Mount Pleasant Planning Commission

The Mount Pleasant Planning Commission met in its regular monthly meeting on Tuesday July 9th at 6:00pm in the Tom Hardin room at City Hall.

Those who were in attendance are: John Hunter-Chair, Jennifer Graham-Vice Chair, Pam Johnston- Secretary, Cedric Hollis, Kris Irvin, Kate Collier, Chris Brooks-Director, Phillip Grooms-City Manager, Ted Howell-Utilities Director, Will Hager Representative with KCI Technology and Ricky Oakley with CEC Engineering both attended via Zoom, Staff and Public. Chaz Molder-City Attorney was unable to attend.

Mr. Hunter called the meeting to order and asked that the minutes reflect that there was a quorum.

Mr. Hunter asked that Mrs. Johnston lead the invocation and Mrs. Graham lead the pledge of allegiance.

Mr. Hunter stated that there will be one (1) change to the agenda and that is No. 6 United Farm & Home Co-op Feed. The requestor is asking for it to be deferred.

Mrs. Johnston made a motion to approve the request and Mr. Hollis seconded the motion and the vote in favor was unanimous.

Mr. Hunter asked if there are any changes to the minutes from the last regular meeting which was held on May 14th, 2024.

There being no changes Mrs. Graham made a motion to approve the minutes with no changes and Mr. Hollis seconded the motion and the vote in favor was unanimous.

<u>Cottages of Bearwood water availability</u>

Cole Newton with TKC Architecture and Engineering LLC representing Burchell Properties owner of Cottages of Bearwood on 78.14 acres identified on Tax Map 127; Parcel 25.00; and located on Magnolia Dr. and Canaan Rd. consisting of 95

single family homes. A Preliminary Plan and Construction drawings previously approved November 14th, 2023 with a condition of approval to limit the homes built to 25 homes a year. The applicant requests that this condition of approval be removed to reflect the revised Water Letter of Availability from CEC prepared by Ricky Oakley dated April 3rd, 2024.

Mr. Hunter began the discussion with some concerns about the approval of this issue. Mr. Hunter. Asked how did they come up the 200 gallons a day average usage and Mr. Oakley said it was based on TDEC.

Mr. Hunter also asked if these new lots would be irrigated, and Mr. Newton said they would not be but they can if its wanted and would not affect the water usage in a major way being that the lots are small. Mr. Hunter commented that he did not see much change in the system and that's why the City secured the contract with CPWS in the first place. Mr. Hunter asked if the CPWS contract was uninterruptable and Mrs. Collier stated it was. Mr. Hunter stated he does not think this is a good long-term plan.

Mr. Oakley was pointing out his concern about the water line on Canaan Rd. It needs to be a 6inch line and it is thought to be a 4inch line and the developer will have to amend that as an off-site improvement.

Mr. Hunter stated he was not comfortable with approving this without all the information needed meaning the contract with CPWS. Mr. Grooms told him that it was just a letter and emails and was trying to pull up the letter on his computer.

Mr. Hunter read the 2-page letter and then asked if there was a water sale agreement that is uninterruptable. Mr. Grooms stated yes there is and their board agreed upon that. Mr. Hunter stated we need to have legal here and to see a signed agreement by all parties.

Mr. Hunter entertained a motion for approval any way the members wanted to do it. Mr. Hollis made a motion to remove the conditional use and Mrs. Graham seconded. Mr. hunter asked for a roll call and Mrs. Collier performed the roll call and all were in agreement to remove the conditional use except for Mr. Hunter and Mr. Irvin. Motion was passed.

Mr. Hunter stated that there was no old business and no other business and no Board/Staff or citizens comments.

Mrs. Johnston made a motion to adjourn the meeting and Mr. Hollis seconded the vote and vote in favor was unanimous.

THE CALLER SHOULD BE PREPARED TO REPORT THE NAME, ADDRESS AND TELEPHONE NUMBER OF THE PERSON REPORTING SPILL, THE EXACT LOCATION OF THE SPILL, COMPANY NAME AND LOCATION, THE MATERIAL SPILLED, THE ESTIMATED QUANTITY, THE SOURCE OF THE SPILL, THE CAUSE OF THE SPILL, THE NEAREST DOWNSTREAM WATER WITH THE POTENTIAL TO RECEIVE THE SPILL, AND THE ACTIONS BEING TAKEN FOR CONTAINMENT AND CLEANUP.

16. ALL EROSION AND SEDIMENT CONTROL DEVICES TO BE SELECTED, INSTALLED AND MAINTAINED IN ACCORDANCE WITH TDEC SEDIMENT AND EROSION CONTROL HANDBOOK, LATEST EDITION.

17. IDENTIFY LIMITS OF DISTURBANCE IN THE FIELD, CLEARLY MARK AREAS TO REMAIN UNDISTURBED, INSTALL CAUTION FENCE IF NECESSARY.

