required site conditions as shown on the plans. The basin shall be provided with a minimum depth of 108". The basin shall be made from a fiberglass reinforced polyester resin. The resins used shall be a commercial grade polyester and shall be evaluated as a laminate by test or determined by previous service to be acceptable for the intended environment. The reinforcing material shall be a commercial grade of glass fiber having a coupling agent to provide a suitable bond between the glass reinforcement and the resin. The manufacturer may supply either (continuous strand, chopped-strand, continuous mat, and/or non-continuous mat) or (non-continuous glass strands having fiber lengths from 0.5 to 2.0 inches). The basin shall be water-tight.

The inner surface shall be smooth and free of cracks, exposed fibers, porosity, and crazing. The exterior surface shall be relatively smooth without exposed fibers or sharp projections. Wall thickness shall vary depending on basin height, to provide necessary strength to meet tensile and flexural physical property requirements. The tank wall and bottom must be designed to withstand 150 percent the pressure exerted by saturated soil loading at maximum burial depth. All station components must function normally when exposed to 150 percent of the maximum external soil and hydrostatic pressure.

The wet well FRP bottom laminate shall have less than 0.375 inches of center elastic deflection (deformation) when in service in totally submerged conditions. The finished FRP laminate will have a Barcol Hardness of at least 90% of the resin manufacturer's specified hardness for the fully cured resin. The Barcol Hardness shall be the same for

both interior and exterior surfaces. The wet well top flange shall have an outside diameter at least 4.0 inches greater than the inside diameter of the wet well. A six-hole pattern shall accommodate the mounting of a cover with at least 0.375 inches in diameter 300 series stainless steel fasteners. Non-corroding stainless steel threaded inserts shall be fully encapsulated with noncontinuous mat or chopped-strand glass fiber reinforcement. The inserts shall have an offset tab to prevent stripping or spinning out when removing and reinserting cover fasteners.

The steel anti-floatation flange shall be constructed from 0.1875 inches thick ASTM A36 structural steel plate, encapsulated in at least 0.125 inches of chopped-strand glass fiber reinforcement on all sides. The steel anti-floatation flange shall be square with outside dimensions of at least 4.0 inches greater than the wet well inside diameter. The steel anti-floatation flange shall be attached to the wet well bottom with chopped-strand glass fiber reinforcement. CONTRACTOR shall place the wet well on a concrete pad and fill with grout covering the entire steel anti- floatation flange. The amount of concrete shall be sufficient to prevent floatation of the wet well based on the site conditions. The steel anti-floatation flange shall not require bolt holes to secure it to the concrete pad.

A. Basin Cover: May be constructed of fiberglass, aluminum, or steel and may include an access hatch of single or double-leaf design.

The solid fiberglass cover shall be constructed with continuous mat or chopped-strand glass fiber reinforcement with a minimum thickness of 0.325 inches. The cover shall be green in color.

The aluminum cover shall be constructed of 0.250 inches thick mill finish in diamond plate pattern with 300 series stainless steel hardware. The access hatch shall have a recessed handle and locking pin. The hatch shall be held open in the vertical position by means of a hold open arm of corrosion resistant design.

The steel cover shall be constructed of 0.375 inches thick black enameled ASTM A36 structural steel plate. The access hatch shall have a recessed handle and locking pin. The hatch shall be held open in the vertical position by means of a positive locking arm of corrosion resistant design.

B. Electrical Connections: The fiberglass basin shall have polyethylene bulkhead fittings or a stainless steel fitting plate, terminating outside the tank wall with ¾” pipe thread. The fittings or plate shall be factory installed and sealed to guarantee watertight connection. There shall be (1) fitting for each pump supply cable and (1) fitting for the float cable.

C. Inlet Penetration: An EPDM grommet for use with 4” SCH40 or SDR35 pipe shall be included for field installation by CONTRACTOR. Hub shall have a six bolt pattern and include a hardware kit, consisting of stainless steel bolts, washers, nuts, and foam adhesive gasket. The pipe grommet or hub shall be the primary method of seal and shall not require any secondary sealing materials.

D. Vent Penetration: The tank shall be vented by means of a factory-provided, field-installed vent kit. A vent grommet for use with 2” DWV pipe shall be provided for field-installation into the tank wall. Vent line shall be terminated in 2” mushroom-style, non-corrosive ABS vent cap with activated carbon media for odor prevention

E. DISCHARGE: A stainless steel discharge wye fitting with two 1-1/4” NPT connections shall be factory installed in basin, to terminate on exterior tank wall. The discharge penetration shall be sealed and watertight. Inside the basin, one quick disconnect discharge fitting shall be provided per pump and fitting shall act as a gate valve, to prevent fluid backflow into basin when closed.

2.02 Grinder Pump: The pump shall have a non-overloading maximum capacity of over 31 GPM and a maximum total dynamic head of 82 feet. The pump shall also be capable of

operating at negative total dynamic head. The quantity of pumps installed shall be as shown in the plans.

A. Grinder Pump Construction: Pump shall be of the centrifugal-type with integral grinder mechanism and submersible type motor. The grinder shall be capable of macerating all material in normal domestic and commercial sewage, including reasonable amounts of foreign objects, to small particles which can freely pass through the pump and the 1-1/4" discharge piping. For easy serviceability, the pump shall be assembled as a single core unit, including motor, grinder, pump, valves, power cord, and quick disconnects for electrical and discharge.

Castings and major components shall be of gray cast iron, ASTM A48, Class 35 with smooth surfaces without irregularities. All exposed hardware shall be 304 stainless steel. All metal surfaces in contact with pumped fluids, which are not stainless steel, shall be protected by a factory-applied multi-layer exterior coating.

Sealing design shall incorporate metal-to-metal contact between machined surfaces. Where watertight sealing is required, surfaces shall be machined and fitted with O-rings, designed, and constructed to meet FM3615 for Class 1, Division 1, Groups C & D standards. Fittings will be the result of controlled compression of rubber O-rings in two planes and O-ring contact of four sides without the requirement of a specific torque limit. No secondary sealing compounds, elliptical O- rings, grease, or other devices shall be used.

B. Grinder Mechanism: Grinding mechanisms are available as either axial slicer or radial grinder. The axial slicer mechanism is comprised of (3) rotary slicer blades and a stationary slicer plate, both of 440C stainless steel material hardened to 58-60 Rockwell C. Slicer shall be bolted to shaft within close tolerance of slicer plate. The slicer plate shall be of engineered design with holes shaped for optimum cutting of debris. Grooved slots in plate shall eject debris away from underside of rotary cutter. The plate shall be fastened with countersunk head screws, flush with the surface of plate. Pumps with protruded or exposed head fasteners shall not be considered equal.

Radial grinder mechanism consists of rotating impeller and stationary shredder ring, both of 440 stainless steel material hardened to 58-60 Rockwell C. Grinder assembly shall be mounted directly below volute passage. The impeller shall be threaded to a stainless steel shaft, locked with a stainless steel screw and washer. The shredder ring shall be secured with a retaining ring, bolted into cast-iron volute. Grinding of solids shall be from the action of the impeller against the shredder ring, where there shall be 24,000 cuts per second.

C. Stator/ Rotor: The rotor shall be a full lobe design of hardened and polished stainless steel. The stator shall be composed of a proprietary EPDM blend, designed, and tested specifically for improved use in domestic and commercial wastewater applications. Stator material shall have high resistance to water, detergent, grease, petroleum, abrasives, and temperature. Stator to be encapsulated by high density polyethylene nylon liner, to stabilize stator when in use and provide for longer stator life.

D. Motor: The pump motor construction shall be per NEMA MG-1 1.15 standard and shall be of the submersible type, rated 2 HP, 3450 RPM, 240 volt, 60 Hz, single phase operation. Motor shall be capacitor start, capacitor run type for high starting torque and both capacitors and start switch shall be housed internally to pump, below the cord entry. This compartment shall be dry and accessible by removing (4) bolts from cord cap for quick serviceability. Major motor operating temperature must not exceed Class B rating.

The stator winding shall be of open type with Class F insulation. The stator shall be pressed into the cast iron motor housing. Winding housing shall be filled with clean, high

dielectric oil that lubricates bearings and seals, transferring heat from windings and rotor to the outer cast housing for improved heat dissipation. Air-filled housings or motors of any other construction type shall not be considered equal

Motor shall have automatic reset overload protection attached to the top end of the motor windings to stop motor if winding temperature reaches 130°C. The high temperature shut-off will cause the pump to cease operation in a run-dry event or in any condition that may cause pump to run outside of specified operating temperature range. All motors shall be manufactured domestically. Pump manufacturer shall test each motor prior to pump construction and shall provide, upon request, documentation to certify motor operation is within design parameters.

E. Mechanical Seal: Mechanical seal shall be type 21 and manufactured domestically. Standard pump shall have a single mechanical seal, though dual mechanical seals are an available option for increased motor protection. Seal material shall be silicon carbide with Viton® elastomers and the seal face shall be lapped to a flatness of one light band. Carbon ceramic seals shall not be considered equal.

F. Bearings: The motor shall have two heavy duty ball bearings and one sleeve bearing to support the pump shaft, taking radial and thrust loadings. Bearings shall be designed to an ABEC® system 1 or better. The upper bearing shall be a Conrad type, single-row, deep groove ball bearing designed to adequately handle the required radial loads. The lower bearing shall be a single row, deep groove ball bearing designed to adequately compensate for the axial loads and radial forces. Bearings shall be designed to deliver a minimum L-10 bearing life of 100,000 hours when operation is within the limitations of the manufacturer's performance curve. The bearings shall be lubricated in oil and will not require maintenance as described in ANSI/HI 1.4-2010 A.6.

G. Valves: The discharge piping of the pump shall include a factory-installed combination anti-siphon check valve and pressure relief valve in 316 stainless steel material. The anti-siphon check valve shall be rated for continuous operation to 235 psi. The pressure relief valve shall be factory-set to begin opening at 70 psi and shall be fully open at 100 psi.

H. Pump Discharge: Pump discharge shall be a 1-1/4" FPT connection. The discharge hose shall be constructed of a high pressure, oil resistant material and terminate in a 1-1/4" MPT fitting on pump side. On tank side, the discharge hose shall terminate in a quick connect fitting for ease of installation. Hose shall be rated to 150 psi.

I. Electrical and Power Cord: The power cord shall be 12 awg Type SOOW, UL listed cable. The cable jacket shall be sealed at the motor entrance by means of an approved rubber compression washer and compression nut. The cord cap is to be epoxy-filled to seal the outer cable jacket and leads, preventing fluid from entering motor housing. Cord shall withstand a pull strain to meet FM requirements. Power cord shall measure a minimum of 5 feet from cord cap and shall terminate in an electrical quick disconnect (EQD). A cord grip shall be used at the EQD to ensure a watertight seal to cable.

2.03 Electrical Components

A. Supply Cables: The pump supply cable(s) and float supply cable shall terminate in six pin EQDs, with water- resistant housings inside the basin. Housings shall include radial seals and shall require no tools for assembly/disassembly. A junction box shall not be considered equal for use inside the basin. Cables shall be a minimum of twenty-five feet for connection to the control panel.

B. Level Controls: Level control shall be through non-mercury, mechanical float switches with minimum (3) floats per basin. Floats shall be control duty rated, narrow angle, normally open type and shall be approved for use in sewage or wastewater

environments. Operating temperature range shall be between 32°F-170°F. Construction material shall be polypropylene with solid polyurethane foam interior. Individual power cords shall be 18 awg, type SJOOW cable constructed of chlorinated polyethylene material. Electrical rating shall be 5 amp (240V) / 10 amp (120V). Floats shall be mounted to float tree with (1) mounting collar per float and shall be capable of field adjustment. Float tree shall have a fixed, factory-installed mounting connection inside basin and shall be completely removable from basin for access to floats. Exterior or interior weights shall not be used. Floats shall terminate (1) 6-pin EQD for a single connection to float supply cable.

C. Control Panel: Each station shall include a NEMA 4X UL-listed panel suitable for vertical mounting. The panel enclosure shall be of fiber-reinforced plastic material for corrosion resistance and include a hinged, lockable cover.

The panel shall contain one 15-amp, double-pole circuit breaker for each pump's power circuit and one 15-amp single-pole circuit breaker for the alarm circuit. The following features shall also be included as a standard: H-O-A switch for each pump, external visual alarm light, external audible buzzer, silence button, redundant run, high level alarm capability, and SAM-capability. Pump operation in duplex stations shall be in alternating sequence. Each pump shall alternate roles as either Lead or Lag after each pump cycle. Lag pump operation shall be linked to the Alarm float terminal in the control panel, which will activate the Lag Pump in the event that the fluid level has risen to the Alarm level in the basin. Provided power is available to panel, the alarm shall be activated as follows:

1. Fluid in wet well rises to ALARM level and ALARM float switch contacts will close. The audible and visual alarms shall be activated.
2. The audible siren may be silenced by pressing the external silence button.
3. Visual alarm light will remain illuminated while ALARM float contacts are engaged.

(SAM) Remote Monitoring: The SAM hardware kit will consist of a cellular modem, power supply, wiring harness and relays and is designed for installation into an existing panel enclosure. The hardware kit shall be connected to dry contacts in the existing panel for alarm and pump data. A cellular modem will then communicate data to a web-based platform, including high level alarm, power loss, pump cycles, and run time information. Once information is transmitted to the system, it will be available for users to access through the website interface.

Users may be given a secure user ID and password by their local distributor or service center, upon request, to access the website. The website shall display "trouble" indicators for easy identification of sites experiencing an alarm condition. Users with multiple sites will have the ability to generate reports based on pump run cycle data or alarm conditions.

Local distributors and designated master users will have the ability to configure alerts for the various conditions, which can be sent via e-mail or SMS text to any number of recipients.

Available alert notifications shall include:

- High Level Alarm
- High Level Alarm Clear
- Power Loss
- Power Restored

Included in the cellular modem is a battery to allow one message to be communicated in the event of a power loss.

D. Generator Receptacle and Auto Transfer: The panel will include a 20 amp, 240V receptacle with gasketed cover for use with a portable generator and cable. Panel will be configured such that when power is present at the receptacle, the power source will be automatically switched to the generator. When power is no longer present at the receptacle, the power source will automatically switch back to main (AC) power.

E. Main Service Disconnect Breaker: A separate breaker shall be installed in the panel for use as a main service disconnect for the station.

2.04 Service and Installation

1) The pump core shall have two lifting eyes bolted to pump housing and the end of a lifting rope shall be securely attached to each eye for easy core removal. The pump shall include a stainless steel base stand, factory installed, to hold the pump upright in the station or as necessary during service. Quick disconnects shall be provided on the electrical power cord and the discharge hose.

2) All maintenance for the pump core, including installation and removal, must be possible without maintenance personnel entering the station. OSHA requirements may deem a grinder pump station installation to be a “permit-required confined space”, therefore pump must be accessible and serviceable from outside the station. The pump manufacturer may designate an authorized service center to provide technical expertise, stock equipment, train internal and/or third-party service technicians, provide field and/or shop repair service, and make judgements regarding warranty claims.

2.05 Factory Test

1) Each pump core shall be tested at the factory to ensure pump components, including valves, discharge assembly, and motor operate within the design parameters. Pump manufacturer shall provide certified test results upon request.

PART 3 - EXECUTION

3.01 FACTORY TEST: Each grinder pump shall be submerged and operated for 1.5 minutes (minimum). Included in this procedure will be the testing of all ancillary components such as, the anti-siphon valve, check valve, discharge assembly and each unit’s dedicated level controls and motor controls. All factory tests shall incorporate each of the above listed items. Actual appurtenances and controls which will be installed in the field shall be particular to the tested pump only. A common set of appurtenances and controls for all pumps is not acceptable. Certified test results shall be available upon request showing the operation of each grinder pump at two different points on its curve. Additional validation tests include: integral level control performance, continuity to ground and acoustic tests of the rotating components.

The ENGINEER reserves the right to inspect such testing procedures with representatives of the OWNER, at the GRINDER PUMP MANUFACTURER’S facility.

All basins shall be factory leak tested to assure the integrity of all joints, seams, and penetrations. All necessary penetrations such as inlets, discharge fittings and cable connectors shall be included in this test along with their respective sealing means (grommets, gaskets etc.).

3.02 CERTIFIED SERVICE PROGRAM: The grinder pump MANUFACTURER shall provide a program implemented by the MANUFACTURER’S personnel as described in this specification to certify the service company as an authorized serviced center. As evidence of this, the MANUFACTURER shall provide, when requested, sufficient evidence that they have maintained their own service department for a minimum of 30 years and currently employ a minimum of five employees specifically in the service department.

As part of this program, the MANUFACTURER shall evaluate the service technicians as well as the service organization annually. The service company will be authorized by the MANUFACTURER to make independent warranty judgments. The areas covered by the program shall include, as a minimum:

1. Pump Population Information: The service company will maintain a detailed database for the grinder pumps in the territory that tracks serial numbers by address.
2. Inventory Management: The service company must maintain an appropriate level of inventory (pumps, tanks, panels, service parts, etc.) including regular inventory review and proper inventory labeling. Service technicians will also maintain appropriate parts inventory and spare core(s) on service vehicles.
3. Service Personnel Certification: Service technicians will maintain their level-specific certification annually. The certifications are given in field troubleshooting, repair, and training.
4. Service Documentation and Records: Start up sheets, service call records, and customer feedback will be recorded and available by the service company.
5. Shop Organization: The service company will keep its service shop organized and pumps will be tagged with site information at all times. The shop will have all required equipment, a test tank, and cleaning tools necessary to service pumps properly.

3.03 DELIVERY: All grinder pump units will be delivered to the job site 100 percent completely assembled, including testing, ready for installation. Field installation of the pump in tanks under 96 inches is not allowed. Field installation of the level sensor into the tank is not allowed. Grinder pump stations will be individually mounted on wooden pallets.

3.04 INSTALLATION: Earth excavation and backfill are specified under SITE WORK, but are also to be done as a part of the work under this Section, including any necessary sheeting and bracing.

The CONTRACTOR shall be responsible for handling ground water to provide a firm, dry subgrade for the structure, and shall guard against flotation or other damage resulting from general water or flooding.

The grinder pump stations shall not be set into the excavation until the installation procedures and excavation have been approved by the ENGINEER.

Remove packing material. Users instructions MUST be given to the OWNER. Hardware supplied with the unit, if required, will be used at installation. The basin will be supplied with a standard 4" inlet grommet (4.50" OD) for connecting the incoming sewer line. Appropriate inlet piping must be used. The basin may not be dropped, rolled, or laid on its side for any reason.

Installation shall be accomplished so that 1" to 4" of accessway, below the bottom of the lid, extends above the finished grade line. The finished grade shall slope away from the unit. The diameter of the excavated hole must be large enough to allow for the concrete anchor.

A 6-inch (minimum) layer of naturally rounded aggregate, clean and free flowing, with particle size of not less than 1/8" or more than 3/4" shall be used as bedding material under each unit.

A concrete anti-flotation collar, as detailed on the drawings, and sized according to the manufacturer’s instructions, shall be required and shall be pre-cast to the grinder pump or poured in place. Each grinder pump station with its pre-cast anti-flotation collar shall have a minimum of three lifting eyes for loading and unloading purposes.

If the concrete is poured in place, the unit shall be leveled, and filled with water, to the bottom of the inlet, to help prevent the unit from shifting while the concrete is being poured. The concrete must be manually vibrated to ensure there are no voids. If it is necessary to pour the concrete to a level higher than the inlet piping, an 8" sleeve is required over the inlet prior to the concrete being poured.

The CONTRACTOR will provide and install a 4-foot piece of 4-inch SCH 40 PVC pipe with water tight cap, to stub-out the inlet for the property OWNER's installation contractor, as depicted on the contract drawings.

The electrical enclosure shall be furnished, installed, and wired to the grinder pump station by the CONTRACTOR. An alarm device is required on every installation, there shall be NO EXCEPTIONS. It will be the responsibility of the CONTRACTOR and the ENGINEER to coordinate with the individual property OWNER(s) to determine the optimum location for the Alarm Panel.

The CONTRACTOR shall mount the alarm device in a conspicuous location, as per national and local codes. The alarm panel will be connected to the grinder pump station by a length of 6-conductor type TC cable as shown on the contract drawings. The power and alarm circuits must be on separate power circuits. The grinder pump stations will be provided with 32', 25' of useable, electrical supply cable to connect the station to the alarm panel. This cable shall be supplied with a FACTORY INSTALLED EQD half to connect to the mating EQD half on the core.

3.05 BACKFILL REQUIREMENTS: Proper backfill is essential to the long-term reliability of any underground structure. Several methods of backfill are available to produce favorable results with different native soil conditions. The most highly recommended method of backfilling is to surround the unit to grade using Class I or Class II backfill material as defined in ASTM 2321. Class 1A and Class 1B are recommended where frost heave is a concern, Class 1B is a better choice when the native soil is sand or if a high, fluctuating water table is expected. Class 1, angular crushed stone offers an added benefit in that it doesn't need to be compacted.

Class II, naturally rounded stone, may require more compactive effort, or tamping, to achieve the proper density. If the native soil condition consists of clean compactible soil, with less than 12 percent fines, free of ice, rocks, roots, and organic material, it may be an acceptable backfill. Soil must be compacted in lifts not to exceed one foot to reach a final Proctor Density of between 85 percent and 90 percent. Heavy, non-compactible clays and silts are not suitable backfill for this or any underground structure such as inlet or discharge lines.

If you are unsure of the consistency of the native soil, it is recommended that a geotechnical evaluation of the material is obtained before specifying backfill.

Another option is the use of a flowable fill (i.e., low slump concrete). This is particularly attractive when installing grinder pump stations in augured holes where tight clearances make it difficult to assure proper backfilling and compaction with dry materials. Flowable fills should not be dropped more than 4 feet from the discharge to the bottom of the hole to avoid separation of the constituent materials.

Backfill of clean native earth, free of rocks, roots, and foreign objects shall be thoroughly compacted in lifts not exceeding 12" to a final Proctor Density of not less than 85 percent. Improper backfilling may result in damaged accessways. The grinder pump station shall be installed at a minimum depth from grade to the top of the 1 1/4" discharge line, to assure maximum frost protection. The finish grade line shall be 1" to 4" below the bottom of the lid, and final grade shall slope away from the grinder pump station.

All restoration will be the responsibility of the CONTRACTOR. Per unit costs for this item shall be included in the CONTRACTOR'S bid price for the individual grinder pump stations. The properties shall be restored to their original condition in all respects, including, but not limited to, curb and sidewalk replacement, landscaping, loaming and seeding, and restoration of the traveled ways, as directed by the ENGINEER.

3.06 START-UP AND FIELD TESTING: The MANUFACTURER shall provide the services of qualified factory trained technician(s) who shall inspect the placement and wiring of each station, perform field tests as specified herein, and instruct the OWNER's personnel in the operation and maintenance of the equipment before the stations are accepted by the OWNER.

All equipment and materials necessary to perform testing shall be the responsibility of the INSTALLING CONTRACTOR. This includes, as a minimum, a portable generator and power cable (if temporary power is required), water in each basin (filled to a depth sufficient to verify the high level alarm is operating), and opening of all valves in the system. These steps shall be completed prior to the qualified factory trained technician(s) arrival on site.

The services of a trained factory-authorized technician shall be provided at a rate of 40 hours for every 100 grinder pump stations supplied.

A. Upon completion of the installation, the authorized factory technician(s) will perform the following test on each station:
   1. Make certain the discharge shut-off valve in the station is fully open.
   2. Turn ON the alarm power circuit and verify the alarm is functioning properly.
   3. Turn ON the pump power circuit. Initiate the pump operation to verify automatic "on/off" controls are operative. The pump should immediately turn ON.
   4. Consult the Manufacturer's Service Manual for detailed start-up procedures.

Upon completion of the start-up and testing, the MANUFACTURER shall submit to the ENGINEER the start-up authorization form describing the results of the tests performed for each grinder pump station. Final acceptance of the system will not occur until authorization forms have been received for each pump station installed and any installation deficiencies corrected.

END OF SECTION

SECTION 40 0500.13 – COMMON WORK RESULTS FOR PROCESS PIPING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all piping systems indicated, complete and operable, in accordance with these Specifications and Contract Documents.

B. The mechanical drawings define the general layout, configuration, routing, method of support, pipe size and pipe type. The mechanical drawings are not pipe construction or fabrication drawings. Details for construction shall be developed as necessary to construct all mechanical piping systems, to accommodate the specific equipment provided, and to provide all spools, spacers, adapters, and connectors for a complete and functional system.

C. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings shall contain the following information:

1. Drawings: Layout drawings including all necessary dimensions, details, pipe joints, fittings, specials, bolts and nuts, gaskets, valves, appurtenances, anchors, guides, and material lists. Fabrication drawings shall indicate all spool pieces, spacers, adapters, connectors, fittings and supports to accommodate the equipment and valves in a complete and functional system.

C. Certifications: All necessary certificates, test reports, and affidavits of compliance shall be obtained.

PART 2 - PRODUCTS

2.01 GENERAL

A. Extent of Work: Pipes, fittings and appurtenances shall be provided in accordance with the requirements of these Specifications and as indicated.

B. Pipe Supports: Pipes shall be adequately supported, restrained, and anchored in accordance with these Specifications, and as indicated.

C. Lining: Application, thickness and curing of pipe lining shall be in accordance with these Specifications, unless otherwise indicated.

D. Coating: Application, thickness and curing of pipe coating shall be in accordance with these Specifications, unless otherwise indicated. Pipes above ground or in structures shall be field-coated in accordance these Specifications.

E. Pressure Rating: Piping systems shall be designed for the maximum expected pressure as defined in accordance with these Specifications, or as indicated on the Piping Schedule.

F. Inspection: Pipe shall be subject to inspection at the place of manufacture. During the manufacture of the pipe, the ENGINEER shall be given access to all areas where manufacturing is in progress and shall be permitted to make all inspections necessary to confirm compliance with requirements.

G. Tests: Except where otherwise indicated, materials used in the manufacture of the pipe shall be tested in accordance with the applicable specifications and standards. Welds shall be tested as indicated.

H. Welding Requirements: Welding procedures used to fabricate pipe shall be prequalified under the provisions of ANSI/AWS D1.1 - Structural Welding Code. Welding procedures shall be reviewed for longitudinal and girth or spiral welds for pipe cylinders, spigot, and bell ring attachments, reinforcing plates and ring flange welds, and plates for lug connections.

I. Welder Qualifications: Welding shall be done by skilled welders and welding operators who have had adequate experience in the methods and materials to be used. Welders shall be qualified under the provisions of ANSI/AWS D1.1 by an independent local, approved testing agency not more than 6 months prior to commencing work on the pipeline. Machines and electrodes similar to those used in the WORK shall be used in qualification tests. Qualification testing of welders and materials used during testing are part of the WORK.

2.02 PIPE FLANGES

A. General: Flanges shall have flat faces and shall be attached with bolt holes straddling the vertical axis of the pipe unless otherwise indicated. Attachment of the flanges to the pipe shall conform to the applicable requirements of ANSI/AWWA C207. Flange faces shall be perpendicular to the axis of the adjoining pipe. Flanges for miscellaneous small pipes shall be in accordance with the standards indicated for these pipes.

B. Pressure Ratings:
   1. 150 psi or less: Flanges shall conform to either ANSI/AWWA C207 - Steel Pipe Flanges for Waterworks Service--Sizes 4-inch. Through 144-inch, Class D, or ANSI/ASME B16.5 - Pipe Flanges and Flanged Fittings, 150-lb class.
   2. 150 psi to 275 psi: Flanges shall conform to either ANSI/AWWA C207 Class E or Class F, or ANSI/ASME B16.5 150-lb class.
   3. 275 psi to 700 psi: Flanges shall conform to ANSI/ASME B16.5, 300-lb class.
   4. Selection based on test pressure: AWWA flanges shall not be exposed to test pressures greater than 125 percent of rated capacity. For higher test pressures, the next higher rated AWWA flange or an ANSI-rated flange shall be selected.

C. Blind Flanges: Blind flanges shall be in accordance with ANSI/AWWA C207, or as indicated for miscellaneous small pipes.

D. Flange Coating: Machined faces of metal blind flanges and pipe flanges shall be coated with a temporary rust-inhibitive coating to protect the metal until the installation is completed.

E. Flange Bolts: Bolts and nuts shall conform to these Specifications. Bolts and nuts shall be installed with anti-seize per Loctite, or ENGINEER-approved equal (or thread locker to be confirmed with WWTP Operations). Studs and bolts shall extend through the nuts a minimum of ¼-inch. All-thread studs shall be used on all valve flange connections, where space restrictions preclude the use of regular bolts.

F. Insulating Flanges: Insulated flanges shall have bolt holes ¼-inch diameter greater than the bolt diameter.

G. Insulating Flange Sets: Insulating flange sets shall be provided where indicated or as needed. Each insulating flange set shall consist of an insulating gasket, insulating sleeves and washers and a steel washer. Insulating sleeves and washers shall be one piece when flange bolt diameter is 1½-inch or smaller and shall be made of acetal resin. For bolt diameters larger than 1½-inch, insulating sleeves and washers shall be 2-piece and shall be made of polyethylene or phenolic material. Steel washers shall be in accordance with ASTM A325 - Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength. Insulating gaskets shall be full-face.

H. Flange Gaskets:
   1. Gaskets for flanged joints used in general water and wastewater service shall be full-faced type, with material and thickness in accordance with ANSI/AWWA C207. Blind flanges shall have gaskets covering the entire inside face of the blind flange and shall be cemented to the blind flange. Ring gaskets shall not be permitted, unless otherwise indicated.
   2. Gaskets for flanged joints used in chemicals, air, solvents, hydrocarbons, steam, chlorine, and other fluids shall be made of materials compatible with the service, pressure, and temperature.

2.03 THREADED INSULATING CONNECTIONS

A. General: Threaded insulating bushings, unions, or couplings, as appropriate, shall be used for joining threaded pipes of dissimilar metals and for piping systems where corrosion control and cathodic protection are involved.

B. Materials: Threaded insulating connections shall be of nylon, Teflon, polycarbonate, polyethylene, or other non-conductive materials, and shall have ratings and properties to suit the service and loading conditions.

2.04 MECHANICAL-TYPE COUPLINGS (GROOVED OR BANDED PIPE)

A. General: Cast mechanical-type couplings shall be provided where indicated. The couplings shall conform to the requirements of ANSI/AWWA C606 - Grooved and Shouldered Joints. Bolts and nuts shall conform to the requirements of these Specifications. Gaskets for mechanical-type couplings shall be compatible with the piping service and fluid utilized, in accordance with the coupling manufacturer's recommendations. The wall thickness of grooved piping shall conform with the coupling manufacturer's recommendations to suit the highest expected pressure. To avoid stress on equipment, equipment connections with mechanical-type couplings shall have rigid-grooved couplings or flexible type coupling with harness in sizes where rigid couplings are not available, unless thrust restraint is provided by other means. Mechanical-type couplings shall be bonded. The Subcontractor shall have the coupling manufacturer's service representative verify the correct choice and application of couplings and gaskets, and the workmanship, to assure a correct installation. To assure uniform and compatible piping components, all grooved fittings, couplings, and valves shall be from the same manufacturer.

2.05 SLEEVE-TYPE COUPLINGS

A. Construction: Sleeve-type couplings shall be provided where indicated, in accordance with ANSI/AWWA C219 - Standard for Bolted Sleeve-Type Couplings for Plain-End Pipe. Couplings shall be steel with steel bolts, without pipe stop. Couplings shall be of sizes to fit the pipe and fittings indicated. The middle ring shall be not less than ¼-inch thick or at least the same wall thickness as the pipe to which the coupling is connected. If the strength of the middle ring material is less than the strength of the pipe material, the thickness of the middle ring shall be increased to have the same strength as the pipe. The coupling shall be either 5 or 7 inches long for sizes up to and including 30 inches and 10 inches long for sizes greater than 30 inches, for standard steel couplings, and 16 inches long for long-sleeve couplings. The followers shall be single-piece contoured mill sections welded and cold-expanded as required for the middle rings, and of sufficient strength to accommodate the number of bolts necessary to obtain adequate gasket pressures without excessive rolling. The shape of the follower shall be of such design as to provide positive confinement of the gasket. Bolts and nuts shall conform to the requirements of these Specifications. Buried sleeve-type couplings shall be epoxy-coated at the factory as indicated.

B. Pipe Preparation: Where indicated, the ends of the pipe shall be prepared for flexible steel couplings. Plain ends for use with couplings shall be smooth and round for a distance of 12 inches from the ends of the pipe, with outside diameter not more than 1/64-inch smaller than the nominal outside diameter of the pipe. The middle ring shall be tested by cold-expanding a minimum of one percent beyond the yield point, to proof-test the weld to the strength of the parent metal. The weld of the middle ring shall be subjected to air test for porosity.

C. Gaskets:
   1. Gaskets for sleeve-type couplings shall be rubber-compound material that will not deteriorate from age or exposure to air under normal storage or use conditions. Gaskets for wastewater and sewerage applications shall be Buna "N," Grade 60, or ENGINEER-approved equivalent suitable elastomer. The rubber in the gasket shall meet the following specifications:
      a. Color: Jet Black
      b. Surface: Non-blooming
      c. Durometer Hardness: 74 plus and minus 5
      d. Tensile Strength: 1000 psi Minimum
      e. Elongation: 175 percent Minimum
   2. The gaskets shall be immune to attack by impurities normally found in water or wastewater. All gaskets shall meet the requirements of ASTM D2000 - Classification System for Rubber Products in Automotive Applications, AA709Z, meeting Suffix B13 Grade 3, except as noted above. Where sleeve couplings are used in water containing chloramine or other fluids, which attack rubber materials, gasket material shall be compatible with the piping service and fluid utilized.

D. Insulating Couplings: Where insulating couplings are required, both ends of the coupling shall have a wedge-shaped gasket which assembles over a rubber sleeve of an insulating compound in order to obtain insulation of all coupling metal parts from the pipe.

E. Restrained Joints: Sleeve-type couplings on pressure lines shall be harnessed unless thrust restraint is provided by other means. Harnesses shall be designed by the pipe manufacturer in accordance with AWWA Manual M11, or as indicated. Harness sets shall be designed for the maximum test pressure of the pipe in which they are installed. Where harness sets are installed near the suction and discharge of the pump, harness bolts shall have zero elongation to prevent misalignment of the pump imparted by the thrust within the piping system.

2.06 DISMANTLING JOINTS

A. General: Dismantling joints shall be provided where indicated, and provide up to 5” of longitudinal adjustment and up to 2 degrees of misalignment in flanged piping systems. The flange spool shall meet the requirements of AWWA Class D Ring Flange, compatible with ANSI Class 125 and 150 bolt circles. The end and body ring shall meet the requirements of ASTM A536 ductile iron meeting or exceeding Grade 65-45-12 for 3” to 12” sizes and ASTM A36 Carbon Steel with AWWA C207 Class D flanges for 14” to 72” sizes. Dismantling joints shall be provided with gaskets compounded for water and sewer service in accordance with ASTM D2000. Dismantling joints shall have a fusion bonded epoxy coating. Bolts and nuts (including tie-rods) shall conform to these Specifications. Dismantling joints shall be per Romac Industries, or ENGINEER-approved equal.

2.07 EXPANSION JOINTS

A. Piping subject to expansion and contraction shall be provided with sufficient means to compensate for such movement without exertion of undue forces to equipment or structures. This may be accomplished with expansion loops, bellow-type expansion joints or sliding-type expansion joints. Expansion joints shall be of stainless steel, monel, rubber, or other materials best suited for each individual service.

2.08 PIPE THREADS

A. Pipe threads shall be in accordance with ANSI/ASME B1.20.1 - Pipe Threads, General Purpose (inch), and be made up with Teflon tape or chemical sealant unless otherwise indicated.

2.09 PIPE INSULATION

A. Pipe thermal insulation for exterior freeze protection shall be self-sealing, flexible, tubular polyolefin/ polyethylene foam insulation. The insulation shall have a low thermal conductivity (not to exceed 0.04 W/mK) and shall have a service temperature range between -330°F and 120°F. Minimum thickness shall be 1 inch. Insulation shall be acceptable for use with heat tracing/ heat tape.

B. Where called out in the Contract Documents, heat tape shall be provided for freeze protection. Heat tape shall be wrap-type cable with built-in thermostat for automatic heat control and energy efficiency. It shall be used in conjunction with foam insulation. The low wattage design shall utilize a 120-volt power with outlet plug. Heat tape shall be manufactured by Wrap-On Co., Inc., or ENGINEER-approved equal.

C. Where called out in the Contract Documents, Pipe insulation for personnel protection against high temperature shall be provided. Protective insulation shall be fiber glass bonded with a thermosetting resin with a jacket designed to protect personnel again accidental contact with hot pipes. The insulation shall be designed to be used on systems operating up to 1000°F. Minimum thickness shall be 1 inch.

2.10 GENERAL

A. Pipes, fittings, and appurtenances shall be installed in accordance with these Specifications.

B. Lined Piping Systems: The lining manufacturer shall take full responsibility for the complete, final product and its application. Pipe ends and joints of lined pipes at screwed flanges shall be epoxy-coated to assure continuous protection.

C. Core Drilling: Where core drilling is required for pipes passing through existing concrete, core drilling locations shall be determined by radiograph of concrete construction to avoid damage to embedded raceways and reinforcing bars.

D. Cleanup: After completion of the WORK, cuttings, joining and wrapping materials, and other scattered debris shall be removed from the Site. The entire piping system shall be handed over in a clean and functional condition.

PART 3 - EXECUTION

3.01 INSTALLATION OF PIPE

A. Piping shall be installed in accordance with manufacturers' recommendation and these Specifications.

END OF SECTION

SECTION 40 0513.53 – DUCTILE, MALLEABLE, AND CAST-IRON ALLOYS PROCESS PIPING

PART 1 – GENERAL

1.01 DESCRIPTION

A. Furnish and install all ductile iron pipe and fittings in accordance with this section.

1.02 REFERENCES

A. Standards of the following agencies are referenced herein: American National Standards Institute (ANSI), American Society for Testing and Materials (ASTM), American Water Works Association (AWWA), Ductile Iron Pipe Research Association (DIPRA).

B. Referenced standards shall be the latest revision.

C. In case of conflict with referenced standards, the provisions of this section shall prevail.

1.03 SUBMITTALS

A. In accordance with Section 01 3300 – Submittal Procedures.

B. Catalog data sheets naming each product to be used identified by manufacturer and type number and additional documentation as required to demonstrate full compliance with this specification.

PART 2 – MATERIALS

2.01 DUCTILE IRON PIPE

A. Pipe shall conform to the following standards as applicable:
   1. AWWA C104: Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.
   2. AWWA C111: Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings
   3. AWWA C115: Flanges Ductile-Iron Pipe with Threaded Flanges
   4. AWWA C150: Thickness Design of Ductile-Iron Pipe
   5. AWWA C151: Ductile-Iron Pipe, Centrifugally Cast, for Water of Other Liquids
   6. AWWA C606: Grooved and Shouldered Joints

B. Pipe wall thickness for push-on joint and mechanical joint pipe shall be Pressure Class 350 psi minimum, or as indicated in the Contract Documents.

C. Unless otherwise noted or required, all pipe shall have a cement mortar lining with asphaltic seal coat.

2.02 FITTINGS AND SPECIALS

A. Fittings and specials shall be ductile iron and shall conform to the following standards as applicable:
   1. AWWA C104: Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.
   2. AWWA C110: Ductile-Iron and Gray Iron Fittings, 3 inches through 48 inches, for Water and Other Liquids.
   3. AWWA C111: Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   4. AWWA C153: Ductile-Iron Compact Fittings, 3 inches through 24 inches and 54 inches through 64 inches for Water Service.
   5. AWWA C606: Grooved and Shouldered Joints.

B. Unless otherwise noted or required, either standard or compact fittings may be used.

C. Unless otherwise noted, all fittings shall have a cement mortar lining with asphaltic seal coat.

D. Grooved and flanged fittings shall have center to end dimensions in accordance with AWWA C111, wall thickness in accordance with AWWA C153, and shall be Class 350 minimum, or as indicated in the Contract Documents.

2.03 GROOVED JOINT COUPLINGS

A. In accordance with ASSA C606, except as modified herein.

B. Coupling body shall be ductile iron, ASTM A536

C. All bolts and nuts shall be 316 stainless steel conforming to ASTM A193, Grade B8M, for bolts and ASTM A194, Grade 8M, for nuts.

2.04 TYPE OF JOINTS

A. Buried joints shall be push-on, mechanical joint, or flexible grooved joint unless otherwise shown or required for installation.

B. Exposed joints shall be flanged or rigid grooved unless otherwise shown or required for the installation.

2.05 RESTRAINED PUSH-ON JOINTS

A. Where specified, called for on the drawings, or otherwise required for thrust restraint, push-on joints shall be Flex-Ring as manufactured by American Ductile Iron Pipe, TR Flex as manufactured by US Pipe, or ENGINEER-approved equal. Restrained joint shall provide for joint deflection after assembly.

2.06 RESTRAINED MECHANICAL JOINTS

A. Where specified, called for on the drawings or otherwise required for thrust restraint, mechanical joints shall be made using retainer glands with set screws or clamping lugs. Retainer glands shall be as manufactured by EBAA Iron; Tyler Pipe, or ENGINEER-approved equal.

2.07 FLANGE GASKETS

A. Full face or ring, except that ring gaskets shall be used for sizes 14-inch and greater. Gaskets shall be 1/8-inch thick synthetic rubber for test pressures up to 250 psi. For test pressures greater than 250 psi, provide suitable gasket as recommended by manufacturer.

2.08 FASTENERS EXCEPT GROOVED COUPLINGS

A. 316 stainless steel conforming to ASTM A193, Grade B8M, for bolts and ASTM A194, Grade 8M, for nuts. Bolts and nuts shall be installed with anti-seize per Loctite, or ENGINEER-approved equal (or thread locker to be confirmed with Fire Camp Operations).

B. Washers, where required, shall be of the same material as the nuts.

2.09 POLYETHYLENE ENCASEMENT

A. Buried pipe and fittings shall be protected by polyethylene encasement in accordance with AWWA C105.

2.10 GLASS LINING

A. Where specified or called for on the drawings, ductile iron pipe shall be glass-lined.

B. Glass lining shall consist of vitreous and inorganic material applied to the internal surfaces of pipe and fittings that have been prepared by blasting. The items shall be exposed to an appropriate maturing temperature (above 1400°F), at which point the vitreous and inorganic material fuses to the base metal, forming an integral molecular bond with the base metal. Subsequent coatings will be processed in a similar manner, forcing an integral

molecular bond with the base coast. The entire coating shall be a minimum of 10 mils thick.

C. Lining shall have a hardness of 5 to 6 on the Mohs scale and a density of 2.5-3.0 g/cm³ measured by ASTM D792. The glass lining shall be capable of withstanding a thermal shock of 350°F without crazing, blistering, or spalling. It shall be resistant to corrosion between pH-3 and pH-10 at 125°F.

D. There shall be no visible loss of surface gloss on the lining after immersing a production run sample in an 8% sulfuric acid solution at 125° F for 15 minutes. When tested according to ASTM C283, it shall show a weight loss of not more than 3 mg/in².

E. Provide continuous coverage as tested by a low voltage wet sponge holiday detectors. Only isolated voids due to casting anomalies and representing less than 0.1% of the total glassed surface shall be permitted.

F. Glass lining shall be Ferrock MEH-32 as provided by Fast Fabricators/Water Works Manufacturing, Vitco, or ENGINEER-approved equal.

2.11 DIRECT TAP

A. Ductile iron pipe shall have a minimum wall thickness allowed by ANSI/AWWA C151/A21.51.

B. The maximum direct tap sizes for 3- through 24-inch ductile iron pipe shall be per the following table:

Sizes (in.)	Pressure Class				
	150	200	250	300	350
	Maximum Direct Tap Size (in.)				
3	-	-	-	-	¾
4	-	-	-	-	¾
6	-	-	-	-	1
8	-	-	-	-	1
10	-	-	-	-	1
12	-	-	-	-	1-1/4
14	-	-	1-1/4	1-1/2	1-1/2
16	-	-	1-1/2	2	2
18	-	-	2	2	2
20	-	-	2	2	2
24	-	2	2	2	2

C. All classes of ductile iron pipe 24 inches or larger in diameter can be direct tapped for 2-inch corporation stop.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install in accordance with the drawings, applicable sections of these specification, applicable section of previously referenced AWWA standards, AWWA C600, and manufacturer's recommendations. In case of conflict, the drawings and specifications shall govern.

END OF SECTION

SECTION 40 0561.53 – WEIR GATES

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall provide Weir Gate and appurtenances, complete and operable, in accordance with the Contract Documents.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures

1.03 REFERENCES

A. Except as modified or supplemented herein, all gates and operators shall conform to the applicable requirements of AWWA C513, latest edition.

PART 2 – PRODUCTS

2.01 GENERAL

A. Gates supplied under this section shall be manufactured by H. Fontaine Ltd., Rodney Hunt or ENGINEER-approved equal.

B. LIFTING MECHANISM

1. Exposed gate valves shall be rising stem, outside screw and yoke (OS&Y) type. The valves shall be handwheel operated with counter-clockwise opening stems. Dual stem arrangements shall be used as indicated and for wide weirs. Manual operators of the types listed in the Contract Documents shall be provided by the gate manufacturer.
2. All bearings and gears shall be totally enclosed in a weather tight housing. The pinion shaft of crank-operated mechanisms shall be constructed of stainless steel and supported by roller or needle bearings.
3. Each manual operator shall be designed to operate the gate under the maximum specified seating and unseating heads by using a maximum effort of 40 lbs (178 N) on the crank or handwheel and shall be able to withstand, without damage, an effort of 80 lbs (356 N).
4. The crank shall be removable and fitted with a corrosion resistant rotating handle. The maximum crank radius shall be 15 inches (381 mm) and the maximum handwheel diameter shall be 24 inches (610 mm).

C. STEM AND COUPLINGS

1. The operating stem shall be of stainless steel designed to transmit in compression at least two (2) times the rated output of the operating manual mechanism with a 40 lbs (178 N) effort on the crank or handwheel.
2. The stem shall have a slenderness ratio (L/r) less than 200. The threaded portion of the stem shall have machine cut threads of the Acme type.
3. For stems in more than one piece and with a diameter of 1¾ inches (45 mm) and larger, the different sections shall be joined together by solid bronze couplings. Stem with a diameter smaller than 1¾ inches (45 mm) shall be pinned to an extension tube. The couplings shall be grooved and keyed and shall be of greater strength than the stem.
4. Stem guides shall be fabricated from type 304L (or 316L) stainless steel. The guide shall be equipped with a UHMWPE bushing. Guides shall be adjustable and spaced in accordance with the manufacturer's recommendation. The L/r ratio shall not be greater than 200.

5. Rising stem gates shall be provided with a clear polycarbonate stem cover. The stem cover shall have a cap and condensation vents as well as a clear mylar position indicating tape. The tape shall be field applied to the stem cover after the gate has been installed and positioned.

D. YOKE. Self-contained gates shall be provided with a yoke made of structural members or formed plates. The maximum deflection of the yoke shall be 1/360 of the gate's span.

2.02 DOWNWARD-OPENING WEIR GATES

A. Downward-opening weir gates shall be Series 40 Downward-Opening Weir Gates as manufactured by H. Fontaine Ltd., or ENGINEER-approved equal.

B. GOVERNING STANDARDS. Except as modified or supplemented herein, all gates and operators shall conform to the applicable requirements of AWWA C513, latest edition.

C. FRAME. The gate frame shall be constructed of structural members or formed plate welded to form a rigid one-piece frame. The frame shall be of the flange back design, suitable for mounting on a concrete wall (CW). The guide slot shall be made of UHMWPE (ultra-high molecular weight polyethylene).

D. SLIDE. The slide shall consist of a flat plate reinforced with formed plates or structural members to limit its deflection to 1/720 of the gate's span under the design head.

E. GUIDES AND SEALS. The guides shall be made of UHMWPE (ultra-high molecular weight polyethylene) and shall be of such length as to retain and support at least two thirds (2/3) of the vertical height of the slide in the fully open position. The bottom and side seals shall be made of UHMWPE (ultra-high molecular weight polyethylene) of the self-adjusting type. A continuous compression cord shall ensure contact between the UHMWPE guide and the gate in all positions. The sealing system shall maintain efficient sealing in any position of the slide and let the water flow only in the open part of the gate. Seals shall maintain the specified leakage rate in both seating and unseating conditions.

F. LEAKAGE. Weir gates shall be substantially watertight under the design head conditions. Leakage shall not exceed 0.05 U.S. gallon per minute per foot (0.60 l/min per meter) of seal periphery under the design seating head and 0.1 U.S. gallon per minute per foot (1.25 l/min per meter) of seal periphery for the design unseating head.

G. DESIGN HEAD. Weir gates shall be designed to withstand the design head (maximum design head shall be taken as the height of the slide unless otherwise shown in the Contract Documents).

H. MATERIALS

1. Frame, yoke, stem guides, slide, stem extension - Stainless steel ASTM A240 type 304L or 316L
2. Guides, side and bottom seals, stem guide liner - Ultra high molecular weight polyethylene ASTM D4020
3. Compression cord - Nitrile ASTM D2000 M6BG 708, A14, B14, E014, E034
4. Threaded stem - Stainless steel ASTM A276 type 303 MX or 316
5. Fasteners - ASTM F593 and F594 GR1 for type 304 and GR2 for type 316
6. Pedestal, handwheel and crank - Tenzaloy aluminum
7. Gasket (between frame and wall) - EPDM ASTM 1056
8. Stem cover - Polycarbonate ASTM D3935
9. Lift nut, couplings - Manganese bronze ASTM B584 UNS-C86500

PART 3 – EXECUTION

3.01 GENERAL

A. Gate valves shall be installed in accordance with these Specifications.

3.02 QUALITY ASSURANCE

A. The manufacturer shall have experience in the production of substantially similar equipment, and shall show evidence of satisfactory operation in at least 50 installations. The manufacturer's shop welds, welding procedures and welders shall be qualified and certified in accordance with the requirement of the latest edition of ASME, Section IX.

B. The fully assembled gates shall be shop inspected, tested for operation and leakage, and adjusted before shipping. There shall be no assembling or adjusting required on the job site other than for the lifting mechanism.

C. The manufacturer shall be ISO 9001: 2000 certified.

D. SEAL PERFORMANCE TEST. The gate's sealing system should have been tested through a cycle test in an abrasive environment and should show that the leakage requirements are still obtained after 25,000 cycles with a minimum deterioration.

E. Gates and appurtenances shall be handled and installed in accordance with the manufacturer’s recommendations.

F. Following the completion of each gate installation, the gates shall be operated through at least two complete open/close cycles.

G. Gates should be checked for leakage by the contractor per the Manufacturer’s recommendations and the requirements of these Specifications.

END OF SECTION

SECTION 40 0531 – PLASTIC PROCESS PIPING

PART 1 - GENERAL

1.01 REQUIREMENT

A. Polyvinyl chloride pressure pipe for water distribution, in nominal diameters 1 inches through 4 inches.

B. Polyvinyl chloride sewer pipe for gravity sewers in nominal diameters 4 inches through 12 inches.

C. Polyvinyl chloride pressure pipe for gravity sewers and force mains in nominal diameters 3 inches through 12 inches.

1.02 REFERENCES

A. Commercial Standards:

ANSI A21.16	Protective Fusion Bonded Epoxy Coating for the Interior and Exterior
(AWWA C116)	Surfaces of Ductile Iron and Grey Iron Fittings for Water Supply Service.
ASTM D1248	Polyethylene Plastics Molding and Extrusion Materials.
ASTM D1784	Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
ASTM D2241	Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).

ASTM D3212	Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
ASTM F477	Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
ASTM F679	Poly (Vinyl Chloride) (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings.
ASTM F794	Poly (Vinyl Chloride) (PVC) Profile Gravity Sewer Pipe and Fittings Based on Controlled Inside Diameter.
ASTM F949	Poly (Vinyl Chloride) (PVC) Corrugated Sewer Pipe with Smooth Interior and Fittings.
PPI TR3	Policies and Procedures for Developing Recommended Hydrostatic Design Stresses for Thermoplastic Pipe Materials.
UNI-B-13	Recommended Standard Performance Specification for Joint Restraint Devices for Use with Polyvinyl Chloride Pipe.

1.03 SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittals.

B. Submit shop drawings showing design of new pipe and fittings indicating alignment and grade, laying dimensions, fabrication, fittings, flanges, and special details.

1.04 QUALITY CONTROL

A. Submit manufacturer's certifications that PVC pipe and fittings meet requirements of this Section and AWWA C900, AWWA C909, and AWWA C905 for pressure pipe applications, or appropriate ASTM standard specified for gravity sewer pipe.

B. Submit manufacturer's certification that PVC pressure pipe for water lines and force mains has been hydrostatically tested at factory in accordance with AWWA C900, AWWA C909 and AWWA C905, and this Section.

C. When foreign manufactured material is proposed for use, have material tested for conformance to applicable ASTM requirements by certified independent testing laboratory located in United States. Certification from another source is not acceptable. Furnish copies of test reports to ENGINEER for review. Cost of testing paid by CONTRACTOR.

PART 2 – PRODUCTS

2.01 MATERIAL

A. Use PVC compounds in manufacture of pipe that contain no ingredient in amount that has been demonstrated to migrate into water in quantities considered to be toxic.

B. Furnish PVC pressure pipe manufactured from Class 12454-A or Class 12454-B virgin PVC compounds as defined in ASTM D1784. Use compounds pre-qualified for a 4,000 psi hydrostatic design basis, and a maximum hydrostatic design stress of 2,000 psi for water at 73°F per requirements of PPI TR3. Provide pipe which is homogeneous throughout, free of voids, cracks, inclusions, and other defects, uniform as commercially practical in color, density, and other physical properties. Deliver pipe with surfaces free from nicks and scratches with joining surfaces of spigots and joints free from gouges and imperfections which could cause leakage.

C. PVC Restrained Pipe: Must be listed on Owner's current Product Approval List.
   1. Pipe Material:
      a. DR 18: For restrained joints where shown on Drawings
      b. DR 14: For alternate to offset pipe section shown on Drawings. Do not use PVC for offset section with depth of cover greater than 20 feet or less than 4 feet. Do not use PVC in potentially petroleum contaminated areas.

D. Water Service:
   1. Bear National Sanitation Foundation Seal of Approval (NSF-PW) and meet the requirements of AWWA C900.

E. Gaskets:
   1. Gaskets shall meet requirements of ASTM F477. Use elastomeric factory-installed gaskets to make joints flexible and watertight.
   2. Flat Face Mating Flange: Full faces 1/8-inch-thick ethylene propylene (EPR) rubber.
   3. Raised Face Mating Flange: Flat ring 1/8-inch ethylene propylene (EDR) rubber, with filler gasket between OD of raised face and flange OD to protect flange from bolting moment.

F. Lubricant for rubber-gasketed joints: Water soluble, non-toxic, non-objectionable in taste and odor imparted to fluid, non-supporting of bacteria growth, having no deteriorating effect on PVC or rubber gaskets.

G. Do not use PVC in potentially or known contaminated areas.

H. Do not use PVC in areas exposed to direct sunlight.

2.02 WATER SERVICE PIPE

A. Pipe 3-inch or smaller: see Section 40 0513.73 – Plastic Process Piping.

B. Pipe 4-inch through 12-inch: AWWA C900, AWWA C909, Class 150, DR 18; AWWA C900, Class 200, DR 14 as alternate to offset pipe sections; nominal 20-foot lengths; cast-iron equivalent outside diameters.

C. Make curves and bends by deflecting joints. Do not exceed maximum deflection recommended by pipe manufacturer. Submit details of other methods of providing curves and bends for review by ENGINEER.

D. Hydrostatic Test: AWWA C900, AWWA C905, AWWA C909, ANSI A21.10 (AWWA C110); at point of manufacture; submit manufacturer's written certification.

2.03 GRAVITY SEWER PIPE

A. PVC gravity sanitary sewer pipe and storm sewer pipe shall be in accordance with provisions in following table:

ASTM or AWWA DESIGNATION	SDR (Max.)/ STIFFNESS (MIN.)	DIAMETER SIZE RANGE
D3034	SDR 35 / PS 46	4" to 15"
D3034	SDR 26 / PS 115	4" to 15"
F679	PS46	18” to 48”
F679	PS 115	18" to 48"
C900	DR 18 / N/A	4" to 12"
C909	DR 18 / N/A	4" to 12"
C905	DR 18 / N/A	14" to 30"
F949	N/A / 46 psi	12" to 36"
F949	N/A / 115 psi	8" to 10"
F794	N/A / 46 psi	8" to 30"
F794	N/A / 46 psi	24" to 36"

B. For sewers up to 12-inch diameter crossing over water lines, or crossing under water lines with less than 2 feet of separation, provide minimum 150 psi pressure-rated pipe conforming to ASTM D2241 with suitable PVC adapter couplings. Pipes shall be encased per MAG Standard Detail 404.

C. Joints: Spigot and integral wall section bell with solid cross section elastomeric or rubber ring gasket conforming to requirements of ASTM D3212 and ASTM F477, or ASTM D3139 and ASTM F477. Gaskets shall be factory-assembled and securely bonded in place to prevent displacement. Manufacturer shall test sample from each batch conforming to requirements ASTM D2444.

D. Fittings: Provide PVC gravity sewer sanitary bends, tee, or wye fittings for new sanitary sewer construction. PVC pipe fittings shall be full-bodied, either injection molded or factory fabricated. Saddle-type tee or wye fittings are not acceptable.

E. Conditioning: Conditioning of samples prior to and during tests is subject to approval by ENGINEER. When referee tests are required, condition specimens in accordance with Procedure A in ASTM D618 at 73.4°F plus or minus 3.6°F and 50 percent relative humidity plus or minus 5 percent relative humidity for not less than 40 hours prior to test. Conduct tests under same conditions of temperature and humidity unless otherwise specified.

2.04 SANITARY SEWER FORCE MAIN PIPE

A. Provide approved PVC pressure pipe conforming to requirements for water service pipe.

B. Acceptable pipe joints are integral bell-and-spigot, containing a bonded-in elastomeric sealing ring meeting requirements of ASTM F477. In designated areas requiring restrained joint pipe and fittings, use approved joint restraint device conforming to UNI-B-13, for PVC pipe 12-inch diameter and less.

C. Fittings: Provide approved ductile iron fittings as per these Specifications, except furnish fittings with one of following approved internal linings:
   1. Nominal 40 mils (35 mils minimum) virgin polyethylene complying with ASTM D1248, heat fused to interior surface of fitting
   2. Nominal 40 mils (35 mils minimum) polyurethane
   3. Nominal 40 mils (35 mils minimum) ceramic epoxy
   4. Nominal 40 mils (35 mils minimum) fusion bonded epoxy

D. Exterior Protection: Provide polyethylene wrapping of ductile-iron fittings.

E. Hydrostatic Tests: Hydrostatically test pressure rated pipe in accordance with Paragraph 2.02D.

2.05 BENDS AND FITTINGS FOR PVC PRESSURE PIPE

A. Bends and Fittings: ANSI A21.10 or ANSI A21.53, ductile iron; ANSI A21.11 single rubber gasket push-on type joint; minimum 150 psi pressure rating. Approved restrained joints, 250 psi, may be provided for up to 12 inches in diameter (water or sanitary).

B. Provide approved restrained joint fittings: Integral restrained joint fittings and pipe do not require secondary restraint.

PART 3 – EXECUTION

3.01 PROTECTION

A. Store pipe under cover out of direct sunlight and protect from excessive heat or harmful chemicals in accordance with manufacturer's recommendations.

3.02 INSTALLATION

A. Install PVC pipe in accordance with these Specifications, ASTM D2321 for Sewer Pipe, and manufacturer's recommendations.

B. Install PVC water service pipe to clear utility lines and have minimum depth of cover below property line grade of street, unless otherwise required by Drawings:
   1. Water service pipe 12 inches in diameter and smaller: 3 feet of cover.

C. Avoid imposing strains that will overstress or buckle pipe when lowering pipe into trench.

D. Hand shovel pipe bedding under pipe haunches and along sides of pipe barrel and compact to eliminate voids and ensure side support.

E. Store PVC pipe under cover out of direct sunlight. Protect pipe from excessive heat or harmful chemicals. Prevent damage by crushing or piercing.

F. Allow PVC pipe to cool to ground temperature before backfilling when assembled out of trench to prevent pullout due to thermal contraction.

3.03 PVC RESTRAINED MECHANISM

A. Do not apply lubricant to spline or pipe or coupling spline grooves.

B. Do not use excessive force while inserting the spline through coupling.

C. Insert spline until it is fully seated around circumference of pipe.

D. Field Cutting of Pipe Ends:
   1. Perform by workers certified by manufacturer.
   2. Use a PVC pipe cutter and provide square ends.
   3. Use manufacturer approved power routing and grooving tool to field fabricate required pipe groove.

END OF SECTION

SECTION 40 0533 – HIGH DENSITY POLYETHYLENE (HDPE) SOLID WALL PIPE

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install high density polyethylene (HDPE) pipe and fittings in accordance with the Contract Documents.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

1.03 QUALITY ASSURANCE

A. HDPE pipe and fittings shall be of the N-12 low head pipe type.

B. This section contains references to some or all of the following documents, most recent edition. They are a part of this section as specified and modified. In case of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
AASHTO M252 & M294	Standard Specification for Corrugated Polyethylene Pipe
ASTM D2321	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications
ASTM D3212	Standard Specification for Joints for Drain and Sewer Plastic Pipes using Flexible Elastomeric Seals
ASTM D3350	Standard Specification for Polyethylene Plastics Pipe and Fittings Materials
ASTM F2306	Standard Specification for 12” to 60” Annular Corrugated Profile-Wall Polyethylene Pipe and Fittings for Gravity-Flow Storm Sewer and Subsurface Drainage Applications
ASTM F2487	Standard Practice for Infiltration and Exfiltration Acceptance Testing of Installed Corrugated High Density Polyethylene Pipe
ASTM F477	Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

PART 2– PRODUCTS

2.01 HDPE PIPE

A. Pipe Requirements: Low Head pipe shall have a smooth interior and annular exterior corrugations.
   1. 12”-diameter pipe shall meet AASHTO M294, Type S or ASTM F2306 with the modifications listed herein.
   2. Manning’s *n* value for use in design shall be 0.012.
   3. Where low head applications sustain continuous pressure, the sustained pressure shall not exceed 5 psi and the surge pressure shall not exceed 10 psi.

B. Joint Performance:
   1. The 12” pipe shall be watertight according to the requirements of ASTM D3212. Spigots shall have two gaskets meeting the requirements of ASTM F477. Gaskets

shall be installed by the pipe manufacturer and covered with a removable wrap to ensure the gasket is free from debris. A joint lubricant available from the manufacturer shall be used on the gasket and bell during assembly.

2. 12” diameters shall have a reinforced bell with a polymer composite band. The bell tolerance device shall be installed by the manufacturer.

C. Fittings: Fittings shall conform to AASHTO M252 and M294, or ASTM 2306. Bell and spigot connections shall utilize a spun on, welded, or integral bell and spigot with gaskets meeting ASTM F477. Fitting joints shall meet the watertight joint performance requirements of ASTM D3212.

D. Field Pipe and Joint Performance: To assure watertightness, field performance verification may be accomplished by testing in accordance with ASTM F2487. Appropriate safety precautions must be used when field-testing any pipe material. Contact the manufacturer for recommended leakage rates.

E. Material Properties: Virgin material for pipe and fitting production shall be high-density polyethylene conforming with the minimum requirements of cell classification 435400C for the corrugated exterior profile, and 4456A for the interior liner as defined and described in the latest version of ASTM D3350, except that carbon black content should not exceed 4%. The 12” virgin pipe material shall comply with the notched constant ligament-stress (NCLS) test as specified in Sections 9.5 and 5.1 of AASHTO M294 and ASTM F2306, respectively. The interior liner resin shall have a material designation code of PE3408/PE3608 by the Plastic Pipe Institute and a Hydrostatic Design Basis of 1600psi.

F. Pipe Dimensions

	Nominal Diameter
Pipe I.D. in (mm)	12 (300)
Pipe O.D. in (mm)	14.5 (368)
Inner Liner Thickness in (mm)	0.035 (0.9)
Min. Pipe Stiffness @ 5% Deflection #/in/in (kN/m^2)	50 (345)

PART 3– EXECUTION

3.01 INSTALLATION

A. General: In accordance with the manufacturer’s recommendations.

B. Installation shall also be in accordance with ASTM D2321, with the exceptions that minimum cover for 12” diameter pipes shall be three feet in single run applications. Backfill for minimum cover situations shall consist of Class 1 or Class 2 (minimum 90% SPD) material. Maximum fill heights depend on embedment material and compactions level.

3.02 TESTING

A. Testing shall be in accordance with ASTM F2487.

END OF SECTION

SECTION 40 0551 – COMMON WORK RESULTS FOR PROCESS VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Furnish and install all valves, actuators, and appurtenances, complete and operable, in accordance with the Contract Documents. These specifications shall not apply to valves, actuators, and appurtenances to be provided by process equipment vendors as part of process systems or equipment already approved by the ENGINEER.

B. The provisions of this Section shall apply to all valves and valve actuators except where otherwise indicated. Valves and actuators in particular locations may require a combination of units, sensors, limit switches, and controls indicated in other Sections of the Specifications.

C. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

D. Where a valve is to be supported by means other than the piping to which it is attached, the CONTRACTOR shall obtain from the valve manufacturer a design for support and foundation that satisfies the criteria in the applicable Sections of Division 46 – Water and Wastewater Equipment. The design, including drawings and calculations sealed by an engineer, shall be submitted with the Shop Drawings. When the design is approved, the support shall be provided.

E. Unit Responsibility: A single manufacturer shall be made responsible for coordination of design, assembly, testing, and furnishing of each valve; however, the CONTRACTOR shall be responsible for compliance with the requirements of each valve section. Unless indicated otherwise, the responsible manufacturer shall be the manufacturer of the valve.

F. Single Manufacturer: Where two or more valves of the same type and size are required, the valves shall be furnished by the same manufacturer.

1.02 SUBMITTALS

A. General: Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Shop Drawings: Shop Drawings shall contain the following information:
   1. Valve name, size, Cv factor, pressure rating and identification number (if any).
   2. Complete information on valve actuator, including size, Manufacturer, model number, limit switches, and mounting.
   3. Cavitation limits for all control valves.
   4. Assembly drawings showing part nomenclature, materials, dimensions, weights, and relationships of valve handles, handwheels, position indicators, limit switches, integral control systems, needle valves, and control systems.

C. Technical Manual: The Technical Manual shall contain the required information for each valve.

D. Spare Parts List: A Spare Parts List shall contain the required information for each valve assembly, where indicated.

1.03 QUALITY ASSURANCE

A. Valve manufacturer and model shall be as described in the Drawings or ENGINEER-approved equal.

1.04 SPARE PARTS

A. The CONTRACTOR shall furnish the required spare parts suitably packaged and labeled with the valve name, location, and identification number. The CONTRACTOR shall also furnish the name, address, and telephone number of the nearest distributor for the spare parts of each valve. Spare parts are intended for use by the OWNER after expiration of the correction of defects period.

PART 2 - PRODUCTS

2.01 PRODUCTS

A. General: Valves and gates shall be new and of current manufacture. Shut-off valves 6 inches and larger shall have actuators with position indicators. Buried valves shall be provided with valve boxes and covers containing position indicators and valve extensions. Manual shut-off valves mounted higher than 7 feet above working level shall be provided with chain actuators. Valves with no clear way to determine position shall be provided with position indicators. Stem extensions shall be provided on valves where operation of the valve cannot be easily accomplished from ground level.

B. Valve Actuators: Unless otherwise indicated, valve actuators shall be in accordance with these Specifications.

C. Valve Labeling: A label shall be provided on all shut-off valves and control valves except for hose bibs. The label shall be of 1/16-inch plastic or steel, minimum 2 inches by 4 inches in size and shall by permanently attached to the valve or on the wall adjacent to the valve as directed by the ENGINEER.

D. Valve Testing: As a minimum, unless otherwise indicated or recommended by the ENGINEER, valves 3 inches in diameter and smaller shall be tested in accordance with manufacturer's standard and 4 inches in diameter and larger shall be factory tested as follows:

1. Hydrostatic Testing: Valve bodies shall be subjected to internal hydrostatic pressure equivalent to twice the water rated pressure of the valve. Metallic valves rating pressures shall be at 100°F and plastic valves shall be 73°F, or at higher temperature according to type of material. During the hydrostatic test, there shall be no leakage through the valve body, end joints, or shaft seals, nor shall any part of the valve be permanently deformed. The duration shall be sufficient time to allow visual examination for leakage. Test duration shall be at least 10 minutes.
2. Seat Testing: Valves shall be tested for leaks in the closed position with the pressure differential across the seat equal to the water rated pressure of the valve. The duration of test shall be sufficient time to allow visual examination for leakage. Test duration shall be at least 10 minutes. Leakage past the closed valve shall not exceed 1 fluid ounce per hour per inch diameter for metal seated valves and drop-tight for resilient seated valves.
3. Performance Testing: All valves shall be shop operated from fully closed to fully open position and reverse under no-flow conditions in order to demonstrate the valve assembly operates properly.

E. Valve Marking: Valve bodies shall be permanently marked in accordance with MSS SP25 - Standard Marking Systems for Valves, Fittings, Flanges, and Unions.

2.02 MATERIALS

A. General: Materials shall be suitable for the intended application. Materials not indicated shall be high-grade standard commercial quality, free from defects and imperfections that might affect the serviceability of the product for the purpose for which it is intended. Unless otherwise indicated, valve and actuator bodies shall conform to the following requirements:

1. Cast Iron: Close-grained gray cast iron, conforming to ASTM A48 - Gray Iron Castings, Class 30, or to ASTM A126 - Gray Iron Castings for Valves, Flanges and Pipe Fittings.
2. Ductile Iron: ASTM A536 - Ductile Iron Castings, or to ASTM A395 - Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures.
3. Steel: ASTM A216 - Steel Castings, Carbon Suitable for Fusion Welding for High-Temperature Service, or to ASTM A515 - Pressure Vessel Plates, Carbon Steel, for Intermediate- and Higher-Temperature Service.
4. Bronze: ASTM B62 - Composition Bronze or Ounce Metal Castings, and valve stems not subject to dezincification shall conform to ASTM B584 - Copper Alloy Sand Castings for General Applications.
5. Stainless Steel: Stainless steel valve and operator bodies and trim shall conform to ASTM A351 - Steel Castings, Austenitic, for High-Temperature Service, Grade CF8M, or shall be Type 304 or 316 stainless steel.
6. PVC: Poly Vinyl Chloride materials for valve body, flanges, and cover shall conform to Cell Classification 12454.
7. CPVC: Chlorinated Poly Vinyl Chloride materials for valve body, flanges, and cover shall conform to Cell Classification 23447.
8. NSF Standard 14 and 61: All materials shall be listed for use in contact with potable water, where applicable.

B. Bodies: Valve bodies shall be cast, molded (in the case of plastic valves), forged, or welded of the materials indicated, with smooth interior passages. Wall thicknesses shall be uniform in agreement with the applicable standards for each type of valve, without casting defects, pinholes, or other defects that could weaken the body. Welds on welded bodies shall be done by certified welders and shall be ground smooth. Valve ends shall be as indicated, and be rated for the maximum temperature and pressure to which the valve will be subjected.

C. Bonnets: Valve bonnets shall be clamped, screwed, or flanged to the body and shall be of the same material, temperature, and pressure rating as the body. The bonnets shall have provision for the stem seal with the necessary glands, packing nuts, or yokes. Below grade valves with above grade worm gear drives/handwheels or electric actuators shall include extended bonnets for mating up to the worm gear drives/handwheel or electric actuators.

D. Stems: Valve stems shall be of the materials indicated, or, if not indicated, of the best commercial material for the specific service, with variable stem packing, O-rings, Chevron V-type packing, or other suitable seal. Where subject to dezincification, bronze valve stems shall conform to ASTM B62, containing not more than 5 percent of zinc or more than 2 percent of aluminum, with a minimum tensile strength of 30,000 psi, a minimum yield strength of 14,000 psi, and an elongation of at least 10 percent in 2 inches. Where dezincification is not a problem, bronze conforming to ASTM B584 may be used, except that zinc content shall not exceed 16 percent.

E. Stem Guides: Stem guides shall be provided, spaced 10-feet on centers unless the manufacturer can demonstrate by calculation that a different spacing is acceptable. Submerged stem guides shall be 304 stainless steel.

F. Internal Parts: Internal parts and valve trim shall be as indicated for each individual valve. Where not indicated, valve trim shall be of Type 316 stainless steel or other best suited material.

G. Nuts and Bolts: Nuts and bolts on valve flanges and supports shall be in accordance with these Specifications.

H. Coatings: Valve coatings shall be in accordance with these Specifications, or as recommended by the valve manufacturer.

I. Environment: Submerged valves shall be of stainless-steel construction as recommended by the valve manufacturer or as approved by the ENGINEER.

2.03 VALVE ACCESSORIES

Valves shall be furnished complete with the accessories required to provide a functional system.

PART 3 - EXECUTION

3.01 VALVE INSTALLATION

A. General: Valves, actuating units, stem extensions, valve boxes, and accessories shall be installed in accordance with the Manufacturer's written instructions and as indicated. Gates shall be adequately braced to prevent warpage and bending under the intended use. Valves shall be firmly supported to avoid undue stresses on the pipe.

B. Access: Valves shall be installed with easy access for actuation, removal, and maintenance and to avoid interference between valve actuators and structural members, handrails, or other equipment.

C. Valve Accessories: Where combinations of valves, sensors, switches, and controls are indicated, the CONTRACTOR shall properly assemble and install such items so that systems are compatible and operating properly. The relationship between interrelated items shall be clearly noted on Shop Drawing submittals.

END OF SECTION

SECTION 40 0557 – ACTUATORS FOR PROCESS VALVES AND GATES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all valve and gate actuators and appurtenances, complete and operable, in accordance with the Contract Documents.

B. The provisions of this Section shall apply to all valves and gates, except where otherwise indicated in the Contract Documents.

C. Single Manufacturer: Where two or more valve or gate actuators of the same type or size are required, the actuators shall all be produced by the same Manufacturer.

1.02 SUBMITTALS

A. General: Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures and these Specifications. The shop drawing shall substantiate compliance with the Contract Documents requirements.

B. Shop Drawings: Shop Drawings of all actuators shall be submitted together with the valve and gate submittals as a complete package.

C. Operation & Maintenance Manuals: Operation and Maintenance Manual shall be furnished in accordance with these Specifications.

PART 2 - PRODUCTS

2.01 GENERAL

A. General: Unless otherwise indicated, all shut-off and throttling valves, and externally actuated valves and gates, shall be provided with manual or power actuators. All actuators shall be complete and operable with mounting hardware, motors, gears, controls, wiring, solenoids, hand wheels, levers, chains, and extensions, as applicable. All actuators shall be capable of holding the valve in any intermediate position between fully open and fully closed without creeping or fluttering.

B. Manufacturers: Where indicated, certain valves and gates may be provided with actuators manufactured by the valve or gate Manufacturer. Where actuators are furnished by different manufacturers, coordinate selection to have the fewest number of manufacturers possible.

C. Materials: All actuators shall be current models of the best commercial quality materials and liberally sized for the maximum expected torque. All materials shall be suitable for the environment in which the valve or gate is to be installed.

D. Mounting: All actuators shall be securely mounted by means of brackets or hardware specially designed and sized for this purpose and of ample strength. The word "open" shall be cast on each valve or actuator with an arrow indicating the direction to open in the counter-clockwise direction. All gear and power actuators shall be equipped with position indicators. Where possible, manual actuators shall be located between 48 and 60 inches above the floor or permanent working platform.

E. Standard: Unless otherwise indicated and where applicable, all actuators shall be in accordance with ANSI/AWWA C540 - AWWA Standard for Power-Actuating Devices for Valves and Sluice Gates.

F. Functionality: Electric, pneumatic, and hydraulic actuators shall be coordinated with the power requirements of these Specifications.

2.02 MANUAL ACTUATORS

A. General: Unless otherwise indicated, all valves and gates shall be furnished with manual actuators. Valves in sizes up to and including 8 inches shall have direct acting lever of the Manufacturer's best standard design. Larger valves and gates shall have gear-assisted manual handwheel actuators, with an operating pull of maximum 60 pounds on the rim of the handwheel. All buried and submerged gear-assisted valves, all gates, all gear-assisted valves for pressures higher than 250 psi, all valves 30 inches in diameter and larger, and where so indicated, shall have worm-gear actuators, hermetically-sealed and grease-packed, where buried or submerged. All other valves 10 inches to 24 inches in diameter may have traveling-nut actuators, worm-gear actuators, spur- or bevel-gear actuators, as appropriate for each valve.

B. Buried Valves: Unless otherwise indicated, all buried valves shall have extension stems (or bonnets where shown on the plans) to grade, with square nuts or floor stands, position indicators, and cast-iron or steel pipe extensions with valve boxes, covers and operating keys. Where so indicated, buried valves shall be in cast-iron, concrete, or similar valve boxes with covers of ample size to allow operation of the valve actuators. Covers of valve boxes shall be permanently labeled as requested by the OWNER, or the ENGINEER. Wrench-nuts shall comply with AWWA C500 - Metal Seated Gate Valves for Water Supply Service, and a minimum of 2 operating keys, or one key per 10 valves, whichever is greater, shall be furnished to the OWNER.

C. Buried and Submerged Actuators: Buried and submerged valve actuators and gear assemblies shall be provided with Type 304 and/or 316 stainless steel bolting and trim, and shall be rated for continuous submerged service. If buried, the valve actuator shall be suitable for a submerged service at a water depth of 10 feet (minimum). If submerged, the actuator shall be suitable for a submerged service at a water depth of 30 feet (minimum).

2.03 ELECTRIC ACTUATORS

A. General: The CONTRACTOR shall verify with the vendor/manufacturer that each electric actuator (supplied and installed) delivers the necessary torque requirements for opening and closing the corresponding valve that it is actuating, and provide supporting documentation to the ENGINEER. Electric actuators shall be suitable as specified on the plans for use on 115VAC, 1-phase, or 480 VAC, 3-phase, 60Hz power supply. The actuator shall include an internal high-torque reversible electric motor, terminal block, heat-treated alloy steel gearing, a minimum of two (2) 1/2" NPT conduit connections, reduction gearing, valve stem drive nut/bushing, position limit switches, mechanical overload torque switches, ductile iron gear case, automatic de-clutchable handwheel, and a two- (2-) year original manufacturer’s warranty. In order to maintain the integrity of the enclosure, setting of the torque levels, position limits and configuration of the indication contacts, etc. shall be carried out without the removal of any actuator covers over an Infrared interface. Sufficient commissioning tools shall be provided with the actuators and must meet the enclosure protection and certification levels of the actuators. Commissioning tools shall not form an integral part of the actuator and must be removable for secure storage/authorized release. In addition, provision shall be made for the protection of configured actuator settings by a means independent of access to the commissioning tool. The actuator shall include a device to ensure that the motor runs with the correct rotation for the required direction of valve travel irrespective of the connection sequence of the power supply.

B. Actuator Sizing: The actuator shall be sized to guarantee valve closure at the specified differential pressure and temperature. The safety margin of motor power available for seating and unseating the valve shall be sufficient to ensure torque switch trip at maximum valve torque with the supply voltage 10% below nominal. For linear operating valves, the operating speed shall be such as to give valve closing and opening at approximately 10-12 inches per minute unless otherwise noted. Actuator manufacturer/vendor shall confirm appropriate opening and closing times for the valve the actuator is operating.

C. Gears: Motor speed reduction shall be by means of a gear train consisting of hardened steel spur gears and self-locking worm and worm gear set. The worm shall be heat treated alloy steel and have worm thread surface rolled or ground. The worm gear shall be bronze. Non-metallic gears in the power train are not acceptable.

D. Environmental: Actuators shall be suitable for indoor and outdoor use. The actuator shall be capable of functioning in an ambient temperature ranging from -33°C (-27°F) to 70°C (158°F), up to 100% relative humidity. Actuators for hazardous area applications shall meet the area classification, gas group and surface temperature requirements specified in data sheet.

E. Rotating Components: All gearing and shafting shall be supported on anti-friction bearings. All thrust components shall be supported by use of tapered roller bearings.

F. Handwheel Drive: The actuator shall be furnished with a handwheel located in a 90-degree plane from the actuator output drive, with a maximum rim pull requirement of 60 pounds for valve travel loads. An external manual declutch lever shall be included to place actuator in the manual mode. The lever shall not require more than a 10-pound force to engage even when the valve has been tightly seated. The lever is to be padlockable in either handwheel or motor mode. Operation by motor shall not cause the handwheel to rotate, or operation of the handwheel shall not cause the motor to rotate. Handwheel shall operate in the clockwise direction to close.

G. Lubrication: All gearing and bearings shall be grease lubricated and suitable for year-round service based on prevailing ambient temperature conditions.

H. Electric Motors: The motor shall an integral part of the actuator, designed specifically for valve actuator applications. It shall be a low inertia high torque design, class F insulated with a class B temperature rise giving a time rating of 15 minutes at 40°C (104°F) at an average load of at least 33% of maximum valve torque. Temperature shall be limited by thermostats embedded in the motor end windings and integrated into its control. Electrical and mechanical disconnection of the motor should be possible without draining the lubricant from the actuator gear case.

I. Motor Protection: Protection shall be provided for the motor as follows:
   1. Stall - the motor shall be de-energized within 8 seconds in the event of a stall when attempting to unseat a jammed valve.
   2. Over temperature - thermostat will cause tripping of the motor. Auto-reset on cooling
   3. Single phasing - lost phase protection.
   4. Direction – phase rotation correction.

J. Limit Switches: Limit switches shall be geared to the drive mechanism and in step with actual valve position at all times, whether operation is by power or manual mode. Switches shall be activated by a rotor type design. Contacts shall be silver and have a rating of 10 amps at 120/230 VAC, a minimum of (3) N.O. and (3) N.C. contacts shall be provided for each direction of travel. Should auxiliary limit switch contacts for intermediate switch positions be required, please specify here. The limit switch gear mechanism shall be enclosed to prevent entrance of foreign matter or wire entanglement. Use of cams or screws to set switches or designs requiring battery back-up methods to ensure position

control in the event of a power failure, are unacceptable. Torque and turns limitation to be adjustable as follows:

1. Position setting range – multi-turn: 2.5 to 100,000 turns, with resolution to 15 deg. of actuator output.
2. Position setting range – direct drive part turn actuators: 90° +/-10°, with resolution to 0.1 deg. of actuator output.
3. Torque setting: 40% to 100% rated torque.

K. Torque Switches: The actuator shall include a variable torque switch to interrupt the motor power circuit when an obstruction is encountered in either direction of travel or when torque seating of valves is required for tight shut off. The torque switch shall have a calibrated dial for adjustment and have means to ensure maximum actuator rating is not exceeded. Contacts shall have the same construction and rating as the limit switch. Mechanical torque springs for load control shall be field replaceable without need of actuator dismantling or removal of the worm assembly. Torque control designs which do not employ mechanical torque springs are unacceptable.

L. Position Indication: Local position indication for quarter turn valves shall be by an indicator dial located on the gear operator and graduated in 25-degree increments. For rising stem multi-turn actuators, a dial window indicator shall be located on the limit switch compartment cover and labeled 0 to 100% open and graduated in 1% increments. Four contacts shall be provided which can be selected to indicate any position of the valve. Provision shall be made for the selection of a normally closed or open contact form. Contacts shall maintain and update position indication during hand wheel operation when all external power to the actuator is isolated. The contacts shall be rated at 5A, 250V AC, 30V DC. As an alternative to providing valve position any of the four above contacts shall be selectable to signal one of the following:

1. Valve opening, closing, or moving
2. Thermostat tripped, lost phase
3. Motor tripped on torque in mid travel, motor stalled
4. Remote selected
5. Actuator being operated by hand wheel
6. Provision shall be made in the design for an additional 4 contacts having the same functionality. Provision shall be made in the design for the addition of a contactless transmitter to give a 4-20mA analogue signal corresponding to valve travel for remote indication when required. The transmitter will auto range to the set limits.

M. Integral Starter and Transformer: The reversing starter, control transformer and local controls shall be integral with the valve actuator suitably housed to prevent breathing and condensation. The starter shall be suitable for 1,200 starts per hour (minimum) and of rating appropriate to motor size. The controls supply transformer shall be fed from two of the incoming three phases and incorporate overload protection. It shall have the necessary tappings and be adequately rated to provide power for the following functions:

1. Energization of the contactor coils.
2. 24V DC output for remote controls.
3. Supply for all the internal electrical circuits.

2.04 ELECTRICAL CONTROLS

A. At a minimum, the actuator shall be furnished with power and control terminal strips, limit switches, torque switches, all housed in a control compartment. The rectangular enclosure shall have a bonded O-ring seal and a hinged cover. Cover bolting shall be captive stainless hex head screws.

B. Controls shall be an integrated modular package, completely wired and be easily removable or replaceable, as a complete package, by removal of four (4) captive screws.

Motor leads and power supply leads will be terminated to the terminal strips located on the modular control package. Power supply terminals (5 points minimum) and control supply terminal (48 points minimum) shall be physically isolated from each other to protect against transient voltages. The terminal strips shall be completely shrouded with a high impact resistant plastic to avoid accidental terminal contact by personnel. The module is to include a snubber circuit to provide control voltage protection for switches and electronic modules for voltage surges. All electrical components of the modular package, such as reversing contactor, transformer, etc., shall be unidirectional plug connected to provide easy removal and replacement without concerns for proper wiring connections. All optional control requirements such as modulating control, 2-wire control, interposing relays, etc. shall be plug-in printed circuit type boards having gold plated contact connectors. Unless otherwise specified, all PC boards must be temperature rated -40°C to +70°C. Ease of replacement or upgrading shall be of paramount consideration.

2.05 OPEN-CLOSE SERVICE CONTROLS

A. Reversing Contactor: Control voltage shall be 120 volts, 50 or 60 Hz. N.O. Seal-in contacts for momentary contact pushbutton control and N.C. contacts for electrical interlock shall be supplied. The following options are available with the integral reversing starter: Motor Overload Relays, Auxiliary Starter Contacts, Phase Sentry.

B. Control Power Transformer: The transformer assembly shall provide 120, 18 and 12 Vac. It shall be epoxy impregnated and encapsulated to prevent moisture incursion and shall be completely wired as an assembly and plug connected to the modular package.

C. Pushbuttons: Each actuator shall be supplied with open-stop-close pushbuttons furnished integrally mounted. Pushbuttons shall be double O-ring sealed and include a protective silicone boot. Seal material shall be resistant to ozone and ultraviolet light. When integrally mounted pushbuttons are specified, the design shall permit operation of the buttons when the electrical enclosure cover is open.

D. Indicating Lights: The actuator shall include two (2) long life high intensity LED type pilot lights to indicate open, closed, and intermediate valve position (both lights on). Red shall indicate valve open and green shall indicate valve closed. An additional LED pilot light shall be furnished to indicate power is on. A fourth optional LED pilot light is available to indicate torque switch trip.

E. Selector Switch: The actuator shall include a 3-position selector switch, for local (hand)-off-remote (auto) control. If specified, the switch shall be padlockable in any position. A tumbler keylock option may be specified.

2.06 ACTUATORS FOR MODULATION DUTY

A. The starter shall be suitable for 1,200 starts per hour.

B. Control Module: For modulating applications, the control module shall be of the electronic solid-state type to control the position of an AC valve operator motor. Provide input/output per Contract Documents, including but not limited to: 4-20 mA analog input position control from PLC; 4-20 mA analog output position indication to PLC; and digital outputs to PLC for motor running, ready mode, remote mode, over torque condition and trouble. Position control shall be within +/- 2 percent of signal position.

Input Signal: The control unit shall be suited to receive an input set-point from an external 4-20 mA DC source or 120 VAC OPEN and CLOSE digital commands to remotely operate the motor in the forward and reverse directions, whichever is required for modulating purposes.

C. The controller shall compare the input signal with the feedback signal to produce an error signal. The controller shall cause the motor to move the valve or gate in a direction so as to reduce the magnitude of the error signal. The controller positioning accuracy shall be plus or minus 1.0 percent of travel or better. Operating speeds, unless otherwise stated, shall be 90 degrees per minute for rotary operators. It shall be possible to adjust Dead Band (0-9.9% of travel) and a Motion Inhibit Timer (2-99 secs), and select action upon loss of signal.

2.07 MANUFACTURERS

A. Rotork - IQT, or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 SERVICES OF MANUFACTURER

A. Field Adjustments: Field representatives of manufacturers of valves or gates with pneumatic, hydraulic, or electric actuators shall adjust actuator controls and limit-switches in the field for the required function.

B. Performance Test Certificate: Each actuator must be performance tested and individual test certificates shall be supplied free-of-charge. The test equipment should simulate a typical valve load and the following parameters should be recorded:
   1. Current at maximum torque setting
   2. Torque at maximum torque setting. Torque curves for both open and close strokes for each MOV shall be provided.
   3. Flash Test Voltage
   4. Actuator Output Speed or Operating Time; in addition, the test certificate should record details of specification, such as closing direction, and wiring diagram code number.

3.02 INSTALLATION

A. All valve and gate actuators and accessories shall be installed in accordance with these Specifications. Actuators shall be located to be readily accessible for operation and maintenance, without obstructing walkways. Actuators shall not be mounted where shock or vibrations will impair their operation, nor shall the support systems be attached to handrails, process piping, or mechanical equipment.

B. Coordinate all installation with the valve supplier. The supplier shall be responsible for fabrication, coordination, and assembly for a complete operating system.

C. Inspection, Startup, and Field Adjustment: An authorized representative of the Manufacturer shall visit the site and witness the following:
   1. Installation of the equipment for not less than 1 day.
   2. Inspection, checking, and adjusting the equipment for not less than 1 day.
   3. Startup and field-testing for proper operation for not less than 1 day.

END OF SECTION

SECTION 40 0561 – GATE VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall provide gate valves and appurtenances, complete and operable, in accordance with these Specifications and the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

PART 2 - PRODUCTS

2.01 GATE VALVES (16-inch and smaller)

A. General. Gate valves for water service shall conform to the AWWA Standard for "Resilient-Seated Gate Valves" (AWWA C509, latest edition). Valves shall be of the resilient seated type with non-rising stem, closing in a clockwise direction. Sealing mechanism shall provide zero leakage at the water working pressure against line flow from either direction. The rubber covered gate shall not be wedged into a pocket nor slide across the seating surface to obtain a tight closure. Synthetic thrust washers shall be provided to minimize operating torque. Valves shall be flanged or have ends to match pipe and shall have solid bronze internal working parts.

B. Stems. Gate valve stems shall be of bronze containing not more than 5 percent of zinc nor more than 2 percent of aluminum, and shall have a minimum tensile strength of 60,000 psi, a yield strength of 35,000 psi, and an elongation of at least ten percent in 2-inches, as determined by a test coupon poured from the same ladle from which the valve stems to be furnished are poured. Seats. Resilient valve seats shall consist of styrene butadiene (SBR) rubber permanently bonded to a high-strength iron wedge gate. The gate shall be totally encapsulated. The bonding process shall meet the requirements of ASTM D429. Mechanically attached seats or seats attached to the valve body shall not be accepted.

C. Operators. Buried valves shall be provided with a 2-inch square operating nut, extension stems, and valve well, as required in Part 2.01. Unless otherwise shown on the drawings, valves in vaults or above grade shall be supplied with a cast iron handwheel and be rising stem. All buried gate valves shall be non-rising stem.

D. Pressure Rating and Testing. Valves shall be rated for a working water pressure of 200 psi and shall be seat tested at this pressure with no leakage. Shell test of 400 psi shall be applied to body with valve in the open position with no leakage through the metal, flanged joints, or stem seals.

E. Epoxy Coating. Valve and operator shall be epoxy coated as specified in part 2.01 of this Section, except coating shall have 12 mil thickness.

F. Spare Parts. Each valve shall be supplied with a spare set of upper and lower O-rings and weather seal.

G. Manufacturer. Resilient seat gate valves shall be manufactured by U.S. Pipe, American Darling CRS-80, ITT Kennedy, or ENGINEER-approved equivalent.

EXECUTION

3.01 GENERAL

A. Gate valves shall be installed in accordance with the provisions of these Specifications. Care shall be taken that valves in plastic lines are well-supported at each end of the valve.

END OF SECTION

SECTION 40 0562 – PLUG VALVES

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide plug valves and appurtenances, complete and operable, in accordance with the Contract Documents.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

1.03 OPERATION AND MAINTENANCE MANUAL

A. Provide six (6) hard copies plus one (1) electronic version in PDF format.

B. Operation and Maintenance Manual shall be furnished in accordance with these Specifications.

1.04 QUALITY ASSURANCE

A. The manufacturer shall provide a 2-year equipment warranty.

1.05 SPARE PARTS

A. Spares shall be as requested by the ENGINEER. Payment for spares shall be made in accordance with the General Conditions.

B. A list of spare parts for each piece of equipment shall be obtained from the manufacturer and submitted at the same time as Shop Drawings. The name, address, and telephone number of the nearest distributor for each piece of equipment shall be furnished.

PART 2 – PRODUCTS

2.01 ECCENTRIC PLUG VALVES

A. General: Plug valves shall be of the quarter-turn, non-lubricated, eccentric type with resilient faced plug. Plug valves shall be designed for a working pressure of 175 psi for valves 12” and smaller, 150 psi for valves 14” and larger. Valves shall provide tight shut-off at rated pressure. Valves 20” and smaller shall have round port design. 24” and larger valves shall have rectangular port design. Minimum port area for all valves shall be 80% of corresponding pipe area.

B. Valve Body: The plug valve body shall be cast iron ASTM A126 Class B with welded-in overlay of greater than 90% nickel alloy content on all surfaces contacting the face of the plug. Sprayed, plated, nickel welded rings or seats screwed into the body are not acceptable. All cover bolts shall be corrosion resistant. The “SEAT END” of the valve shall be designated on the valve body.

C. Coating: Plug valves shall be coated in accordance with Section 09 97 00 – Special Coating

D. Valve Plug: The valve plug shall be cast iron ASTM A126 Class B, with Buna-N resilient seating surface to mate with the body seat.

E. Valve Connections: Flanged valves shall be drilled in compliance with ANSI B16.1, Class 125. Mechanical joint valves shall comply with AWWA C111. Threaded valves shall have NPT full size inlets with hexagonal wrench connection.

F. Valve Bearings: Plug valves shall be furnished with permanently lubricated sleeve type bearings conforming to AWWA C504. Bearings shall be of sintered, oil impregnated type 316 stainless steel ASTM A743 Grade CF-8M or bronze ASTM B127.

G. Valve Shaft Seals: Valve shaft seals shall be of the “U” cup type, in accordance with AWWA C504. Seals shall be self-adjusting and repackable without removing the bonnet from the valve.

H. Valve Actuators: Valves 2.5” and smaller shall be provided with a hand lever. Valves 3” and larger shall be specified as equipped with either a handwheel or 2” square nut for direct quarter-turn operation.

1. Where specified, a totally enclosed and sealed worm gear actuator with position indicator and externally adjustable open and closed stops shall also be included. The worm segment gear shall be ASTM A536 Grade 65-45-12 ductile iron with precision bore and keyway for connection to the valve shaft. All buried valves shall be provided with worm and gear actuators suited for the intended service. All gear actuators shall be designed to withstand, without damage, a rim pull of 200 lbs for handwheels and an input torque of 300 ft-lbs for nuts.

2. Buried service actuators shall be packed with grease and sealed for temporary submergences to 20 feet of water. Exposed worm shafts shall be stainless steel.

I. Electric Actuators: When specified, electric actuators shall be in accordance with Section 40 05 57 – Actuators for Process Valves and Gates.

2.02 Manufacturers, or ENGINEER-approved equal:

A. VAL-MATIC

B. PRATT

C. DeZurik

D. ENGINEER-approved equal

PART 3 – EXECUTION

3.01 GENERAL

A. Valves shall be installed in accordance with these Specifications and Manufacturer’s instructions.

END OF SECTION

SECTION 40 0563 – BALL VALVES

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide ball valves and appurtenances, complete and operable, in accordance with the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

PART 2 – PRODUCTS

2.01 GENERAL

A. The ball valve type and its actuator shall be as indicated in the contract documents. All actuators shall be in accordance with these Specifications.

2.02 BALL VALVES (3- TO 12-INCH)

A. Construction: Ball valves shall be full bore with a design working pressure of 150 psig. Valve construction shall conform to the following:
   1. Top Flange shall be design for direct mounting of actuator and gear operators. Top flange shall provide easy access for adjustment of gland bolts. Design shall conform to EN ISO 5211.
   2. Valve Design shall conform to ASME B16.34-2004/ API 6D / BS EN ISO 17292 Class 150.
   3. Valve end-to-end dimensions shall be per ASME b16.10 / API 6D.
   4. Valve Body shall be flanged, two-piece design in cast construction and shall be coated with two-coat zinc-rich epoxy paint.
   5. Ball shall be floating design, stainless steel with superior finish and sphericity to ensure extended seat life and low operating torque.
   6. Stem shall be stainless steel, heavy duty construction with double “D” (sizes up to 4”) and round and keyed (sizes 6” and greater) configurations.
   7. Seat shall be contoured and be reinforced with PTFE seat.
   8. Body joint bolting shall conform to ASTM A193 B7/ ASTM A194 2H for carbon steel bodies and ASTM A193 GR.B8/ ASTM A194 GR.8 for stainless steel bodies.
   9. Actuators: Unless otherwise indicated, ball valves shall have manual hand lever or wheel actuators.

B. Manufacturers, or ENGINEER-approved equal:
   1. Apollo
   2. Nibco
   3. Valtorc

2.03 BALL VALVES (SMALLER THAN 3-INCH)

A. Construction: Ball valves, smaller than 3-inch, for general purpose use, shall be heavy-duty type for industrial service, with butt weld, grooved, threaded, or soldered ends to match the piping. The bodies shall be cast red bronze conforming to ASTM B584. The ball and threaded pack gland shall be brass with a reinforced PTFE seat ring. The stem shall be of silicon bronze. All valves shall have a pressure rating of minimum 125 psi steam, and 200 psi cold water, unless otherwise indicated.

B. Construction (Thermoplastic Ball Valves): PVC and CPVC ball valves, smaller than 3-inch, for general purpose use, shall be heavy-duty type for industrial service, with butt socket, threaded, or flanged ends to match the piping. The ball valves shall be true union type constructed from PVC Type I, ASTM D1784, or CPVC Type IV, ASTM D1784. All O-rings shall be EPDM or Viton. All ½" to 2" valves shall be pressure rated at 235 psi and all 2-1/2" to 3" valves shall be pressure rated at 150 psi, unless otherwise indicated.

C. Manufacturers, or ENGINEER-approved equal:
   1. Hayward
   2. Apollo
   3. Asahi
   4. Spears

2.04 CURB STOP BALL VALVES

A. Construction: Curb stop ball valves smaller than 3-inch shall be shall be heavy-duty type for industrial service, with butt socket, threaded, or flanged ends to match the piping. If Curb Stop ball valve is connecting to plastic piping, stainless steel insert stiffeners are required. Curb stop ball valve to be made of heavy cast bronze body, end piece to be epoxied into body. A fluorocarbon coated brass ball to eliminate corrosion and electrolysis associated with common plug type curb stops. Curb stops shall be 90-degree rotation for open/close, one-piece cap and stem, double Buna-N Stem O-rings to assure permanent water seal at top. Curb stop ball valves shall be designed and manufactured to conform to AWWA Standard C800-89 (ASTM B62-Index 115-85-5-5-5). Valves shall be individually inspected and tested by the manufacture for leaks by air pressure under water.

B. Manufactures, or ENGINEER-approved equal:
   1. Ford
   2. Mueller Company
   3. Legend

PART 3 – EXECUTION

3.01 GENERAL

A. Ball valves shall be installed in accordance with the provisions of these Specifications. Care shall be taken that valves in plastic lines are well supported at each end of the valve.

END OF SECTION

SECTION 40 0564 – BUTTERFLY VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide butterfly valves and appurtenances, (air and water service) complete and operable, in accordance with the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

B. Complete Shop Drawings

C. Drawings of butterfly valves and actuators.

D. Drawings showing valve port diameter complete with dimensions, part numbers and materials of construction.

1.03 QUALITY ASSURANCE

A. Valves shall be subjected to performance, leakage, and hydrostatic tests in accordance with procedures and acceptance criteria established by AWWA C504.

PART 2 - PRODUCTS

2.01 RESILIENT SEATED BUTTERFLY VALVES

A. General: Butterfly valves steady-state water working pressures and steady-state differential pressure shall be as indicated on the plans.

B. Valves shall be of the body type, pressure class, end joint, and actuator type indicated on Contract Drawings.

C. Construction: Unless otherwise indicated, all materials of construction shall be suitable for the service, whether water or air. The seats shall be positively clamped or bonded into the disc or body of the valve.

Description	Material Standards (may differ for service application – water/air)
Valve Bodies	Cast Iron ASTM A126 Class B
Valve Stem	Stainless Steel 416
Valve discs	Aluminum or Bronze
Painting and coating	Refer to applicable Sections of Division 09 – Finishes

D. Manufacturers, or ENGINEER-approved equal:
1. Val-Matic
2. Keystone
3. Pratt

2.02 BURIED SERVICE BUTTERFLY VALVE

A. General: All butterfly valves shall be manufactured in accordance with the latest revision of AWWA C504 for Class 150B service. Valves in sizes 3-24” shall have 304 stainless steel trim as standard.

B. Valve body shall be constructed of cast iron ASTM A126 Class B and conform to AWWA C504 in terms of laying lengths and minimum body shell thickness. End connections shall be as specified on the plans.

C. Valve disc shall also be made from cast iron ASTM A126 Class B in sizes 20" and smaller. Sizes 24" and larger shall be built from ductile iron in conformance to ASTM A536. Disc shall be furnished with Type 316 stainless steel seating edge to mate with the rubber seat on the body.

D. Valve seat shall be Buna-N rubber located on the valve body. In sizes 20" and smaller, valves shall have bonded seats that meet test procedures outlined in ASTM D429 Method B. Sizes 24" and larger shall be retained in the valve body by mechanical means without use of metal retainers or other devices located in the flow stream.

E. The shaft shall be Type 304 stainless steel conforming to ASTM A276. Shaft seals shall be standard self-adjusting split V packing. Shaft seals shall be of a design allowing replacement without removing the valve shaft.

F. Bearings shall be sleeve type that is corrosion resistant and self-lubricating.

G. Actuators shall be fully grease packed and have stops in the open/close position. The actuator shall have a mechanical stop which will withstand an input torque of 450 ft. lbs. against the stop. The traveling nut shall engage alignment grooves in the housing. The actuators shall have a built-in packing leak bypass to eliminate possible packing leakage into the actuator housing.

H. The Valve Interior and Exterior Surfaces except for seating shall be coated with Ameron Amerlock 370 in accordance with AWWA C550 and C504. All internal and/or external surfaces shall be covered with a polyamide cured epoxy coating applied over a sand blasted “new white metal surface" per SSPC-SP10 to a minimum of 6 mils in compliance with AWWA C550.

I. Manufacturers, or ENGINEER-approved equal:
   1. Val-Matic
   2. Pratt

PART 3 - EXECUTION

3.01 INSTALLATION

A. All exposed butterfly valves shall be installed with a means of removing the complete valve assembly without dismantling the valve or operator. The installation shall be in accordance with these Specifications.

END OF SECTION

SECTION 40 0565 – CHECK VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide check valves and appurtenances, complete and operable, in accordance with the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

PART 2 - PRODUCTS

2.01 SWING CHECK VALVES (3-INCH AND LARGER)

A. General: Swing check valves for water and wastewater service shall be a full body flange type, with a domed access cover and resilient disc. The valves shall meet ANSI/AWWA C 508 - Swing-Check Valves for Waterworks Service, 3 in. through 24 in. NPS, unless otherwise indicated, and shall be with full-opening passages and designed for a water-working pressure of 250 psi. Check valves shall be fully operational in both the vertical and horizontal installation position.

B. Body: The valve body and cover shall be of cast iron conforming to ASTM A536 Grade 65-45-12 with flow area equal to the nominal pipe inside diameter throughout the valve. Seat shall be constructed on a 45-degree angle to reduce disc travel. The seat and internal body shall be fully coated with a two part thermosetting epoxy suitable for use in both potable water and wastewater applications.

C. Disc: The resilient disc shall be of one-piece construction, precision molded with an integral O-ring type seal surface and contain alloy steel and nylon reinforcement in the flexible hinge area. For pressure application 50 psig or greater, the resilient disc shall be a fully encapsulated steel pressure plate with integral molded O-ring on the face of the elastomer. Nylon reinforcements shall be provided in the flexible hinge area of the disc assembly.

D. Backflow Actuator: Check valves shall be provided with a screw-type backflow actuator to allow for the opening of the valve during no flow conditions. The backflow shall be a rising-stem type to indicate position. A stainless-steel T-handle shall be provided for ease of operations.

E. Position Indicator: Check valves shall be provided with a mechanical position indicator to indicate disc position.

F. Disc Accelerator Mechanism: Check valve shall be provided with a disc accelerator mechanism to assist in the rapid closure of the disc to minimize flow reversal. Accelerator mechanism shall be required in high head application of 50 psig or greater. Accelerator mechanism shall be a spring type, weighted type, or hinge type.

G. Valve manufacturer shall be Val-Matic, VSI, Pratt or ENGINEER-approved equal.

2.02 SWING CHECK VALVES (2-1/2-INCH AND SMALLER)

A. General: Swing check valves for steam, water, oil, or gas in sizes 2-1/2-inch and smaller shall be suitable for a steam pressure of 150 psi and a cold water pressure of 300 psi. They shall have screwed ends, unless otherwise indicated, and screwed caps.

B. Body: The valve body and cap shall be of bronze conforming to ASTM B61 - Steam or Valve Bronze Castings, or ASTM B62 with threaded ends conforming to ANSI/ASME B1.20.1 - Pipe Threads, General Purpose (inch).

C. Disc: Valves for steam service shall have bronze or brass discs conforming to ASTM B16 – Free-Cutting Brass Rod, Bar, and Shapes for Use in Screw Machines, and for cold water, oil, and gas service replaceable composition discs.

D. Hinge Pin: The hinge pins shall be of bronze or stainless steel.

E. Position Indicator: Valves shall be provided with mechanical position (open/closed) indicators.

F. Valve manufacturer shall be as shown on the Drawings or ENGINEER-approved equal.

2.03 DOUBLE DISC CHECK VALVE

A. General: Check valve shall be of the double disc, wafer style with torsion spring induced closure. Valve shall be Wafer style for bolting between ANSI Class 125 flanges. Valves have a Ductile Iron body (ASTM A536 65-45-12) to fit inside 125# ANSI bolt circles, a two-piece Stainless-Steel disc (ASTM type 304), type 304 Stainless Steel dual shafts, ASTM A313, type 304 Stainless Steel torsion spring and have an integrally molded elastomer seat vulcanized to the body. Valve for horizontal flow shall be installed with the shafts in vertical position.

B. Valve manufacturer shall be Valmatic, Pratt or ENGINEER-approved equal.

2.04 GLOBE STYLE CHECK VALVE

A. General: Check valve shall be of the silent operating type and the same size as the entering pipe. Globe style thru 24 inches shall be rated 250PSI WOG, have a Ductile Iron body (ASTM A536 65-45-12), 125# ANSI Flat Face Flanges, ASTM A313 Type 304 Stainless Steel helical or conical spring, a Stainless Steel (ASTM type 304) seat and dual guided disc (top and bottom), 304 Stainless Steel guide bushing and type 304 Stainless Steel guide pins. Check valve to have a minimum open area in the body of 110% of the area of the entering or corresponding pipe. Valve is to operate silently in either vertical or horizontal positions, flow up or down.

B. Valve manufacturer shall be Valmatic, Pratt or ENGINEER-approved equal.

2.05 WAFER SILENT CHECK VALVE

A. General: Check valve shall be of the silent wafer type and the same size as the entering pipe. Valves shall be the compact wafer style and have a pressure and temperature rating equal to or greater than the pipeline in which they are installed. Compact wafer-silent style check valves thru 12 inches shall be rated for 250PSI WOG for installation between ANSI Class 125 or Class 250 flanges, have a Ductile Iron body (ASTM A536 65-45-12), ASTM A313, Type 304 Stainless Steel helical or conical spring, a Stainless-Steel guide bushing and type 304 Stainless Steel guide pins. Valves are to operate silently in either vertical or horizontal positions, flow up or down.

B. Valve manufacturer shall be Val-Matic, Pratt, or ENGINEER-approved equal.

2.06 TILTING DISC CHECK VALVE

A. General: The tilting disc check valve shall consist of a circular disc with conical rim, hinged about a fixed pivot above its center-line and offset from the plane of the seat, sealing against a body seat clamped between the two sections of the valve body.

B. Body: The body shall be two-piece, consisting of an entrance and a discharge section bolted together at an angle with the pipeline. An O-ring seal in a groove between the body flanges shall be in place to prevent leakage between the flanges when bolted together. The valve shall be complete with ANSI class flanges to mate with adjacent equipment.

