The Entler Avenue Hybrid and Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.12, Noise and Groundborne Vibration. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would generate noise during construction. During construction, the Entler Avenue Hybrid and Crouch Avenue Alternative would require use of heavy construction equipment that generate noise levels of up to 85 dBA at 50 feet from the equipment. The closest sensitive receptors to the Entler Avenue Hybrid and Crouch Avenue Alternative are residential dwelling units along Entler Avenue, located approximately 50 feet away. Thus, the nearest sensitive receptors to this alternative would be exposed to noise levels of up to 85 dBA from construction equipment. Noise levels from the Entler Avenue Hybrid and Crouch Avenue Alternative would temporarily exceed the daytime noise limits within the applicable jurisdictions

during construction, resulting in a significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-NSE-1: Minimize Construction Noise**), which would reduce impacts on noise levels during construction to less than significant. Noise levels during operation and maintenance activities would be minimal and immeasurable due to the infrequency of these activities. Therefore, no impacts on noise would occur during operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative.

The level of impact would be the same as that for the Proposed Project because sensitive receptors are located at the same distance (50 feet) from both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment. Therefore, both the Proposed Project and the Entler Avenue Hybrid and Crouch Avenue Alternative would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. To minimize potentially significant noise impacts during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-NSE-1** will be implemented.

MM-NSE-1: Minimize Construction Noise (see Section 3.12, Noise and Groundborne Vibration, for description)

Significance after Mitigation. With the implementation of **MM-NSE-1**, noise impacts during construction would be less than significant.

Impact NSE-2: Generate excessive groundborne vibration or groundborne noise levels (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid and Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.12, Noise and Groundborne Vibration. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would generate groundborne vibration during construction. The closest sensitive receptors to the Entler Avenue Hybrid and Crouch Avenue Alternative are residential dwelling units along Entler Avenue, located approximately 50 feet away. Similar to the Proposed Project, the highest reference PPV at 25 feet from construction equipment for this alternative would be 0.21 in/sec. Construction vibration related to building damage is assessed using the following equation: $PPV_{Equipment} = PPV_{Ref} (25/D)^{1.5}$. At 50 feet, construction vibration levels from the Entler Avenue Hybrid and Crouch Avenue Alternative would be 0.07 in/sec. This level is much lower than the 0.12 in/sec threshold for buildings extremely susceptible to vibration damage. Similar to the Proposed Project, the highest reference L_V at 25 feet from construction equipment for this alternative would be 94 VdB. Annoyance or interference associated with vibration-sensitive activities is assessed using the following equation: $L_{V,distance} = L_{V,reference} - 30 \log (D/25)$. At 50 feet, the groundborne vibration level from the Entler Avenue Hybrid and Crouch Avenue Alternative would be 85 VdB. This level exceeds the daytime annoyance threshold of 78 VdB for residential uses, resulting in a significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-NSE-1: Minimize Construction Noise**), which would reduce impacts related to groundborne vibration during construction to less than significant. Operation and maintenance activities do not include the use of

vibration-generating equipment. Therefore, no impacts on groundborne vibration would occur during operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative.

The level of impact would be the same as that for the Proposed Project because sensitive receptors are located at the same distance (50 feet) from both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment. Therefore, both the Proposed Project and the Entler Avenue Hybrid and Crouch Avenue Alternative would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. To minimize potentially significant groundborne vibration impacts during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-NSE-1** will be implemented.

MM-NSE-1: Minimize Construction Noise (see Section 3.12, Noise and Groundborne Vibration, for description)

Significance after Mitigation. With the implementation of **MM-NSE-1**, groundborne vibration impacts during construction would be less than significant.

Impact NSE-3: Be located within the vicinity of a private airstrip or an airport land-use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public-use airport, expose people residing or working in the Project area to excessive noise levels (Less than Significant)

The nearest airport to the Entler Avenue Hybrid and Crouch Avenue Alternative is the privately owned Ranchaero Airport, which is located approximately 1 mile away. However, the Entler Avenue Hybrid and Crouch Avenue Alternative is located within the low noise impact zone for Ranchaero Airport (Butte County Airport Land Use Commission 2017). Therefore, construction, operation, and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would result in less than significant impacts from being located in the vicinity of an airport

The level of impact would be the same as that for the Proposed Project, except that the Entler Avenue Hybrid and Crouch Avenue Alternative is located within 1 mile of the Ranchaero Airport and the Proposed Project is located within 1.5 mile of the Ranchaero Airport. Both the Entler Avenue Hybrid and Crouch Avenue Alternative and Proposed Project are located within the low noise impact zone for the airport. Therefore, impacts would be considered slightly greater under the Entler Avenue Hybrid and Crouch Avenue Alternative when compared to the Proposed Project alignment.

Mitigation. No mitigation required.

5.5.11.5 Alternatives Impact Summary

Table 5.5-11 summarizes the noise and groundborne vibration impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-11. Alternatives Impacts Summary for Noise and Groundborne Vibration

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact NSE-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or in applicable standards of other agencies	S/M	NI (-)	S/M (=)	S/M (-)	S/M (=)
Impact NSE-2: Generate excessive groundborne vibration or groundborne noise levels	S/M	NI (-)	S/M (=)	S/M (-)	S/M (=)
Impact NSE-3: Be located within the vicinity of a private airstrip or an airport land-use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public-use airport, expose people residing or working in the Project area to excessive noise levels	LTS	NI (-)	NI (-)	LTS (+)	LTS (+)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.12 Population and Housing

5.5.12.1 No Project Alternative

Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure) (No Impact)

Under the No Project Alternative, the Town would not make a regional connection to the Chico WPCP and would continue to rely on existing wastewater management. All population and housing trends and characteristics would remain the same as existing conditions. Paradise population and housing would continue to recover from the 2018 Camp Fire. Therefore, the No Project Alternative would have no impact on population growth in the area. The level of impact would be less than that for the Proposed Project because the Proposed Project would result in less-than-significant impacts on population growth.

Mitigation. No mitigation required.

Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (No Impact)

Under the No Project Alternative, the Town would not make a regional connection to the Chico WPCP and would continue to rely on existing wastewater management. All population and housing trends and

characteristics would remain the same as existing conditions. The Paradise population and housing would continue to recover from the 2018 Camp Fire. Therefore, the No Project Alternative would have no impact on housing. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would displace people or housing.

Mitigation. No mitigation required.

5.5.12.2 Entler Avenue Hybrid Alternative

Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure) (Less than Significant Impact)

Consistent with the Proposed Project analysis in Section 3.13, Population and Housing, all construction jobs associated with the Entler Avenue Hybrid Alternative would be temporary and construction workers could be drawn from the existing workforce within the county rather than relocating to the study area. However, it is likely that some would be migrant workers from outside of the County that follow construction jobs from location to location, and there may be others that relocate to the Town for the work and decide to stay. Workers that become permanent residents would be part of the Town's population recovery. Consequently, construction of the Entler Avenue Hybrid Alternative would not result in substantial or unplanned population growth and would not necessitate the construction of new roads, additional housing or business services that would be inconsistent with regrowth planned and presented in the *Town of Paradise 2022-2030 Housing Element Update* (Town of Paradise 2022a) and *Town of Paradise General Plan* (Town of Paradise and Quad Consultants 2008). Therefore, construction of the Entler Avenue Hybrid Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact.

Similar to the Proposed Project, about 5-10 permanent employees would be required to the serve the Entler Avenue Hybrid Alternative. The increase in permanent employees would be minimal because they may be re-assigned from existing staff within the Town or may be additional new staff. The minimal increase in permanent jobs would not result in substantial or unplanned population growth and would not necessitate the construction of additional housing or business services beyond planned regrowth. Although implementation of the Entler Avenue Hybrid Alternative would foster population growth, it is primarily regrowth that would be expected as part of the historic population levels in the Paradise area. Therefore, the Entler Avenue Hybrid Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts on population growth.

Mitigation. No mitigation required.

Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (No Impact)

The Entler Avenue Hybrid Avenue Alternative would not acquire or take any residential-zoned land in the area. While some of the Entler Avenue Hybrid Alternative would be conducted on private parcels,

work would primarily be done within public ROW, which would not cause displacement of existing residents or housing. Work that would occur on private parcels, including connecting properties to the new sewer system or installing the Export Pipeline System would be completed under easements and would not displace existing housing. Therefore, the Entler Avenue Hybrid Alternative would not displace a substantial number of existing people or housing, resulting in no impact. The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would displace people or housing.