18. ACCUMULATED SEDIMENT SHALL BE REMOVED FROM BEHIND EPSC MEASURES WHEN SEDIMENT HAS ACCUMULATED TO 50% OF THE MEASURE'S STORAGE CAPACITY.

19. THE CONTRACTOR SHALL INSTALL A TEMPORARY CONSTRUCTION EXIT AT ALL POINTS OF EGRESS.

FABRIC PROPERTY AND TEST METHODS	REQUIRED PHYSICAL PROPERTIES (MARV VALUES OF TEST DATA)
GEOTEXTILE FABRIC TYPE	WOVEN SLIT FILM
APPARENT OPENING SIZE (ASTM D4751)	#30 TO #70 STANDARD SIEVE
WATER FLUX (ASTM D4491)	≥ .4 GPM/FT^2
TENSILE STRENGTH (ASTM D4632)	≥ 120 LB. (WARP DIRECTION) X 100 LB. (FILL DIRECTION)
ULTRAVIOLET STABILITY (AFTER 500 HRS PER ASTM D4355)	≥ 70%

BURST STRENGTH (ASTM D3786)	≥ 250 PSI
PUNCTURE STRENGTH (ASTM D4833)	≥ 60 LB.
TRAPEZOIDAL TEAR (ASTM D4533)	≥ 50 LB. (WARP DIRECTION) X 40 LB. (FILL DIRECTION)

SILT FENCE GENERAL NOTES

(A) SILT FENCE IS USED TO INTERCEPT SMALL AMOUNTS OF SEDIMENT AND REDUCE VELOCITY FROM SHEET FLOW ONLY. DO NOT USE IT ADJACENT TO NATURAL WATER RESOURCES (WETLANDS OR STREAMS) OR ACROSS CONCENTRATED FLOW PATHS.

(B) THE MAXIMUM DRAINAGE AREA SIZE FOR A CONTINUOUS BARRIER SHALL BE 1/4 ACRE PER 100 LINEAR FEET OF FENCE LENGTH UP TO A MAXIMUM DRAINAGE AREA OF 2 ACRES. MAXIMUM SLOPE LENGTH BEHIND FENCE ON UPSLOPE SIDE SHALL BE 110 FEET (AS MEASURED ALONG THE GROUND SURFACE).

(C) WHEN INSTALLED AT THE TOE OF A SLOPE, SILT FENCE SHOULD BE PLACED 5 FEET TO 7 FEET AWAY FROM THE TOE TO ALLOW SPACE FOR PONDING OF WATER, COLLECTION OF SEDIMENT, AND EASE OF MAINTENANCE AND REMOVAL.

(D) WHEN TWO SECTIONS OF SILT FENCE ARE JOINED EACH OTHER THEY SHALL BE JOINED ACCORDING TO THE DETAILS ON STANDARD DRAWING EC-STR-3E.

(E) MAINTENANCE SHALL BE PERFORMED AS NEEDED; CAPTURED SOIL MATERIAL SHALL BE REMOVED WHEN "BULGES" DEVELOP IN THE SILT FENCE AND/OR OTHER EVIDENCE OF FILTER CLOGGING IS OBSERVED.

(F) STEEL POSTS SHALL BE ROLLED FROM HIGH CARBON STEEL AND SHALL HAVE A MINIMUM WEIGHT OF 1.25 LB/FT. POSTS SHALL BE HOT-DIPPED GALVANIZED OR PAINTED WITH HIGH GRADE WEATHER RESISTANT STEEL PAINT. STEEL POSTS SHALL BE EQUIPPED WITH AN ANCHOR PLATE HAVING A MINIMUM AREA OF 14 SQUARE INCHES. POSTS SHALL BE STUDDED, EMBOSSED, OR PUNCHED TO AID IN THE ATTACHMENT OF THE WIRE BACKING. POSTS AND ANCHOR PLATES SHALL CONFORM TO THE REQUIREMENTS OF ASTM A702.

(G) WHEN STEEL POSTS ARE USED THEY SHALL HAVE A PROJECTION FOR FASTENING WIRE TO THEM. THE WIRE FASTENERS SHOULD BE EVENLY SPACED WITH AT LEAST FIVE PER POST.

(H) IF THE FILTER MATERIAL IS STAPLED TO THE WOODEN STAKES, HEAVY DUTY WIRE STAPLES WITH ONE-HALF INCH LENGTH AND 1 INCH WIDTH SHALL BE USED AND EVENLY SPACED WITH AT LEAST FOUR PER POST. SILT FENCE FABRIC SHALL NOT BE STAPLED TO TREES.