C. Disc and Seat: A body seat shall be clamped in place in a slot between the two body sections. The body seat shall have a conical finish to mate with the disc seat. There shall be an inspection port provided in both the entrance and discharge sections to provide visual access both upstream and downstream of the disc. An indicator shall be provided to show disc position for the full range of travel. Bosses shall be cast in both the entrance and discharge sections to allow for a top mounted oil dashpot for controlled opening and closing. All valve castings shall be ductile iron ASTM A536 Grade 65-45-12. The disc and body seat ring shall be Bronze B62. The hinge-pin shall be stainless steel ASTM A276 Type 304. The bearing sleeve shall be Bronze B62. Coating shall be NSF61 approved epoxy.

D. Backflow Actuator: If required, check valves shall be provided with a screw-type backflow actuator to allow for the opening of the valve during no flow conditions. The backflow shall be a rising-stem type to indicate position. A stainless-steel T-handle shall be provided for ease of operations.

E. Position Indicator: Check valves shall be provided with a mechanical position indicator to indicate disc position.

F. Valve manufacturer shall be Val-Matic, Pratt or ENGINEER-approved equal.

2.07 RUBBER FLEX DUCKBILL CHECK VALVE

A. General: Check valves are to be metal backed, rubber flanged for attaching directly to flanged-end connections. The check valve shall be made of Buna-N elastomer material. CONTRACTOR to verify the valve ID size and flange drilling dimensions.

B. Valve manufacture shall be Cla-Val, or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 GENERAL

A. Valves shall be installed in accordance with provisions of these Specifications.

END OF SECTION

SECTION 40 0567 – SPECIALIZED PRESSURE AND FLOW-CONTROL VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all miscellaneous valves and appurtenances, complete and operable, in accordance with the Contract Documents.

B. American Iron and Steel (AIS) requirement applies to this Section. All iron and steel products used in this project must be produced in the United States.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01 3300 – Submittal Procedures.

1.03 OPERATION AND MAINTENANCE MANUAL

A. Provide two (2) hard copies plus one (1) electronic version in PDF format.

B. Operation and Maintenance Manual shall be furnished in accordance with these Specifications.

1.04 QUALITY ASSURANCE

A. Manufacturer and model shall be described on the Drawings or ENGINEER-approved equal.

B. The manufacturer shall provide a 2-year equipment warranty.

1.05 SPARE PARTS

A. Spares shall be as requested by the ENGINEER. Payment for spares shall be made in accordance with these Specifications and the Contract Documents.

B. A list of spare parts for each piece of equipment shall be obtained from the manufacturer and submitted at the same time as Shop Drawings. The name, address, and telephone number of the nearest distributor for each piece of equipment shall be furnished.

PART 2 - PRODUCTS

2.01 AIR-VACUUM AND AIR-RELEASE VALVES

A. Air and Vacuum Valves: Air and vacuum valves shall be capable of venting large quantities of air while pipelines are being filled, and allowing air to re-enter while pipelines are being drained. They shall be of the size indicated, with flanged or screwed ends to match piping. Bodies shall be of high-strength cast iron. The float, seat, and all moving parts shall be constructed of Type 316 stainless steel. Seat washers and gaskets shall be of a material insuring water tightness with a minimum of maintenance. Valves shall be designed for minimum 150 psi water-working pressure, unless otherwise indicated.

B. Air-Release Valves: Air-release valves shall vent accumulating air while system is in service and under pressure and be of the size indicated and shall meet the same general requirements as indicated for air and vacuum valves except that the vacuum feature will not be required. Valves shall be designed for a minimum water-working pressure of 150 psi, unless otherwise indicated.

C. Combination Air Valves: Combination air valves shall combine the characteristics of air and vacuum valves and air release valves by exhausting accumulated air in systems under pressure and releasing or re-admitting large quantities of air while a system is being

filled or drained, respectively. Valves shall have the same general requirements as indicated for air and vacuum valves.

D. Valves shall be manufactured by ARI, or ENGINEER-approved equal, and designed for a minimum water-working pressure of 150 psi, unless otherwise indicated.

E. ARV valves shall be protected with a lockable cover. The cover shall be provided with air vents and a drain port. The cover shall be easily removed by the operator for maintenance purposes.

2.02 PRESSURE RELIEF/PRESSURE SUSTAINING VALVES

A. Quality Assurance: The valve manufacturer shall warrant the valve to be free of defects in material and workmanship for a period of three years from date of shipment, provided the valve is installed and used in accordance with all applicable instructions. Electrical components shall have a one year warranty. Valves shall be subjected to performance, leakage, and hydrostatic tests in accordance with procedures and acceptance criteria established by AWWA C504

B. General: The pressure relief/sustaining valve shall maintain a constant upstream and/or downstream pressure regardless of changing flow rate and/or inlet pressure.

C. Main Valve: The valve shall be hydraulically operated, single diaphragm-actuated, globe pattern. The valve shall consist of three major components: the body, cover, and diaphragm assembly. The diaphragm shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure. Packing glands and/or stuffing boxes are not permitted and there shall be no pistons operating the main valve or pilot controls.

D. Body: Valve body shall be ductile iron construction. Valve body shall be cast as one piece. No fabrication or welding shall be used in manufacturing.

E. Disc: The valve shall contain a resilient, synthetic rubber disc, with a rectangular cross-section contained on three and one-half sides by a disc retainer and forming a tight seal against a single removable seat insert. No O-ring type discs (circular, square, or quad type) shall be permitted as the seating surface. The disc guide shall be of the contoured type to permit smooth transition of flow and shall hold the disc firmly in place. The disc retainer shall be of a sturdy one-piece design capable of withstanding opening and closing shocks. It must have straight edge sides and a radius at the top edge to prevent excessive diaphragm wear as the diaphragm flexes across this surface. No hourglass-shaped disc retainers shall be permitted and no V-type or slotted type disc guides shall be used.

F. Diaphragm: The diaphragm assembly containing a non-magnetic 303 stainless steel stem with sufficient diameter to withstand high hydraulic pressures shall be fully guided at both ends by a bearing in the valve cover and an integral bearing in the valve seat. No center guides shall be permitted. The stem shall be drilled and tapped in the cover end to receive and affix such accessories as may be deemed necessary. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure.

G. The flexible, non-wicking, FDA approved diaphragm shall consist of nylon fabric bonded with synthetic rubber compatible with the operating fluid. The center hole for the main valve stem must be sealed by the vulcanized process or a rubber grommet sealing the center stem hole from the operating pressure. The diaphragm must withstand a Mullins Burst Test of a minimum of 600 psi per layer of nylon fabric and shall be cycle tested 100,000 times to insure longevity. The diaphragm shall not be used as the seating surface. The diaphragm shall be fully supported in the valve body and cover by machined surfaces

which support no less than one-half of the total surface area of the diaphragm in either the fully opened or fully closed position.

H. Seat & Stem: The main valve seat and the stem bearing in the valve cover shall be removable. The lower bearing of the valve stem shall be contained concentrically within the seat and shall be exposed to the flow on all sides to avoid deposits. To insure proper alignment of the valve stem, the valve body and cover shall be machined with a locating lip. No “pinned” covers to the valve body shall be permitted. Cover bearing, disc retainer, and seat shall be made of the same material. All necessary repairs and/or modifications other than replacement of the main valve body shall be possible without removing the valve from the pipeline. Packing glands and/or stuffing boxes shall not be permitted and components including cast material shall be of North American manufacture.

I. Pilot System: Pilot tubing shall be 316 S.S. construction. The pressure relief pilot control shall be a direct-acting, adjustable, spring-loaded, normally open, diaphragm valve designed to permit flow when controlled pressure is less than the spring setting. The pilot control is held open by the force of the compression on the spring above the diaphragm, and it closes when the delivery pressure acting on the underside of the diaphragm exceeds the spring setting. The pilot control system shall include a fixed orifice. No variable orifices shall be permitted. The pilot system shall include an opening speed control on all valves. The pilot control shall have a second downstream sensing port which can be utilized to install a pressure gauge. A full range of spring settings shall be available in ranges of 20 to 200 psi.

J. Remote Sensing: Valves used for pressure relief or unloading functions in a bypass arrangement shall be provided with a remote pilot sensing. The pilot system shall provide a digital output via flow switch when the valve is actuated.

K. The valve manufacturer shall also provide a computerized cavitation chart which show flow rate, differential pressure, percentage of valve opening, Cv factor, system velocity, and if there will be cavitation damage.

L. Valve manufacturers shall be CLA-VAL, Singer, Wilkens, or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Valves shall be installed in accordance with the manufacturer's printed recommendations, and with provisions of these Specifications.

END OF SECTION

SECTION 40 0573 – MISCELLANEOUS PROCESS VALVES

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. Provide all miscellaneous valves and appurtenances, complete and operable, in accordance with the Contract Documents.

1.02 SUBMITTALS

A. Furnish submittals in accordance with Section 01300 - Submittals.

1.03 OPERATION AND MAINTENANCE MANUAL

A. Provide six (6) hard copies plus one (1) electronic version in PDF format.

1.04 QUALITY ASSURANCE

A. Manufacturer and model shall be described on the Drawings, as specified herein, or Engineer approved equal.

B. The manufacturer shall provide a 2-year equipment warranty.

1.05 SPARE PARTS

A. Spares shall be as requested by the ENGINEER. Payment for spares shall be made in accordance with the General Conditions.

B. A list of spare parts for each piece of equipment shall be obtained from the manufacturer and submitted at the same time as Shop Drawings. The name, address, and telephone number of the nearest distributor for each piece of equipment shall be furnished.

PART 2 - PRODUCTS

2.01 FLOAT VALVES (2-INCHES OR SMALLER)

A. General**:** This valve is heavy duty mechanical float valve for controlling high capacity water flow.

B. The valves have bronze body construction with machine flanges on the inlet side (sizes 1” to 2” (25 to 50mm) have female NPT pipe threaded inlet connections), and male straight-pipe threaded for locknut on the outlet side. The connectors have serrated arms for easy adjustment of water level, bronze long and short arms, replaceable seals, and no-jam single lever action.

C. Maximum working pressure shall be 165 psi. Maximum working temperature shall be 180° F.

D. Valve shall be equipped with brass float stem and plastic float designed to work with the valve. Stem shall be of sufficient length for proper operation of the valve and to maintain the required level in the storage reservoir. Floats shall be injection molded polyethylene construction.

E. Float Valves shall be Watts or approved equal.

2.02 FOOT VALVES

A. Foot Valves shall be of the type designed to provide silent operation, positive sealing, and full flow area.

B. Valves shall be flanged, 125 lb., ANSI standard and of the center-guided, poppet-type, having a linear stroke to provide silent operation. Guide shafts and bushings shall be of the same material as the seat and disc, i.e., bronze, or stainless steel. The Buna-N seal shall be so designed to provide an initial contact of bronze to Buna-N with final contact being metal to metal to prevent destruction of the Buna-N seal ring.

C. Flow area thru the valve, including valve stroke, shall be equal to pipe size.

D. Valve inlet shall be provided with stainless steel screening. The screening should in no way reduce the full flow area of the valve. The screening shall be in the shape of a basket with the bottom also screened.

E. Standard construction to be cast iron body, bronze trim with stainless steel basket screening.

F. Valves shall be manufactured by:
   1. Val-Matic
   2. ENGINEER-approved equal.

2.03 MUD VALVES

A. The Mud Valve shall be of the heavy duty flanged type designed to provide a positive seal under both seating and unseating head conditions. The valves shall be rising stem style as detailed on the schedule or the plans. The frame, plug and yoke shall be cast iron (A126B) The valve operating stem and lift nut shall be bronze (B421) The seat ring shall be bronze (B62) with an accurately machined tapered seating face. The plug seat shall be a seamless molded, tapered resilient ring of BUNA-N designed to accurately mate with the seat ring for a positive seal.

B. Where required the manufacturer shall provide valve operating stems, Floor Stands and Stem Guides as specified in the valve schedule or plans.

C. The Mud Valves are to be coated using TNEMEC Pota Pox two-part epoxy, NSF approved coating.

D. Valves shall be manufactured by:
   1. Troy Valve, Waterman
   2. ENGINEER-approved equal.

2.04 BACKFLOW PREVENTER

A. General**:** Backflow preventers shall be a pressure type or reduced pressure type backflow preventer unit and associated components shall be equal in quality and performance to a “Foundation for Cross-Connection Control and Hydraulic Research”. Backflow preventers shall be Febco, Watts, Wilkins or ENGINEER-approved equal – Standard Orientation and include a fiberglass enclosure per Hot Box, appropriately sized for the backflow preventer. Enclosures shall protect against freezing down to 0°F. All backflow preventers shall be submitted for approval by the Town regardless of make or model.

2.05 TELESCOPING VALVE

A. General**:** Furnish and install manually-operated telescoping valves, complete and operable, as shown and specified, including appurtenances, operators, supports and accessories, in accordance with the requirements of the Contract Documents.

B. Valve Assembly**:** The telescoping valve assembly shall be of the rack and pinion type, of the size shown. The travel range shall be at least the amount shown. Assemblies shall consist of a handwheel pedestal (with offset if required) with handwheel operator, a rising stem, slip tube with flat weir crest skimming funnels, a tube guide collar with companion flange and gasket and a mounting bracket.
   1. Slip Tube: The slip tube and skimming funnel shall be of Type 316, Schedule 40 stainless steel, with a seal to prevent leakage at the seam.
   2. Stem: The stem shall be minimum ¾-inch, Type 316 stainless steel, with a travel and height indicating device calibrated in 1-inch increments. A suitable stem lock shall be provided for holding the stem at the desired level.
   3. Guide Collar: Guide collar shall include a neoprene gasket and cast iron companion flange for securing to the receiving pipe as shown.
   4. Mounting Bracket: A cast iron bracket shall be provided for mounting the operator pedestal with stainless steel anchor bolts.
   5. Fastening Hardware: All nuts and bolts and other fastening hardware shall be Type 316 stainless steel.
   6. Coating: Coating of all ferrous surfaces, except stainless steel, shall be in accordance with these Specifications.

C. Valve shall be Troy Valve, Waterman or ENGINEER-approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Valves shall be installed in accordance with the manufacturer's printed recommendations, and with provisions of these Specifications.

END OF SECTION

SECTION 40 0597 – IDENTIFICATION FOR PROCESS PIPING

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall furnish, paint, mark, and paint/install identification devices for all exposed piping and piping in accessible chases and areas above ceilings with panels, and valves using, lettering, flow direction arrows, and related permanent identification devices, and all appurtenant works, in accordance with the requirements of the Contract Documents.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference specifications of the General Requirements.

B. OCSD TAGGING PROCEDURE

1.03 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with Section 01 3300 – Submittal Procedures.

B. The CONTRACTOR shall submit samples of all types of identification devices to be used in the work.

C. QUALITY ASSURANCE (NOT USED)

PART 2 - PRODUCTS

2.01 IDENTIFICATION OF PIPING

A. All exposed piping and piping in accessible chases and areas above ceilings with panels, including stainless steel, galvanized steel, copper, CPVC, and Fiberglass RTR piping, shall be completely and totally painted for identification purposes. Piping all be identified with lettering or tags designating the service of each piping system, shall have flow directional arrows. All piping scheduled to be color-coded shall be completely painted or coated with the colors indicated in the schedule below.

B. Each pipe identification shall consist of color-coding in accordance with Subsection 3.04 IDENTIFICATION SCHEDULE, a painted label, and a directional flow arrow. Piping identification shall be located in accordance with Subsection 3.03 PIPE IDENTIFICATION LOCATION.

C. For cases where there are insulated lines wrapped with aluminum sheathing, stainless steel sheathing, or gray fabric, the background color shall be applied to a 24-inch length of pipe section and color band centered within the 24 inch field of background color.

D. Paint Colors: Paint colors shall conform to the following designations:

Color	**Mgf./No.**
Paper White	DuPont 40P-1031
	Tnemec F075-WH01A
	Dunn Edwards IP630-SY-1
Dark Brown	DuPont 40P-1039
	Tnemec F075-D2526A
	Dunn Edwards IP630-SY-25
Safety Red	DuPont 333-23664
	Tnemec F075-S1170A
	Dunn Edwards IP630-SY-19

Safety Orange	DuPont 40P-1030 Tnemec F075- S1169A Dunn Edwards IP630- VD9222
Light Gray	DuPont 333-23662 Tnemec F075- A2606A Dunn Edwards IP630- RL7422
Caribbean Blue	DuPont 40P-1048 Tnemec F075-B2478A Dunn Edwards IP630-UD10264
Safety Blue	DuPont 40P-1048 Tnemec F075-B2477A Dunn Edwards IP630-VD10265
Spectra Master (Dark Blue)	DuPont 40P-1496 Tnemec F075-B2476A Dunn Edwards IP630-SY-23
Custom Formula (Purple)	DuPont 40P-1628 Tnemec F075-R1217A Dunn Edwards IP630-SY-13
Cool Green	DuPont 40P-1008 Tnemec F075-S1168A Dunn Edwards IP630-UL9585
Safety Yellow	DuPont 333-23663 Tnemec F075-S1167A Dunn Edwards IP630-UD9223

E. Lettering

1. Identification labels and directional arrows shall be painted directly on piping using stencils or makers.
2. Pipe identification markers shall be vinyl or polyester construction with an adhesive strip, coiled to wrap completely around the pipe (no straps) and have subsurface printing. Pipe less than six inches shall have lettering to meet ANSI A13.1 standards.
3. The size of the letters for identification labels shall be as follows:

PIPE OUTSIDE DIAMETER*	LETTER SIZE
5/8” to 1 1/4”	1/2” high
1 1/2” to 3”	1” high
Over 3”	2” high

*Outside pipe diameter shall include insulation and jacketing.

4. Identification markers shall have letters, directional arrows and colors as follows:

Plant Water	Black Letters on Yellow Field
Industrial Water	Black Letters on Yellow Field
Potable Water	White Letters on Green Field
Reclaimed Water	Black Letters on Yellow Field
Fire Protection Water	White Letters on Red Field
High Pressure Air	White Letters on Blue Field
Instrument Air	White Letters on Blue Field
Sludge	Black Letters on Yellow Field
Steam	Black Letters on Yellow Field
Drain	Black Letters on Yellow Field
Acid	Black Letters on Yellow Field

Caustic Solution	Black Letters on Yellow Field
Polymer	Black Letters on Yellow Field
Ferric Chloride	Black Letters on Yellow Field
Sodium Hypochlorite	Black Letters on Yellow Field
Hydrogen Peroxide	Black Letters on Yellow Field
Digester Gas	Black Letters on Yellow Field
Natural Gas	Black Letters on Yellow Field
Electrical	Per Specification Division 26

PART 3 - EXECUTION

3.01 GENERAL

A. All labels shall be installed in accordance with the manufacturer's printed instructions, and shall be neat and uniform in appearance. All such tags or labels shall be readily visible from all normal working locations.

3.02 VALVE TAGS

A. Valve tags shall be permanently attached to the valve or structure as specified in the OCSD TAGGING PROCEDURES.

B. The wording on the valve tags shall describe the exact function of each valve, e.g., "HWR-BALANCING," "CLS THROTTLING", "RAS-PUMP SHUT-OFF," etc.

3.03 PIPE IDENTIFICATION LOCATION

A. Straight lines of pipe shall be identified at intervals of 20 feet maximum, and at least once in each room unless otherwise directed by the ENGINEER.

B. Piping shall also be identified at a point approximately within 2 feet of all turns, ells, valves, and the upstream side of all distribution fittings or branches and on both sides of each floor, wall, or barrier through which the line passes.

3.04 IDENTIFICATION SCHEDULE

A. Application of identifying devices shall conform to the following color codes, or match existing color code as directed by the ENGINEER.

MATERIAL IN PIPE	**COLOR**
Potable Water (RP Device)	Caribbean Blue
Fresh Water (Air Gap)	Caribbean Blue
Industrial and/or Cooling Water	
LPE	Purple (Custom Formula)
MPE	Purple (Custom Formula)
HPE	Purple (Custom Formula)
HPE (continuously chlorinated)	Purple (Custom Formula)
Fire Water	Caribbean Blue
Industrial Water	Dark Blue
Cooling Water Supply-Plant Effluent	Safety Blue
Cooling Water Return-Plant Effluent	Safety Blue
Cooling Water Return-Industrial Water	Dark Blue
Cooling Water Supply-Industrial Water	Dark Blue
Reclaimed Water	Purple (Custom Formula)
Final Effluent	Safety Blue
Irrigation (continuously chlorinated eff.)	Purple (Custom Formula)

Chemical Supply Lines (Extremely Dangerous)	
Chlorine (gas or liquid)	Cool Green
Chlorine Solution	Cool Green
Sodium Hydroxide	Cool Green
Chlorinator Vent and Detection Lines	Cool Green
Hydrazine	Cool Green
Lime Slurry	Cool Green
Sodium Hypochlorite	Cool Green
Ferric Chloride	Cool Green
Ferrous Chloride	Cool Green
Phosphoric Acid	Cool Green
Concentrated Sulfuric Acid	Cool Green
Dilute Sulfuric Acid	Cool Green
Chemical Draw and Vent	Cool Green
Dilute Acid	Cool Green

Chemical Supply Lines	
Polymer-Anionic	Cool Green
-Cationic	Cool Green
-Nonionic	Cool Green
-Dist.	Cool Green
-Effluent	Cool Green
Chemical Draw and Vent	Cool Green
Sulfite/Bisulfite Scrubbing Liquid	Cool Green
Stratford Solution (Scrubbing Liquor)	Cool Green

Sludge/Ash Transport and Process Lines	
Blended Sludge	Light Gray
Bottom Sludge	Light Gray
Centrate (from digested sludge dewatering)	Light Gray
Centrate (H_2S Scrubbing)	Light Gray
Circulated Sludge	Light Gray
Digested Sludge	Light Gray
Sulfur Slurry (H_2S Scrubber)	Light Gray
Filtrate	Light Gray
Raw Sludge	Light Gray
Screened Digested Sludge	Light Gray
Activated Sludge	Light Gray
Digester Cleanings	Light Gray
Digested Sludge to Screenings	Light Gray
Digested Sludge to Blending Tanks	Light Gray
Digested Sludge Recirculated/Transfer	Light Gray
Digested Sludge Withdrawal	Light Gray
Thickened Waste Activated Sludge	Light Gray
Return Activated Sludge	Light Gray
Thickener Subnatant	Light Gray
Thickener Subnatant Overflow	Light Gray
Cyclone Effluent	Light Gray
Grit	Light Gray
Mixed Liquor	Light Gray
Thickener Pressurized Recycle	Light Gray
Scum	Light Gray

Sludge/Ash Transport and Process Lines	
Ash (hydraulic)	Light Gray
Processed Condensate	Safety Blue
Process Effluent	Safety Blue
Final Clarifier Influent	Safety Blue

Pneumatic Transport Lines	
Sludge Derived Fuel	Cool Green
Hot Ash	Cool Green
Sand Transport	Cool Green

Air and Vacuum Supply Lines	
Oxygen (gaseous)	Cool Green
Oxygen (liquid)	Cool Green
Combustion Air	Paper White
Compressed Air (non-instrument)	Paper White
Instrument Air	Paper White
Process Air	Paper White
Product Air	Paper White
Foul Air	Paper White
Nitrogen (liquid)	Cool Green
Nitrogen (gaseous)	Cool Green
Vacuum	Paper White
Vent Duct	Paper White

Boiler Waters	
Boiler Feedwater Makeup	Caribbean Blue
Boiler Feedwater	Caribbean Blue
Continuous Blow-down	Dark Blue
Demineralized Water	Dark Blue
H. P. Condensate	Dark Blue
L. P. Condensate	Dark Blue
M. P. Condensate	Dark Blue
Intermittent Blow-down	Dark Blue
Softened Water	Dark Blue
Reverse Osmosis Treated Water (permeate)	Purple (Custom Formula)

Steam	
L. P. Steam	Safety Red
M. P. Steam	Safety Red
H. P. Steam	Safety Red

Lube and Hydraulic Oils	
Hydraulic Oil Supply	Safety Yellow
Hydraulic Oil Return	Safety Yellow
Lube Oil	Safety Yellow
Drain Oil	Safety Yellow
Oil Vapor	Safety Yellow
Grease	Safety Yellow
Defoamant-Sludge Blending Tanks (Kerosene)	Safety Yellow

Fuel Supply	
Natural Gas/LNG/Propane	Safety Yellow
Digester Gas: LP, MP, and HP	Safety Yellow
Diesel	Safety Yellow

Lab	
Distilled Water	Dark Blue
Salt Water	Dark Blue

Miscellaneous	
Equipment Vent	same as equipment
Sample Line	same as line or equipment being sampled
Spare Chemical	same as chemical

Sanitary Sewer/Storm Drains	
Roof Drain	Dark Brown or same color as bldg. walls
Plant Drain	Dark Brown
Storm Drain	Dark Brown
Sump Pump Discharge	Dark Brown
Sanitary Sewer	Dark Brown
Sanitary Vent	Dark Brown
Influent Raw Sewage (up to primary tanks)	Light Grey
Demineralized Waste	Dark Brown
Reverse Osmosis Reject	Dark Brown

END OF SECTION

SECTION 40 4200 – PROCESS PIPING AND EQUIPMENT INSULATION

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall furnish and install all pipe and equipment insulation, complete and operable, in accordance with the requirements of the Contract Documents. In addition to the insulation shown and specified, the CONTRACTOR shall insulate any cold or hot piping and exhausts that could be subject to freezing or hazardous to plant personnel upon contact.

B. All steam and hot or chilled water piping shall be insulated with fiberglass metal jacketed insulation to form a watertight and weatherproof system.

C. Exposed process piping shall be heat taped and insulation against freezing as shown per the Contract Documents.

D. All air process piping within the blower building which passes through spaces above finished ceilings, or are suspended over equipment, electrical panels, or cabinets shall be insulated. Refer to the plans for insulation locations and requirements for air process piping.

E. All unions, flanges, mechanical joints, valves, strainers, steam traps, and other devices in insulated piping systems shall be insulated in the same manner as the adjacent piping. Operators, instruments, and other features requiring routine access shall not be covered. Insulation over removable devices shall be easily removable and replaceable.

F. Insulation on any buried piping need not be jacketed.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference specifications of the General Requirements.

B. Comply with the current provisions of the following Codes and Standards.

1. Federal Specifications:
   a. HH-1-558B Insulation Blocks, Boards, Blankets, Felts, Sleeving (Pipe and Tube Covering), and Pipe Fitting Covering, Thermal (Mineral Fiber, Industrial Type)
2. Commercial Standards:
   a. ASTM C547 Specification for Mineral Fiber Preformed Pipe Insulation
   b. ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

1.03 SUBMITTALS

A. Shop Drawings: Shop drawings shall be submitted in accordance with Section 01 3300 – Submittal Procedures.

1. The following submittals and specific information shall be provided.
   a. The CONTRACTOR shall submit complete shop drawings showing locations of placement of all thermal insulation, with manufacturer's data on materials, covering, jackets, and finish.

PART 2 - PRODUCTS

2.01 INSULATION

A. All components of the insulation, including covering, mastics and adhesives shall have a flame-spread rating of not over 25, and a smoke development rating of not over 50. Ratings shall be as established by tests in accordance with ASTM E84 and Federal Specification standards. The integrated insulation assemblies shall also conform to the above specifications. Insulation shall be applied in strict accordance with the manufacturer's instructions.

B. MATERIALS

1. Standard Insulation: This type of insulation shall be employed for process, cold-and hot water, steam, and condensate piping and equipment with surface temperatures up to 850 degrees F. Pipe insulation shall be molded-type pipe covering, made of fibrous glass with a minimum k-factor of 0.23 at 75 degrees F mean temperature. The insulation shall be oversized for installation over electric heating cable. Unless otherwise specified the insulation thickness shall be as follows:

Pipe Insulation:

	Minimum Thickness of Insulation (Inches)
Hot and cold water (domestic)	
6 inches and smaller	1
Hot and chilled water process	
6 inches and smaller	1-1/2
8 inches and larger	2
Low pressure steam (50 psi and less)	
8 inches and less	2
Condensate, boiler blowdown, and boiler feed	
8 inches and less	1-1/2
Heated sludge and process piping	
6 inches and smaller	1
8 inches and larger	1-1/2
Heat traced piping	
3 inches and smaller	1
4 inches and larger	1-1/2
EQUIPMENT AND TANKS	
Boilers, heaters, and manufactured equipment	As recommended by manufacturer
Heat exchangers, tanks, and vessels	3
Blower Discharge, blow-off, and motor exhaust lines	3

2. Vapor barrier: Insulation shall have a factory-applied white fire-retardant vapor-barrier jacket of kraft paper and aluminum foil laminated together and reinforced with fiberglass yarn.
3. Insulation at Supports: Insulation shall be coordinated with the pipe hangers and supports and where insulation protection shields are provided the top half section of pipe insulation at support locations shall be of the same specified density, and the bottom half insulation segments provided between the pipe and the insulation protection shields shall have a density of not less than 6 lb./cu ft.

C. Manufacturers, or ENGINEER-approved Equal:

1. Johns Manville, Micro-Lok HP
2. Owens Corning, Fiberglas SSL II with ECOSE

3. CertainTeed, InsulPure

D. High Temperature Insulation: This type of insulation shall be employed for engine exhaust pipes, flues, and similar pipes and equipment with surface temperatures up to 1200°F. The high temperature insulation shall consist of 4-inch thick calcium silicate or similar pre-molded blocks with a minimum k-factor of 0.14, in two layers of 2-inch thickness, each, with staggered joints, all applied over a 3/4-inch high metal rib lath. The inner layer shall be suitable for 1200°F, and the second layer for 1000°F. All bends, voids, joints, fittings, and other parts of the piping system shall be filled with insulating cement. Aluminum lagging with preformed aluminum fittings shall be banded to the insulation in a similar fashion as specified for standard insulation. Allowance shall be made for thermal expansion.

E. Metal Jacketing
1. General: All insulation shall be covered with smooth aluminum weatherproof jacketing with a factory-attached moisture barrier.
2. The jacket for the fittings shall consist of precision-formed smooth-sided sections and shall be sized to cover and protect the insulated fitting. Each section shall be manufactured from aluminum, and all joints shall be sealed with silicon mastic, to provide a continuous, air and weathertight joint. Strapping shall be 1/2-inch wide, Type 3003 aluminum or Type 304 stainless steel.
3. The jacket at insulated valves shall fit over the removable insulation and be easily removed and re-installed. It shall be held in place by adjustable stainless-steel hose clamps.
4. Metal jacketing shall be 0.016-inch thick, smooth finish aluminum sheet conforming to ASTM B209, alloy 5005, temper H16, with integral vapor barrier. Sheet metal screws shall be aluminum or stainless steel. Jackets shall be secured with 0.020 by ¾-inch Type 304 stainless steel expansion bands.

2.02 HEAT CABLE

A. Heating cable shall be self-regulating through the use of a thermostat for freeze protection. Heating cable shall be applicable to the type of pipe material being protected.

B. Heating cable shall utilize 120VAC and provide heating power of minimum of 5 watt/ft @ 50°F.

PART 3 - EXECUTION

3.01 INSTALLATION

A. All insulation and heat cables shall be installed by a qualified insulation CONTRACTOR in strict accordance with the manufacturer's recommendations and the requirements of these specifications.

B. Insulation shall be installed over heat cable where required.

C. Piping shall be tested and shall be approved by the ENGINEER prior to insulation installation.

D. All end joints of insulation shall be tightly butted.

E. All seams and joints shall be held by manufacturer's standard adhesive.

F. Jacket laps shall be neatly pasted in place.

G. All joints shall be pointed with insulating cement.

H. Fittings and valves shall be covered with the same material as the pipe, cut in segments to fit snugly without open spaces, held in place with copper wire or cement, and then covered with the same jacketing material as the pipe.

I. Insulation at valves and other devices shall be formed into two halves, easily removable for valve maintenance. The halves shall be constructed from segments cemented together to fit the valve and to extend over the adjacent piping insulation.

Insulated fittings adjacent to vapor-barrier insulation shall be sealed with acceptable vapor-barrier cement before installation of the finish jacket.

J. Pipe insulation and vapor-barrier shall be continuous through hangers and supports. Hangers shall permit insulation to pass through. Suitable saddles shall be provided to prevent the weight of the piping from being supported by the insulation.

END OF SECTION

SECTION 40 6113 – INSTRUMENTATION AND CONTROL FOR PROCESS SYSTEMS

PART 1 - GENERAL

1.01 REQUIREMENT

A. This Section includes the general requirements for furnishing and installing the Instrumentation, Control and Monitoring equipment as indicated on the Drawings and in these Specifications. Other instrumentation and control Sections of this Division shall supplement this Section as necessary.

B. The intent of the instrumentation and control Sections of these Specifications is to require that all instrumentation as indicated, specified, and/or required, shall be furnished by a single competent, qualified Instrumentation and Control Integrator (hereinafter referred to as the I&C INTEGRATOR) to assure system compatibility and coordination with all other subsystems.

C. Labor, materials, apparatus, and components essential to the complete functioning of systems described and indicated herein, or which may be reasonably implied as essential, whether mentioned in the Contract Documents or not, shall be furnished and installed by the I&C INTEGRATOR. In case of doubt as to the work intended, or in the event of need for explanation thereof the I&C INTEGRATOR shall refer to the ENGINEER for supplemental instructions.

D. All items not specifically mentioned in these specifications or noted on the Drawings, or on shop drawings, but which are necessary to make a complete and satisfactory, working electrical/instrumentation installation, shall be deemed to be included herein. The Construction Documents are not intended to show every fitting, junction, or component nor every difficulty that may be encountered during installation or coordination with different equipment manufacturers. The I&C INTEGRATOR shall refer to related data in all Contract Documents and shall verify this information on site.

E. Unless otherwise indicated, all equipment and components shall' be rated for use in the environment installed. Outdoor equipment shall be weatherproof or rated for outdoor use. Equipment installed in corrosive areas shall be rated for that environment. Equipment installed in a hazardous area shall be explosion-proof. In case of doubt as to the area classification, or need for explanation thereof, or discrepancies noted between components specified and the environment installed the I&C INTEGRATOR shall refer to the ENGINEER for supplemental instructions.

1.02 REFERENCES

A. The specifications reference known standards and codes. Each such standard referenced shall be considered a part of the Specifications to the same extent as if reproduced therein in full. The following is a representative list of such Associations, Institutes and Societies, together with the acronym by which each is identified.

1. AIEE American Institute of Electrical ENGINEERs
2. ANSI American National Standards Institute
3. ASTM American Society for Testing and Materials
4. ICEA Insulated Cable ENGINEERs Association
5. IEEE Institute of Electrical and Electronics ENGINEERs
6. NEC National Electrical Code (2002)
7. NEMA National Electrical Manufacturers Association
8. NETA National Electrical Testing Association
9. NFPA National Fire Protection Association
10. UL Underwriter's Laboratories, Inc.

B. Every reference in the Specifications shall mean the latest printed edition of each in effect at the Contract date or latest edition as adopted by the local governing authority.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Sections 01 3300 – Submittal Procedures.
   1. Where applicable, provide complete manufacturer's part number, identifying scaling, operating range, housing, and wetted parts materials, NEMA rating, product options, consumable materials, and other pertinent information.
   2. Prior to Final Acceptance of the work, the I&C INTEGRATOR shall provide Operations and Maintenance Manuals, in accordance with the Contract Documents.
   3. Descriptive Data: Submit copies of complete descriptive literature, performance data, physical dimensions, power and signal connections for each component and equipment to be furnished. Provide name of manufacturer, style, and complete model number. Listing items "as specified" without both make and model or type designation is not acceptable.
   4. Component Data Sheets: Submit a component data sheet for each piece of instrumentation equipment similar to an ISA S20 form. Include equipment tag number, manufacturer's model number, location of service, materials of construction, size and scale range, calibrated range, setpoints, optional accessories and any other useful information.
   5. Important Notice:
      a. After material or equipment has been submitted and approved, no substitutions will be allowed.
      b. If I&C INTEGRATOR's submittal(s) depart from the Contract Documents, the I&C INTEGRATOR shall make specific mention thereof in his letter(s) of transmittal, otherwise review of such submittals by the ENGINEER shall not constitute review of such departure(s).
      c. The I&C INTEGRATOR may be charged for costs incurred by the ENGINEER for third and subsequent submittal reviews. Cost for ENGINEER's review time shall be billed at the ENGINEER's standard hourly rates.
   6. Control System Drawings: Submit 11" X 17" detailed shop drawings indicating dimensions, component layout, mounting details, wiring diagrams, nameplate legends and bill of materials for each control panel.
      a. Wiring diagrams shall include all interconnections, inter-wiring, and terminals between all electrical and/or instrumentation units. Wire numbers shall be continuous from start to finish. Wire numbers shall not change when going from one unit, cabinet, enclosure, terminal, or any device to another.
      b. Discrete control and power circuits: Submit ladder diagrams indicating all panel devices related to discrete functions mounted in or on control panel.
      c. Show unique rung numbers on left side of each rung. Label each wire, coil, and terminal block. Show individual component terminal numbers.
      d. Analog signals: Indicate the entire analog loop on the wiring diagram including all devices connected in series and location of each device. Indicate loop power supplies and individual component terminal numbers. Indicate wire and terminal numbers of each device in the loop.
      e. Use different symbols for terminal blocks located in different pieces of equipment. Label each terminal block and wire termination point.
      f. Show each PLC I/O point rack, slot, terminal number, and PLC configured address on each drawing.

7. Submit a complete PLC I/O listing including instrument tag numbers and descriptions. The I/O list shall contain the PLC rack, slot, terminal number, and PLC address. Submit a complete PLC program database cross-reference list linking each database and internal register with its associated I/O point(s).

1.04 QUALITY ASSURANCE

A. Equipment to be furnished under this Section shall be the product of firms regularly engaged in the design and manufacture of this type of equipment. Manufacturer shall assume responsibility for, and guarantee performance of equipment furnished. However, this shall not be construed as relieving the I&C INTEGRATOR from responsibility for the proper installation and functioning of the work.

B. The manufacture shall provide a 2-year equipment warranty.

C. The I&C INTEGRATOR must have a minimum of three (3) years' experience as a system integrator, panel fabricator and instrumentation supplier for other projects of similar type, size, and requirements. The I&C INTEGRATOR must submit documentation from his selected panel fabricator verifying the experience and UL 508A file number.

D. All equipment furnished shall be new and of current design. Like equipment shall be of the same manufacturer.

1.05 SYSTEM RESPONSIBILITY

A. The I&C INTEGRATOR shall have total responsibility for the work as specified in the instrumentation and control specifications of this Division. This includes but is not necessarily limited to furnishing system components, system integration and design, wiring diagrams, loop drawings, programming, installation supervision, field instrument calibration, start-up, testing and operator training.

B. The Prior to start of work, the I&C INTEGRATOR shall verify all existing field conditions. This includes creating as-built plans and documentation of all required field wiring, I/O, loop drawings, etc. as needed. Any conflict with design documents shall be brought up to the ENGINEER.

C. The I&C INTEGRATOR is a Subcontractor. Therefore, references made to the responsibilities and requirements of the CONTRACTOR shall only mean that the responsibilities and requirements pass through the CONTRACTOR and that the final responsibility for all Control and Instrumentation systems rests with the I&C INTEGRATOR.

1.06 OPERATING AND MAINTENANCE MANUALS

A. Operating and Maintenance Manuals (O&M): The I&C INTEGRATOR shall provide O&M manuals for equipment and materials furnished under this contract. Submit number of copies as specified in these specifications (min. 4). Assemble data in a single complete indexed volume and identify the size, model, and features indicated for each item. Equipment O&M manuals shall include the following information as a minimum:
   1. A neatly typewritten index near the front of the manual furnishing immediate information as to the location in the manual of emergency data regarding installation.
   2. Installation requirements and procedures.
   3. Complete instructions regarding the operation and maintenance of equipment involved. Instructions and documentation not related to the equipment furnished must be removed or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished.
   4. Bill of Materials, component data sheets, descriptive literature, product specification sheets, wiring diagrams and calibration procedures. O&M manuals must be individually tailored to the project and equipment as furnished.

5. Complete nomenclature of replaceable parts, part numbers, current cost, name, and address of nearest vendor of replacement parts. Information on equipment or components not related to equipment furnished must be removed or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished
6. Copy of warranties issued on the installation, showing dates of expiration.
7. Provide a copy of all instrument calibration reports.

B. Operator interface/PLC cross-reference table/interface list. The cross-reference list shall include all PLC registers linked to each operator interface display feature. The list shall include the operator interface tag, PLC address, I/O type, and range of analog signals in engineering units.

C. Four (4) copies of the final PLC programs on 8-1/2" x 11" paper and two (2) copies on CDROM after final acceptance of the project. The electronic copies shall be a complete set of fully documented programming files as used by the I&C INTEGRATOR in programming all PLCs. The programs (including electronic copies provided) shall be well documented with control descriptions.

D. Two (2) digital copies of all final operator interface configuration files after final acceptance of the project.

1.07 RECORD DRAWINGS

A. Record Drawings: Upon completion of work, I&C INTEGRATOR shall furnish a complete set of Record Drawings and Shop Drawings which properly reflect final tested system, loop diagrams, PLC programs, etc., as actually installed. Drawings shall accurately record the final constructed system and shall be labeled as "RECORD".

1.08 COORDINATION

A. The I&C INTEGRATOR shall coordinate with all other equipment manufacturers to avoid conflicts and interferences. No extra compensation will be allowed for changes made necessary due to conflicts between various equipment.

B. Any discrepancies noted in these contract documents or discrepancies between Drawings and actual field conditions shall be promptly brought to the ENGINEER for a decision. No extra compensation will be allowed for changes made by the I&C INTEGRATOR without ENGINEER's consent.

C. The I&C INTEGRATOR shall be responsible for coordination of control panel fabrication, testing and instrumentation system installation with configuration of both PLCs and operator interfaces. Project completion will not be granted to the I&C INTEGRATOR until programming and configuration has been completed and complete automatic operation has been tested.

1.09 WARRANTY

A. In addition to specific warranties required by the Specifications, the I&C INTEGRATOR shall leave the entire installation in complete working order and free from defects in materials, workmanship, or finish. I&C INTEGRATOR shall repair or replace at his own expense any part that may develop defects due to faulty material or workmanship during the tests and within a period of one year (minimum, or as indicated elsewhere) after substantial completion acceptance. The I&C INTEGRATOR shall repair or replace existing equipment and work that is damaged during the repair of defective apparatus, materials, or workmanship at no cost to the OWNER.

B. All manufacturers' warranties shall be filled out in their entirety by the I&C INTEGRATOR for the OWNER using the OWNER's name and address. Equipment warranty periods will commence on date of final acceptance.

PART 2 - PRODUCTS

2.01 STANDARD EQUIPMENT

A. Furnish and install equipment of the type specified which has been proven to operate successfully. Material or equipment that has been specified or called out by manufacturer and/or model number is approved by the ENGINEER. All other equipment may be selected based on equal quality and performance. If the I&C INTEGRATOR wishes to use an alternate manufacturer to that indicated on the plans or specified herein, the I&C INTEGRATOR shall submit to the ENGINEER for approval, along with a written request stating the reason(s) for the substitution. The ENGINEER and the OWNER shall review such requests and have final approval prior to purchase or installation. The I&C INTEGRATOR shall be responsible for the design and installation requirements with no additional charge/fee to the OWNER.

B. All control panel components shall be UL recognized and ground fault protected per UL 508A fabrication standards. Each control panel assembly shall bear a serialized UL 508A label.

C. All instrumentation equipment and control panel components shall be capable of operating successfully at full-rated load, without failure, at an ambient air temperature of 50°C, and specifically rated for the altitude in which the equipment will be placed in service. If equipment cannot operate under the specified conditions or excessive heat build-up is expected to exceed component rating, the I&C INTEGRATOR shall supply heat mitigation measures to reduce the operating temperature within the control space to that specified by the manufacturer.

D. Instrument tubing shall be soft annealed, ASTM B280 copper with soldered connections. Tubing bends shall be made with a tubing bender. Tubing shall be run straight, vertical, or horizontal and secured with straps or clamps.

PART 3 - EXECUTION

3.01 FACTORY ACCEPTANCE TEST

A. Prior to final acceptance of the work, the I&C INTEGRATOR shall certify the equipment and installation included under this Section to be free of defects, and suitable for trouble-free operation under the conditions set forth in these specifications. This requirement is in addition to the manufacture's guarantee.

B. Before delivering any control panels to the site, the I&C INTEGRATOR shall notify the ENGINEER in writing at least two weeks prior so that a factory acceptance test can be performed. The test shall be conducted only after the I&C INTEGRATOR has performed his testing, calibrations, and check-out of the system.

C. The PLC and operator interface programs shall be thoroughly tested. Each input and output signal shall be tested for proper indication and control function. The PLC control logic will be tested by using simulated inputs and tripping interlocks.

D. The factory acceptance test shall be conducted by the I&C INTEGRATOR. The test shall be witnessed by the ENGINEER.

E. A successful factory acceptance test only allows the I&C INTEGRATOR to ship the system to the site. It does not constitute final acceptance by the OWNER.

3.02 INSTALLATION

A. Equipment and materials specified in this Section shall be installed and connected as specified, and as shown on the Plans. The I&C INTEGRATOR shall coordinate the installation with the other trades, to insure proper installation of the control instrument, components and associated conduit and cables.

B. The I&C INTEGRATOR shall calibrate the instruments to the proper ranges, as required by the OWNER and the ENGINEER. Where analog signals are connected to local or remote monitoring equipment, the I&C INTEGRATOR shall verify that the calibrated ranges and scaling of the local and remote indicators are correct.

C. The I&C INTEGRATOR shall furnish the services of instrumentation technicians or control system engineers trained and experienced in the installation of the various instrument and control equipment being supplied. These services shall be utilized by the I&C INTEGRATOR as he deems necessary to supervise installation, calibrate, troubleshoot, and put equipment into service.

3.03 INSTRUMENT CALIBRATION

A. The I&C INTEGRATOR shall provide the services of a factory representative with the proper tools and equipment to properly calibrate and adjust each instrument in the field. The ENGINEER shall be notified when the factory representative will be onsite to witness instrumentation calibration and setup. This site visit by the factory representative may also be utilized for the OWNER designated operator training as required below.

B. Each instrument shall be tested with certified test instruments simulating inputs at 0, 25, 50, 75 and 100 percent of the calibrated range. Ten (10) data points shall be recorded by ascending to 100 percent than descending back to O. Data shall be recorded on a prepared Instrument Calibration Report with the following information:

1. Instrument description
2. Type and location of service
3. Manufacturer, model, and serial number of instrument
4. Scale range and engineering units
5. Testing method and description
6. Input values or settings
7. Output values (recorded data)
8. Calibrations notes or explanations
9. Technician's name, date, and signature
10. Copy of the test instrument calibration report. Testing instrument must have been calibrated within one year prior to calibration date.

3.04 FINAL ACCEPTANCE

A. Upon completion of instrument calibration and system validation, all systems to be retested under process conditions. The OWNER, ENGINEER, and I&C INTEGRATOR shall perform this test as a final acceptance test for each instrument or piece of equipment. The process variables will be pushed to their limit to verify accuracy, alarms, and interlocks. Any defects or problems will be corrected immediately. Once all testing has been completed to the OWNER's satisfaction, the I&C INTEGRATOR shall submit a certified report with all substantiating data sheets indicating that the total instrumentation and control system meets the functional intent of the Contract Documents.

B. After installation of the system and checkout by the OWNER, ENGINEER and I&C INTEGRATOR, a performance test shall be performed per these Specifications. The test shall include an operational demonstration during which the system shall run continuously without loss of basic functions. The operational demonstration shall confirm that the status, alarm, and process variable signals are valid and are being updated appropriately. If additional time or tests are need due to improper function of the control system, the I&C INTEGRATOR shall perform the necessary work at no cost/fee to the OWNER.

3.05 SPARE PARTS

A. Provide the OWNER with a list of the manufacturers' recommended spare parts.

END OF SECTION

SECTION 40 6196 – PROCESS CONTROL DESCRIPTIONS

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. This Section includes the general system overview and description of logic for each piece of equipment being controlled by the Filtration Control Panel. Other Sections shall supplement this Section as necessary.

B. The intent of this Section is to provide guidance to the CONTRACTOR and to the Contractor's I&C INTEGRATOR in the programmable logic function for various I/O signals indicated on the Drawings. The control and monitoring functions described herein cover the basic logic to be performed with each I/O signal. These control descriptions are not intended to cover every possible scenario or describe every possible timer, interlock, safety shutdown, etc. that may be necessary for a complete operational system. The primary function of these control descriptions is to provide the I&C INTEGRATOR with information that cannot be indicated in electrical schematic diagrams. A brief description of signals to be provided to/from packaged control panels has also been provided herein. It is also the intent of this Section to list the minimum control, monitoring and alarm functions to be displayed on the PLC and SCADA screens.

C. An attempt has been made on the Drawings and in these Specifications to describe system logic and functionality as well as show signals, interlocks, and devices necessary for proper operation of the control and monitoring systems. However, if a particular signal, device, sensor, interposing control relay, signal converter, control logic, interlock (hardware or software), etc., is required to meet the intent or operational requirements and is not indicated, the I&C INTEGRATOR shall furnish and install this piece of equipment with no extra compensation.

D. All alarm conditions shall be maintained until manually reset and/or acknowledged unless otherwise indicated herein or on the Drawings.

E. The I&C CONTRACTOR shall be fully responsible for the proper operation of all control equipment and documentation of all modifications made to programs at project completion.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.01 OPERATOR INTERFACE CONFIGURATION (HMI)

A. The I&C CONTRACTOR shall be responsible for developing a minimum of three (3) operator interface screens to display and control I/O as indicated on the Drawings and as described herein. The displays shall be reviewed during the submittal stage. A brief written description of each graphic screen shall be provided to the Engineer for review prior to the I&C CONTRACTOR beginning screen development or the graphic display portion of the submittals. The Engineer will review the operator interface screens again during the submittal review stage and yet again during startup and system demonstration. If minor modifications are deemed necessary or requested by the Engineer or Owner during startup, the I&C CONTRACTOR shall make the modifications at no additional cost.

B. The operator interface shall be configured to depict the current system operational status through a hierarchical system of graphical schematic displays. These displays shall revolve around a water treatment plant overview screen with labels of each process area or graphic screen that can be accessed from the overview screen. Touching a process area or label shall open the corresponding process area screen. The process area screens

shall contain a graphical representation of the process selected. The graphical representation can be similar to what is indicated on the P&ID Drawings or in another format acceptable to the Engineer. The I&C CONTRACTOR is encouraged to use his/her imagination to add quality to the graphic displays. Each process area shall be divided into smaller process units with a separate screen created for each process unit if necessary to properly display all information. Each I/O point shown on the P&ID drawings shall be shown on at least one process screen.

C. Each process display shall have symbols and indicators necessary to show all the detail data associated with that piece of equipment. Detail data displayed shall be as indicated on the P&ID Drawings or as described herein.

D. The date and time shall be displayed on each operator interface screen.

E. Equipment RUN indication shall be displayed in green. An elapsed time meter shall be provided for all motors and shall be displayed on the screen next to each motor. The elapsed time meters shall be adjustable by double-clicking on it to bring up a box that can be edited. When a motor or piece of equipment is OFF and not in alarm, it shall be displayed in gray.

F. Alarms shall remain hidden until they become active which will turn the component dark and flash until acknowledged. When the alarm has been acknowledged, the component at fault will stop flashing but remain dark until the alarm condition has been corrected. When an alarm condition occurs, an alarm box shall appear on every screen notifying the operator of an alarm condition. Once the alarm condition has been acknowledged, the alarm box shall disappear. A separate alarm screen shall be provided to indicate the alarm description along with the date and time of the alarm. A graphical pushbutton control station shall be provided on the operator interface for alarm acknowledgement. When the “alarm acknowledge” pushbutton is touched, the alarm displayed shall stop flashing and the alarm screen shall indicate the time and date the alarm was acknowledged.

G. Control features from the operator interface such as Start, Stop or Reset shall have the appearance of an actual pushbutton control station. For example, when a Reset button is touched on the operator interface screen, the button shall take on the appearance of being depressed.

H. A report screen shall be generated that indicates the elapsed time for all motors on this project. The elapsed time for each motor shall continue to increment whenever a run signal from the motor is received. The value on the report screen shall reflect the value indicated on the graphic screens. The elapsed time report screen shall be printable through the printer port.

3.02 ALARMS

A. Alarms will be categorized into three alarm levels as follows:
   1. Level 3 alarms will be displayed on the operator interface. The alarm will remain displayed on each operator interface until the operator acknowledges and resets the alarm at the operator interface.
   2. Level 2 alarms will also be displayed on the operator interface, but will activate an external alarm horn & beacon after a 10-minute time delay. The alarm will remain activated until the operator acknowledges and resets the alarm at an operator interface.
   3. Level 1 alarms will be displayed on the operator interface, activate the external alarm horn/beacon, after 10 minutes and initiate an auto dialer to call offsite operators. The alarm will remain activated until the operator acknowledges and resets the alarm at an operator interface. The auto dialer can be reset from a touch-tone telephone.

3.03 PLC PROGRAMMING & CONFIGURATION

A. Controls and monitoring for the WWTP will consist of the following main components:
   1. SBR PLC
   2. Drying Bed Lift Station Control Panel
   3. Overflow Lift Station Control Panel
   4. Headworks Control Panel
   5. Dewatering Control Panel

B. These components will be networked to allow both local and remote control of automated processes. The local control panels will allow the operator to control only the specific local process, including process monitoring, set point adjustments, and alarm acknowledgements.

C. General System Description: Wastewater is delivered to the WWTP inlet through a 12-inch sewer main and 48-inch metering manhole. Influent from the metering manhole is moved by gravity through the headworks and screening equipment. Headworks is comprised of 1+1 climber-type bar screens. After screening, influent is deposited in either Aeration Basin 1 or Aeration Basin 2 for secondary treatment. The two treatment basins will fill and treat alternately such that while one basin is treating, the other is filling. The treatment cycle for the Aerations basins are comprised of Anoxic Fill, React Fill, React, Settle. After the settling period, treated supernatant will be decanted using a floating mechanical decanter and transferred to the Post-EQ Surge Basin, where the effluent will be held before discharge into the chlorine contact channel. In the chlorine contact channel, effluent will be treated using a chlorine tablet feeder and de-chlorinated with a second tablet feeder prior to discharge into Bitter Creek. After decanting is complete, sludge will be wasted from the aeration basin and sent to dewatering process areas. Dewatering will be provided primarily by a sludge bagging system. The bagging system will be supplemented by two sludge drying beds as a backup method. Filtrate recovered from the dewatering areas will be directed to a lift station, located near the sludge drying beds, which returns the filtrate to the WWTP headworks. During high flow events, overflow from the process basins will also be delivered to the drying bed lift station. If the drying bed lift station reaches capacity, it will drain to three equalization basins located at the bottom of the ravine. The equalization basins discharge into a second, overflow lift station which returns overflow to the drying bed lift station after the high flow event ends.

D. SBR PLC: The SBR PLC will be the primary control panel for the SBR treatment system and will monitor other process areas throughout the plant. The SBR control panel will be provided and programmed by the SBR Manufacturer and at a minimum will provide the following:
   1. SBR treatment operation
   2. Monitors the flow into the SBR process area
   3. Monitors and controls the SBR headworks
   4. Monitors and the SBR treatment cycles
   5. Monitor water levels in the process basins
   6. Monitors drying bed and overflow lift stations
   7. Monitors Standby Generator
   8. Monitors flow rate to chlorine contact channel

Alarms

a. SBR Alarm Conditions (Per SBR Manufacturer)
b. Sludge Pump Fail
c. Mixer Fail
d. Influent Valve Fail
e. Decant Valve Fail
f. Post-EQ Valve Fail
g. Blower System Alarm

Control and Monitor Display at SBR PLC:

a. SBR Phases: Fill, React, Settle, Decant
b. Influent Control Valves (Open/Close) (Manual/Auto)
c. Submersible Mixers (On/Off/Auto)
d. Decanters (On/Off)
e. Decanter Discharge Valves (Open/Close) (Manual/Auto)
f. Sludge Pumps (On/Off/Auto)
g. SBR Level – 0-14.5 feet
h. Blower (In/Out of Service)
i. Blower Operation (Manual, DO, Speed)
j. Blower Filter Differential Pressure – 0-1 psi
k. Blower Inlet/Outlet Temperature
l. Blower Speed – 0-100,000 RPM
m. Blower Air Flow – 0-1,000 SCFM
n. Blower Run Time
o. Blower Operating Mode (Current—Flow—RPM—Pressure—DO)

Signals to SBR PLC

a. Drying Bed Lift Station Alarms
b. Overflow Lift Station Alarms

E. Drying Bed Lift Station Control Panel: The lift station will return water to the head of the treatment plant. The system shall operate based on the water level in the lift station and shall control the start and stop of two (2) grinder pumps. The grinder pumps shall start and stop automatically based on the integral controls. The Drying Bed Lift Station Control Panel shall provide status monitoring back to the SBR Control Panel.

Setpoints for Drying Bed Lift Station Control Panel PLC:

a. Pump #1 ON High Alarm level – 4 feet
b. Pump #2 ON High High Alarm level – 5 feet
c. Pump #1 OFF Low Alarm Level – 1 foot
d. Pump #2 OFF Low Alarm Level – 4 foot
e. High Alarm level Discharge Pressure (adjustable set point 0-100 psi) – 75psi

Control and Monitor Display

a. Pump #1 On/Off/Auto (Lead/Lag/Standby)
b. Pump #2 On/Off/Auto (Lead/Lag/Standby)
c. Lift Station Water Level (ft)

Alarms

a. High Alarm Water Level
b. High High Alarm Water Level
c. High Alarm level Discharge Pressure
d. Pump Fail

F. Overflow Lift Station Control Panel: The overflow lift station will return water from the equalization basins to the Drying Bed Lift Station using a single grinder pump. The overflow lift station shall be manually operated by the Operator. The Overflow Lift Station Control Panel shall relay alarms to the SBR Control Panel to signal the Operator to manually start or stop the overflow lift station pumps. Automatic operation is not acceptable to prevent short-circuiting the Drying Bed Lift Station.

G. Generator: A new 125 KW standby diesel generator provides back-up power for the Water Filtration System. The CONTRACTOR shall verify and make the necessary electrical modifications required for the generator to run when the Automatic Transfer Switch senses a loss of prime power to the facility. The I&C INTEGRATOR shall program the FCP to exercise the generator once a week for an operator-input time interval (default 30 minutes). When sensing a loss of prime power, the FCP shall allow a time delay in the facility process programming for the generator to come on without initiating shutdown of the treatment process or equipment.

Control and Monitor Display at SBR Control Panel:

a. Generator (Running/ Off/ Auto) Applicable Sections of Division
b. Automatic Transfer Switch (Prime Power/ Emergency Power)

Alarms:

a. Low Fuel Alarm
b. Fail Alarm

END OF SECTION

SECTION 40 6653 – RADIO COMMUNICATION EQUIPMENT

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. This section covers the furnishing and installation of radio communication equipment for receiving remote signal information for communication with the Supervisory Control and Data Acquisition (SCADA) system. This includes equipment that is common to the computer system and the field interface devices. The equipment shall consist of the following principal items, as indicated on the Drawings and as required to complete the system.
   1. Yagi Radio Antenna
   2. Radio
   3. Surge Protection
   4. Interconnecting Cables

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Sections 01 3300 – Submittal Procedures.

1.03 OPERATION AND MAINTENANCE MANUAL

A. Provide six (6) hard copies plus one (1) electronic version in PDF format.

B. Operation and Maintenance Manual shall be furnished in accordance with these Specifications.

1.04 QUALITY ASSURANCE

A. Each manufacturer shall provide a 2-year warranty.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Radio manufacturers shall be compatible with the existing WWTP's radio network and shall be MDS iNetII Ethernet Radio, or ENGINEER-approved equal.

B. Antenna manufacturers shall be Antenna Specialists, Laird, Kathrein Scala, or ENGINEER-approved equal.

C. Surge protector shall be Polyphaser IS-50NX Series, or ENGINEER-approved equal.

2.02 RADIO/ REPEATER

A. The radio unit shall meet the following:

(Table on next page)

Characteristic	Specification / Description
Frequency Range	902 – 928 MHz (FHSS/FCC DTS)
Modulation	2 level GFSK
Output Power	5 mW to 1 W
Receive Sensitivity	-108 dBm, at standard speed, $1x10^{-6}$ BER -104 dBm, at high speed, $1x10^{-6}$ BER
Range	40 miles LOS
Frequency Zones	16 zones, 7-8 channels per zone
Serial Interface	(2) RS232/RS422/RS485, programmable RJ-45 connectors

Ethernet Interface	802.3, IPv4, TCP, UDP, DHCP, ICMP, ARP, Multicast, TFTP, DNP3 over TCP (2) 802.3u, Fast Ethernet, RJ-45
Power	Transmit: Outdoor – 6.6 W Receive: 1.8W Idle: 0.8 W
Power Requirement Voltage	+6 VDC to +30 VDC
Temperature Range	-40^0C to 75^0C
Antenna Connector	Board Level: SMA, Female Enclosed: TNC, Male
Size	Board Level: 178x88x32 (mm), 227 g Enclosed: 173c97c36 (mm), 635 g

2.03 ANTENNAS

A. General
1. Antennas shall be provided at the sites listed in the contract drawings.
2. Antennas shall be selected for the specified frequency range and provided with all mounting hardware and grounding connections as required.
3. License frequency antennas shall be factory tuned for the specified frequency and center cut for dual frequency applications.

B. Yagi/ Omni Antenna (900 MHz)
1. The antenna shall be fabricated of fiberglass or anodized aluminum rod and seamless drawn pipe. The hardware and fastenings shall be 316 stainless steel. The coax feed and connector shall be sealed in a foam potting system to prevent moisture penetration and assure long service life in severe environmental conditions.
2. Antenna shall be installed at all remote site(s) as indicated in the Contract Documents.
3. Electrical

Frequency Range	890-960 MHz
Gain	6-12 dBi
Impedence	50 Ohm
Maximum Power Input	100 Watts (at 50 deg C)
VSWR	< 1.5:1 max (1.35:1 Typical)
Front-to-back Ratio	<20 dB
Polarization	Horizontal or Vertical

4. Mechanical

Connector	Integral N-Female
Weight	3 lb or less
Length (Yagi	24 in or less
Wind Survival Rating	150 mph
Operating Temperature	-40°C to +85°C (-40°F to +185°F)

2.04 TRANSIENT SURGE PROTECTOR

A. Coaxial Surge Protection: Lightning surge suppression shall be provided at each radio location. The protector shall be a general coverage bulkhead mount coaxial surge protection device with multi-strike capability. The surge protector shall meet the following:

Response Time	2.5 nanoseconds, maximum
Surge Current Test	(IEC 1000-4-5 8/20 us Waveform): 500 J.
VSWR	1.2 to 1, maximum
Insertion Loss	0.2 dB, maximum
Characteristic Impedance	50 Ohms
Mechanical	Type N female connector, bulkhead mount

2.05 TRANSMISSION LINES

A. Coaxial Jumper
   1. Manufactured coaxial jumpers shall be installed between the radio and panel coaxial surge protector.
   2. The jumper shall be factory assembled with the mating connectors attached and compatible with the radio and surge protector connection points.
   3. The coaxial connection cable length shall be coordinated to provide a strain free connection between the radio and surge protector.
   4. Jumper cable shall be ½", super-flexible.

B. Transmission cable
   1. Transmission cable shall be Commscope WBC series 900 Mhz from Hyperlink Technologies or ENGINEER-approved equal.
   2. Transmission cable shall be Low loss, super flexible non-kinking with a minimum bending radius of 2". Cable length shall be continuous between the surge protector and antenna without splicing or midpoint connection.
   3. Cable construction shall be weather tight and shall be constructed as follows:
      a. Copper/Aluminum Center Conductor
      b. Polyethylene Foam Dielectric
      c. Tinned Copper Outer Braid
      d. Aluminum Tape shield bonded to the dielectric
      e. Polyethylene Outer Jacket
      f. Cable shall be constructed with an inert flooding compound to provide a weather tight seal.

2.06 RF CONNECTORS

A. RF mating connectors shall be selected to match the connection requirements of the Antenna, Surge Arrestor and Radio Equipment for the specified frequency range.

B. Cable connectors shall be low loss connectors compatible with the supplied RF transmission cable.

C. Cable connectors shall match the equipment connection. Cable connection adapters shall not be utilized. Connectors shall be attached to the cable in accordance with the manufacturer's installation requirements.

2.07 ACCESSORIES

A. Provide mounting hardware, grounding kits, cable hangers and other materials per this and applicable specifications required to make a complete and operable radio antenna feed system.

PART 3 – EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS.

A. General installation requirements shall be as described in the manufacturer's O&M manual.

B. Communications equipment shall be mounted as indicated on the Drawings.

C. A physical radio path study must be performed for system configuration parameters and for the sites indicated on the drawings. The results of that study must be available to the OWNER.

D. Surge suppressor shall be bulkhead mounted on the radio enclosures and shall be suitable for the sizes of cable required inside and outside the enclosures.

3.02 INSTALLATION AND START-UP

A. Perform Site Work and install Communications equipment as shown on Drawings. Install associated equipment including antenna mounts, cables, cable jumpers, connectors, and grounding systems.

B. Install antennas, associated transmission lines, conduit work and any ancillary antenna accessories per this and applicable specifications and as shown on the contract drawings.

C. Provide weather wrapping for all exposed cabling and connectors. Weather wrapping shall be Scotch 3M, cold shrink.

D. Antenna shall be firmly secured utilizing all necessary mounting brackets, clamps, bolts, screws, and adapters. Mounting hardware shall be heavy duty rigid stainless steel.

E. Antennas shall be aligned at each location to provide the maximum RSSI.

F. RF connectors shall be installed in accordance with the manufacturer's installation requirements.

3.03 FUNCTIONAL TESTING

A. Perform the following feed system test for each antenna and feed system installation:
   1. Perform a Time Domain Reflectometer (TDR) trace of the antenna and feed system in their installed configuration from the radio port to the antenna at the frequency of operation. For UHF and VHF antennas, use the frequency shown on the drawings. Setup the TDR to normalize the trace to the radio antenna port based on the type of cable used.
   2. Correct components with VSWR greater than the specified maximum.
   3. Correct transmission lines with discontinuities exceeding a VSWR of 1.2.

B. Perform the following transmitter tests (power output at antenna port) for the Licensed MAS Polling Remote, Licensed MAS Repeater and licensed MAS Remote radio installation:
   1. Measure and document transmitter power output.
   2. Label radio with transmit power output.

3. Measure receiving signal strength at repeater for each station.

C. Perform the following adjustments and tests for the Licensed MAS Remote radios:
   1. Align remote site antennas for maximum receive signal level.
   2. Record receiving signal level for the radio and repeater location.
   3. Notify City personnel if receive signal level is below -95 dBm.

D. Perform the following diagnostic tests for each radio installation:
   1. Set the radio for diagnostic loop back mode.
   2. Perform loop back diagnostics using the Cities diagnostic software provided.
   3. Replace any radio that does not meet the manufacturer's specifications.
   4. Print final test record from diagnostic software.

E. Submit test records for each radio station installation including the following information:
   1. Site name.
   2. Test date.
   3. Name of person performing test.
   4. Test equipment model number, serial number, and calibration date.
   5. TDR traces labeled with the antenna identifier as shown on the drawings.
   6. Transmit power.
   7. Reflected Power.
   8. VSWR
   9. Receive signal level at station and repeater location.
   10. Final test record from diagnostic software.
   11. Radio Configuration: Review radio configuration for agreement with manufacturer's recommendations.

3.04 PREPARATION

A. Ensure spare parts and consumables are available to complete the Site Acceptance Test.

B. Provide Radio Commissioning Binder.

3.05 GROUNDING ROD INSTALLATION

A. Where rock bottom is encountered, drive ground rod at an oblique angle not to exceed 45 degrees from the vertical or bury in a trench at least 2½ feet deep.

B. Ensure that any single ground rod having a resistance to ground of greater than 15 ohms is augmented with one additional rod. Where multiple ground rods are required, ensure they are at least 6 feet apart.

C. Attach main ground conductor to ground rod with exothermic welding, listed pressure connectors, or listed clamps.

END OF SECTION

SECTION 40 6700 – LOCAL CONTROL PANELS

PART 1 – GENERAL

1.01 REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies, and shall perform all labor as required for installing Local Control Panel (LCP's) as indicated on the Drawings and as specified herein or in other Sections of the Specifications.

B. The following is a list of LCP's to be furnished under this Contract which are required to meet these specifications:
   1. SBR Control Panel (Furnished by SBR System Manufacturer and installed by CONTRACTOR).
   2. Headworks Control Panel (Furnished and installed by CONTRACTOR).
   3. Sludge Bagging System Control Panel (Furnished and installed by CONTRACTOR).
   4. Drying Bed Lift Station Control Panel (Furnished and installed by CONTRACTOR).
   5. Overflow Lift Station Control Panel (Furnished and installed by CONTRACTOR).

C. All LCP panels shall be designed and constructed to the following minimum standards using the following PLC / HMI platforms:
   1. Allan Bradley – Compact Logics L43 or approved equal
   2. I/O Modules with minimum 15% open I/O
   3. 12” Color Panel View Human Machine Interface (HMI) Terminal w/ 120VAC Power Supply
   4. N-tron Industrial 5-port PoE Ethernet Switch – Model 105TX-POE
   5. Redundant 24 VDC Power Supplies for Field Instrumentation
   6. Sealed, mechanical cabinet cooling, if required, to maintain interior panel ambient temperatures below equipment stated operating conditions.
   7. All inputs such as instruments, sensors, and interfaces (switches, buttons, etc.) shall use 24 VDC
   8. All external inputs shall be individually fused with blown-fuse indicators
   9. All analog inputs shall be provided with loop isolation
   10. All outputs shall be isolated with interposing relays with integrated indication lights and manual override buttons
   11. All external connections into or out of the panel shall be made using UL listed terminal blocks
   12. All spare I/O shall be wired out to terminal blocks
   13. 30mm manual switches, buttons and lights shall be provided for each motor, gate or operator local to each machine.
   14. Panels shall be UL508 listed.

1.02 RELATED WORK AND CONSTRUCTION STANDARDS

A. Each LCP shall be a UL 508A recognized panel assembler. All control panel components shall be UL Listed under the category "Industrial Control Equipment".

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

1.04 OPERATING AND MAINTENANCE MANUALS

A. Installation requirements and procedures.

B. Complete instructions regarding the operation and maintenance of equipment involved. Instructions and documentation not related to the equipment furnished must be removed

or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished

C. Bill of Materials, component data sheets, descriptive literature, product specification sheets, wiring diagrams and calibration procedures. O&M manuals must be individually tailored to the project and equipment as furnished

D. Complete nomenclature of replaceable parts, part numbers, current cost, name, and address of nearest vendor of replacement parts. Information on equipment or components not related to equipment furnished must be removed or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished

1.05 QUALITY ASSURANCE

A. Equipment to be furnished under this Section shall be the product of firms regularly engaged in the design and manufacture of this type of equipment. Manufacturer shall assume responsibility for, and guarantee performance of equipment furnished.

B. The manufacturer shall provide a 1-year equipment warranty.

C. Equipment shall be designed and installed to conform to Drawings, Specifications, engineering data, related equipment furnished by other suppliers and recommendations of the PLC manufacturer.

D. Comply with the following Codes and Standards:
1. NEMA (Testing Standards BU 1.3.03 or 1.304)
2. UL listing and labeling for materials.
3. NFPA-70
4. UL 508A

PART 2 – PRODUCTS

2.01 GENERAL

A. The CONTRACTOR shall furnish the LCP(s) to satisfy the functional requirements specified in the relevant mechanical equipment, these Specifications, and as indicated on the Drawings. All components shall be UL labeled or provided with proper ground fault protection as required by UL 508A.

B. LCP enclosures shall be 304 or 316 stainless steel NEMA 4X with hinged lockable doors. Freestanding enclosures shall have a 3-point latching handle. Outdoor enclosures with panel mounted devices shall contain a white interior swing panel.

C. Identification of panel-mounted devices, conductors, and electrical components shall meet the requirements specified herein.

2.02 TERMINAL BLOCKS

A. Each LCP shall be provided with identified terminal strips for the connection of all external conductors. There shall be sufficient terminal blocks for all external connections plus an additional 25 percent spare for future use. Terminal blocks shall be identified in accordance with approved shop drawings. Terminal blocks shall be individual, stacking, compression type, 600VAC, 30A minimum, suitable for wire sizes No. 10 - No. 18. A printed terminal block label shall be affixed to each terminal block for identification.

B. Each field-mounted device deriving power from the LCP shall be individually fused with a knife-blade or plug-in fused terminal block and blown fuse indicator.

C. Terminal blocks for analog signals shall include an indicator light that is illuminated when the signal is present. A grounding type terminal block shall be provided for termination of the analog signal cable shield/drain wire.

2.03 OPERATOR DEVICES

A. Pushbuttons, selector switches, and pilot lights shall be of the heavy-duty, oil-tight type, 30mm in size. Miniature style devices are not acceptable.

B. Pilot lights shall be push-to-test, LED style with LED and lens color as indicated on the Drawings.

C. START buttons shall have green cap and STOP buttons shall have red caps. All other button caps and selector switch operator handles shall be black.

D. Selector switches shall have the number of positions as indicated on the Drawings or as required to perform the intended function. Provide the number of 120VAC, 10A contacts as indicated on the Drawings or as required to perform the intended function.

E. Provide an engraved legend plate or provide laminated plastic nameplates as specified elsewhere for each device.

F. The operator devices shall have a NEMA rating equal to or more stringent than the control panel in which it is mounted.

G. Acceptable manufacturers:
   1. Cutler-Hammer 10250 series
   2. Square D 9001SK series
   3. Or ENGINEER-approved equal.

2.04 CONTROL RELAYS

A. Relays shall be DPDT (minimum) plug-in type utilizing rectangular blades with an indicating LED, and sockets with screw-type terminals and hold-down clips. Operating coil voltage shall be as required or indicated on the Drawings.

B. Contacts shall be rated 10 Amps at 120 VAC. Contact material shall be silver-cadmium oxide except for signal switching circuits that shall be gold plated or other noble metal.

C. Acceptable manufacturers
   1. Square D Type K,
   2. IDEC Type RH,
   3. Or ENGINEER-approved equal

2.05 TIMING RELAYS

A. Time delay relays shall be a combination on-delay and off-delay (selectable) with adjustable timing range from 1 sec to 10 hours. The timing relays shall include an LED indicator that is illuminated when the relay is timing out. Operating coil voltage rating shall be as indicated on the Drawings with DPDT, 120VAC, 10 amp rated contracts. Provide sockets with screw-type terminals and hold-down clips.

B. Reset Timers: Reset timers shall be synchronous motor driven with a solenoid-operated clutch. The timing relays shall include an LED indicator that is illuminated when the relay is timing out. Voltage rating shall be as indicated on the Drawings with 120VAC, 10 amp rated contacts, and timing range as required or indicated on the Drawings.

C. Acceptable manufacturers:
   1. ATC
   2. DEC
   3. Or ENGINEER-approved equal

2.06 SIGNAL CONDITIONERS

A. Current-to-current converter/isolators shall be 4-20 mA input, 4-20 mA output. The INTEGRATION CONTRACTOR shall utilize signal isolators where necessary to boost or isolate signals for proper operation.

B. Pulse-to-current converters shall convert a square wave pulsed frequency to a proportional 4-20mA output and shall operate on 120 VAC.

C. Acceptable manufacturers:
   1. Moore Industries
   2. AGM
   3. Or ENGINEER-approved equal

2.07 POWER SUPPLIES

A. Power supplies shall be DIN-rail mounted and be of the solid-state circuitry type UL-1950 and CSA-1402C certified. Input power shall be 120VAC, +/- 10%, output voltage shall be as indicated on the Drawings or as required for proper operation of connected loads.

B. Power supplies shall be sized for 200% of the total connected load.

C. Line regulation shall be within +/- 0.05 percent with a 10 percent line change. Load regulation shall be within +/- 0.05 percent with a 50 percent load change. Output ripple shall not exceed 0.2 percent peak-to-peak: Transient response shall be less than 50 microseconds for a 50 percent load change.

D. Power supplies shall be fully rated with an efficiency of at least 60 percent for a temperature range of 0 - 60°C or be oversized appropriately. Power supplies shall produce EMI/RR noise levels within the requirements of FCC Docket 20780.

E. Power supplies shall contain internal short circuit and overload protection. Output fusing shall be supplied on the positive terminal.

F. Acceptable manufacturers:
   1. Acopian
   2. Sola
   3. IDEC
   4. Phoenix Contact
   5. Or ENGINEER-approved equal

2.08 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. The UPS shall be on-line, with automatic bypass switching upon failure, and with automatic bypass switching for maintenance. The UPS shall include built-in surge protection, rectifier/battery charger, batteries, inverter, static transfer switch, and solid-state controls to provide a true sine-wave output.

B. Input power 120VAC, +/-10%, 60Hz.

C. Output power shall be 120VAC +/- 5% 60Hz with a harmonic distribution at less than 5% (voltage).

D. UPS KVA ratings have been indicated on the Drawings for bidding purposes only. Actual KVA rating of each UPS shall be as required to operate all loads being served for a minimum of 20 minutes without input power. KVA in-rush rating shall not be less than 150% of connected load's in-rush current. UPS load calculations must be submitted with the UPS for approval.

E. Switching response time shall be less than 4 milliseconds.

F. Batteries shall be sealed, no maintenance type, designed for 5 years minimum service.

G. Display shall include: On-line or bypass operation, input power failure, UPS fault, UPS battery low.

H. Where indicated, the UPS shall be provided with dry contacts that close upon low battery alarm.

I. The UPS manufacture shall provide 1-year parts and labor warranty.

J. Acceptable manufacturers:
   1. APC
   2. Best
   3. Or ENGINEER-approved equal

2.09 SPARE PARTS

A. Provide a minimum of 10 spare lamps.

B. Provide one control and one timing relay of each type utilized.

C. Provide one spare power supply of each size and type utilized.

D. Provide (3) spare fuses of each size and type utilized.

E. Refer to related Specification Sections for additional spare parts required.

PART 3 – EXECUTION

3.01 FABRICATION

A. LCP's shall contain components as indicated on the Drawings. The division of I/O between LCPs shall be provided per the Process and Instrumentation Diagrams (P&IDs).

B. All front accessible panel-mounted devices shall be mounted a minimum of 42 inches above finished floor elevation.

C. Where AC and DC signals must intercept each other, cross wires at 90-degree angles. Route AC and DC signals in separate wireways. Provide blank wireways for field wiring by the CONTRACTOR.

D. All internal wiring shall be contained in plastic raceways or troughs having removable covers. Wiring to door-mounted devices shall be extra flexible and anchored to doors using wire anchors cemented in place. Exposed terminals of door-mounted devices shall be guarded to prevent accidental contact with energized terminals.

E. Minimum control panel conductor size for power shall be No.12 AWG. Minimum conductor size for control wiring shall be No. 14 unless protected by a 10A overcurrent protective device or smaller, in which case it can be No.16 AWG (in PLC and operator interface cabinets only). Analog signal cables shall be 600V, No.16 AWG twisted shielded pair.

F. Wire markers shall be heat shrinkable, be a minimum of 3/8-inches in length and placed as near as possible to the end of the wire.

G. Identification of panel-mounted devices control equipment enclosure shall be engraved laminated plastic with black letters on white background. Use minimum 3/16-inch letters for identifying individual panel components. Use minimum 3/8-inch letters for identifying control equipment enclosure.

H. LCP enclosure doors that contain 120VAC devices shall be bonded to the enclosure grounding lug.

I. Each PLC I/O point connected to an external device shall be terminated at terminal blocks.

J. All analog signals shall be individually fused at the terminal block. See additional requirements as specified elsewhere in these specifications.

3.02 INSTALLATION

A. LCP(s) shall be installed as indicated on the drawings.

B. All front accessible panel-mounted devices shall be mounted a minimum of 42-inches above finished floor elevation.

C. LCP(s) shall be stored in an indoor, dry location at the jobsite to protect from condensation, damage, and the effects of weather.

D. LCP(s) interiors and exteriors shall be cleaned, and coatings shall be touched up to match original finish upon completion of the work.

END OF SECTION

SECTION 40 7000 – FIELD INSTRUMENTATION

PART 1 - GENERAL

1.01 REQUIREMENT

A. This Section includes the general requirements for furnishing and installing the field instruments as indicated on the Drawings and specified in this Division of these specifications. Other instrumentation and control sections of this Division shall supplement this Section as necessary. These specifications shall not apply to instrumentation to be provided by process equipment vendors as part of the process systems or equipment already approved by the ENGINEER.

B. The field instrument schedule is attached to the end of this Specification Section but shall not be construed as a Bill of Materials or as a complete listing of all required devices. The I&C INTEGRATOR shall be responsible for all field instruments indicated in these Specifications and the Contract Documents.

C. The I&C INTEGRATOR shall provide all labor, materials, and incidentals as indicated, specified, and required to furnish, install, calibrate, adjust, test, document, start-up, and train for each field instrument furnished.

D. Labor, materials, apparatus, and components essential to the complete functioning of field instruments described and indicated herein, or which may be reasonably implied as essential, whether mentioned in the Contract Documents or not, shall be furnished and installed by the I&C INTEGRATOR. In case of doubt as to the work intended, or in the event of need for explanation thereof, the I&C INTEGRATOR shall refer to the ENGINEER for supplemental instructions.

E. For purposes of clarity and legibility, the Drawings are diagrammatic only. Construction Documents are not intended to show every fitting, junction, or component nor every difficulty that may be encountered during installation or coordination with different equipment manufacturers. The I&C INTEGRATOR shall refer to related data in all Contract Documents and shall verify this information on site.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.
   1. Descriptive Data: Submit copies of complete descriptive literature, performance data, physical dimensions, power, and signal connections for each field instrument to be furnished. Provide name of manufacturer, style, and complete model number. Listing items "as specified" without both make and model or type designation is not acceptable.
   2. Component Data Sheets: Submit a component data sheet for each piece of instrumentation equipment similar to an ISA S20 form. Include equipment tag number, manufacturer's model number, location of service, materials of construction, size and scale range, calibrated range, set points, optional accessories, and any other useful information.
   3. Submit drawings and bill of materials for any sun shields that may be required. Drawings must clearly indicate how the sun shield will be fabricated and mounted.

1.03 OPERATING AND MAINTENANCE MANUALS

A. Installation requirements and procedures.

B. Complete instructions regarding the operation and maintenance of equipment involved. Instructions and documentation not related to the equipment furnished must be removed or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished.

C. Bill of Materials, component data sheets, descriptive literature, product specification sheets, wiring diagrams and calibration procedures. O&M manuals must be individually tailored to the project and equipment as furnished.

D. Complete nomenclature of replaceable parts, part numbers, current cost, name and address of nearest vendor of replacement parts. Information on equipment or components not related to equipment furnished must be removed or crossed out. O&M manuals must be individually tailored to the project and equipment as furnished

E. Provide a copy of all instrument calibration reports.

F. Refer to Applicable Sections of Division 40 – Process Integration for additional requirements.

1.04 QUALITY ASSURANCE

A. Equipment to be furnished under this section shall be the product of firms regularly engaged in the design and manufacture of this type of equipment. Manufacturer shall assume responsibility for, and guarantee performance of equipment furnished. However, this shall not be construed as relieving the I&C INTEGRATOR from responsibility for the proper installation and functioning of the work.

B. The manufacturer shall provide a 2-year equipment warranty.

1.05 COORDINATION

A. The I&C INTEGRATOR shall coordinate with all other equipment manufacturer to ensure proper installation and operation of the field instruments.

B. The I&C INTEGRATOR shall coordinate with all other trades to avoid conflicts and interferences. No extra compensation will be allowed for changes made necessary due to conflicts between various equipment.

C. Any discrepancies noted in these contract documents or discrepancies between Drawings and actual field conditions shall be promptly brought to the ENGINEER for a decision. No extra compensation will be allowed for changes made by the I&C INTEGRATOR without ENGINEERs consent.

D. IDENTIFICATION TAGS (To be provided by Contractor, as per these Specifications.)

PART 2 - PRODUCTS

2.01 PROVIDE INSTRUMENTATION AS NOTED ON THE EQUIPMENT LIST.

2.02 MAGNETIC FLOWMETERS

A. General:

1. Magnetic flowmeters systems shall be of the low frequency electromagnetic induction type and produce a DC pulsed signal directly proportional to and linear with the liquid flow rate. Complete zero stability shall be an inherent characteristic of the flowmeter system. Each magnetic flowmeter system shall include a metering tube, signal cable, transmitter, and flowmeter grounding rings.
2. Flowmeter shall be for the appropriate type to measure water flow rate in water or wastewater as required by the Contract Documents.
3. Magnetic flowmeters and electronics shall be manufactured at facilities certified to the quality standards of ISO Standard 9001 - Quality Systems - Model for Quality Assurance in Design/Development, Production, Installation, and Servicing.
4. Flowmeters that are to be located on a submerged pipe shall be designed to operate in such conditions. Flowmeter display shall be located above water level and a connection cable of appropriate length shall be provided to allow connection to display location.

B. Metering Tube:
   1. Constructed of stainless steel with 150 lb. carbon or stainless steel ANSI B16.5 Class 150 flanged connection.
   2. Utilize a minimum of 2 bullet-nosed, self-cleaning electrodes.
   3. The liner shall be non-conductive and in conformance with the Manufacturer's recommended service.
   4. Electrodes constructed of materials that are in conformance with the Manufacturer's recommendation for the meter's intended service.
   5. Meter housing rated for accidental submergence.
   6. Two stainless steel grounding rings shall be furnished and installed in accordance with the manufacturer's bore and material recommendation for the meter's intended service. Installation shall be per flowmeter manufacturer's recommendations. Unless otherwise indicated, flowmeter grounding shall consist of a 3/4" x 10-foot copper clad ground rod bonded to the grounding rings with a No.6 bare copper conductor.

C. Transmitter: The transmitter shall be mounted on the flow-tube or remotely where indicated on the Drawings. The interconnecting cable shall be furnished by the flowmeter manufacturer of sufficient length to avoid splicing. Transmitters shall be housed in NEMA 4X enclosures suitable for mounting outdoors. The transmitter shall produce an electrically isolated 4-20mA DC output into a minimum load of 800 ohms linear to flow and a dry-contact, field adjustable, pulsed output for remote totalization.

D. Performance Requirements:
   1. Measuring Range: 0.33 to 33 ft/s
   2. Calibrated Range: 1.0 to 33 ft/s
   3. Time Constant: 0.01 to 100 seconds.
   4. Accuracy: ±0.2 percent of flow rate from 10 to 100 percent of full range over 1 ft. per second at 0 x D inlet run.
   5. Repeatability: 0.1 percent of full scale.
   6. Isolation: either galvanic or optic
   7. Empty pipe detection: The flow transmitter shall display "Empty Pipe" when the metering tube is not completely full.
   8. Power consumption: 30 watts max
   9. Power supply: 85 to 260 VAC
   10. Communication Protocol: Modbus RS-485, Ethernet

E. Factory Testing: Each flowmeter shall be hydraulically calibrated at a facility that is traceable to the National Institute of Testing Standards using a 3-point (minimum) test. The calibrations procedures shall conform to the requirements of MIL-STD-45662A. A real-time computer-generated printout of the actual calibration data indicated apparent and actual flows for each flow test shall be submitted to the ENGINEER with final project documentation.

F. Acceptable Manufactures:
   1. Endress + Hauser Model Promag 53W,
   2. Toshiba
   3. or ENGINEER-approved equal

2.03 LEVEL TRANSDUCER

A. Signal Output
   1. 4-20 MADC 2 wire twisted pair grounded shield cable @ 0.042 ohm/ft
   2. FM and CSA explosion-proof and intrinsically safe
   3. Unit meets EMI/RFI for Mil-Std 461/462 Rev. E
   4. Response time: <5ms

B. Accuracy
   1. Static Accuracy: 0.25% FSO BFSL
   2. 1-year Stability: 0.20% FSO
   3. Error Band: 0.90% BFSL FSO

C. Temperature
   1. Temp. Compensation: +35°F to +125°F
   2. Operating temp.: -20°F to +190°F
   3. Storage temp: -65°F to +250°F

D. Electrical Connection and Protection
   1. Vented, watertight, polyurethane-jacketed cable, 40 feet standard
   2. 10-30 VDC unregulated power
   3. Unit is FM explosion-proof and FM intrinsic safe.

E. Material
   1. Wetted Parts: 316 Stainless Steel Inconel Sensor
   2. Body: 300 Stainless Steel, explosion-resistant
   3. Cable: Polyurethane-jacketed cable
   4. Cable: 40 feet standard

F. Agency Approval Options
   1. Explosion-proof rated Class I, II, III, Division I, Groups A, B, C, D, E, F, G.

G. Ranges
   1. 50 psi or per plan

H. Acceptable Manufacturers:
   1. E&H FMX-21
   2. Or ENGINEER-approved equal

2.04 LEVEL FLOATS

A. Float switches shall be used to sense liquid level in a tank, basin or other applications as indicated on the Drawings. Floats shall be mechanical activated switch contact, rated for 10A @240V for mechanical pump duty or 5A @ 240V for control duty. The float ball shall be constructed of 316 stainless steel or durable polypropylene material construction with solid polyurethane foam interior. It shall be leak proof, shock proof, and impact resistant. Switch shall be non-mercury type.

B. The switch contact configuration shall be normally open (N.O.) or normally closed (N.C.) as required to perform the proper operation as intended in these Contract documents. Actuation point shall be 1” above or below the horizontal. Power chord shall be chlorinated polyethylene material. Cord weight shall be zinc plated cast iron – 1.22 lb minimum with split-weight design for ease of adjustment.

C. Floats shall be installed such that the switch activation takes place at the liquid level as indicated or directed by the ENGINEER at time of construction. The float switch assembly shall include 1" schedule 80 PVC fastened to the tank/basin wall with 316 stainless steel anchors and clamps if required to secure the float(s) into place or as indicated on the Drawings. Float switch cables shall be secured to the cable or PVC pipe with weather-resistant, UV rated tie-wraps.

D. Acceptable Manufacturers:
   1. Connery
   2. Or ENGINEER-approved equal

2.05 PRESSURE GAUGES

A. Pressure gages shall have the following features as a minimum:
   1. Housing: 4-1/2", aluminum case with plastic lens, white dial and black numbers/graduations/pointer
   2. Silicone oil filled
   3. Range: as indicated elsewhere
   4. Proof pressure: 150 percent of range psi minimum
   5. Accuracy: one percent of full scale
   6. Wetted material: 316 stainless steel
   7. Dial/pointer: stainless steel or aluminum
   8. Service: liquid, gas, or vapors as indicated on the Drawings
   9. Process connection: 1/4" NPT male
   10. Calibration: micro-adjustment screw
   11. Accessories: test cock, female outlets, and an isolation ball valve

B. An isolation ball valve shall be furnished and installed on each pressure gauge for ease of removal without disruption of service. The valve shall be sized as required for the process connection.

C. A diaphragm seal shall be furnished and installed to isolate each pressure gauge installed with a process connection other than potable water or clean air.

D. The I&C CONTRACTOR shall furnish and install all mounting hardware and support structures necessary for proper operation in accordance with the manufacturer's recommendations and the Contract Documents. Materials used for support structures shall be suitable for the environment in which it is installed (corrosive - stainless steel, non-corrosive - galvanized steel; unless indicated otherwise).

E. Acceptable Manufacturers:
   1. US Gauge (Ametek)
   2. Ashcroft
   3. Winters
   4. Or ENGINEER-approved equal

2.06 PRESSURE TRANSMITTER

A. The pressure transmitter shall measure the pressure in the line and shall transmit a 4-20 mA output for process control. The unit shall have an LCD display for local readings.

B. Requirements
   1. Accuracy: ±1% down to 10:1
   2. Display: 4-character LCD
   3. Output: 4-20 mA
   4. Pressure: 200 psi
   5. Sensing Element: 316 SS diaphragm
   6. Wetted Material: 316 SS
   7. Process Connection: 1/4” NPT (F)
   8. Power: 12 – 45 VDC
   9. Enclosure: NEMA 4X

C. Acceptable Manufacturers:
   1. Rosemount
   2. Endress & Hauser
   3. Or ENGINEER-approved equal

PART 3 - EXECUTION

3.01 INSTALLATION

A. The I&C INTEGRATOR shall furnish and install all mounting hardware and support structures for the instrumentation and the logic unit as required for proper operation in accordance with the manufacturer's recommendations and the Contract Documents. Materials used for support structures shall be suitable for the environment in which it is installed (corrosive – PVC, Fiberglass or stainless steel, non-corrosive – stainless steel; unless indicated otherwise).

B. Inspect each instrument and piece of equipment for defects, damage, and correct operation before installation. Inspect work area and work involving other trades to verify readiness for installation.

C. Field instruments shall be installed per manufacturer's requirements. Verify that all mounting, process, and electrical connections are secure and tight before operating instrument.

D. Install field instrument identification tag as described above.

E. The I&C INTEGRATOR shall coordinate with the Mechanical I&C INTEGRATOR to verify process connection type and location.

F. Field instruments installed in hazardous (classified) locations shall be installed in approved enclosures or electrically connected through an intrinsically safe barrier and shall meet all other requirements of NFPA 70 Articles 500-503.

G. Furnish and install sun shields for all analog instruments installed outdoors in direct sunlight where recommended by the instrument manufacturer.

H. Additional installation supervision, calibration, testing, and start-up requirements are provided in these Specifications.

END OF SECTION

SECTION 41 2200 – CRANES AND HOISTS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Provide permanent and/or portable lifting equipment and ancillary equipment as specified below.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

B. Submittal shall also include base dimensions, footing requirements, and footing reaction forces.

1.03 WORK INCLUDES THE FOLLOWING:

A. Detailed design of completed crane system, including bridge, end trucks, trolley, hoists, cabling, controls, and all appurtenances specified hereinafter.

B. Shop drawings

C. Fabrication of a complete crane

D. Inspection and shop testing

1.04 REFERENCES

A. Equipment furnished under this section shall comply in all respects with the requirements of the following standards:

OSHA	Occupational Safety and Health Administration
CMAA	Crane Manufacturer's Association of America
HMI	Hoist Manufacturer's Institute
ANSI	American National Standards Institute
NEMA	National Electric Manufacturer's Association
NEC	National Electric Code
AWS	AWS D14.1 Specification for Welding Cranes

1.05 QUALITY ASSURANCE

A. Contractor shall adhere to OSHA, state, and local safety guidelines, laws, rules, and regulations.

B. Contractor shall be licensed in the state of Arizona and have a minimum of 10 years' experience in the manufacture, fabrication, and installation of bridge cranes.

C. Contractor shall conform to all applicable ANSI, CMAA, and HMI specifications and/or standards.

D. Comply with CMAA specification 74 or 70, as applicable.

E. Long lead items [hoist, end trucks, drives and controls] will be ordered by contractor upon receipt of purchase order and credit approval. Steel will not be ordered until shop drawings and submittals have been approved by the customer.

F. All electric equipment shall be UL, CSA, or ETL labeled.

1.06 WARRANTIES

A. Provide one-year equipment warranty.

1.07 SERVICE AGREEMENT

A. Provide optional cost for two-year service agreement from local service organization.

PART 2 – PRODUCTS

2.02 DAVIT CRANE

A. Manufacturer: davit crane shall be Model Captain 2500 by Thern, Inc., or ENGINEER-approved equal.

B. The following design conditions are required for the crane:

Pump Stations and SBR Basin Davit Crane:

Lifting Capacity:	1,500 lbs. capacity at 122" reach
Hook Reach:	74” (shortest position), 122” (fully extended)
Winch Operation:	Manual
Boom Angle Adjustment:	Manual adjustment
Lift required:	30 Ft. (minimum)
Base Requirement:	Pedestal

C. Design Factor: yield design factor shall be a minimum of 1.5 under static conditions for all crane components including winch and base. Breaking strength safety factor shall be a minimum of 2.5 under static conditions. Comply with CMAA 70 or 74.

D. Hook Height: hook height shall be adjustable by moving the boom up or down between 5 degrees above horizontal and 45 degrees from vertical, with a minimum of 86 inches between the lowest position and the highest position with the boom fully extended.

E. Boom Angle: boom angle shall be adjustable at all times. Hand operated screw jack or ratchet-style screw jack shall be provided as required to raise or lower the boom between 5 degrees above horizontal and 45 degrees from vertical.

F. Boom Sheave: wire rope shall pass over a sheave at the end of the boom. Sheave shall have a bearing and shall be supported by a machined clevis pin which shall be keyed to the boom to keep the pin from rotating.

G. Clearance: minimum height of the boom shall be 36 inches between mounting surface and the underside of the boom in all base configurations.

H. Rotation: mast and boom shall rotate 360 degrees in the base, with a rotational handle attached to the mast to facilitate rotation. Crane shall include a bearing sleeve to support the mast at the top of the base.

I. Fastening Pins: crane components shall be fastened together using stainless steel clevis style pins, secured with lynch pins with lanyards fastening the lynch pins to primary structural components.

J. Portability: davit crane shall break down into portable components with no single component weighing more than 100 pounds. Carrying handles shall be welded to mast and boom.

K. Winch Location: lifting winches shall be located such that the center point of the drive shaft is behind the centerline of the mast.

L. Winch Mounting Bracket: crane shall be equipped with a winch mounting bracket that connects to the crane with a pin allowing the winch with bracket to be attached or removed without tools. Winch shall attach to the bracket using standard fasteners.

M. Nametag: davit crane shall be labeled with a non-corrosive metal identification plate labeled or imprinted with the manufacturer’s name, model number, serial number, capacity rating, and other essential information.

N. Painting**:**

1. Crane shall be factory painted per manufacturer’s standards, with finish per Owner’s Selection.
2. Crane shall be shop cleaned, primed, and painted as defined in these Specifications. The following items shall not be painted: Cable/Wire Rope

PART 3 – EXECUTION

3.01 SERVICES OF MANUFACTURER

A. Inspection, Startup, and Field Adjustment: The hoist systems shall be assembled and tested per the manufacturer's instructions and requirements. The test shall be performed using a load equal to ¾ of the load rating of the system and shall be demonstrated to the satisfaction of the ENGINEER prior to acceptance.

END OF SECTION

SECTION 43 2513 – SUBMERSIBLE SEWERAGE PUMPS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. Furnish and install submersible pumps with associated piping and appurtenances, including pump base, SS guild rails, and supports complete and operable in accordance with the Contract Documents.

B. The Supplier shall examine the site conditions, intended application, and operation of the pump system and recommend the pump which will best satisfy the indicated requirements.

C. Coordinate with hatch manufacturer in accordance with these Specifications.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Sections 01 3300 – Submittal Procedures.

1.03 OPERATING AND MAINTENANCE MANUAL

A. Operation and Maintenance Manual shall be furnished in accordance with these Specifications.

1.04 QUALITY ASSURANCE

A. Pump manufacturer and model shall be as described on the Drawings or Engineer approved equal.

B. The manufacturer shall provide a 2-year equipment warranty.

C. Manufacture shall be required to provide a one-year clog-free guarantee, published in writing from the manufacturer prior to being selected for the project.

1.05 SPARE PARTS

A. Provide all spare parts anticipated to be required for the first 2 years of operation. Manufacturer shall clearly define quantity, description of part and associated part numbers as part of manufacturer's scope of supply.

B. Spare parts shall be placed in a separate container clearly marked as "Spare Parts." All parts shall be identified and clearly labeled with applicable part numbers.

PART 2 – PRODUCTS

2.01 GENERAL

A. Each pump shall be equipped with a submersible electric motor connected for operation on 460 volts, 3 phase, 60 Hz suitable for submersible pump applications.

B. The pumps shall be Grundfos, KSB, Sulzer, Flygt or ENGINEER-approved equal.

C. Operating Conditions**:** Capacity and Head requirements for each submersible pump shall be specified within the plans.

The WORK of this Section shall be suitable for operation under the following conditions:

Pump Name	Design Flow Capacity (gpm)	Total Dynamic Head Required (ft)	Rated HP	VFD Service	Type	Provided by
Drying Bed Drain Return Pumps	70	90	5	No	Submersible Non-Clog with Hard-Iron Impellers	Contractor

2.02 NON-CLOG TYPE

A. Pump Design: The pump shall be automatically and firmly connected to the discharge connection, guided by Sch 40 (316) stainless steel guide bars extending from the top of the station to the discharge connection. Intermediate guide rail bracket shall be provided as required by manufacturer or as shown on Plans. There shall be no need for personnel to enter the basins. Sealing of the pumping unit to the discharge connection shall be accomplished by a machined metal to metal watertight contact. Sealing of the discharge interface with a diaphragm, O-Ring, or profile gasket shall not be acceptable. No portion of the pump shall bear directly on the sump floor. It is preferable that the FEB Pumps be interchangeable with Influent Pumps for Owner redundancy and consolidation of spare parts; however, it is not required.

B. Pump Construction: Construction of the submersible non-clog pumps shall conform to the following requirements:

1. Major pump components shall be of gray cast iron, ASTM A48, Class 35B, with smooth surfaces devoid of blow holes or other irregularities. All exposed nuts or bolts shall be AISI type 316 stainless steel construction. All metal surfaces coming into contact with the pumpage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a two-part epoxy paint finish on the exterior of the pump.
2. Sealing design shall incorporate metal-to-metal contact between machined surfaces. Critical mating surfaces where watertight sealing is required shall be machined and fitted with Nitrile or Viton rubber O-rings. Fittings will be the result of controlled compression of rubber O-rings in two planes and O-ring contact of four sides without the requirement of a specific torque limit.
3. Rectangular cross sectioned gaskets requiring specific torque limits to achieve compression shall not be considered as adequate or equal. No secondary sealing compounds, elliptical O-rings, grease, or other devices shall be used.

C. Cooling System: Each unit shall be provided with an adequately designed cooling system.

1. A stainless steel cooling jacket shall encircle the stator housing; thus, providing heat dissipation for the motor regardless of the type of installation. Impeller back vanes shall provide the necessary circulation of the cooling liquid through the water jacket. The cooling media channels and ports shall be non-clogging by virtue of their dimensions. External cooling and seal flushing shall not be required. Cooling system should be of the closed-loop. Media cooled water jackets will not be allowed.
2. The cooling system shall provide for continuous pump operation in liquid temperature of up to 104°F. Restrictions below this temperature are not acceptable.

D. Cable Entry Seal: The cable entry seal design shall not require specific torque requirements to insure a watertight and submersible seal. The cable entry shall consist of a single cylindrical elastomer grommet, flanked by washers, all having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the body containing a strain relief function, separate from the function of sealing the cable. The assembly shall provide ease of changing the cable when necessary using the same entry seal. The cable entry junction chamber and motor shall be separated by a terminal board, which shall isolate the interior from foreign material gaining access through the pump top. Epoxies, silicones, or other secondary sealing systems shall not be considered acceptable.

E. Motor**:**

1. The pump motor shall be induction type with a squirrel cage rotor, shell type design, housed in an air filled, watertight chamber, NEMA B type. The stator windings and stator leads shall be insulated with moisture resistant Class H insulation rated for 180°C using the trickle impregnation method to achieve a winding fill factor of at least 95%. The use of bolts, pins or other fastening devices requiring penetration of the stator housing is not acceptable. The motor shall be designed for continuous duty handling pumped media of (40°C) (104°F) and capable of up to 30 evenly spaced starts per hour. The rotor bars and short circuit rings shall be made of cast aluminum. The motor and pump shall be designed and assembled by the same manufacturer.
2. The power cable shall be sized according to the NEC and ICEA standards and shall be of sufficient length to reach the junction box without the need of any splices. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be capable of continuous submergence underwater without loss of watertight integrity to a depth of 25 feet.

F. Bearings: The pump shaft shall rotate on two or more permanently greased bearings. Motor bearings shall be permanently grease lubricated. The upper bearing shall be a single roller bearing. The lower bearing shall be a two row angular contact bearing to compensate for axial thrust and radial forces. Single row lower bearings are not acceptable. The minimum L10 bearing life shall be 50,000 hours at any usable portion of the pump curve.

G. Mechanical Seal:

1. Each pump shall be provided with a tandem mechanical shaft seal system consisting of two totally independent seal assemblies. The seals shall operate in a lubricant reservoir that hydrodynamically lubricates the lapped seal faces at a constant rate. The lower, primary seal unit, located between the pump and the lubricant chamber, shall contain one stationary and one rotating tungsten-carbide seal ring. The upper, secondary seal unit, located between the lubricant chamber and the motor housing, shall contain one stationary and one positively driven rotating corrosion resistant tungsten-carbide seal ring and one rotating tungsten-carbide seal ring. The rotating seal ring shall have small back-swept grooves laser inscribed upon its face to act as a pump as it rotates, returning any fluid that should enter the dry motor chamber back into the lubricant chamber. The seals shall require neither maintenance nor adjustment nor depend on direction of rotation for sealing. Shaft seals without positively driven rotating members or conventional double mechanical seals containing either a common single or double spring acting between the upper and lower seal faces are not acceptable.

2. Each pump shall be provided with a lubricant chamber for the shaft sealing system. The lubricant chamber shall be designed to prevent overfilling and to provide lubricant expansion capacity. The drain and inspection plug, with positive anti-leak seal shall be easily accessible from the outside. The seal system shall not rely upon the pumped media for lubrication. The motor shall be able to operate dry without damage while pumping under load.

H. Pump Shaft: Pump and motor shaft shall be the same unit. The pump shaft is an extension of the motor shaft. Couplings shall not be acceptable. The pump shaft shall be of stainless steel ASTM A479 S43100-T and shall be completely isolated from the pumped liquid. Maximum deflection shall not exceed 0.002" at the primary shaft seal. Shaft sleeves will not be acceptable.

I. Impeller: The impeller(s) shall be of gray cast iron, Class 40 or 35B, dynamically balanced, two vane non-clogging design having a long throughlet without acute turns. The impeller(s) shall be capable of handling fibrous materials, heavy sludge and other matter found in wastewater. Whenever possible, a full vaned, not vortex, impeller shall be used for maximum hydraulic efficiency; thus, reducing operating costs. Mass moment of inertia calculations shall be provided by the pump manufacturer upon request. Impeller(s) shall be keyed to the shaft and retained by a stainless steel bolt which must be mechanically prevented from loosening by a positively engaged ratcheting washer assembly. The backside of the impeller shall incorporate an active cutter system designed to protect the motor shaft and mechanical seal from stringy or fibrous solids. Back vanes on the impeller shall eject chopped solids to prevent them from entering the area around the seal.

1. Where required per the table above and due to high abrasive conditions, the impeller and associated insert ring shall be 25% chrome cast iron hardened to meet ASTM A532 (Alloy III A), dynamically balanced, semi-open, multi-vane, back swept, screw-shaped, non-clog design. The impeller leading edges shall be mechanically self-cleaned automatically upon each rotation as they pass across a spiral groove located on the volute suction. The leading edges of the impeller shall be hardened to Rc 60 and shall be capable of handling solids, fibrous materials, heavy sludge, and other matter normally found in wastewater. The screw shape of the impeller inlet shall provide an inducing effect for the handling of up to 5% sludge and rag-laden wastewater. The impeller to volute clearance shall be readily adjustable by the means of a single trim screw. The impeller shall be locked to the shaft, held by an impeller bolt, and shall be coated with alkyd resin primer. Coatings or other means of hardening impellers that are not integrally cast into the iron with 25% chrome iron will not be accepted.

J. Volute: Pump volute(s) shall be single-piece gray cast iron, Class 40 or 35B, non-concentric design with smooth passages large enough to pass any solids that may exit the impeller. The motor shall be attached to the volute by stainless steel bolts. The motor unit with impeller attached, shall be removable from the volute without requiring removal of the impeller and without disturbing the watertight integrity of the motor unit.

K. Flush Valve: Where required, the pump shall be equipped with a flush valve or device to flush and/or mix a pump sump automatically before discharge. The flush valve shall be mounted on the pump housing and is designed based on the ejector principle with a ball valve as the closing device. The operation is automatic and induced by the pump flow and pressure, thus eliminating the need for electrical components and cabling. A flush valve requiring the use of electricity or a timer for operation will not be accepted.

2.03 PROTECTION

A. A temperature monitor will be in each phase of the motor connected in series and set to open at 140°C. They shall be connected to the control panel and used in conjunction, and supplemental to, external motor overload protection.

B. An electrical probe leakage sensor shall be provided to detect the presence of water in the stator chamber. When activated, the relay will send an alarm to the local control panel and cause the pump to shut down (optional). The moisture sensing chamber shall have a drain/ inspection plug with a positive anti-leak seal which is easily accessible from the outside of the pump.

C. All submersible, non-clog pumps supplied for the work in this section shall be UL/FM approved for use in Class I, DIV-1 areas (Explosion-proof).

2.04 PUMP CONTROLS

A. Pumps shall be controlled in accordance with these Specifications.

PART 3 – EXECUTION

3.1 SERVICES OF MANUFACTURER

A. Inspection, Startup, and Field Adjustment: The service representative of the Manufacturer shall be present at the Site to furnish the field services required by these Specifications.

B. Services of manufacturer shall be in accordance with these Specifications.

C. Manufacturer shall define quantity of trips and days on site necessary to perform the specified services as a part of the manufacturer's scope of supply. Scope of supply shall be inclusive of travel and living expenses.