Mitigation. No mitigation required.

5.5.12.3 Crouch Avenue Alternative

Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure) (Less than Significant Impact)

Consistent with the Proposed Project analysis in Section 3.13, Population and Housing, all construction jobs associated with the Crouch Avenue Alternative would be temporary and construction workers could be drawn from the existing workforce within the county. However, it is likely that some would be migrant workers from outside of the County that follow construction jobs from location to location, and there may be others that relocate to the Town for the work and decide to stay. Workers that become permanent residents would be part of the Town's population recovery. Consequently, construction of the Crouch Avenue Alternative would not result in substantial or unplanned population growth and would not necessitate the construction of new roads, additional housing or business services that would be inconsistent with regrowth planned and presented in the *Town of Paradise 2022-2030 Housing Element Update* (Town of Paradise 2022a) and *Town of Paradise General Plan* (Town of Paradise and Quad Consultants 2008). Therefore, construction of the Crouch Avenue Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact.

Similar to the Proposed Project, about 5-10 permanent employees would be required to the serve the Crouch Avenue Alternative. The increase in permanent employees would be minimal because they may be re-assigned from existing staff within the Town or may be additional new staff. Therefore, the Crouch Avenue Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts on population growth.

Mitigation. No mitigation required.

Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (No Impact)

The Crouch Avenue Alternative would not acquire or take any residential-zoned land in the area. While some of the Crouch Avenue Alternative would be conducted on private parcels, work would be primarily be done within public ROW, which would not cause displacement of existing residents or housing. Work that would occur on private parcels, including connecting properties to the new sewer system or installing the Export Pipeline System would be completed under easements and would not displace

existing housing. Therefore, the Crouch Avenue Alternative would not displace a substantial number of existing people or housing, resulting in no impact. The level of impact would be the same as that for the Proposed Project because neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would displace people or housing.

Mitigation. No mitigation required.

5.5.12.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure (Less Than Significant Impact)

Consistent with the Proposed Project analysis in Section 3.13, Population and Housing, all construction jobs associated with the Entler Avenue Hybrid and Crouch Avenue Alternative would be temporary and construction workers could be drawn from the existing workforce within the county. However, it is likely that some would be migrant workers from outside of the County that follow construction jobs from location to location, and there may be others that relocate to the Town for the work and decide to stay. Workers that become permanent residents would be part of the Town's population recovery. Consequently, construction of the Entler Avenue Hybrid and Crouch Avenue Alternative would not result in substantial or unplanned population growth and would not necessitate the construction of new roads, additional housing or business services that would be inconsistent with regrowth planned and presented in the *Town of Paradise 2022-2030 Housing Element Update* (Town of Paradise 2022a) and *Town of Paradise General Plan* (Town of Paradise and Quad Consultants 2008). Therefore, construction of the Entler Avenue Hybrid and Crouch Avenue Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact.

Similar to the Proposed Project, about 5 to 10 permanent employees would be required to the serve the Entler Avenue Hybrid and Crouch Avenue Alternative. The increase in permanent employees would be minimal because they may be re-assigned from existing staff within the Town or may be additional new staff. Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would not induce substantial unplanned population growth in the study area, resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project Entler alignment would result in less-than-significant impacts on population growth.

Mitigation. No mitigation required.

Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (No Impact)

The Entler Avenue Hybrid and Crouch Avenue Alternative would not acquire or take any residential-zoned land in the area. While some of the Entler Avenue Hybrid and Crouch Avenue Alternative would be conducted on private parcels, work would primarily be done within public ROW, which would not cause displacement of existing residents or housing. Work that would occur on private parcels, including connecting properties to the new sewer system or installing the Export Pipeline System would be completed under easements and would not displace existing housing. Therefore, the Entler Avenue

Hybrid and Crouch Avenue Alternative would not displace a substantial number of existing people or housing, resulting in no impact. The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project Entler alignment would displace people or housing.

Mitigation. No mitigation required.

5.5.12.5 Alternatives Impact Summary

Table 5.5-12 summarizes the population and housing impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-12. Alternatives Impacts Summary for Population and Housing

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere	NI	NI (=)	NI (=)	NI (=)	NI (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.13 Public Services

5.5.13.1 No Project Alternative

Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

(a) Fire Protection (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, there would be no impact from an increased demand for fire protection services. The level of impact would be less than that for the Proposed Project because the No Project Alternative would not impact fire protection services, while the Proposed Project would result in less-than-significant impacts with mitigation incorporated.

Mitigation. No mitigation required.

(b) Police Protection (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, there would be no impact from an increased demand for police protection services. The level of impact would be less than that for the Proposed Project because the No Project Alternative would not impact police protection services, while the Proposed Project would result in less-than-significant impacts with mitigation incorporated.

Mitigation. No mitigation required.

(c) Schools (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, there would be no impact from an increased demand for schools. The level of impact would be less than that for the Proposed Project because the No Project Alternative would not impact schools, while the Proposed Project would result in less-than-significant impacts with mitigation incorporated.

Mitigation. No mitigation required.

(d) Other Public Facilities (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, there would be no impact from an increased demand for other public facilities. The level of impact would be less than that for the Proposed Project because the No Project Alternative would not impact other public facilities, while the Proposed Project would result in less-than-significant impacts with mitigation incorporated.

Mitigation. No mitigation required.

5.5.13.2 Entler Avenue Hybrid Alternative

Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

(a) Fire Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for fire protection services. No fire stations would be directly impacted during construction of the Entler Avenue Hybrid Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local

roads, resulting in a potentially significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid Alternative would not result in any permanent impacts to the fire stations within the study area. No home or businesses are proposed that could result in an increased demand for fire protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for fire protection services. Consistent with the Proposed Project, the Entler Avenue Hybrid Alternative may induce population within Paradise town limits, which could eventually result in an increased need for fire protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would have a less-than-significant impact on fire protection services.

The level of impact would be the same as that for the Proposed Project because both the Enter Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on fire protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Enter Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(b) Police Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for police protection services. No police stations would be directly impacted during construction of the Entler Avenue Hybrid Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid Alternative would not result in any permanent impacts to the police stations within the study area. No home or businesses are proposed that could result in an increased demand for police protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for police protection services. Consistent with the Proposed Project, the Entler Avenue Hybrid Alternative may induce population within Paradise town limits, which could eventually

result in an increased need for police protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would have a less-than-significant impact on police protection services.

The level of impact would be the same as that for the Proposed Project because both the Enter Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on police protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Enter Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(c) Schools (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for schools. No schools would be directly impacted during construction of the Entler Avenue Hybrid Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid Alternative would not result in any permanent impacts to the schools within the study area. No home or businesses are proposed that could result in an increased demand for schools. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for schools. Consistent with the Proposed Project, the Entler Avenue Hybrid Alternative may induce population within Paradise town limits, which could eventually result in an increased need for schools. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would have a less-than-significant impact on schools.

The level of impact would be the same as that for the Proposed Project because both the Enter Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on schools.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Enter Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(d) Other Public Facilities (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for other public facilities. Other public facilities, such as libraries, would not be directly impacted during construction of the Entler Avenue Hybrid Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid Alternative would not result in any permanent impacts to the other public facilities, such as libraries, within the study area. No home or businesses are proposed that could result in an increased demand for other public facilities. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for other public facilities. Consistent with the Proposed Project, the Entler Avenue Hybrid Alternative may induce population within Paradise town limits, which could eventually result in an increased need for other public facilities. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would have a less-than-significant impact on other public facilities.