(I) SILT FENCES SHOULD BE PLACED ALONG OR NEAR THE GROUND CONTOUR. THE BOTTOM OF FENCE AT GROUNDLINE SHOULD BE ON A ZERO PERCENT (0%) GRADE, PLUS OR MINUS FIVE TENTHS OF ONE PERCENT (0.5%). THE ENDS OF A ROW OF SILT FENCE SHOULD BE TURNED UPSLOPE FORMING A J-HOOK TO FILTER ANY CONCENTRATED FLOW BEHIND FENCE.

(J) A PREASSEMBLED SILT FENCE MEETING THE REQUIREMENTS OF THIS DRAWING IS ACCEPTABLE IN LIEU OF A FIELD CONSTRUCTED SILT FENCE.

(K) STATIC SLICING IS THE PREFERRED METHOD OF FENCE INSTALLATION. STATIC SLICING INVOLVES THE INSERTION OF THE FABRIC INTO THE SOIL BY A SINGLE PASS OF A SPECIALIZED BLADE. THE BLADE SHALL BE SHOWN ON THE APPLICABLE DETAIL, AND SHALL SIMULTANEOUSLY PULL THE FENCE FABRIC INTO THE TRENCH AS THE TRENCH IS BEING EXCAVATED. ALTERNATE TRENCH-BASED METHODS ARE ALSO ACCEPTABLE. FOR TRENCH-BASED INSTALLATIONS, SILT FENCING SHALL BE INSTALLED PER THE FOLLOWING STEPS AND IN THE FOLLOWING ORDER:

- EXCAVATE TRENCH A MAXIMUM OF 4 INCHES WIDE AND 6 INCHES DEEP. THE TRENCH SHALL BE HAND-CLEANED FOLLOWING EXCAVATION TO REMOVE BULKY DEBRIS SUCH AS ROCKS, STICKS, AND SOIL CLODS FROM THE TRENCH.
- INSTALL FABRIC IN TRENCH.
- BACKFILL TRENCH (OVER-FILL) WITH SOIL PLACED AROUND FABRIC.
- COMPACT SOIL BACKFILL WITH MECHANICAL EQUIPMENT. DO NOT DAMAGE THE FABRIC DURING COMPACTION (DAMAGED FABRIC SHALL BE REPLACED).
- DRIVE AND SET SUPPORT POSTS PER SPACING REQUIREMENTS GIVEN ON THE APPLICABLE FENCE DETAIL. FOR PRE-ASSEMBLED SILT FENCE, DRIVE SUPPORT IN TO GROUND FIRST, FOLLOWED BY FABRIC PLACEMENT IN TRENCH.
- ATTACH FABRIC TO THE POSTS USING WIRE TIES OR STAPLES. SPACING AND DENSITY OF TIES OR STAPLES SHALL BE INSTALLED AS DESCRIBED IN NOTES G AND H.

(L) ONLY SILT FENCE FABRIC LISTED ON THE QUALIFIED PRODUCTS LIST MAY BE USED. ANY PRODUCTS LISTED ON THE QUALIFIED PRODUCTS LIST AS AN APPROVED ALTERNATE MAY ALSO BE USED.

(M) SILT FENCE SHALL BE PAID FOR UNDER ITEM NUMBER 209-08.03 TEMPORARY SILT FENCE (WITHOUT BACKING) PER LINEAR FOOT. PAYMENT SHALL INCLUDE ALL MATERIALS AND LABOR NECESSARY FOR CONSTRUCTION, MAINTENANCE, AND REMOVAL OF THE SILT FENCE.

(N) SEDIMENT SHALL BE REMOVED FROM BEHIND THE SILT FENCE WHEN IT HAS ACCUMULATED TO ONE-HALF THE ORIGINAL HEIGHT OF THE STRUCTURE AND PAID FOR UNDER ITEM NUMBER 209-05, SEDIMENT REMOVAL PER CUBIC YARD.

GENERAL NOTES

(A) SILT FENCE WITH WIRE BACKING IS USED TO INTERCEPT SMALL AMOUNTS OF SEDIMENT AND REDUCE VELOCITY FROM SHEET FLOW ONLY. USE SILT FENCE WITH WIRE BACKING UP-GRADIENT TO, AND ALONG THE PERIMETER OF STREAMS, WETLANDS, PONDS, SPRINGS, OR OTHER NATURAL WATER RESOURCES LOCATED WITHIN OR ADJACENT TO THE PROJECT RIGHT-OF-WAY AND AT LARGE FILL SLOPES.

(B) THE MAXIMUM DRAINAGE AREA SIZE FOR CONTINUOUS SILT FENCE WITH BACKING SHALL BE 1 ACRE PER 150 LINEAR FEET OF FENCE LENGTH. MAXIMUM SLOPE LENGTH BEHIND FENCE ON UP SLOPE SIDE SHALL BE 290 FEET (AS MEASURED ALONG THE GROUND SURFACE).