D. Upon completion of field services, representative of manufacturer shall prepare and submit a report in accordance with the requirements of these Specifications.

3.2 INSTALLATION

A. CONTRACTOR shall install the equipment in accordance with installation requirements of these Specifications.

END OF SECTION

SECTION 46 2111 – CLIMBER-TYPE BAR SCREENS

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The Manufacturer shall furnish a single packaged unit with two (2) fine bar screens, one (1) tank, one (1) control panel, one (1) rock trap, one (1) compactor-conveyor and one (1) set of related accessories required for fully automatic operation as indicated on the Drawings and as specified herein. The screens shall not become blinded by any of influent sewer debris or by Fats, Oil and Grease during operation. Screenings shall be continuously discharged by a mechanical scraper arm to the screw compactor located at grade. Entire screen and compactor maintenance shall be possible from grade. No ladders or platforms will be needed for any portion of the maintenance.

B. The Manufacturer shall certify to not less than five (5) years of experience in the application, design, construction, and operation of climber-type bar screens of the type specified in this Section. The Manufacturer shall produce a list of not less than ten (10) operating installations as evidence of meeting the experience requirement.

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

1.03 OPERATION AND MAINTENANCE MANUALS

A. The Manufacturer shall provide Operation and Maintenance Manual hard copies and electronic version in PDF format for the Screens and all system components.

1.04 QUALITY ASSURANCE

A. Headworks screen shall be manufactured by Or-Tec Inc., EWS Inc., Franklin Miller, or ENGINEER-approved equal.

B. The Manufacturer shall provide a 2-year equipment warranty.

C. The climber-type bar screen specified herein shall be the design and fabrication of a single Manufacturer, which shall have the sole source responsibility for said equipment.

1.05 SPARE PARTS

A. Manufacturer shall provide all spare parts anticipated to be required for the first 2 years of operation. Manufacturer shall clearly define quantity and description of part and associated part numbers as part of Manufacturer’s scope of supply.

B. Spare parts shall be placed in a separate container clearly marked as “Spare Parts.” All parts shall be identified and clearly labeled with applicable part numbers.

PART 2 – PRODUCTS

2.01 GENERAL

A. Each bar screen shall consist of a tapered bar screen panel, two side frames, a drive motor, and two chains with multiple penetrating cushion mounted rakes. Both will be installed in a single tank and be provided with a separate rock trap and control panel.

B. Equipment shall be installed so as not to obstruct the flow of sewage to bar screen.

C. Screen components including shapes, pipes, sheets, side frames and guides, bar rack, rake assembly, scraper assembly, shafting, discharge chute, fasteners, and anchor bolts shall be manufactured from type 304 stainless steel. The screen shall be installed in type 304 stainless steel tank with inlet flange, outlet flange, overflow weir, and level sensor threaded fittings.

D. The tank overflow weir shall allow waste to flow directly to the outlet during overflow events.

E. A rock trap shall be mounted prior to the inlet of the screen tank.

F. Screen selection shall be based on the manufacturer's recommendation, to provide the best possible, most economical performance and mechanical solutions that meet or exceed specified application data:

Screen Opening:	¼"
Screen Angle:	75°
Peak Flow:	270,000 GPD
Wastewater:	Standard Municipal 200-500 mg/L TSS
Motor:	3Ø, 230/460Volt, 60hz

2.02 BAR SCREEN

A. Screen panel face shall consist of a parallel array of tapered bars with even, ¼" spacing between them. Screen bars shall be readily replaceable individually from the front of the screen without the need to remove the screen from the wastewater channel. All material for tapered bars, spacer beams, screenings lead plate, and support beams shall be of 304 stainless steel. The tapered bar screen panel shall be mounted and bolted between a pair of side frames.

B. The screen shall be a self-cleaning system using only the penetrating rake teeth to fully clean the gaps between the tapered bars and keep the screen operational.

C. No wash water shall be required by the screen.

D. The opening between the screen bars shall be able to be field modified to different size opening in the future with the use of a bar spacing kit.

2.03 SIDE FRAMES

A. A pair of side frames shall support the tapered bar screen panel between them. Bearings for head sprockets and bushings for tail sprockets with head and tail shafts shall be mounted on them. Frames shall be made of 304 stainless steel plate of sufficient thickness to prevent deflection.

2.04 CHAINS, RAKES, AND SPROCKETS

A. Rakes shall travel up the screen face, cleaning the screen opening with their penetrating teeth, while lifting captured solids to the top of the machine. The rakes shall be mounted on the chains on both sides of the side frames using cushion mounted brackets. The cushion mounted brackets shall enable the rakes to rotate 60-90° backwards should any blockage occur, and then return to their position between tapered bars.

B. The rakes shall travel approximately 12-15 feet/min. The rakes shall be chain mounted at no greater than 36" intervals.

C. Rake assembly shall be guided over the discharge chute and the accumulated debris shall be removed by a scraper attached to the side frames. Scraper shall be designed to pivot to achieve effected cleaning of bar screen openings with the rake. Rake scraper shall be of 304 stainless steel.

D. Discharge material from screen shall be directed to a tapered chute providing a smooth transition from bar screen discharge to the screw compactor. Chute shall have a minimum slope of 55° and shall be of 304 stainless steel.

E. Screen shall be capable of operating based on level sensor or I/O. Screen shall also be capable of operating continuously (24/7) when there is a continuous flow present if required.

2.05 DRIVE MOTORS

A. Equipment shall be provided complete with drive motors of totally enclosed geared induction type. A torque limiter combined with limit switch shall be provided between the motor and the head shaft in order to disconnect mechanical power in emergency situations.

B. System shall use two 1/6hp, 3Ø, 230/460Volt, 60hz motors, one per screen.

2.06 SCREEN TANK

A. The screen will be supplied with a stainless steel, structural tank which will support and contain the screen. The screen tank shall be self-emptying and fabricated from 11 gauge 304 stainless steel.

B. The two (2) screen inlets shall be a 6” flange and the one (1) screen outlet shall be 10” flanged.

C. The screen tank shall include an internal wall that is to act as an overflow weir as well as to allow screens to seal to the side, allowing no flow past the screens.

2.07 SCREW CONVEYOR COMPACTOR

A. The screening unit will be supplied with a screw compactor which will convey and dewatered the removed screenings. The drain pan and intermittent wash water shall drain to the screen inlet.

B. System shall use one 2hp, 3Ø, 230/460Volt, 60hz motor.

C. The Compactor shall be provided with a wash water supply connection for a maximum allowable 10 gpm sporadic usage.

D. Discharged screenings shall be of adequate dryness to pass the paint filter liquids test for landfill disposal.

2.08 LEVEL SENSORS

A. Four (4) level sensors shall be installed in the screen tank with the following functional parameters:
   1. High: Screen-On / High-High Alarm.
   2. Each side of the tank shall have two (2) sensors to control the accompanying screen.

2.09 ROCK TRAP

A. One (1) rock trap shall be supplied to be mounted at the inlet of the screen tank. The rock trap shall have a 6” inlet and 6” outlet flange. The rock trap shall be of 304 stainless steel and shall include a perforated 304 stainless steel basket.

B. The rock trap shall include a stainless-steel hinged cover and a support stand to bring outlet to level with the screen tank inlet.

2.10 CONTROL PANEL

A. The control panel shall be a NEMA 4X enclosures suitable for outdoor use and shall contain all electrical controls, wires, starters, terminals, relays, overloads, fuses, and labels required for operation of the screen and ancillary equipment described herein.

B. The system shall be fully operational in both manual and automatic modes. The system mode selector switch shall allow the operator to select the desired mode. No other changes or programming by the operator shall be required.

C. In manual mode, the screen will start and operate until it is turned off. In automatic mode, the system will turn on based on a signal from the level sensor provided or operate continuously if there is continuous flow to the screen. When using level sensors or I/O the screen will operate for one minute based on the signal. If at the end of one minute the signal from the level sensor is still made the screen will operate for one more minute. When the level sensor in no longer made the screen will turn off and wait for the next signal.

D. Timers in the panel will allow operator to easily change the on/off period of the compactor washer wash systems.

E. The front of the control panel door shall include a main disconnect breaker switch (power on/off). In the off position all power to the control panel shall be off. An electronic current overload relay overload shall continuously monitor the screen motor and shall alarm the panel in the event of an over current draw.

F. The control panel shall contain the following switches:
   1. NEMA 4X stainless steel outdoor duty enclosure housing.
   2. Main disconnect, "thru the door" with door interlock.
   3. Full voltage non-reversing motor starter (IEC).
   4. Control transformer with primary and secondary fusing.
   5. Control power on/reset push button.
   6. Screen running green pilot light.
   7. General Red Fault Alarm.
   8. Screen Hand/Off/Automatic Switch
   9. Electronic Over Current Relay.
   10. Elapsed time meter.
   11. Lot, control relays, terminal blocks, and related accessories.
   12. E-Stop mushroom red pushbutton with twist reset.
   13. UL Listed Enclosure suitable for wall mounting.
   14. Dry contact outputs for Screen Run, General Fault, Over Current.

G. All switches and switching functions shall be clearly indicated by suitably engraved labels.

PART 3 – EXECUTION

3.01 MANUFACTURER'S SERVICES

A. Inspection, Startup, and Field Adjustment: The service representative of the Manufacturer shall be present at the Site to furnish the field services required as specified herein.

B. Manufacturer shall define quantity of trips and days on site necessary to perform the specified services as a part of the Manufacturer's scope of supply. Scope of supply shall be inclusive of travel and living expenses.

C. Upon completion of field services, the representative of the Manufacturer shall prepare and submit a report in accordance with the requirements of these Specifications.

3.02 INSTALLATION

A. Contractor shall install the equipment in accordance with installation requirements of these Specifications.

END OF SECTION

SECTION 46 36 53 – CHEMICAL TABLET FEEDING EQUIPMENT

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The Contractor shall furnish and install, complete and operable, new factory-built tablet erosion chemical feeding equipment with all necessary parts and accessories.

B. Unless specifically indicated otherwise, the arrangement of equipment shown on the Drawings is based upon information available at the time of design and is not intended to show exact dimensions particular to a specific

1.02 SUBMITTALS

A. Submittals shall be furnished in accordance with the requirements of Section 01 33 00 – Submittal Procedures.

B. Product Data:
   1. Contractor shall supply one (1) electronic copy of submittal data.
   2. Component data and shop drawings of the system shall be supplied, including dimensions, weight, dimensions, and parts list.
   3. Cut sheets of the Manufacturer's recommended chemical tablets, including tablet dimensions, dry weight, and chemical percent availability.

1.03 OPERATION AND MAINTENANCE MANUALS

A. The Manufacturer shall provide Operation and Maintenance Manual hard copies and electronic version in PDF format for the polymer blending and feed equipment and all system components.

1.04 QUALITY ASSURANCE

A. Manufacturer shall have minimum five years' experience in manufacturing chemical tablet feed systems.

B. Manufacturer shall provide a 2-year equipment warranty.

C. Contractor shall obtain all equipment provided under this Section from a single supplier or manufacturer who shall assume full responsibility for the completeness and proper installation of the chemical feed equipment.

1.05 SPARE PARTS

A. Manufacturer shall provide all spare parts anticipated to be required for the first 2 years of operation. Manufacturer shall clearly define quantity and description of part and associated part numbers as part of Manufacturer's scope of supply.

B. Spare parts shall be placed in a separate container clearly marked as "Spare Parts." All parts shall be identified and clearly labeled with applicable part numbers.

PART 2 – PRODUCTS

2.01 CHLORINATION TABLET FEED EQUIPMENT

A. Contractor shall provide one (1) flow rate proportional chemical tablet feeder unit to provide chlorination to the treatment plant effluent. The equipment shall be sized to handle an average daily flow of 90,000 gallons.

B. The feeder shall be for installation outdoors, in-line with treatment accomplished by immersion of vertically stacked chemical tablets. The tablet feeder shall be equipped with a self-draining contact area to allow for a complete dry down during no flow conditions. The tablet feeder hopper shall be sized to hold at least 40 tablets to reduce the frequency of refills. The inlet/outlet hubs shall be sized to allow direct piping of SCH 80 PVC as shown on the Contract Drawings.

C. Chlorination shall be provided through the use of calcium hypochlorite tablets with at least 70% available chlorine upon dissolution.

2.02 DE-CHLORINATION TABLET FEED EQUIPMENT

A. Contractor shall provide one (1) flow rate proportional chemical tablet feeder unit to provide de-chlorination to treatment plant effluent. The de-chlorination feeder shall be located downstream of the chlorination equipment as shown on the Contract Drawings. The equipment shall be sized to handle daily flows up to 90,000 gallons per day.

B. The feeder shall be for installation outdoors, in-line with treatment accomplished by immersion of vertically stacked chemical tablets. The tablet feeder shall be equipped with a self-draining contact area to allow for a complete dry down during no flow conditions. The tablet feeder hopper shall be sized to hold at least 40 tablets to reduce the frequency of refills. The inlet/outlet hubs shall be sized to allow direct piping of SCH 80 PVC as shown on the Contract Drawings.

C. De-chlorination shall be provided through the use of either:
   1. Ascorbic acid tablets with at least 75% available ascorbic acid upon dissolution; or
   2. Sodium sulfite tablets with at least 92% bioavailability upon dissolution.

2.03 MANUFACTURERS

A. Chemical Tablet Feeder Acceptable Manufacturers:
   1. Norweco;
   2. Accutab;
   3. Or ENGINEER-approved equal.

PART 3 – EXECUTION

3.01 MANUFACTURER'S SERVICES

A. Services of the Manufacturer shall be in accordance with these Specifications.

3.02 INSTALLATION

A. Contractor shall install the equipment in accordance with installation requirements of these Specifications.

B. The Contractor shall install the specified equipment per the Contract Documents and Manufacturer's recommendations.

END OF SECTION

SECTION 46 5353 – SEQUENCING BATCH REACTOR PROCESS EQUIPMENT

PART 1 - GENERAL

1.01 THE REQUIREMENT

A. The Contractor shall assign full responsibility for the functional operation of all Sequencing Batch Reactor (SBR) System components to a Single Source Supplier. This Section covers the work necessary of the SBR Manufacturer to furnish, inspect the installing contractor's equipment installation and connections, calibrate, and place into operation the SBR System along with all other supporting equipment and accessories as specified herein.

B. American Iron and Steel (AIS) requirements apply to this Section. All iron and steel products used in this project must be produced in the United States in accordance with the Consolidated Appropriations Act, 2014.

C. System Source & Quality Assurance:

The SBR System shall be supplied by accompany of good reputation that is regularly engaged in the manufacture and fabrication of SBR wastewater treatment systems. The manufacturer's experience shall include a minimum of ten (10) installations where equipment of similar size and design has been in operation successfully in a similar process for a minimum of five (5) years. The supplier shall supply the following components: mixers, decanters, diffusers, pumps, actuators, valves, instrumentation, and controls as specified herein.

D. Electrically Actuated Valve Quality Assurance

Actuated valves shall be tested prior to shipment. Testing shall consist of the following:

1. Project and nameplate data verification per assembly documentation
2. Limit switch and torque switch setup and cycle test
3. Hydrostatic test (two pressurization cycles) for all plug and butterfly valves

E. Control Panel Quality Assurance

All Control Panels shall be UL certified. Testing by manufacturer's electrical engineering prior to releasing for shipment shall be completed. Testing shall consist of the following:

1. Point to point testing of all wiring prior to application of power
2. Intended supply voltage shall be applied to the enclosure
3. All components shall be tested for proper operation and calibration
4. The PLC and operator interface program shall be loaded and functionally checked
5. All components shall be checked to confirm proper mounting specifications have been followed
6. Enclosure shall be inspected for defects and repaired if necessary
7. All labeling of wires and devices are correct properly and clean
8. The manufacturer shall finalize the factory panel checkout by completing a control checklist to document all testing completed above. This document must be signed by a professional electrical engineer.

F. System Operation and Maintenance Manual

Complete system Operation and Maintenance manuals shall be available in hardcopy and electronic form. The electronic form shall be provided in pdf format and be fully bookmarked. Manuals shall address:

1. General project information
2. Installation and start up
3. Process design and operational control description
4. Mechanical, electrical, and field instrumentation component descriptions

5. Maintenance and trouble shooting
6. Mechanical and electrical drawings

G. Motor Compliance

Motors shall follow the Energy Independence and Security Act of 2007 (EISA 2007). The SBR area electrical classification shall be Non-classified. Motors within the basin shall be rated for a temperature code T2A (280°C).

H. Installation

The installation of the equipment furnished by the manufacturer shall be the responsibility of the installing contractor in accordance with all requirements of the contract documents.

I. Specification Precedence

The specifications for equipment and controls under this Section supersede specifications for equipment and controls specified elsewhere in the contract documents and drawings. Purchased components such as gear reducers, pumps, motors, valves, and actuators shall be provided with standard recommended manufacturers paint, unless otherwise specified within this Section.

J. Service

The equipment manufacturer shall furnish the services of a factory trained representative for a maximum of three trips and twelve (12), eight-hour days at the jobsite to inspect the installing contractor's equipment installation, supervise the initial operation of the equipment, instruct the plant operating personnel in a proper operation and maintenance, and provide process assistance. If additional service is required due to the mechanisms not being fully operational, at the time of service requested by the contractor, the additional service days will be at the contractor's expense.

K. Performance Guarantee

The single source supplier of the SBR System equipment shall provide a written Process Performance Guarantee to guarantee the SBR System will meet the effluent criteria specified under this Specification Section. The guarantee period shall commence at time of plant single basin start-up, once the system has reached equilibrium (or within six months of equipment shipment, whichever comes first), and shall be in force for a period of one year. The Process Performance Guarantee shall be submitted as part of the engineer's submittal data.

L. Warranty

The manufacturer shall provide a written warranty against defects in materials and workmanship. Manufacturer shall warrant the goods provided by the Manufacturer to be free from defects in materials and workmanship under normal conditions and use for a period of one (1) year from the date the single-basin equipment is put into service, or eighteen (18) months from shipment of equipment, whichever comes first. This warranty shall not apply to any goods or parts which have been altered, applied, operated, or installed contrary to the Manufacturer's instructions or subjected to misuse, chemical attack or degradation, negligence, or accident.

M. Approved Manufacturers:
1. Aqua-Aerobic Systems, Inc.
2. Fluidyne Corporation
3. Parkson Corporation
4. OR ENGINEER-approved equal.

PART 2 - PRODUCTS

1.02 PERFORMANCE REQUIREMENTS

A. The manufacturer of the SBR system shall be completely responsible for the proper design and integration of their system, including but not limited to; diffused aeration equipment, blowers, pumps, mixers, decanters, valves, and controls. In addition, the SBR manufacturer shall be responsible for providing and integrating local control panels. The equipment and controls in one SBR basin shall be of the same make and model as in the other SBR basin. All equipment shall perform as specified and the completed installation shall operate in accordance with the requirements of the plans and specifications.

B. Site Specific Conditions:

90,000 gpd	Average daily flow
135,000 gpd	Maximum daily flow
270,000 gpd	Peak Hourly flow of 2-hour(s) duration

Loadings	**Influent**	**Effluent**
BOD	360 mg/l	10 mg/l
TSS	250 mg/l	10 mg/l
TKN	40 mg/l	4 mg/l
Total Nitrogen	-- mg/	10 mg/l
Phosphorus	8 mg/l	-- mg/l

Wastewater temperature	50°F to 68°F
Jobsite elevation	4,700 feet MSL
Ambient air temperature	30°F to 100°F
Alpha (maximum value allowed)	0.85
Beta (maximum value allowed)	0.95
F/M ratio	0.16 lb BOD_5/lb MLSS – Day
Max MLSS at low water level	3,500 mg/l
Maximum Cycles at Max. Daily Flow	5/day/basin
Oxygen Requirements	1.25 lbs O2/lb BOD_5 applied 4.6 lbs O2/lb TKN applied
Minimum Aeration Time	2.15 hrs/cycle at maximum daily flow
Minimum Mixing Time	2.99 hrs/cycle at maximum daily flow
Minimum Settling Time	0.75 hrs/cycle at maximum daily flow

C. The SBR cycle structure is based on a timer system with basin level overrides. The cycle structure shall remain constant up to the maximum daily flow. Advancing cycles prior to the maximum daily flow is not acceptable.

1.03 EQUIPMENT

A. Structures:

1. The SBR shall be field erected in two (2) rectangular cast-in-place concrete basins as shown on the contract drawings and summarized below:

Basin Width:	18.0 feet
Basin Length:	36.0 feet
Basin Height:	17.0 feet
Empty Tank volume:	74,616 gallons
Design Operating Volume	56,178 gallons
Type of liquid:	Activated sludge
Max. Dry matter content:	3,500 MLSS
Minimum Operating Level:	10.5 ft. SWD
Maximum Operating Level:	14.0 ft. SWD

2. The Aerobic Digester basin shall be field erected as shown on the contract drawings and summarized below:

Basin Width	10.83 feet
Basin Length	20.0 feet
Basin Height:	17.0 feet
Minimum Operating Level	9.8 feet SWD
Maximum Operating Level	14.0 feet SWD

3. The Post-Equalization/Holding basin shall be field erected as shown on the contract drawings and summarized below:

Basin Width	7.2 feet
Basin Length	20 feet
Basin Height:	17.0 feet
Minimum Operating Level	0 feet SWD
Maximum Operating Level	9.3 feet SWD

B. Influent Plug Valve(s):

1. Furnish two (2), 10-inch diameter electrically operated flanged plug valve, one for each basin, to control the influent flow. Valves shall be a 125# flanged end connection, ASTM A126 Class B cast iron body with welded in nickel seat, EPDM coated ductile iron plug, assembled, and tested with 230-volt, single phase, 60 Hz cycle open/close service electric actuator. The valve shall be a non-lubricated type with a port area of at least 80% of full pipe size. Valve actuator shall be provided in accordance with these Specifications.

2. Each valve shall include a manual override with limit switch feedback to the micro-processor in both the open and closed positions. Field wiring and junction/box disconnect shall be provided by the installing contractor. Provisions for valve access shall be provided by the installing contractor.

C. Submersible Direct Drive Mixer(s):

1. Furnish one (1) close-coupled, submersible type direct drive mixer for each basin, as shown on the project drawings. All components of the mixer, including the motor, shall provide continuous underwater operation while the mixer blades are completely submerged. Mixer unit shall be approved according to UL standards. The mixer shall be capable of handling typical domestic raw, screened sewage with normal concentrations of rags, strings, and sand/grit. A guide rail system shall be used to support each mixer during operation and to guide the units during installation and lubrication/preventative maintenance inspection. The system shall consist of a bottom-bearing console, stop bracket, or stop console, guide pipe, fixing bracket and guide holder assembly. All major components shall be fabricated of 316 stainless steel.

2. Mixer selection shall be based on the manufacturer's recommendation, to provide the best possible, most economical performance and mechanical solutions that meet or exceed specified application data:

Tank I.D.	SBR Tanks
No. of tanks:	2
Phase/Voltage/Hz:	3ph/460V/60Hz
Maximum propeller RPM:	900
Propeller diameter, inches:	13
No. of propeller blades:	2
Propeller material:	316 Stainless steel
FLA, Amps:	6.0
Maximum weight, lbs.:	150

D. Decanter Assembly:

1. Furnish one (1) new mechanical floating decanter and related equipment accessories as described herein for each basin. Each decanter shall be capable of chasing the sludge blanket; be solids excluding to minimize entrance of mixed liquor into the decanter during the SBR aeration and mixing stages; and be designed with submerged supernatant inlet to minimize induction of scum and floatable solids. Two positive means of sealing the decanter shall be provided. Each decanter shall be capable of withdrawing decant fluid from 4-6 inches beneath the liquid surface, regardless of liquid depth, down to the minimum allowable water level specified below.
   a. Maximum allowable water level in the basin during normal operation is 14 ft.
   b. Maximum allowable water level in the basin during occasional storm flow event 16 ft.
   c. Minimum allowable water level in the basin is 10.5 ft.
   d. The decant pipe must be located 1 ft. below the LWL by the installing contractor.
   e. Each decanter shall be rated for an average flow of 211 gallons per minute.

2. The weir shall include vortex control baffles permanently affixed to the weir. The weir shall be attached to the actuator through a single shaft or linkage which shall also function as the torque restraint. The actuator shall be capable of operating with a closing force of 1,500 lbs. and shall operate from a 115-volt, single phase, 60 hertz power source. Adjustable limit switches shall be included to permit adjustment of the weir opening. A corrosion-resistant removable cover shall be included to provide protection to the actuator and motor during normal operation. The power section is 304 stainless steel. #14 AWG ten-conductor power cable shall be provided from the NEMA 4X junction box of the unit to the basin wall. Supply of junction box/disconnect at the basin wall shall be the responsibility of the installing contractor.

3. Each unit shall be equipped with a modular float filled with closed cell polyurethane foam having a minimum 2.0 lbs./ft3 density. Float shall be completely sealed to prevent the foam from being in contact with the external environment. Float shall have adequate reserve buoyancy as specified within this Section to ensure stability and to provide support flotation required during decanter servicing. A urethane type seal shall be molded into the bottom of the float assembly to receive the decanter weir.
4. Each decanter shall include a discharge hose of sufficient size to permit vertical movement of the decanter and provide sufficient capacity to handle the design decant flow rate. Discharge hose shall be an EPDM tube, tire chord braided with helix wire reinforcement. A flanged end 90-degree elbow shall be provided. Proper flanged connections to the decanter and the discharge point shall be provided for trouble free operation while permitting a means for disconnecting for service. Through-the-wall pipe, gaskets, and hardware beyond the 90-degree elbow shall be provided by the installing contractor. The installing contractor shall provide a ¾" valve with hose bib connection on the decant line between the decanter and the decant valve.
5. Each decanter shall include a restraint and support system to secure the decanter in its designate location within the basin and to support the decanter when the basin is empty. Furnished as part of the decanter assembly shall be a mooring frame, which shall permit the assembly to move up and down following the change in liquid level while restrained within the vertical pylons.
6. Each decanter shall be moored with a restrained mooring system consisting of vertical pylon(s) with base plate and/or supports as specified above. Each pylon/support with base plate shall be attached to the basin floor and filled with concrete by the installing contractor. Mooring post supports, if specified within this Section shall be provided for attachment to the basin wall by the installing contractor. The restrained and support system shall be construction of 304 stainless steel or hot-dip galvanize after fabrication.
7. Furnish one (1), 6" diameter electrically operated butterfly valve for each basin to control the decant rate. The modulating valve shall be controlled by the SBR control panel PLC. The valves and the electric valve actuator shall be provided in accordance with these Specifications, and rated for modulating service. Valve actuator shall include motor winding protection, manual override, and limit switch feedback in the open and closed position. Field wiring and junction/box disconnect shall be provided by the installing contractor. Systems not including decant valves are not acceptable.

E. Retrievable Fine Bubble Air Diffuser Assemblies

1. The aeration system shall be a fine bubble diffused air system and shall be a retrievable configuration as shown on the contract drawings. Each assembly shall consist of membrane tube diffusers, frame assembly, manifold, track/beam, isolation valves, and lifting mechanism. The aeration system shall be designed to provide oxygen distribution to the entire basin. Duplex diffuser tubes total that specified herein shall be provided for each diffuser rack. No change in the basin geometry shall be allowed. The velocity and mixing in the basin shall be sufficient to ensure complete biological solids suspension and dispersion.

2. The aeration system for the aeration basins shall be capable of providing mixing such that when operated under any combination of the specified design conditions it shall suspend all biological floc and mixed liquor suspended solids throughout the liquid mass in each basin. The aeration system shall further be capable of maintaining complete aerobic conditions and suspension of all biological floc and suspended solids throughout the liquid mass in each basin. The aeration system shall be designed to operate within a minimum of 10.5 feet and a maximum of 14 feet side water. depth and shall be capable of transferring a minimum of 36.4 lbs/hr of process oxygen (A.O.R.) into the wastewater.

3. In addition, the aeration system shall be designed to transfer the following minimum amount of oxygen per day at standard conditions in clean water, at the specified submergence, air rate, and pressure.

Minimum Air Rate (scfm per basin)	269
Pressure @ Top of Drop Pipe (psig)	7.85
Diffuser Submergence (ft.)	13.45
Maximum Diffuser Rack Size	16 Duplex tubes

4. Air diffuser assemblies shall be of the tubular, non-clog, non-buoyant. fine bubble type with a flexible perforated air release membrane. The diffuser membrane shall be constructed from EPDM rubber and be suitable for continuous or intermittent aeration. Each membrane shall be held in place by 304 stainless steel band clamps. The membrane shall include UV inhibitor and compounds designed for resistance to chemical attack, weathering, fatigue, and aging. The diffuser assemblies shall have double backflow prevention to prevent liquid from passing into the aeration header. The membrane exterior surface shall be smooth as to inhibit biological film growth. The membrane shall inflate during aeration and deflate when the airflow is discontinued, further restricting biological film growth. The membrane shall be cleanable in place with water from a high-pressure wash. Each diffuser membrane shall be supported over its' full length and circumference by a support tube.

5. Each assembly shall include a diffuser hoist assembly with base socket to receive a portable electric winch. A total of one (1) portable electric winch shall be provided for the diffuser assemblies. The winch mechanism shall be of sufficient design capacity to raise the diffuser rack assembly to the servicing position. The portable electric winch shall operate from a single phase, electrical supply. The winch shall be provided with a total of 12 feet of electrical cable. Supply of electrical power supply, wiring and junction box for winch shall be the responsibility of the installing contractor. The lifting mechanism shall consist of a hoist, guide wheels, stainless steel sheave with bronze bushing, and 304 stainless steel lifting cable. The lifting mechanism shall be of sufficient design capacity to raise the diffuser rack assembly to the servicing position. In addition, the mechanism shall be designed to allow the diffuser rack to be pivoted 360° when in the service position for ease of diffuser inspection and servicing.

6. Each diffuser assembly shall include a 3" diameter wire reinforced EPDM flexible air line and a 3" diameter manually operated isolation butterfly valve with quick disconnect end fittings, and a threaded flange, elbow and quick disconnect adapters. All air distribution piping, gaskets, and hardware beyond the threaded flange shall be supplied by the installing contractor. The vertical track/beam shall support the lifting mechanism assembly during operation and servicing. The valves shall be provided in accordance with these Specifications. Routing the air header to the basins and anchoring the diffuser assemblies to the basin shall be the responsibility of the installing contractor.

F. Fixed Coarse Bubble Diffuser System

1. The aeration system for the Digester shall be a coarse bubble diffused air system and shall be a fixed configuration as shown on the contract drawings.

   Airflow per basin: 113 SCFM
   Riser Pipe Diameter: 3 inches
   Diffuser Material: Schedule 80 PVC

2. Furnish one (1) fixed coarse bubble diffuser system for the digester basin. The diffuser system shall consist of diffusers, supports, manifold, and riser pipe. Diffuser pipes shall be not less than three-inch nominal diameter. Each diffuser section shall be supplied with uniformly-spaced machined orifices located on the top of each section. Size and number of orifices shall be provided to ensure a uniform air distribution.

3. Each diffuser section (and manifold pipe) shall be supported at span lengths not greater than 6 feet by supports. No unsupported end shall be longer than 2 ft. Diffuser sections shall be secured to the supports with a corrosion resistant retainer. Support brackets shall be adjustable to provide header leveling within ± 1/4 inch of a fixed elevation for each aeration basin.

4. Diffuser system shall be field assembled by the installing contractor. All submerged PVC joints 8" and smaller shall be socket welded joints. Expansion joints shall be included to compensate for thermal expansion for PVC manifold runs longer than 40 feet. Pipe sizing, location and supports shall be as shown on the drawings. Diffuser sections and internal manifold piping shall have flange connections for disassembly. The riser pipe shall terminate in a flanged connection at the top of the basin wall. All piping, gaskets, and hardware beyond the riser pipe's flanged connection shall be the provided by the installing contractor. Attachment to the basin shall be the responsibility of the installing contractor

G. Blowers

1. Furnish three phase rotary lobe type, positive displacement blowers as described below with premium efficient, T.E.F.C., Class F insulation, Teco, Siemens, or equal motor. The blowers shall be manifolded for individual and/or combined operation. Blowers shall be suitable for operation under the following site conditions:

Elevation:	5,066 Ft. A.S.L.	**Process Gas:**	Air
Ambient Pressure:	13 PSIA	**K-Value:**	1.4
Design Ambient Temp.:	100F	**Specific Gravity:**	1.0
Inlet Pressure:	12 PSIA	**Allowable Blower Package Noise:**	75 dB(A) @ 1-Meter
Inlet Temperature:	100F	**Supply Voltage:**	460 VAC

Blower Quantity:	4
Motor Size:	20 HP (SBR Aeration) (3) 7.5 HP (Digester) (1)
Blower Airflow Rate:	269 SCFM (SBR Aeration) 113 SCFM (Digester)
Discharge Pressure:	7.63 PSIG (SBR Aeration) 6.63 PSIG (Digester)
Discharge Isolation Valve Size:	3 inches (SBR Aeration) 2 inches (Digester)
VFD Control:	Yes (SBR Aeration) No (Digester)

2. Each blower assembly shall be complete and mounted on a base weldment with four corner anti-vibration mountings, designed for direct application on a concrete slab or other solid foundation. Each assembly shall be suitable for shipment as a complete unit, factory assembled (less discharge pipe fittings) as much as possible to facilitate shipping and handling. Equipment shall include a blower, electric motor, belts and sheaves, inlet package, discharge silencer, discharge check valve, rubber inlet sleeve and discharge connection, pressure relief valve, butterfly discharge isolation valve, discharge pressure gauge, and rubber expansion joint. A personnel protection guard shall be included over the belts and sheaves.

3. A sound enclosure shall be provided for each blower package to help reduce the resultant noise level. The sound enclosure shall encompass the entire blower package for maximum noise attenuation. The enclosure shall be constructed of durable powder coated carbon steel with a sound absorbing internal surface. The walls and ceilings shall be shop assembled with all corners and joints properly insulated to prevent noise leakage and maintain the attenuation levels of the room. The blower package and sound enclosure shall ship as a unitized one-piece assembly. Maintenance access doors shall be provided to facilitate servicing of the blower package. A baffled inlet shall be provided to allow supply and cooling air to enter the enclosure during the operation of the blower. An exhaust fan sized for proper enclosure ventilation will be supplied.

4. Furnish two (2) electrically actuated butterfly valve(s) as shown on the plans to direct the blower airflow to the appropriate basin. The valves shall be provided in accordance with these Specifications. Provisions for valve access shall be provided by the installing contractor.

H. Sludge Wasting Pump

1. Furnish one (1) submersible non-clog pump for each basin as specified herein. Each pump shall be equipped with a submersible electrical motor connected for three phase operation. Pump housing shall be painted cast iron. Pump shall include an adequate length of multi-conductor chloroprene jacketed type SPC cable suitable for submersible pump applications. The power cable shall also be sized according to NEC and ICEA standards. The pump shall be supplied with a mating cast iron discharge elbow. Each unit shall be fitted with an adequate length of steel lifting chain of adequate strength to permit raising and lowering the pump.

Quantity:	1 per basin
Pump Function:	Sludge
Motor Size:	1.8 HP
Pump Flow Rate:	20 GPM @ 15 ft TDH
Discharge Size:	2”

2. The pump shall be capable of handling raw, unscreened sewage. The discharge connection elbow shall be permanently installed with the discharge piping. The pump shall be automatically connected to the discharge connection elbow when lowered into place, and shall be easily removed for inspection or service. There shall be no need for personnel to enter the basin to service the pump. Sealing of the pumping unit to the discharge connection elbow shall be accomplished by a simple linear downward motion of the pump.

3. An upper guide bar bracket shall be provided with each pump. The entire weight of the pumping unit shall follow guide bars into the operating position and pressed tightly against the discharge connection elbow with metal-to-metal contact. The pump, with its appurtenances and cable, shall be capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 ft. Supply of all discharge piping, supports, gaskets, and hardware beyond the flanged connection specified above shall be the responsibility of the installing contractor. The pump shall be removed with the portable crane arm.

4. Each pump shall include a discharge check valve and plug valve to control the design transfer flow rate. The plug valve shall be a non-lubricated type with a port area of at least 80% of full pipe size in accordance with these Specifications. Valve(s) shall be provided loose for installation within the discharge piping by the installing contractor. Valve gaskets and hardware shall be supplied by the installing contractor. Field attachment of the pump to the basin shall be the responsibility of the installing contractor.

I. Post-EQ Flow Control Valve

Furnish one (1), 6" diameter electrically operated butterfly valve to control the effluent discharge rate. The modulating valve shall be controlled by the SBR control panel PLC. The valves and the electric valve actuator shall be provided in accordance with these Specifications, and rated for modulating service. Valve actuator shall include motor winding protection, manual override, and limit switch feedback in the open and closed position. Field wiring and junction/box disconnect shall be provided by the installing contractor. Systems not including decant valves are not acceptable.

J. Post-EQ Effluent Flow Meter

One effluent flow meter shall be provided to monitor the effluent discharge rate. The 6” electromagnetic flow meter shall be Krohne, Toshiba, or ENGINEER-approved equal. Output shall be 4-20 mA. The flow meter shall be provided loose to be installed and wired by the installing contractor.

K. Removable Crane Arm System

One portable crane arm assembly shall be provided to easily raise and lower all mixers and pumps within the SBR basin for installation and inspection. It shall consist of a crane arm with telescopic capabilities, rotatable at 360º, a hand winch with brake for load control with stainless steel wire, a hook, and an intermediate piece. The assembly shall be positioned directly into the guide pipe receptacle. All crane base guides shall be located so that multiple pieces of equipment can be removed from a single base.

L. Dissolved Oxygen Controller

Furnish one (1) dissolve oxygen controller per basin (ABB AWT440 or approved equal). The controller shall receive the digital input from a maximum of two devices. The controller will communicate with the main PLC via 4-20 mA signals. The controller will have a NEMA 4X/IP66 metal enclosure with a corrosion-resistant finish and shall be AC powered from a 100-230VAC, 60Hz power source.

M. Dissolved Oxygen Sensors

Furnish one (1) dissolved oxygen sensor per basin (Aztec ADS420 or approved equal). The probe shall be a continuous-reading probe utilizing luminescent sensor technology, and shall provide electrolyte-free operation without requiring sample conditioning. Sensors shall be suspended on a removable mounting pipe assembly. 304 stainless steel pipe, 304 stainless supports and 304 stainless steel anchors shall be provided. Field attachment of the pipe and supports to the basin shall be the responsibility of the installing contractor. Field wiring, conduit, and installation of cable shall be the responsibility of the installing contractor.

N. Pressure Transducer

Furnish one (1) submersible pressure transducer unit constructed of stainless steel for each basin (Keller Levelrat or ENGINEER-approved equal). Transducer shall utilize a diffused silicone semiconductor sensor protected by an integral stainless-steel diaphragm with seal fluid. Transducer output shall be a 4-20 mA signal. Electrical connection shall be 2-wire, loop powered through a shielded integral cable comprised of 22 AWG conductors and separate drain wire. Transducers shall be suspended on a removable mounting pipe assembly. 304 stainless steel pipe, 304 stainless supports and 304 stainless steel anchors shall be provided. Field attachment of the pipe and supports to the basin shall be the responsibility of the installing contractor. A moisture excluding aneroid bellows shall be supplied loose for installation in the junction box/ disconnect. Attachment and supply of the junction box/disconnect at the basin wall shall be the responsibility of the installing contractor.

O. Level Sensors

Furnish one (1) level sensor assembly consisting of a float switch with a smooth, chemical resistant polypropylene casing, and 316 stainless steel mounting brackets for each basin (Anchor Scientific model GSI 40NONC or approved equal). Each float switch shall be provided with a three-conductor electrical cable. Electrical cable shall terminate at a junction box/disconnect located at the basin wall. Field wiring and junction box/disconnect shall be provided by the installing contractor. Adhesive anchors of 304 stainless steel shall be provided for anchoring the level sensor mounting bracket.

P. SBR Control Panel with Motor Starters

1. The control system (i.e., SBR PLC) shall be designed to optimize the SBR process while minimizing operator attention and to accommodate the continuous maximum daily flow without adjusting cycle structures. The SBR PLC shall be programmed to accept and/or control other field instruments and equipment for the proper function of the entire WWTP. The control software program shall be factory tested prior to installation at the jobsite.

2. The control system shall have a timer-based system with level overrides and shall provide control, sequence, monitoring, and alarm annunciation capabilities. The operator shall be able to access the timer values and set points through the operator interface panel to allow for adjustment of cycle times and system flexibility. The control system shall be designed to automatically accommodate the plant's full range of loads and flows.

3. A complete control system for the WWTP shall be provided as described in the following and as shown on the contract drawings and these specifications. The control system shall include a circuit breaker disconnect, control transformer, branch protection, motor starters, microprocessor control, indicator lights, HAND-OFF-AUTOMATIC selector switches.
4. The incoming service of the control system shall be 460 volt, 60 hertz, three-phase. Motor starters for the equipment listed below shall be provided within the SBR control panel. Elapsed time indication shall be provided through (the operator interface of) (hard-wired elapsed time meters located within) the SBR control panel for equipment indicated by an asterisk (*). The list below shows the control requirements for the different treatment process within the SBR PLC. This list is not all inclusive, refer to the Contract Documents for all control requirements.

(Table on next page)

SBR EQUIPMENT DESCRIPTION

2 3.6 HP Mixer(s)*
2 2 HP Sludge Pump(s)*
3 20 HP Blowers*
2 Influent Valve(s)
2 Decanter Valve(s)
2 Air Control Valves
2 4-20 mA D.O. signal(s)
2 4-20 mA Pressure Transducer(s)
2 Level Sensors
2 Common Alarm

HEADWORKS EQUIPMENT DESCRIPTION

1 Common Alarm

DIGESTER EQUIPMENT DESCRIPTION

1 7.5 HP Blower(s)*
1 4-20 mA Pressure Transducer(s)
1 Level Sensors

POST-EQ EQUIPMENT DESCRIPTION

1 4-20 mA Flowmeter(s)
1 4-20 mA Pressure Transducer(s)
1 Level Sensor
1 Effluent Valve

DEWATERING EQUIPMENT DESCRIPTION

1 Common Alarm

DRYING BED LIFT STATION EQUIPMENT DESCRIPTION

1 Common Alarm

OVERFLOW LIFT STATION EQUIPMENT DESCRIPTION

1 Common Alarm

GENERATOR PAD EQUIPMENT DESCRIPTION

1 Generator Status (Running/ Off/ Auto)
1 Automatic Transfer Switch Position
1 Low Fuel Alarm
1 Fail Alarm

Q. Enclosure

1. The automatic controls shall be provided in a UL listed, NEMA Type 4X 304 stainless steel (12 gauge) floor mount enclosure that provides insulation and protection for electrical controls and components from highly corrosive environments indoors and outdoors. Enclosure shall include a seamless foam-in-place gasket to assure watertight and dust-tight seal. An internal 3-point latch and 316SS padlocking handle shall be provided. Enclosures shall be unpainted, with a smooth brushed finish. Enclosure shall include a painted white mild steel (12 gauge) sub-panel mounted with collar studs. The control enclosure shall be mounted remotely in the operations building.

2. Each control enclosure assembly shall be provided with corrosion inhibitors to protect interior electrical components from damage caused by high humidity. The corrosion inhibitors shall be installed prior to shipment to provide protection during shipment and storage of the enclosure.
3. A thermostat-controlled air conditioner with noise suppression shall be supplied to protect control components mounted inside the enclosure from high temperatures, humidity, and ambient air contaminants. The air conditioner shall be constructed of brushed finish stainless steel 304 material and provide NEMA 4X Type protection from outdoor and hose-down applications. The air conditioner unit shall use CFC-free or environmentally safe refrigerant that is universally accepted.
4. A UL listed, automatic molded case 3-pole disconnect breaker shall be provided in the control enclosure(s). The primary function of the disconnect switch shall be to provide a means to manually open a circuit and automatically open a circuit under overload or short circuit conditions. The disconnect breaker shall have a door mounted operating mechanism with trip indication. Power distribution connectors shall be mounted integrally to the circuit breaker for multiple load connections. Integral connectors shall be provided.

R. Control Panel Wiring and Assembly

1. All Control panels shall be UL certified. Testing by manufacturer's electrical engineering prior to releasing for shipment shall be completed. Testing shall consist of the following:
   - Point to point testing of all wiring prior to application of power
   - Intended supply voltage shall be applied to the enclosure
   - All components shall be tested for proper operation and calibration
   - The PLC and operator interface program shall be loaded and functionally checked
   - All components shall be checked to confirm proper mounting specifications have been followed
   - Enclosure shall be inspected for defects and repaired if necessary
   - All labeling of wires and devices are correct, properly installed and clean
2. The manufacturer shall finalize the factory checkout by completing a control panel checklist to document all testing completed above. Upon the successful completion of the control testing of the enclosure assembly, all applicable documentation (i.e. finalized drawing set, signed control checklist cover page, device data sheets, etc.) shall be placed in the drawing pocket of the enclosure.
3. All control enclosures shall be custom assembled and wired in an Underwriters Laboratories (UL) certified cabinet shop using quality materials and labor. Short circuit rating of control enclosure shall be 5 kA RMS symmetrical @ 480VAC maximum. All control panel single conductor wire shall be 16 AWG multi-strand machine tool wire (MTW) minimum, with PVC insulation. Wire colors are as follows: (next page)

208 VAC or higher	-	Black
120 VAC control power	-	Red
Neutral	-	White
Ground	-	Green with Yellow Stripe
Power from remote source	-	Orange
Neutral from remote source	-	White with Orange Stripe
24 VDC (+)	-	Blue
24 VDC (-)	-	White with Blue Stripe
Intrinsically Safe	-	Light Blue

4. All wires shall be clearly marked with an identification number consistent with the wiring schematic drawing. Wire markers shall be a thermal transfer printable type. The material shall be a self-laminating vinyl. Labels shall be Brady THT-9-427-10 or ENGINEER-approved equal. Wiring inside the control panel shall be run in PVC wiring duct rated for continuous temperatures up to 122°F (50°C). Devices mounted in the enclosure door shall have wires run in spiral wrap to avoid pinch points when opening and closing the door. Control components mounted internal and external to the enclosure shall be mounted with stainless steel hardware and clearly labeled with a plastic identification nametag. The tag shall be white with black lettering.

S. Motor Starter(s)

1. A full voltage non-reversing Integrated Motor Starter-Controller shall be provided for motor applications up to 15 kW. Each starter shall provide control, protection, and monitoring functions for the motor. The starter shall be NEMA rated IEC form factor and shall have certifications according to UL and CSA standards and shall bear the CE marking. The starter shall have a maximum rated operational voltage of 690V and provide a 42kA @ 480 VAC rated breaking capacity on short circuit. The starter shall have a mechanical durability of 15 million operations. The starter shall provide short circuit trip, thermal overload trip with selectable tripping class, under current trip and phase imbalance trip.

2. A full voltage non-reversing NEMA Style motor starter shall be provided for motor applications over 15 kW. Each starter shall consist of a circuit breaker, contactor, and overload relay. The starter shall be NEMA rated and shall have certifications according to UL and CSA standards and shall bear the CE marking. The starter shall have a maximum rated operational voltage of 600V and provide a minimum 18 kA @ 480VAC and 25 kA @ 240 VAC interrupt rating on short circuit when used in combination with a PowerPact circuit breaker. The starter shall have a mechanical durability of 2 million operations. The solid-state overload relay shall have class 10/20 (selectable) tripping characteristics with trip current adjustment, phase loss and unbalance protection.

T. Variable Frequency Drive(s)

UL Listed Variable Frequency Drives (VFD) shall be provided to control pumps and/or blowers. The VFD's shall control pump and/or blower speed via an analog signal from the PLC. The VFD output frequency shall be programmable. The VFD shall be provided in a NEMA Type 20 panel mount package and rated for an operating temperature of -4° to 122°F (-20° to 50°C). The VFD shall have a 65-kA maximum short circuit rating.

U. Transformer

A step-down multi-tap transformer shall be supplied when there is a necessity to reduce incoming 3-phase power to 120 VAC single-phase. The transformer power wire connections (incoming and outgoing) shall be protected with a finger-safe cover to protect against accidental contact. Primary and secondary fuse protection shall be provided. Transformer shall be UL listed and of continuous wound construction with vacuum

impregnated with non-hygroscopic thermosetting varnish. Transformer shall be Square D 9070T or approved equal.

V. Transformer Primary and Secondary Fuse

Properly rated fuses and fuse blocks shall be provided for primary and secondary protection of the transformer. Each fuse shall be equipped with a thermoplastic cover to protect against accidental contact. Clip style fuse block shall be rated up to 600 VAC and 100 amps, dual element, time delay fuses shall be rated up to 600 VAC. Fuse blocks and fuses shall be UL listed. Fuses shall be Littelfuse Class CC or ENGINEER-approved equal. Fuse blocks and fuse covers shall be manufactured by Marathon or ENGINEER-approved equal.

W. Circuit Breaker

All single-phase branch or supplementary circuits shall be protected with a single-pole, C-Curve rated circuit breaker. Circuit breakers shall be rated for 240 VAC maximum, 50/60 Hz and UL 489 listed. Supplementary and branch protection circuit breakers shall be Merlin Gerin Multi 9 or ENGINEER-approved equal.

X. Fuse

Properly rated fuses and fuse holders shall be provided for protection of individual control devices (discrete and analog signals) mounted outside of the enclosure. Each fuse shall be housed in a hinged type fuse block to protect against contact with the fuse. Fuses shall be rated up to 250 VAC and be Littelfuse or approved equal. Fuse holders for discrete devices shall be rated to 600 VAC and 30 Amps. Fuse holders for analog devices shall be rated to 300 VAC and 15 Amps. Fuse holders shall be Allen Bradley 1492 or ENGINEER-approved equal.

Y. Operator Device

1. Operator devices (pushbuttons and selector switches) shall be mounted through the control enclosure door for all automatic controlled equipment. Transformer type pilot lights and illuminated pushbuttons shall be provided for indication of an operation status. Lights shall be a 6 VAC incandescent type lamp. Color coding shall be applied as required and is as follows:
   - Amber – Alarm active, caution
   - Green – Valve open, motor running
   - Red – Valve closed
   - White - Information
2. All operator devices shall be UL Listed, 30.5mm style, NEMA Type 4X rated, oil and water tight with finger safe guards located on the contact blocks to prevent accidental contact with wire connections. Operator device function shall be identified with an engraved white Gravoply nameplate with black letters. Operator devices shall be Square D 9001 or approved equal.

Z. High Frequency Noise Filter

A UL listed active tracking filter shall be provided to protect the PLC and HMI power feeds from high-frequency noise and low-energy transients. It shall be designed for a single-phase input voltage of 120VAC operating at 50/60 Hz. The unit shall provide surge capacity of 25,000 amps and provide transient protection in all modes (Line to neutral, line to ground and neutral to ground).

AA. Ground Fault Duplex Receptacle

A UL listed ground fault circuit interrupter (GFCI) duplex receptacle shall be provided within the panel for instrument (e.g. programming terminal, modem, etc.) use only. The receptacle shall be protected with a 5 Amp circuit breaker. The receptacle shall carry a 20A / 120VAC rating. The electro-mechanical circuit interrupter shall be double-pole and trip free (GFCI protection and shall not be overridden by holding reset button). Built-in transient suppression shall protect GFCI's internal circuitry from voltage transients.

BB. 24 Volt DC Power Supply

A UL listed, industrial grade, compact power supply shall be supplied to provide 24 VDC power to such rated components. The power supply shall be DIN rail mounted and functional with input voltage of 100 to 240 VAC (single-phase) incoming control power. The power supply shall have a green LED which shall be illuminated when output voltage is "OK".

CC. Device Surge Protective Device

A UL Recognized surge protective device shall be provided to protect electronic circuits from high voltage transients and temporary overloads on power and signal lines.

DD. Control Relay

UL listed control relays for general control purposes shall be supplied with a pilot light to indicate when the coil is in an energized state. The relay socket shall be panel or DIN rail mounted inside the enclosure. The relays shall provide the following ratings: 120VAC coil, 10A contact rating (thermal), 250 VAC insulation rating and 5 million mechanical life cycles.

EE. Terminal Block

Standard feed-through screw terminal blocks, DIN rail mounted, shall be supplied for all point to point wiring connections. All terminals shall be numbered per the wiring schematic with printed markers. Terminals shall carry a 600V AC/DC voltage rating.

FF. Auto Dialer

The auto dialer shall be a solid-state component capable of dialing up to 16 phone numbers and shall be housed in a NEMA Type 12 rated enclosure. Phone numbers shall be programmed via the system's keyboard or Touch Tone phone. The unit shall continuously monitor the presence of AC power and the status of four contact closure inputs. Upon initiating an alarm phone call, the system is to "speak" only those channels that are currently in "alarm status". The unit shall optionally be field upgradeable to incorporate a total of 8, 16, 24, or 32 digital alarm inputs. The auto dialer is to use a standard rotary pulse or Touch Tone "dial-up" phone line. The auto dialer shall be an RACO Verbatim® or approved equal.

GG. Programmable Logic Controller

Automatic operation of the SBR shall be controlled through a programmable logic controller (PLC) mounted inside the main control panel. The PLC components shall consist of a power supply, CPU, discrete input and output modules and analog input and output modules. The processor unit shall include built-in USB and two (2) Ethernet IP communication ports. All input and output points supplied (including unused) shall be wired to terminal blocks. Processor design characteristics shall include: 1.0MB user memory size, real-time clock and calendar, battery backed RAM and an operating temperature range between 32°F and 140°F. The PLC processor shall be an Allen-Bradley CompactLogix 1769-L30ER or ENGINEER-approved equal.

HH. PLC Power Supply

Input voltage range of 85-265 / 170-265 VAC, 47-63 Hz, maximum inrush current of 30 amps, backplane output current of 4 amps @ 5V or 2 amps @ 24V, internal fuse protection, ambient operating temperature of 32°F to 140°F, Class I, Division 2 hazardous location certified, UL Listed.

II. Discrete Input Module

Operating voltage of 79 to 132 VAC at 47 to 63 Hz, backplane current draw at 5VDC = 115mA, off-state current 2.5mA maximum, maximum inrush current 250mA, LED status indication of each point, ambient operating temperature of 32°F to 140°F, UL Listed.

JJ. Discrete Output Module

Operating voltage of 5 to 265 VAC at 47 to 63 Hz / 5 to 125 VDC, backplane current draw at 5 VDC = 205 mA, at 24VDC = 180mA, off-state current leakage is 1.0mA, LED status indication of each point, ambient operating temperature of 32°F to 140°F, UL Listed.

KK. Analog Input Module

Backplane current draw at 5 VDC = 120mA, at 24VDC = 70mA, LED status indication of each point, ambient operating temperature of 32°F to 140°F, UL Listed.

LL. Analog Output Module

Backplane current draw at 5 VDC = 120mA, at 24VDC = 170mA, LED status indication of each point, ambient operating temperature of 32°F to 140°F, UL Listed.

MM. Ethernet Switch

An unmanaged Ethernet switch shall be provided inside the control enclosure to provide connectivity between the PLC, operator interface and plant networking. The switch shall support both 10 and 100 Mbit/s operation. The switch shall have five (5) 10/100Base-T ports with RJ-45 sockets and shall support auto-crossing, auto-negotiation, and auto-polarity. Maximum distance between devices shall be 100m. The unit shall be DIN rail mounted and require 24VDC power. Diagnostic LEDs for power and connection status shall be included.

NN. Remote Ethernet Access Gateway

A UL marked, remote access VPN gateway shall be supplied to securely connect to a PLC via the Internet using an Ethernet port and a secure VPN tunnel. The gateway can be DIN rail or wall screw mounting and shall provide WAN/LAN 10/100 Mb Ethernet ports.

OO. Human Machine Interface

The operator interface shall be a NEMA Type 12, 13, 4X rated, 6.5” diagonal, color touchscreen display with Ethernet and serial communications. The interface shall be a liquid crystal display (LCD). The display type shall be color active matrix thin-film transistor (TFT) with 640 x 480-pixel resolution. The rated operating temperature shall be 32° to 131°F (0° to 55°C). The operator interface shall be an Allen Bradley PanelView Plus 7 series A with VNC enabled for remote viewing and control

PART 3 - EXECUTION

3.01 FINAL ACCEPTANCE

A. After installation of the system and checkout by the OWNER, ENGINEER and the SBR Manufacturer, a controls certification test shall be performed per the agreed upon testing protocol, shown below. This protocol will test the operation of the entire WWTP control network and SCADA System, and provide confirmation that they will perform as required. This testing will be accomplished with the aid of simulation software and real-world operation to demonstrate the operation of the system in all modes. A copy of this testing protocol shall be provided to the ENGINEER and the OWNER a minimum of two weeks prior to the test. The test shall be completed per the protocol. Any defects or problems will be addressed and a timeframe to resolve the problem will be identified. The operational demonstration shall confirm the SBR control system, alarms and status are functioning as specified. If additional time or tests are needed due to improper function of the SBR control system or equipment provided by the SBR Manufacturer, the SBR Manufacturer shall correct the defects or problems at no cost/fee to the OWNER.

B. The Controls System will be tested during the SBR Manufacturer field service representative's startup trip, and will be performed by the SBR Manufacturer field service representative. The Engineer, Installing Contractor and the Owner shall have the right to witness the test.

Protocol:

The controls field performance test shall be performed by the SBR Manufacturer Systems' field service representative as follows:

1. Confirm that all leads are connected to the proper terminals.
2. Verify that the PLC battery is installed. If memory module is required, confirm installation and setup.
3. Verify operation of input devices through PLC including spares.
4. Verify analog inputs and outputs have been simulated and verified in the PLC.
5. Verify Operation of output devices through PLC
6. Verify all PLC/Module software is setup correctly
7. Program operates correctly when PLC is placed in "Run" mode
8. Check the HMI to verify that each input and reading is correct. This test shall be performed on each screen and will confirm that the input addresses are correct.
9. Check communication between PLC and other vendor PLCs
10. Check communication between PLC and SCADA system
11. Verify SCADA input, readings, and addresses are correct. This test shall be performed on each graphical screen.

The Next steps will be accomplished by utilizing an operational simulator and speeding up the actual times of each phase to mimic true operation of the system.

12. Verify operation of Mix-Fill phase.
    - End of Decant phase interval initiate
    - Cycle reset initiate
    - Verify equipment states are correct throughout the cycle

13. Verify operation of React-Fill phase.
    - End of Mix-Fill phase interval initiate
    - Verify equipment states are correct throughout the cycle
14. Verify operation of React phase.
    - End of React-Fill phase interval initiate
    - Verify equipment states are correct throughout the cycle
15. Verify operation of Settle phase.
    - End of React phase interval initiate
    - Verify equipment states are correct throughout the cycle
16. Verify operation of Decant phase.
    - End of Settle phase interval initiate
    - Verify idle with end decant level input actuation
    - Verify equipment states are correct throughout the cycle
17. Verify operation of Sludge Waste sequence.
    - Applied at end of Decant phase
    - Verify sludge waste phase disables with digester high level alarm (If applicable)
    - Verify equipment states are correct throughout the cycle
18. Verify operation of Storm Mode.
    - Verify storm mode operation in each SBR mode (single, dual, etc.)
    - Verify equipment states are correct throughout the cycle
19. Verify operation of batch reactor blowers/aerators.
    - Timing cycle
    - D.O. mode (if applicable)
20. Verify operation of Auxiliary systems and components.
    - Post Equalization Basin
    - Aerobic Digester
    - Bar Screens
    - Bagger Dewatering Equipment
    - Etc.
21. Verify elapsed time meters function and can be individually reset.
    - Blower(s) run time
    - Sludge pump(s) run time
    - Mixer(s) run time
    - Auxiliary motors run time
22. Verify alarm acknowledge and reset for all conditions. Detailed alarm list is included in the control description.
23. Verify settings of all default values. See the control description.
24. Verify Power cycle does not affect modified values under normal conditions and resets defaults when battery is low or operator requests it.
25. Verify all safety and wiring channels covers are in place.
26. Verify all wiring connections are secure and tight.

27. Verify panel is free of debris and clean
28. Errors or alarms caused by equipment not supplied by SBR Manufacturer shall not affect the pass/fail results of the SBR Manufacturer Control Panel.
29. The equipment is installed, operated, and maintained in full accordance with instructions provided by SBR Manufacturer in the Operation and Maintenance Manual
30. The equipment has been paid for in full in accordance with the terms of the contract.
31. The controls testing requirement shall no longer be applicable or valid if any product supplied by SBR Manufacturer is modified or altered without the written approval of SBR Manufacturer, including any software program.
32. In the event of failure of the equipment to complete the test as proposed above, SBR Manufacturer shall have the option to modify the equipment, programming, and controls as necessary to achieve the guaranteed performance testing. The maximum liability to SBR Manufacturer for the modification or supply of additional equipment shall be limited to 100% of the initial sales price of the equipment supplied.

C. Reporting of Results:

SBR manufacturer shall provide certification once any errors are corrected and the control system has passed the above field tests.

3.02 SPARE PARTS

A. Provide the OWNER with a list of the manufacturers' recommended spare parts.

END OF SECTION

SECTION 46 7600 – DEWATERING EQUIPMENT

PART 1 – GENERAL

1.01 THE REQUIREMENT

A. The Contractor shall furnish and install a new factory-built Sludge Bagger System, one (1) dry polymer mixing and dosing system, one (1) sludge feed pump, and one (1) local control panel, complete and operable with all necessary parts and accessories. The Sludge Bagger System shall have the capacity to receive 1,028 gallons per day of sludge at a maximum nominal feed concentration of 1.5% dry solids generated by a 90,000 GPD wastewater treatment plant.

B. Unless specifically indicated otherwise, the arrangement of equipment shown on the Drawings is based upon information available at the time of design and is not intended to show exact dimensions particular to a specific

1.02 The Manufacturer shall certify to not less than five (5) years of experience in the application, design, construction, and operation of Sludge Bagger Systems of the type specified in this Section. The Manufacturer shall produce a list of not less than ten (10) operating installations as evidence of meeting the experience requirement.

1.03 SUBMITTALS

A. Submittals shall be furnished in accordance with Section 01 3300 – Submittal Procedures.

1.04 OPERATION AND MAINTENANCE MANUALS

A. The Manufacturer shall provide Operation and Maintenance Manual hard copies and electronic version in PDF format for the Sludge Bagger System and all system components.

B. Operation and Maintenance Manuals shall be furnished in accordance with these Specifications.

1.05 QUALITY ASSURANCE

A. The Manufacturer(s) shall provide a 2-year equipment warranty.

1.06 SPARE PARTS

A. Manufacturer shall provide all spare parts anticipated to be required for the first 2 years of operation. Manufacturer shall clearly define quantity and description of part and associated part numbers as part of Manufacturer’s scope of supply.

B. Spare parts shall be placed in a separate container clearly marked as “Spare Parts.” All parts shall be identified and clearly labeled with applicable part numbers.

PART 2– PRODUCTS

2.01 GENERAL

A. The Sludge Bagger System and all components and accessories shall be designed for a covered outdoor service.

B. The Sludge Bagger System shall accommodate 8 bags during normal operation.

C. Throttling polymer dosage by use of valves is not acceptable.

2.02 POLYMER DOSING SYSTEM

A. Furnish and install one (1) polymer mixing unit designed to prepare, age, and feed dry type polymer.
   1. The polymer mixing unit shall include one (1) polymer mixing tank with stand, one (1) mixer, one (1) polymer feed pump, and one (1) static mixer assembly with polymer injection ring and distribution manifold.

B. The polymer mixing tank shall double as a polymer storage tank, and shall be 2'-4" diameter x 3'-6" sidewall height with a nominal 100 gal. working capacity. The tank shall be polyethylene construction and have a flat bottom and 1'-2" IPS half-coupling in the center bottom for discharge and drain.

C. The polymer mixer shall be portable clamp-mount propeller type with ¾" dia. Stainless steel shaft and single propeller designed to operate at 400 RPM. The mixer shall have a ¼ HP TEFC motor designed for 120-volt, single phase, 60 HZ service. The polymer mixer shall include an extension cord with ground and on-off toggle switch, operated from the control panel.

D. The tank stand shall be rigid stainless-steel construction and shall include a base on which the polymer fed pump shall be mounted. Supports for the clamp-mounted type mixer and control panel shall also be provided.

E. The polymer feed pump shall be a diaphragm-type capable of pumping water at a rate up to 4.8 GPM and shall be furnished with a TEFC 115-volt AC motor. Motor speed shall be controlled by an AC speed control unit mounted in the control panel. Pump wetted parts shall be reinforced nylon and EPDM elastomer.

F. The static mixing assembly shall be affixed to the outside of the polymer system and shall mix the polymer solution and sludge together. No piping shall be located inside the polymer tank. At the point of initial mixing, there shall be a polymer injection rink with four (4) polymer injection points for complete blending of polymer and sludge. Supplied with the injection ring shall be a polymer injection manifold with four (4) hoses to the polymer injection ring.

G. Acceptable Manufacturers:
   1. Prominent;
   2. Watson-Marlow Inc.;
   3. Or ENGINEER-approved equal.

2.03 SLUDGE FEED PUMP

A. The sludge feed pump shall be a rotary lobe type pump. The sludge feed pump shall be rated to deliver 20 GPM @ 40 ft TDH and designed to handle a 3/8" maximum particle size. Pump housing shall be cast iron.

B. The drive unit shall be a 3 HP TEFC NEMA motor designed to operate on 120-volt, single phase, 60 Hz service.

C. Acceptable Manufacturers:
   1. Boerger;
   2. LobePro;
   3. Or ENGINEER-approved equal.

2.04 SLUDGE DISTRIBUTION & BAGGING UNIT

A. The sludge distribution and bagging device shall be entirely 304 stainless steel construction. The frame shall be a minimum 1'-1/2" sq. tubing and the open-top plenum shall be a minimum 14 ga. sheet.

B. Funnels attached to the bottom side of the feed plenum shall be nominal 10” dia. and shall be provided with quick-opening clamps for the bag holders on each unit.

C. A quick-opening containment cage shall be provided for each bag. The cage shall be designed to allow free release of the filtrate while providing support for the bag.

D. The top of the plenum shall be covered to protect level proves and plenum walls and floor from rain and light exposure.

E. The plenum shall be provided with a 2” flange for connection of the sludge feed, a 3” connection for the PVC overflow pipe and mounting bracket for the level control system.

F. The plenum shall be provided with a floatless conductivity-type liquid level control system with PVC-coated stainless steel proves and C.I electrode holder mounted on an adjustable bracket.

G. A minimum 14 ga. 304 stainless steel filtrate collection pan shall be provided to collect and direct filtrate to a 3” plain end drain pipe.

H. Suitable stainless-steel members shall be provided to serve as supports for the bags and to permit the forks of the bag cart to be placed under each bag before the holder is opened.

I. Acceptable Manufacturers
   1. Envirodyne;
   2. Charter Machine Company;
   3. Or ENGINEER-approved equal.

2.05 SLUDGE BAGS

A. A quantity of 200 bags shall be provided along with the unit.

B. Each bag shall be nominal 22.5-gallon capacity made of porous synthetic material resistant to tears & breaks.

C. Bag ties and a spring-return ratchet twister shall be provided to close the bags after they have been filled with sludge.

D. Acceptable Manufacturers
   1. Envirodyne;
   2. Or ENGINEER-approved equal.

2.06 BAG CART

A. The bag cart shall be a dual wheel dolly designed with foot operated hydraulic fork lift arrangement to permit easy removal of filled bags from the dewatering unit.

B. Cart shall be carbon steel construction with epoxy paint finish.

C. Acceptable Manufacturers
   1. Envirodyne;
   2. Or ENGINEER-approved equal.

2.07 CONTROL PANEL

A. A single control panel integrating the Sludge Bagger System controls shall be furnished and installed at the dewatering area canopy and provided with a Unistrut support to be free standing from the other equipment or structures.

B. The control panel shall be NEMA 4X FRP enclosure, pre-assembled and pre-wired with terminal strips for connection of control wiring by others.

C. The panel shall be provided with a 480-volt, 3-phase, 60 HZ, 20-amp service.

D. The VENDOR shall provide a 120-volt, 1-phase, 60 HZ step-down transformer in accordance with UL & NEC requirements and shall have the appropriate label attached thereto.

E. The control panel shall include all necessary controls for operation of the Sludge Bagger System and shall provide for “manual/automatic” operation with interlocks and relays as required to automatically control the “failure” shutdowns.

F. All components of the panel shall be UL-listed and of heavy-duty industrial quality as manufactured by Hoffman, GE, Square D, Allen-Bradley, Siemens, or Engineer approved equal.

G. Signals:
   1. The control panel shall receive a signal from the SBR Control Panel when the Aerobic Digester begins wasting sludge. This signal shall initiate polymer mixing and dosing, and open any valves that regulate sludge distribution to the bagging system. The control panel need not send nor receive any other signals from other process areas.
   2. The control panel shall monitor and regulate the polymer dosing rate and all other local functions of the sludge bagging system, polymer system and sludge pump.

PART 3 – EXECUTION

3.01 MANUFACTURER’S SERVICES

A. Inspection, Startup, and Field Adjustment: The service representative of the Manufacturer shall be present at the Site to furnish the field services required as specified herein.

B. Services of the Manufacturer shall be in accordance with these Specifications.

C. Manufacturer shall define quantity of trips and days on site necessary to perform the specified services as a part of the Manufacturer’s scope of supply. Scope of supply shall be inclusive of travel and living expenses.

D. Upon completion of field services, the representative of the Manufacturer shall prepare and submit a report in accordance with the requirements of these Specifications.

3.02 INSTALLATION

A. Contractor shall install the equipment in accordance with installation requirements of these Specifications.

Re: Geotechnical Evaluation
Jerome WWTP Upgrades
Jerome, Arizona

Job No. 2522JW197

Western Technologies Inc. has completed the geotechnical evaluation for the waste water treatment plant upgrades and new wastewater pipeline to be located in Jerome, Arizona. This study was performed in general accordance with our proposal number 2522PW253 dated June 15, 2022. The results of our study, including the boring/test pit location diagrams, laboratory test results, boring/test pit logs, and the geotechnical recommendations are attached.

We have appreciated being of service to you in the geotechnical engineering phase of this project and are prepared to assist you during the construction phases as well. If design conditions change, or if you have any questions concerning this report or any of our testing, inspection, design and consulting services, please do not hesitate to contact us. We look forward to working with you on future projects.

Sincerely,
WESTERN TECHNOLOGIES, INC.
Geotechnical Engineering Services

GEOTECHNICAL EVALUATION
JEROME WWTP UPGRADES
JEROME, ARIZONA
JOB NO. 2522JW197

1.0 PURPOSE

This report contains the results of our geotechnical evaluation for the proposed WWTP upgrades and new wastewater pipeline to be located at the existing wastewater treatment plant in Jerome, Arizona. The purpose of these services is to provide information and recommendations regarding:

- foundation design parameters
- slab-on-grade
- lateral earth pressures
- excavation conditions
- earthwork, including backfill placement, and suitability of existing soils for backfill materials
- drainage
- corrosivity
- on-site aggregate surfacing

Results of the field exploration, field tests, and laboratory testing program are presented in the Appendices.

2.0 PROJECT DESCRIPTION

Based on the revised information provided by Ms. Andrea Jaycox, Senior Project Coordinator, the proposed project will consist of approximately 2,400 linear feet of wastewater line, a new SBR Package Plant, and new primary settling and headworks tanks. The structures will be concrete and/or masonry construction with slab-on-grade floors. Maximum wall and column loads for the structures are assumed to be 3 kips per linear foot and 45 kips, respectively. The wastewater line invert elevations will be a maximum of 10 feet below the lowest existing site grades. We anticipate no extraordinary slab-on-grade criteria and that the finished structure bottom levels will be within about 2 to 3 feet of the existing site grades. In addition, approximately 2,000 linear feet of the existing access road will be resurfaced, widened, and additional pull-outs will be constructed. Should any of our information or assumptions not be correct, we request that the Client notify WT immediately.

3.0 SCOPE OF SERVICES

3.1 Field Exploration

Seven test pits and six borings were excavated/hand-auger drilled to depths of about 1 to 8 feet below the existing site grades at the approximate locations shown on the attached test pit/boring location diagrams. In addition, two samples of on-site rock were obtained for unit weight and unconfined compressive strength testing.

Logs of the test pits/borings are presented in Appendix A. Subsoils encountered during excavating/drilling were examined visually and sampled at selected depth intervals. A field log was prepared for each test pit/boring. These logs contain visual classifications of the materials encountered during excavation/drilling as well as interpolation of the subsurface conditions between samples. Final logs, included in Appendix A, represent our interpretation of the field logs and include modifications based on laboratory observations and tests of the field samples.

The final logs describe the materials encountered, their thicknesses, and the locations where samples were obtained. The Unified Soil Classification System was used to classify soils. The soil classification symbols appear on the test pit/boring logs and are briefly described in Appendix A. Local and regional geologic characteristics were used to estimate the seismic design criteria.

3.2 Laboratory Analyses

Laboratory analyses were performed on representative samples to aid in material classification and to estimate pertinent engineering properties of the on-site materials for preparation of this report. Testing was performed in general accordance with applicable ASTM and Arizona methods. The following tests were performed and the results are presented in Appendix B.

- Water content
- Dry density
- Remolded expansion potential
- Maximum density/optimum moisture
- Gradation
- Plasticity
- Soluble salts/sulfates/chlorides

- Corrosivity (ASTM A674)
- Unconfined compressive strength (rock)
- Unit weight (rock)

Test results were utilized in the development of the recommendations contained in this report.

3.3 Analyses and Report

This geotechnical engineering report includes a description of the project, a discussion of the field and laboratory testing programs, a discussion of the subsurface conditions, and design recommendations as appropriate to the purpose. The scope of services for this project does not include, either specifically or by implication, any environmental assessment of the site, discovery of underground storage tanks or other underground structures, or identification of contaminated or hazardous materials or conditions. If there is concern about the potential for such contamination, other studies should be undertaken. We are available to discuss the scope of such studies with you.

4.0 SITE CONDITIONS

4.1 Surface

At the time of our field exploration, the site was a developed wastewater treatment plant. The exteriors of existing structures appeared to be in good to fair condition. The site is bordered on the east by the existing aggregate surfaced access road to the plant, and on all other sides by northeast-southwest oriented Bitter Creek that is about 50 to 100 feet wide and 20 to 30 feet deep that directs flow to the northeast. The ground surface was relatively flat in the developed portions of the site, steep to very steep surrounding the developed areas, and contained a sparse to moderate growth of native juniper trees, bushes, cacti, grasses and weeds. Surface drainage appeared to be fair to poor with some evidence of previous surface water ponding in the developed portions of the site, and good in the undeveloped portions of the site by means of surface sheet flow to the west and north down the existing slopes into Bitter Creek.

4.2 Subsurface

As presented on the test pit/boring logs, surface and subsoils extending to the full depth of exploration at all locations explored consisted of medium to near-high plasticity Clayey SANDS with variable amounts of gravel, Clayey GRAVELS with variable amounts of sand and non-plastic Silty GRAVELS with variable amounts of sand. All soils encountered contained random amounts of limestone cobbles and boulders. Refusal to excavator/auger penetration occurred in all test pits/borings at depths of about 1 to 8 feet on LIMESTONE or limestone cobbles and boulders. Groundwater was not encountered in any test pit/boring at the time of exploration. The logs in Appendix A show details of the subsurface conditions encountered during the field exploration.

The test pit/boring logs included in this report are indicators of subsurface conditions only at the specific location and date noted. Variations from the field conditions represented by the test pits/borings may become evident during construction. If variations appear, we should be contacted to re-evaluate our recommendations.

5.0 GEOTECHNICAL PROPERTIES

Near-surface soils range from non-plastic to near-high plasticity. The site soils exhibit moderate expansion potential when recompacted, confined by loads approximating floor loads and saturated in accordance with standard Arizona test methods. Slabs-on-grade supported on recompacted native soils have a moderate potential for heaving if the water content of the soil increases. The site soils were too granular to obtain samples suitable for compression testing. Two samples of the on-site rock were obtained for unit weight and unconfined compressive strength testing and the results are present in Appendix B.

6.0 RECOMMENDATIONS

6.1 General

Recommendations contained in this report are based on our understanding of the project criteria described in Section 2.0, **PROJECT DESCRIPTION**, and the assumption that the soil and subsurface conditions are those disclosed by the test pits/borings. Others may change the plans, final elevations, number and type of structures, foundation loads, and tank bottom levels during design or construction. Substantially different subsurface conditions

from those described herein may be encountered or become known. Any changes in the project criteria or subsurface conditions shall be brought to our attention in writing.

6.2 Design Considerations

Existing fill was not encountered in the test pits/borings, but was observed on the site. We understand that no documentation is available regarding any field density testing that may have been performed during fill construction. Based on this lack of documentation and the overall condition of the fill observed, we consider the fill to be uncontrolled and recommend removal of existing fill in all structural areas.

Several of the test pits/borings indicate the presence of medium to near-high plasticity clayey soils on the site. These soils will expand or swell with an increase in moisture content. The structures and related improvements situated on expansive soils will be subject to movements if the foundation soils experience an increase in moisture content. It should be understood that if moisture penetrates expansive soils, there will likely be heave and possible resultant cracking/distress of the proposed structures and related improvements. It should be noted that shallow foundation systems are not designed to resist soil movements resulting from sewer or plumbing leaks, excessive or leaking irrigation systems, poor drainage, or water ponding near the structures. Construction of site fences, screen walls and other miscellaneous improvements such as exterior slabs-on-grade that typically fall under building code guidelines will be susceptible to heave as well.

Cobbles and boulders were encountered in the test pits/borings. These oversized materials, greater than 3 inches, could present construction difficulties for foundation, utility trenches and other excavations. In cut areas and excavations, exposed oversized materials should be removed.

6.3 Tank Foundations

Above-ground tanks may be supported on compacted aggregate underlain by a minimum thickness of 1 foot of site soils removed and replaced with properly compacted, imported engineered fill material. Below-ground tanks may be supported on scarified and recompacted native soils. Any existing fill should be removed in all proposed tank areas. The tank pads, prepared as recommended in the **EARTHWORK** section of the report, will be suitable to support a maximum dead plus live-load pressure of up to 3000 pounds per square foot. We anticipate that total and differential movements of the proposed above-ground tank structures, supported as recommended, should be within tolerable limits of

the tank manufacturer, typically uniform settlement of less than 2 inches and differential settlement less than 0.5-inch per 32 feet of circumference. Total and differential movements of the proposed below-ground tank structures, supported as recommended, are anticipated to be 1 inch and 3/4 inch, respectively. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

We recommend that the geotechnical engineer or his representative observe the tank pad preparation. It should be determined whether the materials exposed are similar to those anticipated for support of the tanks. Any soft, loose or unacceptable materials should be undercut to suitable materials and backfilled with engineered fill material.

6.4 Manhole Foundations

The soils encountered along the alignment are expected to have moderate to high bearing capacity at anticipated manhole foundation depths. Other than removal of any soft, loose, unstable or disturbed materials from beneath manhole foundations, specialized treatment of soils beneath manholes is not anticipated.

6.5 Lateral Design Criteria for Thrust Blocks

For any thrust block design, lateral loads may be resisted using a soil bearing pressure of 2500 pounds per square foot (psf). All fill against or around thrust blocks should be compacted to densities specified herein under **Placement and Compaction**.

6.6 Conventional Spread Footings

If conventional spread footings are used, they should be underlain by a minimum thickness of 1 foot of lean mix (2-sack) concrete backfill. Footings should bear at least 2 feet below the lowest adjacent finished grade. Footings may be designed to impose a maximum dead plus live-load pressure of up to 2500 pounds per square foot.

We anticipate that total movement of the proposed structures, supported as recommended, should be less than 1 inch. Differential movement should be less than ¾ inch. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

Finished grade is the lowest adjacent grade for perimeter footings and floor level for interior footings. The design bearing capacity applies to dead loads plus design live load conditions. Recommended minimum widths of column and wall footings are 24 inches and 16 inches, respectively. The bearing value given is a net bearing value and the weight of the concrete in the footings may be ignored.

All footings, stem walls and masonry walls should be reinforced to reduce the potential for distress caused by differential foundation movements. The use of joints at openings or other discontinuities in masonry walls is recommended.

We recommend that the geotechnical engineer or his representative observe the footing excavations before reinforcing steel and concrete are placed. It should be determined whether the soils exposed are similar to those anticipated for support of the footings. Any soft, loose or unacceptable soils should be undercut to suitable materials and backfilled with either lean mix or structural concrete.

6.7 Lateral Design Criteria

For retaining walls located above any free water surface with no surcharge loads, recommended equivalent fluid pressures and coefficients of base friction for unrestrained elements are:

- Active:
  Undisturbed subsoil .....38 psf/ft
  Compacted granular backfill .....30 psf/ft
  Compacted on-site soils (low expansive potential) .....38 psf/ft
  Clayey site soils ..... not recommended for use

- Passive:
  Shallow wall footings .....220 psf/ft
  Shallow column footings.....350 psf/ft
  Dense rock .....500 psf/ft

- Coefficient of base friction
  Soil.....0.35*
  Rock.....0.55

* The coefficient of base friction (soil) should be reduced to 0.25 when used in conjunction with passive pressure.

Where the design includes restrained elements, the following equivalent fluid pressures are recommended:

- At-rest:
  Undisturbed subsoil .....64 psf/ft
  Compacted granular backfill .....55 psf/ft

These lateral earth pressures are not applicable for submerged soils. We should be consulted for additional recommendations if such conditions are to be included in the design. Any surcharge from adjacent loadings must also be considered. Walls below grade should be waterproofed.

We recommend a free-draining soil layer or manufactured geocomposite material, be constructed adjacent to the back of the retaining wall. A filter may be required between the soil backfill and drainage layer. This drainage zone should help prevent hydrostatic pressure buildup. This vertical drain should be tied into a gravity drainage system at the base of the retaining wall. It is important that all backfill be properly placed and compacted. Backfill should be mechanically compacted in layers. Flooding or jetting should not be permitted. Care should be taken not to damage the walls when placing the backfill. Backfills should be inspected and tested during placement.

Fill against footings, stem walls and retaining walls should be compacted to densities specified in **EARTHWORK**. Medium to high plasticity clay soils should not be used as backfill against retaining walls. Compaction of each lift adjacent to walls should be accomplished with hand-operated tampers or other lightweight compactors. Overcompaction may cause excessive lateral earth pressures which could result in wall movements.

6.8 Seismic Considerations

Structures should be designed in accordance with applicable building codes. The seismic design parameters presented in the following table, in accordance with the 2018 International Building Code and ASCE 7-16, are applicable to the project site:

Seismic Design Parameters International Building Code 2018, ASCE 7-16	
Soil Site Class	C
Mapped Spectral Response Acceleration at 0.2 sec period (S_s)	0.31g
Mapped Spectral Response Acceleration at 1.0 sec period (S_1)	0.097g
Site Coefficient for 0.2 sec period (F_a)	1.3
Site Coefficient for 1.0 sec period (F_v)	1.5
Design Spectral Response Acceleration at 0.2 sec period (S_{DS})	0.269g
Design Spectral Response Acceleration at 1.0 sec period (S_{D1})	0.097g

The soil site class is based upon conditions identified in shallow exploratory test pits/borings and local knowledge of the geotechnical conditions in the vicinity of the site. Conditions extending beyond the depth of our test pits/borings to a depth of 100 feet were assumed for the purposes of providing the information presented in the table. Based upon the density of the on-site soils and lack of groundwater, the potential settlement and lateral spread due to liquefaction is not a considered to be a significant concern on the site.

6.9 Slab-on-Grade Support

Slabs-on-grade should be supported on a minimum thickness of 1 foot of properly placed and compacted, imported, low expansive, engineered fill. For design of interior slabs-on-grade, we recommend using a modulus of subgrade reaction (k) of 200 pounds per cubic inch (pci) for the on-site soils and 225 pci for imported fill material, based on a 30-inch diameter plate. The slab subgrade should be prepared by the procedures outlined in this report. A minimum 4-inch thick layer of base course should be provided beneath all slabs to help prevent capillary rise and a damp slab.

All concrete placement and curing operations should follow the American Concrete Institute manual recommendations. Improper curing techniques and/or high slump (water-cement ratio) could cause excessive shrinkage, cracking or curling. The plastic properties of the concrete should be documented at the time of placement and specimens should also be prepared for strength testing to verify compliance with project specifications. Concrete slabs should be allowed to cure adequately before placing vinyl or other moisture sensitive floor covering.

6.10 Drainage

The major cause of soil-related foundation and slab-on-ground problems is moisture increase in soils below structures. Properly functioning conventional foundations and floor slabs-on-ground require appropriately constructed and maintained site drainage conditions. Therefore, it is extremely important that positive drainage be provided during construction and maintained throughout the life of the structures. It is also important that proper planning and control of any landscape and irrigation practices be performed.

Infiltration of water into utility or foundation excavations must be prevented during construction. Backfill against footings, exterior walls, and in utility line trenches should be well compacted and free of all construction debris to minimize the possibility of moisture infiltration. If utility line trenches are backfilled with a granular material, then a clay or concrete plug should be placed in the trench adjacent to the structure to prevent water from following the trench back under the structure.

6.11 Aggregate-Surfaced Roadways

For unpaved sections, we recommend an initial minimum thickness of 6 inches of granular cover material. As with any unbound vehicular section, additional material will be required over time as cover material is lost due to grading, snow plowing, lateral shoving, and intrusion of the cover material into the underlying subgrade soils. To help reduce intrusion, consideration should be given to the use of a geotextile separator fabric placed at the cover material/subgrade soil interface.

6.12 Corrosivity

Based on the laboratory test results, the on-site soils exhibit a low to moderate corrosive potential to ductile iron piping. This information should be used as an aid in choosing the construction materials that will be in contact with these soils and that will need to be resistant to various corrosive forces. Manufacturers' representatives should be contacted regarding the specific corrosivity resistance for their particular product.

The chemical test results indicate that the soils at the site classify as moderately corrosive to concrete, Class S1 in accordance with ACI 318, Table 4.2.1. Concrete should be made with a cement that provides sulfate resistance and that has a maximum water-cementitious materials ratio and minimum compressive strength set forth in the provisions of ACI 318, Section 4.3.

7.0 EARTHWORK

7.1 General

The conclusions contained in this report for the proposed construction are contingent upon compliance with recommendations presented in this section. Any excavating, trenching, or disturbance which occurs after completion of the earthwork must be backfilled, compacted and tested in accordance with the recommendations contained herein. It is not reasonable to rely upon our conclusions and recommendations if any future unobserved and untested trenching, grading or backfilling occurs.

Although underground facilities were not observed, such features might be encountered during construction. These features should be demolished and removed in accordance with the recommendations of the geotechnical engineer. Any loose or disturbed soils resulting from demolition and/or removal of existing facilities should also be removed and/or recompacted as engineered fill, and any excavations should be backfilled in accordance with recommendations presented herein.

7.2 Site Clearing

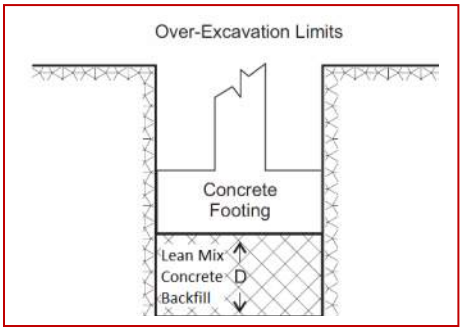
Strip and remove all existing fill, remaining vegetation, debris, aggregate surfacing and/or concrete pavement and any other deleterious materials from the building, tank and wastewater line area. The building/tank area is defined as that area within the structure footprint plus 5 feet beyond the perimeter of the footprint. All exposed surfaces should be free of mounds and depressions which could prevent uniform compaction.

7.3 Excavation

We anticipate that excavations into the shallow site soils for the proposed construction can be accomplished with conventional equipment. Excavations penetrating the underlying limestone will require the use of heavy-duty, specialized equipment, likely together with large pneumatic hammers, to facilitate rock break-up and removal.

Cut slopes into the shallow on-site soils should be constructed no steeper than 1:1 (horizontal:vertical) and 0.5:1 (horizontal:vertical) in the limestone bedrock. Fill slopes should be constructed no steeper than 1.5:1 (horizontal:vertical) to limit erosion, and to provide slope protection. Natural slopes exceeding a 5:1 (horizontal:vertical) slope

configuration, should be benched prior to fill placement. Natural slopes which will support fill embankments should be benched at a maximum 5:1 slope.

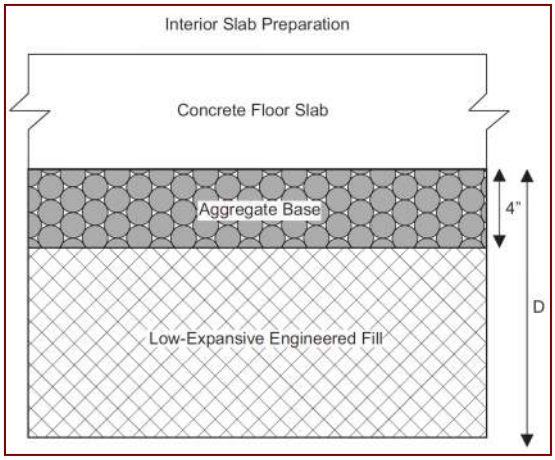


On-site soils will pump or become unworkable at high water contents. Workability may be improved by scarifying and drying. Overexcavation of wet zones and replacement with drier granular materials may be necessary. The use of lightweight excavation and compaction equipment may be required to minimize subgrade pumping.

7.4 Tank Pad Preparation

Following removal of any existing fill material, above-ground tanks should be founded on a minimum thickness of 1 foot of imported, properly compacted, low expansive, engineered fill material. Remove existing soils to a minimum depth of 1 foot below the bottom of the above-ground tank elevation. Following the removal, and immediately below all below-grade tanks, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. The subgrade preparation should be accomplished in a manner which will result in uniform water contents and densities after compaction. In areas where dense limestone is encountered, scarification and recompaction is not required.

7.5 Spread Footing Foundation Preparation



Following removal of any existing fill material in footing areas, remove existing soils to a minimum depth of 1 foot below the bottom of the footing. Removal may extend straight down along the sides of the footing. Replace the removed soils with properly consolidated, lean mix (2-sack) concrete backfill material.

7.6 Slab-on-Grade Preparation

Following removal of any existing fill material, slabs-on-grade should be founded on a minimum thickness of 1 foot of imported, low expansive, engineered fill material. Remove native soils, as necessary, to a minimum depth of 1 foot below the bottom of the slab (depth D in the diagram below). Following the removal, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. Replace the removed soils with properly compacted, imported, low to non-expansive, engineered fill material. The

aggregate base course below the slab may be included as part of the low to non-expansive engineered fill. In areas where dense limestone is encountered, scarification and recompaction is not required.

The subgrade preparation should be accomplished in a manner that will result in uniform water contents and densities after compaction.

7.7 Exterior Slab Preparation

The soils on this site have the potential to expand and shrink with changes in moisture content. In addition, frost penetration in the upper soils may cause surface heaving. Therefore, relatively lightweight exterior concrete flatwork such as sidewalks and patios may experience movements resulting in cracking or vertical offsets. To reduce the potential for damage, we recommend:

- Use of fill with low expansion potential
- Use of fill with low to negligible frost susceptibility
- Placement of effective control joints on relatively close centers
- Moisture-density control during placement of subbase fills
- Provision for adequate drainage in areas adjoining the slabs
- Use of designs which allow vertical movement between the exterior slabs and adjoining structural elements

It should be understood that these recommendations will help reduce the potential for soil movement and resulting distress, but will not eliminate this potential. Furthermore, the use of municipal specifications and details may not mitigate the potential for movements of the expansive or frost susceptible on-site soils.

7.8 Materials

a. Clean on-site native soils with a maximum dimension of 6 inches or imported materials may be used as fill material for the following:

- backfill (non-slab areas)
- Subbase fill in aggregate surfaced roadway areas

b. On-site clayey soils should not be used as subbase fill or backfill below any tanks, foundations, slabs-on-grade or behind any retaining walls. Imported soils with low expansive potential should be used in these areas.

c. Frozen soils should not be used as fill or backfill.

d. Lean mix (2-sack) concrete backfill should consist of aggregate base course type material combined with 2 sacks of cement per cubic yard. A coarse rock mix should not be used.

e. Imported soils should conform to the following:

- Gradation (ASTM C136): percent finer by weight

6"	100
4"	85-100
¾”	70-100
No. 4 Sieve	50-100
No. 200 Sieve	40 (max)

- Maximum expansive potential (%)[1] 1.5

- Maximum soluble sulfates (%) 0.10

f. Base course should conform to current Yavapai County specifications.

[1] Measured on a sample compacted to approximately 95 percent of the ASTM D698 maximum dry density at about 3 percent below optimum water content. The sample is confined under a 100 psf surcharge and submerged.

7.9 Placement and Compaction

a. Place and compact fill in horizontal lifts, using equipment and procedures that will produce recommended water contents and densities throughout the lift.

b. Uncompacted fill lifts should not exceed 8 inches.

c. Materials should be compacted to the following:

Material	Minimum Percent Compaction (ASTM D698)
• On-site soil, reworked:	
Below tanks	95
Below slabs-on-grade	90
Aggregate surfaced roadway areas	95
• On-site clayey soils, fill:	
Aggregate surfaced roadway areas	95
Landscape areas	85
• On-site low expansive potential soils, fill:	
Aggregate surfaced roadway areas	95
Below slabs-on-grade	95
Below tanks	95
• Imported soil, fill:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	95
• Aggregate base:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	100

Minimum Percent
Material Compaction (ASTM D698)

- Backfill:
  Structural 95
  Nonstructural 90

`

d. On-site soils should be compacted with a moisture content in the range of 1 percent below to 3 percent above optimum. Imported soils with low expansive potential and aggregate base course materials should be compacted with a moisture content in the range of 3 percent below to 3 percent above optimum.

7.10 Compliance

Recommendations for structural elements supported on compacted fills or prepared subgrade depend upon compliance with **EARTHWORK** recommendations. To assess compliance, observation and testing should be performed under the direction of a geotechnical engineer.

8.0 ADDITIONAL SERVICES

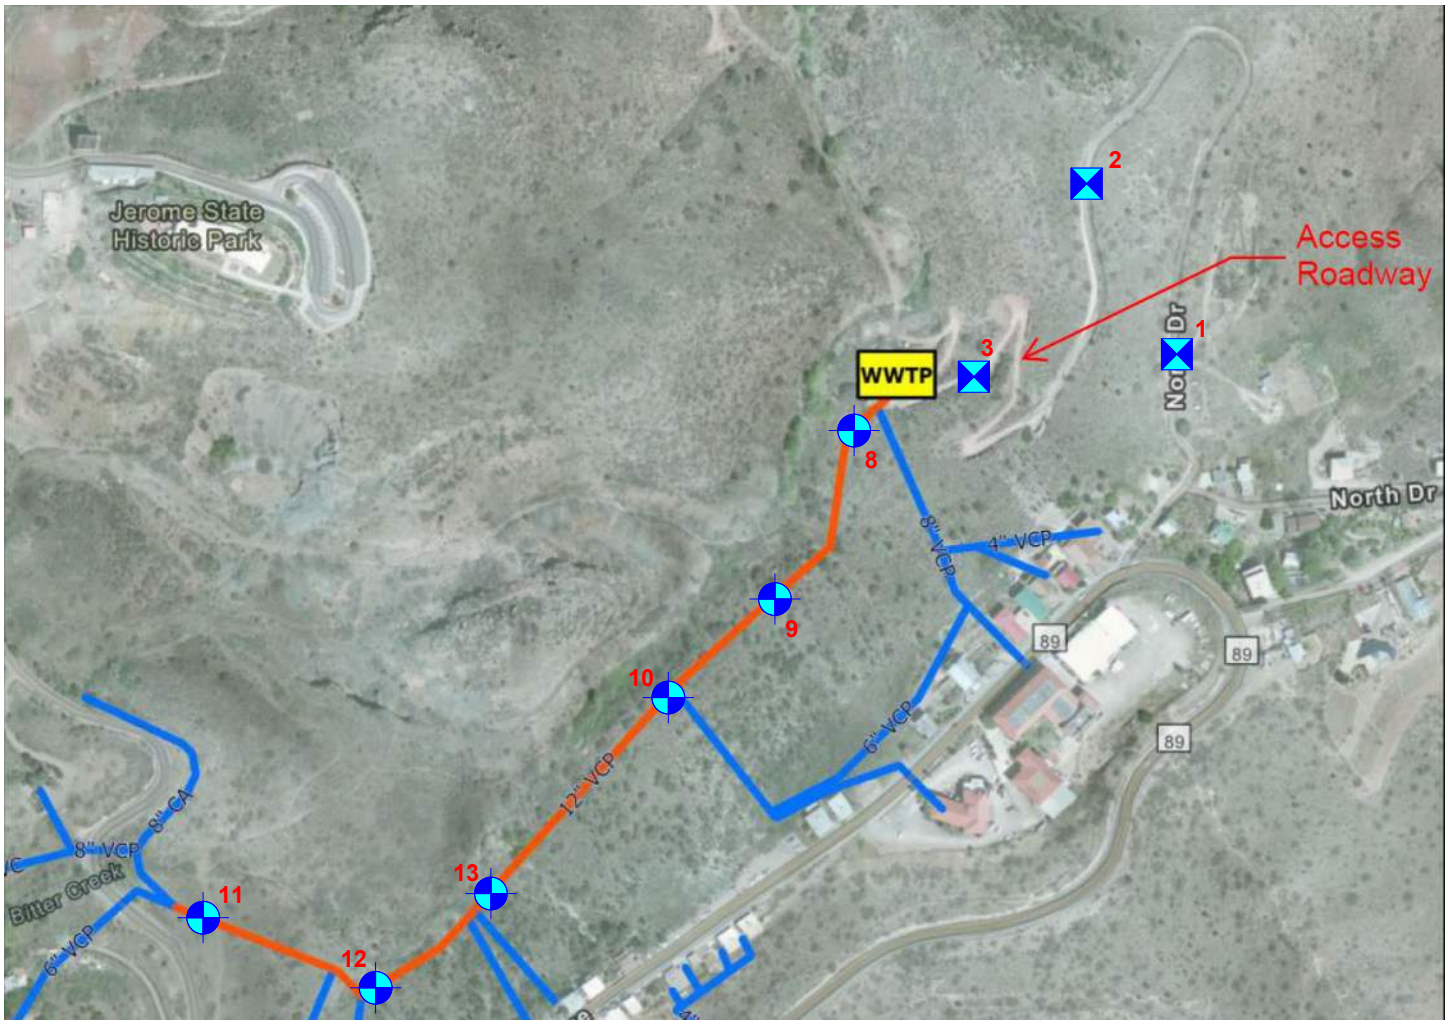
The recommendations provided in this report are based on the assumption that a sufficient schedule of tests and observations will be performed during construction to verify compliance. At a minimum, these tests and observations should be comprised of the following:

- Observations and testing during site preparation and earthwork;
- Observation of foundation excavations; and
- Consultation as may be required during construction.

Retaining the geotechnical engineer who developed your report to provide construction observation is the best way to verify compliance, and to help you manage the risks associated with unanticipated conditions.

9.0 LIMITATIONS

This report has been prepared assuming the project criteria described in Section 2.0. If changes in the project criteria occur, or if different subsurface conditions are encountered or become known, the conclusions and recommendations presented herein shall become invalid. In any such event, WT should be contacted in order to assess the effect that such variations may have on our conclusions and recommendations.



The recommendations presented are based entirely upon data derived from a limited number of samples obtained from widely spaced test pits/borings. The attached logs are indicators of subsurface conditions only at the specific locations and times noted. This report assumes the uniformity of the geology and soil structure between test pits/borings, however variations can and often do exist. Whenever any deviation, difference or change is encountered or becomes known, WT should be contacted.

This report is for the exclusive benefit of our client alone. There are no intended third-party beneficiaries of our contract with the client or this report, and nothing contained in the contract or this report shall create any express or implied contractual or any other relationship with, or claim or cause of action for, any third party against WT.

This report is valid for the earlier of one year from the date of issuance, a change in circumstances, or discovered variations. After expiration, no person or entity shall rely on this report without the express written authorization of WT.

10.0 CLOSURE

We prepared this report as an aid to the designers of the proposed project. The comments, statements, recommendations and conclusions set forth in this report reflect the opinions of the authors. These opinions are based upon data obtained at the location of the test pits/borings, and from laboratory tests. Work on your project was performed in accordance with generally accepted standards and practices utilized by professionals providing similar services in this locality. No other warranty, express or implied, is made.

Geotechnical Environmental Inspections Materials
Western Technologies Inc. The Quality People Since 1955

Allowable Soil Bearing Capacity	The recommended maximum contact stress developed at the interface of the foundation element and the supporting material.
Backfill	A specified material placed and compacted in a confined area.
Base Course	A layer of specified aggregate material placed on a subgrade or subbase.
Base Course Grade	Top of base course.
Bench	A horizontal surface in a sloped deposit.
Caisson/Drilled Shaft	A concrete foundation element cast in a circular excavation which may have an enlarged base (or belled caisson).
Concrete Slabs-On-Grade	A concrete surface layer cast directly upon base course, subbase or subgrade.
Crushed Rock Base Course	A base course composed of crushed rock of a specified gradation.
Differential Settlement	Unequal settlement between or within foundation elements of a structure.
Engineered Fill	Specified soil or aggregate material placed and compacted to specified density and/or moisture conditions under observations of a representative of a soil engineer.
Existing Fill	Materials deposited through the action of man prior to exploration of the site.
Existing Grade	The ground surface at the time of field exploration.
Expansive Potential	The potential of a soil to expand (increase in volume) due to absorption of moisture.
Fill	Materials deposited by the actions of man.
Finished Grade	The final grade created as a part of the project.
Gravel Base Course	A base course composed of naturally occurring gravel with a specified gradation.
Heave	Upward movement.
Native Grade	The naturally occurring ground surface.
Native Soil	Naturally occurring on-site soil.
Rock	A natural aggregate of mineral grains connected by strong and permanent cohesive forces. Usually requires drilling, wedging, blasting or other methods of extraordinary force for excavation.
Sand and Gravel Base Course	A base course of sand and gravel of a specified gradation.
Sand Base Course	A base course composed primarily of sand of a specified gradation.
Scarify	To mechanically loosen soil or break down existing soil structure.
Settlement	Downward movement.
Soil	Any unconsolidated material composed of discrete solid particles, derived from the physical and/or chemical disintegration of vegetable or mineral matter, which can be separated by gentle mechanical means such as agitation in water.
Strip	To remove from present location.
Subbase	A layer of specified material placed to form a layer between the subgrade and base course.
Subbase Grade	Top of subbase.
Subgrade	Prepared native soil surface.

The number shown in **"BORING NO."** or "**TEST PIT NO.**" refers to the approximate location of the same number indicated on the "Boring/Test Pit Location Diagram" as positioned in the field by pacing or measurement from property lines and/or existing features.

"DRILLING TYPE" refers to the exploratory equipment used in the boring. Hand auger methods were used. The dimension presented is the outside diameter of the auger used.

"EQUIPMENT TYPE" refers to the equipment used in the excavation of the test pit, and may include the width of the bucket on the excavator and the use of "rock" teeth or attachments.

"SAMPLE TYPE" refers to the form of sample recovery, in which **R** = Ring-lined sample, **G** = Grab sample.

"DRY DENSITY (LBS/CU FT)" refers to the laboratory-determined dry density in pounds per cubic foot. The symbol **"NR"** indicates that no sample was recovered.

"WATER (MOISTURE) CONTENT (% OF DRY WT.)" refers to the laboratory-determined water content in percent using the standard test method ASTM D2216.

"USCS" refers to the "Unified Soil Classification System" Group Symbol for the soil type as defined by ASTM D2487 and D2488. The soils were classified visually in the field, and where appropriate, classifications were modified by visual examination of samples in the laboratory and/or by appropriate tests.

These notes and boring/test pit logs are intended for use in conjunction with the purposes of our services defined in the text. Boring/test pit log data should not be construed as part of the construction plans nor as defining construction conditions.

Boring/test pit logs depict our interpretations of subsurface conditions at the locations and on the date(s) noted. Variations in subsurface conditions and characteristics may occur between borings/test pits. Groundwater levels may fluctuate due to seasonal variations and other factors.

The stratification lines shown on the boring/test pit logs represent our interpretation of the approximate boundary between soil or rock types based upon visual field classification at the boring/test pit location. The transition between materials is approximate and may be more or less gradual than indicated.

CORROSIVITY TEST RESULTS

The procedures for soil survey tests and observations can be found in Appendix X1.1 of ASTM A674-10 and includes five soil properties: earth resistivity • pH • redox potential • sulfides • moisture.

Test Pit 7(0-5):

Analysis	Results		Points
Resistivity (ohm-cm)	1401		10
pH	8.5		0
Redox Potential (mV)	+134		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	13

Boring 12(0-1):

Analysis	Results		Points
Resistivity (ohm-cm)	2481		2
pH	8.1		0
Redox Potential (mV)	+314		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	5

The test procedure states that if the sum of the points is greater than 10, the soil is considered corrosive to ductile iron pipe and special protection against exterior corrosion is necessary. This conclusion is limited to soil corrosion and does not include consideration of stray direct current.

Appendix B – MAG Standard Details

SECTION 321

PLACEMENT AND CONSTRUCTION OF ASPHALT CONCRETE PAVEMENT

321.1 DESCRIPTION:

This section is to provide specifications for furnishing all materials, mixing at a plant, hauling and placing a mixture of aggregate materials, mineral admixture and asphalt binder to form a pavement course for placement upon a previously prepared base or subbase.

321.2 MATERIALS AND MANUFACTURE:

The materials shall conform to Section 710 for the type specified. Warm Mix Asphalt (WMA) technologies may be used within the mixture provided all requirements of the specifications are met, and the technology is on the ADOT approved product list. The specific required mix type shall be called out in the contract documents or as directed by the Engineer.

321.3 WEATHER AND MOISTURE CONDITIONS:

Asphalt concrete shall be placed only when the surface is dry, and when the atmospheric temperature in the shade is 40 degrees F. (50 degrees F for Asphalt Concrete lift less than 2-inch thick) or greater. No asphalt concrete shall be placed when the weather is foggy or rainy, or when the base or subbase on which the material is to be placed is unstable. Asphalt concrete shall be placed only when the Engineer determines that weather conditions are suitable.

321.4 APPLICATION OF TACK COAT:

A tack coat shall be applied to all existing and to each new course of asphalt concrete prior to the placing of a succeeding lift of asphalt concrete. If approved by the Engineer, the tack coat may be deleted when a succeeding layer of asphalt concrete is being applied over a freshly laid course that has been subjected to very little traffic.

The application of the tack coat shall comply with Section 329. The grade of emulsified asphalt shall be SS-1h or CSS-1h as specified in Section 713. The same material that is specified above for the tack coat shall be applied to the vertical surfaces of existing pavements, curbs, and gutters, against which asphalt concrete is to be placed.

The surface to be covered may require repair or patching as directed by the Engineer. This shall be addressed in the project specifications prior to the bidding of the project.

321.5 MIX DESIGN:

The mix design shall be submitted to the Engineer at least five working days prior to the start of asphalt concrete production. Mix designs provided by the agency may be utilized on projects at the Engineer's discretion. The Engineer will review and approve the mix design to assure it contains all of the required information as outlined in Section 710.3.1. If WMA technologies are used within the mix design, the type of WMA technology used shall be indicated on the mix design. The target values for gradations, binder contents, and air voids will be established as the accepted Job Mix Formula (JMF) based upon the mix design. Mix designs not containing all of the information will be returned within five working days of receipt of all mix design information, for action and resubmission by the contractor.

Once the mix design has been approved by the agency and the mixing plant selected, the Contractor and/or his supplier shall not change plants nor utilize additional mixing plants without prior approval of the Engineer.

If the contractor elects to change its source of material, the contractor shall furnish the Engineer with a new mix design, which meets the requirements of Section 710, as amended by the Project Specifications.

The contractor may make self-directed target changes to the approved mix design within the limits shown below. Requests for self-directed target changes shall be made in writing, acknowledged by the Engineer prior to the start of production of a lot, and will remain in effect until such time as any additional changes are implemented. The self-directed target changes must meet the contract requirements for mix design criteria and gradation limits.

TABLE 321-1 ALLOWABLE SELF-DIRECTED TARGET CHANGES	
MEASURED CHARACTERISTICS	ALLOWABLE SELF-DIRECTED TARGET CHANGES
Gradation (Sieve Size)	
3/8 inch	± 4% from mix design target value
No 8	± 4% from mix design target value
No 40	± 2% from mix design target value
No 200	+ 0.5% from mix design target value
Binder Content	± 0.2% from mix design target value
Effective Air Voids	None

The contractor may propose target changes, other than self-directed changes, to the approved mix design for the approval of the Engineer. The Engineer will determine if the proposed target change will result in mix production that meets the contract requirements for mix design criteria and gradation limits. The target changes will not be retroactive for the purpose of acceptance.