The level of impact would be the same as that for the Proposed Project because both the Enter Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on other public facilities.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Enter Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

5.5.13.3 Crouch Avenue Alternative

Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

(a) Fire Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for fire protection services. No fire stations would be directly impacted during construction of the Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Crouch Avenue Alternative would not result in any permanent impacts to the fire stations within the study area. No home or businesses are proposed that could result in an increased demand for fire protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for fire protection services. Consistent with the Proposed Project, the Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for fire protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Crouch Avenue Alternative would have a less-than-significant impact on fire protection services.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on fire protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(b) Police Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for police protection services. No police stations would be directly impacted during construction of the Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Crouch Avenue Alternative would not result in any permanent impacts to the police stations within the study area. No home or businesses are proposed that could result in an increased demand for police protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for police protection services. Consistent with the Proposed Project, the Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for police protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Crouch Avenue Alternative would have a less-than-significant impact on police protection services.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on police protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(c) Schools (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for schools. No schools would be directly impacted during construction of the Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed

Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Crouch Avenue Alternative would not result in any permanent impacts to the schools within the study area. No home or businesses are proposed that could result in an increased demand for schools. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for schools. Consistent with the Proposed Project, the Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for schools. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Crouch Avenue Alternative would have a less-than-significant impact on schools.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on schools.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(d) Other Public Facilities (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for other public facilities. Other public facilities, such as libraries, would not be directly impacted during construction of the Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Crouch Avenue Alternative would not result in any permanent impacts to the other public facilities, such as libraries, within the study area. No home or businesses are proposed that could result in an increased demand for other public facilities. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for other public facilities. Consistent with the Proposed Project, the Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for other public facilities. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation

and maintenance of the Crouch Avenue Alternative would have a less-than-significant impact on other public facilities.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on other public facilities.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

5.5.13.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

(a) Fire Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid and Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for fire protection services. No fire stations would be directly impacted during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid and Crouch Avenue Alternative would not result in any permanent impacts to the fire stations within the study area. No home or businesses are proposed that could result in an increased demand for fire protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for fire protection services. Consistent with the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for fire protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation

and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would have a less-than-significant impact on fire protection services.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated on fire protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(b) Police Protection (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid and Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for police protection services. No police stations would be directly impacted during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid and Crouch Avenue Alternative would not result in any permanent impacts to the police stations within the study area. No home or businesses are proposed that could result in an increased demand for police protection services. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for police protection services. Consistent with the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for police protection services. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would have a less-than-significant impact on police protection services.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated on police protection services.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(c) Schools (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid and Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for schools. No schools would be directly impacted during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid and Crouch Avenue Alternative would not result in any permanent impacts to the schools within the study area. No home or businesses are proposed that could result in an increased demand for schools. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for schools. Consistent with the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for schools. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would have a less-than-significant impact on schools.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated on schools.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

(d) Other Public Facilities (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project analysis, construction workers for the Entler Avenue Hybrid and Crouch Avenue Alternative would likely be drawn from the existing workforce within Butte County rather than relocating to the study area. The increase in employment during construction of this alternative would be temporary and would not result in an increased demand for other public facilities. Other public facilities, such as libraries, would not be directly impacted during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. However, indirect impacts may occur related to emergency vehicle access that may be impeded during construction due to nearby temporary lane closures and movement of construction equipment on local roads, resulting in a potentially significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency vehicle access during construction to less than significant. During operation and maintenance, the Entler Avenue Hybrid and Crouch Avenue Alternative would not result in any permanent impacts to the other public facilities, such as libraries, within the study area. No home or businesses are proposed that could result in an increased demand for other public facilities. The new employees required during operation and maintenance of this alternative would be minimal and would not result in an increased demand for other public facilities. Consistent with the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative may induce population within Paradise town limits, which could eventually result in an increased need for other public facilities. However, any population inducement would be regrowth and repopulation toward pre-fire levels and would be contained within Paradise. Therefore, operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would have a less-than-significant impact on other public facilities.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated on other public facilities.

Mitigation. To minimize potentially significant impacts related to emergency vehicle access during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency vehicle access during construction would be less than significant.

5.5.13.5 Alternatives Impact Summary

Table 5.5-13 summarizes the public services impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-13. Alternatives Impacts Summary for Public Services

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact PS-1(a): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Fire Protection	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(b): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Police Protection	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(c): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Schools	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(d): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Other Public Facilities	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.14 Recreation

5.5.14.1 No Project Alternative

Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, there would be no impact from an increase in the use of existing neighborhood and regional parks or other recreational facilities. The level of impact would be less than that for the Proposed Project because the No Project Alternative would not increase the use of parks and recreational facilities, while the Proposed Project would result in less-than-significant impacts.

Mitigation. No mitigation required.

Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment (No Impact)

The No Project Alternative would not include recreational facilities. Additionally, there would be no increase in population or damage to existing recreational facilities that would necessitate the expansion of recreational facilities. Therefore, there would be no impact. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would require the construction or expansion of recreational facilities.

Mitigation. No mitigation required.

5.5.14.2 Entler Avenue Hybrid Alternative

Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Less than Significant Impact)

Recreational zonings and the Tuscan Ridge Club adjoin the Entler Avenue Hybrid Alternative. Within the study area there is a bike trail along Midway, and Hegan Lane is also considered a bicycle friendly road. Similar to the Proposed Project, no water-based recreation would be affected by the Entler Avenue Hybrid Alternative and staging areas would not be located within a 2-mile radius of recreational areas.

Construction would occur primarily within the existing ROW on previously disturbed land. Given that most work would occur in the public ROW, there is potential for bike paths or access to recreation to be temporarily closed or impeded during construction. Full road closures would not occur except during movement of large equipment; single lane, temporary closures are proposed. Any road and bike path closures would also be temporary. Minor increases in recreational use at other available facilities may occur on a short-term basis, but substantial physical deterioration of these facilities is not expected to occur or be accelerated. Operation and maintenance activities associated with the Entler Avenue Hybrid Alternative would have no influence on the use of parks and recreational facilities in the study

area. Consistent with the Proposed Project analysis, increases in population supported by the Entler Avenue Hybrid Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008). Therefore, the Entler Avenue Hybrid Alternative would result in a less than significant on the increase in use of an existing neighborhood or regional park or other recreational facility. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment (Less than Significant Impact)

New recreational facilities are not proposed under the Entler Avenue Hybrid Alternative, nor would construction of the Entler Avenue Hybrid Alternative cause construction or expansion of existing recreational facilities where it might have an adverse physical effect on the environment. Operation and maintenance activities associated with the Entler Avenue Hybrid Alternative would have no influence on the use of parks and recreational facilities in the study area. Consistent with the Proposed Project analysis, increases in population supported by the Entler Avenue Hybrid Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008). Therefore, the Entler Avenue Hybrid Alternative would result in a less than significant on the construction or expansion of recreational facilities. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

5.5.14.3 Crouch Avenue Alternative

Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Less than Significant Impact)

Recreational zonings and the Tuscan Ridge Club adjoin the Crouch Avenue Alternative. Within the study area there is a bike trail along Midway, and Hegan Lane is also considered a bicycle friendly road. Similar to the Proposed Project, no water-based recreation would be affected by the Crouch Avenue Alternative and staging areas would not be located within a 2-mile radius of recreational areas.

Construction would occur primarily within the existing ROW on previously disturbed land. Given that most work would occur in the public ROW, there is potential for bike paths or access to recreation to be

temporarily closed or impeded during construction. Full road closures would not occur except during movement of large equipment; single lane, temporary closures are proposed. Any road and bike path closures would also be temporary. Minor increases in recreational use at other available facilities may occur on a short-term basis, but substantial physical deterioration of these facilities is not expected to occur or be accelerated. Operation and maintenance activities associated with the Crouch Avenue Alternative would have no influence on the use of parks and recreational facilities in the study area. Consistent with the Proposed Project analysis, increases in population supported by the Crouch Avenue Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008).Therefore, the Crouch Avenue Alternative would result in a less than significant on the increase in use of an existing neighborhood or regional park or other recreational facility. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Crouch Avenue Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment (Less than Significant Impact)

New recreational facilities are not proposed under the Crouch Avenue Alternative, nor would construction of the Crouch Avenue Alternative cause construction or expansion of existing recreational facilities where it might have an adverse physical effect on the environment. Operation and maintenance activities associated with the Crouch Avenue Alternative would have no influence on the use of parks and recreational facilities in the study area. Consistent with the Proposed Project analysis, increases in population supported by the Crouch Avenue Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008). Therefore, the Crouch Avenue Alternative would result in a less than significant on the construction or expansion of recreational facilities. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Crouch Avenue Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

5.5.14.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Less than Significant Impact)

Recreational zonings and the Tuscan Ridge Club adjoin the Entler Avenue Hybrid and Crouch Avenue Alternative. Within the study area there is a bike trail along Midway, and Hegan Lane is also considered a bicycle friendly road. Similar to the Proposed Project, no water-based recreation would be affected by the Entler Avenue Hybrid and Crouch Avenue Alternative and staging areas would not be located within a 2-mile radius of recreational areas.