(C) WHEN INSTALLED AT THE TOE OF A SLOPE SILT FENCE WITH WIRE BACKING SHOULD BE PLACED 5 FEET TO 10 FEET AWAY FROM THE TOE TO ALLOW SPACE FOR PONDING OF WATER, COLLECTION OF SEDIMENT, AND EASE OF MAINTENANCE AND REMOVAL.

(D) WHEN TWO SECTIONS OF SILT FENCE WITH WIRE BACKING FABRIC ADJOIN EACH OTHER, THEY SHALL BE JOINED ACCORDING TO THE DETAILS ON STANDARD DRAWING EC-STR-3E.

(E) MAINTENANCE SHALL BE PREFORMED AS NEEDED; CAPTURED SOIL MATERIAL SHALL BE REMOVED WHEN "BULGES" DEVELOP IN THE SILT FENCE AND/OR WHEN EVIDENCE OF FILTER CLOGGING IS OBSERVED.

(F) STEEL POSTS SHALL BE ROLLED FROM HIGH CARBON STEEL AND SHALL HAVE A MINIMUM WEIGHT OF 1.25 LB/FT. POSTS SHALL BE HOT-DIPPED GALVANIZED OR PAINTED WITH HIGH GRADE WEATHER RESISTANT STEEL PAINT. STEEL POSTS SHALL BE EQUIPPED WITH AN ANCHOR PLATE HAVING A MINIMUM AREA OF 14 SQUARE INCHES. POSTS SHALL BE STUDDED, EMBOSSED, OR PUNCHED TO AID IN THE ATTACHMENT OF THE WIRE BACKING. POSTS AND ANCHOR PLATES SHALL CONFORM TO THE REQUIREMENTS OF ASTM A702.

FILTER SOCK GENERAL NOTES

(A) FILTER SOCKS CAN BE PLACED IN DITCHES OR AT THE TOP, ON THE FACE, OR AT THE TOE OF SLOPES AS SEDIMENT-TRAPPING DEVICES. THEY CAN ALSO SERVE TO REMOVE SEDIMENT FROM RUNOFF AND RELEASE IT AS SHEET FLOW.

(B) FILTER SOCKS INSTALLED ON A SLOPE SHALL BE PLACED ALONG OR ON THE GROUND CONTOUR. WHERE POSSIBLE FILTER SOCKS APPLIED AT THE TOE OF A SLOPE SHOULD BE PLACED 10 FEET AWAY FROM THE TOE IN ORDER TO PROVIDE SEDIMENT STORAGE. THE MAXIMUM DRAINAGE AREA SHALL BE ¼ ACRE PER 100 LF OF SOCK.

(C) FOR DITCH APPLICATIONS, THE MAXIMUM DRAINAGE AREA SHALL BE 15 ACRES. AT SITES WHICH OUTFALL TO EXCEPTIONAL TENNESSEE WATERS OR SEDIMENT-IMPAIRED STREAMS, THE MAXIMUM DRAINAGE AREA SHALL BE LIMITED TO 10 ACRES. FILTER SOCKS SHALL NOT BE USED IN STREAMS, WETLANDS, OTHER NATURAL WATER RESOURCES, OR IN DITCHES WITH CONTINUOUS FLOWS.

(D) FOR DITCH APPLICATIONS, THE MINIMUM INSTALLED HEIGHT OF A SINGLE SOCK, OR OF AN ASSEMBLY OF STACKED SOCKS, SHALL BE 19 INCHES. FILTER SOCKS MAY BE STACKED AS DETAILED ON THIS DRAWING TO ACHIEVE THE REQUIRED HEIGHT. SOCKS SHALL BE PLACED PERPENDICULAR TO THE FLOW OF WATER. FILTER SOCKS SHALL CONTINUE UP THE SIDE SLOPES TO THE TOP OF BANK OR A MAXIMUM OF 3 FEET ABOVE THE INSTALLED HEIGHT FILTER SOCKS SHALL REMAIN IN PLACE UNTIL ALL UPSTREAM AREAS ARE PERMANENTLY STABILIZED.

(E) FILTER SOCKS SHALL CONSIST OF A TUBULAR MESH SOCK WITH OPENINGS NO GREATER THAN 3/8INS OF AN INCH IN SIZE. THE MESH SOCK IS NOT REQUIRED TO BE BIODEGRADABLE. FILL MATERIAL SHALL CONSIST OF EITHER WOOD CHIPS (MULCH) OR A 50/50 COMBINATION OF WOOD CHIPS AND MANUFACTURED COMPOST MATERIAL.

(F) FILTER SOCKS ARE TYPICALLY SUPPLIED AND INSTALLED IN DIAMETERS OF 8, 12, 18 OR 24 INCHES. DIAMETER TOLERANCE IS ± 2 INCHES. A FILTER SOCK WILL FLATTEN OUT TO AN OVAL WHEN IT IS PLACED; THUS, THE INSTALLED HEIGHT WILL BE LESS THAN THE NOMINAL DIAMETER.