321.6 MIX PRODUCTION:

All materials shall be proportioned by weight in a hot mix asphalt plant in the proportions required by the mix design to provide a homogeneous and workable mass. Each hot mix asphalt plant shall be inspected in accordance with the provisions contained in the 'Hot Mix Asphalt Production Facilities' by the Arizona Rock Products Association and shall have a current inspection certificate. All measuring devices shall be calibrated at least annually by a technician licensed by the Arizona Bureau of Weights & Measures. Mixing plants shall conform to the requirements of AASHTO M-156, except as modified herein. If WMA technology is being used, any equipment associated with the production of hot mix asphalt shall be calibrated and in proper working order according to the WMA equipment specifications. If there are any deviations in the production or compacting temperatures of the hot mix asphalt with WMA technology, the mix design shall state the differences.

In drum mix plants, the mineral admixture shall be added and thoroughly mixed with the mineral aggregate by means of a mechanical mixing device prior to the mineral aggregate and mineral admixture entering the dryer. The moisture content of the combined mineral aggregate shall be a minimum of three percent by weight of the aggregate during the mixing process.

For drum-mix plants, the mineral admixture shall be weighed across a weight belt, or other approved alternative weighing system, with a weight totalizer prior to entry into the mechanical mixing device. The mechanical mixing device shall be a pug mill type mixer that is in good working condition. The rate of the aggregate feed shall not exceed the mixing device's capacity in ton per hour. The mixer shall be constructed to minimize the loss of mineral admixture and shall be located in the aggregate delivery system at a location where the mixed material can be readily inspected. The mixing device shall be capable of effective mixing in the full range of the asphalt concrete production rates.

The hot plant and equipment shall be constructed and operated to prevent loss of mineral admixture through the dust collection system of the plant.

A positive signal system shall be provided and used during production whereby the mixing shall automatically be stopped if the mineral admixture is not introduced into the mineral aggregate. The plant will not be permitted to operate unless the signal system is in good working condition.

The introduction of bituminous material shall be controlled by an automated system fully integrated with the controls or the mineral aggregate and mineral admixture. The production of the plant shall be controlled by the rate required to obtain a uniform mixture of all components. Drying and heating shall be accomplished in such a manner as to preclude the mineral admixture from becoming coated with un-spent fuel.

The completed asphalt concrete may be held in storage for up to 12 hours in insulated or heated silos, providing the minimum temperature noted herein for placement and compaction is met behind the placement device. If the Engineer determines that there is an excessive amount of heat, heat loss, drain down, segregation and/or oxidation of the mixture due to temporary storage, use of surge bins or storage bins will be discontinued.

The temperature of the asphalt concrete, with unmodified binders, upon discharge from the mixer shall not exceed 335 degrees F. The discharge temperature may be increased on the recommendation of the binder supplier, when approved by the Engineer. If the asphalt concrete is discharged from the mixer into a hopper, the hopper shall be constructed so that segregation of the asphalt concrete will be minimized.

321.7 TRANSPORTATION:

Petroleum distillates or other substances that will have a detrimental effect on the asphalt concrete shall not be used as a release agent.

The beds of all transportation units shall be clean and smooth to allow the free flow of material into the paving machine's hopper.

Tarpaulins shall be furnished on all trucks and used when weather condition warrant, or if directed by the Engineer.

321.8 PLACEMENT:

Placement of asphalt concrete pavement shall not commence until authorized by the Engineer. The Engineer's authorization to allow commencement of asphalt concrete paving will generally require all newly constructed valley gutters, curbing, and curb and gutters which new pavement is to be placed against to be in-place and in an acceptable condition. While it is preferred to have all newly constructed concrete items against which new pavement is to be placed be in an acceptable condition, the Engineer may allow paving to commence based on weather, the amount of defective concrete, or other considerations.

321.8.1 Placing: All courses of asphalt concrete shall be placed and finished by means of a self-propelled paving machine equipped with an automatically actuated control system, except under certain conditions or at locations where the Engineer deems the use of a self-propelled paving machine impracticable.

The control system shall control the elevation of the screed at each end by controlling the elevation of one end directly and the other end indirectly either through controlling the transverse slope or alternatively when directed, by controlling the elevation of each end independently.

The control system shall be capable of working with one of the following devices:

(a) Ski or non-contact device of not less than 30 feet in length, supported throughout its entire length
(b) Taut stringline or wire set to grade
(c) Short ski or sonar sensing units from curb control
(d) Joint matching shoe

Failure of the control system to function properly shall be cause for the suspension of asphalt concrete production. In order to achieve a continuous operation, the speed of the paving machine shall be coordinated with the hot mix plant and transport units.

If the asphalt concrete is dumped from the hauling vehicles directly into the paving machine, care shall be taken to avoid jarring the machine or moving it out of alignment. No vertical load shall be exerted on the paving machine by the truck.

If asphalt concrete is dumped upon the surface being paved and subsequently loaded in the paving machine, the loading equipment shall be self-supporting and shall not exert any vertical load on the paving machine. Substantially all of the asphalt concrete shall be picked up and loaded into the paving machine.

Self-propelled paving machines shall spread the mixture without segregation or tearing, true to line, grade and crown indicated on the project plans. Pavers shall be equipped with hoppers and augers that will distribute the mixture uniformly in front of an adjustable floating screed. The raising of the hopper wings must be minimized and the paving machine will not be operated when in an empty condition.

Screeds shall include any strike-off device operated by tamping or vibrating action which is effective, without tearing, shoving or gouging the mixture and which produces a course with a uniform texture and density for the full width being paved. Screeds shall be adjustable as to height and crown and shall be equipped with a controlled heating device for use when required. In the

case of the screed, auger extensions and vibrators shall be installed wherever the screed is extended more than one (1) foot beyond the end of the base auger or auger extension. However, when placing material against an extremely uneven curb or edge over a short distance, the Engineer may waive the auger extensions and vibrators.

At any place not accessible to the roller, the mixture shall be thoroughly compacted with tampers to provide a uniform and smooth layer over the entire area compacted in this manner.

321.8.2 Joints: Transverse joints, before a surface course is placed in contact with a cold transverse construction joint, the cold existing asphalt concrete shall be trimmed to a vertical face for its full depth exposing a fresh face. The fresh face shall be tack coated prior to placement of the new asphalt concrete. After placement and finishing the new asphalt concrete, both sides of the joint shall be dense and the joint shall be smooth and tight. The surface in the area of the joint shall not deviate more than 1/4 inch from a 12-foot straightedge, when tested with the straightedge placed across the joint, parallel to the centerline.

Longitudinal joints of each asphalt course shall be staggered a minimum of 6 inches with relation to the longitudinal joint of the immediate underlying course's cold longitudinal construction joint.

Longitudinal joints with existing or cold (more than 32 hours old) asphalt concrete shall require the existing pavement to be trimmed to a vertical face for its full depth exposing a fresh face. The fresh face shall be tacked prior to placement of the adjacent course. Longitudinal joints with an existing asphalt pavement that is less than 32 hours old that has had its edge protected from damage may have adjacent new asphalt concrete placed after applying the required tack coat. After placement and finishing of longitudinal joints, both sides of the joint shall be dense and the joint shall be smooth and tight. The surface in the area of the joint shall not deviate more than 1/4 inch from a 12-foot straightedge, when tested with the straightedge placed across the joint, in any direction.

321.8.3 Asphalt Leveling Course: A leveling course shall be used when specified, or as directed in writing by the Engineer, to bring existing pavement to a uniform grade prior to placing an overlay or other course. If a leveling course is being applied on an asphalt surface, a tack coat shall be applied. The compaction requirements contained in Section 321.10 do not apply to leveling courses.

321.8.4 Compaction - Asphalt Base Course and Surface Course: It is the contractor's responsibility to perform Quality Control monitoring and/or testing during compaction operations to achieve the required compaction. The temperature of the asphalt concrete immediately behind the laydown machine shall be at least 265 degrees F, unless WMA technology is being used. If WMA technology is being used then the minimum requirements will be stated within the mix design recommended by the WMA manufacturer. A probe type electronic thermometer with a current calibration sticker attached will be used to measure the temperature of the asphalt concrete mixture. When measuring the temperature of the mat, the probe shall be inserted at mid-depth and as horizontal as possible to the mat. The contractor is responsible to achieve the required compaction.

Asphalt compaction equipment shall be of sufficient size and weight to accomplish the required compaction. All compaction equipment shall be operated and maintained in accordance with the manufacturer's recommendations and the project requirements. During the rolling operation, the speed of the roller shall not exceed three miles per hour, unless otherwise approved by the Engineer.

Pneumatic tired compactors shall be equipped with skirt-type devices mounted around the tires so that the temperature of the tires will be maintained during the compaction process.

The Engineer will determine the acceptability of the pavement compaction in accordance with Section 321.10.

321.8.5 Smoothness: The completed surfacing shall be thoroughly compacted, smooth and true to grade and cross-section and free from ruts, humps, depressions or irregularities. An acceptable surface shall not vary more than 1/4 inch from the lower edge of a 12-foot straightedge when the straightedge is placed parallel to the centerline of the roadway.

321.8.6 Asphalt Concrete Overlay: Asphalt concrete overlay consists of the placing and compacting plant mix asphalt concrete over existing pavement. The mix design and thickness of the overlay shall be as shown on the plans or as specified in the special provisions.

Except when the existing asphalt surface is to be preheated and remixed, pavement surfaces shall be prepared as follows:

(A) Areas designated for pavement repair by the contract documents (which may include severely raveled areas, severely cracked areas, over-asphalted areas, and other defects) shall be cut out and replaced. Pavement repairs shall be completed and approved before placing asphalt concrete overlay.

(B) Before placing asphalt concrete overlay, raised pavement markers shall be removed, and milling shall be completed. Milling shall be as shown on the plans or specified in the special provisions and shall be in accordance with Section 317.

(C) After pavement repairs and milling have been completed, the entire surface shall be cleaned with a power broom.

(D) After surfaces have been prepared to the satisfaction of the Engineer, they shall receive a tack coat per Section 321.4. Traffic will not be permitted to travel over surfaces that have received a tack coat, except when tack coat is applied to milled surfaces in compliance with Section 317.2 for dust control purposes. When the overlay is to extend onto a concrete surface, the concrete surface shall be thoroughly cleaned of loose dust and cement particles and shall be tack coated.

Asphalt concrete overlay shall be placed as specified in Section 321.8.1 and compacted as specified in Section 321.8.4. The surface smoothness shall meet the tolerances specified in Section 321.8.5.

Frames and covers of manholes, survey monuments, valve boxes, clean-outs and other existing structures shall be adjusted in accordance with Section 345 to set flush with the finished surface of the new pavement. During adjustment, if pavement or base materials are removed or disturbed, they shall be replaced with approved materials installed in a manner acceptable to the Engineer.

On roads without curb and gutter, the existing unpaved shoulder elevation shall be adjusted by the Contractor to match the elevation at the edge of the new overlay and slope away from the new pavement surface at a rate that the existing quantity of shoulder material will allow. Shoulder material shall be compacted to a minimum of 95% of maximum density, determined in accordance with Section 301.3. Shoulder adjustment to match the new pavement surface elevation shall not be measured. The cost of shoulder adjustment shall be included in the price paid for the asphalt concrete overlay or other related pay items. When the Engineer determines an insufficient amount of material is available for shoulder adjustment, the Engineer may require the Contractor to provide additional material. Acceptable material for shoulders includes the existing shoulder material, millings, untreated base materials, or a granular material approved by the Engineer. Engineer requested imported material for shoulder adjustment is not included in the price paid for the asphalt concrete overlay.

321.8.7 Pavement Fabric Interlayer: Pavement fabric interlayer shall be used only when specified on the plans or in the specifications. Pavement fabric interlayer shall be in accordance with Table 796-1 and be the class designated on the plans or in the specifications.

Asphalt binder coat used to bond the fabric to the pavement shall be paving asphalt PG 70-10 asphalt cement conforming to the requirements of Section 711. The application and distributing equipment for the asphalt binder shall conform to the requirements of Section 330. The asphalt binder coat shall be uniformly spray applied to the prepared pavement surface at the rate of 0.20 gallons per square yard for Class B fabric or at the rate of 0.25 gallons per square yard for Class A fabric. Some underlying surfaces may require a higher or lower application rate. A test strip may be necessary to determine the proper application rate. The width of liquid asphalt cement application shall be the fabric width, plus six inches.

Neither the asphalt binder coat or fabric interlayer shall be placed when weather conditions, in the opinion of the Engineer, are not suitable. The asphalt binder and fabric interlayer shall only be placed when the pavement is dry, the ambient air temperature is 50 degrees F and rising, and pavement temperature is 40 degrees F and rising.

Equipment for placing the fabric shall be mechanized and capable of handling full rolls of fabric. The equipment shall be able to lay the fabric smoothly to maximize pavement contact and remove air bubbles. Stiff bristle brooms shall be used to smooth the fabric. The equipment used to place the fabric shall be in good working order and is subject to approval by the Engineer.

Pavement fabric interlayer shall not be placed if the in-place binder is hotter than 325 degrees F or has cooled to 180 degrees F or below (as determined by non-contact thermometer).

Pavement fabric interlayer shall be placed onto the asphaltic binder with the heat-bonded side up with a minimum amount of wrinkling or folding. Remaining wrinkles or folds 1-inch and larger shall be removed or slit and shingle-lapped in the direction of paving. Burning or torching of wrinkles is not allowed. Fabric shall overlap three to six inches to insure full closure of the joint. Transverse joints shall be shingle-lapped in the direction of paving to prevent edge pickup by the paver. A second application of hand-placed asphalt binder may be required at laps and repairs as determined by the Engineer to ensure proper binding of the narrow double fabric layer.

All areas where fabric has been placed shall be paved with asphaltic concrete during the same work shift. Placement of the asphaltic concrete shall closely follow fabric lay down. The temperature of the asphaltic concrete immediately behind the laydown machine shall not exceed 325 degrees F, unless modified by the WMA technology being used. If WMA technology is being used then the minimum requirements will be stated within the mix design recommended by the WMA manufacturer. In the event that the asphalt binder coat bleeds through the fabric causing construction problems before the overlay is placed, the affected areas shall be sanded with a sand blotter in compliance with Section 333. Excess sand shall be removed before beginning the paving operation. In the event of rainfall prior to the placement of the asphaltic concrete, the fabric shall be allowed to dry before the asphalt concrete is placed.

Turning of the paving machine or of other vehicles on the fabric shall be gradual and kept to a minimum to avoid damage to the fabric. Should equipment tires stick to the fabric during pavement operations, small quantities of paving asphalt concrete shall be broadcast on the fabric to prevent pick-up. Decrease of binder rate in order to minimize pick-up on tires is not allowed.

321.8.8 Thickened Edge: When the depth of the thickened edge extends four inches or more below the bottom of the asphalt pavement, the portion of the thickened edge extending below the asphalt pavement shall be placed and compacted prior to placement of the asphalt pavement. Placement of tack coat on the surface of the compacted thickened edge asphalt may be omitted when additional asphalt pavement is placed on the same day and the Engineer agrees that the surface of the thickened edge asphalt has remained clean.

When the depth of the thickened edge extends less than four inches below the bottom of the asphalt pavement, the portion below the asphalt pavement may be placed and compacted with the asphalt pavement in a single operation.

321.8.9 Safety Edge: The finished safety edge slope shall be planar forming a 30° ± 5° angle with the adjacent roadway surface and extend a minimum of five inches (5”) below the roadway pavement’s finished surface.

The safety edge shall be constructed with the top or final paving lift of a new pavement or overlay using a device that is mounted to or is a part of the screed portion of the laydown machine. The safety edge device shall be capable of constraining the asphalt concrete material to increase density of the extruded profile by reducing the volume. A conventional single strike-off plate is not acceptable. Compaction obtained from the extruded safety edge shall be acceptable when the extruded shape conforms to the specified shape.

During laydown operations if the extruded safety edge does not conform to the specified shape, the Contractor shall take immediate actions to correct the deficiency and to repair all non-compliant sections of safety edge. The Contractor shall stop paving operations until corrections to the laydown operation have been made and resumption of paving is approved by the Engineer or his designated representative.

321.8.10 Protection for Asphalt Base Course: Arterial roadway traffic shall not be allowed on a new asphalt base course that is less than five (5) inches in thickness without the written consent of the Engineer.

321.9 QUALITY CONTROL:

It is the contractor’s responsibility to perform Quality Control monitoring and/or testing during asphalt concrete production to achieve the required compaction and to perform Quality Control monitoring and/or testing during asphalt concrete production to achieve the required mix properties. The Engineer may obtain samples of any portion of any material at any point of the operations for his own use. Also, the Engineer may order the use of any drying, proportioning and mixing equipment or the handling of any material discontinued which, in his/her opinion, fails to produce a satisfactory mixture.

The asphalt concrete produced shall conform to the requirements of the production tolerances established in Section 321.10.

When the asphalt concrete does not conform to the production tolerances, it shall be reported to the Engineer, and corrective quality control measures shall be implemented, or production shall cease immediately at no additional cost to the contracting Agency.

Requests for referee testing as described in Section 321.11 will only be considered based on quality control test results performed by a laboratory accredited by the AASHTO Accreditation Program (AAP) for the tests being performed or a laboratory listed in the current ADOT Directory of Approved Materials Testing Laboratories for the set of tests in question. The laboratory shall use properly certified technicians in accordance with ASTM D3666, Section 7 (Personnel Qualifications).

321.10 ACCEPTANCE:

321.10.1 Acceptance Criteria: Asphalt concrete will be divided into lots for the purpose of acceptance. A lot shall be one day's production. Each lot shall be divided into sublots of 500 ton or fraction thereof. Tests used to determine acceptance will be performed by a laboratory accredited by the AASHTO Accreditation Program (AAP) for the tests being performed. The contracting agency shall provide an appropriately accredited laboratory or laboratories to perform the acceptance testing. Laboratories shall use properly certified technicians in accordance with ASTM D3666, Section 7 (Personnel Qualifications). The acceptance laboratory will take representative samples of the asphalt concrete from each sublot to allow for testing of gradation, binder content, air voids, pavement thickness, and compaction of base and surface courses. Acceptance of each sublot will be based on the test data from the sample(s) from that sublot. All acceptance samples shall be taken using random locations or times designated by the Engineer in accordance with ASTM D3665.

For permit work, testing that does not strictly adhere to the sampling and testing methodology and requirements outlined in this section shall be disregarded and not considered in any acceptance determination. All required retesting shall be at the expense of the permittee.

321.10.2 Gradation, Binder Content and Air Voids: The acceptance laboratory will take a sample of the asphalt concrete in accordance with the requirements of Section 2 or 4 of Arizona Test Methods 104 or AASHTO T-168 from each sublot. The minimum weight of the sample shall be 45 pounds. Asphalt binder content and gradation shall be determined in accordance with AASHTO T-308 using the ignition furnace for each sublot. The acceptance laboratory is responsible for obtaining the necessary materials and performing an ignition furnace calibration as outlined in AASHTO T-308 for each asphalt concrete mixture utilized on the project. The correction factor used for each test shall be clearly indicated on the report. Reports that do not include the correction factor, performed as stated in the previous sentences, shall be considered invalid and not allowed to be used for acceptance. The bulk density for Marshall Mix designs shall be tested in accordance with AASHTO T-245. The bulk density for Gyratory mix designs shall be determined in accordance with AASHTO T-312. The maximum theoretical density shall be determined in accordance with the requirements of AASHTO T-209 including fan drying per AASHTO T-209 Section 15. Effective voids of the laboratory compacted specimens will be determined at a minimum of once per lot in accordance with the requirements of AASHTO T-269. Should the testing for effective air voids not meet the "Full Payment" or "No Corrective Action" requirements of Table 321-5, additional testing for laboratory air voids on the remaining sublots will be performed as necessary to determine the extent of the deficiency. Acceptance testing results will be furnished to the contractor and the supplier within five working days of receipt of samples by the acceptance laboratory.

During production, the allowable deviations from the mix design gradation targets are listed in the tables below. The allowable production tolerances may fall outside of the mix design gradation bands.

TABLE 321-3A
GRADATION ACCEPTANCE LIMITS FOR MARSHALL MIXES

Sieve Size	3/8 inch Mix	1/2 inch Mix	3/4 inch Mix	Base Mix
1 inch	—	—	—	±7%
3/4 inch	—	—	±7%	±6%
1/2 inch	—	±7%	—	—
3/8 inch	±7%	±6%	±6%	±6%
No. 8	±6%	±6%	±6%	±6%
No. 40	±4%	±4%	±4%	±4%
No. 200	±2%	±2%	±2%	±2%

TABLE 321-3B GRADATION ACCEPTANCE LIMITS FOR GYRATORY MIXES			
Sieve Size	3/8 inch Mix	1/2 inch Mix	3/4 inch Mix
3/4 inch	—	—	±7%
1/2 inch	—	±7%	±6%
3/8 inch	±7%	±6%	—
No. 8	±6%	±6%	±6%
No. 40	±4%	±4%	±4%
No. 200	±2%	±2%	±2%

If the results from a single acceptance sample fall outside of the acceptance limits in Table 321-3A or 321-3B as applicable, a second sample shall be taken and if the second acceptance sample is also outside of the acceptance limits the Contractor shall cease production of asphalt concrete. Production shall not begin again until calibration test results verify that adjustments made to materials or proportions yield a gradation that falls within acceptance limits in Table 321-3A or 321-3B as applicable.

If the asphalt binder content is within ± 0.40% of the mix design target value, the asphalt concrete will be paid for at the contract unit price. If the asphalt binder content deviates by more than ± 0.40% from the mix design target value, the deficient area will be evaluated within the sublot by coring one additional location at a maximum interval of 100 feet on each side of the deficient sample. The asphalt content of the original deficient sample will be averaged with the asphalt binder content of the two additional cores to determine compliance with the acceptance requirements. If the resulting average of the asphalt binder content deviates by more than ± 0.40% from the mix design target value, then Table 321-4 shall apply to the sublot. If approved by the Engineer, the Contractor may obtain additional cores to assist in formulation of an Engineering Analysis, but the additional cores shall not be used for re-evaluating acceptance.

TABLE 321-4 ASPHALT BINDER CONTENT ACCEPTANCE AND PENALTIES		
Deviation from that permitted	When the contracting agency is the owner: Payment Reduction ($ per ton of asphalt concrete)	When the contracting agency is not the owner (i.e. permits): Corrective Action
Over 0.2% above that permitted	Removal* or EA	Removal* or EA
Over 0.1% to 0.2% above that permitted	$6.00	EA
Over 0.0% to0.1% above that permitted	$2.00	EA
Within permitted range	Full Payment	No Corrective Action
Over 0.0% to0.1% below that permitted	$2.00	EA
Over 0.1% to 0.2% below that permitted	$6.00	EA
Over 0.2% below that permitted	Removal* or EA	Removal* or EA

NOTES: *The Contractor shall remove and replace the entire sublot that is deficient.
EA = Engineering Analysis per Section 321.10.6

If the laboratory air voids fall within a range of 2.8% to 6.2%, the asphalt concrete will be paid for at the contract unit price. If the laboratory air voids are outside of this range, the deficient area will be evaluated within the sublot by coring one additional location at a maximum interval of 100 feet on each side of the deficient sample. The laboratory air voids of the original deficient sample will be averaged with the laboratory air voids obtained from each of the two additional cores to determine compliance with the acceptance requirements. If the resulting average of the laboratory air voids is outside the indicated range, then Table 321-5 shall apply to the sublot. If approved by the Engineer, the Contractor may obtain additional cores to assist in formulation of an Engineering Analysis, but the additional cores shall not be used for re-evaluating acceptance.

TABLE 321-5 LABORATORY VOIDS ACCEPTANCE AND PENALTIES		
Laboratory Air Voids (Measured at N_{des} or 75 blows as applicable)	When the contracting agency is the owner: Payment Reduction ($ per ton of asphalt concrete)	When the contracting agency is not the owner (i.e. permits): Corrective Action
Less than 1.5%	Removal* or EA	Removal* or EA
1.5-2.0%	$5.00	EA
2.1-2.7%	$2.00	EA
2.8-6.2%	Full Payment	No Corrective Action
6.3-6.9%	$2.00	EA
7.0-8.0%	$5.00	EA
Greater than 8.0%	Removal* or EA	Removal* or EA

NOTES: *The Contractor shall remove and replace the entire sublot that is deficient.
EA = Engineering Analysis per Section 321.10.6

If an agency or Engineer is purchasing asphalt concrete directly from a commercial material supplier, the agency or Engineer will use Section 321.10, and specifically Tables 321-3A or 321-3B as applicable, 321-4 and 321-5 from Section 321.10, when determining the acceptance of the asphalt concrete with the material supplier.

321.10.3 Surface Testing: If directed by the Engineer, surface drainage test shall be performed. The completed surfacing shall be thoroughly compacted, smooth and true to grade and cross-section, and free from ruts, humps, depressions or irregularities. An acceptable surface shall not vary more than 1/4 inch from the lower edge of a 12-foot straightedge when the straightedge is placed parallel to the centerline of the roadway. The straightedge shall be furnished by the contractor and shall be acceptable to the Engineer.

All streets shall be water tested for drainage in the presence of the Engineer or designated representative before final acceptance. Any areas not draining properly shall be corrected to the Engineer's satisfaction at the Contractor's expense. Water for this testing shall be provided and paid for by the Contractor.

When deviations in excess of the above tolerance are found, humps or depressions shall be corrected to meet the specified tolerance. The defective pavement shall be cut out along neat straight lines or for multiple course pavements the surface course may be milled out, and the removed pavement replaced with fresh hot mixture and thoroughly compacted to conform with and bond to the surrounding area. Materials and work necessary to correct such deviations shall be at no additional cost to the Contracting Agency.

When pavement is cut out along neat straight lines, full depth longitudinal joints shall not be located within a lane wheel path or within forty-eight inches (48") of an asphalt pavement edge. Longitudinal joints shall comply with the restrictions for Type A Trench Repairs in Section 336.3.

321.10.4 Asphalt Pavement Thickness: Asphalt pavement thickness will be determined from cores secured from each lift of each sublot. Such cores will be taken and measured by the Asphalt Concrete Coring Method. This method can be found in Section 321.14. Each core location will be patched by the party responsible for the testing.

Acceptance or assessment of penalties for asphalt pavement thickness will be based on the combined total thickness of all asphalt concrete layers omitting all layers of asphalt-rubber asphalt concrete. If the final total pavement thickness exclusive of all ARAC layers is deficient from the target thickness by 0.25 inches or less, it will be paid for at the contract unit price.

If the thickness deficiency of the pavement core exceeds 0.25 inch, the thickness deficiency shall be evaluated by coring at a maximum interval of 100 feet on each side of the deficient core. The thickness of the original deficient core will be averaged with the thicknesses of the cores taken from each side of it to determine compliance with the acceptance requirements.

If the pavement thickness deficiency is greater than 0.25 inches and the contracting agency is not the owner (i.e. permits) the following will apply:

(1) If the pavement thickness deviates from the target thickness by more than 0.25 inch but not more than 0.50 inch, corrective action will be required. This corrective action shall consist of application of a Type II slurry seal coat in accordance to Section 715. The Contractor may present an Engineering Analysis outlining other proposed remedial measures for the consideration by the Engineer. The Engineer will review the Engineering Analysis and decide within 30 working days whether to accept the proposed remedial measures.

(2) If the pavement thickness deviates from the target thickness by more than 0.50 inch, corrective action will be required. The deficient area shall be overlaid with no less than a 1 inch thick lift, for the full width of the pavement to meet or exceed the designed thickness, with appropriate end and edge milling, with a mixture approved by the Engineer. The Contractor may present an Engineering Analysis outlining other proposed remedial measures for the Engineer's consideration. The Engineer will review the Engineering Analysis and decide within ten working days whether to accept the proposed remedial measures. If the Engineer chooses to reject the Engineering Analysis, the indicated overlay shall be constructed by the Contractor at no additional cost to the Owner.

If the contracting agency is the owner and the pavement thickness deficiency is greater than 0.25 inches but less than 0.50 inches, Table 321-6 will apply. If the pavement thickness deficiency is greater than 0.5 inches, the deficient area shall be overlaid with no less than a 1-inch thick lift for the full width of the pavement to meet or exceed the designed thickness using an asphalt mixture approved by the Engineer. The Contractor shall provide appropriate end and edge milling. The overlay and milling shall be accomplished by the Contractor at no additional cost to the contracting agency.

TABLE 321-6
ASPHALT PAVEMENT THICKNESS PAYMENT REDUCTION
For Thickness Deficiency of More Than 0.25 inches and less than 0.50 inches

Total Specified Asphalt Pavement Thickness exclusive of ARAC (if any)	Reduction in Payment Applied to asphalt concrete Except ARAC layers (if any)
Less than 1.5 inches	50%
1.50 inches to 1.99 inches	33%
2.00 inches to 2.49 inches	25%
2.50 inches to 2.99 inches	20%
3.00 inches and greater	17%

321.10.5 Density:

321.10.5.1 Pavement 1-1/2 Inches or Less in Nominal Thickness: Compaction shall consist of a "Rolling Method Procedure" using an established sequence of coverage with specified types of compactors. A pass shall be defined as one movement of a compactor in either direction. Coverage shall be the number of passes as are necessary to cover the entire width being paved.

The rolling sequence, the type of compactor to be used, and the number of coverages required shall be as shown in Table 321-7.

TABLE 321-7				
ROLLING SEQUENCE FOR LIFT THICKNESS 1½" OR LESS				
Rolling	Type of Compactor		No. of Coverages	
Sequence	Option No. 1	Option No. 2	Option No. 1	Option No. 2
Initial	Static Steel	Vibrating Steel	1	1
Intermediate	Pneumatic Tired	Vibrating Steel	4	2- 4*
Finish	Static Steel	Static Steel	1-3	1-3
* Based on the roller pattern which exhibits the best performance.				

The Contractor shall select the option for compaction and, when pneumatic-tired compactors are used will designate the tire pressure. Steel wheel compactors shall not be used in the vibratory mode for courses of one inch or less in thickness nor when the temperature of the asphaltic concrete falls below 180 degrees F. Initial and intermediate compaction shall be accomplished before the temperature of the asphaltic concrete falls below 200 degrees F.

Compaction will be deemed to be acceptable on the condition that the asphaltic concrete is compacted using the type of compactors specified, ballasted and operated as specified, and with the number of coverages of the compactors as specified.

321.10.5.2 Pavement Greater than 1-1/2 Inches in Nominal Thickness: Achieving the required compaction is the responsibility of the contractor. The number and types of rollers is the contractor's responsibility and shall be sufficient to meet these requirements.

In-place air voids shall be determined in accordance with AASHTO T-269 utilizing cores taken from the finished pavement. The maximum theoretical density used in the determination of in-place air voids will be the average value from the acceptance samples determined for the lot as outlined in 321.10.1.

The Engineer will designate one random test location for each sublot and the acceptance laboratory will obtain one core from that location. Regardless of sublot quantities or boundaries, a minimum of one core will be obtained per residential street and a minimum of one core per travel lane for collector and arterial streets. The outside one foot of each pass of the pavement course or any unconfined edge will be excluded from testing. The Engineer may exclude areas from the compaction lot that are not accessible by normal compaction equipment.

The Contractor shall provide the traffic control to facilitate any coring operations necessary for compaction acceptance.

Cores will be taken per the Asphalt Concrete Coring Method. This method can be found in Section 321.14. Acceptance testing results will be furnished to the contractor within five working days of receipt of samples by the acceptance laboratory.

If the pavement density has in-place voids of between 4.0% and 8.0%, the asphalt concrete will be paid for at the contract unit price. If the acceptance core for a sublot indicates that the pavement density has in-place voids of less than 4.0% or greater than 8.0%, the deficient area will be evaluated by coring two additional locations at maximum intervals of 100 feet from the deficient core. The in-place voids of the original deficient core will be averaged with the in-place voids of the cores taken from 100 feet on each side of it to determine compliance with the acceptance requirements. If the resulting average of the in-place voids is outside the indicated range, then Table 321-8 shall apply to the sublot. If approved by the Engineer, the Contractor may obtain additional cores to assist in formulation of an Engineering Analysis, but the additional cores shall not be used for re-evaluating acceptance.

TABLE 321-8		
PAVEMENT DENSITY PENALTIES		
Limits of In-place Air Voids for design lift thicknesses 1.5 inches and greater	When the contracting agency is the owner Payment Reduction ($ per ton of asphalt concrete)	When the contracting agency is not the owner i.e. permits Corrective Action
Below 3.0%	Removal* or EA	Removal* or EA
3.0% to below 4.0%	$10.00	EA and Type II Surry Seal
4.0% to 8.0%	Full Payment	No Corrective Action
Greater than 8.0% to less than 9.0%	$6.00	EA
9.0% to 10.0%	$10.00	EA and Type II Surry Seal
Greater than 10.0%	Removal* or EA	Removal* or EA

NOTES: *The Contractor shall remove and replace the entire sublot that is deficient.
EA = Engineering Analysis per Section 321.10.6

321.10.6 Engineering Analysis (EA): Within 10 working days after receiving notice that a lot or sublot of asphalt concrete is deficient and is found to fall within the "Removal or EA" band per Table(s) 321-4, 321-5, and/or 321-8, the contractor may submit a written proposal (Engineering Analysis) to accept the material in place at the applicable penalties along with possible remediation(s) listed in the "Removal or EA" category. Engineering Analysis can also be proposed for non-removal categories of "Corrective Actions" when the contracting agency is not the owner (i.e. permits).

The Engineering Analysis shall contain an analysis of the anticipated performance of the asphalt concrete if left in place. The Engineering Analysis shall also detail the effect of any proposed corrective action to the material(s) in place as it relates to the in-place material's performance. The Engineering Analysis shall be performed by a professional engineer experienced in asphalt concrete testing and mix designs.

If a lot or sublot is accepted for referee testing and the referee test results still show a deficiency, the contractor shall have ten working days to submit an Engineering Analysis beginning upon notification of referee test results.

When an Engineering Analysis recommends that a specific lot or sublot should not be removed, the Engineering Analysis will recommend that the following penalties (Table 321-9) be paid when the contracting agency is the owner, for the specific criteria being reviewed by the EA.

TABLE 321-9		
ENGINEERING ANALYSIS PENALTIES for REMOVAL* LOTS/SUBLOTS LEFT IN-PLACE		
Acceptance Criteria	**Acceptance Limits**	**Penalty When Contracting Agency is the Owner ($/Ton)**
Asphalt Binder Content	Over 0.2% points from that Permitted	$9.00
Laboratory Air Voids (Measured at N_{des} or 75 blows as applicable)	Less than 1.5% or Greater Than 8.0%	$7.50
Limits of In-place Air Voids	Less than 3% or Greater than 10.0%	$15.00

Within 15 working days, the Engineer will determine whether or not to accept the Contractor's proposed Engineering Analysis.

321.11 REFEREE:

If the Contractor has reason to question the validity of any of the acceptance test results, the Contractor may request that the Engineer consider referee test for final acceptance. Any request for referee testing must describe the contractor's reasons for questioning the validity of the original acceptance test results and must clearly describe which set of acceptance tests are in question. The Engineer may either accept or reject the request for referee testing. When referee testing is accepted the Contractor (at the Contractors own expense) will engage an independent laboratory accredited by the AAP or a laboratory listed in the current ADOT Directory of Approved Materials Testing Laboratories as appropriate the acceptance tests that are being questioned. The independent referee laboratory shall use properly certified technicians in accordance with ASTM D3666, Section 7 (Personnel Qualifications). For the set of test results in question, the referee laboratory shall perform a new set of acceptance tests (as required by Section 321.10 representing the area for the set of tests in question). The referee tests will replace the original acceptance tests that were in question.

For permit work, the permittee, whose results necessitate referee testing, shall bear all expenses in the additional testing (i.e., secondary and the referee testing) if the original results are not substantiated by the referee testing procedure outlined in this section. Additionally, any testing performed that does not strictly adhere to the sampling and testing methodology and requirements in Section 321.10 shall be disregarded and not allowed in any acceptance determination. Disregarded tests will be re-performed at the expense of the permittee.

These tests may include asphalt binder content, aggregate gradation, Marshall or Gyratory unit weight, maximum theoretical unit weight, laboratory air voids and in-place air voids (compaction). All referee testing shall conform to Section 321.10. Samples for referee testing shall come from representative samples obtained from the completed pavement, as directed by the Engineer.

The number of samples taken will be the same as specified in Section 321.10. The independent laboratory shall compile the test results and transmit them to both the Engineer and the contractor. The independent laboratory shall include a report sealed and signed by an Engineer registered in the State of Arizona, who is experienced in asphalt concrete testing and mix design development. The signed report shall give an opinion that the material evaluated does or does not comply with project specifications, shall clearly describe any deficiencies, and the results will be binding between all parties.

321.12 MEASUREMENT:

Asphalt concrete pavement will be measured by the ton, or by the square yard, for the mixture actually used as allowed above, which shall include the required quantities of mineral aggregates, asphalt binder, and mineral admixture. Measurement shall include any tonnage used to construct intersections, roadways, streets, or other miscellaneous surfaces indicated on the plans or as directed by the Engineer.

Measurement for safety edge preparation only applies to overlays of existing pavements that require the construction of a safety edge when none exists. Safety edge preparation will be measured by the linear foot. Safety edge preparation will not be measured when a safety edge is part of new pavement construction, pavement widening, or when overlaying an existing pavement that contains a safety edge. The asphalt concrete pavement measurement shall include the tonnage used to construct safety edges or the square yard measurement for asphalt concrete pavement will be increased by the horizontal extension of the safety edge beyond the roadway pavement edge.

321.13 PAYMENT:

The asphalt concrete measured as provided above will be paid for at the contract price per ton or square yard, as adjusted per Section 321.10, which price shall be full compensation for the item complete, as herein described and specified.

Payment for tack coat will be by the ton diluted, based on the rate of application, as directed by the Engineer.

No payment will be made for any overrun in quantity of asphalt concrete in excess of 10 percent for newly constructed pavement having a total thickness equal to or greater than 2.5 inches. The overrun quantity is excess tonnage above the tonnage calculated based on actual field measurement of area covered, design thickness, and the mix design unit weight. The calculations for overrun will be by individual pay item. To compensate or adjust for a thickness deficiency in an underlying asphalt concrete

course, the Engineer may authorize a quantity increase in excess of 10 percent for a subsequent asphalt concrete course. In such cases, the quantity in excess of 10 percent will be paid for at the lowest unit price.

Removal of raised pavement markers, pavement repairs, and surface pavement replacements required prior to roadway overlay operations will be paid for by other pay items unless otherwise specified.

Except as otherwise specified, no separate payment will be made for work necessary to construct thickened edges, safety edges, or other miscellaneous items or surfaces of asphalt concrete.

Payment for safety edge preparation will be at the contract unit price for the quantities measured as described above.

321.14 ASPHALT CORE METHOD: Core Drilling of Hot Mix Asphalt (HMA) for Specimens of 4" or 6" diameter

321.14.1 Scope: This method is to establish a consistent method of the use of a diamond bit core to recover specimens of 4 or 6 inch diameter for laboratory analysis and testing. The method will require the use of: water, ice (bagged or other suitable type), dry ice, and a water-soap solution to be utilized when coring asphalt rubber concrete. Individuals doing the specimen recovery should be observing all safety regulations from the equipment manufacturer as well as the required job site safety requirements for actions, and required personal protective equipment.

For permit work, testing of cores obtained in a manner that does not strictly adhere to the methodology outlined in this section shall be disregarded and not considered in any acceptance determination. Retesting shall be at the expense of the permittee.

321.14.2 Core Drilling Device: The core drilling device will be powered by an electrical motor, or by an acceptable gasoline engine. Either device used shall be capable of applying enough effective rotational velocity to secure a drilled specimen. The specimen shall be cored perpendicularly to the surface of pavement, and that the sides of the core are cut in a manner to minimize sample distortion or damage. The machinery utilized for the procedure shall be on a mounted base, have a geared column and carriage that will permit the application of variable pressure to the core head and carriage throughout the entire drilling operation. The carriage and column apparatus shall be securely attached to the base of the apparatus; and the base will be secured with a mechanical fastener or held in place by the body weight of the operator. The core drilling apparatus shall be equipped with a water spindle to allow water to be introduced inside of the drill stem while operating. The cutting edge of the core drill bit shall be of hardened steel or other suitable material with embedded diamond chips in the cutting surface. The core barrel shall be of sufficient diameter to secure a specimen that is a minimum of four or six inches or whichever is prescribed for necessary testing. The core barrel shall not be missing more than one of the teeth used for cutting; if so, it shall be discarded and another barrel shall be used. The core barrel shall also be a minimum of two inches longer than the anticipated depth of pavement in accordance with project paving plans.

321.14.3 Accessory Equipment: A sufficient supply of ice and dry ice shall be provided to sufficiently cool the pavement prior to securing the samples from the designated areas in the pavement. The ice should also be used to adjust the temperature of the water used to cool the core bit. A water supply (usually a plastic 35 – 55 gallon drum) with sufficient hose to introduce the water into and through the spindle of the coring device by gravity feed. The drum should be white or light in color to minimize excessive thermal heating of the water (*for coring of asphalt rubber cores see Note 1*). At no time shall the water utilized in the coring operation exceed 65 degrees F during the coring operation. Ice shall be utilized to ensure the temperature control of the water being introduced during the cutting operation. An ice chest or other suitably insulated container that can maintain a temperature of less than 70 degrees F shall be used to secure the specimens during transport. The container will be equipped with flat shelving that will support the drilled cores throughout the entire specimen dimension during transport back to the testing facility.

Miscellaneous hand tools to remove the drilled specimen from the drill hole or the core barrel taking great care in not disturbing the specimen more than necessary (refer to fig. 1 in ASTM D5361).

321.14.4 Process: The pavement surface at the time of coring shall not exceed a temperature of 90 degrees F; the pavement shall be conditioned with ice or dry ice to ensure that this requirement is met. Immediately after it has been ensured that the pavement has dropped to the required temperature, core drilling shall begin. The operator will then apply an even and continuous pressure (Note 2) to penetrate through the full depth of the pavement. The operator will concurrently ensure that enough water is moving over the core surface as to adequately remove any and all cuttings that could damage the drilled core.

After the pavement thickness has been penetrated, the core shall be carefully removed from either the drill hole or the core barrel and be immediately transferred to an ice chest or other suitable container. Each individual core shall be placed on a shelf in the cooler with the exposed side of the specimen facing down, or the "top side" down. If the specimen is a two-lift core, the only acceptable means of separating lifts is with a power or other acceptable wet saw type of equipment (conforming to ASTM D5361); however, at no time shall cores be split using a mallet and screwdriver or metal straight edge when being tested for bulk density. Perpendicularity of the specimen shall be checked in the field after the specimen has been extracted from the surface. The core operator shall hold the core up to eye level and place the core top side down in a "speed square" or small carpenters square. The specimen placed in the square shall not depart from perpendicular to the axis more than 0.5º (approximately equivalent to 1/16 of an inch in 6 inches). If the specimen is outside of this distance from square, it shall be discarded in the field and another sample cored that falls within tolerance. The cores upon arriving at the laboratory for testing shall be carefully cleaned and measured for thickness in accordance with ASTM D3549. A speed square shall be used to measure perpendicularity as compared to a 90 degrees angle and shall not depart from perpendicular to the axis more than 0.5 degrees (approximately equivalent to 1/16 of an inch in 6 inches). All remaining testing shall be done within the parameters of the current project and/or agency required specification.

The core operator that obtained the cores is responsible for restoration of the core holes at the conclusion of the coring process. Immediately before restoration, standing water and errant debris shall be removed from the holes. Core holes shall be patched back with an agency-approved material. One typical material is hot mix asphalt conforming to Section 710, compacted in thin (1.5 inch) lifts with the temperature compaction range as specified on the mix design, or as established by the binder supplier. Another typical material is pre-packaged non-shrink grout conforming to ASTM C1107. If non-shrink grout is used, the individual restoring the core holes is responsible for protecting the finished work from tire traffic, etc. Other patch materials maybe used at the discretion of the Engineer.

- End of Section -

*Note 1 – It should be noted that when the material to be cored is a rubberized asphalt mixture a wetting agent such as liquid dish soap be added to the water barrel to hinder the material from sticking or allowing the binder to spread during coring.
*Note 2 – This refers to pressure exerted on the core barrel and machine during the coring process. Too much pressure can cause damage to the core barrel and the motor; and too little pressure can cause a glazing of the diamonds, reducing cutting efficiency and premature wear of the barrel.

SECTION 324

PORTLAND CEMENT CONCRETE PAVEMENT (PCCP)

324.1 DESCRIPTION:

This item shall consist of construction of a pavement composed of plain jointed Portland cement concrete on a prepared subgrade. The Contractor shall furnish all labor, materials and equipment necessary for the construction of the pavement in accordance with these specifications and in reasonably close conformity to the lines, grades, thicknesses and details indicated by the plans or as established by the Engineer. All tests shall be performed by a laboratory approved by the Engineer.

324.2 MATERIALS:

324.2.1 Portland Cement Concrete: Portland cement concrete shall conform to the applicable requirements of Section 725 and the additional requirements of this section.

Concrete shall comply with Table 725-1 for Class AA, 4000 psi unless otherwise specified by the Engineer.

The maximum concrete slump shall be as determined by the approved mix design in accordance with Section 725.9(A)(1).

324.2.2 Reinforcement: Tie bars shall be deformed billet steel reinforcing bars conforming to the requirements of ASTM A615, Grade 40.

Dowel or load transfer bars shall conform to the requirements of ASTM A615, Grade 40. An approved support system shall be used to hold bars in position.

324.2.3 Curing Materials: Materials for curing concrete shall conform to the requirements of Section 726.

324.2.4 Joint Materials: Joint sealant shall be poured type, conforming to the requirements of Section 729.2 or as approved by the Engineer. Preformed expansion joint filler shall conform to the requirements Section 729.1 or as approved by the Engineer.

324.3 CONSTRUCTION METHODS:

324.3.1 General: Pavement shall be constructed with mechanical equipment utilizing stationary side forms or by the use of slipform paving equipment without stationary side forms. Manual methods of placing and finishing concrete with stationary side forms may be permitted by the Engineer for areas inaccessible for mechanical equipment.

All curb and gutter shall have the same class of concrete as the adjacent PCCP. Gutter sections shall have the same thickness as the PCCP section. All curbs or combined curb and gutter joints shall align with roadway joints.

324.3.2 Equipment: Design, capacity, and mechanical condition of equipment and tools necessary for handling materials and performing all parts of the work shall be approved by the Engineer. Equipment shall be at the jobsite sufficiently ahead of the start of concrete paving operations to permit thorough examination and approval by the Engineer prior to start of concrete paving.

Equipment used to place concrete may consist of one or more machines, shall be capable of uniformly distributing and consolidating the concrete as it is placed without segregation and shall be capable of producing concrete pavement, which will conform to the required cross-section with a minimum of hand work. The number and capacity of machines furnished shall be adequate to perform the work required at a rate equal to the concrete delivery rate.

Vibrators shall be used to consolidate concrete; the rate of vibration shall be not less than 3,500 cycles per minute for surface vibrators and not less than 8,000 cycles per minute for internal vibrators. Power to vibrators mounted on mechanical equipment shall be so connected that vibration ceases when forward or backward motion of the machine is stopped. Contractor shall furnish a tachometer or other suitable device for measuring and indicating the frequency of vibration.

Slipform pavers shall be equipped with high frequency internal vibrators mounted with axes either parallel or normal to pavement alignment for the full paving width. Vibrators mounted with axes parallel with pavement alignment shall be spaced at intervals not to exceed 24 inches, measured center-to-center. Vibrators mounted with axes normal to pavement alignment shall be spaced so that lateral clearance between individual vibrating units does not exceed 6 inches.

Slipform paving equipment which will be wholly or partially supported on subgrade shall be equipped with traveling side forms of sufficient dimensions, shape and strength to support the concrete at free edges laterally for a sufficient length of time during placement to produce pavement of the required cross-section, and shall be equipped and operate with automatic sensing and control devices such that the machine automatically senses deviations from the established guideline and performs the necessary corrective maneuvers to overcome variations from correct grade and alignment.

When concrete will be placed adjacent to existing pavement or curb and gutter, that part of the equipment supported on the existing pavement or curb and gutter shall be equipped with protective pads on crawler tracks or rubber-tired wheels with bearing surfaces offset a sufficient distance from the edge of the pavement or curb and gutter to avoid edge damage, or the surface of the existing pavement or curb and gutter shall be otherwise protected against such damage in a manner approved by the Engineer.

324.3.3 Subgrade and Base Preparation: Subgrade and base shall conform to the applicable compaction requirements of Section 601 and elevation tolerances specified for the material involved, shall be kept smooth and compacted, and shall be free of all loose and extraneous material when concrete is placed.

The surface of the subgrade shall be uniformly moist when concrete is placed. The surface of the subgrade shall be moistened immediately prior to placement of concrete, if necessary to produce a uniformly moist condition. Any excess water standing in pools or flowing on the surface shall be removed prior to placing concrete.

324.3.4 Stationary Side Forms and Setting of Forms: Side form sections shall be straight, free from warps, bends, indentations or other defects. Side forms shall be of metal, have a base width of at least four inches and a minimum depth equal to the thickness of the pavement. No section shall show a variation from a true plane greater than 1/8 inch in ten feet on the top of the form or more than 1/4 inch in ten feet on the inside face. Flexible or curved forms of proper radius shall be used for curves of 100 feet radius or less. Suitable materials other than metal may be used to form end closures or at other locations where use of metal forms is not practical. Forms shall be thoroughly cleaned and oiled each time they are used.

Forms shall be of such cross-section and strength and so secured and supported on the subgrade as to resist the pressure of the concrete when placed and the impact and vibration of any equipment they are to support without springing or settlement. The method of connection between sections shall be such that the joints shall not move in any direction.

Subgrade under forms shall be compacted and cut to grade so that the form when set will be uniformly supported for its entire length at the specified elevation. Forms shall be so supported and secured during the entire operation of placing and finishing that they will not deviate vertically at any point more than 1/8 inch from the proper elevation. Forms shall be set to the required lines and grades well in advance and for a distance sufficient to prevent delay in placing concrete, and shall be approved by the Engineer prior to placing concrete. When any form has been disturbed or any grade has become unstable, the form shall be reset and rechecked.

Side forms shall remain in place until the day after placing concrete, and in all cases until the edge of the pavement no longer requires the protection of the forms. Forms shall be carefully removed in such a manner as to avoid damage to the pavement. Use of pry bars between the pavement and the forms will not be permitted.

324.3.5 Placing, Spreading and Compacting: Construction equipment shall not operate on the subgrade in the paving lane when conditions of the job will permit operation from outside the lane. When job conditions make it necessary to operate equipment on the subgrade in the paving lane, suitable runways or other precautions shall be taken to prevent rutting or displacement of subgrade material. The grade shall be checked and corrected immediately ahead of concrete placement and all disturbed grade shall be properly recompacted. Except when otherwise approved by the Engineer, concrete shall be deposited on the subgrade and spread full width using mechanical methods that result in minimal handling and segregation.

Necessary hand spreading shall be done with shovels, not rakes. Placement shall be continuous between transverse joints without the use of intermediate bulkheads.

The Contractor shall make adequate advance arrangements for preventing delay in delivery and placing of concrete. An interval of more than 15 minutes between placing of any two consecutive batches shall constitute cause for stopping operations, and Contractor shall remove all concrete placed beyond the last scheduled joint or install a joint of the type and at the location as directed by the Engineer.

Concrete shall be deposited as near to expansion and construction joints as possible without disturbing them but shall not be dumped onto a joint assembly. Concrete shall be thoroughly consolidated against and along the faces of all forms, adjacent pavement or curb and gutter, and on both sides of all joint assemblies. Vibrators shall not be permitted to come in contact with joint assemblies, the grade, or side forms, and shall not be operated longer than 15 seconds in any one location.

Manual methods of placing, spreading, and compacting may be used in the construction of pavement lanes of irregular width or widths less than 10 feet, and sections of intersections or other locations with complex variable surface configurations when permitted by the Engineer. Workmen shall not be allowed to walk in the freshly placed concrete.

324.3.6 Shaping and Initial Finishing: Concrete shall be struck off, consolidated, and float-finished with a slipform paver, mechanical finishing machine, vibrating screed, or by hand finishing methods when approved by the Engineer so that the complete pavement will conform to the thickness and cross-section requirements of the plans and specifications. When the pavement being constructed is contiguous to existing parallel concrete pavement or curb and gutter, the elevation of the new pavement surface shall conform as closely as possible to the elevation of the existing pavement or gutter surface in a manner that will prevent ponding. The difference in elevation shall not exceed 1/4 inch.

Water shall not be applied to the pavement surface during screeding and finishing operations in excess of the amount lost by evaporation. Adding water to the surface of the concrete to assist in finishing operations shall not be permitted. When applications of water to the surface are required to prevent rapid evaporation of water from the surface during finishing operations, it shall be applied as a fog spray and with approved spray equipment.

(A) Slipform Supported on Subgrade Method: When concrete pavement will be placed with slipform paving equipment which will be supported and operate on the subgrade, the subgrade and slipform paver track area shall be brought to proper grade and cross-section by means of a properly designed and operated machine. The equipment shall spread, consolidate, screed and float-finish the concrete in one complete pass of the machine. The machine shall be operated with as nearly a continuous forward movement as possible, and all paving operations shall be so coordinated as to provide uniform progress with stopping and starting of the paver held to a minimum. Sliding side forms shall be rigidly held together to prevent spreading. Any edge slump of the pavement, exclusive of edge rounding, in excess of 1/4 inch shall be corrected.

No abrupt changes in longitudinal alignment of the pavement will be permitted. The horizontal deviation shall not exceed one inch from the alignment established by the Engineer.

While concrete is being spread, compacted and shaped, vibrating units shall be operated within fresh concrete so that the longitudinal axis, at the center of each unit, is not more than 6 inches above the top of the subgrade. Amplitude of vibration shall be sufficient to be perceptible on the surface of concrete along the entire length of vibrating units and for a distance of at least one foot.

(B) Mechanical Equipment Supported on Fixed Form Method: When concrete is spread without the use of internal vibration, the finishing machine shall be equipped with vibrating equipment that will internally vibrate the concrete for the full paving width and with not less than two oscillating or reciprocating screeds. Concrete shall be struck off and consolidated so that the surface will conform to the finished grade and cross-section shown on the project plans and with sufficient material on the surface for floating operations.

After the concrete has been struck off and consolidated, it shall be floated with a longitudinal float of a type approved by the Engineer.

A slipform paver or a single machine, which will effectively spread, consolidate, screed, and float in one operation may

be used in lieu of separate finishing and floating equipment.

(C) Manual Methods with Fixed Forms: Concrete shall be deposited, spread and struck off to such an elevation that, when properly consolidated, the surface will conform to the required lines and grades. Concrete shall be consolidated by internal vibration as it is struck off with a screed. A slight excess of concrete shall be kept in front of the screed at all times during the strike-off operation.

After consolidation and screeding, concrete shall be tamped to the proper surface elevation and cross-section using either a heavy plank with a length in excess of the width of pavement being placed by one foot or more, or with a mechanical vibrating unit spanning the full width between forms. The tamping plank, if used, shall be stiffened as necessary to prevent sag and shall have the lower tamping edge shod with metal. The tamping plank shall be moved forward with a combined vertical tamping and longitudinal screeding motion so that the concrete will be thoroughly consolidated and the surface screeded to the required elevation. A small surplus of concrete shall be kept in front of the tamper or vibrating unit. Tamping or vibrating shall continue until the specified cross-section is obtained and the mortar flushed slightly to the surface. On grades in excess of 5 percent a second strike board shall follow from 25 to 50 feet behind the tamper or vibrating unit and shall be used in the same manner to remove waves caused by the flow of concrete behind the first strike board.

Methods other than the tamping plank may be utilized for screeding when approved by the Engineer.

Pavement shall be finished smooth and true to grade with suitable manually operated floats or powered finishing equipment.

324.3.7 Final Finishing: After the pavement has been float-finished, it shall be scraped with a 10-foot long straightedge equipped with a handle to permit operations from the edge of the pavement, and excess water and laitance shall be removed from the surface. The straightedge shall be operated parallel to the centerline of the pavement and shall be moved forward one-half length after each pass. Irregularities shall be corrected by adding or removing concrete, and disturbed places shall be again straight-edged.

Long-handled floats shall be used only in areas not accessible to finishing equipment and in emergencies, and use of such floats shall be confined to a minimum.

The addition of water to the surface of the concrete to assist in finishing operations shall not be permitted unless approved by the Engineer. When the evaporation rate on the concrete surface exceeds the rate of bleeding of the concrete, measures shall be taken to prevent the rapid evaporation of water from the surface during finishing operations. When allowed by the Engineer, the addition of water to the surface may be permitted when applied as a fog spray with approved spray equipment immediately after screeding and/or between finishing operations. A commercial evaporation reducer that forms a monomolecular film may also be sprayed onto the concrete surface in accordance with the Manufacturer's recommendations. When either of these methods is approved and used, it does not take the place of proper curing methods per Section 324.3.8.

Pavement edges and joints shall be edged in accordance with details shown on the project plans or as directed by the Engineer.

In advance of curing operations, pavement shall be textured. Texturing shall be performed with an artificial turf drag with a board added to assure the weight needed to obtain an approved surface. Artificial turf shall be a molded composite structure with polyethylene face, nylon and polyester backing, a pile height of 0.85 inches, and total weight of 75 oz./sq. yd. The surface obtained during initial surface texturing shall be subject to approval by the Engineer. The texturing approved on the initial construction shall not be changed without the Engineer's approval. Each time the construction is stopped or causes the texturing to stop, the artificial turf must be shaken clean before continuing.

324.3.8 Curing: Curing shall begin immediately following surface texturing and edging. Before concrete placement begins, Contractor shall have at hand and ready to install the materials and equipment needed for adequate curing.

After finishing operations have been completed, the newly placed concrete shall be cured by moist curing methods, by application of a white pigmented liquid membrane compound conforming to the requirements of Section 726, or by a combination of these methods. All surfaces not covered by reasonably waterproof forms shall be kept damp by applying water with a nozzle that so atomizes the flow of water that a fog mist and not a spray is formed until the surface is covered with liquid

membrane compound, the surface has hardened sufficiently to permit sprinkling of the surface, or moist curing by covering with wet burlap or other approved materials can be initiated. Moisture from the nozzle shall not be applied under pressure directly upon the concrete and shall not be allowed to accumulate on the concrete in a quantity sufficient to cause a flow and erode the surface. Moist curing shall be continued until liquid membrane curing compound or other type of curing membrane is applied.

Membrane curing compound shall be applied to all pavement by automatic mechanical method from a construction bridge.

The edges of concrete slabs exposed by the removal of forms shall be protected immediately to provide these exposed surfaces with continuous curing treatment equal to the method selected for curing the pavement surface.

The membrane method of curing may be applied behind the final finishing operation after all free water has disappeared from the surface. Complete and uniform coverage at the rate of one gallon per 100 square feet, or as otherwise recommended by the manufacturer, shall be required. Compound shall be kept agitated to prevent pigment from settling.

324.3.9 Joints: Joints shall be provided in the pavement of the type, dimensions and at the locations as indicated in the plans or as specified herein. Joints in concrete pavement will be designated as transverse expansion joints, longitudinal or transverse construction joints, longitudinal or transverse weakened plane joints, or isolation joints. The faces of all joints shall be perpendicular to the pavement surface. Joints shall be constructed in accordance with the details shown or referenced in the plans and in accordance with the following provisions.

At all times prior to acceptance of the construction, joints shall be maintained clean and free of soil, gravel, and other foreign material except approved types of joint filler materials.

(A) Longitudinal Joints: Longitudinal joints shall be weakened plane or construction joints. Longitudinal weakened plane joints shall be constructed by sawing or by insertion of a parting strip in the plastic concrete to be left in place. Longitudinal construction joints shall be constructed with tie bars or keyways as indicated in the plans.

(B) Transverse Joints: Transverse joints shall be weakened plane, construction or expansion joints. All transverse weakened plane joints will be constructed by sawing and in accordance with the details shown in the project plans. Transverse construction joints shall be constructed in accordance with the details shown or referenced in the project plans. Transverse expansion joints shall be constructed in accordance with the details shown or referenced in the project plans.

Dowel bars when required shall be supported with an approved support system.

(C) Joint Location: Longitudinal and transverse joints shall be constructed at locations as indicated in the project plans. Isolation joints shall be provided around manholes, catch basins, or other elements, which extend into or project through the pavement and act as point of restraint to horizontal or vertical movement of the pavement. Isolation joints shall be located in accordance with Detail 224 or as directed by the Engineer.

324.3.9.1 Construction of Joints:

(A) Sawed Joints: Sawed joints shall be constructed by cutting a groove in the pavement using a single or multiple-blade power saw. The groove shall be cut to the dimensions shown on the project plans. Suitable guidelines or devices shall be used to ensure joints are cut true to the lines as shown on the project plans.

If joints are sawed in stages, the initial saw cut shall be of the minimum width specified and sawed to the required depth. The depth of the initial saw cut in the construction of weakened plane joints shall be a minimum of 1/4 of slab thickness.

Sawing of weakened plane joints shall be done before uncontrolled cracking takes place, and after the concrete has hardened to the extent that tearing or raveling of the edges of the saw cut is not excessive. The exact time for all sawing shall be determined by the Contractor when not otherwise specified.

Any procedure for sawing joints that result in premature, uncontrolled cracking shall be revised immediately. The Contractor shall be responsible for replacing or repairing areas containing uncontrolled cracking and for repairing spalled or chipped concrete along the edges of sawed joints to the satisfaction of the Engineer.

After saw cutting of the joint and just prior to sealing the joint, the internal joint surfaces shall be cleaned of all dirt, curing compound residue, laitance and other foreign materials. The internal joint surface shall be defined as the sawed portion of the joint and the resultant crack for the full depth of the pavement.

Sealing of sawed joints where required shall be completed prior to the opening of the pavement to traffic unless otherwise approved by the Engineer. When delayed sealing of sawed joints is permitted, saw cuts and formed recess to be filled with sealant shall be protected to ensure thorough curing of the concrete along the edges of the joint recesses and to prevent entry of foreign materials into the joint. At the Contractor's option, inert compressible joint filler material such as plastic backer rod or upholstery cord may be inserted into joints immediately after sawing or forming of the joint recess to provide curing protection and prevent entry of foreign material. If absorptive filler material is used, it shall be thoroughly moistened either before or immediately after installation in the sawed groove. When filler material is rope, or similar material which does not fill the entire depth of sawed groove, it shall be depressed not less than 1/2 inch below the pavement surface before the pavement is opened to traffic.

(B) Expansion and Construction Joints: Longitudinal and transverse expansion and construction joints shall be as required by the project plans.

(C) Isolation Joints: Isolation joints unless otherwise detailed in construction documents shall be 1/2 inch wide expansion joints in accordance with Detail 224 or as directed by the Engineer.

(D) Sealing of Joints: Sealant shall be applied in accordance with the sealant manufacturer's recommendations. A primer shall be furnished and applied after the joint has been cleaned and prepared to receive sealant when indicated in the manufacturer's recommendations.

Prior to the application of the sealant, an approved type of inert, compressible joint filler material such as plastic backer rod or upholstery cord, or an approved type of bond breaker, shall be inserted along the joint in accordance with the details shown on the project plans. The joint shall then be filled with sealant to a level not less than 1/8 inch or more than 1/4 inch below the elevation of the pavement surface adjacent to the joint edge.

The equipment used to apply sealant shall be as recommended by the sealant manufacturer. Sealant shall not be spilled on the surface of the concrete pavement, and Contractor shall remove any sealant inadvertently spilled on the pavement surface.

(E) Repair of Cracks, Spalls, Raveling and Tearing: Contractor shall be responsible for replacing or repairing all areas of pavement containing uncontrolled cracking, surface spalls, or other types of surface. Repairs when authorized shall be made and completed by methods acceptable to the Engineer.

324.4 TESTS OF FINISHED PAVEMENT:

324.4.1 Smoothness: The pavement surface including pavement in intersections will be tested with a ten-foot straight-edge placed parallel to the centerline of the pavement in each lane. Ordinates measured from the face of the straight-edge to pavement surface shall at no place exceed one-quarter inch. Areas that do not meet the required surface accuracy as determined by straight-edge testing shall be marked, and Contractor shall at his own expense and as required by the Engineer either:

(1) Grind down areas higher than 1/4 inch but not more than 1/2 inch above the correct surface.

(2) Correct areas lower than 1/4 inch but not lower than 1/2 inch below the correct surface by grinding down the adjacent areas.

(3) Remove and replace pavement when the deviation exceeds 1/2 inch from the correct surface. Area replaced shall be of a length, width and depth as required to allow formation of a new slab of the required quality. The area replaced shall be compatible with the joint layout shown on the project plans as determined by the Engineer.

After grinding, the finished surface of the ground area shall be provided with a uniform texture acceptable to the Engineer. The method of texturing shall be approved by the Engineer.

324.4.2 Pavement Thickness: Concrete pavement shall be constructed in accordance with the thickness requirements of the plans and specifications. Tolerances for base and subgrade construction and other provisions of these specifications, which may affect thickness, shall not be construed to modify such thickness requirements.

Pavement thickness testing shall begin after achieving pavement smoothness compliance. For the purpose of determining acceptability for thickness, cores shall be drilled by the Contractor at the locations specified by the Engineer. Cores shall have a minimum diameter of four inches. Length of cores will be determined in accordance with the requirements of AASHTO T-148.

In calculating average length, cores that have a length in excess of the thickness specified by more than 0.25 of an inch, will be deemed to have a length of the specified thickness plus 0.25 of an inch. Field length measurements will be acceptable in lieu of average length measurement in accordance with the requirements of AASHTO T-148, provided the original core in any secondary unit meets or exceeds the specified thickness. Measurements in accordance with the requirements of AASHTO T-148 will be required on any questionable thickness measurements and on the three cores used to determine the average length for payment, regardless of length.

A primary unit of pavement shall be the area of pavement placed in each day's paving operation. Each intersection or special section shall be considered as a primary unit. A secondary unit of pavement shall consist of 1,000 linear feet, or fraction thereof, of each traffic lane. Each 1,300 square yards of pavement in intersections, etc., shall be considered a secondary unit regardless of when the concrete was placed.

One core shall be drilled in each secondary unit. If the length of that core is not deficient by more than 0.25 of an inch, that secondary unit will be measured for payment at 100 percent. If the length of that core is deficient by more than 0.25 of an inch but less than 1.0 inch, two additional cores shall be drilled within that secondary unit and the length of the three cores averaged. If the average length is not deficient by more than 0.25 of an inch, that secondary unit will be measured for payment at 100 percent. If the average length of the three cores is deficient by more than 0.25 of an inch, that secondary unit will be measured for payment in accordance with the requirements of Table 324-1.

If the core in the secondary unit is deficient by more than 1.00 inch, that core will not be used in determining the average thickness of that secondary unit. Additional cores shall be drilled at intervals not to exceed ten feet in each direction from the deficient core, parallel to the main-line centerline, until one core is obtained in each direction that is not deficient by more than 1.00 inch. The pavement between these two cores will be evaluated separately from the balance of the pavement in that secondary unit. The limits for evaluation shall be between the longitudinal weakened plane or construction joint on each side of the core and between the next transverse weakened plane, construction, or expansion joint beyond each of the last two cores. Unless the Engineer allows the pavement to remain, it shall be removed and replaced with pavement of the specified thickness and no payment will be made for the removed pavement.

If the pavement in the deficient area is removed, either by the order of the Engineer or at the option of the Contractor, it shall be removed between the limits of the evaluation. After the pavement has been replaced, one core shall be drilled at random in that secondary unit after deducting the area of the replaced pavement and one core shall be drilled in the new pavement. Pavement represented by the core drilled in the secondary unit, less the replaced pavement, will be measured for payment as hereinbefore specified. The core drilled in the replaced pavement shall be not less than the specified thickness; otherwise, that pavement will not be measured or paid for.

At all locations where cores have been drilled, the resulting holes shall be filled with concrete in a manner satisfactory to the Engineer.

324.5 PROTECTION OF PAVEMENT:

The Contractor shall be responsible for taking adequate steps to protect concrete placed during rain, or hot or cold weather as defined in ACI Standards. Any concrete damaged by rain or extreme temperatures shall be removed and replaced at the Contractor's expense.

When ordered by the Engineer, pavement crossings shall be constructed for the convenience of public traffic. Where motor vehicles are encountered, a temporary bridge to span the newly placed concrete will be provided.

No traffic or Contractor's equipment, except as hereinafter provided, will be permitted on the pavement until the concrete has developed a compressive strength of 3500 psi.

Equipment for sawing joints will be permitted on the pavement when, in the Contractor's judgment, the concrete has developed sufficient strength to support the equipment without damage to the concrete. In case of visible cracking or other damage to the pavement, operation of the equipment on the pavement shall be immediately discontinued.

Any damage to the pavement resulting from early use of pavement by the Contractor's equipment shall be repaired by the Contractor at his expense.

324.6 METHOD OF MEASUREMENT:

Portland Cement Concrete Pavement will be measured by the square yard. Any opening in excess of one square yard will not be measured for payment.

324.7 BASIS OF PAYMENT:

The accepted quantities of Portland Cement Concrete Pavement, measured as provided for herein, will be paid for at the contract unit price complete in place, except that where the average length of cores indicates pavement deficient in thickness by more than 0.25 of an inch but not more than 1.00 inch, payment will be made as specified in Table 324-1. Payment will be made to the nearest cent.

No additional payment will be allowed for pavement constructed in excess of the thickness specified on the project plans.

TABLE 324-1

PAVEMENT THICKNESS PAYMENT REDUCTION (PCCP)

Core Thickness, Less Than Specified Thickness, Inches	Percent of Contract Unit Price Allowed
0.00 to 0.25	100
0.26 to 0.35	93
0.36 to 0.45	85
0.46 to 0.55	75
0.56 to 0.75	63
0.76 to 1.00	50

- End of Section -

SECTION 710

ASPHALT CONCRETE

710.1 GENERAL:

Asphalt concrete shall be a mixture of asphalt cement and mineral aggregates. Mineral admixture shall be included in the mixture when required by the mix design or by the Engineer. Asphalt concrete shall be produced in accordance with Section 321.

The designation for asphalt concrete mixes shall be based on the nominal maximum aggregate size of the mix. The applicable mix designations are 3/8 inch, 1/2 inch, 3/4 inch. Each mix shall be designed using Marshall or Gyratory compaction methods.

The following table (Table 710-1) displays the recommended range for lift thickness for various asphalt concrete mix designations found within Section 710. Please note that the minimum lift thicknesses are based on each mix designation's "Nominal Aggregate Size" and the relative coarseness of its gradation. The compacted thickness of layers placed shall not exceed the Maximum Lift Thickness of Table 710-1 except as otherwise provided in the plans and specifications, or if approved in writing by the Engineer.

TABLE 710-1

RECOMMENDED LIFT THICKNESS FOR ASPHALT CONCRETE MIXES

Asphalt Concrete Mix Designation (inches)	Minimum Lift Thickness Marshall Mixes	Maximum Lift Thickness Marshall Mixes	Minimum Lift Thickness Gyratory Mixes	Maximum Lift Thickness Gyratory Mixes
3/8"	1.0 inches	2.0 inches	1.5 inches	3.0 inches
1/2"	1.5 inches	3.0 inches	2.0 inches	3.0 inches
3/4"	2.5 inches	4.0 inches	3.0 inches	4.0 inches

710.2 MATERIAL:

710.2.1 Asphalt Binder: The asphalt binder specified in this section has been developed for use in desert climate conditions. When used in other climates, consideration should be given to adjustments in the asphalt binder selection. The asphalt binder shall be Performance Grade Asphalt conforming to the requirements of Section 711 for PG 70-10, unless otherwise approved by the Engineer or specified differently in the plans or special provisions.

710.2.2 Aggregate: Coarse and Fine aggregates shall conform to the applicable requirements of this section. Coarse mineral aggregate shall consist of crushed gravel, crushed rock, or other approved inert material with similar characteristics, or a combination thereof, conforming to the requirements of these specifications.

Coarse aggregate for hot mix asphalt is material retained on or above the No. 4 sieve and Fine aggregate is material passing the No. 4 sieve. Aggregates shall be relatively free of deleterious materials, clay balls, and adhering films or other material that prevent coating with the asphalt binder. Coarse and Fine aggregates shall conform to the following requirements when tested in accordance with the applicable test methods.

TABLE 710-2 COARSE/FINE AGGREGATE REQUIREMENTS		
Characteristics	Test Method	Requirements
Fractured Faces, % (Coarse Aggregate Only)	Arizona 212	85, 1 or more 80, 2 or more
Uncompacted Voids, % Min.	AASHTO T-304, Method A	45
Flat & Elongated Pieces, % 5:1 Ratio	ASTM D4791	10.0 Max.
Sand Equivalent, %	AASHTO T-176	50 Min.
Plasticity Index	AASHTO T-90	Non-plastic
L.A. Abrasion, % Loss	AASHTO T-96	9 max. @ 100 Rev. 40 max. @ 500 Rev
Combined Bulk Specific Gravity	AI MS-2/SP-2	2.35-2.85
Combined Water Absorption	AI MS-2/SP-2	0-2.5%

Tests on aggregates used in asphalt concrete outlined above, shall be performed on materials furnished for mix design purposes and composited to the mix design gradation.

Blend sand (naturally occurring or crushed fines) shall be clean, hard and sound material, which will readily accept asphalt binder coating. The blend sand grading shall be such that, when it is mixed with the other mineral aggregates, the combined product shall meet the requirements of Table 710-2.

The natural sand shall not exceed 20 percent for the Marshall mixes and 15 percent for the Gyratory mixes by weight of the total aggregate for a mix.

710.2.3 Reclaimed Asphalt Pavement (RAP): When allowed by the Engineer, Reclaimed Asphalt Pavement (RAP), as defined in Section 701.5, may be used in asphalt concrete provided all requirements of Section 710 are met. References to use of RAP in Section 710 apply only if RAP is used as part of the mixture.

When RAP is used in asphalt concrete, it shall be of a consistent gradation, asphalt content, and properties. When RAP is fed into the plant, the maximum RAP particle size shall not exceed 1 1/2 in. The percentage of asphalt in the RAP shall be established in the mix design. The percentage of RAP binder shall be established in the mix design.

When RAP is used in base and intermediate courses, the amount of RAP aggregate and RAP binder should not exceed 30% contribution; Surface courses should be limited to 20% RAP aggregate and RAP binder contribution.

In addition to the requirements of Section 710.3.1, the job mix formula shall indicate the percent of asphalt RAP and the percent and performance grade of virgin (added) asphalt binder.

When less than or equal to 15% RAP binder is used by weight of total binder in the mix, the added virgin binder shall meet the requirements for PG 70-10 as shown in Section 711. When greater than 15% RAP is used by weight of the total binder in the mix, the added virgin binder will be dropped one grade for low and high temperature properties to a PG 64-16, unless testing indicates that the blend of the recovered RAP binder and virgin binder meets the requirements for PG 70-10 as shown in Section 711. The virgin asphalt binder shall not be more than one standard asphalt material grades different than the specified mix design binder grade.

710.2.4 Mineral Admixture: Mineral admixture when used as an anti-stripping agent in asphalt concrete shall conform to the requirements of AASHTO M-17. Mineral admixture used in asphalt concrete shall be dry hydrated lime, conforming to the requirements of ASTM C1097 or Portland cement conforming to ASTM C150 Type II or ASTM C595 Type IP. The amount

of hydrated lime or Portland cement used shall be determined by the mix design. The minimum mineral admixture content within a mix will be 1.00 percent, by weight of total aggregate.

710.3 MIX DESIGN REQUIREMENTS:

710.3.1 General: The mix design for asphalt concrete shall be prepared by a laboratory that is accredited through the AASHTO Accreditation Program (AAP) in Hot Mix Asphalt Aggregates and Hot Mix Asphalt. The laboratory shall be under the direct supervision of a Civil Engineer, registered by the State of Arizona, and who is listed by ADOT as a "Qualified Asphaltic Concrete Mix Design Engineer" within ADOT's latest list of approved laboratories. The latest list of approved laboratories is available on ADOT's web page www.azdot.gov. The date of the design shall not be older than two years from the date of submittal, unless supportive documentation is provided and approved by the Engineer.

The mix design report shall include the following elements as a minimum.

(1) The name and address of the testing organization and the person responsible for the mix design report.

(2) The mix plant identification and/or location, as well as the supplier or producer name.

(3) A description of all products that are incorporated in the asphalt concrete along with the sources of all products, including admixtures and asphalt binder, and their method of introduction.

(4) The supplier and grade of asphalt binder, the source and type of mineral aggregate, and the percentage of asphalt binder and mineral admixture used.

(5) The percentage of RAP and RAP Binder being contributed to the total mix shall be included in the mix design report.

(6) The mix design report shall state whether it is Gyratory or Marshall, and the size designation.

(7) The results of all testing, determinations, etc., such as: specific gravity and gradation of each component, water absorption, sand equivalent, loss on abrasion, fractured coarse aggregate particles, Tensile Strength Ratio (ASTM D4867), Marshall stability and flow, asphalt absorption, percent air voids, voids in mineral aggregate, and bulk density. Historical abrasion values may be supplied on existing sources. The submittal should include a plot of the gradation on the Federal Highway Administration's 0.45 Power Gradation Chart, plots of the compaction curves and the results of moisture sensitivity testing.

(8) The laboratory mixing and compaction temperature ranges for the supplier and grade of asphalt binder used within the mix design.

(9) A specific recommendation for design asphalt binder content and any limiting conditions that may be associated with the use of the design, such as minimum percentages of crushed or washed fine aggregate.

(10) The supplier's product code, the laboratory Engineer's seal (signed and dated), and the date the design was performed.

(11) If a Warm Mix Technology or additive is used, the following shall be included:

- Technology type and supporting manufacturer information; including instructions pertaining to laboratory mixture temperatures and curing.
- Amount (%) of additive (technology) used in the mixture.
- Attached copy of the ADOT approved product list, showing additive/technology
- Minimum plant production temperature shall not fall below manufacturer's recommendation.
- Minimum field compaction temperature shall be identified.
- Identify any special mixing or compaction temperatures or special methods to be used when conducting Quality Assurance or Quality Control testing of field collected samples. Example: if the field collected samples of warm mix asphalt can be treated as conventional hot asphalt mix, provide the equivalent conventional hot asphalt mix compaction temperature.

The mix design shall be submitted to the Agency or Engineer by the Contractor/Supplier for which it was developed as part of his project submittals. Once the mix design has been approved by the agency or Engineer, the Contractor and/or his supplier shall not change plants nor use additional mixing plants without prior approval of the Engineer. If a Contractor/Supplier elects to change the source of mineral admixture or binder, a volumetric check point may be completed in lieu of a new mix design. The checkpoint shall comply with the mix design volumetric parameters listed in Table 710-3 for Marshall mixes or Table 710-5 for Gyratory mixes. Any change shall be to an equal alternative material, and this shall not apply to changes in aggregate source. Any changes in the plant operation, the producer's pit, modifiers in the asphalt binder, or any other item that will cause an adjustment in the mix, shall be justification for a new mix design to be submitted.

710.3.2 Mix Design Criteria: The mix design shall be performed by one of two methods, Marshall Mix Design or Gyratory Mix Design. The method shall be specified on the plans, special provisions, or by the Engineer. A minimum of 4 points will be used to establish the mix design results. The oven aging period for both Marshall and Gyratory mix design samples shall be 2 hours.

710.3.2.1 Marshall Mix Design: The Marshall Mix Design shall be performed in accordance with the requirements of the latest edition of the Asphalt Institute's Manual, MS-2 "Mix Design Methods for Asphalt Concrete." The mix shall use the compactive effort of 75 blows per side of specimen. The mix shall comply with the criteria in Table 710-3.

TABLE 710-3
MARSHALL MIX DESIGN CRITERIA

Criteria	Requirements			
	3/8" Mix	1/2" Mix	3/4" Mix	Designated Test
1. Voids in Mineral Aggregate: %, min	15.0	14.0	13.0	AI MS-2
2. Effective Voids: %, Range	4.0±0.2	4.0 ±0.2	4.0 ±0.2	AI MS-2
3. Absorbed asphalt: %, Range*	0-1.0	0-1.0	0-1.0	AI MS-2
4. Dust to Eff. Asphalt Ratio, Range **	0.6-1.4	0.6-1.4	0.6-1.4	AI MS-2
5. Tensile Strength Ratio: % Min.	65	65	65	ASTM D4867
6. Dry Tensile Strength: psi, Min.	100	100	100	ASTM D4867
7. Stability: pounds, Minimum	2,000	2,500	2,500	AASHTO T-245
8. Flow: 0.01-inch, Range	8-16	8-16	8-16	AASHTO T-245
9. Mineral Aggregate Grading Limits				AASHTO T-27

		Percent Passing with Admix	
Sieve Size	3/8 inch Mix	1/2 inch Mix	3/4 inch Mix
1-1/4 inch	—	—	—
1 inch	—	—	100
3/4 inch	—	100	90 – 100
1/2 inch	100	85 – 100	—
3/8 inch	90-100	62 – 85	62 – 77
No. 8	45-60	40 – 50	35 – 47
No. 40	10-22	10 – 20	10 – 20
No. 200	2.0 – 10.0	2.0 – 10.0	2.0 – 8.0

* Unless otherwise approved by the Engineer.

** The ratio of the mix design composite gradation target for the No. 200 sieve, including admixture, to the effective asphalt content shall be within the indicated range.

710.3.2.2 Gyratory Mix Design: Gyratory Mix Designs shall be performed in accordance with the requirements of latest edition of the Asphalt Institute's SP-2 manual. Mix design laboratory compacted specimens shall be prepared using a gyratory compactor in accordance with AASHTO T-312.

The mix design shall be formulated in a manner described for volumetric mix designs in the current edition of the Asphalt Institute Manual SP-2, except the number of trial blend gradations necessary will be determined by the mix design laboratory. Duplicate gyratory samples shall be prepared at a minimum of four (4) binder contents to select the recommended binder content. The gyratory specimens shall be compacted to 160 gyrations. Volumetric data for the design number of gyrations, N_{des}, and the initial number of gyrations, N_{ini}, are then back calculated based on the bulk specific gravity, G_{mb}, of the N_{max} specimens and the height data generated during the compaction process of those same specimens.

TABLE 710-4	
Number of Gyrations	
N_{ini}	8
N_{des}	100
N_{max}	160

The corrected density of the specimens shall be less than 89.0 percent of maximum theoretical density at N_{ini}. The corrected density of the specimens shall be less than 98.0 percent of maximum theoretical density at N_{max}. The Gyratory mix shall comply with the criteria in Table 710-5.

TABLE 710-5

* Unless otherwise approved by the Engineer.

** The ratio of the mix design composite gradation target for the No. 200 sieve, including admixture, to the effective asphalt content shall be within the indicated range.

710.3.2.3 Moisture Sensitivity Testing: Moisture sensitivity testing will be performed in accordance with ASTM D4867 for both Marshall and Gyratory mix designs, without the freeze/thaw cycles. The minimum required Tensile Strength Ratio is indicated in the tables above.

- ***End of Section -***

SECTION 711

PAVING ASPHALT

711.1 GENERAL:

The asphalt shall be produced from crude asphalt petroleum or a mixture of refined liquid asphalt and refined solid asphalt. It shall be free from admixture with any residues obtained by the artificial distillation of coal, coal tar, or paraffin oil and shall be homogeneous and free from water.

Polymer modified asphalt cement shall be produced from crude asphalt petroleum and a polymer or blend of polymers mixed to produce a homogeneous material free from water.

Asphalt shall not be heated during the process of its manufacture, storage, or during construction so as to cause injury as evidence by the formation of carbonized particles.

711.2 TESTING REQUIREMENTS:

Paving asphalt shall be classified by the Performance Grading System and shall conform to the requirements set forth in Table 711-1 and AASHTO M-320 with the PAV temperature changes noted in the table. On all grades, flash point temperature AASHTO T-48: minimum 230 °C and mass loss, maximum 1.00 percent.

TABLE 711-1

Direct Tension, AASHTO T-314 (Note 3) Failure Strain, Minimum 1.0% Test Temp. @ 1.0 mm/min. °C	-12	-6	0	-6

NOTES:
(1) This requirement may be waived at the discretion of the specifying agency if the supplier warrants that the asphalt binder can be adequately pumped and mixed at temperatures that meet all applicable safety standards.

(2) For quality control of unmodified asphalt cement production, measurement of the viscosity of the original asphalt cement may be substituted for dynamic shear measurements of G*/sin (d) at test temperatures when the asphalt is a Newtonian fluid. Any suitable standard means of viscosity measurement may be used, including capillary or rotational viscometer (AASHTO T-210 or AASHTO T-202).

(3) If the creep stiffness is below 300 MPa, the direct tension test is not required. If the creep stiffness is between 300 and 600 MPa, the direct tension failure strain requirement can be used in lieu of the creep stiffness requirement. Direct tension test is recommended for polymer modified asphalt binders. The m-value requirement must be satisfied in all cases.

Polymer modified paving asphalt shall be classified by the Performance Grading System and shall conform to the requirements set forth in Table 711-2 and AASHTO M-320 with the PAV temperature changes noted in the table. On all Grades Flash Point Temperature AASHTO T-48: Minimum 230 °C and Mass Loss, Maximum 1.00 percent. P is for Polymer and TR is for Tire Rubber.

Direct Tension, AASHTO T-314 (Note 3) Failure Strain, Minimum 1.0% Test Temp. @ 1.0 mm/min. °C	-18	-12	-12	-12

NOTES: *(Continued on next page.)*

(1) This requirement may be waived at the discretion of the specifying agency if the supplier warrants that the asphalt binder can be adequately pumped and mixed at temperatures that meet all applicable safety standards.

(2) For quality control of unmodified asphalt cement production, measurement of the viscosity of the original asphalt cement may be substituted for dynamic shear measurements of G*/Sin δ, at test temperatures when the asphalt is a Newtonian fluid. Any suitable standard means of viscosity measurement may be used, including capillary or rotational viscometer (AASHTO T-210 or AASHTO T-202).

(3) If the creep stiffness is below 300 MPa, the direct tension test is not required. If the creep stiffness is between 300 and 600 MPa, the direct tension failure strain requirement can be used in lieu of the creep stiffness requirement. Direct tension test is recommended for polymer modified asphalt binders. The m-value requirement must be satisfied in all cases.

(4) "TR" binders shall have 9% to 11% reclaimed tire rubber and enough virgin polymer to meet all performance grade criteria specified. The blend percentages shall be listed on the Certificate of Compliance by the manufacturer. Type 1 shall meet solubility limits.

711.3 TEST REPORT AND CERTIFICATION:

Test reports and certifications shall be provided to the Engineer when requested by the Engineer. At the time of delivery of each shipment of asphalt, the supplier supplying the material shall deliver to the purchaser a certified copy of the test report which shall indicate the name of the refinery and supplier, type and grade of asphalt delivered, date and point of delivery, quantity delivered, delivery ticket number, purchase order number, and results of the above specified tests. The test report shall be signed by an authorized representative of the supplier certifying that the product delivered conforms to the specifications for the type and grade indicated.

Until the certified test reports and samples of the material have been checked by the Engineer, that material will be only tentatively accepted by the Contracting Agency. Final acceptance will be dependent upon the determination of the Engineer that the material involved fulfills the requirements prescribed. The certified test reports and the testing required in connection with the reports shall be at no additional cost to the Contracting Agency.

711.4 TEMPERATURES:

Paving asphalt shall be heated in such a manner that steam or hot oils will not be introduced directly into the paving asphalt during heating.

711.5 CONVERSION OF QUANTITIES:

When pay quantities of paving asphalt are determined from volumetric measurements, the volumetric measurement at any temperature shall be reduced to the volume the material would occupy at 60 degrees F. in accordance with ASTM D1250. In converting volume to weight, the computations shall be based on Table 711-3.

TABLE 711-3
ASPHALT CEMENT QUANTITY CONVERSION

Grade of Material	Gals. Per Ton of 60 °F.	Lbs. Per Gal at 60 °F.
PG 58-22	236	8.47

PG 76-16	233	8.58

- End of Section -

SECTION 725

PORTLAND CEMENT CONCRETE

725.1 GENERAL:

Portland cement concrete shall be composed of cementitious materials, fine and coarse aggregates, water, and, if specified or allowed, certain chemical admixtures and additives.

TABLE 725-1
CONCRETE CLASSES - MINIMUM REQUIREMENTS

Class of Concrete	Minimum Cementitious Materials Content (lbs. per cubic yard)	Minimum Compressive Strength * at 28 Days (psi)
AA	600	4000
A	520	3000
B	470	2500
C	420	2000
* In accordance with Section 725.8		

725.2 CEMENTITIOUS MATERIALS:

Hydraulic cement shall consist of either Portland cement or Blended Hydraulic cement.

Portland cement shall conform to the current revision requirements of ASTM C150 for Type II for moderate sulfate resistance, Type III for high early strength, or Type V for high sulfate resistance, and shall not contain more than 0.60 percent total equivalent alkalis.

Blended hydraulic cement shall conform to the current revision requirements of ASTM C595 for Portland Pozzolan cement Type IP (MS) for moderate sulfate resistance or (HS) for high sulfate resistance, Portland Limestone cement Type IL (MS) for moderate sulfate resistance or (HS) for high sulfate resistance, or Ternary Blended cement Type IT (MS) for moderate sulfate resistance or (HS) for high sulfate resistance.

Up to 25 percent by weight of the Table 725-1 minimum cementitious materials requirements may be an approved coal ash or natural pozzolan when the mix design incorporates C150 Portland cement of any Type or C595 Type IL Blended Limestone cement per Table 725-2. Additional coal ash or pozzolanic material in excess of the minimum Table 725-1 requirements may be incorporated into any concrete mix design to achieve enhanced performance, upon approval of the Engineer.

Supplementary Cementitious Materials (SCM) shall not be used as an additional cementitious materials replacement in concrete in combination with Portland Pozzolan cement Type IP or Ternary Blended cement Type IT without prior approval by the Engineer.

TABLE 725-2

Cement Type ASTM C150/C595	**Allowable Coal Ash or Natural Pozzolan (%)**	**Included Coal Ash or Natural Pozzolan (%)**	**Allowable Limestone (%)**
Type II	</= 25	—	</= 5
Type III	</= 25	—	</= 5
Type V	</= 25	—	</= 5
Type IL(X)[A]	</= 25	—	> 5 and </= 15
Type IP(X)[B]	—	</= 25	—
Type IT(PX)(LX)[C]	—	</= 25	</= 15

Notes: *(See following page.)*

A) Type IL - Portland cement blended or interground with limestone.
(X) - the targeted percentage of limestone in the product expressed as a whole number by mass of the final blended product.
B) Type IP - Portland cement blended or interground with coal ash or natural pozzolan.
(X) - the targeted percentage of coal ash or natural pozzolan in the product expressed as a whole number by mass of the final blended product.
C) Type IT - Portland cement blended or interground with coal ash or natural pozzolan and limestone.
(PX) - where P stands for coal ash or natural pozzolan and X is the targeted percentage expressed as a whole number by mass of the final blended product.
(LX) - where L stands for limestone and X is the targeted percentage expressed as a whole number by mass of the final blended product.

Cementitious materials shall be stored in such manner as to permit ready access for the purpose of inspection and identification, and so as to be suitably protected against damage by contamination or moisture. Should any lot of bulk cementitious material be delivered to the site show evidence of contamination, the Engineer may require that such lot be removed from the site.

725.2.1 Supplementary Cementitious Materials (Pozzolans): Supplementary Cementitious Materials to be used in concrete or furnished under this specification shall conform to the appropriate ASTM requirements as follows:

Coal ash (such as fly ash or bottom ash) or natural pozzolan (raw or calcined)	ASTM C618 and C311
Silica Fume	ASTM C1240

Upon request, the Contractor shall obtain and deliver to the Engineer a Certification of Analysis or Certification of Compliance signed by the pozzolan supplier identifying the pozzolanic material and stating the pozzolan delivered to the batching site complies with the appropriate specifications. The cost of furnishing tested pozzolan shall be considered as included in the contract price and no additional allowance will be made therefore.

Pozzolanic materials shall be handled and stored in the same manner as other cementitious materials. When facilities for handling a bulk pozzolan are not available, the pozzolan shall be delivered in original unopened sacks bearing the name and brand of the supplier, the type and source of the pozzolan, and the weight contained in each sack plainly marked thereon.

725.3 AGGREGATES:

Coarse and fine aggregate shall conform to the applicable requirements of ASTM C33. Coarse aggregate grading requirements shall conform to the appropriate rock size designation in the Grading Requirements for Coarse Aggregate, Table 3. Fine aggregate grading requirements shall conform to Section 6, Table 1.

The average value of three successive sand equivalent samples shall not be less than 70 when tested in accordance with ASTM D2419. No individual sample shall have a sand equivalent less than 65.

The loss by abrasion in the Los Angeles Abrasion Machine, determined as prescribed in ASTM C131, shall not exceed 10 percent, by weight, after 100 revolutions nor 40 percent after 500 revolutions.

Prior to the delivery of the aggregates and whenever required during concrete production, the Contractor shall make stockpiles available to the Engineer for testing. All required samples shall be furnished at the expense of the Contractor, and the cost of sampling and testing shall be at the expense of the Contracting Agency.

Reclaimed Concrete Materials (RCM) and Reclaimed Asphalt Pavement (RAP) as defined in Section 701 shall not be used in Portland Cement Concrete without the prior approval of the Engineer.

725.4 WATER:

The water used for mixing concrete shall be potable or shall meet the requirements of ASTM C1602, when tested by a qualified independent testing laboratory.

SECTION 725

725.5 ADMIXTURES AND ADDITIVES:

Admixtures or additives of any type, except as otherwise specified, shall not be used unless identified in the approved mix design or authorized by the Engineer.

Water reducing admixtures incorporated into the approved concrete mix design shall meet the requirements of ASTM C494 for the appropriate type.

Air entraining admixtures incorporated into the approved concrete mix design shall meet the requirements of ASTM C260.

Pigments incorporated into the approved concrete mix design for integrally colored concrete shall meet the requirements of ASTM C979.

Fibers incorporated into the approved concrete mix shall meet the requirements of ASTM C1116.

Any admixtures used shall be included in the price for that item.

725.6 MIX DESIGN PROPORTIONING:

A concrete mix design carrying the producer's designated mix number for each type of concrete being furnished under these specifications shall be submitted to the Engineer every two years for approval. Each design shall utilize the proper proportioning of ingredients to produce a concrete mix that is homogeneous and sufficiently workable to provide a consistent and durable concrete product that meets the specified compressive strength and other properties as required by the application.

A concrete mix design submittal shall include the mix identification number and the applicable proportions, weights, and quantities of individual materials incorporated into the mix including the size and source of concrete aggregates, the type and source of cement and coal ash or SCM, and the brand and designation of chemical admixtures or other additives.

In the event there is a modification to the mix design proportions:

(A) Modifications that do not require a new mix design submittal/approval:

(1) Modifications, which do not result in batch, target weights for the fine aggregate or combined coarse aggregates changing by more than 5 percent from the original approved mix design.
(2) Modifications to the percentage of coarse aggregate fractions that do not change the total coarse aggregate volume.
(3) Modifications to dosages of chemical or air-entraining admixtures, within the manufacturer's recommendations.
(4) The incorporation or elimination of chemical admixtures, which are listed on the mix design to effect a change in the time-of-set (retarders or accelerators).

(B) Modifications that require a new mix design submittal/approval and may require performance verification:

(1) Modification to the class of concrete per Table 725-1.
(2) Modification to the type/class/source of cement, coal ash, natural pozzolan, or silica fume.
(3) Modification to the percentage of coal ash, natural pozzolan, or silica fume.
(4) Modification to a coarse aggregate size designation.
(5) Modification of the type of chemical admixture, or the incorporation or elimination, of an air-entraining admixture.
(6) Modification of coarse or fine aggregate source.

725.7 MIXING:

All proportioning/batching/mixing equipment shall comply with the standards of the Concrete Plant Manufacturer's Bureau and the certification requirements of the Arizona Rock Products Association or National Ready Mixed Concrete Association. The proportioning shall consist of combining the specified sizes of aggregates with cementitious materials, admixtures/additives, and water as herein provided. No method which may cause the segregation or degradation of materials, shall be used.

Weighing and metering devices used for the purpose of proportioning materials shall fulfill requirements as to accuracy and tolerance prescribed by the Weights and Measures Division of the State of Arizona and shall be sealed and certified in accordance with the procedures established by this agency. This certification shall not be over 12 months old and shall be renewed whenever required by the Engineer. When portable plants are set up at a new or temporary location, the scales and scale assembly shall be inspected and certificate issued regardless of the date when the scales were last tested. The Engineer may require the Contractor to run a quick scale check at any time with certified weights furnished by the Contractor and order the scale recertified if necessary.

Any admixture/additive shall be measured accurately by mechanical means into each batch by equipment or in a method pre-approved by the Engineer.

The equipment for measuring and supplying the water in the mixer shall be so constructed and arranged that the amount of water to be added to the mixture can be measured, in gallons or by weight. The amount of water shall be varied in accordance with the percentage of free moisture in the material and the requirements of the workability of the aggregate. Machine mixing will be required in all cases unless pre-approved by the Engineer. Regardless of the method employed, mixing shall be commenced as soon as possible after the cementitious material is placed in contact with the aggregates or water. All concrete mixers shall be of such design and construction, and so operated, as to provide a thoroughly and properly mixed concrete in which the ingredients are uniformly distributed.

725.7.1 Paving and Stationary Mixers: Paving and stationary mixers shall comply with the standards of the Concrete Plant Manufacturer's Bureau and the certification requirements of the Arizona Rock Products Association or the National Ready Mixed Concrete Association. Mixers shall be maintained in proper and serviceable working condition, and any part or portion thereof that is out of order, or becomes worn to such extent as to detrimentally affect the quality of mixing, shall be promptly repaired or replaced.

The proper proportions of aggregate, cementitious materials, admixtures/additives and water for each batch of concrete shall be placed in the mixer, and shall be mixed for a period of not less than 50 seconds after all such materials are in the drum.

The rotating speed at which the mixer shall be operated shall conform to that recommended by the manufacturer.

The total volume of materials mixed in any one batch shall neither exceed the water level capacity of the mixer nor the manufacturer's catalog rated capacity of the mixer.

725.7.2 Transit Mixers: Transit mixers shall meet the requirements of the Truck Mixer Manufacturer's Bureau and the certification requirements of the Arizona Rock Products Association or the National Ready Mixed Concrete Association. Ready mix concrete shall comply with ASTM C94 except as herein specified.

Each mixer and agitator shall have attached thereto in a prominent place a metal plate or plates, installed by the manufacturer, on which is plainly marked the capacity of the drum in terms of the volume of mixed concrete and the speed of rotation for the agitating and mixing speeds of the mixing drum or blades.

Each mixer shall have an identification number painted on the truck in such a location that it can be easily read from the batching platform.

The total volume of materials introduced into the mixer for mixing purposes shall not exceed the manufacturer's guaranteed mixing capacity. If the concrete so mixed does not meet the uniformity requirements of this section, the amount of materials charged into the mixer shall be reduced.

The rotation speed at which the mixer shall be operated shall conform to that recommended by the manufacturer.

Each batch of concrete placed in the mixer shall be mixed for not less than 70 nor more than 100 revolutions of the drum or blades, at the speed designated by the manufacturer of the equipment as mixing speed. Additional mixing shall be at the agitating speed designated by the manufacturer of the equipment. The revolving of the drum shall be continuous until the concrete is completely emptied from the drum. Before any portion of the materials for any batch of concrete is placed therein, the drum of the mixer shall be completely emptied of the previously mixed batch.

At the time of delivery to the job site, the Engineer shall be provided with a legible delivery ticket that shall contain the following information:

- Date and Truck Number.
- Name of the Supplier.
- Name of the Contractor.
- Specific designation of job (name and location).
- Number of cubic yards in the batch.
- Time the transit mixer is loaded.
- Amount of water added at the job site at request of receiver, and his signature or initials.
- Suppliers' mix design code number.
- Type and amount of admixture or additive that is not already included in the approved mix design, if any.
- Serial number of the ticket.

Additional water may be added on the jobsite in accordance with ASTM C94 Tolerances in Slump section to adjust slump providing the slump after such water addition does not exceed the maximum allowed by these specifications in Section 725.9

(A) (1) and that water so added is mixed into the batch for a minimum of 30 additional revolutions at mixing speed. Loss of cement mortar during discharge, which in the opinion of the Engineer would be of sufficient amount to affect the homogeneity of the concrete, shall be cause for rejection of the load. The Contractor shall be responsible for all concrete to which water is added at the job site.

725.7.3 Job Mixed Concrete: All job mixed materials and procedures shall be pre-approved by the Engineer. A prepackaged commercial product shall be used for job mixed concrete placement in accordance with the manufacturer's recommended procedure.

In lieu of the use of a prepackaged commercial product, individual ingredients for concrete placement shall be prepared in a watertight container of suitable volume in batches not to exceed 1/3 cubic yard each. Proportioning of batches shall be in accordance with the applicable required mix design in Table 725-1 and Section 725.6. All mixing shall be done prior to placement in the forms and in accordance with the following procedure:

(A) Mixing shall be done in a mechanical batch mixer of approved type.
(B) The mixer shall be rotated at a speed recommended by the manufacturer.
(C) Mixing shall continue for at least 1-1/2 minutes after all materials are in the mixer, unless a shorter time is shown to be satisfactory by the mixing uniformity tests of ASTM C94.
(D) Materials handling, batching, and mixing shall conform to the applicable provisions of ASTM C94.
(E) Suitable records shall be kept to identify the number of batches, proportions of materials used, and time and date of mixing and placement along with the approximate location in the structure.

725.7.4 Dry Batched Unmixed Concrete: All dry batched unmixed concrete materials and procedures shall be pre-approved by the Engineer. An accurate batch weight shall be provided to record the quantities of cementitious materials, aggregate, admixtures/additives, and water batched into the containers. The date of batching, the container number and the batching certificate number shall be recorded at the time of batching. Copies of the batch weight records shall be submitted to the Engineer upon request.

All dry batched unmixed concrete delivered to the job site shall be stored in containers so constructed that the cement cannot comingle with the water and aggregate within the container. Any admixture/additive added in powder form shall be added to the cement; if added in liquid form, it shall be added to the water.

The contents of the container shall be discharged into a mixer at the job site. Following discharge of the first container into the mixer, the mixer shall be operated at mixing speeds during the discharge of the remaining containers. After the contents of the last container have been discharged into the mixer, the concrete shall be mixed as specified in this specification for transit mixers, and drum or turbine type mixers.

Any spillage of cementitious materials, aggregate, water or admixtures/additives during the filling, transporting, or the

discharging of the container, shall be cause for rejection of the container or the contents of the mixer if any portion of the rejected container is discharged into the mixer.

725.7.5 Volumetric Batching and Continuous Mixing Concrete and Equipment: Volumetric-batching and continuous-mixing concrete and equipment may be utilized upon approval of the Engineer for job site concreting applications. Material handling, procedures, and operations shall be in accordance with ACI 304.6R, Guide for the use of Volumetric-Measuring and Continuous-Mixing Concrete Equipment and all concrete produced and all test performed shall be in accordance with ASTM C685, Standard Specification for Concrete Made by Volumetric Batching and Continuous Mixing. All equipment shall meet the requirements of the Volumetric Mixer Standards of the Volumetric Mixer Manufacturers Bureau and shall have a suitable copyrighted rating plate furnished by the Bureau and attached to the volumetric mixing equipment.

725.8 TESTS AND TEST METHODS:

725.8.1 Field Sampling and Tests: Concrete shall be sampled in accordance with ASTM C172 for determination of temperature, slump, unit weight and yield (when required) and air content (when required) as well as for fabrication of test cylinders for compressive strength determination at 28 days. Samples shall be of sufficient size to perform all the required tests and fabricate the necessary test cylinders but in no case less than 1 cubic foot. Concrete shall be sampled during discharge of the middle portion of the batch. At the discretion of the Engineer, a sample may be obtained at the beginning of the discharge if the properties of the concrete do not appear to be within the specification limits for slump or temperature.

All sampling and testing shall be done by a certified technician meeting the requirements of the ACI Concrete Field Testing Technician, Grade I or equivalent.

Temperature of the concrete mixture shall be determined in accordance with ASTM C1064.

Slump of the concrete mixture shall be determined in accordance with ASTM C143.

Air content of the concrete mixture (when required) shall be determined in accordance with ASTM C231 or C173, whichever is applicable.

Unit weight and yield of the concrete mixture (when required) shall be determined in accordance with ASTM C138.

All compressive strength test specimens shall be made, cured, handled, protected, and transported in accordance with the requirements of ASTM C31. The contractor shall provide and maintain for the sole use of the testing laboratory/technician adequate facilities for safe storage and proper curing of concrete test cylinders on the project site including sufficient access on weekends and holidays to allow the timely pick-up of cylinders specimens. Any and all deviations from the standard procedure of any test method shall be promptly identified and corrected. Any deviations shall be clearly noted by the testing laboratory on all written reports. Testing results obtained from non-standard testing procedures shall be considered invalid and discarded by Engineer.

Sampling and testing performed for concrete acceptance will be at the expense of the Contracting Agency. Sampling and testing for the Contractor's purposes of quality control or other needs shall be at the Contractor's expense.

725.8.2 Concrete Cylinder Test: A cylinder strength test shall be the average of the strengths of at least two 6 inch by 12 inch cylinders or at least two 4 inch by 8 inch cylinders made from the same sample of concrete and tested at 28 days. An adequate number of cylinder specimens shall be made for each 50 cubic yards or not less than each half-day's placement of each class of concrete. All specimens will be tested in a laboratory approved by the Engineer in accordance with ASTM C39 for concrete acceptance. Should an individual cylinder show evidence of improper sampling, molding, curing, or testing, the results shall be discarded and the compressive strength shall be the result of the average of the remaining cylinder(s). Additional cylinder specimens may be made and tested at other ages to obtain additional compressive strength information and shall not be considered as acceptance tests. Cylinder testing performed for concrete acceptance will be at the expense of the Contracting Agency. Cylinder testing for the Contractor's purposes of quality control or other needs shall be at the Contractor's expense.

725.8.3 Additional Concrete Testing: If the 28-day strength test does not meet the compressive strength requirements, additional concrete testing may be performed to further evaluate the concrete in question for purposes of acceptability or

payment. This may involve testing of additional cylinders at later ages, (for example - hold cylinders at 56 days or more), or core testing to determine in-place concrete strengths. This additional testing and all coring repairs shall be pre-approved by the Engineer and at the expense of the Contractor. If core testing is performed, at least three representative cores shall be obtained, conditioned and tested in accordance with ASTM C42 from each concrete member or area of concrete to be tested at locations designated by the Engineer. Cores damaged subsequent to or during removal shall be rejected and additional core samples taken. Cores shall be obtained and delivered to a laboratory acceptable to the Engineer in time to allow complete strength testing within 48 days of original concrete placement. The Contractor may elect to have a representative present during sampling and testing. A core strength test shall be the average of the results of the three cores. Should an individual core show evidence of improper sampling, curing, or testing, the results shall be discarded and the compressive strength shall be the result of the average of the remaining core(s). Results of the core strength testing shall replace the results of the cylinder strength test for that sample.

725.9 ACCEPTANCE:

(A) Plastic Concrete Properties:

(1) The slump of the concrete shall meet the requirements of ASTM C94 Tolerances in Slump section. When the approved mix design or project specification requirements for slump are a "maximum" or "not to exceed", the following tolerances apply:

Specified slump:	If 3" or less	If more than 3"
Plus tolerance	0 inch	0 inch
Minus tolerance	1 1/2 inch	2 1/2 inch

When the approved mix design or project specification requirements for slump are not written as a "maximum" or "not to exceed," the following tolerances apply:

For design slump of:	Tolerance
2 inch and less	+/- 1/2 inch
More than 2 through 4 inch	+/- 1 inch
More than 4 inch	+/- 1 1/2 inch

(2) Limit the maximum allowable temperature of the concrete mixture immediately before placement to 95°F unless otherwise specified or unless a higher allowable temperature is pre-approved by the Engineer. At the discretion of the Engineer, recommended practices in ACI 305, Specification for Hot Weather Concreting, can provide good reference information and may be used to modify maximum allowable concrete temperature and acceptance.

Per ACI 306, Specification for Cold Weather Concreting, when the atmospheric temperature at the time of placing concrete is above 30°F the temperature of the concrete, as placed, shall not be less than 60°F. When the atmospheric temperature at the time of placing concrete is between 0°F and 30°F the temperature of the concrete, as placed, shall not be less than 65°F.

(3) Air entrained concrete shall meet the requirements of ASTM C94 Air-Entrained Concrete section. The air content of air-entrained concrete when sampled from the transportation unit at the point of discharge shall be within the approved mix design tolerance or +/- 1.5 % of the specified value. When a representative sample taken prior to discharge shows an air content below the specified level by more than the allowable tolerance, additional air entraining admixture shall be added to the concrete mix to achieve the desired air content level, followed by a minimum of 30 revolutions at mixing speed.

(4) Per ASTM C94 Mixing and Delivery section, discharge of the concrete shall be completed within 1 1/2 hours (90 minutes) after the introduction of the mixing water to the cementitious materials or the introduction of the cementitious materials to the aggregates. The Engineer may allow the continuation of concrete placement after the 1 1/2 hours (90 minutes) time limit has been reached if the concrete is of such slump or workability that it can be placed without the addition of water to the batch. The 1 1/2 hours (90 minutes) time limit may also be waived if the mix design incorporates a hydration stabilizing admixture at the sufficient dosage to slow down hydration in order to permit additional transit/placement time. The dosage and associated additional time shall be noted on the delivery ticket. The additional

discharge time shall not exceed the maximum additional time based on the dosage noted on the approved mix design or delivery ticket. It is the Contractor's responsibility to obtain approval for additional discharge time from the Engineer prior to concrete placement.