Construction would occur primarily within the existing ROW on previously disturbed land. Given that most work would occur in the public ROW, there is potential for bike paths or access to recreation to be temporarily closed or impeded during construction. Full road closures would not occur except during movement of large equipment; single lane, temporary closures are proposed. Any road and bike path closures would also be temporary. Minor increases in recreational use at other available facilities may occur on a short-term basis, but substantial physical deterioration of these facilities is not expected to occur or be accelerated. Operation and maintenance activities associated with the Entler Avenue Hybrid and Crouch Avenue Alternative would have no influence on the use of parks and recreational facilities in the study area. Consistent with the Proposed Project analysis, increases in population supported by the Entler Avenue Hybrid and Crouch Avenue Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008). Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would result in a less than significant on the increase in use of an existing neighborhood or regional park or other recreational facility. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment (Less than Significant Impact)

New recreational facilities are not proposed under the Entler Avenue Hybrid and Crouch Avenue Alternative, nor would construction of the Entler Avenue Hybrid and Crouch Avenue Alternative cause construction or expansion of existing recreational facilities where it might have an adverse physical effect on the environment. Operation and maintenance activities associated with the Entler Avenue Hybrid and Crouch Avenue Alternative would have no influence on the use of parks and recreational facilities in the study area. Consistent with the Proposed Project analysis, increases in population supported by the Entler Avenue Hybrid and Crouch Avenue Alternative would primarily consist of regrowth and repopulation toward pre-fire levels. However, recreational facilities within the Town were

sized to meet the pre-fire demand for services by the Town and would be anticipated to rebuild to previous conditions on par with the returning population. Further, growth beyond pre-fire conditions would be in alignment with the *Town of Paradise General Plan* assumptions for future growth (Town of Paradise and Quad Consultants 2008). Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would result in a less than significant on the construction or expansion of recreational facilities. The level of impact would be the same as that for the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative because both would result in a less than significant impact on this criterion.

Mitigation. No mitigation required.

5.5.14.5 Alternatives Impact Summary

Table 5.5-14 summarizes the recreation impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-14. Alternatives Impacts Summary for Recreation

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.15 Transportation

5.5.15.1 No Project Alternative

Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed Therefore, the No Project Alternative would not conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. As a result, no impacts would occur. The level of impact would be less than that for the Proposed Project because the Proposed Project would result in a less than significant impact with mitigation incorporated on this criterion.

Mitigation. No mitigation required.

Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, the No Project Alternative would not conflict with CEQA Guidelines Section 15064.3, subdivision (b), and no impact would occur. The level of impact would be less than that for the Proposed Project because the Proposed Project would result in a less-than-significant impact on this criterion.

Mitigation. No mitigation required.

Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, the No Project Alternative would not increase hazards due to a geometric design feature, and no impact would occur. The level of impact would be the same as that for the proposed Project because neither the No Project Alternative nor the Proposed Project would substantially increase hazards due to a geometric design feature.

Mitigation. No mitigation required.

Impact TRA-4: Result in inadequate emergency access (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, the No Project Alternative would not result in inadequate emergency access, and no impact would occur. The level of impact would be less than that for the Proposed Project because the Proposed Project would result in a less-than-significant impact on this criterion.

Mitigation. No mitigation required.

5.5.15.2 Entler Avenue Hybrid Alternative

Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.16, Transportation. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid Alternative would generate an increase in traffic volumes on roadway segments during construction. The Entler Avenue Hybrid Alternative would generate vehicle trip volumes similar to those listed in Table 3.16-4, 2026 No Construction and Construction Traffic Volumes. However, the additional construction trips would be minimal compared to the typical volume and would not cause a degradation of LOS. As a result, the roadway segments would operate at an acceptable LOS with addition of construction traffic associated with the Entler Avenue Hybrid Alternative. Construction of this alternative within or across streets would require temporary lane closures, which

could obstruct access and cause delays for pedestrians, bicyclists, and transit buses. Therefore, the Entler Avenue Hybrid Alternative would conflict with a program, plan, ordinance, or policy addressing the circulation system, resulting in a significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on pedestrian, bicycle, and transit facilities during construction to less than significant. Relative to existing traffic volumes on roadways in the study area, the addition of traffic associated with operation and maintenance of the Entler Avenue Hybrid Alternative would not affect roadway operations. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. To minimize potentially significant impacts on pedestrian, bicycle, and transit facilities during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts on pedestrian, bicycle, and transit facilities during construction would be less than significant.

Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) (Less than Significant Impact)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid Alternative would cause a temporary increase in VMT during construction. The Entler Avenue Hybrid Alternative would generate VMT similar to those listed in Table 3.16-5, Butte County VMT. The percentage increase in VMT due to construction trips associated with the Entler Avenue Hybrid Alternative would be 2.3 percent of Butte County's VMT. While the construction traffic would cause an increase in VMT, this increase would be temporary and short-term. Operation and maintenance activities would not cause a long-term increase in VMT in the study area due to the infrequency of these activities Therefore, the Entler Avenue Hybrid Alternative would not conflict with CEQA Guidelines Section 15064.3(b), resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts on CEQA Guidelines Section 15064.3(b).

Mitigation. No mitigation required.

Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (No Impact)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid Alternative would not change geometric design features or require incompatible uses. All street legal trucks and vehicles would use the existing roadways to access the Entler Avenue Hybrid Alternative area. Therefore, the Entler Avenue Hybrid Alternative would not increase hazards due to a geometric design feature or incompatible uses, resulting in no impact. The level of impact would be the same as that for the

Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would increase traffic hazards.

Mitigation. No mitigation required.

Impact TRA-4: Result in inadequate emergency access (Less than Significant Impact with Mitigation Incorporated)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid Alternative would require temporary closure of traffic lanes on public roadways. Construction traffic associated with the Entler Avenue Hybrid Alternative could interfere with emergency response to the Entler Avenue Hybrid Alternative area or evacuation procedures in the event of an emergency. Therefore, the Entler Avenue Hybrid Alternative could result in inadequate emergency access, resulting in a significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency access during construction to less than significant. The increase in vehicle trips during operation and maintenance activities associated with this alternative would be minimal and immeasurable due to the infrequency of these activities, resulting in no impact. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated under this criterion.

Mitigation. To minimize potentially significant impacts related to emergency access during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency access during construction would be less than significant.

5.5.15.3 Crouch Avenue Alternative

Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (Less than Significant Impact with Mitigation Incorporated)

The Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.16, Transportation. Consistent with the analysis for the Proposed Project, the Crouch Avenue Alternative would generate an increase in traffic volumes on roadway segments during construction. The Crouch Avenue Alternative would generate vehicle trip volumes similar to those listed in Table 3.16-4, 2026 No Construction and Construction Traffic Volumes. However, the additional construction trips would be minimal compared to the typical volume and would not cause a degradation of LOS. As a result, the roadway segments would operate at an acceptable LOS with addition of construction traffic associated with the Crouch Avenue Alternative. Construction of this alternative within or across streets would require temporary lane closures, which could obstruct access and cause

delays for pedestrians, bicyclists, and transit buses. Therefore, the Crouch Avenue Alternative would conflict with a program, plan, ordinance, or policy addressing the circulation system, resulting in a significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on pedestrian, bicycle, and transit facilities during construction to less than significant. Operation and maintenance activities, as described in Section 2.8, would result in increased traffic volumes on the roadways in the study area. Relative to existing traffic volumes on roadways in the study area, the addition of traffic associated with operation and maintenance of the Crouch Avenue Alternative would not affect roadway operations. The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. To minimize potentially significant impacts on pedestrian, bicycle, and transit facilities during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts on pedestrian, bicycle, and transit facilities during construction would be less than significant.

Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) (Less than Significant Impact)

Consistent with the analysis for the Proposed Project, the Crouch Avenue Alternative would cause a temporary increase in VMT during construction. The Crouch Avenue Alternative would generate VMT similar to those listed in Table 3.16-5, Butte County VMT. The percentage increase in VMT due to construction trips associated with the Crouch Avenue Alternative would be 2.3 percent of Butte County's VMT. While the construction traffic would cause an increase in VMT, this increase would be temporary and short-term. Operation and maintenance activities, as described in Section 2.8, would not cause an increase in VMT in the study area due to the infrequency of these activities. Therefore, the Crouch Avenue Alternative would not conflict with CEQA Guidelines Section 15064.3(b), resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts on CEQA Guidelines Section 15064.3(b).