(G) STEEL POSTS SHALL BE ROLLED FROM HIGH CARBON STEEL AND SHALL HAVE A MINIMUM WEIGHT OF 1.25 LB/FT. POSTS SHALL BE HOT-DIPPED GALVANIZED OR PAINTED WITH HIGH GRADE WEATHER RESISTANT STEEL PAINT. EROSION CONTROL BLANKET SLOPE INSTALLATION GENERAL NOTES

(A) EROSION CONTROL BLANKETS ARE INTENDED TO BE USED AS AN IMMEDIATE MULCH COVER FOR DISTURBED SLOPES THAT HAVE BEEN TEMPORARILY OR PERMANENTLY SEEDED.

(B) EROSION CONTROL BLANKETS MAY ALSO BE USED AS CHANNEL LINERS WHERE THE ANTICIPATED MAXIMUM SHEAR STRESS IS LOW. REFER TO EC-STR-36 FOR INSTALLATION DETAILS.

(C) EROSION CONTROL BLANKETS SHALL BE INSTALLED ACCORDING TO MANUFACTURERS SPECIFICATIONS. WHEN NOT AVAILABLE, INSTALL ACCORDING TO NOTES D THRU J.

(D) STEP ONE: SITE PREPARATION
THE SITE SHOULD BE FINE GRADED TO A SMOOTH PROFILE AND RELATIVELY FREE FROM ALL WEEDS, CLODS, STONES, ROOTS, STICKS, RIVULETS, GULLIES, CRUSTING AND CAKING. FILL ANY VOIDS AND MAKE SURE THE SLOPE IS COMPACTED PROPERLY.

(E) STEP TWO: SEEDING
SEEDING WITHOUT MULCH SHOULD BE APPLIED TO THE AREA TO BE VEGETATED.

(F) STEP THREE: PREPARE THE ANCHOR TRENCH
AT THE TOP OF THE SLOPE EXCAVATE AN ANCHOR TRENCH 6 INCHES DEEP BY 6 INCHES WIDE. THE EROSION CONTROL BLANKET WILL BE ANCHORED INTO THE TRENCH BY STAPLES. ALLOW A MINIMUM OF 3 FEET FROM THE CREST OF THE SLOPE TO THE ANCHOR TRENCH.

(G) STEP FOUR: SECURE THE EROSION CONTROL BLANKET IN THE ANCHOR TRENCH
BEGIN EROSION CONTROL BLANKET PLACEMENT 30 INCHES ABOVE THE ANCHOR TRENCH. RUN THE EROSION CONTROL BLANKET INTO THE ANCHOR TRENCH. ANCHOR THE EROSION CONTROL BLANKET WITH STAPLES ONE FOOT ON CENTER IN THE ANCHOR TRENCH. BE SURE TO DRIVE STAPLES OR STAKES FLUSH WITH THE SOIL SURFACE. BACKFILL THE ANCHOR TRENCH AND COMPACT THE SOIL. PLACE SEED OVER THE COMPACTED SOIL. COVER THE COMPACTED SOIL WITH THE REMAINING 12 INCHES OF THE TERMINAL END OF THE EROSION CONTROL BLANKET. STAPLE OR STAKE TERMINAL END DOWN SLOPE OF THE ANCHOR TRENCH ON ONE FOOT CENTERS.

(H) STEP FIVE: EROSION CONTROL BLANKET DEPLOYMENT
STARTING AT THE CREST OF THE SLOPE, ROLL THE EROSION CONTROL BLANKET DOWN THE SLOPE IN A CONTROLLED MANNER. APPROXIMATELY EVERY 20-25 FEET PULL THE EROSION CONTROL BLANKET TO TAKE OUT ANY EXCESS SLACK. THE GOAL IS TO HAVE THE EROSION CONTROL BLANKET CONTOUR AND INITIATE CONTACT WITH THE SOIL.

(I) STEP SIX: STAPLE OR STAKE THE EROSION CONTROL BLANKET
SECURE THE OVERLAP OR THE EDGES WITH STAPLES. THE TYPICAL INSTALLATION WILL REQUIRE ONE STAPLE PLACED AT THREE TO FIVE FEET INTERVALS ALONG THE VERTICAL LENGTH OF THE EROSION CONTROL BLANKET. STAPLES SHOULD BE STAGGERED EVERY 18 TO 24 INCHES HORIZONTALLY ACROSS THE EROSION CONTROL BLANKET. IF THE EROSION CONTROL BLANKET NEEDS TO BE SPLICED IN THE MIDDLE OF A SLOPE BE SURE THE EROSION CONTROL BLANKET IS "SHINGLED" WITH UP-SLOPE EROSION CONTROL BLANKET OVERLAPPING THE DOWN-SLOPE EROSION CONTROL BLANKET. THERE SHOULD BE A MINIMUM OF 4-INCHES OF OVERLAP IN A SPLICE. USE A STAPLE CHECK SLOT TO SECURE THE OVERLAP. A STAPLE CHECK SLOT IS MADE BY PLACING A ROW OF STAPLES 4-INCHES ON CENTER AND THEN PLACING A SECOND ROW OF STAPLES 4-INCHES ON CENTER, STAGGERED FROM THE FIRST ROW.