Any concrete failing to meet the tolerances for plastic concrete properties in 725.9 (A) (1) through (4) shall be reviewed by the Engineer and is subject to rejection.

(B) Hardened Concrete Properties – Compressive Strength:

Compressive strength of concrete shall be determined on the basis of cylinder strength tests obtained in accordance with Section 725.8.2 and shall be acceptable if the tests meet or exceed the minimum specified strength. When the validity of cylinder strength tests are suspect, the strength of concrete in question shall be determined in accordance with Section 725.8.3.

When compressive strength test results are less than the specified minimum, an Engineering Analysis to determine the impact of the strength reduction may be required by the Engineer prior to the decision to accept or reject the concrete. The Engineering Analysis will be at the Contractor's expense. Any concrete that is rejected by the Engineer shall be removed and replaced by the Contractor at the Contractor's expense.

When concrete is accepted by the Engineer on the basis of test results of less than 100% of the required minimum compressive strength, an adjustment in the concrete unit price may be made for the quantity of concrete represented by such strength tests in accordance with Table 725-3.

TABLE 725-3

Adjustment in Concrete Unit Price Based on Strength Deficiency

Class AA and Class A		Class B and Class C	
Percent of Specified Minimum 28-day Compressive Strength Attained (Nearest 1%)	Percent of Concrete Unit Price Allowed	Percent of Specified Minimum 28-day Compressive Strength Attained (Nearest 1%)	Percent of Concrete Unit Price Allowed
100% or greater	100	100% or greater	100
98-99	90	95-99	95
96-97	85	90-94	90
95	80	85-89	85

- End of Section -

SECTION 726

CONCRETE CURING MATERIALS

726.1 GENERAL:

Curing materials shall consist of curing paper, polyethylene film or liquid membrane-forming compounds which, when applied to fresh concrete, will inhibit moisture loss and reduce temperature rise during the curing period. All curing materials and methods shall be approved by the Engineer prior to use. Wet coverings such as burlap, cotton mats, or other moisture-retaining fabrics also may be used, or may be required by special provisions.

726.2 MATERIALS:

(A) Curing paper, or polyethylene film, shall conform ASTM C171.

(B) Liquid membrane-forming compounds shall conform ASTM C309. Type 1 compound with either a Class A or Class B vehicle shall be used for concrete structures, except bridge decks, approach slabs, and Portland cement concrete pavement. Type 2 white pigmented compound, with either a Class A or Class B vehicle shall be used for Portland cement concrete pavement, bridge decks and approach slabs.

(C) Burlap cloth made from jute or kenaf shall conform to AASHTO M-182.

- ***End of Section*** -

SECTION 727

STEEL REINFORCEMENT

727.1 GENERAL:

The following specifications set forth the requirements for bar reinforcement, wire reinforcement, and wire mesh reinforcement. The reinforcement shall conform accurately to the dimensions and details indicated on the plans or otherwise prescribed and before being placed in any concrete work, shall be thoroughly cleaned of all loose rust, mill scale, mortar, oil, dirt, or coating of any character, which would be likely to destroy, reduce, or impair its proper binding with the concrete.

No reinforcing steel will be accepted under this specification until it has been approved by the Engineer. When required by the Engineer, the Contractor or supplier shall furnish a spot sample taken on the project and notify the Engineer as to when and where they will be available. Such samples shall be furnished at the expense of the Contractor or supplier, but the cost of any testing that may be required will be borne by the Contracting Agency. Samples shall only be taken in the presence of the Engineer. The Contractor shall furnish three certified mill test reports or a Certificate of Compliance for each heat or size of steel, which can be clearly identified with the lot. When such information has been furnished, placing of the steel will not be held up until results of spot samples have been received. Unless otherwise specified, all reinforcing steel bars shall be deformed intermediate grade 40 billet steel in conformance to ASTM A615.

In testing bar reinforcement, only the theoretical cross-sectional area will be used in all computations.

Reinforcing steel shall be furnished in the sizes, shapes, and lengths shown on the plans. Bending of steel shall conform to the requirements of Section 505.5.2.

The various grades of steel shall not be used interchangeably in structures.

727.2 WIRE REINFORCEMENT:

Wire reinforcement shall in all respects fulfill requirements prescribed in ASTM A1064.

727.3 WELDED WIRE REINFORCEMENT:

Welded wire reinforcement shall conform to ASTM A1064. The wire size number and the wire spacing will be specified in the special provisions or shown on the plans. The welded wire reinforcement shall be so constructed as to retain its original shape and form during necessary handling. The effective cross-sectional area of the metal shall be equal to that specified or indicated on the plans.

727.4 WIRE TIES:

Wire for ties shall be black, annealed, and not lighter than 16 gage.

- End of Section -

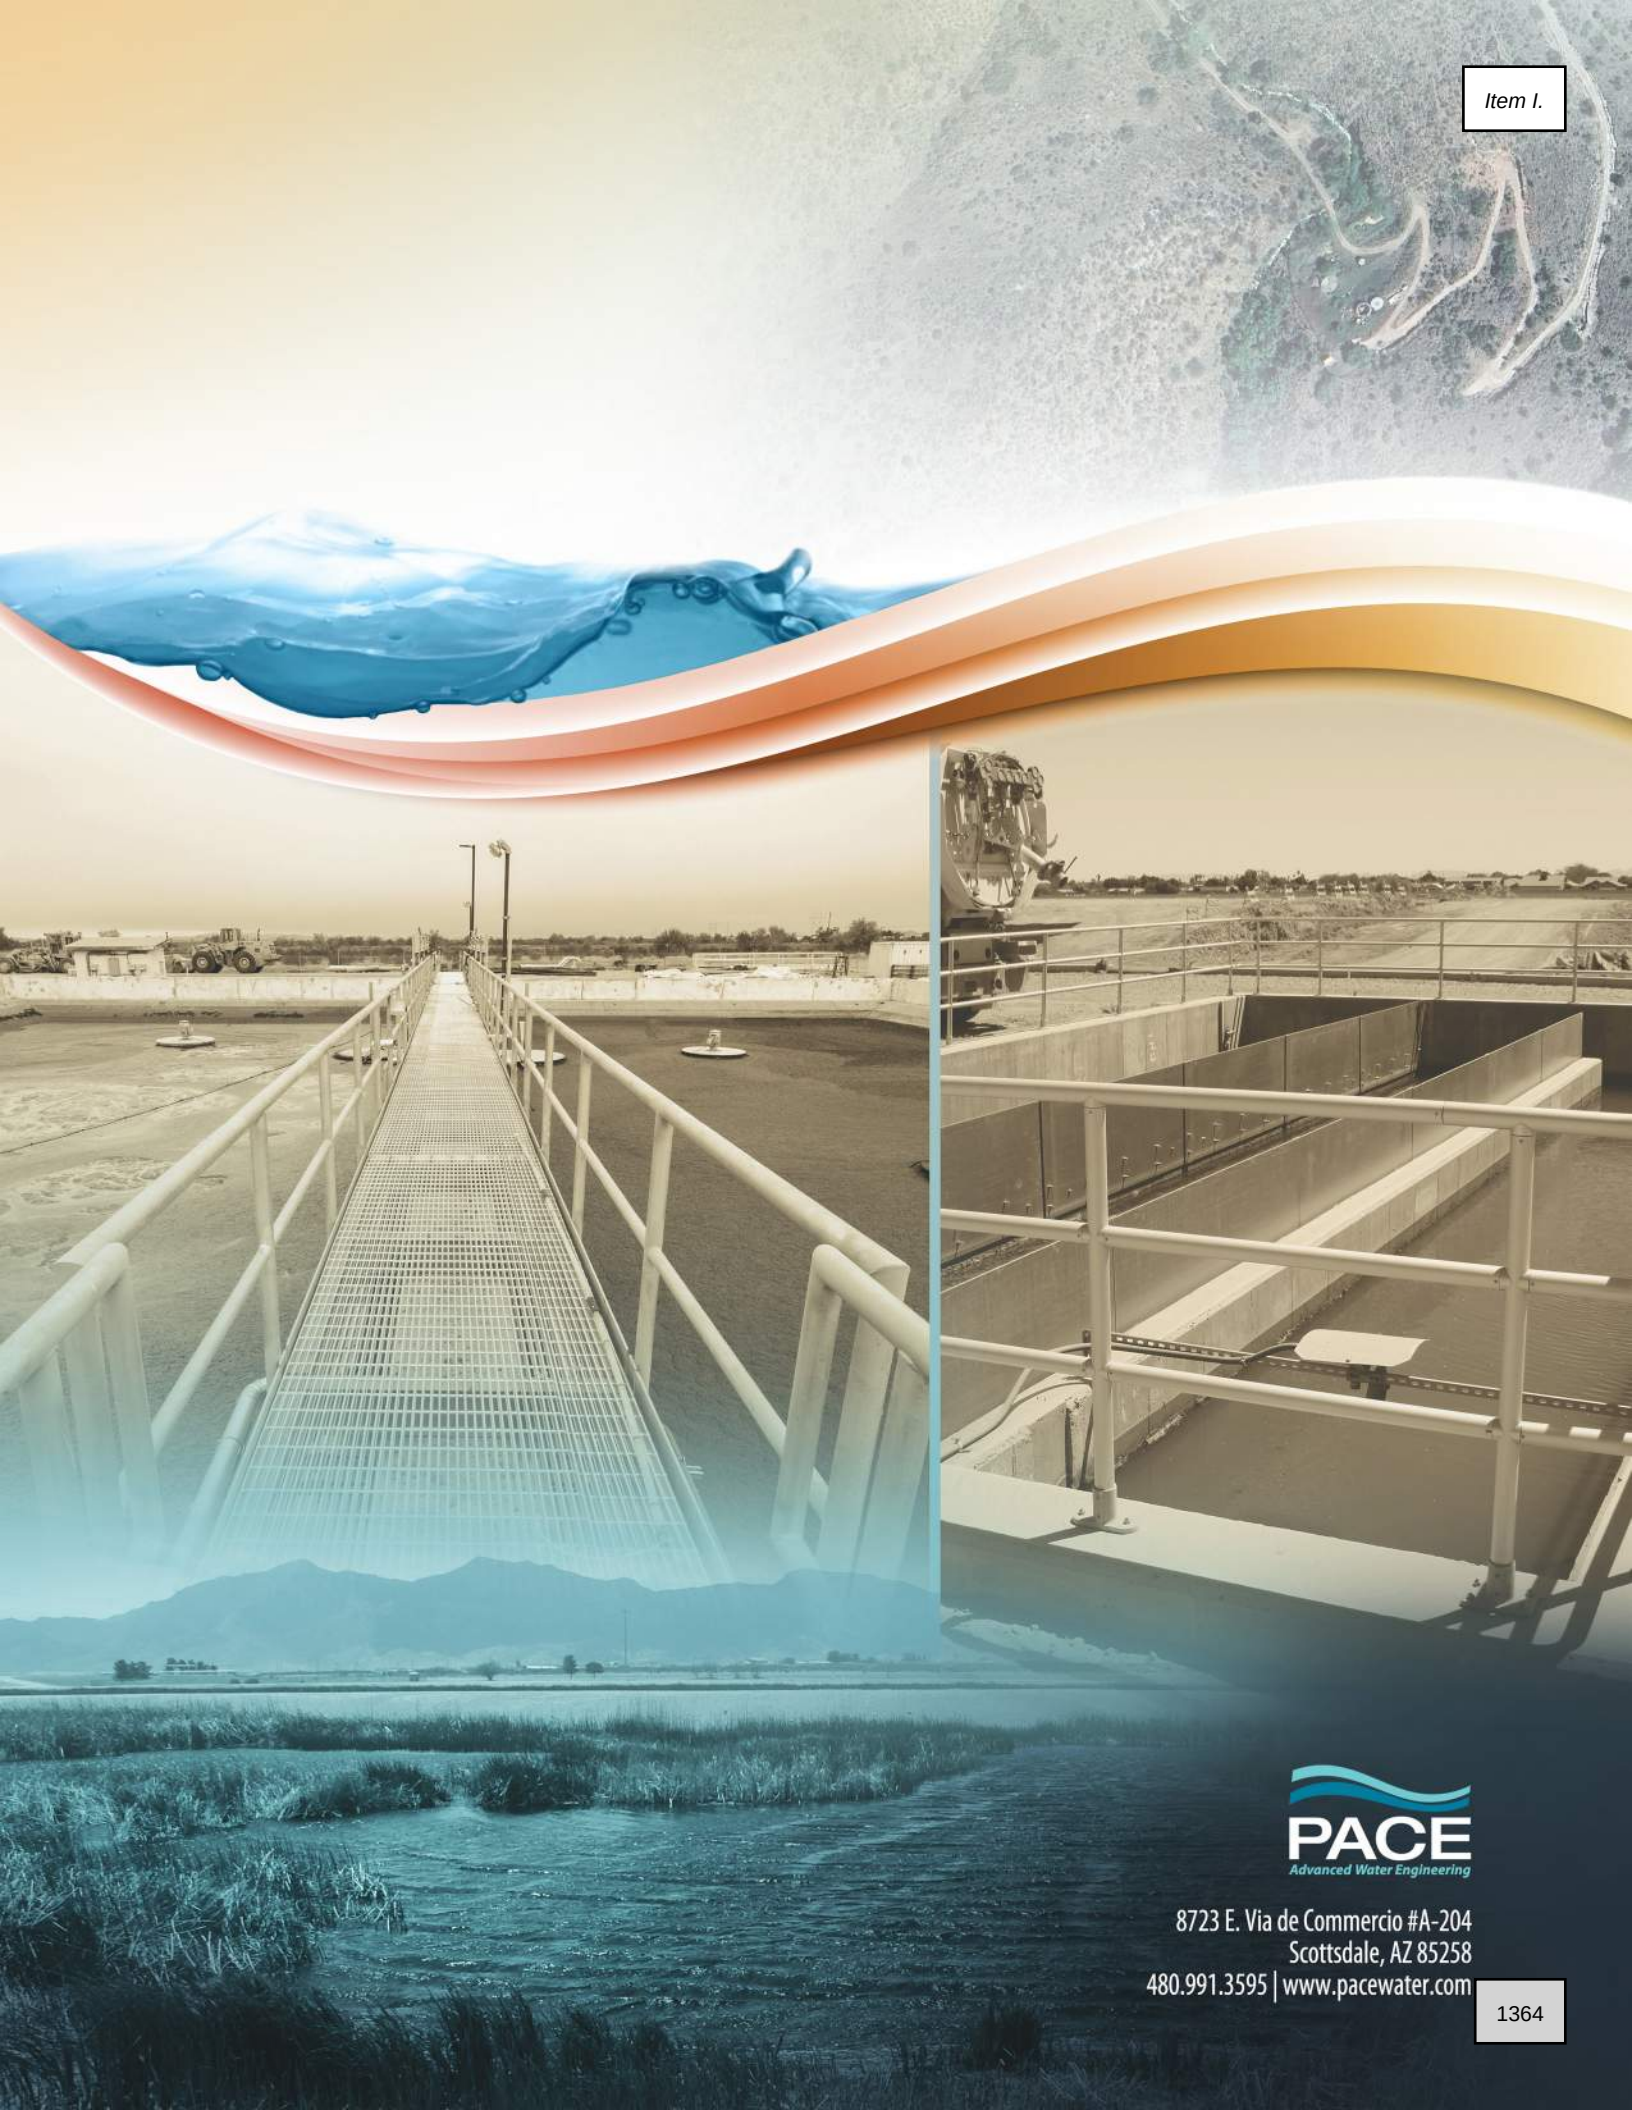
SECTION 729

EXPANSION JOINT FILLER

729.1 PREMOLDED JOINT FILLER:

Expansion joint filler materials shall consist of preformed strips of a durable resilient compound and comply with one of the following as specified by the Contracting Agency or as approved by the Engineer.

(a) ASTM D1751 – Performed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
(b) ASTM D8139 – Semi-Rigid, Closed-Cell Polypropylene Foam, Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction
(c) ASTM D1752 – Preformed Sponge Rubber Cork and Recycled PVC Expansion Joint Fillers for Concrete Paving and Structural Construction
(d) ASTM D2628 – Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements.



729.2 POUR TYPE JOINT FILLERS FOR PORTLAND CEMENT CONCRETE PAVING (PCCP):

Pour type joint fillers shall comply with ASTM D3406 or as approved by the Engineer. Joint sealant shall not contain any coal tar materials. The following requirement shall be added to paragraphs 7.1 of ASTM D3406: The minimum ambient temperature during application and ambient temperatures under various storage conditions shall be clearly marked on the container.

729.3 TEST REPORT AND SHIPMENT CERTIFICATE:

When requested by the Engineer, each shipment shall be accompanied by a Certificate of Compliance that the material complies with the above specifications.

W:\B614\Engineering\B614-30\sheets\B614 - G1.0 TITLE SHEET.dwg - Tab: G1.1 - by reddington on 04/21/26 at 12:17:57 PM

GENERAL NOTES:

1. ALL PAVING, GRADING, PIPING, AND UTILITY LINE CONSTRUCTION WORK WITHIN THE PUBLIC RIGHT OF WAY, ON PRIVATE STREETS, ACCESS WAYS, LOT GRADING, MATERIALS, AND WORKMANSHIP SHALL COMPLY WITH TOWN OF JEROME ENGINEERING STANDARDS AND SPECIFICATIONS, AND SHALL CONFORM TO THE LATEST MARICOPA ASSOCIATION OF GOVERNMENTS (MAG) AND A.D.O.T. STANDARD DETAILS AND SPECIFICATIONS. GRADING WORK SHALL CONFORM TO MAG SPECIFICATIONS, THE SOILS REPORT, AND CHAPTER 70 ENTITLED "EXCAVATION AND GRADING" OF THE UNIFORM BUILDING CODE (UBC) LATEST EDITION, SUBSECTIONS 7001 TO 7005, 7009 TO 7013, FIGURES 70-1 AND 70-2 AND AS STATED THEREIN. LOCAL MUNICIPAL STANDARD DETAILS WILL CONTINUE TO APPLY WHERE NOT ADOPTED OR INCLUDED BY MAG. THE FOLLOWING NOTES AND SPECIFICATIONS ARE HEREBY MADE A PART OF THE CONTRACT DOCUMENTS AND PROJECT SPECIFICATIONS. WHERE THERE EXISTS A CONFLICT BETWEEN THESE NOTES, MAG SPECS, UBC, THE SOILS REPORT, OR THE PROJECT SPECIFICATIONS, THE MORE STRINGENT OF THE REQUIREMENTS SHALL GOVERN UNLESS PRIOR CLARIFICATION FROM THE ENGINEER HAS BEEN GIVEN IN WRITING TO THE CONTRACTOR. THE CONTRACTOR AS STATED HEREIN SHALL MEAN THE GENERAL CONTRACTOR AND HIS ASSOCIATED SUBCONTRACTORS. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR THE COORDINATION AND PERFORMANCE OF THE WORK OF ALL HIS SUBCONTRACTORS AND SUPPLIERS.
2. ALL WORK SHALL BE BID AND INSTALLED BY THE CONTRACTOR COMPLETE AND OPERATIONAL TO LINES, GRADES, AND FUNCTIONS INDICATED ON ALL PLANS AND SPECIFICATIONS. THE CONTRACTOR SHALL PROVIDE ALL LABOR, MATERIALS, EQUIPMENT, AND SERVICES NECESSARY TO COMPLETE ALL PROJECT EARTHWORK AND SITE WORK INCLUDING BUT NOT LIMITED TO: SITE CLEARING, GRUBBING, DEMOLITION, DEBRIS REMOVALS FROM THE SITE, IMPORT AND/OR EXPORT OF SOILS AND OTHER MATERIALS TO AND FROM THE SITE, BORROW MATERIALS, TEMPORARY SOILS MATERIAL STOCKPILING, BACKFILL OF ONSITE BORROW PITS, MOVING OF MATERIALS, CUT AND FILL, SLOPES, SOILS AND BANK STABILIZATION AND PROTECTION, BERMING, ROADWAY EXCAVATIONS, RELOCATIONS, STRUCTURE EXCAVATIONS, TRENCHING, ALL BACKFILLING, SITE GRADING, PAVING, PIPING, UTILITY LINE AND STORM DRAINAGE CONSTRUCTION, CURBS, SITE CONCRETE WORK AND OTHER MISCELLANEOUS SITE WORK STRUCTURES AND ITEMS INDICATED ON THE PLANS AND IN THE CONTRACT DOCUMENTS.
3. ANY QUANTITIES SHOWN ON PLANS ARE NOT VERIFIED BY THE ENGINEER. QUANTITIES ARE APPROXIMATE ONLY AND INTENDED AS A GUIDE FOR ESTIMATING PURPOSES. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING HIS OWN QUANTITY TAKE OFFS. THE CONTRACTOR SHALL VISIT THE SITE AND REVIEW THE SOILS CONDITIONS AND THE SOILS REPORT WITH THE PROJECT SOILS ENGINEER PRIOR TO BIDDING THIS PROJECT. ANY DISCREPANCIES IN SITE MATERIALS SHALL BE BROUGHT TO THE ATTENTION OF THE DESIGN ENGINEER 7 DAYS MINIMUM PRIOR TO BIDDING FOR REVIEW. ALL SHRINK OF EARTH MATERIAL OR EXCESS MATERIAL FROM UTILITY TRENCHES AND FOUNDATIONS SHALL BE INCLUDED IN THE CONTRACTOR'S BID.
4. THE ENGINEER WILL NOT BE RESPONSIBLE FOR CONSTRUCTION MEANS, METHODS, TECHNIQUES, SEQUENCES, OR PROCEDURES OR FOR SAFETY PRECAUTIONS OR PROGRAMS UTILIZED IN CONNECTION WITH THE WORK, AND HE WILL NOT BE RESPONSIBLE FOR THE CONTRACTOR'S FAILURE TO CARRY OUT THE WORK IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
5. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LIMITS OF THE WORK AREA FOR ALL PHASES OF THE WORK PRIOR TO BEGINNING CONSTRUCTION OF THOSE PHASES. ALL CONSTRUCTION LIMITS, AREAS OF WORK, SETBACKS, PERIMETERS, ADJACENT PROPERTY LINES, BOUNDARIES, AND OTHER CRITERIA DEFINING THE LIMITS OF THE CONTRACTOR'S WORK AREA AND LIMITS SHALL BE STAKED BY THE CONTRACTOR'S SURVEYOR PRIOR TO CONSTRUCTION OF CLEARING OF THE SITE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR FAMILIARIZING HIMSELF WITH THE EXTENT OF WORK TO BE DONE IN EACH SEPARATE PHASE OF THE PROJECT, AND ANY WORK NECESSARY IN INACTIVE PHASES REQUIRED TO DEEM THE ACTIVE PHASES FINISHED, SAFE, AND SERVICEABLE.
6. THE DESIGN ENGINEER RESERVES THE RIGHT TO MAKE MINOR FIELD MODIFICATIONS TO GRADES AND STRUCTURE DESIGNS TO ACCOMMODATE FIELD CONDITIONS FOUND ON THE SITE. THIS INCLUDES BUT IS NOT LIMITED TO MINOR MODIFICATIONS TO GRADE, ALIGNMENT, SLOPE, OR STRUCTURE LOCATIONS. THE ENGINEER SHALL HAVE THE RIGHT TO MAKE SUCH CHANGES IN WRITING IN THE LOCATION AND QUANTITIES OF WORK AS MAY BE DEEMED ADVISABLE.
7. NO JOB WILL BE CONSIDERED COMPLETE UNTIL FINAL GRADING IS COMPLETE AND ALL CURBS, PAVEMENT, AND SIDEWALKS HAVE BEEN SWEPT CLEAN OF ALL DIRT AND DEBRIS, ALL SURVEY MONUMENTS ARE INSTALLED AND ALL VALVES, MANHOLES, AND BOXES HAVE BEN ADJUSTED ACCORDING TO THE PLANS AND STANDARD DETAILS.
8. SEE SPECIFICATION SECTION 01 11 00 SUMMARY OF WORK FOR DIVISION OF RESPONSIBILITY. SEE SPECIFICATION SECTION 00 70 00 CONDITIONS OF THE CONTRACT FOR DEFINITIONS.
9. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH UNITED STATES ENVIRONMENTAL PROTECTION AGENCY STANDARDS AND POLICIES AND CURRENT SUPPLEMENTS THERETO.
10. ANY WORK PERFORMED WITHOUT THE APPROVAL OF THE ENGINEER AND/OR ALL WORK AND MATERIAL NOT IN CONFORMANCE WITH THE SPECIFICATIONS IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.
11. DEBRIS SHALL BE DISPOSED OF WITHIN APPROVED DISPOSAL FACILITIES.
12. THE CONTRACTOR SHALL PROVIDE ADEQUATE MEANS FOR CLEANING TRUCKS AND/OR OTHER EQUIPMENT OF MUD PRIOR TO ENTERING PUBLIC STREETS. IT IS THE CONTRACTOR'S RESPONSIBILITY TO CLEAN STREETS, ALLEY DUST, AND TAKE WHATEVER MEASURES ARE NECESSARY TO ENSURE THAT ALL ADJACENT ROADS ARE MAINTAINED IN A CLEAN, MUD AND DUST FREE CONDITION AT ALL TIMES.
13. CONTRACTOR SHALL TAKE MEASURES TO CONTROL DUST AND FUGITIVE EMISSIONS, INCLUDING BUT NOT LIMITED TO WATERING THE SITE TWICE DAILY DURING GRADING TO CONTROL DUST.
14. AN APPROVED SET OF PLANS SHALL BE ON THE JOB SITE AT ALL TIMES WORK IS IN PROGRESS. DEVIATION FROM THE PLANS WILL NOT BE ALLOWED WITHOUT AN APPROVED PLAN REVISION OR AUTHORIZATION FROM THE ENGINEER.
15. THESE DRAWINGS INDICATE THE GENERAL EXTENT OF THE REQUIRED WORK AND ARE NOT INTENDED TO INDICATE EVERY ELEMENT REQUIRED. THE CONTRACTOR SHALL FURNISH ALL ELEMENTS TO COMPLETE THE SCOPE OF WORK IN ACCORDANCE WITH THE CONTRACT DOCUMENTS. ALL ITEMS REQUIRING CLARIFICATIONS SHALL BE SUBMITTED AS A "REQUEST FOR INFORMATION" (RFI) TO THE ENGINEER PER SECTION 01 31 00 OF THE SPECIFICATIONS.
16. ALL CONSTRUCTION VEHICLES OR EQUIPMENT, MOBILE OR FIXED OPERATED, SHALL BE EQUIPPED WITH PROPERLY OPERATING AND MAINTAINED MUFFLERS IN ACCORDANCE WITH THE LOCAL NOISE ORDINANCES.
17. THE CONTRACTOR SHALL PROVIDE SHOP DRAWINGS FOR THE ENGINEER'S REVIEW, AS MAY BE NECESSARY FOR THE EXECUTION OF THE WORK AND AS REQUIRED BY THE DRAWINGS AND SPECIFICATIONS.
18. DUE TO THE ONGOING OPERATION OF THE FACILITY, CONTRACTOR SHALL PROVIDE A SEQUENCE OF CONSTRUCTION FOR TOWN AND ENGINEER'S APPROVAL. TWO WEEKS PRIOR TO THE START OF CONSTRUCTION THE SEQUENCE SHALL INCLUDE A DETAILED SCHEDULE OF EVENTS AND TIMEFRAME. ALL EQUIPMENT, PIPING, LABOR, ETC. FOR THE SEQUENCE SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. ALL TEMPORARY SHUTDOWNS AND CHANGES IN FACILITY OPERATION SHALL BE DISCLOSED TO OWNER AT LEAST 7 DAYS PRIOR.
19. PAVEMENT REPAIR, AS REQUIRED, MAY BE WITH COLD-MIX ASPHALT CONCRETE, WITH A MINIMUM THICKNESS OF 2 INCHES, USING AGGREGATE GRADING IN ACCORDANCE WITH MARSHALL MIX DESIGN OF SECTION 710 OF MAG UNIFORM STANDARD SPECIFICATIONS AND DETAILS FOR PUBLIC WORK CONSTRUCTION.
20. ALL CONSTRUCTION WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE SOILS AND/OR GEOTECHNICAL REPORT PREPARED BY WESTERN TECHNOLOGIES, INC. DATED 10/25/2022. THIS REPORT IS SUPPLEMENTED BY 1) THESE PLANS AND SPECIFICATIONS, 2) YAVAPAI COUNTY PUBLIC WORKS STANDARDS AND SPECIFICATIONS, 3) STATE OF ARIZONA STANDARD DETAILS. IN THE EVENT OF CONFLICT, THE FORMER SHALL TAKE PRECEDENCE OVER THE LATTER. THE PERFORMANCE AND COMPLETION OF ALL WORK MUST BE TO THE SATISFACTION OF THE ENGINEER OF RECORD.

GENERAL CONSTRUCTION NOTES

ENGINEER'S NOTES

1. THE ENGINEER AND APPLICABLE AGENCY MUST APPROVE, PRIOR TO CONSTRUCTION, ANY ALTERATION TO OR VARIANCE FROM THESE PLANS. ANY VARIATION FROM THESE PLANS SHALL BE PROPOSED ON CONSTRUCTION FIELD PRINTS AND TRANSMITTED TO THE ENGINEER.
2. THE CONTRACTOR SHALL PROTECT AND MAINTAIN ALL EXISTING UTILITIES ON THE SITE. ANY DAMAGE TO EXISTING UTILITIES, WHETHER SHOWN OR NOT ON THE DRAWING SHALL BE REPAIRED/REPLACED AT THE CONTRACTOR'S EXPENSE. EXISTING SURFACE FEATURES AND FENCING SHALL BE REPLACED IN KIND.
3. ANY INSPECTION BY THE TOWN, COUNTY OR THE ENGINEER, SHALL NOT IN ANY WAY RELIEVE THE CONTRACTOR FROM ANY OBLIGATION TO PERFORM THE WORK IN STRICT COMPLIANCE WITH THE APPLICABLE CODES AND AGENCY REQUIREMENTS.
4. CONTRACTOR IS TO LOCATE ALL EXISTING PROPERTY MONUMENTS PRIOR TO CONSTRUCTION. NO EXISTING SURVEY MONUMENTATION SHALL BE REMOVED OR DISTURBED BY THE CONTRACTOR WITHOUT NOTIFICATION AND APPROVAL OF THE PROJECT SURVEYOR. THE CONTRACTOR SHALL CONTACT THE PROJECT SURVEYOR FOR THE SETTING OF REFERENCE POINTS 48 HOURS PRIOR TO DISTURBING OR REMOVING ANY MONUMENTS. A REGISTERED LAND SURVEYOR AT THE CONTRACTOR'S EXPENSE SHALL REPLACE ANY MONUMENTS DISTURBED DURING THE CONSTRUCTION OF THIS PROJECT.
5. NOTHING CONTAINED IN THE CONTRACT DOCUMENTS SHALL CREATE, NOR SHALL BE CONSTRUED TO CREATE, ANY CONTRACTUAL RELATIONSHIP BETWEEN THE ENGINEER AND THE CONTRACTOR OR ANY SUBCONTRACTOR.
6. ANY CONSTRUCTION WATER OBTAINED FROM THE TOWN WATER SOURCE WILL REQUIRE METER AND A BULK WATER PERMIT TO TRACK USAGE. THE TOWN WILL WAIVE FEES FOR PERMITTING AND USAGE IF USAGE IS LESS THEN 20,000 GALLONS. CONTACT THE TOWN OF JEROME AT (928) 634-7943 TO REQUEST A METER.
7. THE CONTRACTOR SHALL MAKE NO CLAIM AGAINST THE OWNER OR THE ENGINEER REGARDING ALLEGED INACCURACY OF CONSTRUCTION STAKES SET BY THE ENGINEER UNLESS ALL SURVEY STAKES SET BY THE ENGINEER ARE MAINTAINED INTACT AND CAN BE VERIFIED AS TO THEIR ORIGIN. IF, IN THE OPINION OF THE ENGINEER, THE STAKES ARE NOT MAINTAINED INTACT AND CANNOT BE VERIFIED AS TO THEIR ORIGIN, ANY REMEDIAL WORK REQUIRED TO CORRECT ANY ITEM OR IMPROPER CONSTRUCTION WORK IN THIS DEVELOPMENT SHALL BE PERFORMED AT THE SOLE EXPENSE OF THE RESPONSIBLE CONTRACTOR OR SUBCONTRACTOR.
8. TRAFFIC CONTROL SHALL BE MAINTAINED IN ACCORDANCE WITH THE TOWN OF JEROME MUNICIPAL CODES.
9. A PORTION OF THIS PROJECT SITE IS LOCATED WITHIN A DOCUMENTED 100-YR FEMA FLOODLAIN AS DESIGNATED ON THE PLANS.
10. IN CASES WHEN UNSTAKED EXISTING UTILITIES ARE ENCOUNTERED, SOME MINOR DEVIATION TO THE PROPOSED SEWER ALIGNMENT MAY BE ALLOWED TO MAINTAIN MINIMUM SEPARATION DISTANCES BETWEEN UTILITIES. ANY PROPOSED CHANGES TO THE ALIGNMENT MUST BE SUBMITTED TO THE TOWN'S REPRESENTATIVE FOR REVIEW. NO CHANGES WILL BE ALLOWED WITHOUT PROPER APPROVAL.
11. PRIOR TO BIDDING THE WORK, THE CONTRACTOR SHALL THOROUGHLY SATISFY HIMSELF AS TO THE ACTUAL CONDITIONS AND EARTHWORK QUANTITIES, IF ANY. NO CLAIM SHALL BE MADE AGAINST THE OWNER OR ENGINEER FOR ANY EXCESS OR DEFICIENCY THEREIN, ACTUAL OR RELATIVE.
12. THE ENGINEERS SHALL BE NOTIFIED BEFORE ANY ONSITE CONSTRUCTION BEGINS.
13. A SEPARATE PERMIT IS NECESSARY FOR ANY OFFSITE CONSTRUCTION.
14. APPROVAL OF THESE PLANS SHALL NOT PREVENT THE TOWN FROM REQUIRING CORRECTION OF ERRORS IN THE PLANS WHERE SUCH ERRORS ARE SUBSEQUENTLY FOUND TO BE IN VIOLATION OF ANY LAW OR ORDINANCE.

MECHANICAL CONSTRUCTION NOTES:

1. CONTRACTOR TO INSTALL PIPE SUPPORTS PER MANUFACTURER'S REQUIREMENTS AND SPECIFICATIONS. ALL DRY AREA PIPE SUPPORTS SHALL BE GALVANIZED STEEL U.N.O. ALL SUBMERGED PIPE SUPPORTS SHALL BE S.S. 316.
2. CONTRACTOR TO INSTALL PUMP BASE, GUIDE RAILS, AND BRACKETS PER MANUFACTURER'S REQUIREMENTS. CONTRACTOR SHALL CONFIRM SUPPLY OF PUMP MOUNTING EQUIPMENT WITH PUMP SUPPLIER.
3. ALL PROCESS PIPES SHALL BE COLOR COATED PER THE SPECIFICATIONS WITH THE EXCEPTION OF STAINLESS STEEL PIPES. ALL ABOVE GROUND PIPES SHALL ALSO BE OUTFITTED WITH A FLOW DIRECTION ARROW.
4. ALL ANCHORING/FASTENING SYSTEMS SHALL BE 316 S.S. REGARDLESS OF LOCATION, U.N.O.
5. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS FOR REVIEW AND APPROVAL FOR EACH EQUIPMENT ITEM PRIOR TO INSTALLATION. INSTALLATION DETAILS FOR ALL EQUIPMENT ITEMS SHALL BE PER RESPECTIVE EQUIPMENT MANUFACTURER'S SHOP DRAWINGS AND RECOMMENDED INSTALLATION REQUIREMENTS.
6. ALL D.I.P. SHALL BE CLASS 350, UNLESS NOTED OTHERWISE.
7. ELEVATION OF EXISTING STRUCTURES, PIPING, AND COMPONENTS ARE APPROXIMATE. CONTRACTOR TO FIELD VERIFY PRIOR TO CONSTRUCTION.
8. PRECAST SUPPLIER TO PROVIDE STRUCTURAL CALCULATIONS STAMPED BY REGISTERED ENGINEER IN AZ TO DOCUMENT DESIGN OF PRECAST STRUCTURE.
9. GROOVE FITTINGS MAY BE USED IN LIEU OF FLANGE FITTINGS FOR ALL ABOVE GROUND D.I. PIPING.
10. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY PIPING AND EQUIPMENT NEEDED FOR PROCESS ISOLATION, BYPASS, AND TRANSITION.
11. ALL YARD PIPING SHALL BE SURVEYED FOR VERTICAL AND HORIZONTAL ALIGNMENT PRIOR TO BACKFILL.
12. ALL PIPE SUPPORTS SPACING SHALL MEET PIPING MANUFACTURER'S REQUIREMENTS.
13. STRUCTURAL DIMENSIONS CONTROLLED BY OR RELATED TO MECHANICAL OR ELECTRICAL EQUIPMENT SHALL BE VERIFIED BY THE CONTRACTOR AND REFLECTED ON SHOP DRAWING PRIOR TO CONSTRUCTION.
14. ALL PVC PIPE GREATER THAN 3" IN DIAMETER SHALL BE DIPS.
15. ALL EXPOSED PIPE SHALL INCLUDE HEAT TRACING AND INSULATION.
16. ALL NEW BURIED GRAVITY SEWER LINES AND FORCE MAINS SHALL BE INSTALLED WITH A MINIMUM 3' DEPTH OF EARTH COVER.

PERMITS

1. CONTRACTOR SHALL OBTAIN ALL PERMITS AT HIS OWN EXPENSE FROM LOCAL MUNICIPAL AND AIR POLLUTION CONTROL AUTHORITIES PRIOR TO BEGINNING CONSTRUCTION.
2. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO ARRANGE FOR THE RELOCATION AND RELOCATION COSTS, IF ANY, OF ALL UTILITIES, AND SUBMIT A UTILITY RELOCATION SCHEDULE TO THE MUNICIPALITY AND DESIGN ENGINEER PRIOR TO CONSTRUCTION. ALL PUBLIC UTILITY EQUIPMENT POLES, BOXES, STRUCTURES, AND MUNICIPAL UTILITY COMPANY EQUIPMENT SHALL BE RELOCATED BY THE APPROPRIATE UTILITY COMPANY OR MUNICIPALITY BEFORE ANY WORK IS STARTED.

RECORD DRAWINGS

1. ACCEPTANCE OF THE COMPLETED PAVING, GRADING, OR UTILITY INSTALLATION WILL NOT BE GIVEN UNTIL REPRODUCIBLE AS-BUILT PLANS HAVE BEEN SUBMITTED BY THE ENGINEER AND APPROVED BY THE LOCAL GOVERNING AGENCY.

OBSERVATION

1. THE CONTRACTOR SHALL CONTACT THE APPROPRIATE PUBLIC UTILITY COMPANIES FOR INSPECTION OF TRENCHING, BEDDING, AND BACKFILLING DONE IN CONJUNCTION WITH INSTALLATION OF THOSE UTILITIES ON THIS PROJECT.
2. SOILS COMPACTION TEST RESULTS MUST BE SUBMITTED TO THE ENGINEER'S OFFICE FOR ALL FILL MATERIAL FOR ROADS, TRENCH BACKFILL, AND SITE FILL MATERIALS UNDER SLABS AND STRUCTURES. NO FILL MATERIALS SHALL BE PLACED WITHOUT TESTING DURING PLACEMENT. CONTRACTOR SHALL SUBMIT ALL TEST RESULTS TO THE DESIGN ENGINEER AND GOVERNMENTAL AGENCIES.
3. CONTRACTOR SHALL SUBMIT A SCHEDULE, APPROVED IN WRITING BY A QUALIFIED CONSULTING TESTING AGENCY, FOR FREQUENCY, LOCATION, AND TYPE OF ALL PROJECT TESTING. THE CONTRACTOR WILL BE RESPONSIBLE FOR SCHEDULING AND COORDINATION OF ALL TESTING INCLUDING THE FOLLOWING TERMS WHICH SHALL BE TESTED IN ACCORDANCE WITH MAG SPECIFICATIONS:
   - 3.1. SUBGRADE COMPACTION
   - 3.2. BASE COURSE COMPACTION
   - 3.3. ASPHALT PAVEMENT MIX DESIGN QUALITY
   - 3.4. CONCRETE STRENGTH
   - 3.5. TRENCH BEDDING AND BACKFILL
   - 3.6. TESTING FOR UTILITIES, PIPING, AND DRAINAGE SYSTEMS

UTILITIES

1. A UTILITY COORDINATION MEETING SHALL BE COORDINATED BY THE CONTRACTOR PRIOR TO THE START OF ANY WORK. ALL UTILITY ISSUES SHALL BE ADDRESSED IN ACCODANCE WITH MAG 105.6.
2. LOCATION OF UNDERGROUND UTILITIES SHALL BE ACCOMPLISHED IN ACCORDANCE WITH ARS 40-360.22 PRIOR TO ANY EXCAVATION. BLUE STAKE SHALL BE CALLED AT 1-800-STAKE-IT FOR ACCURATE LOCATION OF UTILITIES AS NECESSARY AND PRIOR TO AN EXCAVATION. UTILITIES IF INDICATED ON PLANS ARE APPROXIMATE LOCATIONS ONLY, TAKEN FROM THE UTILITY COMPANY MAPS. IF THE CONTRACTOR ENCOUNTERS ANY LINES NOT INDICATED ON THE DRAWINGS OR MARKED IN THE FIELD BY THE UTILITY COMPANY THAT MAY INTERFERE WITH HIS WORK, HE SHALL NOTIFY THE APPROPRIATE UTILITY COMPANY IMMEDIATELY FOR DISPOSITION OF THOSE FACILITIES.
3. UTILITIES MUST BE LOCATED TO MINIMIZE INTERFERENCE WITH ONE ANOTHER, TO PROVIDE REQUIRED HORIZONTAL AND VERTICAL SEPARATIONS, AND TO PROVIDE MAINTENANCE ACCESS WITHOUT VIOLATING EASEMENT BOUNDARIES. SEPARATION BETWEEN UTILITIES PER MAG STANDARD.
4. ALL WATER MAINS, APPURTENANCES, AND INSTALLATIONS SHALL CONFORM TO A.W.W.A. STANDARDS AND ARIZONA DEPARTMENT OF ENVIRONMENTAL QUALITY AND TOWN OF JEROME REQUIREMENTS. WATER SYSTEMS SHALL BE TESTED PER A.D.E.Q. BULLETIN NO. 10 TO THE APPROPRIATE A.W.W.A. STANDARDS.

CONSTRUCTION STAKING

1. THE ACCURACY OF ALL CONSTRUCTION WORK SHALL BE MAINTAINED AND VERIFIED BY THE OWNER'S SURVEYOR AT THE OWNER'S EXPENSE BY PROVIDING CONSTRUCTION STAKING SUITABLE TO THE TOWN ENGINEER. STAKES WILL BE SET ESTABLISHING LINES AND GRADES (FINISH OR FLOWLINE) FOR ALL CONSTRUCTION INCLUDING ROADS, CURB AND GUTTER, SIDEWALKS, UTILITIES, STRUCTURES, AND OTHER WORK AS CONSIDERED NECESSARY BY THE ENGINEER. ALL SURVEY CONTROL SHALL BE SET BY THE OWNER'S SURVEYOR FROM MONUMENTS ACCEPTABLE TO THE ENGINEER.

GRADING AND EARTHWORK

1. NO GRADING OR TRENCHING WORK SHALL BEGIN PRIOR TO SUPPORTING AND PROTECTING EXISTING ONSITE AND ADJACENT PROPERTY FROM SETTLING, CRACKING, OR OTHER DAMAGE WHICH MIGHT RESULT. CONTRACTOR SHALL VERIFY FROM SOILS REPORT RECOMMENDATIONS THE DEGREE OF DIFFICULTY REQUIRED FOR TRENCHING AND EXCAVATION WORK BASED ON DEPTH AND TYPE OF MATERIALS TO BE ENCOUNTERED.
2. CLEARING AND GRUBBING: EXAMINE SITE AND PROVIDE NECESSARY EQUIPMENT AND LABOR TO REMOVE FROM THE SITE AND DISPOSE OF STUMPS, ROOTS, ROCKS, LOOSE FILL, VEGETATION DEBRIS, AND ANY OTHER OBJECTIONABLE MATERIALS FROM THE BUILDING AND MATERIAL. CLEAN. UNCLASSIFIED ONSITE SOILS MAY BE USED IN GENERAL AS FILL MATERIAL. SEE MAG SPECIFICATIONS 201 AND 215.
3. SUBGRADE PREPARATION: IF THE NATURAL SUBGRADE IS LESS THAN THE REQUIRED DENSITY, IT SHALL BE SCARIFIED AND COMPACTED TO A MINIMUM DEPTH OF TWELVE INCHES OR AS NOTED IN THE SOILS REPORT IMMEDIATELY PRIOR TO PLACING SUBSEQUENT FILL MATERIAL THEREON. THE CONTRACTOR IS RESPONSIBLE FOR MAINTENANCE AND REPAIR OF DAMAGE TO PREPARED SUBGRADE CAUSED BY CONTRACTOR'S OPERATIONS OR PUBLIC TRAFFIC UNTIL ACCEPTANCE OF PROJECT. NO MATERIALS SHALL BE PLACED UPON THE PREPARED SUBGRADE UNTIL IT MEETS THE SPECIFIED REQUIREMENTS. ROADWAY SUBGRADE COMPACTION INCLUDES SUBGRADE UNDER ALL PAVEMENT, CURB, SIDEWALKS, SHOULDERS, AND FILL SLOPES. SUBGRADE TOLERANCES SHALL BE AS SPECIFIED IN MAG SECTION 301. OPEN LANDSCAPED AREAS SHALL BE GRADED TO ±0.2 FEET.
4. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO CONTACT THE TESTING COMPANY FOR SCHEDULING OF COMPACTION TESTING. THE FREQUENCY OF DENSITY AND MOISTURE TESTS REQUIRED FOR ADEQUATE CONTROL SHALL BE THE RESPONSIBILITY OF THE SOILS ENGINEER WHO SHALL CERTIFY TO THE ENGINEER AND CONTRACTOR AT PROJECT END THAT THE ROADBED FILL IS COMPACTED AS OUTLINED HEREIN. COMPACTION SHALL BE ACHIEVED BY MECHANICAL MEANS. IN NO CASE SHALL STRUCTURE BACKFILLING BE FLOOD WATER SETTLED.
5. ALL SLOPE CONSTRUCTION AND ROADWAY EXCAVATION SHALL CONFORM TO THE REQUIREMENTS OF MAG SPECIFICATIONS SECTIONS 20, 205, 211, 301, AND UBC SECTIONS 7009 AND 8010. CUT AND FILL SLOPES SHALL BE AS INDICATED ON THE DETAILS AND PLANS. CUT AND FILL SLOPE GRADIENTS SHALL NOT EXCEED 2:1 IN STEEPNESS WITHOUT WRITTEN AUTHORIZATION FROM THE SOILS ENGINEER AND EXAMINATION BY THE DESIGN ENGINEER. ALL SLOPE CONDITIONS SHALL BE PROVIDED WITH THE APPROPRIATE BENCHES AS SPECIFIED IN THE REFERENCE DOCUMENTS AND INDICATED ON THE PLANS. IF SOILS CONDITIONS ARE ENCOUNTERED WHICH DO NOT ALLOW THE ESTABLISHMENT OF THE INDICATED CUT OR FILL SLOPES, THE DESIGN ENGINEER AND SOILS ENGINEER SHALL BE CONTACTED IMMEDIATELY TO DETERMINE AN ADJUSTMENT TO THE SLOPE GRADIENT OR TO ESTABLISH A METHOD OF STABILIZATION. ALL FILL SLOPES SHALL BE COMPACTED AS EACH LIFT OF FILL MATERIAL IS PLACED. ALL CUT AND FILL SLOPES SHALL BE UNIFORMLY GRADED TO LINES AND GRADES INDICATED. TOPS OF ALL CUT SLOPES SHALL BE ROUNDED AND ALL UNSTABLE AND LOOSE MATERIAL AT TOP OF SLOPE SHALL BE REMOVED. TOP OF CUT SLOPES OVER 10' HIGH SHALL BE PROVIDED WITH BRO DITCHES FOR DRAINAGE. ALL CUT AND FILL SLOPES SHALL BE REVEGETATED WITH A MIXTURE OF NATIVE GRASSES AND WILD FLOWER SEED OR AS SPECIFIED WITHIN THE LANDSCAPE PLANS. COMPACT ALL SHOULDERS AND BACKFILLS BEHIND ALL STRUCTURES AND WALLS.
6. COMPACT TO THE FOLLOWING SPECIFIED PERCENT OF MAXIMUM DENSITY AS DETERMINED IN ACCORDANCE WITH ASTM D698 AND MAG SECTION 211 OR AS DIRECTED IN THE SOILS REPORT.

MINIMUM PERCENT COMPACTION

SUBGRADE SOIL:
- ROADWAY AND STRUCTURE AREAS - - - - - - - - - - - - - 95
- PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS) - - 95

EARTH FILL:
- ROADWAY AND STRUCTURE AREAS - - - - - - - - - - - - - 95
- PAVED ARES (PAVEMENTS, SIDEWALKS, & PADS) - - - 95
- GRASSED AND PLANTING AREAS - - - - - - - - - - - - - - 85
- AGGREGATE BASE COURSE - - - - - - - - - - - - - - - - - - 100
- BACKFILL AROUND STRUCTURES - - - - - - - - - - - - - - 95

BACKFILL FOR UTILITY TRENCHES (PER MAG SECTION 601). PROVIDE TYPE 1 BACKFILL OR AS DIRECTED BY APPROPRIATE UTILITY REQUIREMENTS. BACKFILL FOR TRENCHES WITHIN 10' OF STRUCTURES AND WALLS SHALL BE COMPACTED TO 95% UNLESS DIRECTED OTHERWISE BY ENGINEER.

NO	BY	DATE	REVISIONS	DATE	APP.

EQUIPMENT LIST

ITEM	ID #	DESCRIPTION	MANUFACTURER	MODEL #	HP	SPECIFICATIONS / DESCRIPTION	QTY
1	03010A 03010B	INFLUENT COARSE SCREEN	OR-TEC OR EQUAL	MB480T2 W/ RT	0.16	TANK MOUNTED MECHANICALLY CLEANED BAR SCREEN WITH TWO INDEPENDENT 6MM SCREENING CHANNELS W/ ISOLATING SLIDE GATE & SST ENCLOSURE, PROVIDED WITH SEPERATE ROCK TRAP W/ BAFFLE AND OUTLET WEIR. 480V, 3 PHASE, 60HZ. 0.27 MGD PEAK FLOW	1
2	05120 05121	SBR INFLUENT PLUG VALVES	BY SBR VENDOR		0.5	ELECTRICALLY ACTUATED 10" PLUG VALVE W/ OPEN/CLOSE SERVICE. 120V, 1 PHASE, 60 HZ	2
3	05110 05112	SBR SUBMERSIBLE MIXERS	BY SBR VENDOR		3.6	PREMIUM EFFICIENCY CONSTANT SPEED DIRECT DRIVE MOTOR MIXER W/ MAST MOUNT AND MOORING, 480V, 3 PHASE, 60HZ.	2
4	04310 04311 04312	SBR AERATION BLOWERS	BY SBR VENDOR		20	VFD CONTROLLED PD BLOWER UNIT W/ SOUND ATTENUATED ENCLOSURE, 361 SCFM @ 6.63 PSI, 480V, 3 PHASE, 60HZ.	3
5	04313	DIGESTER AERATION BLOWER	BY SBR VENDOR		7.5	VFD CONTROLLED PD BLOWER UNIT W/ SOUND ATTENUATED ENCLOSURE, 110 SCFM @ 6.63 PSI, 480V, 3 PHASE, 60HZ. CONTROLLED	1
6	04180 04181	RETREIVABLE FINE BUBBLE DIFFUSER SYSTEM	BY SBR VENDOR		N/A	RETRIEVABLE DIFFUSER RACK ASSEMBLY WITH MIN 30" EPDM TUBE DIFFUSERS, RANGE 1.0 CFM - 10.0 CFM (1 - 5 SCFM DESIGN) 2/ W EPDM FLEXIBLE DROP LINE AND QUICK DISCONNECT FITTINGS	60
7	04280	COARSE BUBBLE DIFFUSER SYSTEM	BY SBR VENDOR		N/A	3" EPDM DISK COARSE BUBBLE DIFFUSERS, RANGE 0.5 CFM - 5.0 CFM (0.5 - 2 SCFM DESIGN) 3/8" CXN	12
8	05100 05101	WAS TRANSFER PUMPS	BY SBR VENDOR		1.8	20 GPM @ 15' TDH SUBMERSIBLE NON-CLOG SLUDGE PUMP, 1.8 HP 480V, 3 PHASE, 60HZ W/ BASE AND SS GUIDE RAIL	2
9	05111 05113	SOLIDS EXCLUDING FLOATING DECANTER	BY SBR VENDOR		0.5	211 GPM FLOATING DECANTER W/ 120V, 1 PHASE, 60 HZ ACTUATED SUBMERGED WEIR, MOORING AND 6" DISCHARGE HOSE ASSEMBLY	2
10	05121 05123	SBR DECANT VALVE	BY SBR VENDOR		0.33	ELECTRICALLY ACTUATED 6" BUTTERFLY VALVE W/ MODULATING SERVICE, 480V, 3 PHASE, 60HZ	2
11	06221	TRANSFER/EFFLUENT VALVE	BY SBR VENDOR		0.33	ELECTRICALLY ACTUATED 6" BUTTERFLY VALVE W/ MODULATING SERVICE, 480V, 3 PHASE, 60HZ	1
12	06290	CHLORINATION EROSION TABLET FEEDER	NORWECO OR EQUAL	SERIES 4000	N/A	6" SCH 80 PVC HUB TABLET FEEDER W/ ADJUSTABLE INLET BAFFLE AND OUTLET WEIR AND 24" RISER ASSEMBLIES	1
13	05291	DECHLORINATION EROSION TABLET FEEDER	NORWECO OR EQUAL	SERIES 4000	N/A	6" SCH 80 PVC HUB TABLET FEEDER W/ ADJUSTABLE INLET BAFFLE AND OUTLET WEIR AND 24" RISER ASSEMBLIES	1
14	08400	DEWATERING FEED PUMP	BOERGER OR EQUAL	AN 40	3.0	20 GPM ROTARY LOBE SLUDGE PUMP, 3 HP 480V, 3 PHASE, 60HZ	1
15	08410	DRY POLYMER MAKE-DOWN AND FEED UNIT	PROMINENT OR EQUAL	ULTROMAT MT 140	0.25	POLYPROPOLENE PREP TANK W/ ELECTRIC STIRRER, WETTING CONE AND INJECTOR 480V, 3 PHASE, 60 HZ	1
16	08401	POLYMER METERING PUMP	PROMINENT OR EQUAL	DULCOFLEX - DFXa 0530	0.16	0.08 - 7.93 GPH SHELF-MOUNTED PERISTALTIC METERING PUMP, 73 PSI MAX BACK PRESSURE, 1/2" x 3/8" POLYURETHANE CONNECTOR TUBING, 115V, 1-PH SERVICE	1
17	08490	SLUDGE BAGGER SYSTEM	ENVIRODYNE, OR EQUAL	585-8i	N/A	20 GPM 8-BAG SLUDGE DEWATERING SYSTEM MAX LOADING RATE OF 20 GPM OR 100 #/HR - 25# ACTIVE POLYMER / TON DS	1
18	07400	DRYING BED DRAIN RETURN PUMPS	GRUNDFOS OR EQUAL	SEG.A15.40.EX.2.60H	4.16	70 GPM @ 90' TDH SUBMERSIBLE GRINDER PUMP, 5 HP 480V, 3 PHASE, 60HZ W/ BASE AND SS GUIDE RAIL	2
19	07401	PACKAGED OVERFLOW LIFT STATION	E ONE OR EQUAL	SP84S	2	31 GPM @ 82' TDH SDUPLEX GRINDER PRE-PACKAGED PUMP STATION, 2 HP 240V, 1 PHASE, 60 HZ W/ INTEGRAL FLOAT CONTROLS, PANEL AND SINGLE WARNING BEACON	1
20	SEE PID	PRESSURE TRANSDUCER	BY SBR VENDOR		N/A	304 SS SUBMERSIBLE PRESSURE TRANSDUCER WITH 4-20 mA SIGNAL OUTPUT	4
21	SEE PID	LEVEL SENSOR	BY SBR VENDOR		N/A	316 SS FLOAT SWITCH WITH THREE-CONDUCTOR ELECTRICAL CABLE	4
22	05160A 05161A	DISSOLVED OXYGEN CONTROLLER	BY SBR VENDOR		N/A	NEMA 4X ENCLOSURE WITH AC 100-230 VAC POWER SUPPLY, 4-20 mA SIGNAL OUTPUT	2
23	05160B 05161B	DISSOLVED OXYGEN PROBE	BY SBR VENDOR		N/A	304 SS PROBE	2
24	06240	EFFLUENT FLOW METER	BY SBR VENDOR		N/A	6" ELECTROMAGNETIC FLOW METER W/ TRAMSMITTER, ±1%ACCURACY 5D/3D, WITH 4-20 mA SIGNAL OUTPUT	1
25	01003	STANDBY GENERATOR			N/A	600 KW STANDBY GENERATOR W/ SOUND ATTENUATED OUTDOOR ENCLOSURE AND SUB BASE FUEL TANK	1

DESIGN FLOWS:

MAX MONTH AVE DAY FLOW:	90,000 GPD
MAX PEAK DAY FLOW:	135,000 GPD
PEAK HOUR FLOW:	270,000 GPD

INFLUENT PARAMETERS:

BOD:	360 MG/L
TSS:	250 MG/L
TKN:	40 MG/L

EFFLUENT PARAMETERS:

BOD:	<30 MG/L
TSS:	<30 MG/L
TN:	<10 MG/L
FECAL COLIFORM:	200 CFU/100 ML (4/7 SAMPLES); 800 CFU/100 ML (SINGLE SAMPLE MAX)

JOB NO. B614

W:\B614\Engineering\B614-30sheets\B614-G3.0 HYDRAULIC PROFILE.dwg - Tab: G3.2 - by neddington on 03/02/26 at 9:32:17 AM

1 GENERAL

1.1 ALL PAVING, GRADING PIPING AND UTILITY LINE CONSTRUCTION WORK WITHIN THE PUBLIC RIGHT-OF-WAY, ON PRIVATE STREETS, ACCESS WAYS, LOT GRADING, MATERIALS, AND WORKMANSHIP SHALL COMPLY WITH TOWN OF JEROME ENGINEERING STANDARDS AND SPECIFICATIONS, AND SHALL CONFORM TO THE LATEST MARICOPA ASSOCIATION OF GOVERNMENTS (MAG) AND A.D.O.T. STANDARD DETAILS AND SPECIFICATIONS. GRADING WORK SHALL CONFORM TO MAG SPECS, THE SOILS REPORT* AND CHAPTER 70 ENTITLED "EXCAVATION AND GRADING" OF THE UNIFORM BUILDING CODE (UBC) LATEST EDITION, SUBSECTIONS 7001 TO 7005, 7009 TO 7013, FIGURES 70-1 AND 70-2 AND AS STATED THEREIN. LOCAL MUNICIPAL STANDARD DETAILS WILL CONTINUE TO APPLY WHERE NOT ADOPTED OR INCLUDED BY MAG. THE FOLLOWING NOTES AND SPECIFICATIONS ARE HEREBY MADE A PART OF THE CONTRACT DOCUMENTS AND PROJECT SPECIFICATIONS. WHERE THERE EXISTS A CONFLICT BETWEEN THESE NOTES, MAG SPECS, UBC, THE SOILS REPORT* OR THE PROJECT SPECIFICATIONS, THE MORE STRINGENT OF THE REQUIREMENTS SHALL GOVERN UNLESS PRIOR CLARIFICATION FROM THE ENGINEER HAS BEEN GIVEN IN WRITING TO THE CONTRACTOR. THE CONTRACTOR AS STATED HEREIN SHALL MEAN THE GENERAL CONTRACTOR AND HIS ASSOCIATED SUBCONTRACTORS. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR THE COORDINATION AND PERFORMANCE OF THE WORK OF ALL OF HIS SUBCONTRACTORS AND SUPPLIERS.

1.2 ALL WORK SHALL BE BID AND INSTALLED BY THE CONTRACTOR COMPLETE AND OPERATIONAL TO LINES, GRADES AND FUNCTIONS INDICATED ON ALL PLANS AND SPECIFICATIONS. PROVIDE ALL LABOR, MATERIALS, EQUIPMENT AND SERVICES NECESSARY TO COMPLETE ALL PROJECT EARTHWORK AND SITE WORK INCLUDING BUT NOT LIMITED TO: SITE CLEARING, GRUBBING, DEMOLITION'S, DEBRIS REMOVALS FROM THE SITE, IMPORT AND/OR EXPORT OF SOILS AND OTHER MATERIALS TO AND FROM THE SITE, BORROW MATERIALS, TEMPORARY SOILS MATERIAL STOCKPILING, BACKFILL OF ONSITE BORROW PITS, MOVING OF MATERIALS, CUT AND FILL, SLOPES, SOILS AND BANK STABILIZATION AND PROTECTION, BERMING, ROADWAY EXCAVATIONS, RELOCATION'S, STRUCTURE EXCAVATIONS, TRENCHING, ALL BACKFILLING, SITE GRADING, PAVING, PIPING, UTILITY LINE AND STORM DRAINAGE CONSTRUCTION, CURBS, SITE CONCRETE WORK AND OTHER MISCELLANEOUS SITE WORK STRUCTURES AND ITEMS INDICATED ON THE PLANS AND IN THE CONTRACT DOCUMENTS.

1.4 ANY QUANTITIES SHOWN ON PLANS ARE NOT VERIFIED BY THE ENGINEER. QUANTITIES ARE APPROXIMATE ONLY AND INTENDED AS A GUIDE FOR ESTIMATING PURPOSES. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING HIS OWN QUANTITY TAKE OFFS. THE CONTRACTOR SHALL VISIT THE SITE AND REVIEW THE SOILS CONDITIONS AND THE SOILS REPORT* WITH THE PROJECT SOILS ENGINEER PRIOR TO BIDDING THIS PROJECT. ANY DISCREPANCIES IN SITE MATERIALS SHALL BE BROUGHT TO THE ATTENTION OF THE DESIGN ENGINEER 7 DAYS MINIMUM PRIOR TO BIDDING FOR REVIEW. ALL SHRINK OF EARTH MATERIAL OR EXCESS MATERIAL FROM UTILITY TRENCHES AND FOUNDATIONS SHALL BE INCLUDED IN THE CONTRACTOR'S BID.

1.5 THE ENGINEER MAY REQUIRE THE SUBMITTAL OF A "CERTIFICATE OF COMPLIANCE" AND/OR "MANUFACTURER'S GUIDELINES" FOR ANY MATERIALS USED IN THE WORK. MANUFACTURER'S GUIDELINES SHALL CONSISTS OF WRITTEN INSTRUCTIONS FOR SHIPPING, HANDLING, UNLOADING, CUTTING, JOINING, INSTALLATION, STORAGE, AND/OR ANY OTHER FACETS OF CONSTRUCTION

1.6 THE ENGINEER MAY REQUIRE ANY MATERIALS USED IN THE WORK TO BE TESTED ACCORDING TO AASHTO AND ASTM STANDARDS. THE CONTRACTOR SHALL, AT HIS EXPENSE, SUPPLY CERTIFICATES OR RESULTS OF TESTING.

1.7 ALL WORK AND MATERIALS NOT CONFORMING TO SPECIFICATIONS OR PERFORMED WITHOUT THE CONSENT OF THE OWNER OR HIS REPRESENTATIVE WILL BE SUBJECT TO REJECTION BY THE OWNER AND/OR ENGINEER AND REPLACED AT THE CONTRACTOR'S EXPENSE.

1.8 THE CONTRACTOR SHALL GUARD AGAINST DAMAGE DURING CONSTRUCTION TO ADJACENT PROPERTIES, FENCES, WALLS AND UTILITY EQUIPMENT. ANY ITEMS DAMAGED BY CONSTRUCTION SHALL BE REPLACED WITH SAME KIND OR BETTER AT CONTRACTOR'S EXPENSE.

1.9 NO CONSTRUCTION SHALL BEGIN UNTIL CONFLICTING UNDERGROUND UTILITY MITIGATING CONSTRUCTION IS COMPLETED, IF ANY, AND UNTIL PIPE SLEEVES AND SERVICE STUBS TO ALL BUILDINGS OR LOTS HAVE BEEN EXTENDED.

1.10 NO EXISTING SURVEY MONUMENTATION SHALL BE REMOVED OR DISTURBED BY THE CONTRACTOR WITHOUT NOTIFICATION AND APPROVAL OF THE PROJECT SURVEYOR. THE CONTRACTOR SHALL CONTACT THE PROJECT SURVEYOR FOR THE SETTING OF REFERENCE POINTS 48 HOURS PRIOR TO DISTURBING OR REMOVING ANY MONUMENTS. THE CONTRACTOR SHALL BE FINANCIALLY RESPONSIBLE FOR COSTS TO REESTABLISH MONUMENTATION OR CONTROLS REMOVED WITHOUT PRIOR NOTICE AND APPROVAL.

1.11 TRAFFIC CONTROL SHALL CONFORM TO THE LOCAL MUNICIPAL ADOPTED STANDARDS.

1.12 THESE PLANS ARE SUBJECT TO THE INTERPRETATION OF THE INTENT BY THE ENGINEER. ANY QUESTIONS REGARDING THESE PLANS MUST BE GIVEN TO THE ENGINEER AND YOU MUST HAVE RECEIVED A RESPONSE TO THE QUESTION. ANYONE WHO TAKES IT UPON THEMSELVES TO MAKE AN INTERPRETATION OF THE DRAWINGS OR MAKES REVISIONS TO THE SAME WITHOUT CONFERRING WITH THE DESIGN ENGINEER SHALL BE RESPONSIBLE FOR THE CONSEQUENCES THEREOF.

1.13 CONTRACTOR SHALL COORDINATE HIS WORK WITH THE DESIGN ENGINEER, OWNER, PUBLIC UTILITY COMPANIES AND OTHER ASSOCIATED TRADES ON AND ADJACENT TO THE PROJECT SITE. COORDINATE INSTALLATION OF ALL PUBLIC AND PRIVATE UNDERGROUND UTILITIES, PIPES, CONDUITS AND PIPE SLEEVE SIZES AND LOCATIONS PRIOR TO THEIR PLACEMENT. INSTALLATION: THE CONTRACTOR IS RESPONSIBLE FOR SETTING CAPPED SLEEVES AND PROVIDING TYPE 1 COMPACTION IN ALL BACKFILLED TRENCHES IN PAVED AREAS AND EASEMENTS. PROVIDE TRACER WIRE AND MARKER AT GRADE LEVEL FOR FUTURE LOCATING.

1.14 CONTRACTOR SHALL BE RESPONSIBLE FOR FINANCIAL REIMBURSEMENT TO THE OWNER AND ENGINEER FOR THE FOLLOWING ADDITIONAL ENGINEERING SERVICES SHOULD THEY OCCUR, AND SUCH A/E DESIGN SERVICES WILL BE DEDUCTED FROM CONTRACTOR'S FINAL PAYMENTS BY THE OWNER.

A. REINSPECTION, COORDINATION AND EXTRA TESTING OR RETESTING COSTS INCURRED BECAUSE OF IMPROPER OR FAULTY CONSTRUCTION. ONE TIME TESTING AND INSPECTION IS PROVIDED FOR BY THE OWNER. ALL OTHER TESTING IS THE CONTRACTOR'S RESPONSIBILITY.

B. ADDITIONAL STAKING NOT INCLUDED IN CONTRACT OR RESTAKING AS REQUESTED BY CONTRACTOR.

C. CHANGES AND SUBSTITUTIONS IN MATERIALS CONSTRUCTION METHODS, REQUESTED BY THE CONTRACTOR, THAT MUST BE REVIEWED, RECALCULATED OR APPROVED BY ENGINEER.

D. ENGINEERING DESIGN SERVICES REQUESTED BY THE CONTRACTOR OR CAUSED BY ERRORS OR OMISSIONS BY THE CONTRACTOR.

E. ANY ENGINEERING DESIGN APPROVED BY OTHERS AND SUBMITTED FOR REVIEW. THESE SHALL BEAR THE SEAL OF AN ENGINEER REGISTERED IN ARIZONA.

ANY DIFFERENCE BETWEEN PLANS AND SPECIFICATIONS AND QUESTIONS AS TO THEIR MEANING SHALL BE DETERMINED PRIOR TO AWARD OF THE CONTRACT AND SHALL BE INTERPRETED BY THE ENGINEER. THE GENERAL INTENT AND MEANING OF THE PLANS AND SPECIFICATIONS WILL GOVERN AND SHALL NOT WARRANT ANY ADDITIONAL COMPENSATION TO THE CONTRACTOR. THE ENGINEER WILL PROVIDE FULL INSTRUCTIONS WHEN DISCREPANCIES ARE DISCOVERED IN THE DOCUMENTS.

1.16 THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LIMITS OF THE WORK AREA FOR ALL PHASES OF THE WORK PRIOR TO BEGINNING CONSTRUCTION OF THOSE PHASES. ALL CONSTRUCTION LIMITS, AREAS OF WORK, SETBACKS, PERIMETERS, ADJACENT PROPERTY LINES, BOUNDARIES, AND OTHER CRITERIA DEFINING THE LIMITS OF THE CONTRACTOR'S WORK AREA AND LIMITS, SHALL BE STAKED BY THE CONTRACTOR'S SURVEYOR PRIOR TO CONSTRUCTION OR CLEARING OF THE SITE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR FAMILIARIZING HIMSELF WITH THE EXTENT OF WORK TO BE DONE IN EACH SEPARATE PHASE OF THE PROJECT, AND ANY WORK NECESSARY IN INACTIVE PHASES REQUIRED TO DEEM THE ACTIVE PHASES FINISHED, SAFE, AND SERVICEABLE.

1.17 THE CONTRACTOR OR SUBCONTRACTORS SHALL NOT DEVIATE FROM THESE PLANS OR MAKE FIELD CHANGES WITHOUT REQUESTING THE ENGINEER TO PROVIDE, IN WRITING, THE APPROVAL OF THESE MODIFICATIONS. ANY CHANGES MADE WITHOUT APPROVAL OF THE DESIGN ENGINEER ARE SUBJECT TO REMOVAL AT THE EXPENSE OF THE CONTRACTOR.

1.18 THE DESIGN ENGINEER RESERVES THE RIGHT TO MAKE MINOR FIELD MODIFICATIONS TO GRADES AND STRUCTURE DESIGNS TO ACCOMMODATE FIELD CONDITIONS FOUND ON SITE. THIS INCLUDES BUT IS NOT LIMITED TO MINOR MODIFICATIONS TO GRADE, ALIGNMENT, SLOPE OR STRUCTURE LOCATIONS. THE ENGINEER SHALL HAVE THE RIGHT TO MAKE SUCH CHANGES IN WRITING IN THE LOCATION AND QUANTITIES OF WORK AS MAY BE DEEMED ADVISABLE.

1.19 NO JOB WILL BE CONSIDERED COMPLETE UNTIL FINE GRADING IS COMPLETE AND ALL CURBS, PAVEMENT AND SIDEWALKS HAVE BEEN SWEPT CLEAN OF ALL DIRT AND DEBRIS, ALL SURVEY MONUMENTS ARE INSTALLED AND ALL VALVES, MANHOLES AND BOXES HAVE BEEN ADJUSTED ACCORDING TO THE PLANS AND STANDARD DETAILS.

1.20 EXISTING GRADES INDICATED ON PLANS ARE BASED ON PREGRADING CONDITIONS. LOSSES IN MATERIAL DUE TO SHRINKAGE OF MATERIAL, DEMOLITION OF EXISTING SITE FEATURES, CLEARING AND GRUBBING OF THE SITE SHALL BE INCLUDED IN CONTRACTOR'S BID.

1.21 SHOP DRAWINGS SHALL BE PROVIDED BY THE CONTRACTOR PER MAG SECTION 105.2.

2 PERMITS

2.1 CONTRACTOR SHALL OBTAIN ALL PERMITS AT HIS OWN EXPENSE FROM LOCAL MUNICIPAL AND AIR POLLUTION CONTROL AUTHORITIES PRIOR TO BEGINNING CONSTRUCTION.

2.2 REQUIRED PERMITS SHALL BE SECURED BY THE CONTRACTOR FROM THE APPROPRIATE AGENCIES. A.D.O.T. REQUIRES THAT A PERMIT BE ISSUED FROM THEIR OFFICE FOR ANY WORK WITHIN STATE RIGHT-OF-WAY. FEDERAL PERMITS, UTILITY CO. AND OTHER PERMITS MAY BE REQUIRED. A.D.E.Q. REQUIRES PERMITS BE ISSUED PRIOR TO NEW CONSTRUCTION, EXTENSION TO, OR MODIFICATION OF WATER DISTRIBUTION SYSTEM, SEWAGE COLLECTION OR INDIVIDUAL SEWAGE TREATMENT SYSTEM. A RIGHT-OF-WAY PERMIT, ISSUED BY THE TOWN, IS REQUIRED FOR ANY EXCAVATION OR GRADING (INCLUDING PLACEMENT OF FILL). PRIOR TO CONSTRUCTION THE APPROPRIATE AGENCIES SHALL BE NOTIFIED BY THE CONTRACTOR AS REQUIRED BY THE PERMITS.

2.3 THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING AT HIS OWN EXPENSE ALL APPROPRIATE INSURANCE FORMS FOR PERMIT REQUIREMENTS.

2.4 IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO ARRANGE FOR THE RELOCATION AND RELOCATION COSTS, IF ANY, OF ALL UTILITIES, AND SUBMIT A UTILITY RELOCATION SCHEDULE TO THE MUNICIPALITY AND DESIGN ENGINEER PRIOR TO CONSTRUCTION. ALL PUBLIC UTILITY EQUIPMENT POLES, BOXES, STRUCTURES AND MUNICIPAL UTILITY COMPANY EQUIPMENT SHALL BE RELOCATED BY THE APPROPRIATE UTILITY COMPANY OR MUNICIPALITY BEFORE ANY WORK IS STARTED.

3 APPROVALS

3.1 THE CONTRACTOR IS TO USE ONLY THAT OFFICIAL CONSTRUCTION SET OF DRAWINGS WHICH CONTAINS THE APPROVAL OF THE GOVERNMENT AGENCY/UTILITY SIGNED ON THE COVER SHEET OF THE PLANS. THE CONTRACTOR SHALL NOT PLACE BIDS OR START CONSTRUCTION ON A SET OF DRAWINGS UNSIGNED BY THE GOVERNMENT AGENCY AND/OR MARKED "NOT FOR CONSTRUCTION".

4 RECORD DRAWINGS

4.1 IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE AND KEEP AN UPDATED RECORD SET OF AS-BUILT INFORMATION DRAWINGS IN GOOD CONDITION ON THE JOB SITE AND PROVIDE THE DESIGN ENGINEER AT COMPLETION OF THE WORK, WITH THE RECORD SET SHOWING FIELD VERIFIED LOCATIONS OF ALL VALVES, BOXES, MANHOLES, UTILITY POLES, PIPE SLEEVES, UTILITY ENCASEMENT AND OTHER UTILITY LINES AND EQUIPMENT ABOVE AND BELOW GROUND WHICH THE CONTRACTOR ENCOUNTERS AND INSTALLS IN HIS AREA OF WORK.

4.2 ACCEPTANCE OF THE COMPLETED PAVING, GRADING OR UTILITY INSTALLATION WILL NOT BE GIVEN UNTIL REPRODUCIBLE AS-BUILT PLANS HAVE BEEN SUBMITTED BY THE ENGINEER AND APPROVED BY THE LOCAL GOVERNING AGENCY.

5 OBSERVATION

5.1 ALL MATERIALS USED AND ALL WORK DONE BY THE CONTRACTOR SHALL BE SUBJECT AT ALL TIMES TO THE INSPECTION, TESTING AND APPROVAL OF THE ENGINEER AND GOVERNING AGENCY. SPECIAL INSPECTION AND TESTING SERVICES SHALL BE PROVIDED AT THE OWNER'S EXPENSE, AS REQUIRED BY THE TOWN ENGINEER.

5.2 THE CONTRACTOR SHALL CONTACT THE APPROPRIATE PUBLIC UTILITY COMPANIES FOR INSPECTION OF TRENCHING, BEDDING AND BACKFILLING DONE IN CONJUNCTION WITH INSTALLATION OF THOSE UTILITIES ON THIS PROJECT.

5.3 SUBMITTAL OF AN ENGINEER'S CERTIFICATE OF COMPLETION IS REQUIRED BY A.D.E.Q. FOR ALL WATER AND SEWER SYSTEM CONSTRUCTION. RELATED INSPECTION AND TESTING SHALL BE PROVIDED BY THE OWNER'S ENGINEER AT THE OWNER'S EXPENSE.

5.4 SOILS COMPACTION TEST RESULTS MUST BE SUBMITTED TO THE ENGINEER'S OFFICE FOR ALL FILL MATERIAL FOR ROADS, TRENCH BACKFILL AND SITE FILL MATERIALS UNDER SLABS AND STRUCTURES. NO FILL MATERIALS SHALL BE PLACED WITHOUT TESTING DURING PLACEMENT. NO EARTH MATERIAL SHALL BE PLACED WITHOUT APPROVAL OF THE PREVIOUS LIFTS. THE CONTRACTOR SHALL SUBMIT ALL TEST RESULTS TO THE DESIGN ENGINEER AND GOVERNMENTAL AGENCIES.

5.5 CONTRACTOR SHALL SUBMIT A SCHEDULE, APPROVED IN WRITING BY A QUALIFIED CONSULTING TESTING AGENCY, FOR FREQUENCY, LOCATION AND TYPE OF ALL PROJECT TESTING. THE CONTRACTOR WILL BE RESPONSIBLE FOR SCHEDULING AND COORDINATION OF ALL TESTING INCLUDING THE FOLLOWING ITEMS WHICH SHALL BE TESTED IN ACCORDANCE WITH MAG SPECIFICATIONS...

1. SUBGRADE COMPACTION
2. BASE COURSE COMPACTION
3. ASPHALT PAVEMENT MIX DESIGN QUALITY
4. CONCRETE STRENGTH
5. TRENCH BEDDING AND BACKFILL
6. TESTING FOR UTILITIES, PIPING AND DRAINAGE SYSTEMS

5.6 THE TOWN SHALL BE NOTIFIED BY THE CONTRACTOR 24 HOURS PRIOR TO BEGINNING DIFFERENT PHASES OF CONSTRUCTION SO THAT CITY INSPECTIONS MAY BE SCHEDULED.

6 FINAL ACCEPTANCE

6.1 FINAL ACCEPTANCE OF THE CONSTRUCTION, BY THE TOWN ENGINEER, IS REQUIRED BEFORE RELEASING OF A PERMIT AND OR TRANSFERRING OWNERSHIP OF THE IMPROVEMENTS TO THE CITY.

6.2 APPROVAL OF A PORTION OF THE WORK IN PROGRESS DOES NOT GUARANTEE ITS FINAL ACCEPTANCE. TESTING AND EVALUATION MAY CONTINUE UNTIL WRITTEN FINAL ACCEPTANCE OF A COMPLETE WORKABLE UNIT. ACCEPTANCE OF COMPLETED IMPROVEMENTS WILL NOT BE GIVEN UNTIL DEFECTIVE OR UNAUTHORIZED WORK IS REMOVED, AND FINAL CLEANUP IS COMPLETE.

7 UTILITIES

7.1 A UTILITY COORDINATION MEETING SHALL BE COORDINATED BY THE CONTRACTOR PRIOR TO THE START OF ANY WORK. ALL UTILITY ISSUES SHALL BE ADDRESSED IN ACCORDANCE WITH MAG SECTION 105.6.

7.2 LOCATION OF UNDERGROUND UTILITIES SHALL BE ACCOMPLISHED IN ACCORDANCE WITH ARS 40-360.22 PRIOR TO ANY EXCAVATION. BLUE STAKE SHALL BE CALLED AT 1-800-STAKE-IT FOR ACCURATE LOCATION OF UTILITIES AS NECESSARY AND PRIOR TO ANY EXCAVATION. UTILITIES IF INDICATED ON PLANS ARE APPROXIMATE LOCATIONS ONLY, TAKEN FROM THE UTILITY COMPANY MAPS. IF THE CONTRACTOR ENCOUNTERS ANY LINES NOT INDICATED ON THE DRAWINGS OR MARKED IN THE FIELD BY THE UTILITY COMPANY THAT MAY INTERFERE WITH HIS WORK, HE SHALL NOTIFY THE APPROPRIATE UTILITY COMPANY IMMEDIATELY FOR DISPOSITION OF THOSE FACILITIES.

7.3 THE CONTRACTOR IS RESPONSIBLE FOR PREPARATION OF GRADE, TRENCHING, BACKFILLING, PAD CONSTRUCTION AND CONCRETE PADS FOR UTILITY EQUIPMENT INSTALLED ON THIS PROJECT. CONTRACTOR SHALL CONTACT LOCAL UTILITY COMPANIES FOR DETAILS AND REQUIREMENTS.

7.4 UTILITIES MUST BE LOCATED TO MINIMIZE INTERFERENCE WITH ONE ANOTHER, TO PROVIDE REQUIRED HORIZONTAL AND VERTICAL SEPARATIONS, AND TO PROVIDE MAINTENANCE ACCESS WITHOUT VIOLATING EASEMENT BOUNDARIES. SEPARATION BETWEEN UTILITIES PER MAG STANDARD

7.5 ALL UTILITY SLEEVES SHALL BE PLACED PRIOR TO SUBBASE CONSTRUCTION AND PAVING. CONTACT APPROPRIATE UTILITY COMPANIES FOR REQUIREMENTS IN ALL AREAS.

7.6 ALL WATER MAINS, APPURTENANCES, AND INSTALLATION SHALL CONFORM TO A.W.W.A. STANDARDS AND ARIZONA DEPARTMENT OF ENVIRONMENTAL QUALITY, AND TOWN OF JEROME REQUIREMENTS. WATER SYSTEM SHALL BE TESTED PER A.D.E.Q. BULLETIN NO. 10 TO THE APPROPRIATE A.W.W.A. STANDARDS.

7.7 ALL FIRE HYDRANTS SHALL MEET ALL REQUIREMENTS OF A.W.W.A. C-509-80 AND TOWN OF JEROME REQUIREMENTS.

8 CONSTRUCTION STAKING

8.1 THE ACCURACY OF ALL CONSTRUCTION WORK SHALL BE MAINTAINED AND VERIFIED BY THE OWNER'S SURVEYOR AT THE OWNER'S EXPENSE BY PROVIDING CONSTRUCTION STAKING SUITABLE TO THE TOWN ENGINEER. STAKES WILL BE SET ESTABLISHING LINES AND GRADES (FINISH OR FLOWLINE) FOR ALL CONSTRUCTION INCLUDING ROADS, CURB AND GUTTER, SIDEWALKS, UTILITIES, STRUCTURES, AND OTHER WORK AS CONSIDERED NECESSARY BY THE ENGINEER. ALL SURVEY CONTROL SHALL BE SET BY THE OWNER'S SURVEYOR FROM MONUMENTS ACCEPTABLE TO THE ENGINEER.

9 GRADING AND EARTHWORK

9.1 PERFORM ALL EARTHWORK GRADING, CUTTING AND FILLING AS PER THE PROJECT SOILS REPORT* AND ALL ADDENDA. ALL WORK TO BE COORDINATED AS PER THE SWPPP.

9.2 NO GRADING OR TRENCHING WORK SHALL BEGIN PRIOR TO SUPPORTING AND PROTECTING EXISTING ONSITE AND ADJACENT PROPERTY FROM SETTLING, CRACKING, OR OTHER DAMAGE WHICH MIGHT RESULT. CONTRACTOR SHALL VERIFY FROM SOILS REPORT RECOMMENDATIONS THE DEGREE OF DIFFICULTY REQUIRED FOR TRENCHING AND EXCAVATION WORK BASED ON DEPTH AND TYPES OF MATERIALS TO BE ENCOUNTERED.

9.3 WATER SOURCE: THE CONTRACTOR SHALL MAKE THE NECESSARY ARRANGEMENTS FOR OBTAINING ALL WATER REQUIRED FOR SOIL COMPACTION, DRINKING PURPOSES AND DUST CONTROL. (MAG SPEC 225)

9.4 CLEARING AND GRUBBING: EXAMINE SITE AND PROVIDE NECESSARY EQUIPMENT AND LABOR TO REMOVE FROM THE SITE AND DISPOSE OF STUMPS, ROOTS, ROCKS, LOOSE FILL, VEGETATION, DEBRIS, AND ANY OTHER OBJECTIONABLE MATERIALS FROM THE BUILDING AND FILL AREAS. CLEAN, UNCLASSIFIED ONSITE SOILS MAY BE USED IN GENERAL AS FILL MATERIAL. SEE MAG SPECIFICATION SECTIONS 201 AND 215.

9.5 TOPSOIL THAT WILL BE AFFECTED BY ROUGH GRADING OR EXCAVATION SHALL BE STOCKPILED ON THE SITE SEPARATELY AND SHALL NOT BE USED FOR FILL, BUT SHALL BE CONSERVED AND USED FOR FINE AND FINISH GRADING.

9.6 SITE DRAINAGE: CONSTRUCTION OF ALL SWALES, CHANNELS, DRAINAGE PIPES, DRAINAGE STRUCTURES AND BANK PROTECTION SHALL BE CONSTRUCTED DURING THE FIRST PHASES OF SITE CONSTRUCTION TO PROTECT ALL OTHER CONSTRUCTION FROM SURFACE WATERS. DIVERT RUN OFF WATER AROUND CONSTRUCTION OPERATIONS. CARE SHALL BE TAKEN BY THE CONTRACTOR NOT TO ADVERSELY AFFECT ADJACENT PROPERTIES. DRAIN EXCAVATIONS BY PUMPING OR OTHER SATISFACTORY METHOD TO PREVENT SOFTENING OF THE FOUNDATION SOILS, UNDERCUTTING OF FOOTINGS, OR OTHER ACTIONS DETRIMENTAL TO PROPER CONSTRUCTION PROCEDURES. ALL WORK TO BE COORDINATED AS PER THE SWPPP.

9.7 THE CONTRACTOR SHALL PROVIDE POSITIVE DRAINAGE AWAY FROM ALL WALLS AND FOUNDATIONS. ALL STORM DRAINS, DRAIN LINES, OVERFLOWS, OUTLETS, AND/OR OTHER DRAINAGE TYPE OUTLETS WHICH CONDUCT MOISTURE NEAR THE STRUCTURES SHALL BE POSITIVELY DRAINED AWAY FORM THE STRUCTURE. NO WATER SHALL BE PERMITTED TO POND NEAR STRUCTURES OR FOUNDATIONS. ALL DRAINAGE SHALL BE CHANNELED AND TAKEN A MINIMUM OF 10 FEET AWAY FROM ALL STRUCTURES.

9.8 SUBGRADE PREPARATION: IF THE NATURAL SUBGRADE IS LESS THAN THE REQUIRED DENSITY, IT SHALL BE SCARIFIED AND COMPACTED TO A MINIMUM DEPTH OF TWELVE INCHES OR AS NOTED IN THE SOILS REPORT IMMEDIATELY PRIOR TO PLACING SUBSEQUENT FILL MATERIAL THEREON. THE CONTRACTOR IS RESPONSIBLE FOR MAINTENANCE AND REPAIR OF DAMAGE TO PREPARED SUBGRADE CAUSED BY CONTRACTORS OPERATIONS OR PUBLIC TRAFFIC UNTIL ACCEPTANCE OF PROJECT. NO MATERIALS SHALL BE PLACED UPON THE PREPARED SUBGRADE UNTIL IT MEETS THE SPECIFIED REQUIREMENTS. ROADWAY SUBGRADE COMPACTION INCLUDES SUBGRADE UNDER ALL PAVEMENT, CURB, SIDEWALKS, SHOULDERS AND FILL SLOPES. SUBGRADE TOLERANCES SHALL BE AS SPECIFIED IN MAG SECTION 301. OPEN LANDSCAPED AREAS SHALL BE GRADED TO +/- 0.20 FEET.

9.9 EARTH FILL: AREAS TO BE FILLED SHALL BE LEVELED TO PROVIDE A LEVEL BASE TO SUPPORT FILL MATERIALS. SUBGRADE AND SUBBASE AREAS REQUIRING FILL MATERIAL SHALL BE SCARIFIED MOISTENED AND COMPACTED PRIOR TO PLACING FILL. ALL FILL, SUBGRADE AND SUBBASE MATERIALS SHALL BE COMPACTED TO SPECIFIED DENSITIES AT OR NEAR OPTIMUM MOISTURE CONTENTS AS VERIFIED AND RECOMMENDED BY THE SOILS ENGINEER. PLACE FILL IN HORIZONTAL LIFTS NOT EXCEEDING EIGHT INCHES IN LOOSE THICKNESS BEFORE COMPACTION. SLOPED SURFACES SHALL BE PLOWED, STEPPED, AND BENCHED SO THAT THE FILL MATERIAL WILL BOND WITH THE EXISTING MATERIAL. BENCH AT THE TOE OF FILL SLOPES AND PERIODIC INTERVALS UP THE FILL SLOPES BENCHES.

9.10 IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO CONTACT THE TESTING COMPANY FOR SCHEDULING OF COMPACTION TESTING. THE FREQUENCY OF DENSITY AND MOISTURE TESTS REQUIRED FOR ADEQUATE CONTROL SHALL BE THE RESPONSIBILITY OF THE SOILS ENGINEER WHO SHALL CERTIFY TO THE ENGINEER AND CONTRACTOR AT PROJECT END THAT THE ROADBED FILL IS COMPACTED AS OUTLINED HEREIN. COMPACTION SHALL BE ACHIEVED BY MECHANICAL MEANS. IN NO CASE SHALL STRUCTURE BACKFILLING BE FLOOD WATER SETTLED.

9.11 ALL SLOPE CONSTRUCTION AND ROADWAY EXCAVATION SHALL CONFORM TO THE REQUIREMENTS OF MAG SPECIFICATIONS SECTIONS 201, 205, 211, 301, AND UBC SECTIONS 7009 AND 8010. CUT AND FILL SLOPES SHALL BE AS INDICATED ON THE DETAILS AND PLANS. CUT AND FILL SLOPE GRADIENTS SHALL NOT EXCEED 2:1 IN STEEPNESS WITHOUT WRITTEN AUTHORIZATION FROM THE SOILS ENGINEER AND EXAMINATION BY THE DESIGN ENGINEER. ALL SLOPE CONDITIONS SHALL BE PROVIDED WITH THE APPROPRIATE BENCHES AS SPECIFIED IN THE REFERENCE DOCUMENTS AND INDICATED ON THE PLANS. IF SOILS CONDITIONS ARE ENCOUNTERED WHICH DO NOT ALLOW THE ESTABLISHMENT OF THE INDICATED CUT OR FILL SLOPES, THE DESIGN ENGINEER AND SOILS ENGINEER SHALL BE CONTACTED IMMEDIATELY TO DETERMINE AN ADJUSTMENT TO THE SLOPE GRADIENT OR TO ESTABLISH A METHOD OF STABILIZATION ALL FILL SLOPES SHALL BE COMPACTED AS EACH LIFT OF FILL MATERIAL IS PLACED. ALL CUT AND FILL SLOPES SHALL BE UNIFORMLY GRADED TO LINES AND GRADES INDICATED. TOPS OF ALL CUT SLOPES SHALL BE ROUNDED AND ALL UNSTABLE AND LOOSE MATERIAL AT TOP OF SLOPE SHALL BE REMOVED. TOP OF CUT SLOPES OVER 10' HIGH SHALL BE PROVIDED WITH BROW DITCHES FOR DRAINAGE. ALL CUT AND FILL SLOPES SHALL BE REVEGETATED WITH A MIXTURE OF NATIVE GRASSES AND WILD FLOWER SEED OR AS SPECIFIED WITHIN THE LANDSCAPE PLANS. COMPACT ALL SHOULDERS AND BACKFILLS BEHIND ALL STRUCTURE AND WALLS.

9.12 COMPACT TO THE FOLLOWING SPECIFIED PERCENT OF MAXIMUM DENSITY AS DETERMINED IN ACCORDANCE WITH ASTM D698 AND MAG SECTION 211 OR AS DIRECTED IN THE SOILS REPORT.

MINIMUM PERCENT COMPACTION
SUBGRADE SOIL:
ROADWAY AND STRUCTURE AREAS----------95
PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS)---------95
EARTH FILL:
ROADWAY AND STRUCTURE AREAS----------95
PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS)---------95
GRASSED AND PLANTING AREAS----------85
AGGREGATE BASE COURSE----------100
BACKFILL AROUND STRUCTURES----------95
BACKFILL FOR UTILITY TRENCHES (PER MAG SECTION 601). PROVIDE TYPE 1 BACKFILL OR AS DIRECTED BY APPROPRIATE UTILITY REQUIREMENTS. BACKFILL FOR TRENCHES WITHIN 10' OF STRUCTURES AND WALLS SHALL BE COMPACTED TO 95% UNLESS DIRECTED OTHERWISE BY ENGINEER.

9.13 EXCAVATION: EXCAVATE TO THE DIMENSIONS AND DEPTHS INDICATED ON THE DRAWINGS. FOUNDATIONS SHALL REST ON ENGINEERED COMPACTED FILL OR UNDISTURBED NATURAL SOILS AT GRADE ELEVATIONS INDICATED. IF SUITABLE SOIL IS NOT REACHED AT THE DEPTHS INDICATED, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE SOILS ENGINEER AND ENGINEER. THE CONTRACTOR WILL BE DIRECTED, IN WRITING, TO EXCAVATE TO THE DEPTH OF SUITABLE SOIL. EXCAVATION FOR FOUNDATIONS WHICH ARE CARRIED BELOW THE DEPTHS INDICATED SHALL HAVE THE CONCRETE EXTENDED TO THE BOTTOM OF THE EXCAVATION AT THE CONTRACTOR'S EXPENSE. SEE MAG SPECIFICATION SECTION 206.

9.14 WATERING: CAREFULLY WATER EARTH FILL DURING PLACING BY MEANS OF A FINE SPRAY OR OTHER APPROVED METHOD, SO THAT EACH LAYER IS THOROUGHLY AND UNIFORMLY WETTED. MOISTURE CONTENT OF THE MATERIAL SHALL BE CAREFULLY CONTROLLED AT ALL TIMES AND CHECKED AT PROPER INTERVALS TO INSURE CORRECT MOISTURE FOR COMPACTION SPECIFIED. SEE MAG SECTION 225 AND SOILS REPORT.

10 PAVING

10.1 COMPLETE ASPHALTIC CONCRETE PAVEMENT INSTALLATION SHALL INCLUDE BUT NOT BE LIMITED TO THE FOLLOWING:
A. TACK COATING OF ALL SURFACES, UNDILUTED .02 TO .10 GAL/SY, DILUTED 1:1 MIXTURE, .05 TO .15 GAL/SY, OR AS DIRECTED.
B. SEAL COATING: SEAL COATING WITHIN THE RIGHT-OF-WAY SHALL BE A FOG SEAL COAT.
C. PAINT FOR PAVEMENT STRIPING AND MARKING SHALL CONFORM TO FEDERAL SPEC. NO. TTP-155E, "PAINT, TRAFFIC, HIGHWAY, WHITE AND YELLOW". COLORS FOR PAVEMENT MARKING AND STRIPING SHALL BE AS SPECIFIED BY THE TOWN ENGINEER.
D. TRAFFIC CONTROL DEVICES: SIGNS AND PAVEMENT

11 FIELD INSPECTION

11.1 THE CONTRACTOR SHALL CAREFULLY PRESERVE ALL STAKES, REFERENCE AND CONTROL POINTS, ETC. AGAINST DESTRUCTION AND SHALL PROMPTLY NOTIFY THE ENGINEER OF ANY STAKES WHICH HAVE BEEN DISTURBED.

11.2 OWNER'S REGISTERED SURVEYOR SHALL BE NOTIFIED TWO WORKING DAYS (48 HOURS) MINIMUM PRIOR TO FIELD STAKING SCHEDULING.

11.3 ANY QUESTIONS RAISED RELATIVE TO ACCURACY OF IMPROVEMENT INSTALLATION SHALL NOT BE RAISED SUBSEQUENT TO COMPLETION OF THE WORK UNLESS ALL SURVEY STAKES ARE MAINTAINED INTACT. SHOULD SUCH STAKES NOT BE PRESENT AND VERIFIED AS TO THEIR ORIGIN, NO CLAIM FOR ADDITIONAL COMPENSATION FOR CORRECTION SHALL BE PRESENTED TO ANY PARTY AND SUCH WORK SHALL BE CORRECTED BY THE CONTRACTOR AT HIS EXPENSE.

12 SUSPENSION OF WORK

12.1 THE ENGINEER OR HIS AUTHORIZED REPRESENTATIVE MAY SUSPEND THE WORK BY WRITTEN NOTICE WHEN, IN HIS JUDGMENT, PROGRESS IS UNSATISFACTORY, WORK BEING DONE IS UNAUTHORIZED OR DEFECTIVE, WEATHER CONDITIONS ARE UNSUITABLE, OR THERE IS DANGER TO THE PUBLIC HEALTH OR SAFETY.

13 WARRANTY

13.1 ANY DEFECTS WHICH APPEAR IN THE WORK WITHIN TWO YEARS FROM THE DATE OF ACCEPTANCE AND WHICH ARE DUE TO IMPROPER WORKMANSHIP OR INFERIOR MATERIALS SUPPLIED SHALL BE CORRECTED BY OR AT THE EXPENSE OF THE CONTRACTOR.

14 EROSION CONTROL NOTES

(SPECIFICATIONS FOR PERMANENT SEEDING)

14.1 SITE PREPARATION
- A. INSTALL NECESSARY SURFACE WATER CONTROL MEASURES PRIOR TO PLANTING PERMANENT SEEDING.
- B. GRADE TO PERMIT USE OF CONVENTIONAL EQUIPMENT FOR SEEDBED PREPARATION.
- C. PROVIDE ADEQUATE DRAINAGE WHERE INTERNAL WATER MOVEMENT, ESPECIALLY AT TOES OF SLOPES, MAY CAUSE SEEPS OR SLIPPAGE BEFORE SEEDING IS WELL ESTABLISHED.

14.2 SEEDBED PREPARATION A. AS PRACTICAL, PERFORM ALL CULTURAL OPERATIONS AT RIGHT ANGLES TO THE SLOPE. B. IMMEDIATELY BEFORE SEEDING, RAKE OR OTHERWISE LOOSEN PLANTING SURFACE TO PROVIDE A SMOOTH, FRIABLE SURFACE FREE OF EARTH CLODS, HUMPS AND DEPRESSIONS, AND DISPOSE OF LOOSE STONES HAVING A DIMENSION GREATER THAN ONE INCH AND DEBRIS BROUGHT TO THE SURFACE DURING CULTIVATION.

14.3 PLANTING A. APPLY SEED MIX AT THE RATE OF 11 POUNDS PER ACRE. SHALL CONTAIN THE FOLLOWING PROPORTION OF PURE LIVE SEED: SAND DROPSEED (SPOROBOLUS CRYPTANDRUS) 1 LB SIDEOATS GRAMA (BOUTELOUS CURTIPENDULA)5 LB CRESTED WHEATGRASS (AGROPYRON CRISTATUM) 5 LB B. APPLY SEED IN TWO DIRECTIONS AT RIGHT ANGLES TO EACH OTHER WITH HALF THE SPECIFIED APPLICATION RATE APPLIED IN EACH DIRECTION. C. IMMEDIATELY AFTER SEEDING, UNIFORMLY SPREAD SCREENED MANURE AT THE RATE OF ONE CUBIC YARD PER 1000 SQUARE FEET AND WATER UNTIL THE GROUND IS WET TO A MINIMUM DEPTH OF TWO INCHES. D. HYDRAULIC SEEDING USING 1500 POUNDS OF WOOD CELLULOSE FIBER PER ACRE MAY BE UTILIZED IN LIEU OF PLANTING.

14.4 MAINTENANCE A. PROTECT PLANTED AREAS FROM GRAZING, FIRE, TRAFFIC, AND WEED GROWTH. B. MAINTAIN PLANTED AREAS UNTIL A GOOD STAND OF GRASS IS ESTABLISHED. AREAS AS REQUIRED IF NO GROWTH IS PRESENT WITHIN 15 DAYS OF PLANTING.

15 TEMPORARY EROSION CONTROL

15.1 EROSION CONTROL BERMS AND ROCK CHECK DAMS
- A. PROVIDE EARTHEN BERMS AT TOES OF SLOPES REMAINING BARE BETWEEN CONSTRUCTION PHASES.
- B. PLACE TEMPORARY ROCK CHECK DAMS IN ROAD DITCHES AND CHANNELS IF RIP-RAP PROTECTION WILL NOT BE PROVIDED WITHIN 60 DAYS.

15.2 CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING EROSION CONTROL MEASURES SUCH AS SAND BAGGING, TEMPORARY DE-SILTING BASIN CONSTRUCTION BERMS, VISQUEEN, ETC. TO PROTECT ADJOINING PROPERTIES FROM EROSION.

16 GENERAL CONSTRUCTION NOTES

16.1 ALL CORRUGATED METAL PIPE TO BE 14 GAUGE, UNLESS OTHERWISE APPROVED BY THE DESIGN ENGINEER.

16.2 ALL CORRIGATED METAL PIPE SHALL HAVE FLARED END SECTIONS, EXCEPT WHERE HEADWALLS ARE USED.

16.3 ALL DRAINAGE CULVERTS AND PIPES SHALL HAVE A MINIMUM COVER OF 24" OR AS SPECIFIED.

16.4 ADDITIONAL CARE SHALL BE TAKEN TO PROTECT ALL CMP DURING CONSTRUCTION.

16.5 RETAINING WALLS SHALL BEAR ONTO NATURAL BEDROCK, OR COMPACTED SOIL WHICH HAS A BEARING VALUE OF 3,000 P.S.F. VERIFICATION OF SAID BEARING VALUE TO BE PROVIDED BY THE SOILS ENGINEER.

16.6 RIPRAP MATERIAL SHALL BE AS SPECIFIED TO A DEPTH OF TWICE THE SIZE OF Dso UNDER LAYING A FILLER LAYER OF Dso =3/4" TO A DEPTH OF 10" OR GEOTEXTILES. THE GRADATION OF RIPRAP SHOULD FOLLOW A SMOOTH CURVE. THE RATIO TO THE LARGEST SIZE ROCK TO Dso SHOULD BE EQUAL TO OR LESS THAN 2 (Dso/Dso ~0.5). THE RIPRAP SHOULD BE HARD, DENSE, DURABLE AND RESISTANT TO WEATHER AND FRACTURE. ALL RIPRAP TO BE HAND PLACED IN AN INTERLOCKING POSITION. FILLER MATERIAL TO BE WELL GRADED GRAVEL AS SPECIFIED. MATERIAL FURNISHED FOR RIPRAP SHALL CONFORM TO MAG SPEC 220.2.

16.7 ALL CONCRETE AND REBAR PLACEMENT PER MAG SPEC 505.

16.8 CONCRETE TESTING PER MAG SPEC 725.

16.9 ALL CONCRETE TO BE CLASS B (2500PSI) IF NOT SPECIFIED.

16.10 MINIMUM COVER ON ALL REBAR TO BE MIN 1" UNLESS OTHERWISE SPECIFIED.

16.11 MINIMUM LAP AT REBAR SPLICES TO BE 1' UNLESS OTHERWISE SPECIFIED.

16.12 ALL MANHOLE FRAMES TO HAVE 12" ANCHORS SPACED A MINIMUM OF 12" RADIALLY AROUND FRAME.

16.13 CONCRETE FOR FOOTINGS AND PADS AHALL BE CLASS A (3000 PSI)

SURVEY

1. TOPOGRAPHIC SURVEY BY KENNEY AERIAL MAPPING, INC., PHOENIX, AZ, DATED NOVEMBER 2022 AND SUPPLEMENTED IN FEBRUARY 2023. ADDITIONAL TOPOGRAPHIC SURVEY DATA PERFORMED BY SEC, INC. COORDINATES ARE RELATIVE TO NAD 83, AZ STATE PLANE CENTRAL ZONE, INTERNATIONAL FEET. ELEVATIONS RELATIVE TO NAVD 83. SURVEY CONTROL ON SHEET C2.0.

TREE NOTES

1. ALL EXISTING TREES AND SHRUBS NOT AFFECTED BY BUILDING CONSTRUCTION OR ROAD DEVELOPMENT MUST BE FENCED WITH A CONSTRUCTION ENVELOPE FENCE TO PROTECT THEM DURING CONSTRUCTION

2. NO TREES TO BE PLACED OVER/ON SEWER LINE

ADEQ WATER AND SEWER SYSTEM NOTES

MANHOLES

ALL MANHOLES SHALL BE 4-FT. ID PRECAST CONCRETE WITH POURED-IN-PLACE CONCRETE BASE AND TRAFFIC BEARING RING AND COVER. ALL COVERS SHALL BE 2-FT. IN DIAMETER AND SHALL BE MARKED "SEWER". TEST MANHOLES FOR WATER TIGHTNESS (INFILTRATION) PER R 18-9-E301.4.01.D.3.F. WATER TIGHTNESS SHALL BE TESTED BY EITHER 1) FILLING THE MANHOLE WITH WATER AND ENSURING THAT THE DROP IN WATER LEVEL DOES NOT EXCEED 0.0034 OF THE TOTAL MANHOLE VOLUME PER HOUR, OR 2) AIR PRESSURE TESTING USING THE "STANDARD TEST METHOD FOR CONCRETE SEWER MANHOLES BY NEGATIVE AIR PRESSURE (VACUUM) TEST", ASTM C1244-02a1 (2002). TEST 100% OF ALL MANHOLES. MANHOLES SHALL CONFORM TO A.D.E.Q. AND M.A.G. SPECIFICATIONS. CONSTRUCTION SHALL CONFORM TO M.A.G. STD. DTLS. 420-1 AND 420-2.'

CONCRETE

CLASS A CONCRETE SHALL HAVE A MINIMUM 28 DAY COMPRESSIVE STRENGTH OF 2000 PSI.

PIPE

GRAVITY SEWER PIPE SHALL BE PVC, SDR-26 AND CONFORM TO ASTM D-1784 AND ASTM D-3034. SEALS SHALL CONFORM TO ASTM F-477. PIPE SHALL BE JOINED BY BELL AND SPIGOT TYPE JOINTS. FITTINGS SHALL CONFORM TO ASTM D-3212. GRAVITY SEWER PIPE SHALL BE TESTED FOR DEFLECTION AND LEAKAGE. SHORT TERM DEFLECTION TESTING SHALL BE PERFORMED AFTER COMPLETE BACKFILL BUT PRIOR TO INSTALLATION OF FINISH SURFACE MATERIAL. A SHORT TERM DEFLECTION IN EXCESS OF 5% SHALL BE CONSIDERED UNACCEPTABLE AND PIPE SHALL BE REPAIRED, OR REPLACED AND RETESTED. A MINIMUM OF 100% OF GRAVITY SEWER SHALL BE DEFLECTION TESTED. SEWER PIPE SHALL BE TESTED FOR LEAKAGE USING LOW PRESSURE AIR TESTING PER "STANDARD TEST METHOD FOR INSTALLATION ACCEPTANCE OF PLASTIC GRAVITY SEWER LINES USING LOW PRESSURE AIR", ASTM F 1417-92, REAPPROVED 1998. TEST 100% OF ALL SEWER LINES. TEST THE TOTAL LENGTH OF THE SEWER LINE FOR UNIFORM SLOPE BY LAMP LIGHTING, REMOTE CAMERA OR SIMILAR METHOD APPROVED BY ADEQ AND RECORD THE RESULTS.

DUCTILE IRON PIPE SHALL BE AWWA C-150, CLASS 350 AND SHALL BE TESTED FOR LEAKAGE PER AWWA STANDARD C-600.

A MINIMUM HORIZONTAL DISTANCE OF 6-FT SHALL BE MAINTAINED BETWEEN MAINS AND GRAVITY SEWERS.

MATERIAL

ALL MATERIALS & PRODUCTS THAT COME INTO CONTACT WITH DRINKING WATER OR DRINKING WATER TREATMENT CHEMICALS MUST COMPLY WITH AWWA STANDARDS & NSF STANDARD 61. ANY 'OR EQUAL' SUBSTITUTION SHALL ALSO MEET NSF STANDARD 61.

ALL MATERIALS USED IN THE INSTALLATION OF WATER MAINS SHALL BE PURSUANT TO AAC R-18-4-119, & SHALL BE NSF APPROVED FOR POTABLE WATER.