Mitigation. No mitigation required.

Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (No Impact)

Consistent with the analysis for the Proposed Project, the Crouch Avenue Alternative would not change geometric design features or require incompatible uses. All street legal trucks and vehicles would use the existing roadways to access the Crouch Avenue Alternative area. Therefore, the Crouch Avenue Alternative would not increase hazards due to a geometric design feature or incompatible uses, resulting in no impact. The level of impact would be the same as that for the Proposed Project because

neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would increase traffic hazards.

Mitigation. No mitigation required.

Impact TRA-4: Result in inadequate emergency access (Less than Significant Impact with Mitigation Incorporated)

Consistent with the analysis for the Proposed Project, the Crouch Avenue Alternative would require temporary closure of traffic lanes on public roadways. Construction traffic associated with the Crouch Avenue Alternative could interfere with emergency response to the Crouch Avenue Alternative area or evacuation procedures in the event of an emergency. Therefore, the Crouch Avenue Alternative could result in inadequate emergency access, resulting in a significant impact. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency access during construction to less than significant. Operation and maintenance activities, as described in Section 2.8, would result in increased traffic volumes on the roadways in the study area. Relative to existing traffic volumes on roadways in the study area, the addition of traffic associated with operation and maintenance of the Crouch Avenue Alternative would not affect roadway operations in the study area. The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated under this criterion.

Mitigation. To minimize potentially significant impacts related to emergency access during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency access during construction would be less than significant.

5.5.15.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid and Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.16, Transportation. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would generate an increase in traffic volumes on roadway segments during construction. The Entler Avenue Hybrid and Crouch Avenue Alternative would generate vehicle trip volumes similar to those listed in Table 3.16-4, 2026 No Construction and Construction Traffic Volumes. However, the additional construction trips would be minimal compared to the typical volume and would not cause a degradation of LOS. As a result, the roadway segments would operate at an acceptable LOS with addition of construction traffic

associated with the Entler Avenue Hybrid and Crouch Avenue Alternative. Construction of this alternative within or across streets would require temporary lane closures, which could obstruct access and cause delays for pedestrians, bicyclists, and transit buses. Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would conflict with a program, plan, ordinance, or policy addressing the circulation system, resulting in a significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on pedestrian, bicycle, and transit facilities during construction to less than significant. Operation and maintenance activities, as described in Section 2.8, would result in increased traffic volumes on the roadways in the study area. Relative to existing traffic volumes on roadways in the study area, the addition of traffic associated with operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would not affect roadway operations. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. To minimize potentially significant impacts on pedestrian, bicycle, and transit facilities during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts on pedestrian, bicycle, and transit facilities during construction would be less than significant.

Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) (Less than Significant Impact)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would cause a temporary increase in VMT during construction. The Entler Avenue Hybrid and Crouch Avenue Alternative would generate VMT similar to those listed in Table 3.16-5, Butte County VMT. The percentage increase in VMT due to construction trips associated with the Entler Avenue Hybrid and Crouch Avenue Alternative would be 2.3 percent of Butte County's VMT. While the construction traffic would cause an increase in VMT, this increase would be temporary and short-term. Operation and maintenance activities, as described in Section 2.8, would not cause an increase in VMT in the study area due to the infrequency of these activities. Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would not conflict with CEQA Guidelines Section 15064.3(b), resulting in a less-than-significant impact. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts on CEQA Guidelines Section 15064.3(b).

Mitigation. No mitigation required.

Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (No Impact)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would not change geometric design features or require incompatible uses. All street legal trucks and vehicles would use the existing roadways to access the Entler Avenue Hybrid and Crouch Avenue Alternative area. Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative would not increase hazards due to a geometric design feature or incompatible uses, resulting in no impact. The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project alignment would increase traffic hazards.

Mitigation. No mitigation required.

Impact TRA-4: Result in inadequate emergency access (Less than Significant Impact with Mitigation Incorporated)

Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative would require temporary closure of traffic lanes on public roadways. Construction traffic associated with the Entler Avenue Hybrid and Crouch Avenue Alternative could interfere with emergency response to the Entler Avenue Hybrid and Crouch Avenue Alternative area or evacuation procedures in the event of an emergency. Therefore, the Entler Avenue Hybrid and Crouch Avenue Alternative could result in inadequate emergency access, resulting in a significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-HAZ-6: Traffic Management Plan**), which would reduce impacts related to emergency access during construction to less than significant. Operation and maintenance activities, as described in Section 2.8, would result in increased traffic volumes on the roadways in the study area. Relative to existing traffic volumes on roadways in the study area, the addition of traffic associated with operation and maintenance of the Proposed Project would not affect roadway operations in the study area. The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated under this criterion.

Mitigation. To minimize potentially significant impacts related to emergency access during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-HAZ-6** will be implemented.

MM-HAZ-6: Traffic Management Plan (see Section 3.9 Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-6**, impacts related to emergency access during construction would be less than significant.

5.5.15.5 Alternatives Impact Summary

Table 5.5-15 summarizes the transportation impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-15. Alternatives Impacts Summary for Transportation

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact TRA-4: Result in inadequate emergency access	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.16 Tribal Cultural Resources

5.5.16.1 No Project Alternative

Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources code section 5020.1(k), or**
- **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe (No Impact)**

Under the No Project Alternative, the Town would not construct the Core or Extended Collection Systems or an Export Pipeline System and would continue to rely on individualized septic systems for wastewater management. Under the No Project Alternative, existing conditions would remain the same, and no ground disturbance or disturbance of landscape or viewshed would occur as a result of implementation of the Proposed Project. Therefore, there would be no impacts on the significance of a TCR under the No Project Alternative. The level of impact would be less than that for the Proposed

Project because the Proposed Project would result in less-than-significant impacts with mitigation incorporated on TCRs.

5.5.16.2 Entler Avenue Hybrid Alternative

Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources code section 5020.1(k), or**
- **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe (Less than Significant Impact with Mitigation Incorporated)**

The Entler Avenue Hybrid Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.17, Tribal Cultural Resources. Consistent with the analysis for the Proposed Project, no CRHR-eligible TCRs have been identified within the Entler Avenue Hybrid Alternative area. Excavation and ground disturbing activities during construction of the Entler Avenue Hybrid Alternative have the potential to impact unknown TCRs in the Entler Avenue Hybrid Alternative area, resulting in a potentially significant impact. The Entler Avenue Hybrid Alternative would implement the same mitigation measures as the Proposed Project (**MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe** and **MM-TCR-2: Tribal Cultural Monitoring**), which would reduce impacts on TCRs during construction to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not include ground disturbing activities except if there were a pipe break and a section of pipeline needed to be replaced. Operation and maintenance activities would mostly occur in previously disturbed areas (within paved roads), resulting in no potential to impact TCRs. In the case of a pipe break, the section would be repaired and returned to previous conditions as expeditiously as possible so as to limit impacts to the public and sewer service. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would result in a less than significant impact on TCRs.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts with mitigation incorporated on TCRs.

Mitigation. To minimize potentially significant impacts on TCRs during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measures **MM-TCR-1** and **MM-TCR-2** will be implemented.

MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe (see Section 3.17, Tribal Cultural Resources, for description)

MM-TCR-2: Tribal Cultural Monitoring (see Section 3.17, Tribal Cultural Resources, for description)

Significance after Mitigation. With the implementation of **MM-TCR-1** and **MM-TCR-2**, impacts resulting from inadvertent damage or destruction of unknown TCRs during construction would be less than significant.

5.5.16.3 Crouch Avenue Alternative

Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources code section 5020.1(k), or**
- **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe (Less than Significant Impact with Mitigation Incorporated)**

The Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.17, Tribal Cultural Resources. Consistent with the analysis for the Proposed Project, no CRHR-eligible TCRs have been identified within the Crouch Avenue Alternative area. Excavation and ground disturbing activities during construction of the Crouch Avenue Alternative have the potential to impact unknown TCRs in the Crouch Avenue Alternative area, resulting in a potentially significant impact. The Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe** and **MM-TCR-2: Tribal Cultural Monitoring**), which would reduce impacts on TCRs during construction to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not include ground disturbing activities except if there were a pipe break and a section of pipeline needed to be replaced. Operation and maintenance activities would mostly occur in previously disturbed areas (within paved roads), resulting in no potential to impact TCRs. In the case of a pipe break, the section would be repaired and returned to previous conditions as expeditiously as possible so as to limit impacts to the public and sewer service. Therefore, operation and maintenance of the Crouch Avenue Alternative would result in a less than significant impact on TCRs.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in less-than-significant impacts with mitigation incorporated on TCRs.