(J) STEP SEVEN: SECURING THE EROSION CONTROL BLANKET AT THE TOE OF SLOPE
ROLL THE EROSION CONTROL BLANKET 24-INCHES PAST THE TOE OF THE SLOPE. STAPLE OR STAKE TERMINAL END OF THE EROSION CONTROL BLANKET ON ONE FOOT CENTERS.

(K) ONLY EROSION CONTROL BLANKETS LISTED ON THE QUALIFIED PRODUCTS LIST MAY BE USED.

(L) EROSION CONTROL BLANKETS FOR SLOPE INSTALLATION SHALL BE PAID FOR UNDER THE FOLLOWING ITEM NUMBERS:

801-02	SEEDING (WITHOUT MULCH) PER UNIT
801-02.01	CROWN VETCH MIXTURE (WITHOUT MULCH) PER UNIT
801-02.08	TEMPORARY SEEDING (WITHOUT MULCH) PER UNIT
805-12.01	EROSION CONTROL BLANKET (TYPE I) PER SQUARE YARD
805-12.02	EROSION CONTROL BLANKET (TYPE II) PER SQUARE YARD
805-12.03	EROSION CONTROL BLANKET (TYPE III) PER SQUARE YARD
805-12.04	EROSION CONTROL BLANKET (TYPE IV) PER SQUARE YARD

PAYMENT SHALL INCLUDE ALL MATERIALS AND LABOR NECESSARY FOR CONSTRUCTION AND MAINTENANCE OF EROSION CONTROL BLANKETS.

PROJECT NARRATIVE

Project Description

The proposed project is the construction of a 18,000 sf feed building with a 720 sf office attached, with two new gravel drives through the site. The project is located off North Main Street in Mt. Pleasant, Tennessee. The approximate site area is 21.25 acres, with approximately 5.01 acres being disturbed. The site has been designed to meet the City of Mt. Pleasant stormwater management regulations.

Soil Conditions

The web soil survey shows that the site consists of Type A, B & Type C soils.

Refer to Appendix B for the soil report and further details.

Existing Stormwater Conditions

The site is currently a Co-op center providing feed and fertilizer. The stormwater currently sheet flows to a channel in the middle of the site that flows through the site, from east to west. Said channel splits the site, with about half of the stormwater coming from the north side of the channel and the remainder from the south side of the channel. The north side of the channel is where all of the buildings/facility are located, while the south side of the channel is a field used for row cropping. All the site's stormwater leaves the site through the channel to the west. There are a three storm pipe that route water from the northeast portion of the site to the channel in the middle of the site. Based on the FEMA map, approximately 40% of the site in Zone A floodplain.

See Appendix C for Existing Conditions Drainage Exhibit.

Proposed Stormwater Conditions

The proposed site will include a detention pond on the west side of the site, a few areas drains and storm pipe to be routed to the channel in the middle of the site, as it is doing in the existing condition.

See Appendix C for Proposed Development Drainage Exhibit.

STORMWATER QUANTITY (DETENTION)

Storm Sewer System

The storm sewer system on site conveys stormwater to the drainage channel. The system is shown on the Grading and Drainage plan for United Farm & Home Co-op accompanying this report.

Refer to Grading and Drainage Plans for storm sewer information.

The Storm Sewer calculations are provided in Appendix D.

Stormwater Detention

The detention pond on site are designed meet pre vs. post conditions. This will ensure there is no adverse effect on neighboring properties from this development. There is one foot and nine inches of freeboard between the top of berm elevation and the 100-year storm elevation in the pond.

The Detention Calculations are provided in Appendix E.

OFF-SITE DRAINAGE

Approximately 0.55 acres of offsite drainage, from the northeast, that was accounted for when performing the stormwater calculations for this site.

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas

are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Soil Information for All Uses

Soil Properties and Qualities

The Soil Properties and Qualities section includes various soil properties and qualities displayed as thematic maps with a summary table for the soil map units in the selected area of interest. A single value or rating for each map unit is generated by aggregating the interpretive ratings of individual map unit components. This aggregation process is defined for each property or quality.

Soil Qualities and Features

Soil qualities are behavior and performance attributes that are not directly measured, but are inferred from observations of dynamic conditions and from soil properties. Example soil qualities include natural drainage, and frost action. Soil features are attributes that are not directly part of the soil. Example soil features include slope and depth to restrictive layer. These features can greatly impact the use and management of the soil.

Hydrologic Soil Group

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Drainage Class

"Drainage class (natural)" refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized-excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."