DISINFECTION

WATER MAINS. SHALL BE DISINFECTED IN ACCORDANCE WITH ADEQ ENGINEERING BULLETIN NO.8 "DISINFECTION OF WATER SYSTEMS".

TESTING

ONE HUNDRED PERCENT (100%) OF PIPE LINES SHALL BE PRESSURE AND LEAK TESTED IN ACCORDANCE WITH AWWA C-600, SECTION 4 AND MAG SECTION 611. MINIMUM TEST PRESSURES SHALL BE 200 PSI PLUS ALLOWANCE FOR WATER HAMMER.

AFTER PRESSURE AND LEAK TESTING IS SHOWN TO BE SATISFACTORY, WATER LINES SHALL BE DISINFECTED BY CHLORINATION IN ACCORDANCE WITH AWWA C-601, MAG SECTION 610.15, AND ADEQ BULLETIN 8. ALL VALVES SHALL BE WORKED INTERMITTENTLY FOR A PERIOD OF 24 HOURS FOLLOWING CHLORINATION.

WATER SYSTEM THRUST BLOCKING AND/OR JOINT RESTRAINT

PIPE LINES SHALL BE PROVIDED WITH CONCRETE THRUST BLOCKS AT ALL CHANGES IN DIRECTION AND SIZE AND AT ALL TEES, VALVES, PLUGS, AND DEAD ENDS, PER MAG STANDARD DETAILS 301 AND 380 AND YAG STANDARD DETAIL 3-03. PIPE LINES MAY ALSO BE PROVIDED WITH RESTRAINED JOINTS AT ALL CHANGES IN DIRECTION AND SIZE AND AT ALL TEES, VALVES, PLUGS, AND DEAD ENDS, PER MAG STANDARD DETAILS 302 AND 303.

ADEQ WATER & SEWER NOTES (CONT.)

TRENCHING AND BACKFILLING

ROUGH GRADING SHALL BE COMPLETED PRIOR TO INSTALLATION OF UNDERGROUND UTILITIES.

TRENCH BOTTOM SHALL BE COMPACTED BY SUITABLE MEANS APPROVED BY THE ENGINEER PRIOR TO PLACEMENT OF BEDDING MATERIAL. BEDDING MATERIAL SHALL BE PLACED TO PROVIDE UNIFORM AND ADEQUATE LONGITUDINAL SUPPORT UNDER THE PIPE. THE CONTRACTOR SHALL ENSURE THAT A MINIMUM COMPACTED DEPTH OF 6" IS MAINTAINED UNDERNEATH THE PIPE. BELL HOLES SHOULD BE PROVIDED AT EACH JOINT TO PERMIT PROPER ASSEMBLY WHILE MAINTAINING UNIFORM SUPPORT.

BEDDING MATERIAL SHALL BE ROUNDED GRAVEL WITH A MAXIMUM PARTICLE SIZE OF 1 1/2" AND SHALL BE NON-PLASTIC. WHERE DEPTH OF COVER IS 2-FT. OR LESS, BACKFILL MATERIAL SHALL BE ROUNDED GRAVEL WITH A MAXIMUM PARTICLE SIZE OF 4" AND WITH NO MORE THAN 20% PASSING THE #200 SIEVE.

BACKFILL SHALL BE PLACED IN LAYERS OF NOT MORE THAN 8" LOOSE DEPTH AND COMPACTED TO ACHIEVE COMPACTION OF 95% OF THE MAXIMUM DENSITY AS DETERMINED BY AASHTO T-99 AND T-191 OR ASTM D-2922 AND D-3017. THE CONTRACTOR SHALL CONTRACT WITH AN INDEPENDENT TESTING LABORATORY TO PROVIDED COMPACTION TESTING. TESTS SHALL BE PROVIDED AT MINIMUM INTERVALS OF ONE TEST PER 50 CUBIC YARDS OF TRENCH BACKFILL. TEST RESULTS SHALL BE SUBMITTED DAILY TO THE ENGINEER.

TRENCHING, PIPELAYING, BACKFILLING, AND ALL OTHER CONSTRUCTION SHALL BE PERFORMED UNDER THE INSPECTION, COORDINATION, AND SUPERVISION OF A REGISTERED PROFESSIONAL CIVIL ENGINEER.

NO TRENCH SHALL BE FILLED WITH BEDDING MATERIAL OR BACKFILL UNTIL THE EXCAVATION AND PIPE LAYING, RESPECTIVELY, HAVE BEEN APPROVED BY THE OWNER OR HIS AUTHORIZED REPRESENTATIVE.

THE EXCAVATION METHOD EMPLOYED SHALL BE THE CONTRACTOR'S OPTION. MATERIAL SHALL NOT BE STOCKPILED TO A DEPTH OF MORE THAN 5 FEET ABOVE FINISHED GRADE WITHIN 25 FEET OF ANY EXCAVATION OR STRUCTURE. EXCAVATION SHALL EXTEND SUFFICIENT DISTANCE FROM WALLS AND FOOTINGS TO ALLOW PLACING AND REMOVAL OF FORMS, INSTALLATION OF SERVICES AND INSPECTION BY THE ENGINEER. WITHIN 12" OF FINISHED GRADE SHOWN ON THE DRAWINGS, AND FOR THE MANHOLES, FILL AND BACKFILL SHALL BE NATIVE MATERIAL, FEE FROM BROKEN CONCRETE, ORGANIC MATERIAL, OR OTHER DEBRIS WITH SUFFICIENT FINES TO FILL ALL VOIDS AND TO INSURE A UNIFORMLY COMPACTED MASS OF THE REQUIRED DENSITY AND HAVING A MAXIMUM SIZE OF 2 - ½ INCHES WITH 0 TO 20% MINUS #200. ALL FILL AND BACKFILL SHALL BE PLACED IN LAYERS OF NOT MORE THAN 8" LOOSE AND COMPACTED TO 95% OF MAXIMUM DENSITY, DETERMINED BY AASHTO TEST METHOD T-99, PRIOR TO PLACEMENT OF THE NEXT LAYER.

WATER AND SEWER SYSTEM DESIGN: MINIMUM DESIGN CRITERIA

WATER AND SEWER MAINS SHALL BE SEPARATED IN ORDER TO PROTECT PUBLIC WATER SYSTEMS FROM POSSIBLE CONTAMINATION. ALL DISTANCES ARE MEASURED PERPENDICULARLY FROM THE OUTSIDE OF THE SEWER MAIN TO THE OUTSIDE OF THE WATER MAIN. SEPARATION REQUIREMENTS ARE AS FOLLOWS:
1. A WATER MAIN SHALL NOT BE PLACED:
A. WITHIN SIX FEET, HORIZONTAL DISTANCE, AND BELOW TWO FEET, VERTICAL DISTANCE, ABOVE THE TOP OF A SEWER MAIN UNLESS EXTRA PROTECTION IS PROVIDED. EXTRA PROTECTION SHALL CONSIST OF CONSTRUCTING THE SEWER MAIN WITH MECHANICAL JOINT DUCTILE IRON PIPE OR WITH SLIP-JOINT DUCTILE IRON PIPE IF JOINT RESTRAINT IS PROVIDED. ALTERNATE EXTRA PROTECTION SHALL CONSIST OF ENCASING BOTH THE WATER AND SEWER MAINS IN AT LEAST SIX INCHES OF CONCRETE FOR AT LEAST TEN FEET BEYOND THE AREA COVERED BY THIS SUBPARAGRAPH.
B. WITHIN TWO FEET HORIZONTALLY AND TWO FEET BELOW THE SEWER MAIN.
2. NO WATER PIPE SHALL PASS THROUGH OR COME INTO CONTACT WITH ANY PART OF A SEWER MANHOLE. THE MINIMUM HORIZONTAL SEPARATION BETWEEN WATER MAINS AND MANHOLES SHALL BE SIX FEET, MEASURED FROM THE CENTER OF THE MANHOLE.
3. THE MINIMUM SEPARATION BETWEEN FORCE MAINS OR PRESSURE SEWERS AND WATER MAINS SHALL BE TWO FEET VERTICALLY AND SIX FEET HORIZONTALLY UNDER ALL CONDITIONS. WHERE A SEWER FORCE MAIN CROSSES ABOVE OR LESS THAN SIX FEET BELOW A WATER LINE, THE SEWER MAIN SHALL BE ENCASED IN AT LEAST SIX INCHES OF CONCRETE OR CONSTRUCTED USING MECHANICAL JOINT DUCTILE IRON PIPE FOR TEN FEET ON EITHER SIDE OF THE WATER MAIN.

CONSTRUCTION NOTES
1. THE EXISTING SEWER IS VERY SHALLOW. EXTREME CAUTION IS REQUIRED TO ENSURE THE PIPE IS PROTECTED DURING CONSTRUCTION. EXISTING SEWER TO REMAIN OPERATIONAL AT ALL TIMES UNTIL THE NEW SEWER IS ACTIVATED.
2. THE EXISTING LATERAL SEWERS SHALL BE TEMPORARILY RE-ROUTED AS NEEDED DURING CONSTRUCTION. TO REMAIN OPERATIONAL UNTIL THE NEW SEWER IS ACTIVATED
3. WASTE MATERIAL FROM THE SEWER AND ROAD CONSTRUCTION SHALL BE REMOVED FROM PRIVATELY OWNED PROPERTIES.
4. CUT SLOPES STEEPER THAN 2:1 SHOULD BE EVALUATED AND APPROVED BY GEOTECHNICAL ENGINEER.
5. ALL TEMPORARY AND NEW SEWER PIPES AND STRUCTURES SHALL BE INSTALLED PER THE SPECIFICATIONS PROVIDED BY THE SEWER PLANT ENGINEER.
6. NEW EASEMENTS ARE NEEDED FOR BOTH EXISTING AND PROPOSED SEWER ACROSS PRIVATE PROPERTIES. TO BE COORDINATED BY THE TOWN.

CONSTRUCTION NOTES:

1. HEADWORKS PER SHEET M3.0.
2. SEQUENCING BATCH REACTOR PER SHEET M3.0.
3. BLOWER ROOM PER SHEET M7.0.
4. DEWATERING PAD PER SHEET M5.3.
5. CHLORINE CONTACT CHANNEL PER SHEET M4.0.
6. SLUDGE DRYING BED PER SHEET M5.0.
7. DRYING BED LIFT STATION PER SHEET M5.2.
8. EMERGENCY OVERFLOW BASIN PER SHEET M6.0.
9. PACKAGED OVERFLOW LIFT STATION PER DETAIL A SHEET M8.2.
10. REPLACE 140± LF OF PERIMETER FENCING TO MATCH.
11. RETAINING WALL PER STRUCTURAL SHEET S2.10.
12. PRECAST CONCRETE EFFLUENT SAMPLE BOX PER SHEET M5.0.
13. OPERATIONS ROOM PER SHEET M7.0.

10. INSTALL 6" RUBBER SKIRT W/ SS CLAMPS.
11. INSTALL 6" PLUG VALVE W/ HANDWHEEL.
12. INSTALL 4" CLEANOUT PER DETAIL I SHEET M8.3.
13. INSTALL 1'-7" WIDE x8" THICK CONCRETE SLAB W/ 2 #5 CONT. AND #5 AT 16" O.C. TRANS., BOTTOM. TYPICAL OF 2.
14. INSTALL 2'-0" WIDE x8" THICK CONCRETE SLAB W/ 3 #5 CONT. AND #5 AT 16" O.C. TRANS., BOTTOM. TYPICAL OF 2.
15. INSTALL 3'-10" WIDE x12" THICK CONCRETE SLAB W/ 6 #5 CONT. AND #5 AT 16" O.C. TRANS., BOTTOM.
16. INSTALL CMU BLOCK WALL, #5 VERTICAL W/ DOWEL INTO CONCRETE PAD AT 48" O.C. ALTERNATING, GROUT WALL SOLID.
17. INSTALL 8" THICK CONCRETE RAMP W #5 AT 12" O.C. EACH WAY, BOTTOM OVER 6" ABC.
18. INSTALL 12" SAND LAYER.
19. INSTALL 4-8 mm FINE GRAVEL.
20. INSTALL 1'-6" DEEP ¾" CRUSHED ROCK.
21. INSTALL 4" GRANULAR SAND LAYER.
22. INSTALL 100 mm GEOTEXTILE FABRIC PER SPECS.
23. INSTALL FLEXIBLE POLYPROPYLENE LINER PER SPECS.
24. INSTALL ANCHOR TRENCH PER DETAIL D SHEET M8.3.
25. INSTALL PIPE BOOT PER LINER MANUFACTURER RECOMMENDATIONS AND DETAIL E SHEET M8.3.
26. INSTALL HDPE LINER ANCHOR BOLT, ANCHOR TO EXISTING WALLS PER DETAIL C SHEET M8.3.
27. PIPE SUPPORT / STRAP

NOTES:

1. SLOPE GRADE MIN. 5:1 AWAY AS NEEDED AROUND ENTIRE PERIMETER.
2. PROTECT IN PLACE EXISTING ROADWAY BARRIERS.

NOTES:

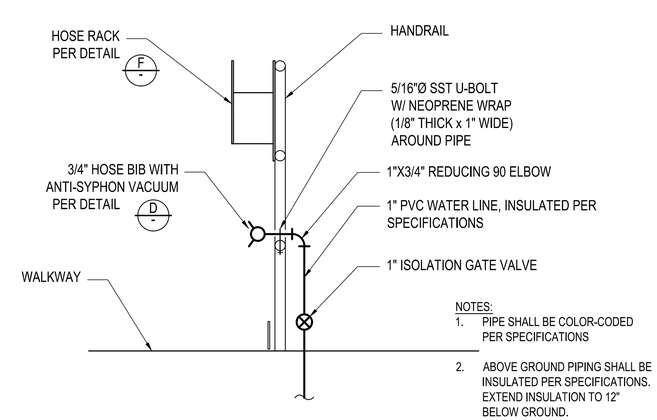
1. ALL MATERIALS SHALL BE CARBON STEEL.
2. ALL MATERIALS TO BE SHOP PRIMED W/ CARBOLINE 150 AFTER FABRICATION.

SHIP LADDER

N.T.S. **C**

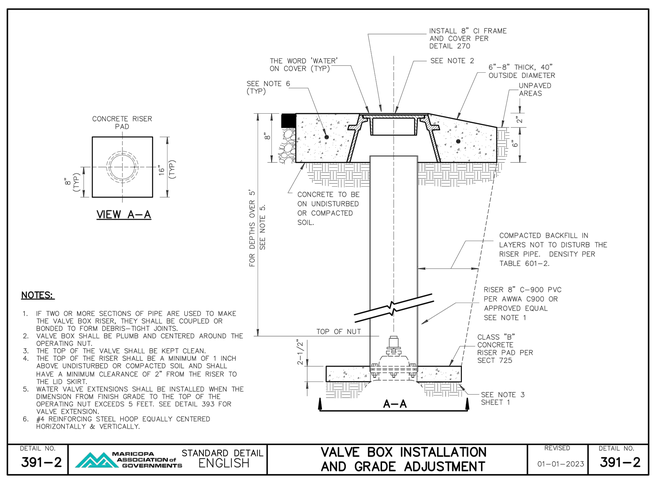


NOTES:

1. PIPE SHALL BE COLOR-CODED PER SPECIFICATIONS
2. ABOVE GROUND PIPING SHALL BE INSULATED PER SPECIFICATIONS. EXTEND INSULATION TO 12" BELOW GROUND.

HOSE BIB

N.T.S. **D**



NOTES:

1. PIPE SHALL BE COLOR-CODED PER SPECIFICATIONS
2. ABOVE GROUND PIPING SHALL BE INSULATED PER SPECIFICATIONS. EXTEND INSULATION TO 12" BELOW GROUND.

RAIL MOUNTED HOSE VALVE

N.T.S. **E**

NOTES:

1. IF TWO OR MORE SECTIONS OF PIPE ARE USED TO MAKE THE VALVE BOX RISER, THEY SHALL BE COUPLED OR BONDED TO FORM DEBRIS-TIGHT JOINTS.
2. VALVE BOX SHALL BE PLUMB AND CENTERED AROUND THE OPERATING NUT.
3. THE TOP OF THE VALVE SHALL BE KEPT CLEAN.
4. THE TOP OF THE RISER SHALL BE A MINIMUM OF 1 INCH ABOVE UNDISTURBED OR COMPACTED SOIL AND SHALL HAVE A MINIMUM CLEARANCE OF 2" FROM THE RISER TO THE LID SKIRT.
5. WATER VALVE EXTENSIONS SHALL BE INSTALLED WHEN THE DIMENSION FROM FINISH GRADE TO THE TOP OF THE OPERATING NUT EXCEEDS 5 FEET. SEE DETAIL 393 FOR VALVE EXTENSION.
6. #4 REINFORCING STEEL HOOP EQUALLY CENTERED HORIZONTALLY & VERTICALLY.

GENERAL NOTES:

1. WHERE NO REFERENCE TO PIPE HANGERS OR SUPPORTS IS GIVEN ON THE DRAWINGS, THE CONTRACTOR SHALL USE THE APPROPRIATE HANGER OR SUPPORT SHOWN ON THIS DRAWING. MAXIMUM HANGER AND SUPPORT SPACING SHALL BE AS SHOWN IN SCHEDULE "A" ON THIS DRAWING. FIGURE NUMBERS ARE B-LINE, UNISTRUT OR GRINNELL.
2. ALL CONCRETE INSERTS, BRACKETS, CHANNELS, BOLTS, RODS, AND MISCELLANEOUS HARDWARE USED FOR PIPE HANGERS OR SUPPORTS SHALL BE 316 S.S., U.N.O.
3. CONCRETE CONTINUOUS INSERTS, B-LINE SERIES B52i, OR EQUAL, SHALL BE PROVIDED IN THE WALLS AND CEILINGS AS REQ'D OR AS NOTED ON THE DRAWINGS. INSERTS IN THE WALLS SHALL BE VERTICAL, UNLESS OTHERWISE NOTED AND SHALL BEGIN 6 INCHES ABOVE THE FLOOR AND END 6 INCHES BELOW THE CEILING. INSERTS IN THE CEILING SHALL BEGIN AND END 3 INCHES FROM WALLS AND BEAMS, WHERE PRACTICABLE. THE CENTERLINES OF WALL AND CEILING INSERTS SHALL ALIGN. MAXIMUM CENTER TO ENTER SPACING OF INSERTS SHALL BE 5'-0".
4. IN AREAS NOT COVERED UNDER NOTE 3, CONCRETE INSERTS SHALL BE B-LINE SERIES B3014N WITH APPROPRIATE NUT, B-LINE SERIES B521i CHANNEL EMBEDDED ANCHOR BOLTS, OR EQUAL. IN WITHOUT THE PRIOR WRITTEN APPROVAL OF THE ENGINEER (FOR EQUIPMENT LIFTING DEVICES, (SEE STRUCTURAL DRAWINGS).
5. SUPPORTS SHALL MEET MANUFACTURERS STANDARDIZATION SOCIETY OF THE VALVE AND FITTINGS INDUSTRY STANDARD PRACTICE SP58, LATEST EDITION.
6. HANGER BRACKET AND SUPPORT COMPONENTS MAY BE INTERCHANGED AS APPROVED BY THE ENGINEER.
7. TRAPEZE AND PIPE RACK COMPONENTS SHALL HAVE A MINIMUM STEEL THICKNESS OF 12 GAUGE. MAXIMUM DEFLECTION SHALL BE LIMITED TO 1/240 OF THE SPAN. CHANNEL COMPONENTS SHALL BE B-LINE SERIES B22 OR B22A, OR EQUAL.
8. CONCRETE INSERTS IN AREAS BELOW WATER SURFACE OR NORMALLY SUBJECT TO SUBMERGING SHALL BE EMBEDDED ANCHOR BOLTS, OR APPROVED EQUAL. IN NO CASE SHALL CONCRETE CONTINUOUS INSERTS BE USED IN THESE AREAS.
9. ALL PIPING, DUCTWORK, ACCESSORIES, APPURTENANCES, ETC. SHALL BE ANCHORED TO RESIST 200% OF THE APPLIED LOAD & A LATERAL SEISMIC FORCE OF 40 PERCENT OF ITS WEIGHT WITHOUT EXCESSIVE DEFLECTION.
10. CONTRACTOR SHALL VERIFY ALL SUPPORT DIMENSIONS AND LOCATIONS WITH APPROVED SHOP DRAWINGS FOR ITEMS BEING SUPPORTED BEFORE FABRICATION OR INSTALLATION OF SUPPORTS.

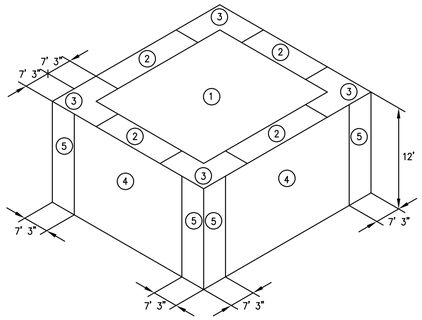
BUILDING CODE:

2012 EDITION OF THE INTERNATIONAL BUILDING CODE WITH TOWN OF JEROME AMENDMENTS.



LOADS:

ROOF LIVE LOAD = 20 PSF (REDUCIBLE).
TOTAL ROOF DEAD LOAD = 20 PSF.
GROUND SNOWLOAD = 20 PSF.
ROOF SNOW = 18.5 PSF.

WIND:

THE STRUCTURE AND ITS COMPONENTS ARE DESIGNED FOR WIND LOADS AS DEFINED BY THE BUILDING CODE, WHERE:

BASIC WIND SPEED 120 MPH.
RISK CATEGORY: III.
WIND EXPOSURE: C.
VELOCITY PRESSURE, qz = 23.7 PSF AT h = 12' FT. (MEAN ROOF HEIGHT). DESIGN WIND PRESSURES COMPONENTS AND CLADDING:

*PRESSURES SHOWN ARE ULTIMATE. MULTIPLY BY 0.6 FOR SERVICE LEVEL PRESSURES.

LOCATION	ZONE	EFFECTIVE WIND AREA (SF)	DESIGN WIND PRESSURE (PSF)*	
ROOF	1	10	+16.0	−54.9
		20	+16.0	−50.9
		50	+16.0	−45.6
		100	+16.0	−41.6
	2	10	+16.0	−74.2
		20	+16.0	−69.1
		50	+16.0	−62.3
		100	+16.0	−57.1
	3	10	+16.0	−103.3
		20	+16.0	−93.0
		50	+16.0	−79.4
		100	+16.0	−69.1
WALLS	4	10	+31.1	−30.4
		20	+29.1	−29.1
		50	+26.3	−27.2
		100	+24.2	−25.8
		500	+19.4	−22.6
	5	10	+31.1	−63.7
		20	+29.1	−58.1
		50	+26.3	−50.8
		100	+24.2	−45.2
		500	+19.4	−32.3
PARAPET	INTERIOR	10	+103.3	−58.1

		100	+81.4	−50.0
	EXTERIOR	10	+132.4	−87.2
		50	+105.7	−77.0
		100	+93.3	−69.4

ZONE1: INTERIOR AREA OF ROOF AWAY FROM BUILDING EXTERIOR WALLS.
ZONE2: ROOF AREAS WITHIN 7'−3" OF EXTERIOR WALLS.
ZONE3: ROOF AREAS WITHIN 7'−3" OF BUILDING CORNERS.
ZONE4: EXTERIOR WALLS AWAY FROM BUILDING CORNERS.
ZONE5: EXTERIOR WALLS WITHIN 7'−3" OF BUILDING CORNERS.
−DESIGN WIND PRESSURES − PLUS AND MINUS SIGNS SIGNIFY PRESSURE ACTING TOWARD AND AWAY FROM EXTERIOR SURFACE.
−LINEAR INTERPOLATION BETWEEN VALUES OF TRIBUTARY AREA IS PERMISSIBLE.

SEISMIC:

RISK CATEGORY = III.
SEISMIC IMPORTANCE FACTOR: Ie = 1.25.
DESIGN CATEGORY = B.
SITE CLASS C.
SS = 0.31, S1 = 0.097, R = 3.5.
Sds = 0.269, Sd1 = 0.097.
BASIC SEISMIC−FORCE−RESISTING SYSTEM (INTERMEDIATE REINFORCED MASONRY SHEAR WALLS).
ANALYSIS PROCEDURE USED (EQUIVALENT LATERAL FORCE PROCEDURE).
CS = 0.096 (FACTORED).

FOUNDATIONS:

SOIL REPORT BY WESTERN TECHNOLOGIES INC; JOB NO.2522JW197; DATED OCTOBER 25, 2022; SPREAD FOOTINGS SHALL BEAR ON FIRM, UNDISTURBED SOIL AT BELOW GRADE TANKS AND 1' OF 2 SACK SLURRY AT GRADE. IN ACCORDANCE WITH THE ABOVE REPORT, BOTTOM OF FOOTING TO BE 2'0" MINIMUM BELOW FINISHED GRADE. (THESE FOOTING DEPTHS ARE MINIMUMS AND THE CONTRACTOR SHALL COORDINATE WITH SOILS REPORT AND OTHER TRADES TO ENSURE THESE MINIMUMS ARE SUFFICIENT FOR THE WORK.) FINISHED GRADE IS DEFINED AS TOP OF SLAB FOR INTERIOR FOOTINGS AND LOWEST ADJACENT GRADE WITHIN 5 FEET FOR PERIMETER FOOTINGS. DESIGN SOIL BEARING VALUE = 2500 PSF. FOUNDATION EXCAVATIONS SHALL BE INSPECTED BY SOILS ENGINEER PRIOR TO PLACEMENT OF CONCRETE.

CONCRETE:

MINIMUM 28 DAY STRENGTH 5,000 PSI EXCEPT AS FOLLOWS: (TYPE II, U.N.O.)

WALLS ---------- 5,000 PSI
MILD REINFORCED SLAB ---------- 5,000 PSI
FOUNDATIONS ---------- 5,000 PSI

MECHANICALLY VIBRATE ALL CONCRETE WHEN PLACED, EXCEPT THAT SLABS ON GRADE NEED BE VIBRATED ONLY AROUND UNDER−FLOOR DUCTS, ETC. MAXIMUM SLUMP 4 1/2" FOR CONCRETE WITHOUT PLASTICIZER. IF PLASTICIZER IS USED, A HIGHER FINAL SLUMP MAY BE ALLOWED UPON STRUCTURAL ENGINEER'S APPROVAL. CAST CLOSURE POUR AROUND COLUMNS AFTER COLUMN DEAD LOAD IS APPLIED. UNLESS APPROVED OTHERWISE IN WRITING BY THE ARCHITECT, ALL CONCRETE SLABS ON GRADE SHALL BE BOUND BY CONTROL JOINTS (KEYED OR SAW CUT), SUCH THAT THE ENCLOSED AREA DOES NOT EXCEED 225 SQUARE FEET. KEYED CONTROL JOINTS NEED ONLY OCCUR AT EXPOSED EDGES DURING POURING, ALL OTHER JOINTS MAY BE SAW CUT. CONTRACTOR SHALL SUBMIT PROPOSED LOCATIONS FOR APPROVAL PRIOR TO CONSTRUCTION.

REINFORCING:

ASTM A615 (FY = 60 KSI) DEFORMED BARS FOR ALL BARS. ALL GRADE 60 REINFORCING TO BE WELDED SHALL BE ASTM A706. WELDED WIRE FABRIC PER ASTM A185, WIRE PER ASTM A82. NO TACK WELDING OF REINFORCING BARS ALLOWED WITHOUT PRIOR REVIEW OF PROCEDURE WITH THE STRUCTURAL ENGINEER. LATEST ACI CODE AND DETAILING MANUAL APPLY. CLEAR CONCRETE COVERAGES AS FOLLOWS UNLESS NOTED OTHERWISE IN THE CONCRETE FIRE RATING TABLE:

CAST AGAINST AND PERMANENTLY EXPOSED TO EARTH ---------- 3"
EXPOSED TO EARTH OR WEATHER
#6 OR LARGER ---------- 2"
#5 AND SMALLER ---------- 1 1/2"
FLAT SLAB ---------- 3/4"
ALL OTHER PER LATEST EDITION OF ACI 318.

LAP SPLICES IN CONCRETE:

LAP SPLICES, UNLESS NOTED OTHERWISE, SHALL BE CLASS "B" TENSION LAP SPLICES PER LATEST EDITION OF ACI 318. LAP SPLICES IN CONCRETE COLUMNS SHALL BE TENSION LAP SPLICES. STAGGER SPLICES A MINIMUM OF ONE LAP LENGTH. LAPS IN WELDED WIRE FABRIC SHALL BE MADE SO THAT THE OVERLAP, MEASURED BETWEEN OUTERMOST CROSS WIRES OF EACH FABRIC SHEET, IS NOT LESS THAN THE SPACING OF CROSS WIRES PLUS 2 INCHES. ALL WELDED WIRE FABRIC SHALL BE CHAIRED TO ENSURE PROPER CLEARANCES.

ALL SPLICE LOCATIONS SUBJECT TO APPROVAL BY THE STRUCTURAL ENGINEER. PROVIDE BENT CORNER BARS TO MATCH AND LAP WITH HORIZONTAL BARS AT ALL CORNERS AND INTERSECTIONS PER TYPICAL DETAILS. REINFORCING BAR SPACING GIVEN ARE MAXIMUM ON CENTERS. ALL BARS PER CRSI SPECIFICATIONS AND HANDBOOK. DOWEL ALL VERTICAL REINFORCING TO FOUNDATION WITH STANDARD 90−DEGREE HOOKS UNLESS NOTED OTHERWISE. SECURELY TIE ALL BARS IN LOCATION BEFORE PLACING CONCRETE.

MASONRY:

MECHANICALLY VIBRATE GROUT IN VERTICAL SPACES IMMEDIATELY AFTER POURING AND AGAIN ABOUT 5 MINUTES LATER. PROVIDE CLEANOUTS IF GROUT LIFT EXCEEDS 4'−0" IN BLOCK WALLS. MAXIMUM GROUT LIFT SHALL BE 8'−0". UNLESS NOTED OTHERWISE ON THE PLANS, PLACE CONTROL JOINTS IN MASONRY WALLS SUCH THAT NO STRAIGHT RUN OF WALL EXCEEDS 24'−0". CONTROL JOINTS SHALL NOT OCCUR WITHIN 8'−0" OF WALL CORNERS, INTERSECTIONS, ENDS, WITHIN 24" OF CONCENTRATED POINTS OF BEARING OR JAMBS, OR OVER OPENINGS UNLESS SPECIFICALLY SHOWN ON THE STRUCTURAL DRAWINGS. ALL MASONRY BELOW FINISHED FLOOR OR GRADE SHALL BE GROUTED SOLID. LAP SPLICES SHALL BE AS FOLLOWS:

BAR SIZE	#3	#4	#5	#6	#7	#8	#9
BAR LAPS (INCHES)	27	36	45	54	63	72	81

HOLLOW CONCRETE MASONRY UNITS SHALL CONFORM TO ASTM C90, NORMAL WEIGHT, RUNNING BOND, MORTAR TYPE S (1800 PSI), COMPRESSIVE STRENGTHS AS FOLLOWS:

F'M(PSI)	UNIT STRENGTH, NET (PSI)	GROUT (PSI)	LOCATION
2000	2000	2000	TYPICAL U.N.O.

VERTICAL REINFORCING:

1 #5 IN CENTER OF GROUT AT CENTER OF WALL, CONTINUOUS FULL HEIGHT OF WALL AT ALL CORNERS, INTERSECTIONS, WALL ENDS, BEAM BEARINGS, JAMBS, EACH SIDE OF CONTROL JOINTS AND AT INTERVALS NOT TO EXCEED 48" O.C. UNLESS NOTED OTHERWISE. TIE AT 8'−0" VERTICALLY, WITH SINGLE WIRE LOOP TIE BY A.A. WIRE PRODUCTS COMPANY. LAP SPLICES SHALL BE AS PER SCHEDULE UNDER "MASONRY" SECTION. DOWEL ALL VERTICAL REINFORCING TO FOUNDATION WITH DOWELS TO MATCH VERTICAL REINFORCING.

HORIZONTAL REINFORCING:

2 #5 IN MINIMUM 8" DEEP GROUTED CONTINUOUS BOND BEAM AT (ELEVATED FLOORS AND) ROOFLINE. 1 #5 IN MINIMUM 8" DEEP GROUTED CONTINUOUS BOND BEAM AT TOP OF PARAPET OR TOP OF A FREESTANDING WALL AND AT BOTTOM OF WALL. USE 1 #4 HORIZONTAL BOND BEAM AT 48" O.C. VERTICALLY SPACED FOR ALL WALLS WITHOUT RUNNING BOND (STACKED BOND). PLACE THESE BARS CONTINUOUS THRU CONTROL JOINTS PER TYPICAL DETAIL. PROVIDE BENT BARS PER TYPICAL DETAILS, TO MATCH HORIZONTAL BOND BEAM REINFORCING, AT CORNERS AND WALL INTERSECTION TO MAINTAIN BOND BEAM CONTINUITY. LAP SPLICES SHALL BE AS PER SCHEDULE UNDER "MASONRY" SECTION. DO NOT SPLICE WITHIN 8'−0" OF CONTROL JOINTS. USE STANDARD WEIGHT (NO. 9 GAGE WIRE) DUR−O−WAL OR DUR−O−WIRE (OR EQUIVALENT) LADDER TYPE JOINT REINFORCEMENT AT 16" O.C. IN MASONRY WALLS.

ANCHOR BOLTS:

ALL ANCHOR BOLTS SHALL BE ASTM F1554 GRADE 36 (WELDABLE), U.N.O., WHEN SPECIFIED ON PLAN, ALL ASTM F1554 GRADE ANCHOR BOLTS SHALL BE 511 (WELDABLE) ANCHOR BOLTS.

MAY BE BENT IN FIELD PER AISC REQUIREMENTS TO FIX DAMAGED ANCHOR BOLTS; FIELD BENT IS LIMITED TO 45° OR LESS. ANCHOR BOLTS CAN HAVE HEADED OR HOOKED BOLTS SHAPES. USE HEADED ANCHOR BOLTS WHERE ANCHOR BOLT SHAPE IS NOT SPECIFIED. ANCHOR BOLTS SHALL BE INSPECTED PER SPECIAL INSPECTION TABLE REQUIREMENTS.

STRUCTURAL STEEL:

STEEL SETIONS − MINIMUM GRADE AND STRENGTH

STEEL WIDE FLANGES	= ASTM A992 (50KSI)
STEEL CHANNELS	= ASTM A36 (36KSI)
STEEL ANGLES	= ASTM A36 (36KSI)
STEEL COLUMN BASE PLATES	= ASTM A992 (50KSI)
STEEL PLATES AT MOMENT FRAME AND BRACED FRAME CONNECTIONS	= ASTM A992 (50KSI)
STEEL PLATES (MISCELLLANEOUS)	= ASTM A36 (36KSI)
STEEL HSS (RECTANGLE)	= ASTM A500 (46KSI)
STEEL HSS (ROUND)	= ASTM A500 (42KSI)
STEEL PIPES	= ASTM A501 (36KSI) − OR − ASTM A53 (35KSI), TYPE E OR S

NOTE: ALL 36KSI STEEL MAY BE SUBSTITUTED WITH 50KSI STEEL UNLESS NOTED OTHERWISE.

ALL CONSTRUCTION PER LATEST AISC HANDBOOK. ALL REFERENCE TO HEADED STUDS SHALL BE HIGH STRENGTH HEADED STUDS. ATTACHMENT OF HEADED STUDS SHALL CONFORM TO ALL REQUIREMENTS OF THE LATEST EDITION OF THE "RECOMMENDED PRACTICES FOR STUD WELDING" AND THE "STRUCTURAL WELDING CODE" PUBLISHED BY AWS. ALL BOLTS, ANCHOR BOLTS, EXPANSION BOLTS, ETC. SHALL BE INSTALLED WITH STEEL WASHERS AT SLOTTED HOLES IN STEEL SECTIONS. ALL WELDING SHALL BE PERFORMED BY WELDERS HOLDING VALID CERTIFICATES AND HAVING CURRENT EXPERIENCE IN THE TYPE OF WELD SHOWN ON THE DRAWINGS OR NOTES. CERTIFICATES SHALL BE THOSE ISSUED BY AN ACCEPTED TESTING AGENCY. ALL WELDING DONE BY E70 SERIES LOW HYDROGEN RODS UNLESS NOTED OTHERWISE. FOR GRADE 60 REINFORCING BARS, USE E90 SERIES. ALL WELDING PER LATEST AMERICAN WELDING SOCIETY STANDARDS, (EXCEPT STEEL JOISTS AND JOIST GIRDERS SHALL COMPLY WITH SJI STANDARDS). THESE DRAWINGS DO NOT DISTINGUISH BETWEEN SHOP AND FIELD WELDS; THE CONTRACTOR MAY SHOP WELD OR FIELD WELD AT HIS DISCRETION. SHOP WELDS AND FIELD WELDS SHALL BE SHOWN ON THE SHOP DRAWINGS SUBMITTED FOR REVIEW. ALL FULL (COMPLETE) PENETRATION WELDS SHALL BE TESTED AND CERTIFIED BY AN INDEPENDENT TESTING LABORATORY. WHEN STRUCTURAL STEEL IS FURNISHED TO A SPECIFIED MINIMUM YIELD POINT GREATER THAN 36 KSI, THE ASTM OR OTHER SPECIFICATION DESIGNATION SHALL BE INCLUDED NEAR THE ERECTION MARK ON EACH SHIPPING ASSEMBLY OR IMPORTANT CONSTRUCTION COMPONENT, OVER ANY SHOP COAT OF PAINT, PRIOR TO SHIPMENT FROM THE FABRICATOR'S PLANT. STRUCTURAL STEEL COMPONENTS, AND FASTENERS AT ALL EXTERIOR CONDITIONS SHALL BE GALVANIZED OR PROTECTED AGAINST CORROSION USING APPROVED METHOD PUBLISHED BY AISC OR ANSI. WELDS ON GALVANIZED STEEL SHALL FOLLOW AWS D−19.0 SPECIFICATIONS.

STRUCTURAL BOLTS:

ALL STRUCTURAL BOLTS SHALL BE ASTM F3125 GRADE A325 TYPE 1 AND SHALL BE INSTALLED AS BEARING−TYPE CONNECTIONS WITH THREADS INCLUDED IN SHEAR PLANE (I.E. A TYPE "N" CONNECTION) UNLESS NOTED OTHERWISE. USE A325 TYPE 3 BOLTS AT ALL CONNECTIONS EXPOSED TO WEATHERING. USE SC (SLIP CRITICAL) AT ALL MOMENT FRAMES AND BRACED FRAMES. USE ASTM A354 BOLTS WHERE THE BOLT LENGTH REQUIRED FOR THE CONNECTION EXCEEDS THE MINIMUM LENGTH OF AN A325 BOLT. BOLTS MAY BE TIGHTENED USING ANY AISC APPROVED METHOD. ALL STRUCTURAL BOLTING SHALL BE INSPECTED BY AN INDEPENDENT TESTING LABORATORY TO ENSURE BOLT TENSION.

STEEL GRATING:

UNLESS NOTED OTHERWISE IN ARCHITECTURAL SPECIFICATIONS, USE PAINTED (GALVANIZED) STEEL GRATING WITH 2 1/2" X 3/16" BEARING BARS AT 1 3/16" O.C. AND CROSSBARS AT 4" O.C. GRATING SHALL BE ERECTED AND ATTACHED PER MANUFACTURER'S RECOMMENDATIONS.

ROOF DECK:

DECK SHALL BE 1 1/2" DEEP, 36" WIDE, 20 GAGE GALVANIZED STEEL, WITH MINIMUM YIELD STRESS OF 50 KSI, WITH MINIMUM S = 0.237 IN3 AND I = 0.231 IN4 PER FOOT OF WIDTH. DECK SHALL BE ERECTED IN ACCORDANCE WITH MANUFACTURER'S RECOMMENDATIONS AS 1 SPAN MINIMUM AND SHALL BE ATTACHED FOR A MINIMUM DIAPHRAGM SHEAR CAPACITY OF 650 PLF USING THE FOLLOWING MINIMUM ATTACHMENTS:

WELD DECK TO SUPPORTING MEMBERS WITH 4 − 5/8" DIAMETER OR 3/8" X 1" PUDDLE WELDS PER SHEET AT ENDS, END LAPS AND AT INTERMEDIATE SUPPORTS, AND AT 24" O.C. AT PERIMETER BEAMS AND OPENING EDGES RUNNING PARALLEL TO THE DECK. SIDE SEAM ATTACHMENT SHALL BE VSC2 AT 24" O.C.

CONSTRUCTION JOINTS:

ALL CONSTRUCTION JOINTS IN WALLS SHALL BE KEYED IN ACCORDANCE WITH THE TYPICAL CONSTRUCTION JOINT DETAILS SHOWN ON THE STRUCTURAL DRAWINGS OR, AT THE CONTRACTOR'S OPTION, SHALL BE INTENTIONALLY ROUGHENED IN ACCORDANCE WITH THE FOLLOWING: THE SURFACE OF ROUGHENED JOINTS SHALL BE SAND BLASTED OR ROUGHENED WITH A CHIPPING HAMMER TO EXPOSE THE AGGREGATE EMBEDDED IN THE PREVIOUS POUR. THE EXPOSED AGGREGATE SHALL PROTRUDE A MINIMUM OF 1/4 INCH. ALL SURFACES OF CONSTRUCTION JOINTS SHALL BE CLEANED AND LAITANCE REMOVED. IMMEDIATELY BEFORE NEW CONCRETE IS PLACED, ALL CONSTRUCTION JOINTS SHALL BE WETTED AND STANDING WATER REMOVED. VERTICAL CONSTRUCTION JOINTS IN WALLS SHALL BE HELD TO A MAXIMUM SPACING OF 60'−0". ALL CONSTRUCTION JOINTS IN SLABS, JOISTS, BEAMS, AND GIRDERS SHALL BE OFFSET A DISTANCE EQUAL TO TWICE THE WIDTH OF THE BEAM.

ACCORDANCE WITH THE TYPICAL SLAB ON DECK CONSTRUCTION JOINT DETAIL SHOWN ON THE STRUCTURAL DRAWINGS. BEAMS AND GIRDERS HAVE BEEN DESIGNED ASSUMING THE CONSTRUCTION JOINTS TO BE LOCATED IN THE MIDDLE THIRD OF THE BEAM, GIRDER, OR SLAB SPAN. ALL CONSTRUCTION, CONTROL, AND ISOLATION JOINTS FOR SLABS ON GRADE SHALL BE IN ACCORDANCE WITH THE TYPICAL SLAB ON GRADE DETAILS. THE CONTRACTOR SHALL SUBMIT THE PROPOSED LOCATIONS OF CONSTRUCTION JOINTS TO THE ENGINEER FOR ACCEPTANCE BEFORE STARTING CONSTRUCTION.

ELECTRICAL CONDUIT IN CONCRETE SLABS:

ELECTRICAL CONDUIT SHALL BE RIGID STEEL CONDUIT OR FLEXIBLE PLASTIC CONDUIT. ALUMINUM CONDUIT IS PROHIBITED. CONDUIT WITH A MAXIMUM OUTSIDE DIAMETER OF 1/6 TIMES THE SLAB THICKNESS MAY BE EMBEDDED IN ONE LAYER AT THE MID−DEPTH OF SLABS. MINIMUM CLEAR DISTANCE BETWEEN CONDUITS SHALL BE 3 TIMES CONDUIT DIAMETER. CONDUIT SHALL BE FIRMLY CHAIRED AND TIED TO PREVENT DISPLACEMENT DURING POURING. PLACE #3 AT 12 INCHES O.C. ADDITIONAL REINFORCING ABOVE AND BELOW, PERPENDICULAR TO THE CONDUIT. THE ADDED REINFORCING SHALL EXTEND 1'−0" PAST THE CONDUIT ON BOTH SIDES. FOR CONDUIT PLACED IN SLABS ON METAL DECKING, CONDUIT SHALL RUN IN THE METAL DECK FLUTES PER THE TYPICAL CONDUIT IN SLAB ON METAL DECK DETAIL.

CONCRETE INSERTS:

THIN SLAB TYPE INSERTS SHALL BE GALVANIZED AND HAVE THE FOLLOWING MINIMUM WORKING LOADS(A 4:1 RATIO OF ULTIMATE TO WORKING VALUES IS ASSUMED):

BOLT DIAMETER	WORKING LOAD SHEAR	TENSION
1/2"	1,000 LBS.	650 LBS.
5/8"	1,250 LBS.	700 LBS.
3/4"	1,600 LBS.	850 LBS.

COIL LOOP INSERTS SHALL BE GALVANIZED AND HAVE THE FOLLOWING MINIMUM WORKING LOADS(A 3:1 RATIO OF ULTIMATE TO WORKING VALUES IS ASSUMED):

BOLT DIAMETER	WORKING LOAD SHEAR	TENSION
1/2"	2,200 LBS.	2,820 LBS.
5/8"	3,000 LBS.	3,620 LBS.
3/4"	3,100 LBS.	3,660 LBS.

THREADED COIL RODS, COIL NUTS, ETC., USED IN CONJUNCTION WITH CONCRETE INSERTS, SHALL HAVE A WORKING LOAD EQUAL TO OR GREATER THAN THE CORRESPONDING CONCRETE INSERT. CONTRACTOR SHALL SUBMIT MANUFACTURER'S SIZE AND STRENGTH DATA PRIOR TO CONSTRUCTION TO THE STRUCTURAL ENGINEER THRU THE ARCHITECT. VALUES LISTED ABOVE ARE FOR RICHMOND STRUCTURAL CONNECTION INSERTS.

EXPANSION AND SCREW ANCHORS:

USE STUD TYPE EXPANSION ANCHOR WITH A SINGLE PIECE WEDGE ONLY WHERE NOTED ON PLANS. IF USE IS REQUESTED FOR OTHER THAN WHERE NOTED CONTACT STRUCTURAL ENGINEER THROUGH ARCHITECT FOR APPROVAL.

CONTRACTOR SHALL SUBMIT MANUFACTURER'S SIZE AND STRENGTH DATA TO ENGINEER THROUGH ARCHITECT PRIOR TO CONSTRUCTION. INSTALL ALL BOLTS AS OUTLINED IN MANUFACTURER'S SPECIFICATIONS, UTILIZING PROPER SIZE AND TYPE OF DRILL, CLEANING HOLE, DRIVING AND TIGHTENING BOLT.

IN CONCRETE:

ANCHORS USED MUST HAVE ICC APPROVAL AND INCLUDE HILTI KWIK BOLT TZ2 (ESR−4266), AND SIMPSON STRONG BOLT−2 (ESR−3037), AND DEWALT POWER−STUD+SD2 (ESR−2502), AND SIMPSON TITEN HD (ESR−2713), HILTI KWIK HUS−EZ (ESR−3027), AND DEWALT SCREW−BOLT+ (ESR−3889) OR APPROVED EQUAL.

IN MASONRY:

ANCHORS USED MUST HAVE ICC APPROVAL AND INCLUDE HILTI KWIK BOLT 3 (ESR−1385), AND SIMPSON STRONG BOLT−2 (ES−240), DEWALT POWER−STUD+SD1 (ESR−2966), HILTI KWIK HUS−EZ (ESR−3056) AND SIMPSON TITEN HD (ESR−1056), AND DEWALT SCREW−BOLT+ (ESR−4042) OR APPROVED EQUAL.

EPOXY ANCHORS IN CONCRETE AND MASONRY:

INJECTABLE ADHESIVE SHALL BE USED FOR INSTALLATION OF REINFORCING STEEL DOWELS OR THREADED ANCHOR RODS AND INSERTS INTO NEW OR EXISTING CONCRETE OR SOLID GROUTED CONCRETE MASONRY UNITS ONLY WHERE SPECIFIED ON PLANS. IF USE IS REQUESTED FOR OTHER THAN WHERE NOTED CONTACT STRUCTURAL ENGINEER THROUGH ARCHITECT FOR APPROVAL. ADHESIVE SHALL BE FURNISHED IN SIDE BY SIDE PACKS WHICH KEEP COMPONENT A AND COMPONENT B SEPARATE. USE ONLY INJECTION TOOLS AND STATIC MIXING NOZZLES RECOMMENDED BY MANUFACTURER. MANUFACTURER'S INSTRUCTIONS SHALL BE FOLLOWED.

IN CONCRETE:

ANCHORS USED MUST HAVE I.C.C. APPROVAL IN CRACKED CONCRETE AND INCLUDE SIMPSON SET−XP (ESR−2508), HILTI HIT−RE500−V3 (ESR−3814), DEWALT PURE110+ (ESR−3298) OR APPROVED EQUIVALENT. THE USE OF ANY EPOXY ANCHOR MUST BE APPROVED BY THE ENGINEER OF RECORD PRIOR TO INSTALLATION.

IN MASONRY:

ANCHORS USED MUST HAVE ICC APPROVAL AND INCLUDE SIMPSON SET (ESR−1772) AND HILTI HIT−HY 270 MAX (ESR−4143) AND DEWALT AC100+GOLD (ESR−3200) OR APPROVED EQUIVALENT. THE USE OF ANY EPOXY ANCHOR MUST BE APPROVED BY THE ENGINEER OR RECORD PRIOR TO INSTALLATION.

1. ADHESIVE ANCHORS INSTALLED IN HORIZONTAL TO VERTICALLY OVERHEAD ORIENTATION TO SUPPORT SUSTAINED TENSION LOADS SHALL BE DONE BY A CERTIFIED ADHESIVE ANCHOR INSTALLER (AAI) AS CERTIFIED THROUGH ACI (ACI 318−11 D.9.2.2) / (ACI 318−14 17.8.2.2) / (ACI 318−19 17.2.3) PROOF OF CURRENT CERTIFICATION SHALL BE SUBMITTED TO THE ENGINEER FOR APPROVAL PRIOR TO COMMENCEMENT OF INSTALLATION.
2. ADHESIVE ANCHORS MUST BE INSTALLED IN CONCRETE AGED A MINIMUM OF 21 DAYS (ACI 318−11 D.2.2) / (ACI 318−14 17.1.2) / (ACI 318−19 17.2.2).
3. THE REMOVAL AND RESETTING OF POST INSTALLED ANCHORS IS PROHIBITED (ACI 318−19 17.3.1).
4. PROVIDE SPECIAL INSPECTION FOR ALL MECHANICAL AND ADHESIVE ANCHORS PER THE APPLICABLE BUILDING CODE AND PER THE CURRENT ICC−ES REPORT (IBC 2012, 2015, 2018 TABLE 1705.3 TYPE 4, NOTE B).

STRUCTURAL FILL:

ALL FILL PLACED TO SUPPORT SLABS ON GRADE, BEHIND PERMANENT WALLS, AND AROUND ALL DRAINS SHALL CONSIST OF WELL GRADED, GRANULAR MATERIAL PER THE SPECIFICATIONS. SOILS FOR STRUCTURAL FILL SHALL BE APPROVED BY THE GEOTECHNICAL ENGINEER. STRUCTURAL FILL SHALL BE PLACED ON SOUND NATIVE MATERIAL. PROOF−ROLL CUT AREAS WHICH PROVIDE SUPPORT FOR PERMANENT STRUCTURES. AREAS WHICH ARE EXCESSIVELY YIELDING, AS DETERMINED BY THE CONTINUOUS OBSERVATION OF THE GEOTECHNICAL ENGINEER, SHALL BE OVEREXCAVATED AND REPLACED WITH STRUCTURAL FILL. STRUCTURAL FILL SHALL BE PLACED PER THE SPECIFICATION. USE LEAN CONCRETE FILL BELOW ALL PIPES EXISTING OUT OF BASEMENT WALL, FULL HEIGHT OF WALL. CONCRETE SHALL CONTAIN 2 SACKS OF CEMENT PER YARD.

LATERAL PRESSURE ON SUBGRADE WALLS:

THE DESIGN PRESSURES FOR SUBGRADE WALLS ARE BASED ON A "DRAINED" CONDITION. SEE CIVIL AND MECHANICAL DRAWINGS FOR SUBGRADE DRAINAGE SYSTEM. SEE GEOTECHNICAL REPORT FOR COMPACTION REQUIREMENTS AT SUBGRADE WALLS. SUBGRADE WALLS AND SUPPORTING SLABS SHALL HAVE ATTAINED THEIR FULL CONCRETE STRENGTH BEFORE PLACING ANY BACKFILL U.N.O. THE CONTRACTOR SHALL PROVIDE TEMPORARY BRACES FOR WALLS IF BACKFILL IS PLACED BEFORE WALLS AND SLABS ACHIEVE FULL CONCRETE STRENGTH.

NOTES ON CRACKING OF CONCRETE STRUCTURES:

CRACKING IS INHERENT TO THE MATERIAL PROPERTIES OF CONCRETE CONSTRUCTION (INCLUDING POST−TENSIONED CONCRETE STRUCTURES). WHILE EVERY EFFORT HAS BEEN MADE TO MINIMIZE THE EFFECTS OF UNSIGHTLY CRACKING, THE PRESENCE OF CRACKS ARE NORMAL AND UNAVOIDABLE. THE DESIGN OF THE CONCRETE STRUCTURAL ITEMS HAVE BEEN ANALYZED USING A "CRACKING SECTION." THE PRESENCE OF THE CRACKING SHOULD NOT BE CONSIDERED DETRIMENTAL TO THE STRUCTURE. CRACKS LARGER THAN 10 MILS SHALL BE FILLED AND SEALED WITH AN APPROVED CRACK FILLER TO PREVENT FUTURE DETERIORATION. ALLOWANCE SHALL BE MADE IN THE CONSTRUCTION BUDGET FOR SEALING OF SUCH CRACKS. IN SOME CASE, CRACKS DO NOT APPEAR UNTIL WELL AFTER CONSTRUCTION HAS BEEN COMPLETED. IT IS THE RESPONSIBILITY OF THE OWNER TO MAINTAIN THE STRUCTURE PROPERLY OVER THE LIFE OF THE STRUCTURE. CONCRETE CRACKS, SHOULD THEY OCCUR, SHALL BE FILLED AND SEALED TO PREVENT PREMATURE DETERIORATION OF THE STRUCTURE.

Email: cadd@pkastructural.com
Website: www.pkastructural.com

SHOP DRAWINGS:

SHOP DRAWINGS SHALL BE SUBMITTED FOR ALL STRUCTURAL ITEMS IN ADDITION TO ITEMS REQUIRED BY ARCHITECTURAL SPECIFICATIONS.

THE CONTRACTOR SHALL REVIEW ALL SHOP DRAWINGS PRIOR TO SUBMITTAL. ITEMS NOT IN ACCORDANCE WITH CONTRACT DOCUMENTS SHALL BE FLAGGED UPON HIS REVIEW.

VERIFY ALL DIMENSIONS WITH ARCHITECTURAL DRAWINGS AND ALL FINISHED GRADE WITH CIVIL DRAWINGS.

ANY CHANGES, SUBSTITUTIONS, OR DEVIATIONS FROM CONTRACT DOCUMENTS SHALL BE CLOUDED BY MANUFACTURER OR FABRICATOR. ANY OF THE AFOREMENTIONED WHICH ARE NOT CLOUDED OR FLAGGED BY SUBMITTING PARTIES, SHALL NOT BE CONSIDERED APPROVED AFTER ENGINEER'S REVIEW, UNLESS NOTED ACCORDINGLY.

THE ENGINEER HAS THE RIGHT TO APPROVE OR DISAPPROVE ANY CHANGES TO CONTRACT DOCUMENTS AT ANYTIME BEFORE OR AFTER SHOP DRAWING REVIEW.

THE SHOP DRAWINGS DO NOT REPLACE THE CONTRACT DOCUMENTS. ITEMS OMITTED OR SHOWN INCORRECTLY AND ARE NOT FLAGGED BY THE STRUCTURAL ENGINEER OR ARCHITECT ARE NOT TO BE CONSIDERED CHANGES TO CONTRACT DOCUMENTS. IT IS THE CONTRACTOR'S RESPONSIBILITY TO MAKE SURE ITEMS ARE CONSTRUCTED PER THE CONTRACT DOCUMENTS.

THE ADEQUACY OF ENGINEERING DESIGNS AND LAYOUT PERFORMED BY OTHERS RESTS WITH THE DESIGNING OR SUBMITTING AUTHORITY.

REVIEWING IS INTENDED ONLY AS AN AID TO THE CONTRACTOR IN OBTAINING CORRECT SHOP DRAWINGS. RESPONSIBILITY FOR CORRECTNESS SHALL REST WITH THE CONTRACTOR.

GENERAL:

ENTIRE CONTRACT DOCUMENTS SHALL BE USED TO CONSTRUCT BUILDING. SOME CRITICAL ITEMS REQUIRED BY OTHER DISCIPLINES MAY NOT BE SHOWN ON STRUCTURAL DRAWING (I.E. WALL, FLOOR AND ROOF OPENINGS, ARCHITECTURAL, MECHANICAL AND PLUMBING LOADS, SUPPORT PLATES ETC.)

ITEMS SHOWN BY OTHER DISCIPLINES WITH REFERENCE TO STRUCTURAL DRAWING BUT NOT SHOWN ON THESE STRUCTURAL DOCUMENTS SHALL BE CONSIDERED DESIGN BUILD ITEMS. CONTRACTOR SHALL SUBMIT DESIGN BY OTHERS FOR REVIEW.

THE STRUCTURAL CONSTRUCTION DOCUMENTS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE STRUCTURE DURING CONSTRUCTION. SUCH MEASURES SHALL INCLUDE, BUT NOT BE LIMITED TO, BRACING, SHORING FOR LOADS DUE TO CONSTRUCTION EQUIPMENT, ETC. THE STRUCTURAL ENGINEER SHALL NOT BE RESPONSIBLE FOR THE CONTRACTOR'S MEANS, METHODS, TECHNIQUES, SEQUENCES FOR PROCEDURE OF CONSTRUCTION, OR THE SAFETY PRECAUTIONS AND THE PROGRAMS INCIDENT THERETO (NOR SHALL OBSERVATION VISITS TO THE SITE INCLUDE INSPECTION OF THESE ITEMS).

CONSTRUCTION MATERIALS SHALL BE SPREAD OUT IF PLACED ON FRAMED CONSTRUCTION. LOAD SHALL NOT EXCEED THE DESIGN LIVE LOAD PER SQUARE FOOT.

WHERE REFERENCE IS MADE TO VARIOUS TEST STANDARDS FOR MATERIALS, SUCH STANDARDS SHALL BE THE LATEST EDITION AND/OR ADDENDA.

ESTABLISH AND VERIFY ALL OPENINGS AND INSERTS FOR ARCHITECTURAL, MECHANICAL, PLUMBING AND ELECTRICAL WITH APPROPRIATE TRADES, DRAWINGS AND SUBCONTRACTORS PRIOR TO CONSTRUCTION.

OPTIONS ARE FOR CONTRACTOR'S CONVENIENCE. IF THE CONTRACTOR CHOOSES AN OPTION, THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL NECESSARY CHANGES AND SHALL COORDINATE ALL DETAILS.

NOTES AND DETAILS ON DRAWINGS SHALL TAKE PRECEDENCE OVER GENERAL STRUCTURAL NOTES AND TYPICAL DETAILS. WHERE NO DETAILS ARE SHOWN, CONSTRUCTION SHALL CONFORM TO SIMILAR WORK ON THE PROJECT.

ALL DIMENSIONS SHOWN (INCLUDING ELEVATIONS) ON STRUCTURAL DRAWINGS ARE TO ASSIST CONTRACTOR IN VERIFICATION. SCALING DIMENSIONS FROM DRAWINGS IS NOT PERMITTED. LOCATION OF ALL ITEMS SHALL BE DETERMINED BY DIMENSIONS OR NOTES ONLY; DO NOT USE GRAPHIC APPEARANCE TO ASSUME SPECIFIC LOCATIONS.

CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFICATION OF ALL DIMENSIONS WITH ARCHITECTURAL AND FINISHED GRADE WITH CIVIL DRAWINGS PRIOR TO START OF CONSTRUCTION. RESOLVE ANY DISCREPANCY WITH THE ARCHITECT.

TYPICAL DETAILS MAY NOT NECESSARILY BE CUT ON PLANS, BUT APPLY UNLESS NOTED OTHERWISE.

WHERE DISCREPANCIES OCCUR BETWEEN PLANS, DETAILS, GENERAL STRUCTURAL NOTES AND SPECIFICATIONS, THE GREATER REQUIREMENTS SHALL GOVERN.

ANY ENGINEERING DESIGN, PROVIDED BY OTHERS AND SUBMITTED FOR REVIEW, SHALL BEAR THE SEAL OF AN ENGINEER REGISTERED IN THE STATE OF JURISDICTION.

SUPPLIER OF ENGINEERED STRUCTURAL COMPONENTS (I.E. STEEL JOISTS, STAIRS, PRECAST ITEMS) SHALL BE RESPONSIBLE FOR COMPLETE DESIGN AND SHALL USE ENTIRE CONTRACT DOCUMENTS TO INCLUDE ALL LOADS AND DETAIL REQUIREMENTS FROM ALL DISCIPLINES. SUPPLIER SHALL PROVIDE ADDITIONAL MATERIAL REQUIRED TO MEET ALL THEIR REQUIREMENTS FOR INSTALLATION (I.E. WIDER BEARING PLATES, SHIMS, ERECTION BOLTS ETC.).

STRUCTURAL STEEL SUPPLIER SHALL FURNISH BOLTS FOR OSHA CONNECTIONS (SEE DRAWINGS FOR DETAILS).

WALL SHORING SHALL BE INSTALLED PRIOR TO BACKFILLING BEHIND ALL BUILDING RETAINING WALLS, UNLESS ALL RESTRAINING SLABS ARE INSTALLED. USE HANDTAPPING ONLY WHEN WITHIN 8'-0", OR WITHIN HALF THE WALL HEIGHT OF BACKFILLED WALL.

CONTINUOUS FOUNDATION DRAIN PIPES (FRENCH DRAINS) OR WEEP HOLES SHALL BE PROVIDED BEHIND ALL BASEMENT WALLS AND ALL EXTERIOR RETAINING WALLS THAT RETAIN MORE THAN 3'-0" OF SOIL. WEEP HOLES WHERE USED SHALL BE 2" IN DIAMETER AT 6'-0" O.C. MAXIMUM.

BUILDING TOLERANCES:

STANDARD TOLERANCES SHALL BE BASED ON THE REQUIREMENTS OF THE AISC CODE OF STANDARD PRACTICE AND ACI 117, STANDARD SPECIFICATIONS FOR TOLERANCES FOR CONCRETE CONSTRUCTION AND MATERIALS.

SEQUENCING CONSTRUCTION AND LATERAL STABILITY:

THE STRUCTURAL COMPONENTS BY THEMSELVES ARE A NON-SELF-SUPPORTING STRUCTURE. LATERAL FORCES DUE TO WIND, EARTHQUAKE, OR SOIL ARE CARRIED BY THE ROOF AND FLOOR DIAPHRAGMS TO THE LATERAL SYSTEM. CERTAIN ELEMENTS SHOWN ON OR LOCAL STABILITY OF OTHER ELEMENTS (SUCH AS BEAMS, COLUMNS, AND WALLS). IF, DUE TO SEQUENCING OF CONSTRUCTION, THESE STABILITY ELEMENTS ARE NOT IN PLACE, THE CONTRACTOR SHALL RETAIN A LICENSED STRUCTURAL ENGINEER WHO SHALL INVESTIGATE WHERE TEMPORARY SHORING/BRACING IS REQUIRED, AND SHALL DESIGN THIS TEMPORARY SHORING/BRACING. THE CONTRACTOR SHALL PROVIDE THIS SHORING/BRACING UNTIL THE REQUIRED STRUCTURAL ELEMENTS AND THEIR CONNECTIONS HAVE BEEN INSTALLED AND REACH THEIR FINAL DESIGN STRENGTHS.

MISCELLANEOUS:

REFER TO ARCHITECTURAL, MECHANICAL, ELECTRICAL, CIVIL, ELEVATOR, OR OTHER SPECIALTY ENGINEERING DRAWINGS FOR DIMENSIONS NOT SHOWN, INCLUDING BUT NOT LIMITED TO: SIZE AND LOCATION OF CURBS, EQUIPMENT HOUSEKEEPING PADS, WALL AND FLOOR OPENINGS, BLOCKOUTS, FLOOR DEPRESSIONS, SUMPS, DRAINS, ANCHOR BOLTS, EMBEDDED ITEMS, ARCHITECTURAL TREATMENT, ETC. CONTRACTOR SHALL VERIFY DIMENSIONS AND RESOLVE DISCREPANCIES OR CONFLICTS PRIOR TO CONSTRUCTION. WHERE SECTIONS ARE INDICATED ON THE PLAN BY A NUMBER AND A DRAWNG NUMBER THUS, 1/S5.01, THE INDICATED SECTION (1) IS SHOWN ON STRUCTURAL DRAWING S5.01.

ALL WINDOW SYSTEMS SHALL BE DESIGNED TO ACCOMMODATE VERTICAL DEFLECTION OF THE STRUCTURE OF 1/2" MINIMUM LIVE LOAD DEFLECTION, UNLESS GREATER VALUE IS NOTED ON PLANS OR DETAILS.

FLOOR FLATNESS/LEVELNESS SHALL MEET ARCHITECTURAL SPECIFICATIONS (1/4" IN 10 FOOT MINIMUM LEVELNESS UNLESS TIGHTER REQUIREMENT IN SPECIFICATIONS) IN HEIGHT FOR ALL STRUCTURAL SYSTEMS. CONTRACTOR SHALL INCLUDE COST FOR LEVELING ALL FLOORS. FOR ESTIMATING PURPOSES ONLY, ASSUME 1/2" THICK LEVELING AGENT OVER 15% OF FLOOR AREA.

FABRICATOR APPROVAL:

SPECIAL INSPECTIONS NOTED ABOVE APPLY TO SHOP FABRICATED ASSEMBLIES IN ADDITION TO ON-SITE WORK UNLESS THE FABRICATOR IS AN "APPROVED FABRICATOR" AS DEFINED IN 2022 CBC.

STRUCTURAL OBSERVATION:

ENGINEER OF RECORD SHALL PROVIDE VISUAL OBSERVATION OF THE STRUCTURAL SYSTEM, FOR GENERAL CONFORMANCE TO THE APPROVED PLANS AND SPECIFICATIONS, AT SIGNIFICANT CONSTRUCTION STAGES AND AT THE COMPLETION OF THE STRUCTURAL SYSTEM. CONTRACTOR IS REQUIRED FOR COORDINATING THE TIMING OF SITE VISITS AND SHALL INCLUDE A MINIMUM OF 3 VISITS. THESE VISITS ARE TO BE PAID BY THE CONTRACTOR. STRUCTURAL OBSERVATION DOES NOT INCLUDE OR WAIVE THE RESPONSIBILITY FOR THE INSPECTIONS REQUIRED BY THE BUILDING CODE (NOTED ABOVE).

INSTRUCTIONS TO BIDDERS CONTINGENCIES:

1. UNDER NO CIRCUMSTANCES SHALL THESE DRAWINGS BE "FINAL BID" UNTIL THE PROJECT IS FULLY PERMITTED.
2. ALL PRELIMINARY PRICING EFFORTS SHALL BE CONSIDERED TO BE ESTIMATES ONLY AND SHALL INCLUDE THE NECESSARY CONTINGENCIES, ALLOWANCES, ALTERNATES, ETC. AS APPROPRIATE TO ACCOUNT FOR MODIFICATIONS AND ADDITIONS THAT WILL OCCUR TO THE DRAWINGS DURING THE FINALIZATION OF THE DESIGN AND PERMITTING.
3. THE OWNER OR CONTRACTOR SHALL UTILIZE THE FOLLOWING MINIMUM CONTINGENCIES FOR EACH OF THE STRUCTURAL ELEMENT COSTS TO BE USED AT THE SOLE DISCRETION OF THE STRUCTURAL ENGINEER:

CONSTRUCTION DOCUMENTS/FINAL BID 3% MINIMUM

ALL OF THE "FINAL BID" CONTINGENCIES NOT USED BY THE STRUCTURAL ENGINEER SHALL BE REFUNDED TO THE OWNER PRIOR TO THE CLOSEOUT OF THE PROJECT.
4. ANY MODIFICATIONS, DELETIONS OR ELIMINATIONS TO THE STRUCTURAL BIDDING AND CONTINGENCY REQUIREMENTS, WITHOUT THE CONSENT OF THE STRUCTURAL ENGINEER, SHALL AUTOMATICALLY INDEMNIFY THE STRUCTURAL ENGINEER OF ANY COSTS THAT MAY ARISE DURING THE DESIGN AND CONSTRUCTION OF THE PROJECT.
5. WHERE DISCREPANCIES OCCUR WITHIN THE DRAWINGS THE CONTRACTOR WILL EITHER RESOLVE THE DISCREPANCIES WITH THE ARCHITECT BEFORE BIDDING OR INCLUDE THE GREATER COST ITEM IN THE BID AND RESOLVE THE DISCREPANCY PRIOR TO CONSTRUCTION.

NOTE TO CONTRACTOR REGARDING PRICING/BIDDING OF CITY SUBMITTAL DRAWINGS:

THESE DRAWINGS HAVE BEEN PREPARED FOR CITY SUBMITTAL, AND ARE NOT TO BE CONSIDERED 100% CONSTRUCTION DOCUMENTS UNTIL CITY PLAN REVIEW HAS BEEN COMPLETED AND FINAL BUILDING PERMIT HAS BEEN ISSUED. IF THESE DOCUMENTS ARE TO BE USED FOR PRICING, BID, OR STEEL MILL ORDER, THE CONTRACTOR SHALL PROVIDE IN THE PROJECT BUDGET AN ALLOWANCE FOR POTENTIAL CHANGES BETWEEN THE CITY SUBMITTAL DRAWINGS AND THE FINAL APPROVED SUBMITTAL AND CONSTRUCTION DOCUMENTS. ADDITIONALLY, MISCELLANEOUS ITEMS MAY NOT BE SHOWN ON THESE DRAWINGS. THESE ITEMS INCLUDE, BUT ARE NOT LIMITED TO, ELEVATOR AND EQUIPMENT SUPPORTS, BLOCKOUTS, ETC. REFER TO ARCHITECTURAL, MECHANICAL, ELECTRICAL, AND OTHER SPECIALTY DRAWINGS FOR ADDITIONAL INFORMATION. THE CONSTRUCTION BUDGET SHALL INCLUDE THESE ITEMS. THE STRUCTURAL ENGINEER WILL NOT BE RESPONSIBLE FOR CHANGE ORDER COSTS INCURRED (INCLUDING DISCARDED MATERIAL COSTS) DUE TO BIDDING OR STEEL MILL ORDER FROM THESE DRAWINGS. CONTACT STRUCTURAL ENGINEER FOR CLARIFICATION IF THE SCOPE AND QUANTITY OF ALLOWANCE TO BE CARRIED IS NOT CLEAR.

CONTRACTOR RESPONSIBILITY:

EACH CONTRACTOR OR SUB-CONTRACTOR RESPONSIBLE FOR THE CONSTRUCTION OF THE WIND AND/OR SEISMIC RESISTING SYSTEM THAT IS LISTED IN THE STATEMENT OF SPECIAL INSPECTIONS SHALL SUBMIT A WRITTEN STATEMENT OF RESPONSIBILITY TO THE BUILDING OFFICIAL AND THE OWNER PRIOR TO THE COMMENCEMENT OF WORK REQUIRING SPECIAL INSPECTION. THE CONTRACTOR'S STATEMENT OF RESPONSIBILITY SHALL CONTAIN ACKNOWLEDGMENT OF AWARENESS OF THE SPECIAL REQUIREMENTS CONTAINED IN THE STATEMENT OF SPECIAL INSPECTIONS.

DEFERRED SUBMITTALS: (PER 2012 IBC 107.3.4.1)

FOR THE PURPOSES OF THIS SECTION, DEFERRED SUBMITTALS ARE DEFINED AS THOSE PORTIONS OF THE DESIGN WHICH ARE NOT SUBMITTED AT THE TIME OF THE APPLICATION AND THAT ARE TO BE SUBMITTED TO THE BUILDING OFFICIAL WITHIN A SPECIFIED PERIOD.

DOCUMENTS FOR DEFERRED SUBMITTAL ITEMS SHALL BE SUBMITTED TO THE PROFESSIONAL IN RESPONSIBLE CHARGE FOR REVIEW. THE CONTRACTOR SHALL FORWARD THE REVIEWED DOCUMENTS TO BUILDING OFFICAL WITH A NOTATION INDICATING THAT THE DEFERRED SUBMITTAL DOCUMENTS HAVE BEEN REVIEWED AND BEEN FOUND TO BE IN GENERAL CONFORMANCE TO THE DESIGN OF THE BUILDING. THE DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THE DESIGN AND SUBMITTAL DOCUMENTS HAVE BEEN APPROVED BY THE BUILDING OFFICIAL.

DEFERRED SUBMITTAL ITEMS:

ALUMINUM WALKWAY
GRATING
HANDRAILS/STAIRS
SHORING EXCAVATIONS
EQUIPMENT ATTACHMENTS, INCLUDING ADD'L FRAMING REQ'D

SPECIAL INSPECTION:

PER IBC CHAPTER 17, SPECIAL INSPECTION IS REQUIRED FOR THE FOLLOWING ITEMS:

CONCRETE: VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD (NOTE 1)	IBC REFERENCE
1. Inspection of reinforcing steel, including prestressing tendons, and placement.	–	X	ACI 318: Ch. 20, 25.2 25.3, 26.6.1–26.6.3	1908.4
2. Reinforcing bar welding: a. Verify weldability of reinforcing bars other than ASTM A706; b. Inspect single-pass fillet welds, maximum 5/16"; and c. Inspect all other welds.	– – X	X X –	AWS D1.4 ACI 318: 26.6.4	---
3. Inspect anchors to be installed in concrete prior to and during placement of concrete where allowable loads have been increased or where strength design is used.	–	X	ACI 318: 17.8.2	---
4. Inspection of anchors post-installed in hardened concrete members. a. Adhesive anchors installed in horizontally or upwardly inclined orientations to resist sustained tension loads. b. Mechanical anchors and adhesive anchors not defined in 4.a.	X –	– X	ACI 318: 17.8.2.4 ACI 318: 17.8.2	---
5. Verifying use of required design mix.	–	X	ACI318: Ch. 19, 26.4.3, 26.4.4	1904.1, 1904.2 1908.2, 1908.3
6. Prior to concrete placement, fabricate specimens for strength tests, per form slump and air content tests, and determine the temperature of the concrete.	X	–	ASTM C172 ASTM C31 ACI 318: 26.4, 26.12	1908.10
7. Inspection of concrete and shotcrete placement for proper application techniques.	X	–	ACI 318: 26.5	1908.6, 1908.7, 1908.8
8. Verify maintenance of specified curing temperature and techniques.	–	X	ACI 318: 26.5.3–26.5.5	1908.9
9. Inspect prestressed concrete for: a. Application of prestressing forces; and b. Grouting of bonded prestressing tendons	X X	– –	ACI 318: 26.10	--- ---
10. Inspect erection of precast concrete members.	–	X	ACI 318: Ch. 26.8	---
11. Verification of in-situ concrete strength, prior to stressing of tendons in post-tensioned concrete and prior to removal of shores and forms from beams and structural slab.	–	X	ACI 318: 26.11.2	---
12. Inspect formwork for shape, location and dimensions of the concrete member being formed.	–	X	ACI 318: 26.11.1.2(b)	---

NOTES:
1. WHERE APPLICABLE, SEE ALSO SECTION 1707.1, SPECIAL INSPECTION FOR SEISMIC RESISTANCE.
2. TABLES TAKEN DIRECTLY FROM IBC FOR REFERENCE.

MASONRY INSPECTION TASK	FREQUENCY (a) LEVEL 3	REFERENCE FOR CRITERIA: TMS 402	REFERENCE FOR CRITERIA: TMS 602	IBC REFERENCE
1. As masonry construction begins, verify that the following are in compliance: a. Proportions of site-prepared mortar. b. Grade, type and size of reinforcement connectors and anchor bolts. c. Sample panel construction.	P P C		ART. 2.1, 2.6A, & 2.6C ART. 3.4 ART. 1.6D	
2. Prior to grouting, verify that the following are in compliance: a. Grout space. b. Placement of reinforcement, connectors, & anchor bolts. c. Proportions of site-prepared grout.	C C P	SEC. 6.1, 6.3.1, 6.3.6, & 6.3.7	ART. 3.2D & 3.2F ART. 3.2E & 3.4 ART. 2.6B & 2.4 G.1.b	
3. Verify compliance of the following during construction: a. Materials and procedures with the approved submittals. b. Placement of masonry units and mortar joint construction. c. Size and location of structural members. d. Type, size, and location of anchors, including other details of anchorage of masonry to structural members, frames, or other construction. e. Welding of reinforcement. f. Preparation, construction, and protection of masonry during cold weather (temperature below 40°F (4.4°C) or hot weather (temperature above 90°F (32.2°C). g. Placement of grout is in compliance.	P P P C C P C	SEC. 1.2.1(e), 6.2.1, & 6.3.1 SEC. 6.1.6.1.2	ART. 1.5 ART. 3.3B ART. 3.3F ART. 1.8C & 1.8D ART. 3.5	1705.04, 2104 & 2105
4. Observe preparation of grout specimens, mortar specimens, and/or prisms.	C		ART. 1.4 B.2.a.3, 1.4 B.2.b.3, 1.4 B.2.c.3, 1.4 b.3, & 1.4 B.4	

NOTES:
(a) Frequency refers to the frequency of inspection, which may be continuous during the listed task or periodically during the listed task, as defined in the table.
NR=Not Required, P=Periodic, C=Continuous
(b) Required for the first 5000 sq. ft. (465 sq. m.) of AAC masonry.
(c) Required after the first 5000 sq. ft. (465 sq. m.) of AAC masonry.

STEEL: VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD (NOTE1)	IBC REFERENCE
1. Material verification of high-strength bolts, nuts and washers: a. Identification markings to conform to ASTM standards specified in the approved construction documents. b. Manufacturer's certificate of compliance required.	– –	X X	APPLICABLE ASTM MATERIAL SPECS AISC 360, SEC. A3.3	
2. Inspection of high-strength bolting: a. Bearing-type connections. AISC 360, Section M2.5 1704.3.3	–	X		
3. Material verification of structural steel: a. Identification markings to conform to ASTM standards specified in the approved construction documents. b. Manufacturers' certified mill test reports.	–	–	AISC 360, SEC. M2.5 ASTM A 6 OR ASTM A 568	
4. Material verification of weld filler materials: a. Identification markings to conform to AWS specification in the approved construction documents. b. Manufacturer's certificate of compliance required.	– –	– –	AISC 360, SEC. A3.5	
5. Inspection of welding: a. Structural steel: 1) Complete and partial penetration groove welds. 2) Multipass fillet welds. 3) Single-pass fillet welds > 5/16" 4) Single-pass fillet welds = 5/16" 5) Floor and roof deck welds. b. Reinforcing steel: 1) Verification of weld ability of reinforcing steel other than ASTM A 706. 2) Reinforcing steel-resisting flexural and Axial forces in intermediate and special Moment frames, and boundary elements of Special reinforced concrete shear walls and shear reinforcement. 3) Shear reinforcement. 4) Other reinforcing steel.	– X X – – – – X X –	– – – X X – – X – X	AWS D1.1 AWS D1.1 AWS D1.1 AWS D1.1 AWS D1.3 AWS D1.4 ACI 318: 3.5.2	
6. Inspection of steel frame joint details for compliance with approved construction documents: a. Details such as bracing and stiffening. b. Member locations. c. Application of joint details at each connection.	– – – –	X – – –		

NOTES:
1. WHERE APPLICABLE SEE ALSO SECTION 1701.1, SPECIAL INSPECTION FOR SEISMIC RESISTANCE.
2. TABLES TAKEN DIRECTLY FROM IBC FOR REFERENCE.

STEEL: CONSTRUCTION OTHER THAN STRUCTURAL STEEL: VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD (NOTE1)	IBC REFERENCE
1. Material verification of cold-formed steel deck: a. Identification markings to conform to ASTM standards specified in the approved construction documents. b. Manufacturer's certified test reports.	– –	X	APPLICABLE ASTM MATERIAL STANDARDS	
2. Inspection of welding: a. Cold formed steel deck: 1) Floor and roof deck welds. b. Reinforcing steel: 1) Verification of weldability of reinforcing steel other than ASTM A 706. 2) Reinforcing steel resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special structural walls of concrete and shear reinforcement. 3) Shear reinforcement. 4) Other reinforcing steel.	– – X – X	X X – X –	AWS D1.3 ACI 318: 3.5.2 AWS D1.4	
SOILS: 1. Verify materials below shallow foundations are adequate to achieve the design bearing apacity. 2. Verify excavations are extended to proper depth and have reached proper material. 3. Perform classification and testing of compacted fill materials. 4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of compacted fill. 5. Prior to placement of compacted fill, inspect subgrade and verify that site has been properly prepared. Not the responsibility of the structural engineer. Special inspection certificate to be completed by geotechnical engineer.	– – – X –	X X X – X		
EXPANSION, SCREW, AND EPOXY BOLTS: 1. During placement of all expansion, screw, & epoxy bolts, for visual verification of hole diameter and depth and placement of bolt and/or epoxy.	–	X		

DUTIES AND RESPONSIBILITIES OF THE SPECIAL INSPECTOR:

A) THE SPECIAL INSPECTOR SHALL OBSERVE THE WORK ASSIGNED TO BE CERTAIN IT CONFORMS WITH THE APPROVED DESIGN DRAWINGS AND SPECIFICATION.

B) THE SPECIAL INSPECTOR SHALL FURNISH INSPECTION REPORTS TO THE BUILDING OFFICIAL, AND TO THE ENGINEER.

C) UPON COMPLETION OF THE ASSIGNED WORK THE ENGINEER OR ARCHITECT SHALL COMPLETE AND SIGN THE APPROPRIATE FORMS CERTIFYING THAT TO THE BEST OF HIS KNOWLEDGE THE WORK IS IN CONFORMANCE WITH THE APPROVED PLANS AND SPECIFICATIONS AND THE APPLICABLE WORKMANSHIP PROVISIONS OF THE CODE.

NOTES:
1. CONT. 16 GAGE "UNPUNCHED" STEEL TRACK. FOR ATTACHMENT SEE DETAIL 40.
2. STEEL STUD WALL.
3. USE 1/2"ø PUDDLE WELD AT 16" O.C. WHERE TRACK IS INSTALLED ON STEEL DECK (ROOF CONDITIONS).
4. STEEL CLIP ANGLE 4"x4"x12 GA. x 4" LONG AT EACH STUD.
5. PROVIDE 1" VERT. SLOTTED HOLE WHERE STUDS ARE FULL FLOOR HEIGHT.
6. HILTI SHOT PIN TO BOTTOM OF CONCRETE SLAB.
7. STEEL MEMBER (BENT PLATE AND BEAM FLANGE SHOWN OR CONTINUOUS EDGE ANGLE AT CONCRETE SLAB).
8. ALTERNATE TO WELD AT STUD TO CLIP ANGLE CONNECTION – 4 – #10 x 3/4" LONG SELF– TAPPING TEK SCREWS.
9. DEFLECTION TRACK TO ALLOW VERTICAL MOVEMENT – USE (2)– 16 GA. TRACKS BOTTOM TRACKS TO HAVE 2" LEGS. (ALLOW 3/4" DEFLECTION).
10. #10 x 3/4" LONG SELF–TAPPING SCREW EACH SIDE.

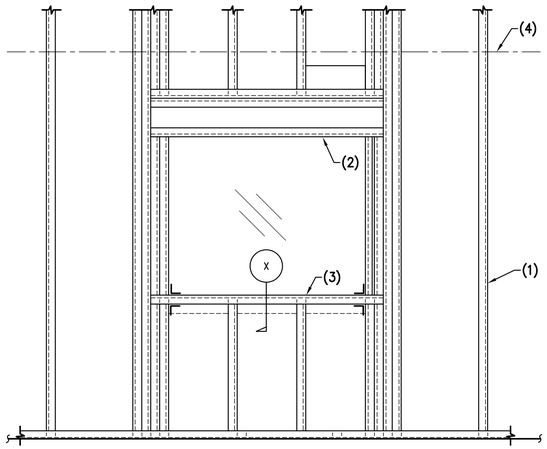
COLD FORMED STRUCTURAL STEEL FRAMING:

ALL COLD–FORMED STEEL FRAMING SHALL BE DESIGNED, FABRICATED AND ERECTED IN ACCORDANCE WITH MANUFACTURER'S RECOMMENDATIONS AND IN ACCORDANCE WITH THE LATEST EDITION OF "SPECIFICATIONS FOR THE DESIGN OF COLD–FORMED STEEL STRUCTURAL MEMBERS" BY THE AMERICAN IRON AND STEEL INSTITUTE.

STEEL FOR 14 AND 16 GAGE STUDS AND JOISTS, AND FOR ALL DIAGONAL TENSION STRAPS SHALL HAVE A MINIMUM YIELD STRENGTH OF 50 KSI. STEEL FOR ALL 18 AND 20 GAGE STUDS AND JOISTS, AND FOR ALL GAGES OF TRACK, ACCESSORIES AND BRIDGING SHALL HAVE A MINIMUM YIELD STRENGTH OF 33 KSI. STEEL SHALL BE GALVANIZED AT LOCATIONS EXPOSED TO WEATHER AND WHEREVER NOTED.

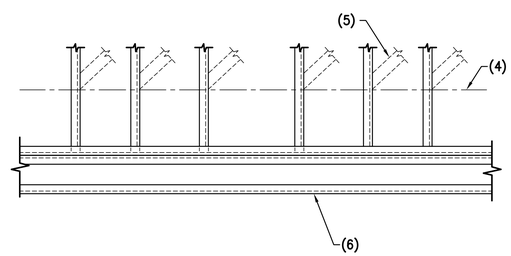
ALL STUD FRAMING (BOTH INTERIOR AND EXTERIOR) SHALL BE DESIGNED AND CONSTRUCTED TO ACCOMMODATE VERTICAL DEFLECTION OF THE STRUCTURE OF UP TO 1/2" LIVE LOAD DEFLECTION, UNLESS GREATER VALUE IS NOTED ON PLANS OR DETAILS. UTILIZE SLIP TRACK OR OTHER SIMILAR MEANS.

ALL STUDS SHALL BE SECURELY SEATED FOR FULL END BEARING ON TOP AND BOTTOM TRACK. UNLESS NOTED OTHERWISE, PROVIDE DOUBLE STUDS AT ALL JAMBS, CORNERS, INTERSECTIONS, BEAM BEARINGS AND JOIST BEARINGS. BRIDGING SHALL BE INSTALLED PER MANUFACTURER'S RECOMMENDATION WITH THE FOLLOWING MINIMUM REQUIREMENTS.

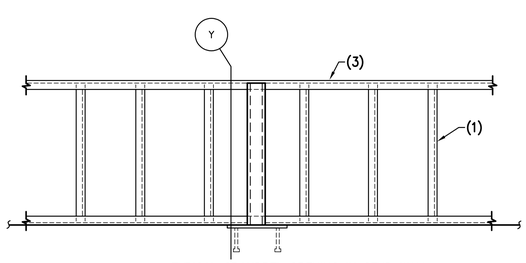


FOR WALLS WITH NO AXIAL LOAD, PROVIDE BRIDGING AT MID–HEIGHT FOR WALLS LESS THAN OR EQUAL TO 10'–0" HIGH, AND 5'–0" O.C. MAXIMUM FOR WALLS GREATER THAN 10'–0" HIGH. FOR AXIAL LOAD BEARING WALLS, PROVIDE BRIDGING EQUALLY SPACED AT 4'–0" MAXIMUM. IN ADDITION, BRIDGING SHALL BE PROVIDED AT ROOF LINES AND ELSEWHERE AS NOTED ON THE DRAWINGS. SOLID BLOCKING SHALL BE INSTALLED IN LIEU OF BRIDGING WHERE NOTED ON THE DRAWINGS.

STEEL STUD DETAILS AND GAGES DEPICATED ON STRUCTURAL DRAWINGS SHOW GENERAL STRUCTURAL REQUIREMENTS AND ARE FOR SCHEMATICS PURPOSE ONLY. THE CONTRACTOR SHALL BE REQUIRED TO SUBMIT SHOP DRAWINGS WITH DESIGN CALCULATIONS SEALED BY A REGISTERED ENGINEER FOR ALL STEEL STUD FRAMING AND ANY ADDITIONAL FRAMING MATERIALS REQUIRED FOR COMPLETE DESIGN SHALL BE INCORPORATED. CALCULATIONS SHALL INCLUDE DERIVATION OF WND LOADS PER SPECIFIED BUILDING CODE.



ALL WELDING SHALL BE PERFORMED BY WELDERS EXPERIENCED IN LIGHT GAGE STRUCTURAL STEEL FRAMING WORK. DO NOT NOTCH FLANGES OF JOISTS OR STUDS. DOUBLE UP FLOOR JOISTS AND BLOCKING UNDER PARTITIONS. PROVIDE BLOCKING AT SUPPORTS OF ALL JOISTS. DOUBLE UP STUDS AT JAMBS AND AS REQUIRED UNDER BEAMS IN BEARING WALLS.



TYPICAL STUDS SHALL BE DESIGNED FOR L/360 EXCEPT STUDS SUPPORTING VENEER SHALL BE DESIGN FOR MAXIMUM DEFLECTION OF L/600.

STEEL STUD SUPPLIER SHALL DESIGN AND SUPPLY STRUCTURAL STEEL AS REQUIRED FOR COMPLETE CONSTRUCTION OF VERTICAL WALL AWNINGS, SOFFITS, WING PLATES, FASCIA EXTENSIONS, ETC. ANY "RED METAL" OF FABRICATED STRUCTURAL STEEL REQUIRED TO COMPLETE WALL SYSTEMS SHALL BE DESIGNED AND INSTALLED BY STEEL STUD SUPPLIER.

ARCH. PLAN
SCALE: 1/2" = 1'-0"

NORTH

GENERAL NOTES

1. ALL INTERIOR WALLS, EXTERIOR WALLS, AND CEILINGS SHALL BE INSULATED PER SPECIFICATION SECTION 07 2100 OF THE CONTRACT DOCUMENTS.

DOOR & WINDOW NOTES:

1. ALL EXITS SHALL OPEN FROM THE INSIDE WITHOUT THE USE OF A KEY AND/OR SPECIAL KNOWLEDGE (U.N.O.). MANUALLY OPERATED EDGE OR SURFACE MOUNTED FLUSH BOLTS AND SURFACE BOLTS ARE PROHIBITED.
2. PAINT STEEL DOORS AND FRAMES WITH ONE (1) COAT OF RUST INHIBITING PRIMER AND ONE (1) COAT OF SEMI-GLOSS ALKYD ENAMEL.
3. ALL INTERIOR DOORS TO BE SOLID CORE MASONITE DOOS IN "TIMELY" FRAMES (U.N.O.).
4. ALL DOOR HARDWARE TO BE AL SERIES "SCHLAGE" LEVER TYPE WITH FINISH PER OWNER'S DIRECTION. VERIFY KEYING WITH OWNER.
5. PROVIDE DOOR STOPS AS REQUIRED AT FLOOR AND/OR WALL.
6. ALL DOORS TO BE MASTER KEYED. VERIFY KEYING WITH OWNER.
7. ALL THRESHOLDS TO BE MAXIMUM HEIGHT OF 1/2".
8. DOOR LOCK AND LATCHES SHALL COMPLY WITH UBC SECTION 1004.3 AND ADA.
9. THE AUTHORITY HAVING JURISDICTION MAY INCREASE THE MAXIMUM EFFORT TO OPERATE FIRE DOORS IN ORDER TO ACHIEVE POSITIVE LATCHING, BUT NOT EXCEEDING THE 15 LP MAX.
10. MAXIMUM EFFORT TO OPERATE EXTERIOR DOORS IS 5 LBS.
11. HAND-ACTIVATED DOOR OPENING HARDWARE SHALL BE CENTERED BETWEEN 30" AND 44" A.F.F.
12. PROVIDE 1/4" TEMPERED GLASS AT ALL INTERIOR WINDOW LOCATIONS.
13. MAIN EXTERIOR DOORS: PROVIDE VISIBLE DURABLE SIGN ON THE EGRESS SIDE, ON OR ADJACENT TO THE DOOR, STATING: "THIS DOOR TO REMAIN UNLOCKED WHEN THE BUILDING IS OCCUPIED." THE SIGN SHALL BE IN LETTERS 1" HIGH ON A CONTRASTING BACKGROUND.

FLOOR PLAN NOTES:

1. ALL INSULATION SHALL HAVE FLAME SPREAD RATE NOT TO EXCEED 25 AND A SMOKE DENSITY NOT TO EXCEED 450 WHEN TESTED IN ACCORDANCE WITH STANDARD NO. 42-1.
2. PROVIDE 4'-0" HIGH ANGLE IRON DOOR GUARDS AT FLOOR OF EACH JAMB OF EACH OVERHEAD DOOR OPENING.
3. ALL NEW DRYWALL SHALL BE TAPED, TEXTURED, AND PAINTED WITH ONE (1) COAT VINYL ACRYLIC WALL SEALER AND TWO (2) COATS LO-GLO ACRYLIC SEMI-GLOSS ENAMEL. PROVIDE SAMPLE FOR OWNER'S APPROVAL. PROVIDE LIGHT KNOCKDOWN TEXTURE.
4. RESTROOM DRYWALL SHALL BE WATER RESISTANT TYPE X. RESTROOMS TO HAVE +4' HIGH 12"x12" GLAZED CERAMIC TILE BY "DAL TALE" OR EQUAL, FROM STANDARD COLOR SELECTION WAINSCOT. PAINT DRYWALL ABOVE WITH ONE (1) COAT PRIMER AND TWO (2) COATS SEMI-GLOSS ENAMEL PAINT. USE DUNN-EDWARDS OR FRAZEE.
5. BLOWER ROOM: PROVIDE SAWCUT CONTROL JOINTS AT 5'x5' MINIMUM FOR AREAS WITH SEALED CONCRETE FINISHED FLOOR. RESTROOM AND OPERATIONS ROOM TO RECEIVE 12"x12" VINYL COMPOSITE TILES. PROVIDE VCT AND CERAMIC TILE SAMPLES FOR OWNER'S SELECTION.
6. PROVIDE 4" CERAMIC TILE BASE TO MATCH FLOOR TILE. AT RESTROOM, PROVIDE 6" COVERED CERAMIC TILE BASE.
7. SEE PLUMBING DRAWING FOR FLOOR AREA DRAINAGE AND RESTROOM. PLUMBING DRAWINGS SHALL APPLY FOR APPLICABLE FIXTURES.

WALL FINISH LEGEND

P1 DUNN EDWARDS - FOSSIL

TOWN OF JEROME WWTP
ELECTRICAL
JEROME, ARIZONA

GENERAL ELECTRICAL NOTES

1. ELECTRICAL WORK SHALL COMPLY WITH THE NATIONAL ELECTRIC CODE (2011), FEDERAL, STATE AND LOCAL JURISDICTION CODES.
2. ALL WORK SHALL BE DONE IN A NEAT, WORKMANLIKE, FINISHED AND SAFE MANNER, ACCORDING TO THE LATEST PUBLISHED NATIONAL ELECTRICAL CONTRACTORS ASSOCIATION STANDARDS OF INSTALLATION, UNDER COMPETENT SUPERVISION.
3. VISIT THE SITE PRIOR TO BIDDING TO BECOME FAMILIAR WITH EXISTING CONDITIONS AND ALL OTHER FACTORS WHICH MAY AFFECT THE EXECUTION OF THIS WORK. INCLUDE ALL RELATED COSTS IN THE INITIAL BID PROPOSAL.
4. CONTRACTOR IS RESPONSIBLE FOR VERIFYING LOCATIONS OF ALL EXISTING UTILITIES AND AVOIDING DAMAGE TO SAME. CONTRACTOR SHALL BE RESPONSIBLE FOR DAMAGE TO UTILITIES CAUSED AS A RESULT OF HIS WORK. CALL (602) 263-1100 FOR BLUE STAKES. IRRIGATION LINES LESS THAN 2" WILL NOT BE MARKED AND SHALL BE REPAIRED IN KIND BY THE CONTRACTOR.
5. PROPER PROTECTION OF THE CONSTRUCTION AREA FOR SAFETY SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. COVER ALL TRENCHES AT THE END OF EACH WORK DAY. BARRICADES SHALL BE INSTALLED AS DIRECTED BY THE EPCOR OR THE PROJECT INSPECTOR. THE SITE AND ALL WORK SHALL CONFORM TO OSHA REQUIREMENTS.
6. CONTRACTOR SHALL PAY FOR PERMITS AND INSPECTIONS AS MAY BE REQUIRED AND PROVIDE A CERTIFICATE OF INSPECTION TO THE EPCOR.
7. PROTECT ALL MATERIAL AND EQUIPMENT INSTALLED AGAINST DAMAGE BY OTHER TRADES, WEATHER CONDITIONS OR ANY OTHER CAUSES. EQUIPMENT FOUND DAMAGED OR IN OTHER THAN NEW CONDITION WILL BE REJECTED AS DEFECTIVE. ALL COMPONENTS SHALL BE FREE OF DUST, GRIT AND FOREIGN MATERIALS, AND LEFT AS NEW BEFORE FINAL ACCEPTANCE OF WORK.
8. LEAVE THE SITE CLEAN, REMOVE ALL DEBRIS, EMPTY CARTONS, TOOLS, CONDUIT, WIRE SCRAPS AND ALL MISCELLANEOUS SPARE EQUIPMENT AND MATERIALS USED IN THE WORK DURING CONSTRUCTION.
9. IT IS THE OBLIGATION OF THE CONTRACTOR TO ORGANIZE HIS WORK SO THAT A COMPLETE ELECTRICAL, INSTRUMENTATION, AND/OR CONTROL SYSTEM FOR THE FACILITY WILL BE PROVIDED AND SUPPORTED BY ACCURATE SHOP AND RECORD DRAWINGS, AND ALL O & M MANUALS.
10. ALL UNDERGROUND CONDUIT SHALL BE SCHEDULE 40 PVC, BURIED 24" MINIMUM BELOW FINISHED GRADE, UNLESS SPECIFICALLY NOTED OTHERWISE ON PLANS OR IN DETAILS.
11. PROVIDE EMT INDOOR AND GRS OUTDOOR FOR ABOVE GROUND CONDUIT. WHERE METALLIC CONDUITS COME IN CONTACT WITH DIRT, THEY SHALL BE HALF LAP WRAPPED WITH SCOTCH 50 TAPE TO 12" AFG. FITTINGS SHALL BE STEEL, THREADED TYPE WITH INSULATED THROATS. SECURELY ATTACH ALL SURFACE MOUNTED CONDUIT EVERY 10 FEET AND WITHIN 3 FEET OF EACH JUNCTION BOX, PER NEC ARTICLE 344.30. OUTDOOR FLEX CONDUIT SHALL BE LIQUID TITE UV RESISTANT (BLACK) FLEX CONDUIT.
12. UNDERGROUND VERTICAL AND HORIZONTAL 90 DEGREE BEND CONDUIT SHALL BE GRS HALF LAPPED WRAPPED WITH SCOTCHRAP 50 10-MIL TAPE TO 18" MIN ABOVE GRADE WITH A RADIUS OF NOT LESS THAN 18" (FACTORY BENDS ONLY SHALL BE USED)
13. UNDERGROUND CONDUITS SHALL BE A MINIMUM 1".
14. ALL FEEDERS AND BRANCH CIRCUIT WIRE SHALL BE COPPER TYPE XHHW (75 DEGREE C) FOR BELOW GRADE INSTALLATIONS (AND CONDUIT RISERS) AND THHN/THWN (75 DEGREE C) FOR ABOVE GRADE INSTALLATIONS. MINIMUM SIZE SHALL BE #12 AWG, UNLESS SPECIFICALLY NOTED OTHERWISE ON PLANS OR IN DETAILS. ALL WIRING SHALL BE IN CONDUIT.
15. A SEPARATE GREEN INSULATED EQUIPMENT GROUNDING CONDUCTOR (BOND) SHALL BE INSTALLED WITHIN EACH RACEWAY PER NEC CODE.
16. WHEN A PANEL IS SUPPLIED BY A FEEDER OR BRANCH CIRCUIT, ANY INSTALLED GROUNDED CONDUCTOR SHALL NOT BE CONNECTED TO THE EQUIPMENT GROUNDING CONDUCTOR (GEC) OR TO THE GROUNDING ELECTRODE(S) PER NEC ARTICLE 250.32(B).
17. BOND ALL ENCLOSURES PER NEC ARTICLE 250.96.
18. CONTRACTOR SHALL PLAN AND INSTALL WORK IN SUCH A MANNER AS TO CONFORM TO THE STRUCTURE, AVOID OBSTRUCTIONS, PRESERVE HEADROOM AND KEEP OPENINGS AND PASSAGEWAYS CLEAR.
19. CONTRACTOR SHALL PROVIDE ALL LABOR, MATERIAL, ETC. NECESSARY FOR A COMPLETE AND WORKABLE ELECTRICAL SYSTEM WHETHER OR NOT THESE ITEMS ARE SPECIFICALLY NOTED ON THESE DRAWINGS. INCIDENTAL ITEMS NOT INDICATED ON THE DRAWINGS, NOR MENTIONED IN SPECIFICATIONS THAT CAN BE LEGITIMATELY AND REASONABLY INFERRED TO BELONG TO THE WORK DESCRIBED OR BE NECESSARY IN GOOD PRACTICE TO PROVIDE A COMPLETE SYSTEM, SHALL BE FURNISHED AND INSTALLED AS THOUGH ITEMIZED HERE IN EVERY DETAIL.
20. CONTRACTOR IS RESPONSIBLE FOR AND SHALL PROVIDE ALL LABOR, MATERIAL, TRENCHING, CONDUIT, TRANSFORMER PAD AND OTHER REQUIRED EQUIPMENT PER UTILITY COMPANY PLANS AND SPECIFICATIONS NECESSARY FOR A COMPLETE UNDERGROUND CONDUIT SYSTEM FROM THE UTILITY POINT OF SERVICE TO THE UTILITY CO. TRANSFORMER AND FROM THE UTILITY CO. TRANSFORMER TO THE ELECTRICAL SERVICE ENTRANCE SECTION.
21. ALL TRENCHING, CONDUITS, ETC. SHALL BE ROUTED AND INSTALLED IN SUCH A MANNER THAT WILL NOT DAMAGE EXISTING FACILITIES. SHOULD DAMAGE OCCUR, IT WILL BE THE CONTRACTORS RESPONSIBILITY TO REPAIR DAMAGE TO THE SATISFACTION OF THE EPCOR OR INSPECTOR.
22. ALL CONDUIT RUNS SHOWN ON THIS PLAN ARE SCHEMATIC IN NATURE. THE CONTRACTOR SHALL MAKE SURE THAT ALL CONDUIT, ETC. FALLS WITHIN THE CONSTRUCTION AREA/RIGHT OF WAY. (THIS INCLUDES MAINTAINING ALL REQUIRED CLEARANCES.)
23. WHEN CROSSING PATHWAYS OR SIDEWALKS, CONTRACTOR SHALL BORE UNDER EXISTING CONCRETE WALKS AND SAWCUT ASPHALT WALKS. ASPHALT WALKS SHALL BE REPLACED IN KIND.
24. CONTRACTOR SHALL GUARANTEE WORK INSTALLED UNDER THE CONTRACT TO BE FREE FROM DEFECTIVE WORKMANSHIP AND MATERIALS, USUAL WEAR EXPECTED, AND SHOULD ANY SUCH DEFECTS DEVELOP WITHIN A PERIOD OF ONE YEAR ACCEPTANCE OF THE PROJECT BY THE EPCOR, THE CONTRACTOR SHALL REPAIR AND/OR REPLACE ANY DEFECTIVE ITEMS AND DAMAGE RESULTING FROM FAILURE OF THESE ITEMS, AT NO EXPENSE WHATSOEVER TO THE EPCOR.
25. CONTRACTOR SHALL IDENTIFY EQUIPMENT PANELS, DISCONNECTS, PANELS, INSTRUMENTS ETC. USING P&ID NOMENCLATURE WITH 3/32-INCH THICK LAMINATED PHENOLIC TYPE NAMEPLATES WITH 1/4-INCH MINIMUM HEIGHT LETTERS. NAMEPLATE TO BE BLACK MATTE FINISH SURFACE WITH WHITE LETTER ENGRAVING AND BE UV RESISTANT. ATTACH NAMEPLATE TO THE OUTSIDE PANEL FACE WITH TWO STAINLESS STEEL SELF-TAPPING SCREWS. NAMEPLATE SHALL READ THE EQUIPMENT NAME AND P&ID NOMENCLATURE. SEE NEC ARTICLE 230.70(B) FOR SERVICE EQUIPMENT.
26. ALL CIRCUITS SHALL BE LEGIBLY IDENTIFIED AT THE PANEL, JUNCTION BOXES AND AT ALL EQUIPMENT IN A PERMANENT MANNER (I.E. ETCHED PLATES, CONDUCTOR TAG, PERMANENT MARKER, ETC.). THE LABELING SHALL INCLUDE PANEL CIRCUIT NUMBER, "TO" AND "FROM" IDENTIFICATION, AND MARKED "SPARE" WHERE APPLICABLE.
27. CONTRACTOR SHALL TEST ELECTRICAL SYSTEM FOR SHORT CIRCUITS AND MEGGER TEST FEEDERS AND BRANCH CIRCUIT WIRING. CONTRACTOR SHALL INSURE LOW IMPEDANCE GROUND PATH SYSTEM. PROVIDE CERTIFIED TEST RESULTS FOR MEGGER TEST TO EPCOR UPON COMPLETION OF PROJECT.
28. CONTRACTOR SHALL PERFORM HIGH POTENTIAL (HIPOT) TESTING WHEN REQUIRED BY LOCAL JURISDICTION OR EPCOR.
29. CONTRACTOR SHALL PROVIDE A GROUND-FAULT COORDINATION STUDY AND PERFORM RECOMMENDED SETTINGS ON NEW OVERCURRENT PROTECTION DEVICES, PROVIDE LABELS ON EQUIPMENT INDICATING SETTINGS.
30. CONTRACTOR SHALL PROVIDE AN ARC-FLASH STUDY, PROVIDE ALL APPLICABLE LABELS ON NEW EQUIPMENT AFTER STUDY IS COMPLETED.
31. ALL CONDUIT AND J-BOXES SHOWN SHALL BE CONCEALED WHEN POSSIBLE. WHEN NOT POSSIBLE, CONDUIT AND J-BOXES MAY BE SURFACE MOUNTED WITH PERMISSION OF THE EPCOR OR EPCOR'S REPRESENTATIVE.
32. CONTRACTOR SHALL COORDINATE ALL EQUIPMENT CONNECTIONS WITH EQUIPMENT SUPPLIER PRIOR TO ROUGH-IN. PROVIDE ADDITIONAL FUSED DISCONNECT SWITCHES AND CONTROLS IF OVERCURRENT PROTECTION OR CONTROLS IS NOT INTEGRAL WITH UNITS.
33. ALL EQUIPMENT SHALL BE FUSE SIZED PER MANUFACTURES RECOMMENDATIONS AND U.L. APPROVAL.
34. ELECTRICAL DEVICES, DISCONNECT SWITCHES, ETC., SHALL BE SUPPORTED INDEPENDENT OF AND ISOLATED FROM EQUIPMENT VIBRATIONS.
35. FULL LOAD AMPS (FLA) SIZES, AS NOTED IN THESE DRAWINGS, ARE BASED ON SPECIFIED EQUIPMENT DATA. CONTRACTOR SHALL VERIFY NAMEPLATE FLA OF EQUIPMENT SUPPLIED AND COORDINATE ACCORDINGLY PER EQUIPMENT SUPPLIERS RECOMMENDATIONS.
36. ALL OUTDOOR ELECTRICAL EQUIPMENT SHALL BE NEMA-3R OR NEMA-4 ENCLOSURES.
37. CONDUITS OR RACEWAYS ROUTED FROM INDOORS TO OUTDOORS OR AS DESCRIBED IN NEC 300.7(A), SHALL BE SEALED WITH A PLIABLE SEALING COMPOUND AT A CONDUIT BODY OR AT A JUNCTION BOX BEFORE THE CONDUIT ENTERS THE COLDER ENVIRONMENT.
38. CONDUITS OR RACEWAYS INSTALLED IN AREAS WHERE ELEVATION CHANGES MAY CAUSE WATER OR MOISTURE TO ENTER THE ELECTRICAL EQUIPMENT THROUGH THE CONDUIT SHALL BE SEALED WITH A HERMETIC CONDUIT SEAL AT BOTH ENDS OF THE CONDUIT OR RACEWAY.
39. MATERIALS SHALL BE NEW AND OF THE BEST QUALITY WITH MANUFACTURER'S NAME PRINTED THEREON. MATERIALS SHALL BE MANUFACTURED IN ACCORDANCE WITH NEMA, ANSI, UNDERWRITER'S LABORATORY OR OTHER APPLICABLE STANDARDS AND RATED FOR HEAVY DUTY SERVICE.
40. ALL WIRING DEVICES SHALL BE SPECIFICATION GRADE. ALL 15 AND 20 AMP, 125 AND 250 VOLT, NONLOCKING RECEPTACLES INSTALLED OUTDOORS SHALL BE LISTED WEATHER-RESISTANT TYPE. ALL WEATHERPROOF WHILE IN-USE RECEPTACLE COVERS SHALL BE METAL.
41. SELECTION OF MATERIALS SHALL BE IN STRICT ACCORDANCE WITH THE DRAWINGS AND/OR SPECIFICATIONS. THE USE OF MANUFACTURER'S NAME, MODEL, AND NUMBER IS INTENDED TO ESTABLISH STYLE, QUALITY, APPEARANCE, USEFULNESS AND BID PRICE. CONTRACTOR SHALL SUBMIT TO THE EPCOR OR EPCOR'S REPRESENTATIVE FOR REVIEW AND APPROVAL (PRIOR TO ORDERING MATERIALS) COPIES OF EQUIPMENT SHOP DRAWINGS AS FOLLOWS: 1) LIGHT FIXTURES, 2) PUMP CONTROL PANEL 3) RTU/PLC 4) SERVICE ENTRANCE SECTION, 5) ELECTRICAL EQUIPMENT, 6) DISCONNECT SWITCHES, 7) TIME CLOCKS AND OTHER CONTROLS, 8) LIGHTING CONTACTORS AND 9) PULL BOXES. AT THE TIME OF EACH SUBMITTAL, THE CONTRACTOR SHALL DEFINE AND DELINEATE IN WRITING ANY DEVIATIONS FROM THE CONTRACT DOCUMENTS. THE REVIEW WILL BE ONLY FOR CONFORMANCE WITH THE DESIGN CONCEPT OF THE WORK AND FOR COMPLIANCE WITH THE INFORMATION CONTAINED IN THE CONTRACT DOCUMENTS. THE REVIEW OF A SPECIFIED ITEM, AS SUCH, WILL NOT INDICATE REVIEW OF THE ASSEMBLY IN WHICH THE ITEM FUNCTIONS. REVIEW BY THE EPCOR OR EPCOR'S REPRESENTATIVE WILL NOT RELIEVE THE CONTRACTOR FROM RESPONSIBILITY FOR ANY ERRORS OR OMISSIONS IN THE SUBMITTALS NOR FROM HIS RESPONSIBILITY FOR COMPLYING WITH THE CONTRACT DOCUMENTS.
42. THE SUBMITTALS SHALL BE NEATLY GROUPED AND ORGANIZED. PERTINENT INFORMATION SHALL BE HIGHLIGHTED, AND THE SPECIFIC PRODUCT SHALL BE IDENTIFIED. ALL SUBMITTALS SHALL BE COMPLETE, AND PRESENTED IN ONE PACKAGE. THE SUBMITTAL SHALL INCLUDE A COMPLETE LIST OF THE EQUIPMENT AND MATERIALS, INCLUDING THE MANUFACTURER'S NAME, PRODUCT SPECIFICATION, DESCRIPTIVE DATA, TECHNICAL LITERATURE, PERFORMANCE CHARTS, CATALOG CUTS, INSTALLATION INSTRUCTIONS, AND SPARE PART RECOMMENDATIONS FOR EACH DIFFERENT ITEM OF THE EQUIPMENT SPECIFIED.
43. ELECTRICAL CONTRACTOR SHALL HAVE A MINIMUM OF 5 YEARS EXPERIENCE WORKING IN THE WATER/WASTEWATER INDUSTRY AND PROVIDE REFERENCES.