Mitigation. To minimize potentially significant impacts on TCRs during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-TCR-1** and **MM-TCR-2** will be implemented.

MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe (see Section 3.17, Tribal Cultural Resources, for description)

MM-TCR-2: Tribal Cultural Monitoring (see Section 3.17, Tribal Cultural Resources, for description)

Significance after Mitigation. With the implementation of **MM-TCR-1** and **MM-TCR-2**, impacts resulting from inadvertent damage or destruction of unknown TCRs during construction would be less than significant.

5.5.16.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources code section 5020.1(k), or**
- **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe (Less than Significant Impact with Mitigation Incorporated)**

The Entler Avenue Hybrid and Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.17, Tribal Cultural Resources. Consistent with the analysis for the Proposed Project, no CRHR-eligible TCRs have been identified within the Entler Avenue Hybrid and Crouch Avenue Alternative area. Excavation and ground disturbing activities during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative have the potential to impact unknown TCRs in the Entler Avenue Hybrid and Crouch Avenue Alternative area, resulting in a potentially significant impact. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe** and **MM-TCR-2: Tribal Cultural Monitoring**), which would reduce impacts on TCRs during construction to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not include ground disturbing activities except if there were a pipe break and a section of pipeline needed to be replaced. Operation and maintenance activities would mostly occur in previously disturbed areas (within paved roads), resulting in no potential to impact TCRs. In the case of a pipe break, the section would be repaired and returned to previous conditions as expeditiously as possible so as to limit impacts to the public and sewer service. Therefore, operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would result in a less than significant impact on TCRs.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in less-than-significant impacts with mitigation incorporated on TCRs.

Mitigation. To minimize potentially significant impacts on TCRs during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-TCR-1** and **MM-TCR-2** will be implemented.

MM-TCR-1: Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe (see Section 3.17, Tribal Cultural Resources, for description)

MM-TCR-2: Tribal Cultural Monitoring (see Section 3.17, Tribal Cultural Resources, for description)

Significance after Mitigation. With the implementation of **MM-TCR-1** and **MM-TCR-2**, impacts resulting from inadvertent damage or destruction of unknown TCRs during construction would be less than significant.

5.5.16.5 Alternatives Impact Summary

Table 5.5-16 summarizes the tribal cultural resources impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-16. Alternatives Impacts Summary for Tribal Cultural Resources

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: • Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Public Resources code section 5020.1(k), or • A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe					

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.5.17 Utilities and Service Systems

5.5.17.1 No Project Alternative

Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects (No Impact)

Under the No Project Alternative, the Town would not make a regional connection to the Chico WPCP and would continue to rely on existing wastewater management. No new utility infrastructure would be required, and none would require relocation. All existing utilities would remain the same, and there would be no impact on any utilities in Paradise and the regional area. Therefore, no impact on utilities would occur, and no mitigation is required. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would require or result in the relocation or construction of new utility infrastructure.

Mitigation. No mitigation required.

Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years (No Impact)

Under the No Project Alternative, the Town would not make a regional connection to the Chico WPCP and would continue to rely on existing wastewater management. The use of water supply would not be required under the No Project Alternative. Therefore, no impact on water supply would occur, and no mitigation is required. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would impact water supplies.

Mitigation. No mitigation required.

Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments? (No Impact)

Under the No Project Alternative, the Town would not make a regional connection to the Chico WPCP and would continue to rely on existing wastewater management. Therefore, no impact on wastewater treatment providers would occur, and no mitigation is required. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would impact existing wastewater commitments.

Mitigation. No mitigation required.

Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals (No Impact)

Under the No Project Alternative, no construction, ground disturbance, or other waste generating activities would be proposed. Therefore, there would be no impact from solid waste generation, and no mitigation is needed. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure.

Mitigation. No mitigation required.

Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste? (No Impact)

Under the No Project Alternative, no construction, ground disturbance, or other waste generating activities would be proposed. Therefore, there would be no impact from conflicts with federal, state, and local waste management reduction statutes. The level of impact would be the same as that for the Proposed Project because neither the No Project Alternative nor the Proposed Project would conflict with federal, state, and local management and reduction statutes related to solid waste.

Mitigation. No mitigation required.

5.5.17.2 Entler Avenue Hybrid Alternative

Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid Alternative is within the existing capacity of the Chico WPCP and would not stress the capacity of the current system. Consistent with the analysis for the

Proposed Project, construction of the Entler Avenue Hybrid Alternative would not require relocation of wastewater facilities, electricity transmission lines, and fiber optic cables. There is potential that groundwater would be encountered during construction of the Entler Avenue Hybrid Alternative. Construction work associated with this alternative would occur near waterbodies. However, significant environmental effects would not occur because a SWPPP, which includes water quality BMPs, would be implemented to protect groundwater and water quality. Nevertheless, because utilities could be affected during construction of the Entler Avenue Hybrid Alternative, with the potential for disruption of utility service, this impact would be significant. The Entler Avenue Hybrid Alternative would implement the same mitigation measure as the Proposed Project (**MM-UTIL-1: Minimize Utility and Service System Disruptions**), which would reduce impacts on utility infrastructure during construction to less than significant. Consistent with the Proposed Project, the Entler Avenue Hybrid Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term utility usage is expected to be similar to pre-Camp Fire levels and within the approved capacities for these services. This would not be a displacement or relocation of utilities, but rather part of the Town's recovery efforts. Operation and maintenance activities associated with this alternative would occur periodically throughout the year and would be minimally invasive. Therefore, operation and maintenance of the Entler Avenue Hybrid Alternative would result in no impacts on utility infrastructure.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on utility infrastructure.

Mitigation. To minimize potentially significant impacts on utility infrastructure during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measure **MM-UTIL-1** will be implemented.

MM-UTIL-1: Minimize Utility and Service System Disruptions (see Section 3.18, Utilities and Service Systems, for description)

Significance after Mitigation. With the implementation of **MM-UTIL-1**, impacts on utility infrastructure during construction would be less than significant.

Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years (No Impact)

Consistent with the analysis for the Proposed Project, water supply required during construction of the Entler Avenue Hybrid Alternative would be the responsibility of the construction contractor. Water supply would only be required temporarily during the construction period. Water would be required for such activities as dust suppression, equipment washing, or contractor potable and non-potable water needs. Water use during operations and maintenance would periodically involve flushing activities, flow monitoring, and flow data and wastewater sampling, as described in Section 2.8, Proposed Operation and Maintenance. No potable water would be required during operation and maintenance of this alternative. Therefore, no impact on water supply would occur.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would impact water supply.

Mitigation. No mitigation required.

Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments? (No Impact)

Impacts on wastewater would be similar to those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Wastewater would be generated during construction of the Entler Avenue Hybrid Alternative. Water encountered during pit excavation would be placed into a settling tank before being trucked to a nearby sewer main for discharge. Perched water and nuisance water encountered in trenches during construction would be collected via sump pump to a Baker Tank for settling and reused for truck dust control. Therefore, there would be no impact on wastewater during construction. Consistent with the analysis for the Proposed Project, wastewater generated during operation and maintenance of the Entler Avenue Hybrid Alternative would be within the current capacity of the Chico WPCP or within the amount agreed upon by the City of Chico. Therefore, there would be no impact on wastewater during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would impact wastewater.

Mitigation. No mitigation required.

Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals (No Impact)

The Entler Avenue Hybrid Alternative would generate solid waste such as construction debris, asphalt, and excess soil during construction. Solid waste would be transported to a local landfill or another approved location, such as the Neal Road Recycling Waste Facility, which has capacity to accommodate solid waste from the Entler Avenue Hybrid Alternative. Therefore, there would be no impacts related to solid waste during construction. Operation and maintenance of this alternative would not generate additional solid waste. The Entler Avenue Hybrid Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term landfill usage would be similar to pre-Camp Fire levels and within the approved capacities. Therefore, there would be no impacts related to solid waste during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would result in impacts related to solid waste.