RE: ***Xxentria – Cherry Glen Industrial Park***
William Shirley Road at Sam Watkins Blvd
Mount Pleasant, TN 38474

Mr. Brooks,

Included with this letter is the resubmittal documents for the Site Plan review for the proposed Xxentria manufacturing facility within the Cherry Glen Industrial Park. The project site is located at the northeast corner of William Shirly Road and Sam Watkins Boulevard.

The proposed project includes one industrial tilt-up building totaling approximately 167,480 square feet. The building material consists of pre-cast concrete that is consistent with other Class A industrial buildings in Tennessee and the southeast.

Both the building layout and site are designed as required for Xxentria's facility operations and are unable to be rotated or mirrored. The front of the building along William Shirley Road accommodates employee parking and the building's office. The west and north sides of the building accommodate both building internal operations and shipping/receiving logistics, the east side accommodates two (2) equipment entrances and back-and-forth operations for a future onsite Phase 2 building to the east.

The building's west dock area fronts Sam Watkins Boulevard and does not encroach in to the 50' side street yard. Thus, this does not appear to vary from the Section 11.2.L.1 off-street loading location code. Additionally, the project is proposing landscape screening from the intersection and street trees to screen the off-street pavement areas along both Sam Watkins Blvd and William Shirley Rd. The established manufacturing program for Xxentria has a set process flow through the facility that has dictated placement of dock and drive-in positions. To shift the door locations would require them to change their process flow, which is very problematic to the Xxentria workflow. In addition, the current layout has been positioned within the overall site to allow for future development by Xxentria in order to expand their presence in the market.

The site also proposed to use 30-feet mounting height for the site lighting, which exceeds the city zoning ordinance 22-ft height, while being at the max Planning Commission allowable height of 30-ft (Sec 11.3.D). A 30-ft mounting height is standard for Class A industrial facilities and meets the listed 30-ft max height in the city's design review guidelines. Furthermore, 30-foot mounting heights were

used to allow for increase uniformity of lighting on the site. There will be no spill light along the majority of the property lines per the submitted photometric plan.

Included with this resubmittal letter is a comment response memo, the site plan, grading and utility plans, a landscape plan, a site lighting plan and building elevations. Full civil plans will be provided in the future for the Land Disturbance Permit submittal. We appreciate your review and assistance with this project. Please do not hesitate to contact me with any questions or concerns at our office (615) 564-2701.

Sincerely,

Brendan Boles, PE

RE: ***Site Plan Resubmittal Comment Response***
Xxentria – Cherry Glen Industrial Park
William Shirley Road at Sam Watkins Blvd
Mount Pleasant, TN 38474

Dear Chris Brooks,

Below is an explanation of how we addressed the comments regarding the above stated project:

7/17/2024 KCI Site Plan Comments:

Comment # 1. Please call out the overhead doors. As previously discussed, please be prepared to address the location of the overhead doors that face the corner side yard (See 11.2.L. Design of off-street loading spaces). Your letter mentions the site cannot be mirrored. It may help to be prepared to explain why it cannot be mirrored during for the Planning Commission.

KCI Comment #1 response: The overhead doors have been called out. See Sheet C2-00. The building's west dock area fronts Sam Watkins Boulevard and does not encroach in to the 50' side street yard. Thus, this does not appear to vary from the Section 11.2.L.1 off-street loading location code. The project is proposing landscape screening from the intersection and street trees to screen the off-street pavement areas along both Sam Watkins Blvd and William Shirley Rd. The established manufacturing program for Xxentria has a set process flow through the facility that has dictated placement of dock and drive-in positions. To shift the door locations would require them to change their system operations, which is very problematic to the Xxentria workflow. In addition, the current layout has been positioned within the overall site to allow for future development by Xxentria in order to expand their presence in the market.

Comment # 2. Provide plant schedule with species and size information to demonstrate proposed plant materials meet minimum sized required in Section 11.4.

KCI Comment #2 response: Plant Schedule table is incorporated on Sheet L1-00.

11.4.D.11. Irrigation. Automatic irrigation systems are required for all required landscaped areas within commercial and industrial districts as well as multi-family developments and institutional uses. The planning commission may waive automatic irrigation requirements for existing areas with existing vegetation; however, plant material planted within such areas to meet transitional buffering requirements must be within 100 feet of a hose bib or be provided a temporary above-ground irrigation system. All irrigation systems shall be designed to minimize the use of water. Plans shall be prepared and stamped by a certified irrigation designer, certified irrigation contractor, or landscape architect. Irrigation systems shall be designed to meet the standards shown in appendix E (landscape standards).

KCI Comment #3 response: Conceptual irrigation between the building and public frontage is shown on sheet L1-00. Final irrigation plans will provided with future land disturbance submittal.