PLANS

- CONDUIT RUN CONCEALED UNDER SLAB OR BELOW GRADE. (CONCEALED IN SLAB WHERE SO NOTED OR WHERE ALLOWED PER SPECIFICATIONS).
- CONDUIT RUN EXPOSED UNLESS OTHERWISE NOTED
- EXISTING CONDUIT RUN
- HASH MARKS INDICATE QUANTITY OF #12 WIRES IN CONDUIT (PLUS 1#12 GROUND WIRE) EXCEPT NO HASH MARKS=3/4", 2#12 (PLUS 1#12 GROUND WIRE) UNLESS OTHERWISE NOTED.
  - 3/4", 3#12 — 1", 6#12
  - 3/4", 4#12 — 1", 7#12
  - 3/4", 5#12 — 1", 8#12
- L(1,3) — HOMERUN TO PANEL L, CIRCUITS 1 AND 3
- GROUND WIRE
- CONDUIT UP (OUT TOP OF EQUIPMENT)
- CONDUIT DOWN (OUT BOTTOM OF EQUIPMENT)
- CONDUIT STUBBED OUT AND CAPPED
- LIGHTING FIXTURE MOUNTED ON POLE OR POST OR ABOVE PLATFORM
- CEILING MOUNTED LIGHTING FIXTURE
- BRACKET MOUNTED LIGHTING FIXTURE
- FLOODLIGHT
- FLUORESCENT LIGHTING FIXTURE
- POLE MOUNTED LIGHT FIXTURE
- EXIT LIGHT
- RECESSED LIGHTING FIXTURE
- LIGHTING FIXTURES CONNECTED TO EMERGENCY CIRCUITS
- A 1/100 — LIGHTING FIXTURE TYPE A, 100 WATTS, WITH 1 LAMP. SEE LIGHTING FIXTURE SCHEDULE
- $ — SINGLE POLE, SINGLE THROW TOGGLE SWITCH
- $2 — DOUBLE POLE, SINGLE THROW TOGGLE SWITCH
- $3 — THREE-WAY TOGGLE SWITCH
- $4 — FOUR-WAY TOGGLE SWITCH
- $M — MANUAL MOTOR STARTER

  (AT +48" OR AS NOTED)
- $a — OUTLETS SHOWN WITH SUBSCRIPT "a" ADJACENT TO THEM SHALL BE CONTROLLED BY S a
- DUPLEX CONVENIENCE RECEPTACLE AT +12" OR AS NOTED
- SINGLE CONVENIENCE RECEPTACLE AT +12" OR AS NOTED
- SPECIAL PURPOSE RECEPTACLE AT +12" OR AS NOTED, RATING AS INDICATED
- JUNCTION BOX, SIZE AS REQUIRED BY CODE
- THERMOSTAT OUTLET AT +54"
- CLOCK OUTLET AT +7'-6" OR AS NOTED
- TELEPHONE OUTLET AT +12" OR AS NOTED
- TELEPHONE FLOOR OUTLET
- HORN
- (P) CONTROL DEVICE
  - P = PRESSURE SWITCH
  - ZS = LIMIT SWITCH
  - L = LEVEL SWITCH
  - V = CONTROL VALVE
- CONTROL STATION: PUSH-BUTTON STATION OR SELECTOR SWITCH. SEE CONTROL WIRING DIAGRAMS FOR REQUIREMENTS.
- (M) EXISTING MOTOR
- (M) NEW MOTOR
- (M) FUTURE MOTOR
- GROUND WELL
- GROUND ROD
- DISCONNECT SWITCH. SEE SINGLE LINE DIAGRAM FOR SIZE.
- LIGHTING PANEL. SURFACE MOUNTED.
- SWITCHBOARD, DISTRIBUTION PANEL OR MOTOR CONTROL CENTER
- (12) CONDUIT NUMBER 12. SEE CONDUIT AND WIRING SCHEDULE FOR SIZES AND QUANTITIES OF CONDUIT AND WIRES.
- +12" — INDICATES HEIGHT FROM FINISHED FLOOR OR GRADE TO CENTERLINE OF DEVICE.
- (1) — INDICATES TO REFER TO NOTE (1) ON DRAWING
- W.P. — WEATHERPROOF. PROVIDE GASKETS AS REQUIRED
- C.O. — CONDUIT ONLY
- FE-184 — INSTRUMENTATION DEVICE. SEE PROCESS AND INSTRUMENTATION DRAWINGS FOR DESCRIPTIONS.
- PULL BOX (SIZE AS REQUIRED)
- OUTPUT TERMINAL
- INPUT TERMINAL

NOTES: (ELECTRICAL SYMBOLS)

1. POWER TRANSFORMERS SHALL BE DRY TYPE 480-208Y/120 VOLTS, 3 PHASE 4 WIRE UNLESS OTHERWISE INDICATED.
2. CONTROL TRANSFORMER SHALL BE DRY TYPE 480-120 VOLTS 1 PHASE UNLESS OTHERWISE INDICATED. SEE CONTROL WIRING DIAGRAMS FOR USE OF 120 VOLT CONTROL CIRCUITS CONTROL TRANSFORMERS SHALL BE SIZED TO HANDLE THE LOADS OF ALL RELAYS, PILOT LIGHTS, ETC. CONNECTED THERE TO PLUS 50 VA EXTRA CAPAOWNER.
3. LOCATED IN OR ON MOTOR CONTROL CENTER UNLESS OTHERWISE INDICATED.

CONSTRUCTION NOTES

1. REMOVE ALL EXISTING CUSTOMER OWNED OVERHEAD ELECTRICAL AND POWER POLE AND DISPOSE OF PROPERLY. COORDINATE WITH OWNER FOR SCHEDULING.
2. REMOVE EXISTING SES AND PANEL AND DISPOSE OF PROPERLY. COORDINATE DISCONNECTION OF THE METER AND SECONDARY CONDUCTORS WITH APS
3. DE-ENERGIZE EXISTING LAB BUILDING UPON COMPLETION OF CONSTRUCTION OF THE NEW LAB. REMOVE ALL EXISTING CONDUCTORS AND ELECTRICAL EQUIPMENT AND DISPOSE OF PROPERLY. COORDINATE ALL WORK WITH OWNER AND POWER COMPANY PRIOR TO DE-ENERGIZATION.
4. COORDINATE WITH APS TO REPLACE THE EXISTING POLE MOUNTED SINGLE PHASE TRANSFORMER. APS TO INSTALL THREE PHASE TRANSFORMERS. CONTRACTOR SHALL VERIFY LOCATION OF NEW TRANSFORMER WITH APS. APS PLANS WILL DETERMINE EXACT LOCATION AND TAKE PRECEDENCE OVER THESE DRAWINGS. COORDINATE ALL WORK WITH APS.
5. APS SERVICE LINE. TRENCH AND INSTALL CONDUIT PER APS SPECIFICATIONS. POWER COMPANY PLANS WILL DETERMINE EXACT LOCATION OF CONDUIT AND TAKE PRECEDENCE OVER THESE DRAWINGS.
6. SES, 400 AMP, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.1.
7. MINI-POWER ZONE AND PANELBOARD. SEE DETAIL 1 ON E4.1.
8. ATS 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
9. GENERATOR 125KW, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.3.
10. TRANSFORMER 50KVA 480V - 120/240V 1ø, SEE DETAIL 2 ON SHEET E4.1.
11. PANELBOARD, 120/240V, 1ø, 3W, SEE DETAIL 2 ON E4.1.
12. DISTRIBUTION PANEL DSP-1 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
13. ELECTRICAL CONTRACTOR SHALL INSTALL POWER FEED TO MINI SPLIT AIR CONDITIONER AND HEAT PUMP & MAKE ALL 240V CONNECTIONS.
14. TANKLESS WATER HEATER & DISCONENCT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
15. GROUNDING ELECTRODE CONDUCTORS, GROUND ROD, AND INSPECTION WELL FOR ONLY THE FIRST GROUND ROD, PER SINGLE LINE DIAGRAMS AND DETAILS ON SHEET E4.6.
16. LIGHTNING PROTECTION SYSTEM, PER NFPA AND DETAIL 6 ON SHEET E4.6
17. CLASSIFIED SEAL OFF LISTED FOR CLASS 1 DIV 1. LOCATE WITHIN 10 FEET OF CLASSIFIED AREA BOUNDARY. PVC COATED RMS EYS TYPE OR EQUIVALENT. SEAL SHALL HAVE SEALING COMPOUND CHICO, OR EQUAL.
20. 20A HEADWORKS CONTROL PANEL, BY VENDOR CLASS 1 DIVISION 2 LISTED. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
21. INFLUENT COARSE SCREEN MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
22. INFLUENT CONVEYOR MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
23. POTABLE SOLENOID VALVE AT HEADWORKS. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
24. ULTRASONIC LEVEL TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
30. SBR PANEL BY VENDOR, ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
31. SBR INFLUENT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
32. SBR SUBMERSIBLE MIXER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
33. WAS TRANSFER PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
34. DECANT MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
35. SBR DECANT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
36. DO TRANSMITTER AND ANALYZER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
37. SUBMERSIBLE PRESSURE TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
38. LEVEL FLOAT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
39. SBR MOTOR CONTROL PANEL, PROVIDE AND INSTALL. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
40. SBR EFFLUENT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
41. FLOW METER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
42. SBR AIR VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
50. VARIABLE FREQUENCY DRIVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
51. SBR AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
52. DIGESTER AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
53. PRESSURE TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
54. TEMPERATURE TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
60. 20A SLUDGE BAGGING SYSTEM CONTROL PANEL, BY VENDOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
61. POTABLE WATER VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
62. POLYMER METERING PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
63. DRY POLYMER MIXER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
64. DEWATERING FEED PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
70. 30A DRYING BED LIFT PUMP CONTROL PANEL, 480V, 3ø, 4W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
71. DRYING BED LIFT PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.
72. LEVEL FLOAT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.
80. OVERFLOW LIFT PUMP CONTROL PANEL, BY VENDOR. 240V, 1ø, 3W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
81. OVERFLOW LIFT PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.
82. LEVEL FLOAT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.
90. JOINT TRENCH WITH WATER LINES. MAINTAIN 24-INCH SEPARATION. SEE DETAIL 3 ON SHEET E4.3.
91. STACKED #7 CONCRETE PULL BOX. INSTALL AS SHOWN OR AS NEEDED IF CONDUIT RUNS WILL EXCEED 360 DEGREE OF BENDS OR THE LENGTH EXCEEDS 400 FEET. INSTALL 1 FOR POWER AND 1 FOR CONTROL. SEE DETAIL 5 ON SHEET E4.3.
92. STANCHION MOUNTED NEMA 4X SST JUNCTION BOXES. MAINTAIN 3' CLEARANCE IN FRONT OF EQUIPMENT. EXTRA SLACK SHALL REMAIN IN THE J-BOX FOR FUTURE LEVEL ADJUSTMENT. SEE DETAIL 2 ON SHEET E4.2 AND DETAIL 1 ON SHEET E4.4.
93. TRAFFIC BOLLARD TO BE INSTALLED PER CIVIL PLANS. LOCATE OUT OF 4 FOOT WORKING SPACE ENVELOPE PER NEC.
94. NON-FUSED DISCONNECT, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2 & SEE DETAIL 1 ON SHEET E4.4.
95. ROTARY TYPE DISCONNECT, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2 & SEE DETAIL 1 ON SHEET E4.4.
96. E-STOP, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2.
97. 20A 120V GFCI DUPLEX RECEPTACLE WITH METAL WEATHERPROOF WHILE-IN-USE AND LOCKABLE COVER INSTALLED PER DETAIL 1 ON SHEET E4.2.
98. 20A 120V GFCI DUPLEX RECEPTACLE WITH METAL WEATHERPROOF WHILE-IN-USE AND LOCKABLE COVER INSTALLED ONTO LIGHT POLE. SEE DETAIL 2 ON SHEET E4.5.
99. CLASSIFIED AREA VERIFY BOUNDARY WITH THE NFPA. INSTALL ANY PANELS, DISCONNECTS, SPLICES, ARC MAKING EQUIPMENT OUT OF THE BOUNDARY, WHERE NOT POSSIBLE THEN INSTALL CLASS 1 DIV 1 LISTED EQUIPMENT. ALL CONDUIT WITHIN BOUNDARY SHALL BE CLASS 1 DIV 1 OR 2 RATED AS REQUIRED BY THE BOUNDARY. USE PVC COATED THREADED RMC CONDUIT, INSTALL STAINLESS STEEL 316 ENCLOSURES, HARDWARE AND EQUIPMENT WITHIN 10 FEET OF THE BOUNDARY. INSTALL CLASSIFIED SEAL OFFS WITHIN 10 FEET OF THE BOUNDARY, AT A PANEL OR JUNCTION BOX IS PREFERRED.

CONSTRUCTION NOTES

4. COORDINATE WITH APS TO REPLACE THE EXISTING POLE MOUNTED SINGLE PHASE TRANSFORMER. APS TO INSTALL THREE PHASE TRANSFORMERS. CONTRACTOR SHALL VERIFY LOCATION OF NEW TRANSFORMER WITH APS. APS PLANS WILL DETERMINE EXACT LOCATION AND TAKE PRECEDENCE OVER THESE DRAWINGS. COORDINATE ALL WORK WITH APS.
5. APS SERVICE LINE. TRENCH AND INSTALL CONDUIT PER APS SPECIFICATIONS. POWER COMPANY PLANS WILL DETERMINE EXACT LOCATION OF CONDUIT AND TAKE PRECEDENCE OVER THESE DRAWINGS.
6. SES, 400 AMP, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.1.
7. MINI-POWER ZONE AND PANELBOARD. SEE DETAIL 1 ON E4.1.
8. ATS 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
9. GENERATOR 125KW, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.3.
17. CLASSIFIED SEAL OFF LISTED FOR CLASS 1 DIV 1. LOCATE WITHIN 10 FEET OF CLASSIFIED AREA BOUNDARY. PVC COATED RMS EYS TYPE OR EQUIVALENT. SEAL SHALL HAVE SEALING COMPOUND CHICO, OR EQUAL.
80. OVERFLOW LIFT PUMP CONTROL PANEL, BY VENDOR. 240V, 1ø, 3W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
81. OVERFLOW LIFT PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.
99. CLASSIFIED AREA VERIFY BOUNDARY WITH THE NFPA. INSTALL ANY PANELS, DISCONNECTS, SPLICES, ARC MAKING EQUIPMENT OUT OF THE BOUNDARY, WHERE NOT POSSIBLE THEN INSTALL CLASS 1 DIV 1 LISTED EQUIPMENT. ALL CONDUIT WITHIN BOUNDARY SHALL BE CLASS 1 DIV 1 OR 2 RATED AS REQUIRED BY THE BOUNDARY. USE PVC COATED THREADED RMC CONDUIT. INSTALL STAINLESS STEEL 316 ENCLOSURES, HARDWARE AND EQUIPMENT WITHIN 10 FEET OF THE BOUNDARY. INSTALL CLASSIFIED SEAL OFFS WITHIN 10 FEET OF THE BOUNDARY, AT A PANEL OR JUNCTION BOX IS PREFERRED.

CONSTRUCTION NOTES

(12) DISTRIBUTION PANEL DSP-1 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.

(17) CLASSIFIED SEAL OFF LISTED FOR CLASS 1 DIV 1. LOCATE WITHIN 10 FEET OF CLASSIFIED AREA BOUNDARY. PVC COATED RMS EYS TYPE OR EQUIVALENT. SEAL SHALL HAVE SEALING COMPOUND CHICO, OR EQUAL.

(20) 20A HEADWORKS CONTROL PANEL, BY VENDOR CLASS 1 DIVISION 2 LISTED. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.

(21) INFLUENT COARSE SCREEN MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(22) INFLUENT CONVEYOR MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(30) SBR PANEL BY VENDOR, ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(31) SBR INFLUENT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(32) SBR SUBMERSIBLE MIXER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(33) WAS TRANSFER PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(34) DECANT MOTOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(35) SBR DECANT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(39) SBR MOTOR CONTROL PANEL, PROVIDE AND INSTALL. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(40) SBR EFFLUENT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(42) SBR AIR VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(50) VARIABLE FREQUENCY DRIVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(51) SBR AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(52) DIGESTER AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(60) 20A SLUDGE BAGGING SYSTEM CONTROL PANEL, BY VENDOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(61) POTABLE WATER VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(62) POLYMER METERING PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(63) DRY POLYMER MIXER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(64) DEWATERING FEED PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.

(70) 30A DRYING BED LIFT PUMP CONTROL PANEL, 480V, 3ø, 4W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.

(71) DRYING BED LIFT PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.

(94) NON-FUSED DISCONNECT, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2 & SEE DETAIL 1 ON SHEET E4.4.

(95) ROTARY TYPE DISCONNECT, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2 & SEE DETAIL 1 ON SHEET E4.4.

(99) CLASSIFIED AREA VERIFY BOUNDARY WITH THE NFPA. INSTALL ANY PANELS, DISCONNECTS, SPLICES, ARC MAKING EQUIPMENT OUT OF THE BOUNDARY, WHERE NOT POSSIBLE THEN INSTALL CLASS 1 DIV 1 LISTED EQUIPMENT. ALL CONDUIT WITHIN BOUNDARY SHALL BE CLASS 1 DIV 1 OR 2 RATED AS REQUIRED BY THE BOUNDARY. USE PVC COATED THREADED RMC CONDUIT, INSTALL STAINLESS STEEL 316 ENCLOSURES, HARDWARE AND EQUIPMENT WITHIN 10 FEET OF THE BOUNDARY. INSTALL CLASSIFIED SEAL OFFS WITHIN 10 FEET OF THE BOUNDARY, AT A PANEL OR JUNCTION BOX IS PREFERRED.

CONSTRUCTION NOTES

1. REMOVE ALL EXISTING CUSTOMER OWNED OVERHEAD ELECTRICAL AND POWER POLE AND DISPOSE OF PROPERLY. COORDINATE WITH OWNER FOR SCHEDULING.
2. REMOVE EXISTING SES AND PANEL AND DISPOSE OF PROPERLY. COORDINATE DISCONNECTION OF THE METER AND SECONDARY CONDUCTORS WITH APS
3. DE-ENERGIZE EXISTING LAB BUILDING UPON COMPLETION OF CONSTRUCTION OF THE NEW LAB. REMOVE ALL EXISTING CONDUCTORS AND ELECTRICAL EQUIPMENT AND DISPOSE OF PROPERLY. COORDINATE ALL WORK WITH OWNER AND POWER COMPANY PRIOR TO DE-ENERGIZATION.
4. COORDINATE WITH APS TO REPLACE THE EXISTING POLE MOUNTED SINGLE PHASE TRANSFORMER. APS TO INSTALL THREE PHASE TRANSFORMERS. CONTRACTOR SHALL VERIFY LOCATION OF NEW TRANSFORMER WITH APS. APS PLANS WILL DETERMINE EXACT LOCATION AND TAKE PRECEDENCE OVER THESE DRAWINGS. COORDINATE ALL WORK WITH APS.
5. APS SERVICE LINE. TRENCH AND INSTALL CONDUIT PER APS SPECIFICATIONS. POWER COMPANY PLANS WILL DETERMINE EXACT LOCATION OF CONDUIT AND TAKE PRECEDENCE OVER THESE DRAWINGS.
6. SES, 400 AMP, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.1.
7. MINI-POWER ZONE AND PANELBOARD. SEE DETAIL 1 ON E4.1.
8. ATS 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
9. GENERATOR 125KW, 277/480V, 3ø, 4W, SEE DETAIL 1 ON E4.3.
70. 30A DRYING BED LIFT PUMP CONTROL PANEL, 480V, 3ø, 4W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
80. OVERFLOW LIFT PUMP CONTROL PANEL, BY VENDOR. 240V, 1ø, 3W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.
90. JOINT TRENCH WITH WATER LINES. MAINTAIN 24-INCH SEPARATION. SEE DETAIL 3 ON SHEET E4.3.
91. STACKED #7 CONCRETE PULL BOX. INSTALL AS SHOWN OR AS NEEDED IF CONDUIT RUNS WILL EXCEED 360 DEGREE OF BENDS OR THE LENGTH EXCEEDS 400 FEET. INSTALL 1 FOR POWER AND 1 FOR CONTROL. SEE DETAIL 5 ON SHEET E4.3.

ELECTRICAL SITE - DEWATERING & CHLORINE CONTACT

CONSTRUCTION NOTES

(15) GROUNDING ELECTRODE CONDUCTORS, GROUND ROD, AND INSPECTION WELL FOR ONLY THE FIRST GROUND ROD, PER SINGLE LINE DIAGRAMS AND DETAILS ON SHEET E4.6.

(16) LIGHTNING PROTECTION SYSTEM, PER NFPA AND DETAIL 6 ON SHEET E4.6

(40) SBR EFFLUENT VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(41) FLOW METER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(60) 20A SLUDGE BAGGING SYSTEM CONTROL PANEL, BY VENDOR. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(61) POTABLE WATER VALVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(62) POLYMER METERING PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(63) DRY POLYMER MIXER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(64) DEWATERING FEED PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

(91) STACKED #7 CONCRETE PULL BOX. INSTALL AS SHOWN OR AS NEEDED IF CONDUIT RUNS WILL EXCEED 360 DEGREE OF BENDS OR THE LENGTH EXCEEDS 400 FEET. INSTALL 1 FOR POWER AND 1 FOR CONTROL. SEE DETAIL 5 ON SHEET E4.3.

(95) ROTARY TYPE DISCONNECT, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2 & SEE DETAIL 1 ON SHEET E4.4.

(96) E-STOP, NEMA 4X FOR OUTDOOR AND CLASS 1 DIV 1 WITHIN CLASSIFIED BOUNDARY. IF LOCATION IS ABOVE BOUNDARY, NEMA 4X WITH CLASSIFIED SEAL OFFS IS ACCEPTABLE. PROVIDE PERMANENT LABEL SUITABLE FOR CORROSIVE ENVIRONMENTS AND UV RESISTANT. MATCH LABEL NAMING CONVENTION WITH P&ID. SEE DETAIL 5 ON SHEET E4.2.

CONSTRUCTION NOTES

8. ATS 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
10. TRANSFORMER 50KVA 480V – 120/240V 1ø, SEE DETAIL 2 ON SHEET E4.1.
11. PANELBOARD, 120/240V, 1ø, 3W, SEE DETAIL 2 ON E4.1.
12. DISTRIBUTION PANEL DSP-1 400A 277/480V, 3ø, 4W, SEE DETAIL 2 ON SHEET E4.1.
13. ELECTRICAL CONTRACTOR SHALL INSTALL POWER FEED TO MINI SPLIT AIR CONDITIONER AND HEAT PUMP & MAKE ALL 240V CONNECTIONS.
14. TANKLESS WATER HEATER & DISCONENCT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
15. GROUNDING ELECTRODE CONDUCTORS, GROUND ROD, AND INSPECTION WELL FOR ONLY THE FIRST GROUND ROD, PER SINGLE LINE DIAGRAMS AND DETAILS ON SHEET E4.6.
16. LIGHTNING PROTECTION SYSTEM, PER NFPA AND DETAIL 6 ON SHEET E4.6
30. SBR PANEL BY VENDOR, ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
50. VARIABLE FREQUENCY DRIVE. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
51. SBR AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
52. DIGESTER AERATION BLOWER WITH INTEGRAL DISCONNECT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
53. PRESSURE TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.
54. TEMPERATURE TRANSDUCER. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS.

DRYING BED LIFT STATION ELECTRICAL

CONSTRUCTION NOTES

(15) GROUNDING ELECTRODE CONDUCTORS, GROUND ROD, AND INSPECTION WELL FOR ONLY THE FIRST GROUND ROD. PER SINGLE LINE DIAGRAMS AND DETAILS ON SHEET E4.6.

(70) 30A DRYING BED LIFT PUMP CONTROL PANEL, 480V, 3ø, 4W. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 1 ON SHEET E4.4.

(71) DRYING BED LIFT PUMP. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.

(72) LEVEL FLOAT. ELECTRICAL CONTRACTOR SHALL MAKE ALL POWER AND CONTROL CONNECTIONS PER THESE PLANS AND SPECIFICATIONS AND THE MANUFACTURERS REQUIREMENTS. SEE DETAIL 4 ON SHEET E4.5.

(90) JOINT TRENCH WITH WATER LINES. MAINTAIN 24-INCH SEPARATION. SEE DETAIL 3 ON SHEET E4.3.

(98) 20A 120V GFCI DUPLEX RECEPTACLE WITH METAL WEATHERPROOF WHILE-IN-USE AND LOCKABLE COVER INSTALLED ONTO LIGHT POLE. SEE DETAIL 2 ON SHEET E4.5.

(99) CLASSIFIED AREA VERIFY BOUNDARY WITH THE NFPA. INSTALL ANY PANELS, DISCONNECTS, SPLICES, ARC MAKING EQUIPMENT OUT OF THE BOUNDARY, WHERE NOT POSSIBLE THEN INSTALL CLASS 1 DIV 1 LISTED EQUIPMENT. ALL CONDUIT WITHIN BOUNDARY SHALL BE CLASS 1 DIV 1 OR 2 RATED AS REQUIRED BY THE BOUNDARY. USE PVC COATED THREADED RMC CONDUIT, INSTALL STAINLESS STEEL 316 ENCLOSURES, HARDWARE AND EQUIPMENT WITHIN 10 FEET OF THE BOUNDARY. INSTALL CLASSIFIED SEAL OFFS WITHIN 10 FEET OF THE BOUNDARY, AT A PANEL OR JUNCTION BOX IS PREFERRED.

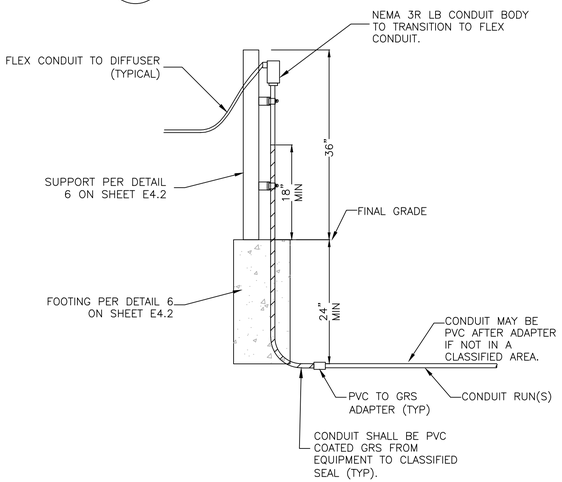
SHEET E4.1
84 OF 99 SHEETS

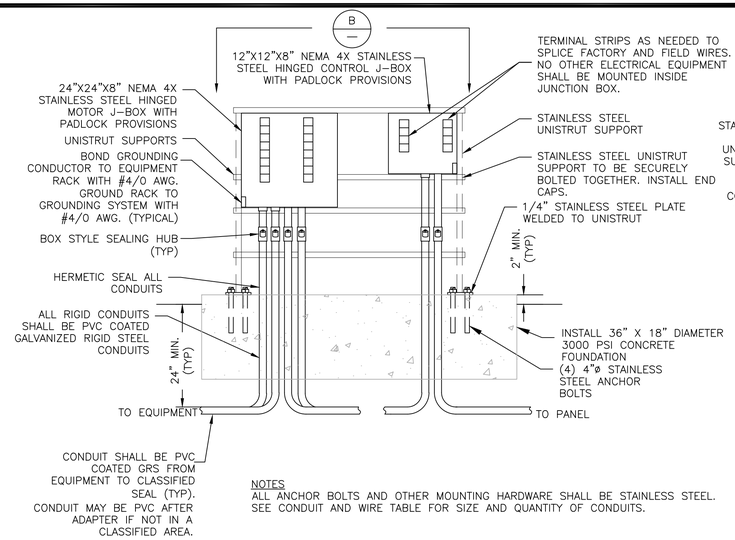
JOB NO. B614

1 RECEPTACLE PEDESTAL DETAIL



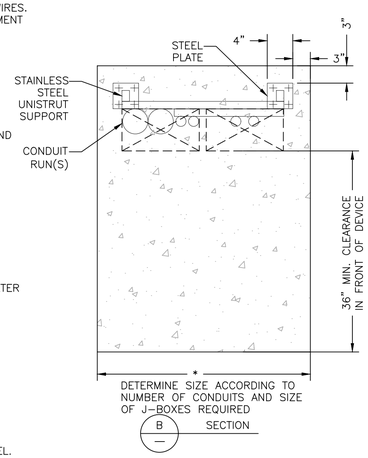
NO SCALE

NOTES:
1. ALL DIMENSIONS SHOWN ARE MINIMUM.
2. PROVIDE 6 INCH COVER OF CONCRETE WITHIN 2 FEET OF ALL DRIVABLE AREAS PER DETAILS AND PLAN.
3. CONDUITS THROUGH CLASSIFIED AREA SHALL BE PVC COATED RGS UNDERGROUND



2 TYPICAL CONDUIT STUB UP DETAIL

NO SCALE



3 CONDUIT TO EQUIPMENT SUPPORT DETAIL

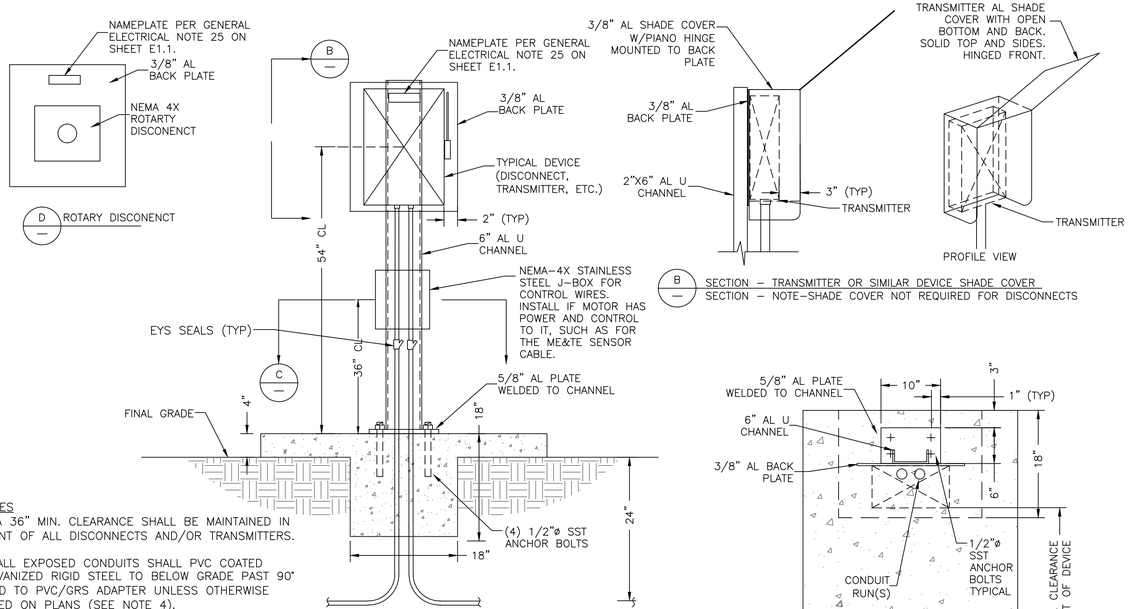
NO SCALE

NOTES
ALL ANCHOR BOLTS AND OTHER MOUNTING HARDWARE SHALL BE STAINLESS STEEL.
SEE CONDUIT AND WIRE TABLE FOR SIZE AND QUANTITY OF CONDUITS.

NOTES:
1) A 36" MIN. CLEARANCE SHALL BE MAINTAINED IN FRONT OF ALL ELECTRICAL DEVICES.

2) ALL EXPOSED CONDUITS SHALL BE GALVANIZED RIGID STEEL TO BELOW GRADE PAST 90° BEND TO PVC/GRS ADAPTER UNLESS OTHERWISE NOTED ON PLANS. WRAP PER GENERAL NOTE 11 ON SHEET E1.1.

3) ALL JUNCTION BOXES SHALL BE NEMA-4X STAINLESS STEEL UNLESS OTHERWISE NOTED ON PLANS.



4) ALL BARE STEEL COMPONENTS SHALL BE PRIMED AND PAINTED TAN TO MATCH SURROUNDING EQUIPMENT.

5) SEE RESPECTIVE SITE PLAN FOR CONDUIT SIZE AND QUANTITY DESIGNATIONS.

6)CONTRACTOR SHALL MAINTAIN AN 18" AIR GAP FOR CONDUIT RUN COMING FROM WET WELL. AIR GAP SHALL BE LOCATED AT THE JUNCTION BOX. CONTRACTOR SHALL INSTALL HERMETIC SEALS AT THE END OF THE THE CONDUIT RUNS INTO VAULT WALL TO PREVENT MOISTURE FROM ENTERING CONDUIT. CONDUIT SHALL BE CONTINUOUS GRS FROM WET WELL TO AIR GAP.

4 STANCHION MOUNTED JUNCTION BOX

NO SCALE

NOTES
1) A 36" MIN. CLEARANCE SHALL BE MAINTAINED IN FRONT OF ALL DISCONNECTS AND/OR TRANSMITTERS.

2) ALL EXPOSED CONDUITS SHALL PVC COATED GALVANIZED RIGID STEEL TO BELOW GRADE PAST 90° BEND TO PVC/GRS ADAPTER UNLESS OTHERWISE NOTED ON PLANS (SEE NOTE 4).

3) ALL DISCONNECTS SHALL BE NEMA-4X STAINLESS STEEL UNLESS OTHERWISE NOTED ON PLANS.

4)CONTRACTOR SHALL MAINTAIN 18" AIR GAP ON CONDUIT RUN COMING FROM WET WELL. AIR GAP SHALL BE LOCATED AT THE JUNCTION BOX. AIR GAP SHALL CONFORM TO THE NATIONAL ELECTRICAL CODE FOR CLASS 1, DIVISION 1 HAZARDOUS AREA. CONTRACTOR SHALL INSTALL HERMETIC SEALS AT THE END OF THE THE CONDUIT RUNS INTO VAULT WALL TO PREVENT MOISTURE FROM ENTERING CONDUIT. CONDUIT SHALL BE CONTINUOUS GRS FROM WET WELL TO 18" AIR GAP.

NOTES:
1. THE LIGHTNING ROD IS CONNECTED TO GROUND WITH AT LEAST TWO DOWN CONDUCTORS LOCATED ON OPPOSITE FACADES WHEREVER POSSIBLE.
2. THE DOWN CONDUCTORS MUST BE INSTALLED OUTSIDE THE BUILDING, AVOIDING THE PROXIMITY OF ELECTRICAL CABLES AND GAS. ITS PATH MUST BE AS STRAIGHT AS POSSIBLE, USING THE SHORTEST PATH TO EARTH, AVOIDING ANY SHARP BEND OR LIFT.
3. INSTALL IN ACCORDANCE WITH NFPA 780, NEC 250.60 AND NEC 250.106.
4. DETAIL SHOWN FOR REFERENCE ONLY.

Jerome Wastewater Treatment Plant Improvements

ADDENDUM #1

Date: May 7, 2026

Quest CDN #9117808

This addendum is to formally issue responses to bidder questions and minor modifications. Reminder: Acknowledge receipt of this addendum on the Bid Form.

Attachments:

1. Attachment 1 – Geotechnical Evaluation
2. Attachment 2 – C-410 Bid Form

Notice:

1. The non-mandatory pre-bid conference will be held on **Thursday May 14th** at **2:00 PM** at the Council Chambers, Town of Jerome, 600 Clark Street, Jerome AZ, 86331.

   The pre-bid conference will also be made available for **virtual attendees at the link below:**

   https://teams.microsoft.com/meet/21531934771837?p=2ZyfMU58TuhQfICc40

   Meeting ID: 215 319 347 718 37
   Passcode: DE22xX6D

Clarifications

1. It was brought to our attention that the project completion dates were not included in the bid manual. Form C-520 – Agreement Between Owner and Contractor, Section 4.03(A) shall be modified to reflect the project times as follows:

   "The Work will be substantially complete within **300** days after the date when the Contract Times commence to run as provided in Paragraph 4.01 of the General Conditions, and completed and ready for final payment in accordance with Paragraph 15.06 of the General Conditions within **330** days after the date when the Contract Times commence to run."

2. The bid form (form C-410 – Bid Form) has been updated and is **attached.**

Questions

1. We'd like to receive a copy of the geotechnical report for the Jerome WWTP.

   Response: Please find a copy of the geotechnical report attached to this addendum. The geotechnical report is also appended to the Technical Specifications included in the bid manual.

Re: Geotechnical Evaluation
Jerome WWTP Upgrades
Jerome, Arizona

Job No. 2522JW197

Western Technologies Inc. has completed the geotechnical evaluation for the waste water treatment plant upgrades and new wastewater pipeline to be located in Jerome, Arizona. This study was performed in general accordance with our proposal number 2522PW253 dated June 15, 2022. The results of our study, including the boring/test pit location diagrams, laboratory test results, boring/test pit logs, and the geotechnical recommendations are attached.

We have appreciated being of service to you in the geotechnical engineering phase of this project and are prepared to assist you during the construction phases as well. If design conditions change, or if you have any questions concerning this report or any of our testing, inspection, design and consulting services, please do not hesitate to contact us. We look forward to working with you on future projects.

Sincerely,
WESTERN TECHNOLOGIES, INC.
Geotechnical Engineering Services

Gregory L. E. Burr, R.G., E.I.T.
Director of Geotechnical Services

GEOTECHNICAL EVALUATION
JEROME WWTP UPGRADES
JEROME, ARIZONA
JOB NO. 2522JW197

1.0 PURPOSE

This report contains the results of our geotechnical evaluation for the proposed WWTP upgrades and new wastewater pipeline to be located at the existing wastewater treatment plant in Jerome, Arizona. The purpose of these services is to provide information and recommendations regarding:

- foundation design parameters
- slab-on-grade
- lateral earth pressures
- excavation conditions
- earthwork, including backfill placement, and suitability of existing soils for backfill materials
- drainage
- corrosivity
- on-site aggregate surfacing

Results of the field exploration, field tests, and laboratory testing program are presented in the Appendices.

2.0 PROJECT DESCRIPTION

Based on the revised information provided by Ms. Andrea Jaycox, Senior Project Coordinator, the proposed project will consist of approximately 2,400 linear feet of wastewater line, a new SBR Package Plant, and new primary settling and headworks tanks. The structures will be concrete and/or masonry construction with slab-on-grade floors. Maximum wall and column loads for the structures are assumed to be 3 kips per linear foot and 45 kips, respectively. The wastewater line invert elevations will be a maximum of 10 feet below the lowest existing site grades. We anticipate no extraordinary slab-on-grade criteria and that the finished structure bottom levels will be within about 2 to 3 feet of the existing site grades. In addition, approximately 2,000 linear feet of the existing access road will be resurfaced, widened, and additional pull-outs will be constructed. Should any of our information or assumptions not be correct, we request that the Client notify WT immediately.

3.0 SCOPE OF SERVICES

3.1 Field Exploration

Seven test pits and six borings were excavated/hand-auger drilled to depths of about 1 to 8 feet below the existing site grades at the approximate locations shown on the attached test pit/boring location diagrams. In addition, two samples of on-site rock were obtained for unit weight and unconfined compressive strength testing.

Logs of the test pits/borings are presented in Appendix A. Subsoils encountered during excavating/drilling were examined visually and sampled at selected depth intervals. A field log was prepared for each test pit/boring. These logs contain visual classifications of the materials encountered during excavation/drilling as well as interpolation of the subsurface conditions between samples. Final logs, included in Appendix A, represent our interpretation of the field logs and include modifications based on laboratory observations and tests of the field samples.

The final logs describe the materials encountered, their thicknesses, and the locations where samples were obtained. The Unified Soil Classification System was used to classify soils. The soil classification symbols appear on the test pit/boring logs and are briefly described in Appendix A. Local and regional geologic characteristics were used to estimate the seismic design criteria.

3.2 Laboratory Analyses

Laboratory analyses were performed on representative samples to aid in material classification and to estimate pertinent engineering properties of the on-site materials for preparation of this report. Testing was performed in general accordance with applicable ASTM and Arizona methods. The following tests were performed and the results are presented in Appendix B.

- Water content
- Dry density
- Remolded expansion potential
- Maximum density/optimum moisture
- Gradation
- Plasticity
- Soluble salts/sulfates/chlorides

- Corrosivity (ASTM A674)
- Unconfined compressive strength (rock)
- Unit weight (rock)

Test results were utilized in the development of the recommendations contained in this report.

3.3 Analyses and Report

This geotechnical engineering report includes a description of the project, a discussion of the field and laboratory testing programs, a discussion of the subsurface conditions, and design recommendations as appropriate to the purpose. The scope of services for this project does not include, either specifically or by implication, any environmental assessment of the site, discovery of underground storage tanks or other underground structures, or identification of contaminated or hazardous materials or conditions. If there is concern about the potential for such contamination, other studies should be undertaken. We are available to discuss the scope of such studies with you.

4.0 SITE CONDITIONS

4.1 Surface

At the time of our field exploration, the site was a developed wastewater treatment plant. The exteriors of existing structures appeared to be in good to fair condition. The site is bordered on the east by the existing aggregate surfaced access road to the plant, and on all other sides by northeast-southwest oriented Bitter Creek that is about 50 to 100 feet wide and 20 to 30 feet deep that directs flow to the northeast. The ground surface was relatively flat in the developed portions of the site, steep to very steep surrounding the developed areas, and contained a sparse to moderate growth of native juniper trees, bushes, cacti, grasses and weeds. Surface drainage appeared to be fair to poor with some evidence of previous surface water ponding in the developed portions of the site, and good in the undeveloped portions of the site by means of surface sheet flow to the west and north down the existing slopes into Bitter Creek.

4.2 Subsurface

As presented on the test pit/boring logs, surface and subsoils extending to the full depth of exploration at all locations explored consisted of medium to near-high plasticity Clayey SANDS with variable amounts of gravel, Clayey GRAVELS with variable amounts of sand and non-plastic Silty GRAVELS with variable amounts of sand. All soils encountered contained random amounts of limestone cobbles and boulders. Refusal to excavator/auger penetration occurred in all test pits/borings at depths of about 1 to 8 feet on LIMESTONE or limestone cobbles and boulders. Groundwater was not encountered in any test pit/boring at the time of exploration. The logs in Appendix A show details of the subsurface conditions encountered during the field exploration.

The test pit/boring logs included in this report are indicators of subsurface conditions only at the specific location and date noted. Variations from the field conditions represented by the test pits/borings may become evident during construction. If variations appear, we should be contacted to re-evaluate our recommendations.

5.0 GEOTECHNICAL PROPERTIES

Near-surface soils range from non-plastic to near-high plasticity. The site soils exhibit moderate expansion potential when recompacted, confined by loads approximating floor loads and saturated in accordance with standard Arizona test methods. Slabs-on-grade supported on recompacted native soils have a moderate potential for heaving if the water content of the soil increases. The site soils were too granular to obtain samples suitable for compression testing. Two samples of the on-site rock were obtained for unit weight and unconfined compressive strength testing and the results are present in Appendix B.

6.0 RECOMMENDATIONS

6.1 General

Recommendations contained in this report are based on our understanding of the project criteria described in Section 2.0, **PROJECT DESCRIPTION**, and the assumption that the soil and subsurface conditions are those disclosed by the test pits/borings. Others may change the plans, final elevations, number and type of structures, foundation loads, and tank bottom levels during design or construction. Substantially different subsurface conditions

from those described herein may be encountered or become known. Any changes in the project criteria or subsurface conditions shall be brought to our attention in writing.

6.2 Design Considerations

Existing fill was not encountered in the test pits/borings, but was observed on the site. We understand that no documentation is available regarding any field density testing that may have been performed during fill construction. Based on this lack of documentation and the overall condition of the fill observed, we consider the fill to be uncontrolled and recommend removal of existing fill in all structural areas.

Several of the test pits/borings indicate the presence of medium to near-high plasticity clayey soils on the site. These soils will expand or swell with an increase in moisture content. The structures and related improvements situated on expansive soils will be subject to movements if the foundation soils experience an increase in moisture content. It should be understood that if moisture penetrates expansive soils, there will likely be heave and possible resultant cracking/distress of the proposed structures and related improvements. It should be noted that shallow foundation systems are not designed to resist soil movements resulting from sewer or plumbing leaks, excessive or leaking irrigation systems, poor drainage, or water ponding near the structures. Construction of site fences, screen walls and other miscellaneous improvements such as exterior slabs-on-grade that typically fall under building code guidelines will be susceptible to heave as well.

Cobbles and boulders were encountered in the test pits/borings. These oversized materials, greater than 3 inches, could present construction difficulties for foundation, utility trenches and other excavations. In cut areas and excavations, exposed oversized materials should be removed.

6.3 Tank Foundations

Above-ground tanks may be supported on compacted aggregate underlain by a minimum thickness of 1 foot of site soils removed and replaced with properly compacted, imported engineered fill material. Below-ground tanks may be supported on scarified and recompacted native soils. Any existing fill should be removed in all proposed tank areas. The tank pads, prepared as recommended in the **EARTHWORK** section of the report, will be suitable to support a maximum dead plus live-load pressure of up to 3000 pounds per square foot. We anticipate that total and differential movements of the proposed above-ground tank structures, supported as recommended, should be within tolerable limits of

the tank manufacturer, typically uniform settlement of less than 2 inches and differential settlement less than 0.5-inch per 32 feet of circumference. Total and differential movements of the proposed below-ground tank structures, supported as recommended, are anticipated to be 1 inch and 3/4 inch, respectively. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

We recommend that the geotechnical engineer or his representative observe the tank pad preparation. It should be determined whether the materials exposed are similar to those anticipated for support of the tanks. Any soft, loose or unacceptable materials should be undercut to suitable materials and backfilled with engineered fill material.

6.4 Manhole Foundations

The soils encountered along the alignment are expected to have moderate to high bearing capacity at anticipated manhole foundation depths. Other than removal of any soft, loose, unstable or disturbed materials from beneath manhole foundations, specialized treatment of soils beneath manholes is not anticipated.

6.5 Lateral Design Criteria for Thrust Blocks

For any thrust block design, lateral loads may be resisted using a soil bearing pressure of 2500 pounds per square foot (psf). All fill against or around thrust blocks should be compacted to densities specified herein under **Placement and Compaction**.

6.6 Conventional Spread Footings

If conventional spread footings are used, they should be underlain by a minimum thickness of 1 foot of lean mix (2-sack) concrete backfill. Footings should bear at least 2 feet below the lowest adjacent finished grade. Footings may be designed to impose a maximum dead plus live-load pressure of up to 2500 pounds per square foot.

We anticipate that total movement of the proposed structures, supported as recommended, should be less than 1 inch. Differential movement should be less than ¾ inch. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

Finished grade is the lowest adjacent grade for perimeter footings and floor level for interior footings. The design bearing capacity applies to dead loads plus design live load conditions. Recommended minimum widths of column and wall footings are 24 inches and 16 inches, respectively. The bearing value given is a net bearing value and the weight of the concrete in the footings may be ignored.

All footings, stem walls and masonry walls should be reinforced to reduce the potential for distress caused by differential foundation movements. The use of joints at openings or other discontinuities in masonry walls is recommended.

We recommend that the geotechnical engineer or his representative observe the footing excavations before reinforcing steel and concrete are placed. It should be determined whether the soils exposed are similar to those anticipated for support of the footings. Any soft, loose or unacceptable soils should be undercut to suitable materials and backfilled with either lean mix or structural concrete.

6.7 Lateral Design Criteria

For retaining walls located above any free water surface with no surcharge loads, recommended equivalent fluid pressures and coefficients of base friction for unrestrained elements are:

- Active:
  Undisturbed subsoil .....38 psf/ft
  Compacted granular backfill .....30 psf/ft
  Compacted on-site soils (low expansive potential) .....38 psf/ft
  Clayey site soils ..... not recommended for use

- Passive:
  Shallow wall footings .....220 psf/ft
  Shallow column footings.....350 psf/ft
  Dense rock .....500 psf/ft

- Coefficient of base friction
  Soil.....0.35*
  Rock.....0.55

* The coefficient of base friction (soil) should be reduced to 0.25 when used in conjunction with passive pressure.

Where the design includes restrained elements, the following equivalent fluid pressures are recommended:

- At-rest:
  Undisturbed subsoil .....64 psf/ft
  Compacted granular backfill .....55 psf/ft

These lateral earth pressures are not applicable for submerged soils. We should be consulted for additional recommendations if such conditions are to be included in the design. Any surcharge from adjacent loadings must also be considered. Walls below grade should be waterproofed.

We recommend a free-draining soil layer or manufactured geocomposite material, be constructed adjacent to the back of the retaining wall. A filter may be required between the soil backfill and drainage layer. This drainage zone should help prevent hydrostatic pressure buildup. This vertical drain should be tied into a gravity drainage system at the base of the retaining wall. It is important that all backfill be properly placed and compacted. Backfill should be mechanically compacted in layers. Flooding or jetting should not be permitted. Care should be taken not to damage the walls when placing the backfill. Backfills should be inspected and tested during placement.

Fill against footings, stem walls and retaining walls should be compacted to densities specified in **EARTHWORK**. Medium to high plasticity clay soils should not be used as backfill against retaining walls. Compaction of each lift adjacent to walls should be accomplished with hand-operated tampers or other lightweight compactors. Overcompaction may cause excessive lateral earth pressures which could result in wall movements.

6.8 Seismic Considerations

Structures should be designed in accordance with applicable building codes. The seismic design parameters presented in the following table, in accordance with the 2018 International Building Code and ASCE 7-16, are applicable to the project site:

Seismic Design Parameters International Building Code 2018, ASCE 7-16	
Soil Site Class	C
Mapped Spectral Response Acceleration at 0.2 sec period (S_s)	0.31g
Mapped Spectral Response Acceleration at 1.0 sec period (S_1)	0.097g
Site Coefficient for 0.2 sec period (F_a)	1.3
Site Coefficient for 1.0 sec period (F_v)	1.5
Design Spectral Response Acceleration at 0.2 sec period (S_{DS})	0.269g
Design Spectral Response Acceleration at 1.0 sec period (S_{D1})	0.097g

The soil site class is based upon conditions identified in shallow exploratory test pits/borings and local knowledge of the geotechnical conditions in the vicinity of the site. Conditions extending beyond the depth of our test pits/borings to a depth of 100 feet were assumed for the purposes of providing the information presented in the table. Based upon the density of the on-site soils and lack of groundwater, the potential settlement and lateral spread due to liquefaction is not a considered to be a significant concern on the site.

6.9 Slab-on-Grade Support

Slabs-on-grade should be supported on a minimum thickness of 1 foot of properly placed and compacted, imported, low expansive, engineered fill. For design of interior slabs-on-grade, we recommend using a modulus of subgrade reaction (k) of 200 pounds per cubic inch (pci) for the on-site soils and 225 pci for imported fill material, based on a 30-inch diameter plate. The slab subgrade should be prepared by the procedures outlined in this report. A minimum 4-inch thick layer of base course should be provided beneath all slabs to help prevent capillary rise and a damp slab.

All concrete placement and curing operations should follow the American Concrete Institute manual recommendations. Improper curing techniques and/or high slump (water-cement ratio) could cause excessive shrinkage, cracking or curling. The plastic properties of the concrete should be documented at the time of placement and specimens should also be prepared for strength testing to verify compliance with project specifications. Concrete slabs should be allowed to cure adequately before placing vinyl or other moisture sensitive floor covering.

6.10 Drainage

The major cause of soil-related foundation and slab-on-ground problems is moisture increase in soils below structures. Properly functioning conventional foundations and floor slabs-on-ground require appropriately constructed and maintained site drainage conditions. Therefore, it is extremely important that positive drainage be provided during construction and maintained throughout the life of the structures. It is also important that proper planning and control of any landscape and irrigation practices be performed.

Infiltration of water into utility or foundation excavations must be prevented during construction. Backfill against footings, exterior walls, and in utility line trenches should be well compacted and free of all construction debris to minimize the possibility of moisture infiltration. If utility line trenches are backfilled with a granular material, then a clay or concrete plug should be placed in the trench adjacent to the structure to prevent water from following the trench back under the structure.

6.11 Aggregate-Surfaced Roadways

For unpaved sections, we recommend an initial minimum thickness of 6 inches of granular cover material. As with any unbound vehicular section, additional material will be required over time as cover material is lost due to grading, snow plowing, lateral shoving, and intrusion of the cover material into the underlying subgrade soils. To help reduce intrusion, consideration should be given to the use of a geotextile separator fabric placed at the cover material/subgrade soil interface.

6.12 Corrosivity

Based on the laboratory test results, the on-site soils exhibit a low to moderate corrosive potential to ductile iron piping. This information should be used as an aid in choosing the construction materials that will be in contact with these soils and that will need to be resistant to various corrosive forces. Manufacturers' representatives should be contacted regarding the specific corrosivity resistance for their particular product.

The chemical test results indicate that the soils at the site classify as moderately corrosive to concrete, Class S1 in accordance with ACI 318, Table 4.2.1. Concrete should be made with a cement that provides sulfate resistance and that has a maximum water-cementitious materials ratio and minimum compressive strength set forth in the provisions of ACI 318, Section 4.3.

7.0 EARTHWORK

7.1 General

The conclusions contained in this report for the proposed construction are contingent upon compliance with recommendations presented in this section. Any excavating, trenching, or disturbance which occurs after completion of the earthwork must be backfilled, compacted and tested in accordance with the recommendations contained herein. It is not reasonable to rely upon our conclusions and recommendations if any future unobserved and untested trenching, grading or backfilling occurs.

Although underground facilities were not observed, such features might be encountered during construction. These features should be demolished and removed in accordance with the recommendations of the geotechnical engineer. Any loose or disturbed soils resulting from demolition and/or removal of existing facilities should also be removed and/or recompacted as engineered fill, and any excavations should be backfilled in accordance with recommendations presented herein.

7.2 Site Clearing

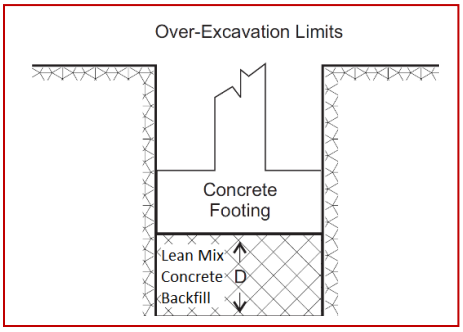
Strip and remove all existing fill, remaining vegetation, debris, aggregate surfacing and/or concrete pavement and any other deleterious materials from the building, tank and wastewater line area. The building/tank area is defined as that area within the structure footprint plus 5 feet beyond the perimeter of the footprint. All exposed surfaces should be free of mounds and depressions which could prevent uniform compaction.

7.3 Excavation

We anticipate that excavations into the shallow site soils for the proposed construction can be accomplished with conventional equipment. Excavations penetrating the underlying limestone will require the use of heavy-duty, specialized equipment, likely together with large pneumatic hammers, to facilitate rock break-up and removal.

Cut slopes into the shallow on-site soils should be constructed no steeper than 1:1 (horizontal:vertical) and 0.5:1 (horizontal:vertical) in the limestone bedrock. Fill slopes should be constructed no steeper than 1.5:1 (horizontal:vertical) to limit erosion, and to provide slope protection. Natural slopes exceeding a 5:1 (horizontal:vertical) slope

configuration, should be benched prior to fill placement. Natural slopes which will support fill embankments should be benched at a maximum 5:1 slope.

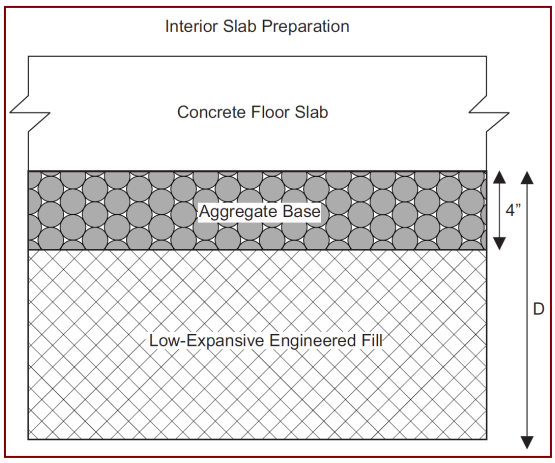


On-site soils will pump or become unworkable at high water contents. Workability may be improved by scarifying and drying. Overexcavation of wet zones and replacement with drier granular materials may be necessary. The use of lightweight excavation and compaction equipment may be required to minimize subgrade pumping.

7.4 Tank Pad Preparation

Following removal of any existing fill material, above-ground tanks should be founded on a minimum thickness of 1 foot of imported, properly compacted, low expansive, engineered fill material. Remove existing soils to a minimum depth of 1 foot below the bottom of the above-ground tank elevation. Following the removal, and immediately below all below-grade tanks, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. The subgrade preparation should be accomplished in a manner which will result in uniform water contents and densities after compaction. In areas where dense limestone is encountered, scarification and recompaction is not required.

7.5 Spread Footing Foundation Preparation



Following removal of any existing fill material in footing areas, remove existing soils to a minimum depth of 1 foot below the bottom of the footing. Removal may extend straight down along the sides of the footing. Replace the removed soils with properly consolidated, lean mix (2-sack) concrete backfill material.

7.6 Slab-on-Grade Preparation

Following removal of any existing fill material, slabs-on-grade should be founded on a minimum thickness of 1 foot of imported, low expansive, engineered fill material. Remove native soils, as necessary, to a minimum depth of 1 foot below the bottom of the slab (depth D in the diagram below). Following the removal, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. Replace the removed soils with properly compacted, imported, low to non-expansive, engineered fill material. The

aggregate base course below the slab may be included as part of the low to non-expansive engineered fill. In areas where dense limestone is encountered, scarification and recompaction is not required.

The subgrade preparation should be accomplished in a manner that will result in uniform water contents and densities after compaction.

7.7 Exterior Slab Preparation

The soils on this site have the potential to expand and shrink with changes in moisture content. In addition, frost penetration in the upper soils may cause surface heaving. Therefore, relatively lightweight exterior concrete flatwork such as sidewalks and patios may experience movements resulting in cracking or vertical offsets. To reduce the potential for damage, we recommend:

- Use of fill with low expansion potential
- Use of fill with low to negligible frost susceptibility
- Placement of effective control joints on relatively close centers
- Moisture-density control during placement of subbase fills
- Provision for adequate drainage in areas adjoining the slabs
- Use of designs which allow vertical movement between the exterior slabs and adjoining structural elements

It should be understood that these recommendations will help reduce the potential for soil movement and resulting distress, but will not eliminate this potential. Furthermore, the use of municipal specifications and details may not mitigate the potential for movements of the expansive or frost susceptible on-site soils.

7.8 Materials

a. Clean on-site native soils with a maximum dimension of 6 inches or imported materials may be used as fill material for the following:

- backfill (non-slab areas)
- Subbase fill in aggregate surfaced roadway areas

b. On-site clayey soils should not be used as subbase fill or backfill below any tanks, foundations, slabs-on-grade or behind any retaining walls. Imported soils with low expansive potential should be used in these areas.

c. Frozen soils should not be used as fill or backfill.

d. Lean mix (2-sack) concrete backfill should consist of aggregate base course type material combined with 2 sacks of cement per cubic yard. A coarse rock mix should not be used.

e. Imported soils should conform to the following:

- Gradation (ASTM C136): percent finer by weight

6"	100
4"	85-100
¾”	70-100
No. 4 Sieve	50-100
No. 200 Sieve	40 (max)

- Maximum expansive potential (%)[1] 1.5

- Maximum soluble sulfates (%) 0.10

f. Base course should conform to current Yavapai County specifications.

[1] Measured on a sample compacted to approximately 95 percent of the ASTM D698 maximum dry density at about 3 percent below optimum water content. The sample is confined under a 100 psf surcharge and submerged.

7.9 Placement and Compaction

a. Place and compact fill in horizontal lifts, using equipment and procedures that will produce recommended water contents and densities throughout the lift.

b. Uncompacted fill lifts should not exceed 8 inches.

c. Materials should be compacted to the following:

Material	Minimum Percent Compaction (ASTM D698)
• On-site soil, reworked:	
Below tanks	95
Below slabs-on-grade	90
Aggregate surfaced roadway areas	95
• On-site clayey soils, fill:	
Aggregate surfaced roadway areas	95
Landscape areas	85
• On-site low expansive potential soils, fill:	
Aggregate surfaced roadway areas	95
Below slabs-on-grade	95
Below tanks	95
• Imported soil, fill:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	95
• Aggregate base:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	100

Minimum Percent
Material Compaction (ASTM D698)

- Backfill:
  Structural 95
  Nonstructural 90

`

d. On-site soils should be compacted with a moisture content in the range of 1 percent below to 3 percent above optimum. Imported soils with low expansive potential and aggregate base course materials should be compacted with a moisture content in the range of 3 percent below to 3 percent above optimum.

7.10 Compliance

Recommendations for structural elements supported on compacted fills or prepared subgrade depend upon compliance with **EARTHWORK** recommendations. To assess compliance, observation and testing should be performed under the direction of a geotechnical engineer.

8.0 ADDITIONAL SERVICES

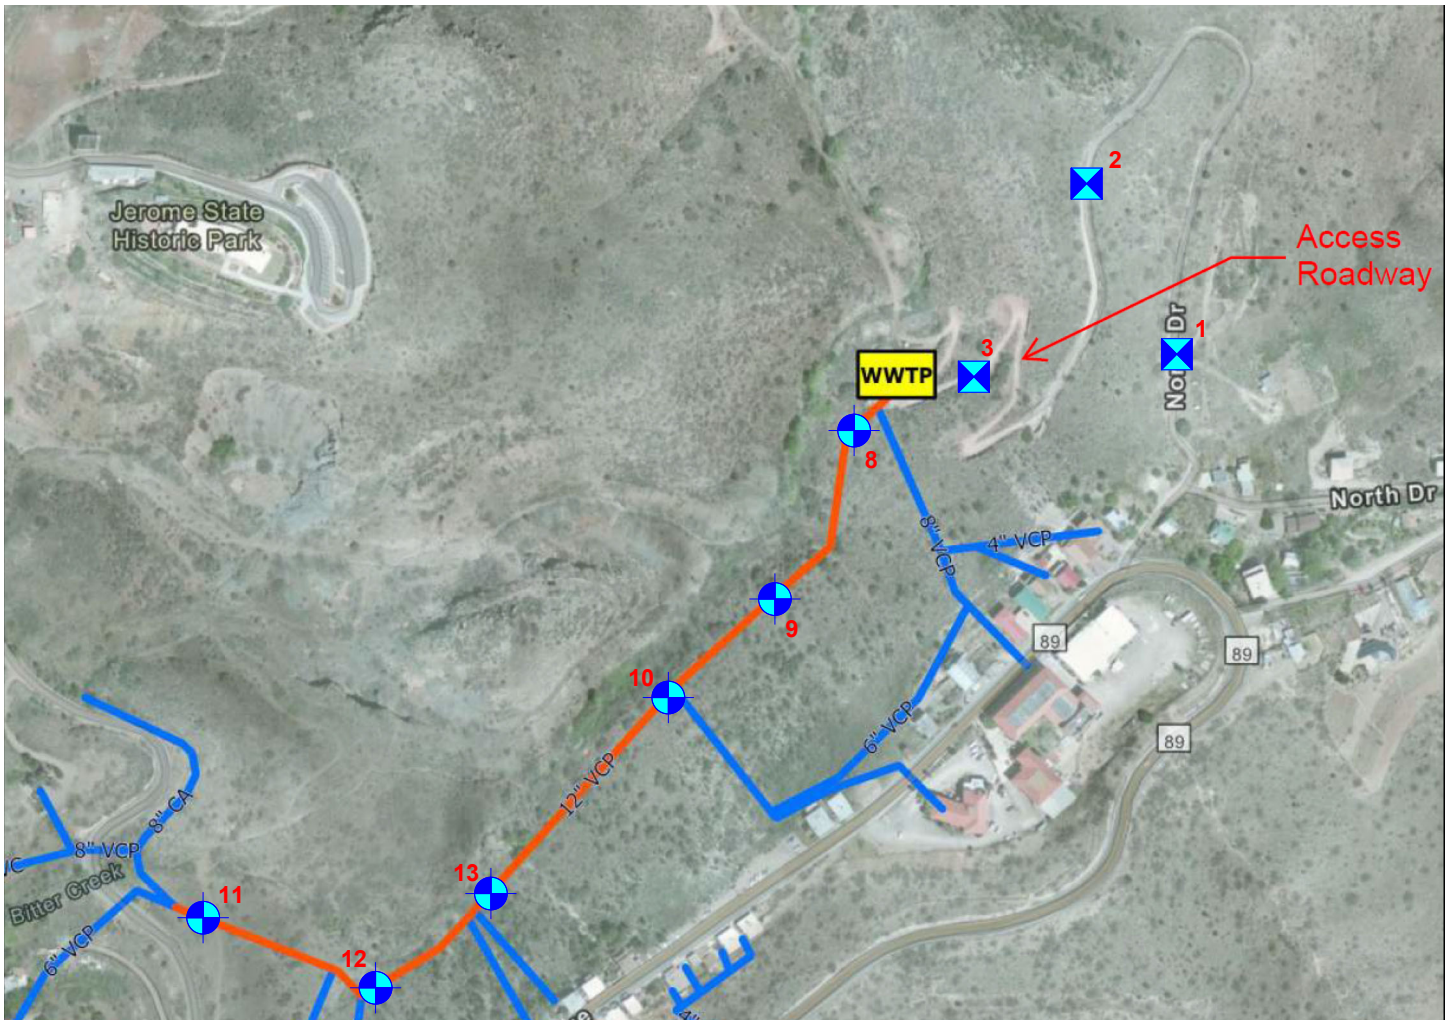
The recommendations provided in this report are based on the assumption that a sufficient schedule of tests and observations will be performed during construction to verify compliance. At a minimum, these tests and observations should be comprised of the following:

- Observations and testing during site preparation and earthwork;
- Observation of foundation excavations; and
- Consultation as may be required during construction.

Retaining the geotechnical engineer who developed your report to provide construction observation is the best way to verify compliance, and to help you manage the risks associated with unanticipated conditions.

9.0 LIMITATIONS

This report has been prepared assuming the project criteria described in Section 2.0. If changes in the project criteria occur, or if different subsurface conditions are encountered or become known, the conclusions and recommendations presented herein shall become invalid. In any such event, WT should be contacted in order to assess the effect that such variations may have on our conclusions and recommendations.



The recommendations presented are based entirely upon data derived from a limited number of samples obtained from widely spaced test pits/borings. The attached logs are indicators of subsurface conditions only at the specific locations and times noted. This report assumes the uniformity of the geology and soil structure between test pits/borings, however variations can and often do exist. Whenever any deviation, difference or change is encountered or becomes known, WT should be contacted.

This report is for the exclusive benefit of our client alone. There are no intended third-party beneficiaries of our contract with the client or this report, and nothing contained in the contract or this report shall create any express or implied contractual or any other relationship with, or claim or cause of action for, any third party against WT.

This report is valid for the earlier of one year from the date of issuance, a change in circumstances, or discovered variations. After expiration, no person or entity shall rely on this report without the express written authorization of WT.

10.0 CLOSURE

We prepared this report as an aid to the designers of the proposed project. The comments, statements, recommendations and conclusions set forth in this report reflect the opinions of the authors. These opinions are based upon data obtained at the location of the test pits/borings, and from laboratory tests. Work on your project was performed in accordance with generally accepted standards and practices utilized by professionals providing similar services in this locality. No other warranty, express or implied, is made.

Allowable Soil Bearing Capacity	The recommended maximum contact stress developed at the interface of the foundation element and the supporting material.
Backfill	A specified material placed and compacted in a confined area.
Base Course	A layer of specified aggregate material placed on a subgrade or subbase.
Base Course Grade	Top of base course.
Bench	A horizontal surface in a sloped deposit.
Caisson/Drilled Shaft	A concrete foundation element cast in a circular excavation which may have an enlarged base (or belled caisson).
Concrete Slabs-On-Grade	A concrete surface layer cast directly upon base course, subbase or subgrade.
Crushed Rock Base Course	A base course composed of crushed rock of a specified gradation.
Differential Settlement	Unequal settlement between or within foundation elements of a structure.
Engineered Fill	Specified soil or aggregate material placed and compacted to specified density and/or moisture conditions under observations of a representative of a soil engineer.
Existing Fill	Materials deposited through the action of man prior to exploration of the site.
Existing Grade	The ground surface at the time of field exploration.
Expansive Potential	The potential of a soil to expand (increase in volume) due to absorption of moisture.
Fill	Materials deposited by the actions of man.
Finished Grade	The final grade created as a part of the project.
Gravel Base Course	A base course composed of naturally occurring gravel with a specified gradation.
Heave	Upward movement.
Native Grade	The naturally occurring ground surface.
Native Soil	Naturally occurring on-site soil.
Rock	A natural aggregate of mineral grains connected by strong and permanent cohesive forces. Usually requires drilling, wedging, blasting or other methods of extraordinary force for excavation.
Sand and Gravel Base Course	A base course of sand and gravel of a specified gradation.
Sand Base Course	A base course composed primarily of sand of a specified gradation.
Scarify	To mechanically loosen soil or break down existing soil structure.
Settlement	Downward movement.
Soil	Any unconsolidated material composed of discrete solid particles, derived from the physical and/or chemical disintegration of vegetable or mineral matter, which can be separated by gentle mechanical means such as agitation in water.
Strip	To remove from present location.
Subbase	A layer of specified material placed to form a layer between the subgrade and base course.
Subbase Grade	Top of subbase.
Subgrade	Prepared native soil surface.

The number shown in **"BORING NO."** or "**TEST PIT NO.**" refers to the approximate location of the same number indicated on the "Boring/Test Pit Location Diagram" as positioned in the field by pacing or measurement from property lines and/or existing features.

"DRILLING TYPE" refers to the exploratory equipment used in the boring. Hand auger methods were used. The dimension presented is the outside diameter of the auger used.

"EQUIPMENT TYPE" refers to the equipment used in the excavation of the test pit, and may include the width of the bucket on the excavator and the use of "rock" teeth or attachments.

"SAMPLE TYPE" refers to the form of sample recovery, in which **R** = Ring-lined sample, **G** = Grab sample.

"DRY DENSITY (LBS/CU FT)" refers to the laboratory-determined dry density in pounds per cubic foot. The symbol **"NR"** indicates that no sample was recovered.

"WATER (MOISTURE) CONTENT (% OF DRY WT.)" refers to the laboratory-determined water content in percent using the standard test method ASTM D2216.

"USCS" refers to the "Unified Soil Classification System" Group Symbol for the soil type as defined by ASTM D2487 and D2488. The soils were classified visually in the field, and where appropriate, classifications were modified by visual examination of samples in the laboratory and/or by appropriate tests.

These notes and boring/test pit logs are intended for use in conjunction with the purposes of our services defined in the text. Boring/test pit log data should not be construed as part of the construction plans nor as defining construction conditions.

Boring/test pit logs depict our interpretations of subsurface conditions at the locations and on the date(s) noted. Variations in subsurface conditions and characteristics may occur between borings/test pits. Groundwater levels may fluctuate due to seasonal variations and other factors.

The stratification lines shown on the boring/test pit logs represent our interpretation of the approximate boundary between soil or rock types based upon visual field classification at the boring/test pit location. The transition between materials is approximate and may be more or less gradual than indicated.

CORROSIVITY TEST RESULTS

The procedures for soil survey tests and observations can be found in Appendix X1.1 of ASTM A674-10 and includes five soil properties: earth resistivity • pH • redox potential • sulfides • moisture.

Test Pit 7(0-5):

Analysis	Results		Points
Resistivity (ohm-cm)	1401		10
pH	8.5		0
Redox Potential (mV)	+134		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	13

Boring 12(0-1):

Analysis	Results		Points
Resistivity (ohm-cm)	2481		2
pH	8.1		0
Redox Potential (mV)	+314		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	5

The test procedure states that if the sum of the points is greater than 10, the soil is considered corrosive to ductile iron pipe and special protection against exterior corrosion is necessary. This conclusion is limited to soil corrosion and does not include consideration of stray direct current.

BID FORM FOR CONSTRUCTION CONTRACT
ADDENDUM 1 VERSION

Contractor Name: _____

The terms used in this Bid with initial capital letters have the meanings stated in the Instructions to Bidders, the General Conditions, and the Supplementary Conditions.

ARTICLE 1—OWNER AND BIDDER

1.01 This Bid is submitted to:

Town of Jerome
Submitted electronically via email to tpierce@pacewater.com. Alternatively, Bidder may submit a hard copy the Town of Jerome, 600 Clark Street, Jerome, AZ 86331.

The undersigned Bidder proposes and agrees, if this Bid is accepted, to enter into an Agreement with Owner in the form included in the Bidding Documents to perform all Work as specified or indicated in the Bidding Documents for the prices and within the times indicated in this Bid and in accordance with the other terms and conditions of the Bidding Documents.

ARTICLE 2—ATTACHMENTS TO THIS BID

2.01 The following documents are submitted with and made a condition of this Bid:

A. Required Bid security;

B. List of Proposed Subcontractors;

~~C. List of Proposed Suppliers;~~

D. Evidence of authority to do business in the state of the Project; or a written covenant to obtain such authority within the time for acceptance of Bids;

E. Contractor's license number as evidence of Bidder's State Contractor's License or a covenant by Bidder to obtain said license within the time for acceptance of Bids;

F. Required Bidder Qualification Statement with supporting data; ~~and~~

G. If Bid amount exceeds $10,000, signed Compliance Statement (RD 400-6). Refer to specific equal opportunity requirements set forth in the Supplementary Conditions of the Construction Contract (EJCDC C-800);

H. If Bid amount exceeds $25,000, signed Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion - Lower Tier Covered Transactions (AD-1048);

I. If Bid amount exceeds $100,000, signed RD Instruction 1940-Q Exhibit A-1, Certification for Contracts, Grants, and Loans.

ARTICLE 3—BASIS OF BID—LUMP SUM BID AND UNIT PRICES

3.01 *Lump Sum Bids*

A. Bidder will complete the Work in accordance with the Contract Documents for the following lump sum (stipulated) price(s), together with any Unit Prices indicated in Paragraph 3.02:

ARTICLE 4—DELETED

ARTICLE 5—DELETED

ARTICLE 6—TIME OF COMPLETION

6.01 Bidder agrees that the Work will be substantially complete and will be completed and ready for final payment in accordance with Paragraph 15.06 of the General Conditions on or before the dates or within the number of calendar days indicated in the Agreement.

6.02 **[Deleted]**

6.03 **[Deleted]**

6.04 Bidder accepts the provisions of the Agreement as to liquidated damages.

ARTICLE 7—BIDDER'S ACKNOWLEDGEMENTS: ACCEPTANCE PERIOD, INSTRUCTIONS, AND RECEIPT OF ADDENDA

7.01 *Bid Acceptance Period*

A. This Bid will remain subject to acceptance for 60 days after the Bid opening, or for such longer period of time that Bidder may agree to in writing upon request of Owner.

7.02 *Instructions to Bidders*

A. Bidder accepts all of the terms and conditions of the Instructions to Bidders, including without limitation those dealing with the disposition of Bid security.

7.03 *Receipt of Addenda*

A. Bidder hereby acknowledges receipt of the following Addenda:

Addendum Number	Addendum Date

Copyright© 2018 National Society of Professional Engineers, American Council of Engineering Companies, and American Society of Civil Engineers. All rights reserved.

7.04 **[Deleted]**

ARTICLE 8—BIDDER'S REPRESENTATIONS AND CERTIFICATIONS

8.01 *Bidder's Representations*

A. In submitting this Bid, Bidder represents the following:

1. Bidder has examined and carefully studied the Bidding Documents, including Addenda.

2. **[Deleted]**

3. Bidder is familiar with all Laws and Regulations that may affect cost, progress, and performance of the Work**, including all American Iron and Steel requirements.**

4. Bidder has carefully studied the reports of explorations and tests of subsurface conditions at or adjacent to the Site and the drawings of physical conditions relating to existing surface or subsurface structures at the Site that have been identified in the Supplementary Conditions, with respect to the Technical Data in such reports and drawings.

5. Bidder has carefully studied the reports and drawings relating to Hazardous Environmental Conditions, if any, at or adjacent to the Site that have been identified in the Supplementary Conditions, with respect to Technical Data in such reports and drawings.

6. Bidder has considered the information known to Bidder itself; information commonly known to contractors doing business in the locality of the Site; information and observations obtained from visits to the Site; the Bidding Documents; and the Technical Data identified in the Supplementary Conditions or by definition, with respect to the effect of such information, observations, and Technical Data on (a) the cost, progress, and performance of the Work; (b) the means, methods, techniques, sequences, and procedures of construction to be employed by Bidder, if selected as Contractor; and (c) Bidder's (Contractor's) safety precautions and programs.

7. Based on the information and observations referred to in the preceding paragraph, Bidder agrees that no further examinations, investigations, explorations, tests, studies, or data are necessary for the performance of the Work at the Contract Price, within the Contract Times, and in accordance with the other terms and conditions of the Contract.

8. Bidder is aware of the general nature of work to be performed by Owner and others at the Site that relates to the Work as indicated in the Bidding Documents.

9. Bidder has given Engineer written notice of all conflicts, errors, ambiguities, or discrepancies that Bidder has discovered in the Bidding Documents, and of discrepancies between Site conditions and the Contract Documents, and the written resolution thereof by Engineer is acceptable to Contractor.

10. The Bidding Documents are generally sufficient to indicate and convey understanding of all terms and conditions for performance and furnishing of the Work.

Copyright© 2018 National Society of Professional Engineers, American Council of Engineering Companies, and American Society of Civil Engineers. All rights reserved.

11. The submission of this Bid constitutes an incontrovertible representation by Bidder that without exception the Bid and all prices in the Bid are premised upon performing and furnishing the Work required by the Bidding Documents.

8.02 *Bidder's Certifications*

A. The Bidder certifies the following:

1. This Bid is genuine and not made in the interest of or on behalf of any undisclosed individual or entity and is not submitted in conformity with any collusive agreement or rules of any group, association, organization, or corporation.

2. Bidder has not directly or indirectly induced or solicited any other Bidder to submit a false or sham Bid.

3. Bidder has not solicited or induced any individual or entity to refrain from bidding.

4. Bidder has not engaged in corrupt, fraudulent, collusive, or coercive practices in competing for the Contract. For the purposes of this Paragraph 8.02.A:

a. Corrupt practice means the offering, giving, receiving, or soliciting of anything of value likely to influence the action of a public official in the bidding process.

b. Fraudulent practice means an intentional misrepresentation of facts made (a) to influence the bidding process to the detriment of Owner, (b) to establish bid prices at artificial non-competitive levels, or (c) to deprive Owner of the benefits of free and open competition.

c. Collusive practice means a scheme or arrangement between two or more Bidders, with or without the knowledge of Owner, a purpose of which is to establish bid prices at artificial, non-competitive levels.

d. Coercive practice means harming or threatening to harm, directly or indirectly, persons or their property to influence their participation in the bidding process or affect the execution of the Contract.

Re: Geotechnical Evaluation
Jerome WWTP Upgrades
Jerome, Arizona

Job No. 2522JW197

Western Technologies Inc. has completed the geotechnical evaluation for the waste water treatment plant upgrades and new wastewater pipeline to be located in Jerome, Arizona. This study was performed in general accordance with our proposal number 2522PW253 dated June 15, 2022. The results of our study, including the boring/test pit location diagrams, laboratory test results, boring/test pit logs, and the geotechnical recommendations are attached.

We have appreciated being of service to you in the geotechnical engineering phase of this project and are prepared to assist you during the construction phases as well. If design conditions change, or if you have any questions concerning this report or any of our testing, inspection, design and consulting services, please do not hesitate to contact us. We look forward to working with you on future projects.

Sincerely,
WESTERN TECHNOLOGIES, INC.
Geotechnical Engineering Services

GEOTECHNICAL EVALUATION
JEROME WWTP UPGRADES
JEROME, ARIZONA
JOB NO. 2522JW197

1.0 PURPOSE

This report contains the results of our geotechnical evaluation for the proposed WWTP upgrades and new wastewater pipeline to be located at the existing wastewater treatment plant in Jerome, Arizona. The purpose of these services is to provide information and recommendations regarding:

- foundation design parameters
- slab-on-grade
- lateral earth pressures
- excavation conditions
- earthwork, including backfill placement, and suitability of existing soils for backfill materials
- drainage
- corrosivity
- on-site aggregate surfacing

Results of the field exploration, field tests, and laboratory testing program are presented in the Appendices.

2.0 PROJECT DESCRIPTION

Based on the revised information provided by Ms. Andrea Jaycox, Senior Project Coordinator, the proposed project will consist of approximately 2,400 linear feet of wastewater line, a new SBR Package Plant, and new primary settling and headworks tanks. The structures will be concrete and/or masonry construction with slab-on-grade floors. Maximum wall and column loads for the structures are assumed to be 3 kips per linear foot and 45 kips, respectively. The wastewater line invert elevations will be a maximum of 10 feet below the lowest existing site grades. We anticipate no extraordinary slab-on-grade criteria and that the finished structure bottom levels will be within about 2 to 3 feet of the existing site grades. In addition, approximately 2,000 linear feet of the existing access road will be resurfaced, widened, and additional pull-outs will be constructed. Should any of our information or assumptions not be correct, we request that the Client notify WT immediately.

3.0 SCOPE OF SERVICES

3.1 Field Exploration

Seven test pits and six borings were excavated/hand-auger drilled to depths of about 1 to 8 feet below the existing site grades at the approximate locations shown on the attached test pit/boring location diagrams. In addition, two samples of on-site rock were obtained for unit weight and unconfined compressive strength testing.

Logs of the test pits/borings are presented in Appendix A. Subsoils encountered during excavating/drilling were examined visually and sampled at selected depth intervals. A field log was prepared for each test pit/boring. These logs contain visual classifications of the materials encountered during excavation/drilling as well as interpolation of the subsurface conditions between samples. Final logs, included in Appendix A, represent our interpretation of the field logs and include modifications based on laboratory observations and tests of the field samples.

The final logs describe the materials encountered, their thicknesses, and the locations where samples were obtained. The Unified Soil Classification System was used to classify soils. The soil classification symbols appear on the test pit/boring logs and are briefly described in Appendix A. Local and regional geologic characteristics were used to estimate the seismic design criteria.

3.2 Laboratory Analyses

Laboratory analyses were performed on representative samples to aid in material classification and to estimate pertinent engineering properties of the on-site materials for preparation of this report. Testing was performed in general accordance with applicable ASTM and Arizona methods. The following tests were performed and the results are presented in Appendix B.

- Water content
- Dry density
- Remolded expansion potential
- Maximum density/optimum moisture
- Gradation
- Plasticity
- Soluble salts/sulfates/chlorides

- Corrosivity (ASTM A674)
- Unconfined compressive strength (rock)
- Unit weight (rock)

Test results were utilized in the development of the recommendations contained in this report.

3.3 Analyses and Report

This geotechnical engineering report includes a description of the project, a discussion of the field and laboratory testing programs, a discussion of the subsurface conditions, and design recommendations as appropriate to the purpose. The scope of services for this project does not include, either specifically or by implication, any environmental assessment of the site, discovery of underground storage tanks or other underground structures, or identification of contaminated or hazardous materials or conditions. If there is concern about the potential for such contamination, other studies should be undertaken. We are available to discuss the scope of such studies with you.

4.0 SITE CONDITIONS

4.1 Surface

At the time of our field exploration, the site was a developed wastewater treatment plant. The exteriors of existing structures appeared to be in good to fair condition. The site is bordered on the east by the existing aggregate surfaced access road to the plant, and on all other sides by northeast-southwest oriented Bitter Creek that is about 50 to 100 feet wide and 20 to 30 feet deep that directs flow to the northeast. The ground surface was relatively flat in the developed portions of the site, steep to very steep surrounding the developed areas, and contained a sparse to moderate growth of native juniper trees, bushes, cacti, grasses and weeds. Surface drainage appeared to be fair to poor with some evidence of previous surface water ponding in the developed portions of the site, and good in the undeveloped portions of the site by means of surface sheet flow to the west and north down the existing slopes into Bitter Creek.

4.2 Subsurface

As presented on the test pit/boring logs, surface and subsoils extending to the full depth of exploration at all locations explored consisted of medium to near-high plasticity Clayey SANDS with variable amounts of gravel, Clayey GRAVELS with variable amounts of sand and non-plastic Silty GRAVELS with variable amounts of sand. All soils encountered contained random amounts of limestone cobbles and boulders. Refusal to excavator/auger penetration occurred in all test pits/borings at depths of about 1 to 8 feet on LIMESTONE or limestone cobbles and boulders. Groundwater was not encountered in any test pit/boring at the time of exploration. The logs in Appendix A show details of the subsurface conditions encountered during the field exploration.

The test pit/boring logs included in this report are indicators of subsurface conditions only at the specific location and date noted. Variations from the field conditions represented by the test pits/borings may become evident during construction. If variations appear, we should be contacted to re-evaluate our recommendations.

5.0 GEOTECHNICAL PROPERTIES

Near-surface soils range from non-plastic to near-high plasticity. The site soils exhibit moderate expansion potential when recompacted, confined by loads approximating floor loads and saturated in accordance with standard Arizona test methods. Slabs-on-grade supported on recompacted native soils have a moderate potential for heaving if the water content of the soil increases. The site soils were too granular to obtain samples suitable for compression testing. Two samples of the on-site rock were obtained for unit weight and unconfined compressive strength testing and the results are present in Appendix B.

6.0 RECOMMENDATIONS

6.1 General

Recommendations contained in this report are based on our understanding of the project criteria described in Section 2.0, **PROJECT DESCRIPTION**, and the assumption that the soil and subsurface conditions are those disclosed by the test pits/borings. Others may change the plans, final elevations, number and type of structures, foundation loads, and tank bottom levels during design or construction. Substantially different subsurface conditions

from those described herein may be encountered or become known. Any changes in the project criteria or subsurface conditions shall be brought to our attention in writing.

6.2 Design Considerations

Existing fill was not encountered in the test pits/borings, but was observed on the site. We understand that no documentation is available regarding any field density testing that may have been performed during fill construction. Based on this lack of documentation and the overall condition of the fill observed, we consider the fill to be uncontrolled and recommend removal of existing fill in all structural areas.

Several of the test pits/borings indicate the presence of medium to near-high plasticity clayey soils on the site. These soils will expand or swell with an increase in moisture content. The structures and related improvements situated on expansive soils will be subject to movements if the foundation soils experience an increase in moisture content. It should be understood that if moisture penetrates expansive soils, there will likely be heave and possible resultant cracking/distress of the proposed structures and related improvements. It should be noted that shallow foundation systems are not designed to resist soil movements resulting from sewer or plumbing leaks, excessive or leaking irrigation systems, poor drainage, or water ponding near the structures. Construction of site fences, screen walls and other miscellaneous improvements such as exterior slabs-on-grade that typically fall under building code guidelines will be susceptible to heave as well.

Cobbles and boulders were encountered in the test pits/borings. These oversized materials, greater than 3 inches, could present construction difficulties for foundation, utility trenches and other excavations. In cut areas and excavations, exposed oversized materials should be removed.

6.3 Tank Foundations

Above-ground tanks may be supported on compacted aggregate underlain by a minimum thickness of 1 foot of site soils removed and replaced with properly compacted, imported engineered fill material. Below-ground tanks may be supported on scarified and recompacted native soils. Any existing fill should be removed in all proposed tank areas. The tank pads, prepared as recommended in the **EARTHWORK** section of the report, will be suitable to support a maximum dead plus live-load pressure of up to 3000 pounds per square foot. We anticipate that total and differential movements of the proposed above-ground tank structures, supported as recommended, should be within tolerable limits of

the tank manufacturer, typically uniform settlement of less than 2 inches and differential settlement less than 0.5-inch per 32 feet of circumference. Total and differential movements of the proposed below-ground tank structures, supported as recommended, are anticipated to be 1 inch and 3/4 inch, respectively. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

We recommend that the geotechnical engineer or his representative observe the tank pad preparation. It should be determined whether the materials exposed are similar to those anticipated for support of the tanks. Any soft, loose or unacceptable materials should be undercut to suitable materials and backfilled with engineered fill material.

6.4 Manhole Foundations

The soils encountered along the alignment are expected to have moderate to high bearing capacity at anticipated manhole foundation depths. Other than removal of any soft, loose, unstable or disturbed materials from beneath manhole foundations, specialized treatment of soils beneath manholes is not anticipated.

6.5 Lateral Design Criteria for Thrust Blocks

For any thrust block design, lateral loads may be resisted using a soil bearing pressure of 2500 pounds per square foot (psf). All fill against or around thrust blocks should be compacted to densities specified herein under **Placement and Compaction**.

6.6 Conventional Spread Footings

If conventional spread footings are used, they should be underlain by a minimum thickness of 1 foot of lean mix (2-sack) concrete backfill. Footings should bear at least 2 feet below the lowest adjacent finished grade. Footings may be designed to impose a maximum dead plus live-load pressure of up to 2500 pounds per square foot.

We anticipate that total movement of the proposed structures, supported as recommended, should be less than 1 inch. Differential movement should be less than ¾ inch. Additional foundation movements could occur if water from any source infiltrates the foundation soils. Therefore, proper drainage should be provided in the final design and during construction.

Finished grade is the lowest adjacent grade for perimeter footings and floor level for interior footings. The design bearing capacity applies to dead loads plus design live load conditions. Recommended minimum widths of column and wall footings are 24 inches and 16 inches, respectively. The bearing value given is a net bearing value and the weight of the concrete in the footings may be ignored.

All footings, stem walls and masonry walls should be reinforced to reduce the potential for distress caused by differential foundation movements. The use of joints at openings or other discontinuities in masonry walls is recommended.

We recommend that the geotechnical engineer or his representative observe the footing excavations before reinforcing steel and concrete are placed. It should be determined whether the soils exposed are similar to those anticipated for support of the footings. Any soft, loose or unacceptable soils should be undercut to suitable materials and backfilled with either lean mix or structural concrete.

6.7 Lateral Design Criteria

For retaining walls located above any free water surface with no surcharge loads, recommended equivalent fluid pressures and coefficients of base friction for unrestrained elements are:

- Active:
  Undisturbed subsoil .....38 psf/ft
  Compacted granular backfill .....30 psf/ft
  Compacted on-site soils (low expansive potential) .....38 psf/ft
  Clayey site soils ..... not recommended for use

- Passive:
  Shallow wall footings .....220 psf/ft
  Shallow column footings.....350 psf/ft
  Dense rock .....500 psf/ft

- Coefficient of base friction
  Soil.....0.35*
  Rock.....0.55

* The coefficient of base friction (soil) should be reduced to 0.25 when used in conjunction with passive pressure.

Where the design includes restrained elements, the following equivalent fluid pressures are recommended:

- At-rest:
  Undisturbed subsoil .....64 psf/ft
  Compacted granular backfill .....55 psf/ft

These lateral earth pressures are not applicable for submerged soils. We should be consulted for additional recommendations if such conditions are to be included in the design. Any surcharge from adjacent loadings must also be considered. Walls below grade should be waterproofed.

We recommend a free-draining soil layer or manufactured geocomposite material, be constructed adjacent to the back of the retaining wall. A filter may be required between the soil backfill and drainage layer. This drainage zone should help prevent hydrostatic pressure buildup. This vertical drain should be tied into a gravity drainage system at the base of the retaining wall. It is important that all backfill be properly placed and compacted. Backfill should be mechanically compacted in layers. Flooding or jetting should not be permitted. Care should be taken not to damage the walls when placing the backfill. Backfills should be inspected and tested during placement.

Fill against footings, stem walls and retaining walls should be compacted to densities specified in **EARTHWORK**. Medium to high plasticity clay soils should not be used as backfill against retaining walls. Compaction of each lift adjacent to walls should be accomplished with hand-operated tampers or other lightweight compactors. Overcompaction may cause excessive lateral earth pressures which could result in wall movements.

6.8 Seismic Considerations

Structures should be designed in accordance with applicable building codes. The seismic design parameters presented in the following table, in accordance with the 2018 International Building Code and ASCE 7-16, are applicable to the project site:

Seismic Design Parameters International Building Code 2018, ASCE 7-16	
Soil Site Class	C
Mapped Spectral Response Acceleration at 0.2 sec period (S_s)	0.31g
Mapped Spectral Response Acceleration at 1.0 sec period (S_1)	0.097g
Site Coefficient for 0.2 sec period (F_a)	1.3
Site Coefficient for 1.0 sec period (F_v)	1.5
Design Spectral Response Acceleration at 0.2 sec period (S_{DS})	0.269g
Design Spectral Response Acceleration at 1.0 sec period (S_{D1})	0.097g

The soil site class is based upon conditions identified in shallow exploratory test pits/borings and local knowledge of the geotechnical conditions in the vicinity of the site. Conditions extending beyond the depth of our test pits/borings to a depth of 100 feet were assumed for the purposes of providing the information presented in the table. Based upon the density of the on-site soils and lack of groundwater, the potential settlement and lateral spread due to liquefaction is not a considered to be a significant concern on the site.

6.9 Slab-on-Grade Support

Slabs-on-grade should be supported on a minimum thickness of 1 foot of properly placed and compacted, imported, low expansive, engineered fill. For design of interior slabs-on-grade, we recommend using a modulus of subgrade reaction (k) of 200 pounds per cubic inch (pci) for the on-site soils and 225 pci for imported fill material, based on a 30-inch diameter plate. The slab subgrade should be prepared by the procedures outlined in this report. A minimum 4-inch thick layer of base course should be provided beneath all slabs to help prevent capillary rise and a damp slab.

All concrete placement and curing operations should follow the American Concrete Institute manual recommendations. Improper curing techniques and/or high slump (water-cement ratio) could cause excessive shrinkage, cracking or curling. The plastic properties of the concrete should be documented at the time of placement and specimens should also be prepared for strength testing to verify compliance with project specifications. Concrete slabs should be allowed to cure adequately before placing vinyl or other moisture sensitive floor covering.

6.10 Drainage

The major cause of soil-related foundation and slab-on-ground problems is moisture increase in soils below structures. Properly functioning conventional foundations and floor slabs-on-ground require appropriately constructed and maintained site drainage conditions. Therefore, it is extremely important that positive drainage be provided during construction and maintained throughout the life of the structures. It is also important that proper planning and control of any landscape and irrigation practices be performed.

Infiltration of water into utility or foundation excavations must be prevented during construction. Backfill against footings, exterior walls, and in utility line trenches should be well compacted and free of all construction debris to minimize the possibility of moisture infiltration. If utility line trenches are backfilled with a granular material, then a clay or concrete plug should be placed in the trench adjacent to the structure to prevent water from following the trench back under the structure.

6.11 Aggregate-Surfaced Roadways

For unpaved sections, we recommend an initial minimum thickness of 6 inches of granular cover material. As with any unbound vehicular section, additional material will be required over time as cover material is lost due to grading, snow plowing, lateral shoving, and intrusion of the cover material into the underlying subgrade soils. To help reduce intrusion, consideration should be given to the use of a geotextile separator fabric placed at the cover material/subgrade soil interface.

6.12 Corrosivity

Based on the laboratory test results, the on-site soils exhibit a low to moderate corrosive potential to ductile iron piping. This information should be used as an aid in choosing the construction materials that will be in contact with these soils and that will need to be resistant to various corrosive forces. Manufacturers' representatives should be contacted regarding the specific corrosivity resistance for their particular product.

The chemical test results indicate that the soils at the site classify as moderately corrosive to concrete, Class S1 in accordance with ACI 318, Table 4.2.1. Concrete should be made with a cement that provides sulfate resistance and that has a maximum water-cementitious materials ratio and minimum compressive strength set forth in the provisions of ACI 318, Section 4.3.

7.0 EARTHWORK

7.1 General

The conclusions contained in this report for the proposed construction are contingent upon compliance with recommendations presented in this section. Any excavating, trenching, or disturbance which occurs after completion of the earthwork must be backfilled, compacted and tested in accordance with the recommendations contained herein. It is not reasonable to rely upon our conclusions and recommendations if any future unobserved and untested trenching, grading or backfilling occurs.

Although underground facilities were not observed, such features might be encountered during construction. These features should be demolished and removed in accordance with the recommendations of the geotechnical engineer. Any loose or disturbed soils resulting from demolition and/or removal of existing facilities should also be removed and/or recompacted as engineered fill, and any excavations should be backfilled in accordance with recommendations presented herein.

7.2 Site Clearing

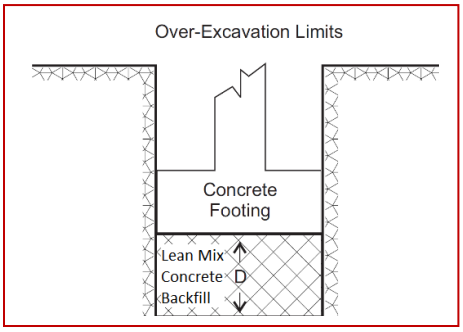
Strip and remove all existing fill, remaining vegetation, debris, aggregate surfacing and/or concrete pavement and any other deleterious materials from the building, tank and wastewater line area. The building/tank area is defined as that area within the structure footprint plus 5 feet beyond the perimeter of the footprint. All exposed surfaces should be free of mounds and depressions which could prevent uniform compaction.

7.3 Excavation

We anticipate that excavations into the shallow site soils for the proposed construction can be accomplished with conventional equipment. Excavations penetrating the underlying limestone will require the use of heavy-duty, specialized equipment, likely together with large pneumatic hammers, to facilitate rock break-up and removal.

Cut slopes into the shallow on-site soils should be constructed no steeper than 1:1 (horizontal:vertical) and 0.5:1 (horizontal:vertical) in the limestone bedrock. Fill slopes should be constructed no steeper than 1.5:1 (horizontal:vertical) to limit erosion, and to provide slope protection. Natural slopes exceeding a 5:1 (horizontal:vertical) slope

configuration, should be benched prior to fill placement. Natural slopes which will support fill embankments should be benched at a maximum 5:1 slope.

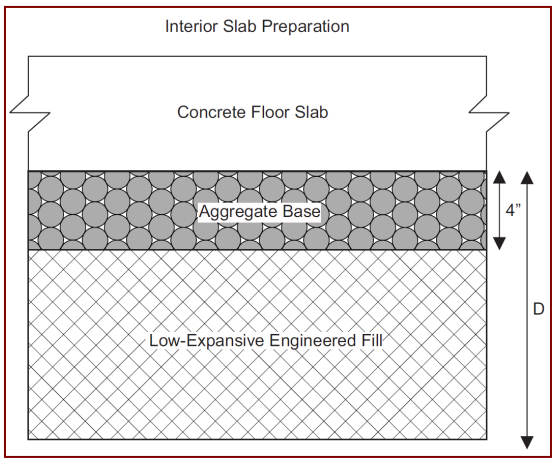


On-site soils will pump or become unworkable at high water contents. Workability may be improved by scarifying and drying. Overexcavation of wet zones and replacement with drier granular materials may be necessary. The use of lightweight excavation and compaction equipment may be required to minimize subgrade pumping.

7.4 Tank Pad Preparation

Following removal of any existing fill material, above-ground tanks should be founded on a minimum thickness of 1 foot of imported, properly compacted, low expansive, engineered fill material. Remove existing soils to a minimum depth of 1 foot below the bottom of the above-ground tank elevation. Following the removal, and immediately below all below-grade tanks, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. The subgrade preparation should be accomplished in a manner which will result in uniform water contents and densities after compaction. In areas where dense limestone is encountered, scarification and recompaction is not required.

7.5 Spread Footing Foundation Preparation



Following removal of any existing fill material in footing areas, remove existing soils to a minimum depth of 1 foot below the bottom of the footing. Removal may extend straight down along the sides of the footing. Replace the removed soils with properly consolidated, lean mix (2-sack) concrete backfill material.

7.6 Slab-on-Grade Preparation

Following removal of any existing fill material, slabs-on-grade should be founded on a minimum thickness of 1 foot of imported, low expansive, engineered fill material. Remove native soils, as necessary, to a minimum depth of 1 foot below the bottom of the slab (depth D in the diagram below). Following the removal, scarify, moisten or dry as required, and compact all subgrade soils to a minimum depth of 8 inches. Replace the removed soils with properly compacted, imported, low to non-expansive, engineered fill material. The

aggregate base course below the slab may be included as part of the low to non-expansive engineered fill. In areas where dense limestone is encountered, scarification and recompaction is not required.

The subgrade preparation should be accomplished in a manner that will result in uniform water contents and densities after compaction.

7.7 Exterior Slab Preparation

The soils on this site have the potential to expand and shrink with changes in moisture content. In addition, frost penetration in the upper soils may cause surface heaving. Therefore, relatively lightweight exterior concrete flatwork such as sidewalks and patios may experience movements resulting in cracking or vertical offsets. To reduce the potential for damage, we recommend:

- Use of fill with low expansion potential
- Use of fill with low to negligible frost susceptibility
- Placement of effective control joints on relatively close centers
- Moisture-density control during placement of subbase fills
- Provision for adequate drainage in areas adjoining the slabs
- Use of designs which allow vertical movement between the exterior slabs and adjoining structural elements

It should be understood that these recommendations will help reduce the potential for soil movement and resulting distress, but will not eliminate this potential. Furthermore, the use of municipal specifications and details may not mitigate the potential for movements of the expansive or frost susceptible on-site soils.

7.8 Materials

a. Clean on-site native soils with a maximum dimension of 6 inches or imported materials may be used as fill material for the following:

- backfill (non-slab areas)
- Subbase fill in aggregate surfaced roadway areas

b. On-site clayey soils should not be used as subbase fill or backfill below any tanks, foundations, slabs-on-grade or behind any retaining walls. Imported soils with low expansive potential should be used in these areas.

c. Frozen soils should not be used as fill or backfill.

d. Lean mix (2-sack) concrete backfill should consist of aggregate base course type material combined with 2 sacks of cement per cubic yard. A coarse rock mix should not be used.

e. Imported soils should conform to the following:

- Gradation (ASTM C136): percent finer by weight

6"	100
4"	85-100
¾"	70-100
No. 4 Sieve	50-100
No. 200 Sieve	40 (max)

- Maximum expansive potential (%)[1] 1.5

- Maximum soluble sulfates (%) 0.10

f. Base course should conform to current Yavapai County specifications.

[1] Measured on a sample compacted to approximately 95 percent of the ASTM D698 maximum dry density at about 3 percent below optimum water content. The sample is confined under a 100 psf surcharge and submerged.

7.9 Placement and Compaction

a. Place and compact fill in horizontal lifts, using equipment and procedures that will produce recommended water contents and densities throughout the lift.

b. Uncompacted fill lifts should not exceed 8 inches.

c. Materials should be compacted to the following:

Material	Minimum Percent Compaction (ASTM D698)
• On-site soil, reworked:	
Below tanks	95
Below slabs-on-grade	90
Aggregate surfaced roadway areas	95
• On-site clayey soils, fill:	
Aggregate surfaced roadway areas	95
Landscape areas	85
• On-site low expansive potential soils, fill:	
Aggregate surfaced roadway areas	95
Below slabs-on-grade	95
Below tanks	95
• Imported soil, fill:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	95
• Aggregate base:	
Below slabs-on-grade	95
Below tanks	95
Aggregate surfaced roadway areas	100

Material	Minimum Percent Compaction (ASTM D698)
• Backfill:	
Structural	95
Nonstructural	90

`

d. On-site soils should be compacted with a moisture content in the range of 1 percent below to 3 percent above optimum. Imported soils with low expansive potential and aggregate base course materials should be compacted with a moisture content in the range of 3 percent below to 3 percent above optimum.

7.10 Compliance

Recommendations for structural elements supported on compacted fills or prepared subgrade depend upon compliance with **EARTHWORK** recommendations. To assess compliance, observation and testing should be performed under the direction of a geotechnical engineer.