Mitigation. No mitigation required.

Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste? (No Impact)

The Entler Avenue Hybrid Alternative would comply with federal, state, and local management and reduction statutes and regulations related to solid waste that have been identified in Section 3.18, Utilities and Service Systems. Table 3.18-3, Consistency with State and Local Plans, Policies, and Regulations, provides a consistency analysis of these local management and reduction statutes and regulations. Therefore, construction, operation, and maintenance of the Entler Avenue Hybrid Alternative would not conflict with federal, state, and local solid waste regulations and statutes, and no impact would occur.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid Alternative nor the Proposed Project Entler Avenue alignment would conflict with federal, state, and local solid waste regulations and statutes.

Mitigation. No mitigation required.

5.5.17.3 Crouch Avenue Alternative

Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects (Less than Significant Impact with Mitigation Incorporated)

The Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Consistent with the analysis for the Proposed Project, the Crouch Avenue Alternative is within the existing capacity of the Chico WPCP and would not stress the capacity of the current system. Consistent with the analysis for the Proposed Project, construction of the Crouch Avenue Alternative would not require relocation of wastewater facilities, electricity transmission lines, and fiber optic cables. There is potential that groundwater would be encountered during construction of the Crouch Avenue Alternative. Construction work associated with this alternative would occur near waterbodies. However, significant environmental effects would not occur because a SWPPP, which includes water quality BMPs, would be implemented to protect groundwater and water quality. Nevertheless, because utilities could be affected during construction of the Crouch Avenue Alternative, with the potential for disruption of utility service, this impact would be significant. The Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-UTIL-1: Minimize Utility and Service System Disruptions**), which would reduce impacts on utility infrastructure during construction to less than significant. Consistent with the Proposed Project, the Crouch Avenue Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term utility usage is expected to be similar to pre-Camp Fire levels and within the approved capacities for these services. This would not be a displacement or relocation of utilities, but rather part of the Town's recovery efforts. Operation and maintenance activities associated with this alternative would occur periodically throughout the year and would be minimally invasive. Therefore, operation and maintenance of the Crouch Avenue Alternative would result in no impacts on utility infrastructure.

The level of impact would be the same as that for the Proposed Project because both the Crouch Avenue Alternative and the Proposed Project Entler Avenue alignment would result in a less-than-significant impact with mitigation incorporated on utility infrastructure.

Mitigation. To minimize potentially significant impacts on utility infrastructure during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-UTIL-1** will be implemented.

MM-UTIL-1: Minimize Utility and Service System Disruptions (see Section 3.18, Utilities and Service Systems, for description)

Significance after Mitigation. With the implementation of **MM-UTIL-1**, impacts on utility infrastructure during construction would be less than significant.

Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years (No Impact)

Consistent with the analysis for the Proposed Project, water supply required during construction of the Crouch Avenue Alternative would be the responsibility of the construction contractor. Water supply would only be required temporarily during the construction period. Water would be required for such activities as dust suppression, equipment washing, or contractor potable and non-potable water needs. Water use during operations and maintenance would periodically involve flushing activities, flow monitoring, and flow data and wastewater sampling, as described in Section 2.8, Proposed Operation and Maintenance. No potable water would be required during operation and maintenance of this alternative. Therefore, no impact on water supply would occur.

The level of impact would be the same as that for the Proposed Project because neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would impact water supply.

Mitigation. No mitigation required.

Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments? (No Impact)

Impacts on wastewater would be similar to those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Wastewater would be generated during construction of the Crouch Avenue Alternative. Water encountered during pit excavation would be placed into a settling tank before being trucked to a nearby sewer main for discharge. Perched water and nuisance water encountered in trenches during construction would be collected via sump pump to a Baker Tank for settling and reused for truck dust control. Therefore, there would be no impact on wastewater during construction. Consistent with the analysis for the Proposed Project, wastewater generated during operation and maintenance of the Crouch Avenue Alternative would be within the current capacity of the Chico WPCP or within the amount agreed upon by the City of Chico. Therefore, there would be no impact on wastewater during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would impact wastewater.

Mitigation. No mitigation required.

Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals (No Impact)

The Crouch Avenue Alternative would generate solid waste such as construction debris, asphalt, and excess soil during construction. Solid waste would be transported to a local landfill or another approved location, such as the Neal Road Recycling Waste Facility, which has capacity to accommodate solid waste from the Crouch Avenue Alternative. Therefore, there would be no impacts related to solid waste during construction. Operation and maintenance of this alternative would not generate additional solid waste. The Crouch Avenue Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term landfill usage would be similar to pre-Camp Fire levels and within the approved capacities. Therefore, there would be no impacts related to solid waste during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would result in impacts related to solid waste.

Mitigation. No mitigation required.

Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste (No Impact)

The Crouch Avenue Alternative would comply with federal, state, and local management and reduction statutes and regulations related to solid waste that have been identified in Section 3.18, Utilities and Service Systems. Table 3.18-3, Consistency with State and Local Plans, Policies, and Regulations, provides a consistency analysis of these local management and reduction statutes and regulations. Therefore, construction, operation, and maintenance of the Crouch Avenue Alternative would not conflict with federal, state, and local solid waste regulations and statutes, and no impact would occur.

The level of impact would be the same as that for the Proposed Project because neither the Crouch Avenue Alternative nor the Proposed Project Entler Avenue alignment would conflict with federal, state, and local solid waste regulations and statutes.

Mitigation. No mitigation required.

5.5.17.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications

facilities, the construction or relocation of which could cause significant environmental effects (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid and Crouch Avenue Alternative would result in similar impacts as those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Consistent with the analysis for the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative is within the existing capacity of the Chico WPCP and would not stress the capacity of the current system. Consistent with the analysis for the Proposed Project, construction of the Entler Avenue Hybrid and Crouch Avenue Alternative would not require relocation of wastewater facilities, electricity transmission lines, and fiber optic cables. There is potential that groundwater would be encountered during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. Construction work associated with this alternative would occur near waterbodies. However, significant environmental effects would not occur because a SWPPP, which includes water quality BMPs, would be implemented to protect groundwater and water quality. Nevertheless, because utilities could be affected during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative, with the potential for disruption of utility service, this impact would be significant. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measure as the Proposed Project (**MM-UTIL-1: Minimize Utility and Service System Disruptions**), which would reduce impacts on utility infrastructure during construction to less than significant. Consistent with the Proposed Project, the Entler Avenue Hybrid and Crouch Avenue Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term utility usage is expected to be similar to pre-Camp Fire levels and within the approved capacities for these services. This would not be a displacement or relocation of utilities, but rather part of the Town's recovery efforts. Operation and maintenance activities associated with this alternative would occur periodically throughout the year and would be minimally invasive. Therefore, operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would result in no impacts on utility infrastructure.

The level of impact would be the same as that for the Proposed Project because both the Entler Avenue Hybrid and Crouch Avenue Alternative and the Proposed Project alignment would result in a less-than-significant impact with mitigation incorporated on utility infrastructure.

Mitigation. To minimize potentially significant impacts on utility infrastructure during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measure **MM-UTIL-1** will be implemented.

MM-UTIL-1: Minimize Utility and Service System Disruptions (see Section 3.18, Utilities and Service Systems, for description)

Significance after Mitigation. With the implementation of **MM-UTIL-1**, impacts on utility infrastructure during construction would be less than significant.

Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years (No Impact)

Consistent with the analysis for the Proposed Project, water supply required during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative would be the responsibility of the construction

contractor. Water supply would only be required temporarily during the construction period. Water would be required for such activities as dust suppression, equipment washing, or contractor potable and non-potable water needs. Water use during operations and maintenance would periodically involve flushing activities, flow monitoring, and flow data and wastewater sampling, as described in Section 2.8, Proposed Operation and Maintenance. No potable water would be required during operation and maintenance of this alternative. Therefore, no impact on water supply would occur.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project alignment would impact water supply.

Mitigation. No mitigation required.

Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments (No Impact)

Impacts on wastewater would be similar to those discussed for the Proposed Project in Section 3.18, Utilities and Service Systems. Wastewater would be generated during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative. Water encountered during pit excavation would be placed into a settling tank before being trucked to a nearby sewer main for discharge. Perched water and nuisance water encountered in trenches during construction would be collected via sump pump to a Baker Tank for settling and reused for truck dust control. Therefore, there would be no impact on wastewater during construction. Consistent with the analysis for the Proposed Project, wastewater generated during operation and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would be within the current capacity of the Chico WPCP or within the amount agreed upon by the City of Chico. Therefore, there would be no impact on wastewater during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project alignment would impact wastewater.