Comment # 4. Detention and retention ponds. Detention and retention ponds shall be landscaped with trees, shrubs and turf. Detention ponds shall be considered a service area and shall be screened from public view. This would apply to the proposed detention areas in the corner side and front yards.

KCI Comment #4 response: Due to future phase project construction and planned expansion of the proposed pond with additional phases, landscape screening from public view will be provided at a later date upon final phase expansion of pond. The pond is strategically located at the northeast rear area of the site, away from public view.

Comment # 5. Structures (such as headwalls and weirs) within ponds located in front and side yards adjacent to public streets shall be faced with brick or stone. Slopes exceeding 3:1 shall be vegetated with plants that do not require frequent mowing.

KCI Comment #5 response: We have noted on the plans. We are not proposing above grade structures in the front and side yards.

Comment # 6. Groundcovers used for this purpose shall be planted with sufficiently tight spacing to provide 100 percent coverage within the first year.

KCI Comment #6 response. We have noted on the plans. Please refer to sheet L1-00.

Comment # 7. On the lighting plan sheets, does “MH: 30” mean a mounting height of 30 feet? Lights poles and building-mounted fixtures shall be designed with fully shielded luminaires. Such poles or mounts shall not exceed 22 feet in height. The planning commission may approve, in appropriate circumstances as part of site plan review, a pole or mount of up to 30 feet. Please provide a justification if you are requesting a height greater than 22 feet.

KCI Comment #7 response. Yes, “MH:30” refers to the propose mounting height of 30-feet. 30-feet mounting height is standard for industrial facilities, which meets the listed 30-ft max height in the city’s design review guidelines. Furthermore 30-foot mounting heights were used to allow for increase uniformity of lighting on the site. The property lines are substantially far from the located poles and spill light will be minimal at the entries. There will be no spill light along the majority of the property lines per the submitted photometric plan.

Comment # 8. Show the location for any storage area outside the building for pallets, cardboard, ect.

KCI Comment #8 response: The proposed facility will use interior space for storage; therefore, no outdoor storage is proposed.

Comment # 9. Show in a detailed all Building or Ground signage for the site and sizes.

KCI Comment #9 response: The building and ground signage package is to be prepared at a later date and will be submitted separately for city review as required.

Comment # 10. Will the paved area excluding the parking area in the front have curbing?

KCI Comment #10 response: In addition to the employee parking, the driveway aprons will have curb and gutter as well as the rear truck court. See sheet C2-00.

Comment # 11. Show the Dumpster location and detail for the enclosure.

KCI Comment #11 response: Please refer to sheet C2-00 for the dumpster location and detail.

7/17/2024 CEC Engineering Comments:

Comment #2. Please note this is a preliminary review as only preliminary documents are provided. When a complete submittal is received, a complete review will be conducted. A complete submittal includes at a minimum the following additional information:

a. Erosion and Sediment Control Plans (signed and sealed by Professional Engineer)
    i. Proposed Limits of Disturbance
    ii. Perimeter EPSC Measures
    iii. EPSC Details
b. Stormwater Calculations (signed and sealed by Professional Engineer)
    i. Existing Conditions Hydrologic Calculations
        1. Drainage Area(s) Calculations & Exhibit
        2. Time of Concentration Calculations & Flow Path Exhibit
        3. Impervious Area Table/Exhibit
    ii. Existing Conditions Hydraulic Calculations (if any)
        1. Ditches
        2. Pipes/Culverts
        3. Storm sewer system
    iii. Proposed Conditions Hydrologic Calculations
        1. Drainage Area(s) Calculations & Exhibit
        2. Time of Concentration Calculations & Flow Path Exhibit
        3. Impervious Area Table/Exhibit
    iv. Proposed Conditions Hydraulic Calculations
        1. Ditches
        2. Pipes/Culverts
        3. Storm sewer system
        4. Detention Basins
        5. Evaluation of impacts to existing stormwater infrastructure downstream of the site
    v. Please note that post-construction discharges for each outfall location should be equal to or less than the pre-construction discharges.

KCI Comment #2 response: A complete civil submittal, including these items, will be provided when our client is ready to submit for Land Disturbance Permit with city. Our client is only seeking Planning Commission Site Plan approval at this time.

Comment #3. Please provide a TDEC CGP Notice of Intent/Notice of Coverage/SWPPP if more than one acre is disturbed.

KCI Comment #3 response: A TDEC CGP NOI/SWPPP will be provided when our client is ready to submit for Land Disturbance Permit. Our client is only seeking Planning Commission Site Plan approval at this time.

Comment #4. The outlet pipe from the detention pond appears to be concentrating flow at the property line. Please revise the design, such as using a level spreader or other methods, to more closely resemble how the flow leaves the site in existing conditions.
A level spreader will be implemented at the pond outfall. This has been called out on the included preliminary Grading Plan and will be detailed in the future complete civil submittal.

Sincerely,