8.0 ADDITIONAL SERVICES

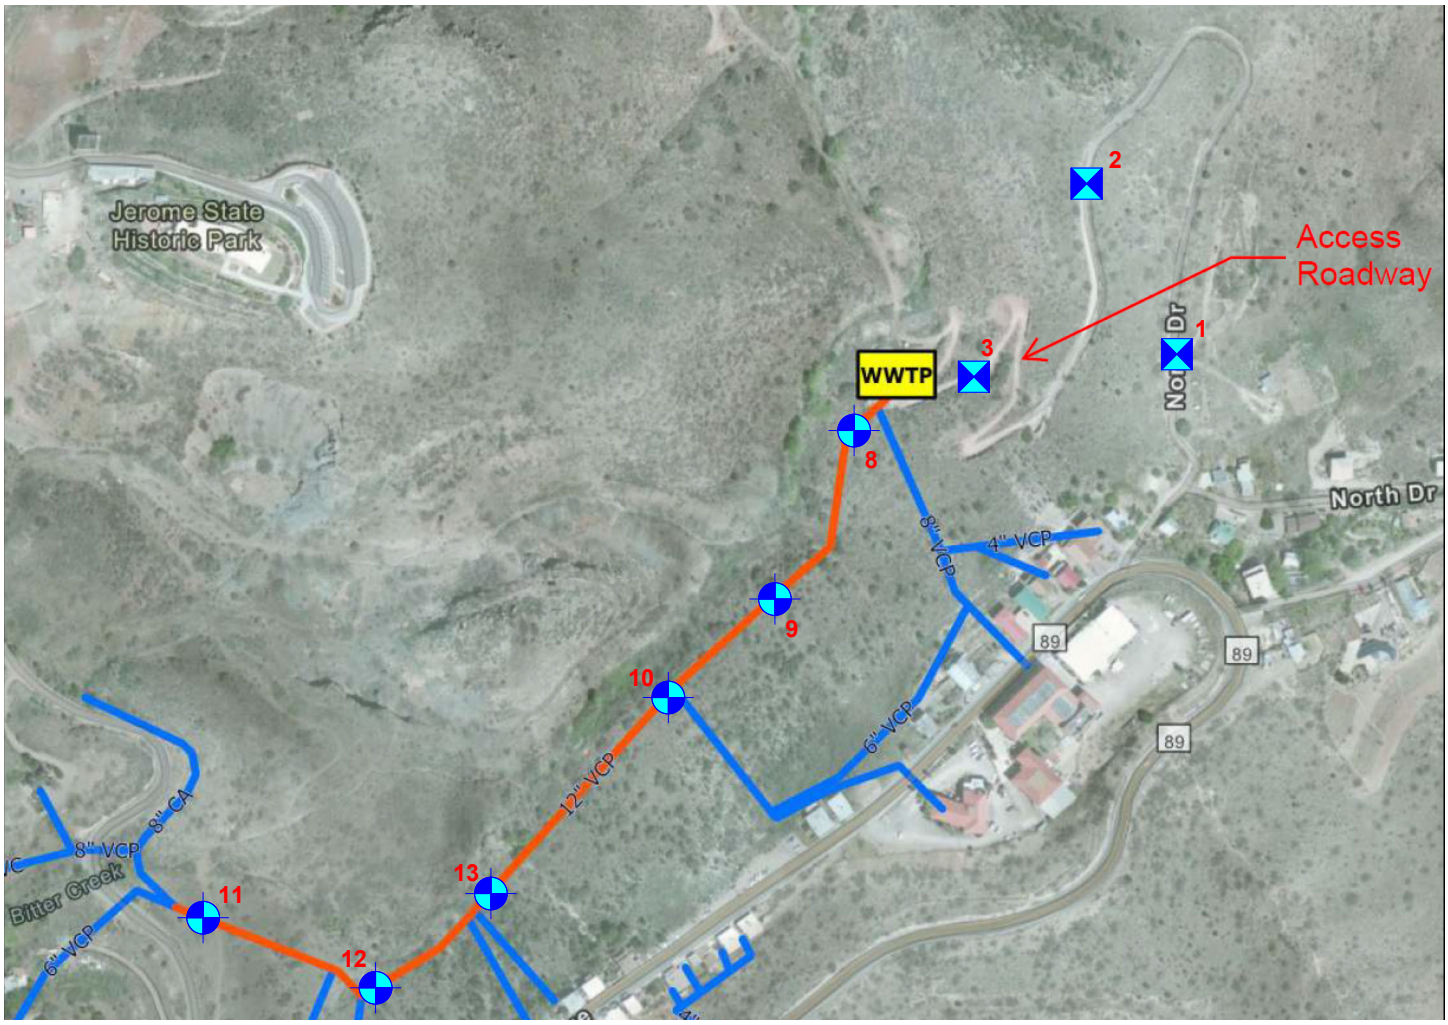
The recommendations provided in this report are based on the assumption that a sufficient schedule of tests and observations will be performed during construction to verify compliance. At a minimum, these tests and observations should be comprised of the following:

- Observations and testing during site preparation and earthwork;
- Observation of foundation excavations; and
- Consultation as may be required during construction.

Retaining the geotechnical engineer who developed your report to provide construction observation is the best way to verify compliance, and to help you manage the risks associated with unanticipated conditions.

9.0 LIMITATIONS

This report has been prepared assuming the project criteria described in Section 2.0. If changes in the project criteria occur, or if different subsurface conditions are encountered or become known, the conclusions and recommendations presented herein shall become invalid. In any such event, WT should be contacted in order to assess the effect that such variations may have on our conclusions and recommendations.



The recommendations presented are based entirely upon data derived from a limited number of samples obtained from widely spaced test pits/borings. The attached logs are indicators of subsurface conditions only at the specific locations and times noted. This report assumes the uniformity of the geology and soil structure between test pits/borings, however variations can and often do exist. Whenever any deviation, difference or change is encountered or becomes known, WT should be contacted.

This report is for the exclusive benefit of our client alone. There are no intended third-party beneficiaries of our contract with the client or this report, and nothing contained in the contract or this report shall create any express or implied contractual or any other relationship with, or claim or cause of action for, any third party against WT.

This report is valid for the earlier of one year from the date of issuance, a change in circumstances, or discovered variations. After expiration, no person or entity shall rely on this report without the express written authorization of WT.

10.0 CLOSURE

We prepared this report as an aid to the designers of the proposed project. The comments, statements, recommendations and conclusions set forth in this report reflect the opinions of the authors. These opinions are based upon data obtained at the location of the test pits/borings, and from laboratory tests. Work on your project was performed in accordance with generally accepted standards and practices utilized by professionals providing similar services in this locality. No other warranty, express or implied, is made.

Geotechnical Environmental Inspections Materials

Western Technologies Inc. The Quality People Since 1955

Allowable Soil Bearing Capacity	The recommended maximum contact stress developed at the interface of the foundation element and the supporting material.
Backfill	A specified material placed and compacted in a confined area.
Base Course	A layer of specified aggregate material placed on a subgrade or subbase.
Base Course Grade	Top of base course.
Bench	A horizontal surface in a sloped deposit.
Caisson/Drilled Shaft	A concrete foundation element cast in a circular excavation which may have an enlarged base (or belled caisson).
Concrete Slabs-On-Grade	A concrete surface layer cast directly upon base course, subbase or subgrade.
Crushed Rock Base Course	A base course composed of crushed rock of a specified gradation.
Differential Settlement	Unequal settlement between or within foundation elements of a structure.
Engineered Fill	Specified soil or aggregate material placed and compacted to specified density and/or moisture conditions under observations of a representative of a soil engineer.
Existing Fill	Materials deposited through the action of man prior to exploration of the site.
Existing Grade	The ground surface at the time of field exploration.
Expansive Potential	The potential of a soil to expand (increase in volume) due to absorption of moisture.
Fill	Materials deposited by the actions of man.
Finished Grade	The final grade created as a part of the project.
Gravel Base Course	A base course composed of naturally occurring gravel with a specified gradation.
Heave	Upward movement.
Native Grade	The naturally occurring ground surface.
Native Soil	Naturally occurring on-site soil.
Rock	A natural aggregate of mineral grains connected by strong and permanent cohesive forces. Usually requires drilling, wedging, blasting or other methods of extraordinary force for excavation.
Sand and Gravel Base Course	A base course of sand and gravel of a specified gradation.
Sand Base Course	A base course composed primarily of sand of a specified gradation.
Scarify	To mechanically loosen soil or break down existing soil structure.
Settlement	Downward movement.
Soil	Any unconsolidated material composed of discrete solid particles, derived from the physical and/or chemical disintegration of vegetable or mineral matter, which can be separated by gentle mechanical means such as agitation in water.
Strip	To remove from present location.
Subbase	A layer of specified material placed to form a layer between the subgrade and base course.
Subbase Grade	Top of subbase.
Subgrade	Prepared native soil surface.

GROUP SYMBOLS	DESCRIPTION	MAJOR DIVISIONS
ML	SILT, SILT WITH SAND OR GRAVEL, SANDY SILT, OR GRAVELLY SILT	SILTS AND CLAYS LIQUID LIMIT LESS THAN 50
CL	LEAN CLAY OF LOW TO MEDIUM PLASTICITY, SANDY CLAY, OR GRAVELLY CLAY	
OL	ORGANIC SILT OR ORGANIC CLAY OF LOW TO MEDIUM PLASTICITY	
MH	ELASTIC SILT, SANDY ELASTIC SILT, OR GRAVELLY ELASTIC SILT	SILTS AND CLAYS LIQUID LIMIT MORE THAN 50
CH	FAT CLAY OF HIGH PLASTICITY, SANDY FAT CLAY, OR GRAVELLY FAT CLAY	
OH	ORGANIC SILT OR ORGANIC CLAY OF HIGH PLASTICITY	
PT	PEAT AND OTHER HIGHLY ORGANIC SOILS	HIGHLY ORGANIC SOILS

NOTE: Fine-grained soils may receive dual classification based upon plasticity characteristics (e.g. CL-ML).

SOIL SIZES

COMPONENT	SIZE RANGE
BOULDERS	Above 12 in.
COBBLES	3 in. – 12 in.
GRAVEL	No. 4 – 3 in.
Coarse	¾ in. – 3 in.
Fine	No. 4 – ¾ in.
SAND	No. 200 – No. 4
Coarse	No. 10 – No. 4
Medium	No. 40 – No. 10
Fine	No. 200 – No. 40
Fines (Silt or Clay)	Below No. 200

NOTE: Only sizes smaller than three inches are used to classify soils

CONSISTENCY

CLAYS & SILTS	BLOWS PER FOOT
VERY SOFT	0 – 2
SOFT	3 – 4
FIRM	5 – 8
STIFF	9 – 15
VERY STIFF	16 – 30
HARD	OVER 30

RELATIVE DENSITY

SANDS & GRAVELS	BLOWS PER FOOT
VERY LOOSE	0 – 4
LOOSE	5 – 10
MEDIUM DENSE	11 – 30
DENSE	31 – 50
VERY DENSE	OVER 50

NOTE: Number of blows using 140-pound hammer falling 30 inches to drive a 2-inch-OD (1⅜-inch ID) split-barrel sampler (ASTM D1586).

PLASTICITY OF FINE GRAINED SOILS

PLASTICITY INDEX	TERM
0	NON-PLASTIC
1 – 7	LOW
8 – 20	MEDIUM
Over 20	HIGH

DEFINITION OF WATER CONTENT

DRY
SLIGHTLY DAMP
DAMP
MOIST
WET
SATURATED

The number shown in **"BORING NO."** or "**TEST PIT NO.**" refers to the approximate location of the same number indicated on the "Boring/Test Pit Location Diagram" as positioned in the field by pacing or measurement from property lines and/or existing features.

"DRILLING TYPE" refers to the exploratory equipment used in the boring. Hand auger methods were used. The dimension presented is the outside diameter of the auger used.

"EQUIPMENT TYPE" refers to the equipment used in the excavation of the test pit, and may include the width of the bucket on the excavator and the use of "rock" teeth or attachments.

"SAMPLE TYPE" refers to the form of sample recovery, in which **R** = Ring-lined sample, **G** = Grab sample.

"DRY DENSITY (LBS/CU FT)" refers to the laboratory-determined dry density in pounds per cubic foot. The symbol **"NR"** indicates that no sample was recovered.

"WATER (MOISTURE) CONTENT (% OF DRY WT.)" refers to the laboratory-determined water content in percent using the standard test method ASTM D2216.

"USCS" refers to the "Unified Soil Classification System" Group Symbol for the soil type as defined by ASTM D2487 and D2488. The soils were classified visually in the field, and where appropriate, classifications were modified by visual examination of samples in the laboratory and/or by appropriate tests.

These notes and boring/test pit logs are intended for use in conjunction with the purposes of our services defined in the text. Boring/test pit log data should not be construed as part of the construction plans nor as defining construction conditions.

Boring/test pit logs depict our interpretations of subsurface conditions at the locations and on the date(s) noted. Variations in subsurface conditions and characteristics may occur between borings/test pits. Groundwater levels may fluctuate due to seasonal variations and other factors.

The stratification lines shown on the boring/test pit logs represent our interpretation of the approximate boundary between soil or rock types based upon visual field classification at the boring/test pit location. The transition between materials is approximate and may be more or less gradual than indicated.

CORROSIVITY TEST RESULTS

The procedures for soil survey tests and observations can be found in Appendix X1.1 of ASTM A674-10 and includes five soil properties: earth resistivity • pH • redox potential • sulfides • moisture.

Test Pit 7(0-5):

Analysis	Results		Points
Resistivity (ohm-cm)	1401		10
pH	8.5		0
Redox Potential (mV)	+134		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	13

Boring 12(0-1):

Analysis	Results		Points
Resistivity (ohm-cm)	2481		2
pH	8.1		0
Redox Potential (mV)	+314		0
Sulfides	trace		2
Moisture	fair		1
		Total Points	5

The test procedure states that if the sum of the points is greater than 10, the soil is considered corrosive to ductile iron pipe and special protection against exterior corrosion is necessary. This conclusion is limited to soil corrosion and does not include consideration of stray direct current.

BID FORM FOR CONSTRUCTION CONTRACT

ADDENDUM 1 VERSION

Contractor Name: _____

The terms used in this Bid with initial capital letters have the meanings stated in the Instructions to Bidders, the General Conditions, and the Supplementary Conditions.

ARTICLE 1—OWNER AND BIDDER

1.01 This Bid is submitted to:

Town of Jerome
Submitted electronically via email to tpierce@pacewater.com. Alternatively, Bidder may submit a hard copy the Town of Jerome, 600 Clark Street, Jerome, AZ 86331.

The undersigned Bidder proposes and agrees, if this Bid is accepted, to enter into an Agreement with Owner in the form included in the Bidding Documents to perform all Work as specified or indicated in the Bidding Documents for the prices and within the times indicated in this Bid and in accordance with the other terms and conditions of the Bidding Documents.

ARTICLE 2—ATTACHMENTS TO THIS BID

2.01 The following documents are submitted with and made a condition of this Bid:

A. Required Bid security;

B. List of Proposed Subcontractors;

~~C. List of Proposed Suppliers;~~

D. Evidence of authority to do business in the state of the Project; or a written covenant to obtain such authority within the time for acceptance of Bids;

E. Contractor's license number as evidence of Bidder's State Contractor's License or a covenant by Bidder to obtain said license within the time for acceptance of Bids;

F. Required Bidder Qualification Statement with supporting data; ~~and~~

G. If Bid amount exceeds $10,000, signed Compliance Statement (RD 400-6). Refer to specific equal opportunity requirements set forth in the Supplementary Conditions of the Construction Contract (EJCDC C-800);

H. If Bid amount exceeds $25,000, signed Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion - Lower Tier Covered Transactions (AD-1048);

I. If Bid amount exceeds $100,000, signed RD Instruction 1940-Q Exhibit A-1, Certification for Contracts, Grants, and Loans.

ARTICLE 3—BASIS OF BID—LUMP SUM BID AND UNIT PRICES

3.01 *Lump Sum Bids*

A. Bidder will complete the Work in accordance with the Contract Documents for the following lump sum (stipulated) price(s), together with any Unit Prices indicated in Paragraph 3.02:

Copyright© 2018 National Society of Professional Engineers, American Council of Engineering Companies, and American Society of Civil Engineers. All rights reserved.

ARTICLE 4—DELETED

ARTICLE 5—DELETED

ARTICLE 6—TIME OF COMPLETION

6.01 Bidder agrees that the Work will be substantially complete and will be completed and ready for final payment in accordance with Paragraph 15.06 of the General Conditions on or before the dates or within the number of calendar days indicated in the Agreement.

6.02 **[Deleted]**

6.03 **[Deleted]**

6.04 Bidder accepts the provisions of the Agreement as to liquidated damages.

ARTICLE 7—BIDDER'S ACKNOWLEDGEMENTS: ACCEPTANCE PERIOD, INSTRUCTIONS, AND RECEIPT OF ADDENDA

7.01 *Bid Acceptance Period*

A. This Bid will remain subject to acceptance for 60 days after the Bid opening, or for such longer period of time that Bidder may agree to in writing upon request of Owner.

7.02 *Instructions to Bidders*

A. Bidder accepts all of the terms and conditions of the Instructions to Bidders, including without limitation those dealing with the disposition of Bid security.

7.03 *Receipt of Addenda*

A. Bidder hereby acknowledges receipt of the following Addenda:

Addendum Number	Addendum Date

Copyright© 2018 National Society of Professional Engineers, American Council of Engineering Companies, and American Society of Civil Engineers. All rights reserved.

7.04 **[Deleted]**

ARTICLE 8—BIDDER'S REPRESENTATIONS AND CERTIFICATIONS

8.01 *Bidder's Representations*

A. In submitting this Bid, Bidder represents the following:

1. Bidder has examined and carefully studied the Bidding Documents, including Addenda.

2. **[Deleted]**

3. Bidder is familiar with all Laws and Regulations that may affect cost, progress, and performance of the Work**, including all American Iron and Steel requirements.**

4. Bidder has carefully studied the reports of explorations and tests of subsurface conditions at or adjacent to the Site and the drawings of physical conditions relating to existing surface or subsurface structures at the Site that have been identified in the Supplementary Conditions, with respect to the Technical Data in such reports and drawings.

5. Bidder has carefully studied the reports and drawings relating to Hazardous Environmental Conditions, if any, at or adjacent to the Site that have been identified in the Supplementary Conditions, with respect to Technical Data in such reports and drawings.

6. Bidder has considered the information known to Bidder itself; information commonly known to contractors doing business in the locality of the Site; information and observations obtained from visits to the Site; the Bidding Documents; and the Technical Data identified in the Supplementary Conditions or by definition, with respect to the effect of such information, observations, and Technical Data on (a) the cost, progress, and performance of the Work; (b) the means, methods, techniques, sequences, and procedures of construction to be employed by Bidder, if selected as Contractor; and (c) Bidder's (Contractor's) safety precautions and programs.

7. Based on the information and observations referred to in the preceding paragraph, Bidder agrees that no further examinations, investigations, explorations, tests, studies, or data are necessary for the performance of the Work at the Contract Price, within the Contract Times, and in accordance with the other terms and conditions of the Contract.

8. Bidder is aware of the general nature of work to be performed by Owner and others at the Site that relates to the Work as indicated in the Bidding Documents.

9. Bidder has given Engineer written notice of all conflicts, errors, ambiguities, or discrepancies that Bidder has discovered in the Bidding Documents, and of discrepancies between Site conditions and the Contract Documents, and the written resolution thereof by Engineer is acceptable to Contractor.

10. The Bidding Documents are generally sufficient to indicate and convey understanding of all terms and conditions for performance and furnishing of the Work.

Copyright© 2018 National Society of Professional Engineers, American Council of Engineering Companies, and American Society of Civil Engineers. All rights reserved.

11. The submission of this Bid constitutes an incontrovertible representation by Bidder that without exception the Bid and all prices in the Bid are premised upon performing and furnishing the Work required by the Bidding Documents.

8.02 *Bidder's Certifications*

A. The Bidder certifies the following:

1. This Bid is genuine and not made in the interest of or on behalf of any undisclosed individual or entity and is not submitted in conformity with any collusive agreement or rules of any group, association, organization, or corporation.

2. Bidder has not directly or indirectly induced or solicited any other Bidder to submit a false or sham Bid.

3. Bidder has not solicited or induced any individual or entity to refrain from bidding.

4. Bidder has not engaged in corrupt, fraudulent, collusive, or coercive practices in competing for the Contract. For the purposes of this Paragraph 8.02.A:

a. Corrupt practice means the offering, giving, receiving, or soliciting of anything of value likely to influence the action of a public official in the bidding process.

b. Fraudulent practice means an intentional misrepresentation of facts made (a) to influence the bidding process to the detriment of Owner, (b) to establish bid prices at artificial non-competitive levels, or (c) to deprive Owner of the benefits of free and open competition.

c. Collusive practice means a scheme or arrangement between two or more Bidders, with or without the knowledge of Owner, a purpose of which is to establish bid prices at artificial, non-competitive levels.

d. Coercive practice means harming or threatening to harm, directly or indirectly, persons or their property to influence their participation in the bidding process or affect the execution of the Contract.

Jerome Wastewater Treatment Plant Improvements

ADDENDUM #2

Date: May 11, 2026

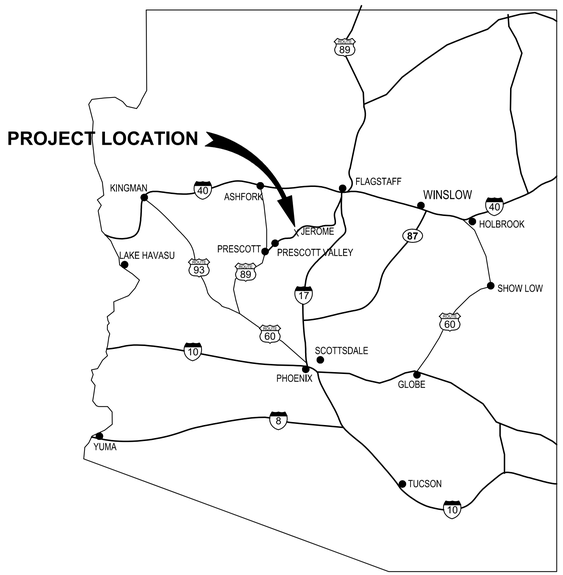
Quest CDN #9117808

This addendum is to formally issue responses to bidder questions and minor modifications. Reminder: Acknowledge receipt of this addendum on the Bid Form.

Attachments:

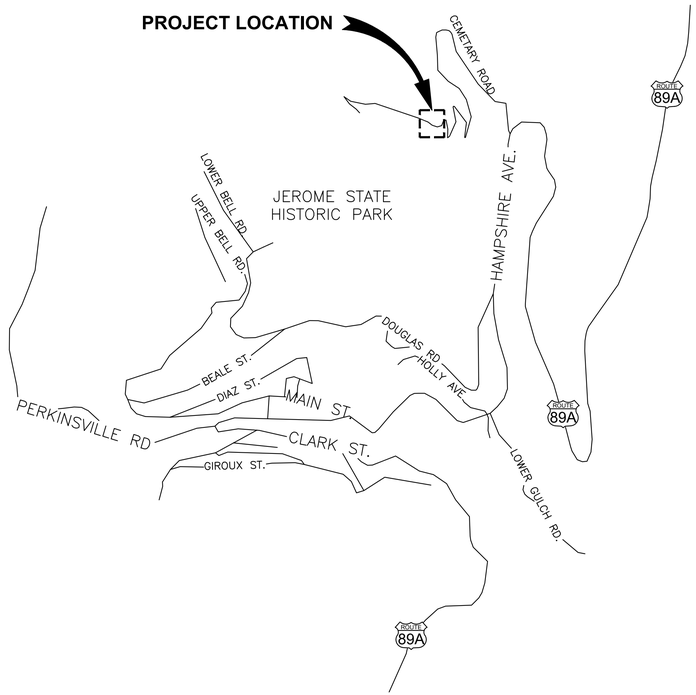
1. Attachment 1 – Jerome WWTP Improvements Plan Set
2. Attachment 2 – C-410 Bid Form

Clarifications



1. It was brought to our attention that the construction plan set included in the bid manual appears to be scaled to 8.5” x 11”. If there are any difficulties obtaining the correct plan size, 24” x 36” construction plans are **attached.**
2. The bid form quantities (form C-410 – Bid Form) have been updated. The updated bid form is **attached.** Please note that bidders are responsible for their own quantity takeoffs.

TOWN OF JEROME



YAVAPAI COUNTY, ARIZONA

WASTEWATER TREATMENT PLANT

100% ISSUED FOR BID

LOCATION MAP
N.T.S.

VICINITY MAP
N.T.S.

SURVEY DETAILS:

1. COORDINATES WERE VERIFIED IN THE FIELD USING REAL TIME KINEMATIC GPS OBSERVATIONS RELATIVE TO PUBLISHED CONTROL POINTS.
2. SURVEYED DURING THE MONTH OF DECEMBER 2022.
3. CONTRACTOR SHALL VERIFY HORIZONTAL AND VERTICAL CONTROLS IN THE FIELD PRIOR TO CONSTRUCTION.
4. PROJECT METADATA:
   - UNITS:
     COORDINATES, DISTANCE AND ELEVATIONS ARE SHOWN IN INTERNATIONAL FEET.
   - HORIZONTAL DATUM (BASIS OF BEARINGS):
     NAD83 (2011 Epoch) ARIZONA CENTRAL ZONE
   - VERTICAL DATUM:
     NAVD '88
   - PROJECT BENCHMARK:
     POINT NUMBER 1
     PRIMARY BENCHMARK DESCRIBED AS: SET 1/2" REBAR
     SET REBAR WITH OPUS PROCESSED SOLUTION:
     GRID NORTHING = 1365466.36
     GRID EASTING = 643466.42
     OPUS ELEVATION = 4827.11
5. THE COORDINATES PRESENTED ARE SHOWN TO THREE DECIMAL PLACES FOR CALCULATION PURPOSES AND ARE NOT REPRESENTATIVE OF THE PRECISION OF THE SURVEY MEASUREMENTS.
6. THIS NOT A PROPERTY BOUNDARY SURVEY.

GENERAL NOTES:

1. ALL PAVING, GRADING, PIPING, AND UTILITY LINE CONSTRUCTION WORK WITHIN THE PUBLIC RIGHT OF WAY, ON PRIVATE STREETS, ACCESS WAYS, LOT GRADING, MATERIALS, AND WORKMANSHIP SHALL COMPLY WITH TOWN OF JEROME ENGINEERING STANDARDS AND SPECIFICATIONS, AND SHALL CONFORM TO THE LATEST MARICOPA ASSOCIATION OF GOVERNMENTS (MAG) AND A.D.O.T. STANDARD DETAILS AND SPECIFICATIONS. GRADING WORK SHALL CONFORM TO MAG SPECIFICATIONS, THE SOILS REPORT, AND CHAPTER 70 ENTITLED "EXCAVATION AND GRADING" OF THE UNIFORM BUILDING CODE (UBC) LATEST EDITION, SUBSECTIONS 7001 TO 7005, 7009 TO 7013, FIGURES 70-1 AND 70-2 AND AS STATED THEREIN. LOCAL MUNICIPAL STANDARD DETAILS WILL CONTINUE TO APPLY WHERE NOT ADOPTED OR INCLUDED BY MAG. THE FOLLOWING NOTES AND SPECIFICATIONS ARE HEREBY MADE A PART OF THE CONTRACT DOCUMENTS AND PROJECT SPECIFICATIONS. WHERE THERE EXISTS A CONFLICT BETWEEN THESE NOTES, MAG SPECS, UBC, THE SOILS REPORT, OR THE PROJECT SPECIFICATIONS, THE MORE STRINGENT OF THE REQUIREMENTS SHALL GOVERN UNLESS PRIOR CLARIFICATION FROM THE ENGINEER HAS BEEN GIVEN IN WRITING TO THE CONTRACTOR. THE CONTRACTOR AS STATED HEREIN SHALL MEAN THE GENERAL CONTRACTOR AND HIS ASSOCIATED SUBCONTRACTORS. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR THE COORDINATION AND PERFORMANCE OF THE WORK OF ALL HIS SUBCONTRACTORS AND SUPPLIERS.
2. ALL WORK SHALL BE BID AND INSTALLED BY THE CONTRACTOR COMPLETE AND OPERATIONAL TO LINES, GRADES, AND FUNCTIONS INDICATED ON ALL PLANS AND SPECIFICATIONS. THE CONTRACTOR SHALL PROVIDE ALL LABOR, MATERIALS, EQUIPMENT, AND SERVICES NECESSARY TO COMPLETE ALL PROJECT EARTHWORK AND SITE WORK INCLUDING BUT NOT LIMITED TO: SITE CLEARING, GRUBBING, DEMOLITION, DEBRIS REMOVALS FROM THE SITE, IMPORT AND/OR EXPORT OF SOILS AND OTHER MATERIALS TO AND FROM THE SITE, BORROW MATERIALS, TEMPORARY SOILS MATERIAL STOCKPILING, BACKFILL OF ONSITE BORROW PITS, MOVING OF MATERIALS, CUT AND FILL, SLOPES, SOILS AND BANK STABILIZATION AND PROTECTION, BERMING, ROADWAY EXCAVATIONS, RELOCATIONS, STRUCTURE EXCAVATIONS, TRENCHING, ALL BACKFILLING, SITE GRADING, PAVING, PIPING, UTILITY LINE AND STORM DRAINAGE CONSTRUCTION, CURBS, SITE CONCRETE WORK AND OTHER MISCELLANEOUS SITE WORK STRUCTURES AND ITEMS INDICATED ON THE PLANS AND IN THE CONTRACT DOCUMENTS.
3. ANY QUANTITIES SHOWN ON PLANS ARE NOT VERIFIED BY THE ENGINEER. QUANTITIES ARE APPROXIMATE ONLY AND INTENDED AS A GUIDE FOR ESTIMATING PURPOSES. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING HIS OWN QUANTITY TAKE OFFS. THE CONTRACTOR SHALL VISIT THE SITE AND REVIEW THE SOILS CONDITIONS AND THE SOILS REPORT WITH THE PROJECT SOILS ENGINEER PRIOR TO BIDDING THIS PROJECT. ANY DISCREPANCIES IN SITE MATERIALS SHALL BE BROUGHT TO THE ATTENTION OF THE DESIGN ENGINEER 7 DAYS MINIMUM PRIOR TO BIDDING FOR REVIEW. ALL SHRINK OF EARTH MATERIAL OR EXCESS MATERIAL FROM UTILITY TRENCHES AND FOUNDATIONS SHALL BE INCLUDED IN THE CONTRACTOR'S BID.
4. THE ENGINEER WILL NOT BE RESPONSIBLE FOR CONSTRUCTION MEANS, METHODS, TECHNIQUES, SEQUENCES, OR PROCEDURES OR FOR SAFETY PRECAUTIONS OR PROGRAMS UTILIZED IN CONNECTION WITH THE WORK, AND HE WILL NOT BE RESPONSIBLE FOR THE CONTRACTOR'S FAILURE TO CARRY OUT THE WORK IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
5. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LIMITS OF THE WORK AREA FOR ALL PHASES OF THE WORK PRIOR TO BEGINNING CONSTRUCTION OF THOSE PHASES. ALL CONSTRUCTION LIMITS, AREAS OF WORK, SETBACKS, PERIMETERS, ADJACENT PROPERTY LINES, BOUNDARIES, AND OTHER CRITERIA DEFINING THE LIMITS OF THE CONTRACTOR'S WORK AREA AND LIMITS SHALL BE STAKED BY THE CONTRACTOR'S SURVEYOR PRIOR TO CONSTRUCTION OF CLEARING OF THE SITE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR FAMILIARIZING HIMSELF WITH THE EXTENT OF WORK TO BE DONE IN EACH SEPARATE PHASE OF THE PROJECT, AND ANY WORK NECESSARY IN INACTIVE PHASES REQUIRED TO DEEM THE ACTIVE PHASES FINISHED, SAFE, AND SERVICEABLE.
6. THE DESIGN ENGINEER RESERVES THE RIGHT TO MAKE MINOR FIELD MODIFICATIONS TO GRADES AND STRUCTURE DESIGNS TO ACCOMMODATE FIELD CONDITIONS FOUND ON THE SITE. THIS INCLUDES BUT IS NOT LIMITED TO MINOR MODIFICATIONS TO GRADE, ALIGNMENT, SLOPE, OR STRUCTURE LOCATIONS. THE ENGINEER SHALL HAVE THE RIGHT TO MAKE SUCH CHANGES IN WRITING IN THE LOCATION AND QUANTITIES OF WORK AS MAY BE DEEMED ADVISABLE.
7. NO JOB WILL BE CONSIDERED COMPLETE UNTIL FINAL GRADING IS COMPLETE AND ALL CURBS, PAVEMENT, AND SIDEWALKS HAVE BEEN SWEPT CLEAN OF ALL DIRT AND DEBRIS, ALL SURVEY MONUMENTS ARE INSTALLED AND ALL VALVES, MANHOLES, AND BOXES HAVE BEN ADJUSTED ACCORDING TO THE PLANS AND STANDARD DETAILS.
8. SEE SPECIFICATION SECTION 01 11 00 SUMMARY OF WORK FOR DIVISION OF RESPONSIBILITY. SEE SPECIFICATION SECTION 00 70 00 CONDITIONS OF THE CONTRACT FOR DEFINITIONS.
9. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH UNITED STATES ENVIRONMENTAL PROTECTION AGENCY STANDARDS AND POLICIES AND CURRENT SUPPLEMENTS THERETO.
10. ANY WORK PERFORMED WITHOUT THE APPROVAL OF THE ENGINEER AND/OR ALL WORK AND MATERIAL NOT IN CONFORMANCE WITH THE SPECIFICATIONS IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.
11. DEBRIS SHALL BE DISPOSED OF WITHIN APPROVED DISPOSAL FACILITIES.
12. THE CONTRACTOR SHALL PROVIDE ADEQUATE MEANS FOR CLEANING TRUCKS AND/OR OTHER EQUIPMENT OF MUD PRIOR TO ENTERING PUBLIC STREETS. IT IS THE CONTRACTOR'S RESPONSIBILITY TO CLEAN STREETS, ALLEY DUST, AND TAKE WHATEVER MEASURES ARE NECESSARY TO ENSURE THAT ALL ADJACENT ROADS ARE MAINTAINED IN A CLEAN, MUD AND DUST FREE CONDITION AT ALL TIMES.
13. CONTRACTOR SHALL TAKE MEASURES TO CONTROL DUST AND FUGITIVE EMISSIONS, INCLUDING BUT NOT LIMITED TO WATERING THE SITE TWICE DAILY DURING GRADING TO CONTROL DUST.
14. AN APPROVED SET OF PLANS SHALL BE ON THE JOB SITE AT ALL TIMES WORK IS IN PROGRESS. DEVIATION FROM THE PLANS WILL NOT BE ALLOWED WITHOUT AN APPROVED PLAN REVISION OR AUTHORIZATION FROM THE ENGINEER.
15. THESE DRAWINGS INDICATE THE GENERAL EXTENT OF THE REQUIRED WORK AND ARE NOT INTENDED TO INDICATE EVERY ELEMENT REQUIRED. THE CONTRACTOR SHALL FURNISH ALL ELEMENTS TO COMPLETE THE SCOPE OF WORK IN ACCORDANCE WITH THE CONTRACT DOCUMENTS. ALL ITEMS REQUIRING CLARIFICATIONS SHALL BE SUBMITTED AS A "REQUEST FOR INFORMATION" (RFI) TO THE ENGINEER PER SECTION 01 31 00 OF THE SPECIFICATIONS.
16. ALL CONSTRUCTION VEHICLES OR EQUIPMENT, MOBILE OR FIXED OPERATED, SHALL BE EQUIPPED WITH PROPERLY OPERATING AND MAINTAINED MUFFLERS IN ACCORDANCE WITH THE LOCAL NOISE ORDINANCES.
17. THE CONTRACTOR SHALL PROVIDE SHOP DRAWINGS FOR THE ENGINEER'S REVIEW, AS MAY BE NECESSARY FOR THE EXECUTION OF THE WORK AND AS REQUIRED BY THE DRAWINGS AND SPECIFICATIONS.
18. DUE TO THE ONGOING OPERATION OF THE FACILITY, CONTRACTOR SHALL PROVIDE A SEQUENCE OF CONSTRUCTION FOR TOWN AND ENGINEER'S APPROVAL. TWO WEEKS PRIOR TO THE START OF CONSTRUCTION THE SEQUENCE SHALL INCLUDE A DETAILED SCHEDULE OF EVENTS AND TIMEFRAME. ALL EQUIPMENT, PIPING, LABOR, ETC. FOR THE SEQUENCE SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. ALL TEMPORARY SHUTDOWNS AND CHANGES IN FACILITY OPERATION SHALL BE DISCLOSED TO OWNER AT LEAST 7 DAYS PRIOR.
19. PAVEMENT REPAIR, AS REQUIRED, MAY BE WITH COLD-MIX ASPHALT CONCRETE, WITH A MINIMUM THICKNESS OF 2 INCHES, USING AGGREGATE GRADING IN ACCORDANCE WITH MARSHALL MIX DESIGN OF SECTION 710 OF MAG UNIFORM STANDARD SPECIFICATIONS AND DETAILS FOR PUBLIC WORK CONSTRUCTION.
20. ALL CONSTRUCTION WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE SOILS AND/OR GEOTECHNICAL REPORT PREPARED BY WESTERN TECHNOLOGIES, INC. DATED 10/25/2022. THIS REPORT IS SUPPLEMENTED BY 1) THESE PLANS AND SPECIFICATIONS, 2) YAVAPAI COUNTY PUBLIC WORKS STANDARDS AND SPECIFICATIONS, 3) STATE OF ARIZONA STANDARD DETAILS. IN THE EVENT OF CONFLICT, THE FORMER SHALL TAKE PRECEDENCE OVER THE LATTER. THE PERFORMANCE AND COMPLETION OF ALL WORK MUST BE TO THE SATISFACTION OF THE ENGINEER OF RECORD.

GENERAL CONSTRUCTION NOTES

ENGINEER'S NOTES

1. THE ENGINEER AND APPLICABLE AGENCY MUST APPROVE, PRIOR TO CONSTRUCTION, ANY ALTERATION TO OR VARIANCE FROM THESE PLANS. ANY VARIATION FROM THESE PLANS SHALL BE PROPOSED ON CONSTRUCTION FIELD PRINTS AND TRANSMITTED TO THE ENGINEER.
2. THE CONTRACTOR SHALL PROTECT AND MAINTAIN ALL EXISTING UTILITIES ON THE SITE. ANY DAMAGE TO EXISTING UTILITIES, WHETHER SHOWN OR NOT ON THE DRAWING SHALL BE REPAIRED/REPLACED AT THE CONTRACTOR'S EXPENSE. EXISTING SURFACE FEATURES AND FENCING SHALL BE REPLACED IN KIND.
3. ANY INSPECTION BY THE TOWN, COUNTY OR THE ENGINEER, SHALL NOT IN ANY WAY RELIEVE THE CONTRACTOR FROM ANY OBLIGATION TO PERFORM THE WORK IN STRICT COMPLIANCE WITH THE APPLICABLE CODES AND AGENCY REQUIREMENTS.
4. CONTRACTOR IS TO LOCATE ALL EXISTING PROPERTY MONUMENTS PRIOR TO CONSTRUCTION. NO EXISTING SURVEY MONUMENTATION SHALL BE REMOVED OR DISTURBED BY THE CONTRACTOR WITHOUT NOTIFICATION AND APPROVAL OF THE PROJECT SURVEYOR. THE CONTRACTOR SHALL CONTACT THE PROJECT SURVEYOR FOR THE SETTING OF REFERENCE POINTS 48 HOURS PRIOR TO DISTURBING OR REMOVING ANY MONUMENTS. A REGISTERED LAND SURVEYOR AT THE CONTRACTOR'S EXPENSE SHALL REPLACE ANY MONUMENTS DISTURBED DURING THE CONSTRUCTION OF THIS PROJECT.
5. NOTHING CONTAINED IN THE CONTRACT DOCUMENTS SHALL CREATE, NOR SHALL BE CONSTRUED TO CREATE, ANY CONTRACTUAL RELATIONSHIP BETWEEN THE ENGINEER AND THE CONTRACTOR OR ANY SUBCONTRACTOR.
6. ANY CONSTRUCTION WATER OBTAINED FROM THE TOWN WATER SOURCE WILL REQUIRE METER AND A BULK WATER PERMIT TO TRACK USAGE. THE TOWN WILL WAIVE FEES FOR PERMITTING AND USAGE IF USAGE IS LESS THEN 20,000 GALLONS. CONTACT THE TOWN OF JEROME AT (928) 634-7943 TO REQUEST A METER.
7. THE CONTRACTOR SHALL MAKE NO CLAIM AGAINST THE OWNER OR THE ENGINEER REGARDING ALLEGED INACCURACY OF CONSTRUCTION STAKES SET BY THE ENGINEER UNLESS ALL SURVEY STAKES SET BY THE ENGINEER ARE MAINTAINED INTACT AND CAN BE VERIFIED AS TO THEIR ORIGIN. IF, IN THE OPINION OF THE ENGINEER, THE STAKES ARE NOT MAINTAINED INTACT AND CANNOT BE VERIFIED AS TO THEIR ORIGIN, ANY REMEDIAL WORK REQUIRED TO CORRECT ANY ITEM OR IMPROPER CONSTRUCTION WORK IN THIS DEVELOPMENT SHALL BE PERFORMED AT THE SOLE EXPENSE OF THE RESPONSIBLE CONTRACTOR OR SUBCONTRACTOR.
8. TRAFFIC CONTROL SHALL BE MAINTAINED IN ACCORDANCE WITH THE TOWN OF JEROME MUNICIPAL CODES.
9. A PORTION OF THIS PROJECT SITE IS LOCATED WITHIN A DOCUMENTED 100-YR FEMA FLOODLAIN AS DESIGNATED ON THE PLANS.
10. IN CASES WHEN UNSTAKED EXISTING UTILITIES ARE ENCOUNTERED, SOME MINOR DEVIATION TO THE PROPOSED SEWER ALIGNMENT MAY BE ALLOWED TO MAINTAIN MINIMUM SEPARATION DISTANCES BETWEEN UTILITIES. ANY PROPOSED CHANGES TO THE ALIGNMENT MUST BE SUBMITTED TO THE TOWN'S REPRESENTATIVE FOR REVIEW. NO CHANGES WILL BE ALLOWED WITHOUT PROPER APPROVAL.
11. PRIOR TO BIDDING THE WORK, THE CONTRACTOR SHALL THOROUGHLY SATISFY HIMSELF AS TO THE ACTUAL CONDITIONS AND EARTHWORK QUANTITIES, IF ANY. NO CLAIM SHALL BE MADE AGAINST THE OWNER OR ENGINEER FOR ANY EXCESS OR DEFICIENCY THEREIN, ACTUAL OR RELATIVE.
12. THE ENGINEERS SHALL BE NOTIFIED BEFORE ANY ONSITE CONSTRUCTION BEGINS.
13. A SEPARATE PERMIT IS NECESSARY FOR ANY OFFSITE CONSTRUCTION.
14. APPROVAL OF THESE PLANS SHALL NOT PREVENT THE TOWN FROM REQUIRING CORRECTION OF ERRORS IN THE PLANS WHERE SUCH ERRORS ARE SUBSEQUENTLY FOUND TO BE IN VIOLATION OF ANY LAW OR ORDINANCE.

MECHANICAL CONSTRUCTION NOTES:

1. CONTRACTOR TO INSTALL PIPE SUPPORTS PER MANUFACTURER'S REQUIREMENTS AND SPECIFICATIONS. ALL DRY AREA PIPE SUPPORTS SHALL BE GALVANIZED STEEL U.N.O. ALL SUBMERGED PIPE SUPPORTS SHALL BE S.S. 316.
2. CONTRACTOR TO INSTALL PUMP BASE, GUIDE RAILS, AND BRACKETS PER MANUFACTURER'S REQUIREMENTS. CONTRACTOR SHALL CONFIRM SUPPLY OF PUMP MOUNTING EQUIPMENT WITH PUMP SUPPLIER.
3. ALL PROCESS PIPES SHALL BE COLOR COATED PER THE SPECIFICATIONS WITH THE EXCEPTION OF STAINLESS STEEL PIPES. ALL ABOVE GROUND PIPES SHALL ALSO BE OUTFITTED WITH A FLOW DIRECTION ARROW.
4. ALL ANCHORING/FASTENING SYSTEMS SHALL BE 316 S.S. REGARDLESS OF LOCATION, U.N.O.
5. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS FOR REVIEW AND APPROVAL FOR EACH EQUIPMENT ITEM PRIOR TO INSTALLATION. INSTALLATION DETAILS FOR ALL EQUIPMENT ITEMS SHALL BE PER RESPECTIVE EQUIPMENT MANUFACTURER'S SHOP DRAWINGS AND RECOMMENDED INSTALLATION REQUIREMENTS.
6. ALL D.I.P. SHALL BE CLASS 350, UNLESS NOTED OTHERWISE.
7. ELEVATION OF EXISTING STRUCTURES, PIPING, AND COMPONENTS ARE APPROXIMATE. CONTRACTOR TO FIELD VERIFY PRIOR TO CONSTRUCTION.
8. PRECAST SUPPLIER TO PROVIDE STRUCTURAL CALCULATIONS STAMPED BY REGISTERED ENGINEER IN AZ TO DOCUMENT DESIGN OF PRECAST STRUCTURE.
9. GROOVE FITTINGS MAY BE USED IN LIEU OF FLANGE FITTINGS FOR ALL ABOVE GROUND D.I. PIPING.
10. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY PIPING AND EQUIPMENT NEEDED FOR PROCESS ISOLATION, BYPASS, AND TRANSITION.
11. ALL YARD PIPING SHALL BE SURVEYED FOR VERTICAL AND HORIZONTAL ALIGNMENT PRIOR TO BACKFILL.
12. ALL PIPE SUPPORTS SPACING SHALL MEET PIPING MANUFACTURER'S REQUIREMENTS.
13. STRUCTURAL DIMENSIONS CONTROLLED BY OR RELATED TO MECHANICAL OR ELECTRICAL EQUIPMENT SHALL BE VERIFIED BY THE CONTRACTOR AND REFLECTED ON SHOP DRAWING PRIOR TO CONSTRUCTION.
14. ALL PVC PIPE GREATER THAN 3" IN DIAMETER SHALL BE DIPS.
15. ALL EXPOSED PIPE SHALL INCLUDE HEAT TRACING AND INSULATION.
16. ALL NEW BURIED GRAVITY SEWER LINES AND FORCE MAINS SHALL BE INSTALLED WITH A MINIMUM 3' DEPTH OF EARTH COVER.

PERMITS

1. CONTRACTOR SHALL OBTAIN ALL PERMITS AT HIS OWN EXPENSE FROM LOCAL MUNICIPAL AND AIR POLLUTION CONTROL AUTHORITIES PRIOR TO BEGINNING CONSTRUCTION.
2. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO ARRANGE FOR THE RELOCATION AND RELOCATION COSTS, IF ANY, OF ALL UTILITIES, AND SUBMIT A UTILITY RELOCATION SCHEDULE TO THE MUNICIPALITY AND DESIGN ENGINEER PRIOR TO CONSTRUCTION. ALL PUBLIC UTILITY EQUIPMENT POLES, BOXES, STRUCTURES, AND MUNICIPAL UTILITY COMPANY EQUIPMENT SHALL BE RELOCATED BY THE APPROPRIATE UTILITY COMPANY OR MUNICIPALITY BEFORE ANY WORK IS STARTED.

RECORD DRAWINGS

1. ACCEPTANCE OF THE COMPLETED PAVING, GRADING, OR UTILITY INSTALLATION WILL NOT BE GIVEN UNTIL REPRODUCIBLE AS-BUILT PLANS HAVE BEEN SUBMITTED BY THE ENGINEER AND APPROVED BY THE LOCAL GOVERNING AGENCY.

OBSERVATION

1. THE CONTRACTOR SHALL CONTACT THE APPROPRIATE PUBLIC UTILITY COMPANIES FOR INSPECTION OF TRENCHING, BEDDING, AND BACKFILLING DONE IN CONJUNCTION WITH INSTALLATION OF THOSE UTILITIES ON THIS PROJECT.
2. SOILS COMPACTION TEST RESULTS MUST BE SUBMITTED TO THE ENGINEER'S OFFICE FOR ALL FILL MATERIAL FOR ROADS, TRENCH BACKFILL, AND SITE FILL MATERIALS UNDER SLABS AND STRUCTURES. NO FILL MATERIALS SHALL BE PLACED WITHOUT TESTING DURING PLACEMENT. CONTRACTOR SHALL SUBMIT ALL TEST RESULTS TO THE DESIGN ENGINEER AND GOVERNMENTAL AGENCIES.
3. CONTRACTOR SHALL SUBMIT A SCHEDULE, APPROVED IN WRITING BY A QUALIFIED CONSULTING TESTING AGENCY, FOR FREQUENCY, LOCATION, AND TYPE OF ALL PROJECT TESTING. THE CONTRACTOR WILL BE RESPONSIBLE FOR SCHEDULING AND COORDINATION OF ALL TESTING INCLUDING THE FOLLOWING TERMS WHICH SHALL BE TESTED IN ACCORDANCE WITH MAG SPECIFICATIONS:
   - 3.1. SUBGRADE COMPACTION
   - 3.2. BASE COURSE COMPACTION
   - 3.3. ASPHALT PAVEMENT MIX DESIGN QUALITY
   - 3.4. CONCRETE STRENGTH
   - 3.5. TRENCH BEDDING AND BACKFILL
   - 3.6. TESTING FOR UTILITIES, PIPING, AND DRAINAGE SYSTEMS

UTILITIES

1. A UTILITY COORDINATION MEETING SHALL BE COORDINATED BY THE CONTRACTOR PRIOR TO THE START OF ANY WORK. ALL UTILITY ISSUES SHALL BE ADDRESSED IN ACCODANCE WITH MAG 105.6.
2. LOCATION OF UNDERGROUND UTILITIES SHALL BE ACCOMPLISHED IN ACCORDANCE WITH ARS 40-360.22 PRIOR TO ANY EXCAVATION. BLUE STAKE SHALL BE CALLED AT 1-800-STAKE-IT FOR ACCURATE LOCATION OF UTILITIES AS NECESSARY AND PRIOR TO AN EXCAVATION. UTILITIES IF INDICATED ON PLANS ARE APPROXIMATE LOCATIONS ONLY, TAKEN FROM THE UTILITY COMPANY MAPS. IF THE CONTRACTOR ENCOUNTERS ANY LINES NOT INDICATED ON THE DRAWINGS OR MARKED IN THE FIELD BY THE UTILITY COMPANY THAT MAY INTERFERE WITH HIS WORK, HE SHALL NOTIFY THE APPROPRIATE UTILITY COMPANY IMMEDIATELY FOR DISPOSITION OF THOSE FACILITIES.
3. UTILITIES MUST BE LOCATED TO MINIMIZE INTERFERENCE WITH ONE ANOTHER, TO PROVIDE REQUIRED HORIZONTAL AND VERTICAL SEPARATIONS, AND TO PROVIDE MAINTENANCE ACCESS WITHOUT VIOLATING EASEMENT BOUNDARIES. SEPARATION BETWEEN UTILITIES PER MAG STANDARD.
4. ALL WATER MAINS, APPURTENANCES, AND INSTALLATIONS SHALL CONFORM TO A.W.W.A. STANDARDS AND ARIZONA DEPARTMENT OF ENVIRONMENTAL QUALITY AND TOWN OF JEROME REQUIREMENTS. WATER SYSTEMS SHALL BE TESTED PER A.D.E.Q. BULLETIN NO. 10 TO THE APPROPRIATE A.W.W.A. STANDARDS.

CONSTRUCTION STAKING

1. THE ACCURACY OF ALL CONSTRUCTION WORK SHALL BE MAINTAINED AND VERIFIED BY THE OWNER'S SURVEYOR AT THE OWNER'S EXPENSE BY PROVIDING CONSTRUCTION STAKING SUITABLE TO THE TOWN ENGINEER. STAKES WILL BE SET ESTABLISHING LINES AND GRADES (FINISH OR FLOWLINE) FOR ALL CONSTRUCTION INCLUDING ROADS, CURB AND GUTTER, SIDEWALKS, UTILITIES, STRUCTURES, AND OTHER WORK AS CONSIDERED NECESSARY BY THE ENGINEER. ALL SURVEY CONTROL SHALL BE SET BY THE OWNER'S SURVEYOR FROM MONUMENTS ACCEPTABLE TO THE ENGINEER.

GRADING AND EARTHWORK

1. NO GRADING OR TRENCHING WORK SHALL BEGIN PRIOR TO SUPPORTING AND PROTECTING EXISTING ONSITE AND ADJACENT PROPERTY FROM SETTLING, CRACKING, OR OTHER DAMAGE WHICH MIGHT RESULT. CONTRACTOR SHALL VERIFY FROM SOILS REPORT RECOMMENDATIONS THE DEGREE OF DIFFICULTY REQUIRED FOR TRENCHING AND EXCAVATION WORK BASED ON DEPTH AND TYPE OF MATERIALS TO BE ENCOUNTERED.
2. CLEARING AND GRUBBING: EXAMINE SITE AND PROVIDE NECESSARY EQUIPMENT AND LABOR TO REMOVE FROM THE SITE AND DISPOSE OF STUMPS, ROOTS, ROCKS, LOOSE FILL, VEGETATION DEBRIS, AND ANY OTHER OBJECTIONABLE MATERIALS FROM THE BUILDING AND MATERIAL. CLEAN. UNCLASSIFIED ONSITE SOILS MAY BE USED IN GENERAL AS FILL MATERIAL. SEE MAG SPECIFICATIONS 201 AND 215.
3. SUBGRADE PREPARATION: IF THE NATURAL SUBGRADE IS LESS THAN THE REQUIRED DENSITY, IT SHALL BE SCARIFIED AND COMPACTED TO A MINIMUM DEPTH OF TWELVE INCHES OR AS NOTED IN THE SOILS REPORT IMMEDIATELY PRIOR TO PLACING SUBSEQUENT FILL MATERIAL THEREON. THE CONTRACTOR IS RESPONSIBLE FOR MAINTENANCE AND REPAIR OF DAMAGE TO PREPARED SUBGRADE CAUSED BY CONTRACTOR'S OPERATIONS OR PUBLIC TRAFFIC UNTIL ACCEPTANCE OF PROJECT. NO MATERIALS SHALL BE PLACED UPON THE PREPARED SUBGRADE UNTIL IT MEETS THE SPECIFIED REQUIREMENTS. ROADWAY SUBGRADE COMPACTION INCLUDES SUBGRADE UNDER ALL PAVEMENT, CURB, SIDEWALKS, SHOULDERS, AND FILL SLOPES. SUBGRADE TOLERANCES SHALL BE AS SPECIFIED IN MAG SECTION 301. OPEN LANDSCAPED AREAS SHALL BE GRADED TO ±0.2 FEET.
4. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO CONTACT THE TESTING COMPANY FOR SCHEDULING OF COMPACTION TESTING. THE FREQUENCY OF DENSITY AND MOISTURE TESTS REQUIRED FOR ADEQUATE CONTROL SHALL BE THE RESPONSIBILITY OF THE SOILS ENGINEER WHO SHALL CERTIFY TO THE ENGINEER AND CONTRACTOR AT PROJECT END THAT THE ROADBED FILL IS COMPACTED AS OUTLINED HEREIN. COMPACTION SHALL BE ACHIEVED BY MECHANICAL MEANS. IN NO CASE SHALL STRUCTURE BACKFILLING BE FLOOD WATER SETTLED.
5. ALL SLOPE CONSTRUCTION AND ROADWAY EXCAVATION SHALL CONFORM TO THE REQUIREMENTS OF MAG SPECIFICATIONS SECTIONS 20, 205, 211, 301, AND UBC SECTIONS 7009 AND 8010. CUT AND FILL SLOPES SHALL BE AS INDICATED ON THE DETAILS AND PLANS. CUT AND FILL SLOPE GRADIENTS SHALL NOT EXCEED 2:1 IN STEEPNESS WITHOUT WRITTEN AUTHORIZATION FROM THE SOILS ENGINEER AND EXAMINATION BY THE DESIGN ENGINEER. ALL SLOPE CONDITIONS SHALL BE PROVIDED WITH THE APPROPRIATE BENCHES AS SPECIFIED IN THE REFERENCE DOCUMENTS AND INDICATED ON THE PLANS. IF SOILS CONDITIONS ARE ENCOUNTERED WHICH DO NOT ALLOW THE ESTABLISHMENT OF THE INDICATED CUT OR FILL SLOPES, THE DESIGN ENGINEER AND SOILS ENGINEER SHALL BE CONTACTED IMMEDIATELY TO DETERMINE AN ADJUSTMENT TO THE SLOPE GRADIENT OR TO ESTABLISH A METHOD OF STABILIZATION. ALL FILL SLOPES SHALL BE COMPACTED AS EACH LIFT OF FILL MATERIAL IS PLACED. ALL CUT AND FILL SLOPES SHALL BE UNIFORMLY GRADED TO LINES AND GRADES INDICATED. TOPS OF ALL CUT SLOPES SHALL BE ROUNDED AND ALL UNSTABLE AND LOOSE MATERIAL AT TOP OF SLOPE SHALL BE REMOVED. TOP OF CUT SLOPES OVER 10' HIGH SHALL BE PROVIDED WITH BRO DITCHES FOR DRAINAGE. ALL CUT AND FILL SLOPES SHALL BE REVEGETATED WITH A MIXTURE OF NATIVE GRASSES AND WILD FLOWER SEED OR AS SPECIFIED WITHIN THE LANDSCAPE PLANS. COMPACT ALL SHOULDERS AND BACKFILLS BEHIND ALL STRUCTURES AND WALLS.
6. COMPACT TO THE FOLLOWING SPECIFIED PERCENT OF MAXIMUM DENSITY AS DETERMINED IN ACCORDANCE WITH ASTM D698 AND MAG SECTION 211 OR AS DIRECTED IN THE SOILS REPORT.

MINIMUM PERCENT COMPACTION

SUBGRADE SOIL:
- ROADWAY AND STRUCTURE AREAS - - - - - - - - - - - - - 95
- PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS) - - 95

EARTH FILL:
- ROADWAY AND STRUCTURE AREAS - - - - - - - - - - - - - 95
- PAVED ARES (PAVEMENTS, SIDEWALKS, & PADS) - - - 95
- GRASSED AND PLANTING AREAS - - - - - - - - - - - - - - 85
- AGGREGATE BASE COURSE - - - - - - - - - - - - - - - - - - 100
- BACKFILL AROUND STRUCTURES - - - - - - - - - - - - - - 95

BACKFILL FOR UTILITY TRENCHES (PER MAG SECTION 601). PROVIDE TYPE 1 BACKFILL OR AS DIRECTED BY APPROPRIATE UTILITY REQUIREMENTS. BACKFILL FOR TRENCHES WITHIN 10' OF STRUCTURES AND WALLS SHALL BE COMPACTED TO 95% UNLESS DIRECTED OTHERWISE BY ENGINEER.

EQUIPMENT LIST

ITEM	ID #	DESCRIPTION	MANUFACTURER	MODEL #	HP	SPECIFICATIONS / DESCRIPTION	QTY
1	03010A 03010B	INFLUENT COARSE SCREEN	OR-TEC OR EQUAL	MB480T2 W/ RT	0.16	TANK MOUNTED MECHANICALLY CLEANED BAR SCREEN WITH TWO INDEPENDENT 6MM SCREENING CHANNELS W/ ISOLATING SLIDE GATE & SST ENCLOSURE, PROVIDED WITH SEPERATE ROCK TRAP W/ BAFFLE AND OUTLET WEIR. 480V, 3 PHASE, 60HZ. 0.27 MGD PEAK FLOW	1
2	05120 05121	SBR INFLUENT PLUG VALVES	BY SBR VENDOR		0.5	ELECTRICALLY ACTUATED 10" PLUG VALVE W/ OPEN/CLOSE SERVICE. 120V, 1 PHASE, 60 HZ	2
3	05110 05112	SBR SUBMERSIBLE MIXERS	BY SBR VENDOR		3.6	PREMIUM EFFICIENCY CONSTANT SPEED DIRECT DRIVE MOTOR MIXER W/ MAST MOUNT AND MOORING, 480V, 3 PHASE, 60HZ.	2
4	04310 04311 04312	SBR AERATION BLOWERS	BY SBR VENDOR		20	VFD CONTROLLED PD BLOWER UNIT W/ SOUND ATTENUATED ENCLOSURE, 361 SCFM @ 6.63 PSI, 480V, 3 PHASE, 60HZ.	3
5	04313	DIGESTER AERATION BLOWER	BY SBR VENDOR		7.5	VFD CONTROLLED PD BLOWER UNIT W/ SOUND ATTENUATED ENCLOSURE, 110 SCFM @ 6.63 PSI, 480V, 3 PHASE, 60HZ. CONTROLLED	1
6	04180 04181	RETREIVABLE FINE BUBBLE DIFFUSER SYSTEM	BY SBR VENDOR		N/A	RETRIEVABLE DIFFUSER RACK ASSEMBLY WITH MIN 30" EPDM TUBE DIFFUSERS, RANGE 1.0 CFM - 10.0 CFM (1 - 5 SCFM DESIGN) 2/ W EPDM FLEXIBLE DROP LINE AND QUICK DISCONNECT FITTINGS	60
7	04280	COARSE BUBBLE DIFFUSER SYSTEM	BY SBR VENDOR		N/A	3" EPDM DISK COARSE BUBBLE DIFFUSERS, RANGE 0.5 CFM - 5.0 CFM (0.5 - 2 SCFM DESIGN) 3/8" CXN	12
8	05100 05101	WAS TRANSFER PUMPS	BY SBR VENDOR		1.8	20 GPM @ 15' TDH SUBMERSIBLE NON-CLOG SLUDGE PUMP, 1.8 HP 480V, 3 PHASE, 60HZ W/ BASE AND SS GUIDE RAIL	2
9	05111 05113	SOLIDS EXCLUDING FLOATING DECANTER	BY SBR VENDOR		0.5	211 GPM FLOATING DECANTER W/ 120V, 1 PHASE, 60 HZ ACTUATED SUBMERGED WEIR, MOORING AND 6" DISCHARGE HOSE ASSEMBLY	2
10	05121 05123	SBR DECANT VALVE	BY SBR VENDOR		0.33	ELECTRICALLY ACTUATED 6" BUTTERFLY VALVE W/ MODULATING SERVICE, 480V, 3 PHASE, 60HZ	2
11	06221	TRANSFER/EFFLUENT VALVE	BY SBR VENDOR		0.33	ELECTRICALLY ACTUATED 6" BUTTERFLY VALVE W/ MODULATING SERVICE, 480V, 3 PHASE, 60HZ	1
12	06290	CHLORINATION EROSION TABLET FEEDER	NORWECO OR EQUAL	SERIES 4000	N/A	6" SCH 80 PVC HUB TABLET FEEDER W/ ADJUSTABLE INLET BAFFLE AND OUTLET WEIR AND 24" RISER ASSEMBLIES	1
13	05291	DECHLORINATION EROSION TABLET FEEDER	NORWECO OR EQUAL	SERIES 4000	N/A	6" SCH 80 PVC HUB TABLET FEEDER W/ ADJUSTABLE INLET BAFFLE AND OUTLET WEIR AND 24" RISER ASSEMBLIES	1
14	08400	DEWATERING FEED PUMP	BOERGER OR EQUAL	AN 40	3.0	20 GPM ROTARY LOBE SLUDGE PUMP, 3 HP 480V, 3 PHASE, 60HZ	1
15	08410	DRY POLYMER MAKE-DOWN AND FEED UNIT	PROMINENT OR EQUAL	ULTROMAT MT 140	0.25	POLYPROPOLENE PREP TANK W/ ELECTRIC STIRRER, WETTING CONE AND INJECTOR 480V, 3 PHASE, 60 HZ	1
16	08401	POLYMER METERING PUMP	PROMINENT OR EQUAL	DULCOFLEX - DFXa 0530	0.16	0.08 - 7.93 GPH SHELF-MOUNTED PERISTALTIC METERING PUMP, 73 PSI MAX BACK PRESSURE, 1/2" x 3/8" POLYURETHANE CONNECTOR TUBING, 115V, 1-PH SERVICE	1
17	08490	SLUDGE BAGGER SYSTEM	ENVIRODYNE, OR EQUAL	585-8i	N/A	20 GPM 8-BAG SLUDGE DEWATERING SYSTEM MAX LOADING RATE OF 20 GPM OR 100 #/HR - 25# ACTIVE POLYMER / TON DS	1
18	07400	DRYING BED DRAIN RETURN PUMPS	GRUNDFOS OR EQUAL	SEG.A15.40.EX.2.60H	4.16	70 GPM @ 90' TDH SUBMERSIBLE GRINDER PUMP, 5 HP 480V, 3 PHASE, 60HZ W/ BASE AND SS GUIDE RAIL	2
19	07401	PACKAGED OVERFLOW LIFT STATION	E ONE OR EQUAL	SP84S	2	31 GPM @ 82' TDH SDUPLEX GRINDER PRE-PACKAGED PUMP STATION, 2 HP 240V, 1 PHASE, 60 HZ W/ INTEGRAL FLOAT CONTROLS, PANEL AND SINGLE WARNING BEACON	1
20	SEE PID	PRESSURE TRANSDUCER	BY SBR VENDOR		N/A	304 SS SUBMERSIBLE PRESSURE TRANSDUCER WITH 4-20 mA SIGNAL OUTPUT	4
21	SEE PID	LEVEL SENSOR	BY SBR VENDOR		N/A	316 SS FLOAT SWITCH WITH THREE-CONDUCTOR ELECTRICAL CABLE	4
22	05160A 05161A	DISSOLVED OXYGEN CONTROLLER	BY SBR VENDOR		N/A	NEMA 4X ENCLOSURE WITH AC 100-230 VAC POWER SUPPLY, 4-20 mA SIGNAL OUTPUT	2
23	05160B 05161B	DISSOLVED OXYGEN PROBE	BY SBR VENDOR		N/A	304 SS PROBE	2
24	06240	EFFLUENT FLOW METER	BY SBR VENDOR		N/A	6" ELECTROMAGNETIC FLOW METER W/ TRAMSMITTER, ±1%ACCURACY 5D/3D, WITH 4-20 mA SIGNAL OUTPUT	1
25	01003	STANDBY GENERATOR			N/A	600 KW STANDBY GENERATOR W/ SOUND ATTENUATED OUTDOOR ENCLOSURE AND SUB BASE FUEL TANK	1

DESIGN FLOWS:

MAX MONTH AVE DAY FLOW:	90,000 GPD
MAX PEAK DAY FLOW:	135,000 GPD
PEAK HOUR FLOW:	270,000 GPD

INFLUENT PARAMETERS:

BOD:	360 MG/L
TSS:	250 MG/L
TKN:	40 MG/L

EFFLUENT PARAMETERS:

BOD:	<30 MG/L
TSS:	<30 MG/L
TN:	<10 MG/L
FECAL COLIFORM:	200 CFU/100 ML (4/7 SAMPLES); 800 CFU/100 ML (SINGLE SAMPLE MAX)

JOB NO. B614

W:\B614\Engineering\B614-30\sheets\B614-G3.0 HYDRAULIC PROFILE.dwg - Tab: G3.2 - by reddington on 03/02/26 at 9:32:17 AM

1 GENERAL

1.1 ALL PAVING, GRADING PIPING AND UTILITY LINE CONSTRUCTION WORK WITHIN THE PUBLIC RIGHT-OF-WAY, ON PRIVATE STREETS, ACCESS WAYS, LOT GRADING, MATERIALS, AND WORKMANSHIP SHALL COMPLY WITH TOWN OF JEROME ENGINEERING STANDARDS AND SPECIFICATIONS, AND SHALL CONFORM TO THE LATEST MARICOPA ASSOCIATION OF GOVERNMENTS (MAG) AND A.D.O.T. STANDARD DETAILS AND SPECIFICATIONS. GRADING WORK SHALL CONFORM TO MAG SPECS, THE SOILS REPORT* AND CHAPTER 70 ENTITLED "EXCAVATION AND GRADING" OF THE UNIFORM BUILDING CODE (UBC) LATEST EDITION, SUBSECTIONS 7001 TO 7005, 7009 TO 7013, FIGURES 70-1 AND 70-2 AND AS STATED THEREIN. LOCAL MUNICIPAL STANDARD DETAILS WILL CONTINUE TO APPLY WHERE NOT ADOPTED OR INCLUDED BY MAG. THE FOLLOWING NOTES AND SPECIFICATIONS ARE HEREBY MADE A PART OF THE CONTRACT DOCUMENTS AND PROJECT SPECIFICATIONS. WHERE THERE EXISTS A CONFLICT BETWEEN THESE NOTES, MAG SPECS, UBC, THE SOILS REPORT* OR THE PROJECT SPECIFICATIONS, THE MORE STRINGENT OF THE REQUIREMENTS SHALL GOVERN UNLESS PRIOR CLARIFICATION FROM THE ENGINEER HAS BEEN GIVEN IN WRITING TO THE CONTRACTOR. THE CONTRACTOR AS STATED HEREIN SHALL MEAN THE GENERAL CONTRACTOR AND HIS ASSOCIATED SUBCONTRACTORS. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR THE COORDINATION AND PERFORMANCE OF THE WORK OF ALL OF HIS SUBCONTRACTORS AND SUPPLIERS.

1.2 ALL WORK SHALL BE BID AND INSTALLED BY THE CONTRACTOR COMPLETE AND OPERATIONAL TO LINES, GRADES AND FUNCTIONS INDICATED ON ALL PLANS AND SPECIFICATIONS. PROVIDE ALL LABOR, MATERIALS, EQUIPMENT AND SERVICES NECESSARY TO COMPLETE ALL PROJECT EARTHWORK AND SITE WORK INCLUDING BUT NOT LIMITED TO: SITE CLEARING, GRUBBING, DEMOLITION'S, DEBRIS REMOVALS FROM THE SITE, IMPORT AND/OR EXPORT OF SOILS AND OTHER MATERIALS TO AND FROM THE SITE, BORROW MATERIALS, TEMPORARY SOILS MATERIAL STOCKPILING, BACKFILL OF ONSITE BORROW PITS, MOVING OF MATERIALS, CUT AND FILL, SLOPES, SOILS AND BANK STABILIZATION AND PROTECTION, BERMING, ROADWAY EXCAVATIONS, RELOCATION'S, STRUCTURE EXCAVATIONS, TRENCHING, ALL BACKFILLING, SITE GRADING, PAVING, PIPING, UTILITY LINE AND STORM DRAINAGE CONSTRUCTION, CURBS, SITE CONCRETE WORK AND OTHER MISCELLANEOUS SITE WORK STRUCTURES AND ITEMS INDICATED ON THE PLANS AND IN THE CONTRACT DOCUMENTS.

1.4 ANY QUANTITIES SHOWN ON PLANS ARE NOT VERIFIED BY THE ENGINEER. QUANTITIES ARE APPROXIMATE ONLY AND INTENDED AS A GUIDE FOR ESTIMATING PURPOSES. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING HIS OWN QUANTITY TAKE OFFS. THE CONTRACTOR SHALL VISIT THE SITE AND REVIEW THE SOILS CONDITIONS AND THE SOILS REPORT* WITH THE PROJECT SOILS ENGINEER PRIOR TO BIDDING THIS PROJECT. ANY DISCREPANCIES IN SITE MATERIALS SHALL BE BROUGHT TO THE ATTENTION OF THE DESIGN ENGINEER 7 DAYS MINIMUM PRIOR TO BIDDING FOR REVIEW. ALL SHRINK OF EARTH MATERIAL OR EXCESS MATERIAL FROM UTILITY TRENCHES AND FOUNDATIONS SHALL BE INCLUDED IN THE CONTRACTOR'S BID.

1.5 THE ENGINEER MAY REQUIRE THE SUBMITTAL OF A "CERTIFICATE OF COMPLIANCE" AND/OR "MANUFACTURER'S GUIDELINES" FOR ANY MATERIALS USED IN THE WORK. MANUFACTURER'S GUIDELINES SHALL CONSISTS OF WRITTEN INSTRUCTIONS FOR SHIPPING, HANDLING, UNLOADING, CUTTING, JOINING, INSTALLATION, STORAGE, AND/OR ANY OTHER FACETS OF CONSTRUCTION

1.6 THE ENGINEER MAY REQUIRE ANY MATERIALS USED IN THE WORK TO BE TESTED ACCORDING TO AASHTO AND ASTM STANDARDS. THE CONTRACTOR SHALL, AT HIS EXPENSE, SUPPLY CERTIFICATES OR RESULTS OF TESTING.

1.7 ALL WORK AND MATERIALS NOT CONFORMING TO SPECIFICATIONS OR PERFORMED WITHOUT THE CONSENT OF THE OWNER OR HIS REPRESENTATIVE WILL BE SUBJECT TO REJECTION BY THE OWNER AND/OR ENGINEER AND REPLACED AT THE CONTRACTOR'S EXPENSE.

1.8 THE CONTRACTOR SHALL GUARD AGAINST DAMAGE DURING CONSTRUCTION TO ADJACENT PROPERTIES, FENCES, WALLS AND UTILITY EQUIPMENT. ANY ITEMS DAMAGED BY CONSTRUCTION SHALL BE REPLACED WITH SAME KIND OR BETTER AT CONTRACTOR'S EXPENSE.

1.9 NO CONSTRUCTION SHALL BEGIN UNTIL CONFLICTING UNDERGROUND UTILITY MITIGATING CONSTRUCTION IS COMPLETED, IF ANY, AND UNTIL PIPE SLEEVES AND SERVICE STUBS TO ALL BUILDINGS OR LOTS HAVE BEEN EXTENDED.

1.10 NO EXISTING SURVEY MONUMENTATION SHALL BE REMOVED OR DISTURBED BY THE CONTRACTOR WITHOUT NOTIFICATION AND APPROVAL OF THE PROJECT SURVEYOR. THE CONTRACTOR SHALL CONTACT THE PROJECT SURVEYOR FOR THE SETTING OF REFERENCE POINTS 48 HOURS PRIOR TO DISTURBING OR REMOVING ANY MONUMENTS. THE CONTRACTOR SHALL BE FINANCIALLY RESPONSIBLE FOR COSTS TO REESTABLISH MONUMENTATION OR CONTROLS REMOVED WITHOUT PRIOR NOTICE AND APPROVAL.

1.11 TRAFFIC CONTROL SHALL CONFORM TO THE LOCAL MUNICIPAL ADOPTED STANDARDS.

1.12 THESE PLANS ARE SUBJECT TO THE INTERPRETATION OF THE INTENT BY THE ENGINEER. ANY QUESTIONS REGARDING THESE PLANS MUST BE GIVEN TO THE ENGINEER AND YOU MUST HAVE RECEIVED A RESPONSE TO THE QUESTION. ANYONE WHO TAKES IT UPON THEMSELVES TO MAKE AN INTERPRETATION OF THE DRAWINGS OR MAKES REVISIONS TO THE SAME WITHOUT CONFERRING WITH THE DESIGN ENGINEER SHALL BE RESPONSIBLE FOR THE CONSEQUENCES THEREOF.

1.13 CONTRACTOR SHALL COORDINATE HIS WORK WITH THE DESIGN ENGINEER, OWNER, PUBLIC UTILITY COMPANIES AND OTHER ASSOCIATED TRADES ON AND ADJACENT TO THE PROJECT SITE. COORDINATE INSTALLATION OF ALL PUBLIC AND PRIVATE UNDERGROUND UTILITIES, PIPES, CONDUITS AND PIPE SLEEVE SIZES AND LOCATIONS PRIOR TO THEIR PLACEMENT. INSTALLATION: THE CONTRACTOR IS RESPONSIBLE FOR SETTING CAPPED SLEEVES AND PROVIDING TYPE 1 COMPACTION IN ALL BACKFILLED TRENCHES IN PAVED AREAS AND EASEMENTS. PROVIDE TRACER WIRE AND MARKER AT GRADE LEVEL FOR FUTURE LOCATING.

1.14 CONTRACTOR SHALL BE RESPONSIBLE FOR FINANCIAL REIMBURSEMENT TO THE OWNER AND ENGINEER FOR THE FOLLOWING ADDITIONAL ENGINEERING SERVICES SHOULD THEY OCCUR, AND SUCH A/E DESIGN SERVICES WILL BE DEDUCTED FROM CONTRACTOR'S FINAL PAYMENTS BY THE OWNER.

A. REINSPECTION, COORDINATION AND EXTRA TESTING OR RETESTING COSTS INCURRED BECAUSE OF IMPROPER OR FAULTY CONSTRUCTION. ONE TIME TESTING AND INSPECTION IS PROVIDED FOR BY THE OWNER. ALL OTHER TESTING IS THE CONTRACTOR'S RESPONSIBILITY.

B. ADDITIONAL STAKING NOT INCLUDED IN CONTRACT OR RESTAKING AS REQUESTED BY CONTRACTOR.

C. CHANGES AND SUBSTITUTIONS IN MATERIALS CONSTRUCTION METHODS, REQUESTED BY THE CONTRACTOR, THAT MUST BE REVIEWED, RECALCULATED OR APPROVED BY ENGINEER.

D. ENGINEERING DESIGN SERVICES REQUESTED BY THE CONTRACTOR OR CAUSED BY ERRORS OR OMISSIONS BY THE CONTRACTOR.

E. ANY ENGINEERING DESIGN APPROVED BY OTHERS AND SUBMITTED FOR REVIEW. THESE SHALL BEAR THE SEAL OF AN ENGINEER REGISTERED IN ARIZONA.

ANY DIFFERENCE BETWEEN PLANS AND SPECIFICATIONS AND QUESTIONS AS TO THEIR MEANING SHALL BE DETERMINED PRIOR TO AWARD OF THE CONTRACT AND SHALL BE INTERPRETED BY THE ENGINEER. THE GENERAL INTENT AND MEANING OF THE PLANS AND SPECIFICATIONS WILL GOVERN AND SHALL NOT WARRANT ANY ADDITIONAL COMPENSATION TO THE CONTRACTOR. THE ENGINEER WILL PROVIDE FULL INSTRUCTIONS WHEN DISCREPANCIES ARE DISCOVERED IN THE DOCUMENTS.

1.16 THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE LIMITS OF THE WORK AREA FOR ALL PHASES OF THE WORK PRIOR TO BEGINNING CONSTRUCTION OF THOSE PHASES. ALL CONSTRUCTION LIMITS, AREAS OF WORK, SETBACKS, PERIMETERS, ADJACENT PROPERTY LINES, BOUNDARIES, AND OTHER CRITERIA DEFINING THE LIMITS OF THE CONTRACTOR'S WORK AREA AND LIMITS, SHALL BE STAKED BY THE CONTRACTOR'S SURVEYOR PRIOR TO CONSTRUCTION OR CLEARING OF THE SITE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR FAMILIARIZING HIMSELF WITH THE EXTENT OF WORK TO BE DONE IN EACH SEPARATE PHASE OF THE PROJECT, AND ANY WORK NECESSARY IN INACTIVE PHASES REQUIRED TO DEEM THE ACTIVE PHASES FINISHED, SAFE, AND SERVICEABLE.

1.17 THE CONTRACTOR OR SUBCONTRACTORS SHALL NOT DEVIATE FROM THESE PLANS OR MAKE FIELD CHANGES WITHOUT REQUESTING THE ENGINEER TO PROVIDE, IN WRITING, THE APPROVAL OF THESE MODIFICATIONS. ANY CHANGES MADE WITHOUT APPROVAL OF THE DESIGN ENGINEER ARE SUBJECT TO REMOVAL AT THE EXPENSE OF THE CONTRACTOR.

1.18 THE DESIGN ENGINEER RESERVES THE RIGHT TO MAKE MINOR FIELD MODIFICATIONS TO GRADES AND STRUCTURE DESIGNS TO ACCOMMODATE FIELD CONDITIONS FOUND ON SITE. THIS INCLUDES BUT IS NOT LIMITED TO MINOR MODIFICATIONS TO GRADE, ALIGNMENT, SLOPE OR STRUCTURE LOCATIONS. THE ENGINEER SHALL HAVE THE RIGHT TO MAKE SUCH CHANGES IN WRITING IN THE LOCATION AND QUANTITIES OF WORK AS MAY BE DEEMED ADVISABLE.

1.19 NO JOB WILL BE CONSIDERED COMPLETE UNTIL FINE GRADING IS COMPLETE AND ALL CURBS, PAVEMENT AND SIDEWALKS HAVE BEEN SWEPT CLEAN OF ALL DIRT AND DEBRIS, ALL SURVEY MONUMENTS ARE INSTALLED AND ALL VALVES, MANHOLES AND BOXES HAVE BEEN ADJUSTED ACCORDING TO THE PLANS AND STANDARD DETAILS.

1.20 EXISTING GRADES INDICATED ON PLANS ARE BASED ON PREGRADING CONDITIONS. LOSSES IN MATERIAL DUE TO SHRINKAGE OF MATERIAL, DEMOLITION OF EXISTING SITE FEATURES, CLEARING AND GRUBBING OF THE SITE SHALL BE INCLUDED IN CONTRACTOR'S BID.

1.21 SHOP DRAWINGS SHALL BE PROVIDED BY THE CONTRACTOR PER MAG SECTION 105.2.

2 PERMITS

2.1 CONTRACTOR SHALL OBTAIN ALL PERMITS AT HIS OWN EXPENSE FROM LOCAL MUNICIPAL AND AIR POLLUTION CONTROL AUTHORITIES PRIOR TO BEGINNING CONSTRUCTION.

2.2 REQUIRED PERMITS SHALL BE SECURED BY THE CONTRACTOR FROM THE APPROPRIATE AGENCIES. A.D.O.T. REQUIRES THAT A PERMIT BE ISSUED FROM THEIR OFFICE FOR ANY WORK WITHIN STATE RIGHT-OF-WAY. FEDERAL PERMITS, UTILITY CO. AND OTHER PERMITS MAY BE REQUIRED. A.D.E.Q. REQUIRES PERMITS BE ISSUED PRIOR TO NEW CONSTRUCTION, EXTENSION TO, OR MODIFICATION OF WATER DISTRIBUTION SYSTEM, SEWAGE COLLECTION OR INDIVIDUAL SEWAGE TREATMENT SYSTEM. A RIGHT-OF-WAY PERMIT, ISSUED BY THE TOWN, IS REQUIRED FOR ANY EXCAVATION OR GRADING (INCLUDING PLACEMENT OF FILL). PRIOR TO CONSTRUCTION THE APPROPRIATE AGENCIES SHALL BE NOTIFIED BY THE CONTRACTOR AS REQUIRED BY THE PERMITS.

2.3 THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING AT HIS OWN EXPENSE ALL APPROPRIATE INSURANCE FORMS FOR PERMIT REQUIREMENTS.

2.4 IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO ARRANGE FOR THE RELOCATION AND RELOCATION COSTS, IF ANY, OF ALL UTILITIES, AND SUBMIT A UTILITY RELOCATION SCHEDULE TO THE MUNICIPALITY AND DESIGN ENGINEER PRIOR TO CONSTRUCTION. ALL PUBLIC UTILITY EQUIPMENT POLES, BOXES, STRUCTURES AND MUNICIPAL UTILITY COMPANY EQUIPMENT SHALL BE RELOCATED BY THE APPROPRIATE UTILITY COMPANY OR MUNICIPALITY BEFORE ANY WORK IS STARTED.

3 APPROVALS

3.1 THE CONTRACTOR IS TO USE ONLY THAT OFFICIAL CONSTRUCTION SET OF DRAWINGS WHICH CONTAINS THE APPROVAL OF THE GOVERNMENT AGENCY/UTILITY SIGNED ON THE COVER SHEET OF THE PLANS. THE CONTRACTOR SHALL NOT PLACE BIDS OR START CONSTRUCTION ON A SET OF DRAWINGS UNSIGNED BY THE GOVERNMENT AGENCY AND/OR MARKED "NOT FOR CONSTRUCTION".

4 RECORD DRAWINGS

4.1 IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE AND KEEP AN UPDATED RECORD SET OF AS-BUILT INFORMATION DRAWINGS IN GOOD CONDITION ON THE JOB SITE AND PROVIDE THE DESIGN ENGINEER AT COMPLETION OF THE WORK, WITH THE RECORD SET SHOWING FIELD VERIFIED LOCATIONS OF ALL VALVES, BOXES, MANHOLES, UTILITY POLES, PIPE SLEEVES, UTILITY ENCASEMENT AND OTHER UTILITY LINES AND EQUIPMENT ABOVE AND BELOW GROUND WHICH THE CONTRACTOR ENCOUNTERS AND INSTALLS IN HIS AREA OF WORK.

4.2 ACCEPTANCE OF THE COMPLETED PAVING, GRADING OR UTILITY INSTALLATION WILL NOT BE GIVEN UNTIL REPRODUCIBLE AS-BUILT PLANS HAVE BEEN SUBMITTED BY THE ENGINEER AND APPROVED BY THE LOCAL GOVERNING AGENCY.

5 OBSERVATION

5.1 ALL MATERIALS USED AND ALL WORK DONE BY THE CONTRACTOR SHALL BE SUBJECT AT ALL TIMES TO THE INSPECTION, TESTING AND APPROVAL OF THE ENGINEER AND GOVERNING AGENCY. SPECIAL INSPECTION AND TESTING SERVICES SHALL BE PROVIDED AT THE OWNER'S EXPENSE, AS REQUIRED BY THE TOWN ENGINEER.

5.2 THE CONTRACTOR SHALL CONTACT THE APPROPRIATE PUBLIC UTILITY COMPANIES FOR INSPECTION OF TRENCHING, BEDDING AND BACKFILLING DONE IN CONJUNCTION WITH INSTALLATION OF THOSE UTILITIES ON THIS PROJECT.

5.3 SUBMITTAL OF AN ENGINEER'S CERTIFICATE OF COMPLETION IS REQUIRED BY A.D.E.Q. FOR ALL WATER AND SEWER SYSTEM CONSTRUCTION. RELATED INSPECTION AND TESTING SHALL BE PROVIDED BY THE OWNER'S ENGINEER AT THE OWNER'S EXPENSE.

5.4 SOILS COMPACTION TEST RESULTS MUST BE SUBMITTED TO THE ENGINEER'S OFFICE FOR ALL FILL MATERIAL FOR ROADS, TRENCH BACKFILL AND SITE FILL MATERIALS UNDER SLABS AND STRUCTURES. NO FILL MATERIALS SHALL BE PLACED WITHOUT TESTING DURING PLACEMENT. NO EARTH MATERIAL SHALL BE PLACED WITHOUT APPROVAL OF THE PREVIOUS LIFTS. THE CONTRACTOR SHALL SUBMIT ALL TEST RESULTS TO THE DESIGN ENGINEER AND GOVERNMENTAL AGENCIES.

5.5 CONTRACTOR SHALL SUBMIT A SCHEDULE, APPROVED IN WRITING BY A QUALIFIED CONSULTING TESTING AGENCY, FOR FREQUENCY, LOCATION AND TYPE OF ALL PROJECT TESTING. THE CONTRACTOR WILL BE RESPONSIBLE FOR SCHEDULING AND COORDINATION OF ALL TESTING INCLUDING THE FOLLOWING ITEMS WHICH SHALL BE TESTED IN ACCORDANCE WITH MAG SPECIFICATIONS...

1. SUBGRADE COMPACTION
2. BASE COURSE COMPACTION
3. ASPHALT PAVEMENT MIX DESIGN QUALITY
4. CONCRETE STRENGTH
5. TRENCH BEDDING AND BACKFILL
6. TESTING FOR UTILITIES, PIPING AND DRAINAGE SYSTEMS

5.6 THE TOWN SHALL BE NOTIFIED BY THE CONTRACTOR 24 HOURS PRIOR TO BEGINNING DIFFERENT PHASES OF CONSTRUCTION SO THAT CITY INSPECTIONS MAY BE SCHEDULED.

6 FINAL ACCEPTANCE

6.1 FINAL ACCEPTANCE OF THE CONSTRUCTION, BY THE TOWN ENGINEER, IS REQUIRED BEFORE RELEASING OF A PERMIT AND OR TRANSFERRING OWNERSHIP OF THE IMPROVEMENTS TO THE CITY.

6.2 APPROVAL OF A PORTION OF THE WORK IN PROGRESS DOES NOT GUARANTEE ITS FINAL ACCEPTANCE. TESTING AND EVALUATION MAY CONTINUE UNTIL WRITTEN FINAL ACCEPTANCE OF A COMPLETE WORKABLE UNIT. ACCEPTANCE OF COMPLETED IMPROVEMENTS WILL NOT BE GIVEN UNTIL DEFECTIVE OR UNAUTHORIZED WORK IS REMOVED, AND FINAL CLEANUP IS COMPLETE.

7 UTILITIES

7.1 A UTILITY COORDINATION MEETING SHALL BE COORDINATED BY THE CONTRACTOR PRIOR TO THE START OF ANY WORK. ALL UTILITY ISSUES SHALL BE ADDRESSED IN ACCORDANCE WITH MAG SECTION 105.6.

7.2 LOCATION OF UNDERGROUND UTILITIES SHALL BE ACCOMPLISHED IN ACCORDANCE WITH ARS 40-360.22 PRIOR TO ANY EXCAVATION. BLUE STAKE SHALL BE CALLED AT 1-800-STAKE-IT FOR ACCURATE LOCATION OF UTILITIES AS NECESSARY AND PRIOR TO ANY EXCAVATION. UTILITIES IF INDICATED ON PLANS ARE APPROXIMATE LOCATIONS ONLY, TAKEN FROM THE UTILITY COMPANY MAPS. IF THE CONTRACTOR ENCOUNTERS ANY LINES NOT INDICATED ON THE DRAWINGS OR MARKED IN THE FIELD BY THE UTILITY COMPANY THAT MAY INTERFERE WITH HIS WORK, HE SHALL NOTIFY THE APPROPRIATE UTILITY COMPANY IMMEDIATELY FOR DISPOSITION OF THOSE FACILITIES.

7.3 THE CONTRACTOR IS RESPONSIBLE FOR PREPARATION OF GRADE, TRENCHING, BACKFILLING, PAD CONSTRUCTION AND CONCRETE PADS FOR UTILITY EQUIPMENT INSTALLED ON THIS PROJECT. CONTRACTOR SHALL CONTACT LOCAL UTILITY COMPANIES FOR DETAILS AND REQUIREMENTS.

7.4 UTILITIES MUST BE LOCATED TO MINIMIZE INTERFERENCE WITH ONE ANOTHER, TO PROVIDE REQUIRED HORIZONTAL AND VERTICAL SEPARATIONS, AND TO PROVIDE MAINTENANCE ACCESS WITHOUT VIOLATING EASEMENT BOUNDARIES. SEPARATION BETWEEN UTILITIES PER MAG STANDARD

7.5 ALL UTILITY SLEEVES SHALL BE PLACED PRIOR TO SUBBASE CONSTRUCTION AND PAVING. CONTACT APPROPRIATE UTILITY COMPANIES FOR REQUIREMENTS IN ALL AREAS.

7.6 ALL WATER MAINS, APPURTENANCES, AND INSTALLATION SHALL CONFORM TO A.W.W.A. STANDARDS AND ARIZONA DEPARTMENT OF ENVIRONMENTAL QUALITY, AND TOWN OF JEROME REQUIREMENTS. WATER SYSTEM SHALL BE TESTED PER A.D.E.Q. BULLETIN NO. 10 TO THE APPROPRIATE A.W.W.A. STANDARDS.

7.7 ALL FIRE HYDRANTS SHALL MEET ALL REQUIREMENTS OF A.W.W.A. C-509-80 AND TOWN OF JEROME REQUIREMENTS.

8 CONSTRUCTION STAKING

8.1 THE ACCURACY OF ALL CONSTRUCTION WORK SHALL BE MAINTAINED AND VERIFIED BY THE OWNER'S SURVEYOR AT THE OWNER'S EXPENSE BY PROVIDING CONSTRUCTION STAKING SUITABLE TO THE TOWN ENGINEER. STAKES WILL BE SET ESTABLISHING LINES AND GRADES (FINISH OR FLOWLINE) FOR ALL CONSTRUCTION INCLUDING ROADS, CURB AND GUTTER, SIDEWALKS, UTILITIES, STRUCTURES, AND OTHER WORK AS CONSIDERED NECESSARY BY THE ENGINEER. ALL SURVEY CONTROL SHALL BE SET BY THE OWNER'S SURVEYOR FROM MONUMENTS ACCEPTABLE TO THE ENGINEER.

9 GRADING AND EARTHWORK

9.1 PERFORM ALL EARTHWORK GRADING, CUTTING AND FILLING AS PER THE PROJECT SOILS REPORT* AND ALL ADDENDA. ALL WORK TO BE COORDINATED AS PER THE SWPPP.

9.2 NO GRADING OR TRENCHING WORK SHALL BEGIN PRIOR TO SUPPORTING AND PROTECTING EXISTING ONSITE AND ADJACENT PROPERTY FROM SETTLING, CRACKING, OR OTHER DAMAGE WHICH MIGHT RESULT. CONTRACTOR SHALL VERIFY FROM SOILS REPORT RECOMMENDATIONS THE DEGREE OF DIFFICULTY REQUIRED FOR TRENCHING AND EXCAVATION WORK BASED ON DEPTH AND TYPES OF MATERIALS TO BE ENCOUNTERED.

9.3 WATER SOURCE: THE CONTRACTOR SHALL MAKE THE NECESSARY ARRANGEMENTS FOR OBTAINING ALL WATER REQUIRED FOR SOIL COMPACTION, DRINKING PURPOSES AND DUST CONTROL. (MAG SPEC 225)

9.4 CLEARING AND GRUBBING: EXAMINE SITE AND PROVIDE NECESSARY EQUIPMENT AND LABOR TO REMOVE FROM THE SITE AND DISPOSE OF STUMPS, ROOTS, ROCKS, LOOSE FILL, VEGETATION, DEBRIS, AND ANY OTHER OBJECTIONABLE MATERIALS FROM THE BUILDING AND FILL AREAS. CLEAN, UNCLASSIFIED ONSITE SOILS MAY BE USED IN GENERAL AS FILL MATERIAL. SEE MAG SPECIFICATION SECTIONS 201 AND 215.

9.5 TOPSOIL THAT WILL BE AFFECTED BY ROUGH GRADING OR EXCAVATION SHALL BE STOCKPILED ON THE SITE SEPARATELY AND SHALL NOT BE USED FOR FILL, BUT SHALL BE CONSERVED AND USED FOR FINE AND FINISH GRADING.

9.6 SITE DRAINAGE: CONSTRUCTION OF ALL SWALES, CHANNELS, DRAINAGE PIPES, DRAINAGE STRUCTURES AND BANK PROTECTION SHALL BE CONSTRUCTED DURING THE FIRST PHASES OF SITE CONSTRUCTION TO PROTECT ALL OTHER CONSTRUCTION FROM SURFACE WATERS. DIVERT RUN OFF WATER AROUND CONSTRUCTION OPERATIONS. CARE SHALL BE TAKEN BY THE CONTRACTOR NOT TO ADVERSELY AFFECT ADJACENT PROPERTIES. DRAIN EXCAVATIONS BY PUMPING OR OTHER SATISFACTORY METHOD TO PREVENT SOFTENING OF THE FOUNDATION SOILS, UNDERCUTTING OF FOOTINGS, OR OTHER ACTIONS DETRIMENTAL TO PROPER CONSTRUCTION PROCEDURES. ALL WORK TO BE COORDINATED AS PER THE SWPPP.

9.7 THE CONTRACTOR SHALL PROVIDE POSITIVE DRAINAGE AWAY FROM ALL WALLS AND FOUNDATIONS. ALL STORM DRAINS, DRAIN LINES, OVERFLOWS, OUTLETS, AND/OR OTHER DRAINAGE TYPE OUTLETS WHICH CONDUCT MOISTURE NEAR THE STRUCTURES SHALL BE POSITIVELY DRAINED AWAY FORM THE STRUCTURE. NO WATER SHALL BE PERMITTED TO POND NEAR STRUCTURES OR FOUNDATIONS. ALL DRAINAGE SHALL BE CHANNELED AND TAKEN A MINIMUM OF 10 FEET AWAY FROM ALL STRUCTURES.

9.8 SUBGRADE PREPARATION: IF THE NATURAL SUBGRADE IS LESS THAN THE REQUIRED DENSITY, IT SHALL BE SCARIFIED AND COMPACTED TO A MINIMUM DEPTH OF TWELVE INCHES OR AS NOTED IN THE SOILS REPORT IMMEDIATELY PRIOR TO PLACING SUBSEQUENT FILL MATERIAL THEREON. THE CONTRACTOR IS RESPONSIBLE FOR MAINTENANCE AND REPAIR OF DAMAGE TO PREPARED SUBGRADE CAUSED BY CONTRACTORS OPERATIONS OR PUBLIC TRAFFIC UNTIL ACCEPTANCE OF PROJECT. NO MATERIALS SHALL BE PLACED UPON THE PREPARED SUBGRADE UNTIL IT MEETS THE SPECIFIED REQUIREMENTS. ROADWAY SUBGRADE COMPACTION INCLUDES SUBGRADE UNDER ALL PAVEMENT, CURB, SIDEWALKS, SHOULDERS AND FILL SLOPES. SUBGRADE TOLERANCES SHALL BE AS SPECIFIED IN MAG SECTION 301. OPEN LANDSCAPED AREAS SHALL BE GRADED TO +/- 0.20 FEET.

9.9 EARTH FILL: AREAS TO BE FILLED SHALL BE LEVELED TO PROVIDE A LEVEL BASE TO SUPPORT FILL MATERIALS. SUBGRADE AND SUBBASE AREAS REQUIRING FILL MATERIAL SHALL BE SCARIFIED MOISTENED AND COMPACTED PRIOR TO PLACING FILL. ALL FILL, SUBGRADE AND SUBBASE MATERIALS SHALL BE COMPACTED TO SPECIFIED DENSITIES AT OR NEAR OPTIMUM MOISTURE CONTENTS AS VERIFIED AND RECOMMENDED BY THE SOILS ENGINEER. PLACE FILL IN HORIZONTAL LIFTS NOT EXCEEDING EIGHT INCHES IN LOOSE THICKNESS BEFORE COMPACTION. SLOPED SURFACES SHALL BE PLOWED, STEPPED, AND BENCHED SO THAT THE FILL MATERIAL WILL BOND WITH THE EXISTING MATERIAL. BENCH AT THE TOE OF FILL SLOPES AND PERIODIC INTERVALS UP THE FILL SLOPES BENCHES.

9.10 IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO CONTACT THE TESTING COMPANY FOR SCHEDULING OF COMPACTION TESTING. THE FREQUENCY OF DENSITY AND MOISTURE TESTS REQUIRED FOR ADEQUATE CONTROL SHALL BE THE RESPONSIBILITY OF THE SOILS ENGINEER WHO SHALL CERTIFY TO THE ENGINEER AND CONTRACTOR AT PROJECT END THAT THE ROADBED FILL IS COMPACTED AS OUTLINED HEREIN. COMPACTION SHALL BE ACHIEVED BY MECHANICAL MEANS. IN NO CASE SHALL STRUCTURE BACKFILLING BE FLOOD WATER SETTLED.

9.11 ALL SLOPE CONSTRUCTION AND ROADWAY EXCAVATION SHALL CONFORM TO THE REQUIREMENTS OF MAG SPECIFICATIONS SECTIONS 201, 205, 211, 301, AND UBC SECTIONS 7009 AND 8010. CUT AND FILL SLOPES SHALL BE AS INDICATED ON THE DETAILS AND PLANS. CUT AND FILL SLOPE GRADIENTS SHALL NOT EXCEED 2:1 IN STEEPNESS WITHOUT WRITTEN AUTHORIZATION FROM THE SOILS ENGINEER AND EXAMINATION BY THE DESIGN ENGINEER. ALL SLOPE CONDITIONS SHALL BE PROVIDED WITH THE APPROPRIATE BENCHES AS SPECIFIED IN THE REFERENCE DOCUMENTS AND INDICATED ON THE PLANS. IF SOILS CONDITIONS ARE ENCOUNTERED WHICH DO NOT ALLOW THE ESTABLISHMENT OF THE INDICATED CUT OR FILL SLOPES, THE DESIGN ENGINEER AND SOILS ENGINEER SHALL BE CONTACTED IMMEDIATELY TO DETERMINE AN ADJUSTMENT TO THE SLOPE GRADIENT OR TO ESTABLISH A METHOD OF STABILIZATION ALL FILL SLOPES SHALL BE COMPACTED AS EACH LIFT OF FILL MATERIAL IS PLACED. ALL CUT AND FILL SLOPES SHALL BE UNIFORMLY GRADED TO LINES AND GRADES INDICATED. TOPS OF ALL CUT SLOPES SHALL BE ROUNDED AND ALL UNSTABLE AND LOOSE MATERIAL AT TOP OF SLOPE SHALL BE REMOVED. TOP OF CUT SLOPES OVER 10' HIGH SHALL BE PROVIDED WITH BROW DITCHES FOR DRAINAGE. ALL CUT AND FILL SLOPES SHALL BE REVEGETATED WITH A MIXTURE OF NATIVE GRASSES AND WILD FLOWER SEED OR AS SPECIFIED WITHIN THE LANDSCAPE PLANS. COMPACT ALL SHOULDERS AND BACKFILLS BEHIND ALL STRUCTURE AND WALLS.

9.12 COMPACT TO THE FOLLOWING SPECIFIED PERCENT OF MAXIMUM DENSITY AS DETERMINED IN ACCORDANCE WITH ASTM D698 AND MAG SECTION 211 OR AS DIRECTED IN THE SOILS REPORT.

MINIMUM PERCENT COMPACTION
SUBGRADE SOIL:
ROADWAY AND STRUCTURE AREAS----------95
PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS)---------95
EARTH FILL:
ROADWAY AND STRUCTURE AREAS----------95
PAVED AREAS (PAVEMENTS, SIDEWALKS, & PADS)---------95
GRASSED AND PLANTING AREAS----------85
AGGREGATE BASE COURSE----------100
BACKFILL AROUND STRUCTURES----------95
BACKFILL FOR UTILITY TRENCHES (PER MAG SECTION 601). PROVIDE TYPE 1 BACKFILL OR AS DIRECTED BY APPROPRIATE UTILITY REQUIREMENTS. BACKFILL FOR TRENCHES WITHIN 10' OF STRUCTURES AND WALLS SHALL BE COMPACTED TO 95% UNLESS DIRECTED OTHERWISE BY ENGINEER.

9.13 EXCAVATION: EXCAVATE TO THE DIMENSIONS AND DEPTHS INDICATED ON THE DRAWINGS. FOUNDATIONS SHALL REST ON ENGINEERED COMPACTED FILL OR UNDISTURBED NATURAL SOILS AT GRADE ELEVATIONS INDICATED. IF SUITABLE SOIL IS NOT REACHED AT THE DEPTHS INDICATED, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE SOILS ENGINEER AND ENGINEER. THE CONTRACTOR WILL BE DIRECTED, IN WRITING, TO EXCAVATE TO THE DEPTH OF SUITABLE SOIL. EXCAVATION FOR FOUNDATIONS WHICH ARE CARRIED BELOW THE DEPTHS INDICATED SHALL HAVE THE CONCRETE EXTENDED TO THE BOTTOM OF THE EXCAVATION AT THE CONTRACTOR'S EXPENSE. SEE MAG SPECIFICATION SECTION 206.

9.14 WATERING: CAREFULLY WATER EARTH FILL DURING PLACING BY MEANS OF A FINE SPRAY OR OTHER APPROVED METHOD, SO THAT EACH LAYER IS THOROUGHLY AND UNIFORMLY WETTED. MOISTURE CONTENT OF THE MATERIAL SHALL BE CAREFULLY CONTROLLED AT ALL TIMES AND CHECKED AT PROPER INTERVALS TO INSURE CORRECT MOISTURE FOR COMPACTION SPECIFIED. SEE MAG SECTION 225 AND SOILS REPORT.

10 PAVING

10.1 COMPLETE ASPHALTIC CONCRETE PAVEMENT INSTALLATION SHALL INCLUDE BUT NOT BE LIMITED TO THE FOLLOWING:
A. TACK COATING OF ALL SURFACES, UNDILUTED .02 TO .10 GAL/SY, DILUTED 1:1 MIXTURE, .05 TO .15 GAL/SY, OR AS DIRECTED.
B. SEAL COATING: SEAL COATING WITHIN THE RIGHT-OF-WAY SHALL BE A FOG SEAL COAT.
C. PAINT FOR PAVEMENT STRIPING AND MARKING SHALL CONFORM TO FEDERAL SPEC. NO. TTP-155E, "PAINT, TRAFFIC, HIGHWAY, WHITE AND YELLOW". COLORS FOR PAVEMENT MARKING AND STRIPING SHALL BE AS SPECIFIED BY THE TOWN ENGINEER.
D. TRAFFIC CONTROL DEVICES: SIGNS AND PAVEMENT

11 FIELD INSPECTION

11.1 THE CONTRACTOR SHALL CAREFULLY PRESERVE ALL STAKES, REFERENCE AND CONTROL POINTS, ETC. AGAINST DESTRUCTION AND SHALL PROMPTLY NOTIFY THE ENGINEER OF ANY STAKES WHICH HAVE BEEN DISTURBED.

11.2 OWNER'S REGISTERED SURVEYOR SHALL BE NOTIFIED TWO WORKING DAYS (48 HOURS) MINIMUM PRIOR TO FIELD STAKING SCHEDULING.

11.3 ANY QUESTIONS RAISED RELATIVE TO ACCURACY OF IMPROVEMENT INSTALLATION SHALL NOT BE RAISED SUBSEQUENT TO COMPLETION OF THE WORK UNLESS ALL SURVEY STAKES ARE MAINTAINED INTACT. SHOULD SUCH STAKES NOT BE PRESENT AND VERIFIED AS TO THEIR ORIGIN, NO CLAIM FOR ADDITIONAL COMPENSATION FOR CORRECTION SHALL BE PRESENTED TO ANY PARTY AND SUCH WORK SHALL BE CORRECTED BY THE CONTRACTOR AT HIS EXPENSE.

12 SUSPENSION OF WORK

12.1 THE ENGINEER OR HIS AUTHORIZED REPRESENTATIVE MAY SUSPEND THE WORK BY WRITTEN NOTICE WHEN, IN HIS JUDGMENT, PROGRESS IS UNSATISFACTORY, WORK BEING DONE IS UNAUTHORIZED OR DEFECTIVE, WEATHER CONDITIONS ARE UNSUITABLE, OR THERE IS DANGER TO THE PUBLIC HEALTH OR SAFETY.

13 WARRANTY

13.1 ANY DEFECTS WHICH APPEAR IN THE WORK WITHIN TWO YEARS FROM THE DATE OF ACCEPTANCE AND WHICH ARE DUE TO IMPROPER WORKMANSHIP OR INFERIOR MATERIALS SUPPLIED SHALL BE CORRECTED BY OR AT THE EXPENSE OF THE CONTRACTOR.

14 EROSION CONTROL NOTES

(SPECIFICATIONS FOR PERMANENT SEEDING)

14.1 SITE PREPARATION
- A. INSTALL NECESSARY SURFACE WATER CONTROL MEASURES PRIOR TO PLANTING PERMANENT SEEDING.
- B. GRADE TO PERMIT USE OF CONVENTIONAL EQUIPMENT FOR SEEDBED PREPARATION.
- C. PROVIDE ADEQUATE DRAINAGE WHERE INTERNAL WATER MOVEMENT, ESPECIALLY AT TOES OF SLOPES, MAY CAUSE SEEPS OR SLIPPAGE BEFORE SEEDING IS WELL ESTABLISHED.

14.2 SEEDBED PREPARATION A. AS PRACTICAL, PERFORM ALL CULTURAL OPERATIONS AT RIGHT ANGLES TO THE SLOPE. B. IMMEDIATELY BEFORE SEEDING, RAKE OR OTHERWISE LOOSEN PLANTING SURFACE TO PROVIDE A SMOOTH, FRIABLE SURFACE FREE OF EARTH CLODS, HUMPS AND DEPRESSIONS, AND DISPOSE OF LOOSE STONES HAVING A DIMENSION GREATER THAN ONE INCH AND DEBRIS BROUGHT TO THE SURFACE DURING CULTIVATION.

14.3 PLANTING A. APPLY SEED MIX AT THE RATE OF 11 POUNDS PER ACRE. SHALL CONTAIN THE FOLLOWING PROPORTION OF PURE LIVE SEED: SAND DROPSEED (SPOROBOLUS CRYPTANDRUS) 1 LB SIDEOATS GRAMA (BOUTELOUS CURTIPENDULA)5 LB CRESTED WHEATGRASS (AGROPYRON CRISTATUM) 5 LB B. APPLY SEED IN TWO DIRECTIONS AT RIGHT ANGLES TO EACH OTHER WITH HALF THE SPECIFIED APPLICATION RATE APPLIED IN EACH DIRECTION. C. IMMEDIATELY AFTER SEEDING, UNIFORMLY SPREAD SCREENED MANURE AT THE RATE OF ONE CUBIC YARD PER 1000 SQUARE FEET AND WATER UNTIL THE GROUND IS WET TO A MINIMUM DEPTH OF TWO INCHES. D. HYDRAULIC SEEDING USING 1500 POUNDS OF WOOD CELLULOSE FIBER PER ACRE MAY BE UTILIZED IN LIEU OF PLANTING.

14.4 MAINTENANCE A. PROTECT PLANTED AREAS FROM GRAZING, FIRE, TRAFFIC, AND WEED GROWTH. B. MAINTAIN PLANTED AREAS UNTIL A GOOD STAND OF GRASS IS ESTABLISHED. AREAS AS REQUIRED IF NO GROWTH IS PRESENT WITHIN 15 DAYS OF PLANTING.

15 TEMPORARY EROSION CONTROL

15.1 EROSION CONTROL BERMS AND ROCK CHECK DAMS
- A. PROVIDE EARTHEN BERMS AT TOES OF SLOPES REMAINING BARE BETWEEN CONSTRUCTION PHASES.
- B. PLACE TEMPORARY ROCK CHECK DAMS IN ROAD DITCHES AND CHANNELS IF RIP-RAP PROTECTION WILL NOT BE PROVIDED WITHIN 60 DAYS.

15.2 CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING EROSION CONTROL MEASURES SUCH AS SAND BAGGING, TEMPORARY DE-SILTING BASIN CONSTRUCTION BERMS, VISQUEEN, ETC. TO PROTECT ADJOINING PROPERTIES FROM EROSION.

16 GENERAL CONSTRUCTION NOTES

16.1 ALL CORRUGATED METAL PIPE TO BE 14 GAUGE, UNLESS OTHERWISE APPROVED BY THE DESIGN ENGINEER.

16.2 ALL CORRIGATED METAL PIPE SHALL HAVE FLARED END SECTIONS, EXCEPT WHERE HEADWALLS ARE USED.

16.3 ALL DRAINAGE CULVERTS AND PIPES SHALL HAVE A MINIMUM COVER OF 24" OR AS SPECIFIED.

16.4 ADDITIONAL CARE SHALL BE TAKEN TO PROTECT ALL CMP DURING CONSTRUCTION.

16.5 RETAINING WALLS SHALL BEAR ONTO NATURAL BEDROCK, OR COMPACTED SOIL WHICH HAS A BEARING VALUE OF 3,000 P.S.F. VERIFICATION OF SAID BEARING VALUE TO BE PROVIDED BY THE SOILS ENGINEER.