Mitigation. No mitigation required.

Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals (No Impact)

The Entler Avenue Hybrid and Crouch Avenue Alternative would generate solid waste such as construction debris, asphalt, and excess soil during construction. Solid waste would be transported to a local landfill or another approved location, such as the Neal Road Recycling Waste Facility, which has capacity to accommodate solid waste from the Entler Avenue Hybrid and Crouch Avenue Alternative. Therefore, there would be no impacts related to solid waste during construction. Operation and maintenance of this alternative would not generate additional solid waste. The Entler Avenue Hybrid and Crouch Avenue Alternative has the potential to foster population regrowth as a result of Camp Fire recovery efforts. However, long-term landfill usage would be similar to pre-Camp Fire levels and within

the approved capacities. Therefore, there would be no impacts related to solid waste during operation and maintenance.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project alignment would result in impacts related to solid waste.

Mitigation. No mitigation required.

Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste (No Impact)

The Entler Avenue Hybrid and Crouch Avenue Alternative would comply with federal, state, and local management and reduction statutes and regulations related to solid waste that have been identified in Section 3.18, Utilities and Service Systems. Table 3.18-3, Consistency with State and Local Plans, Policies, and Regulations, provides a consistency analysis of these local management and reduction statutes and regulations. Therefore, construction, operation, and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would not conflict with federal, state, and local solid waste regulations and statutes, and no impact would occur.

The level of impact would be the same as that for the Proposed Project because neither the Entler Avenue Hybrid and Crouch Avenue Alternative nor the Proposed Project alignment would conflict with federal, state, and local solid waste regulations and statutes.

Mitigation. No mitigation required.

5.5.17.5 Alternatives Impact Summary

Table 5.5-17 summarizes the utilities and service systems impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-17. Alternatives Impacts Summary for Utilities and Service Systems

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years	NI	NI (=)	NI (=)	NI (=)	NI (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste	NI	NI (=)	NI (=)	NI (=)	NI (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project Wildfire

5.5.18 Wildfire

5.5.18.1 No Project Alternative

Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan (No Impact)

Under the No Project Alternative, existing conditions would remain the same, and no construction is proposed. Therefore, the No Project Alternative would not impair an adopted emergency response plan or emergency evacuation plan, and no impact would occur. The level of impact would be less than that for the Proposed Project because the Proposed Project would result in a less-than-significant impact with mitigation incorporated on this criterion.

Mitigation. No mitigation required.

Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire (No Impact)

Under the No Project Alternative existing conditions would not change. No construction, operations or maintenance would occur that would exacerbate wildfire risk due to slope, prevailing winds and other factors in the study area. Therefore, no impact would occur.

Mitigation. No mitigation required.

Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment (No Impact)

Under the No Project Alternative, no installation or maintenance of associated infrastructure is proposed. Conditions in the study area would not change. Therefore, fire risk would not be exacerbated, and no impact would occur.

Mitigation. No mitigation required.

Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (No Impact)

Under the No Project Alternative, existing conditions would not change, and no construction and operational activities are proposed. Therefore, the No Project Alternative would not expose people or structures to significant risks, including downslope or downstream flooding or landslides. There would be no impact.

Mitigation. No mitigation required.

5.5.18.2 Entler Avenue Hybrid Alternative

Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project, no total road closures are proposed under the Entler Avenue Hybrid Alternative other than temporary movement of equipment. Portions of the alternative would be located along Skyway, which is a primary evacuation route. Closures within the ROW would be partial, however, in the event of a wildfire, all four lanes would be needed for evacuation along Skyway. Therefore, during construction impacts to an emergency response plan or emergency evacuation plan would be significant. The Entler Avenue Hybrid Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-3: Road Closure Restrictions, MM-HAZ-4: Rapid Demobilization Plan, MM-HAZ-5: Evacuation Warning Procedures** and **MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on an emergency response plan or emergency evacuation plan to a less than significant level.

Operations and maintenance activities would not involve the presence or operation of equipment on roads for extended periods of time. As described in Section, 3.16, Transportation, the addition of traffic associated with operation and maintenance of the Entler Avenue Hybrid Alternative would not affect roadway operations in the study area. As such, operation and maintenance activities would have no impact on an adopted emergency response plan or emergency evacuation route.

The level of impact would be the same as that for the Proposed Project because impacts on an emergency response plan or emergency evacuation plan would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative.

Mitigation. To minimize potentially significant impacts on emergency response or emergency evacuation plan during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measures **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6** will be implemented.

MM-HAZ-3: Road Closure Restrictions (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-4: Rapid Demobilization Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-5: Evacuation Warning Procedures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6**, impacts on an emergency response or evacuation plan would be less than significant.

Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire (Less than Significant Impact with Mitigation Incorporated)

Portions of the Entler Avenue Hybrid Alternative are located in Very High FHSZs. Operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Hazardous materials would also be used, transported and disposed of during construction activities. The Town would comply with all relevant federal, state, and local statutes and regulations related to the transport, use, storage, or disposal of hazardous materials associated with construction activities, and all materials designated for disposal would be evaluated for appropriate state and federal hazardous waste criteria and properly disposed of according to their classifications. However, because the alternative is located in a Very High FHSZ, the potential for wildfire exists during construction. Therefore, this impact is considered significant. The Entler Avenue Hybrid Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level.

Operations and maintenance would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Additionally, fire suppression equipment would be made available during operation and maintenance and Chico WPCP would continue to comply with existing fire codes. As a result, impacts from exacerbating fire risks during operation and maintenance would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts on wildfire risks due to slope, prevailing winds, or other factors would be less than significant with mitigation

incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative.

Mitigation. To minimize potentially significant impacts from exacerbating wildfire risk in the study area during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from wildfire risk due to slope, prevailing winds, and other factors would be less than significant.

Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid Alternative would involve the construction of an Export Pipeline System. As discussed under Impact FIRE-2, portions of the study area are located in Very High FHSZs. Construction activities such as operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Therefore, impacts during construction would be significant. The Entler Avenue Hybrid Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level. Operation and maintenance activities including the inspection of the Export Pipeline System and associated instrumentation, and flow data sampling would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Therefore, impacts from operation and maintenance of utility infrastructure would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts from the installation or maintenance of associated infrastructure that may exacerbate fire risk would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative.

Mitigation. To minimize potentially significant impacts on wildfire from installation or maintenance of utility infrastructure during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from the installation or maintenance of associated infrastructure that may exacerbate wildfire risk would be less than significant.

Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (Less than Significant Impact with Mitigation Incorporated)

Paradise is located on a broad and gently sloping ridge, while Chico is predominantly flat. Installation of the Export Pipeline System would require installation via trenching or open cut methods within the Town's roadway ROWs. Given the sloped topography of the Town and ground disturbing activities that could create runoff or temporarily alter drainage patterns, impacts would be significant during construction. The Entler Avenue Hybrid Alternative would implement the same mitigation measures as the Proposed Project (**MM-HYD-1: Stormwater Management and Treatment Plan, MM-HYD-3: Flood Protection Plan,** and **MM-GEO-1: Minimize Geologic Hazards**), which would reduce impacts to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not involve activities that create runoff or alter drainage. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. As a result, operations and maintenance of the Entler Avenue Hybrid Alternative would not expose people or structures to significant risks, including downslope or downstream flooding or landslides and there would be no impact.

The level of impact would be the same as that for the Proposed Project because impacts from exposing people or structure to significant risks, including downslope or downstream flooding or landslides would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid Alternative.

Mitigation. To minimize significant impacts on post-fire slope instability, or drainage changes during construction of the Entler Avenue Hybrid Alternative to a less than significant level, mitigation measures **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1** will be implemented.

MM-HYD-1: Stormwater Management and Treatment Plan (see Section 3.10, Hydrology and Water Quality, for description)

MM-HYD-3: Flood Protection Plan (see Section 3.10, Hydrology and Water Quality, for description)

MM-GEO-1: Minimize Geologic Hazards (see Section 3.7, Geology, Soils, and Paleontological Resources, for description)

Significance after Mitigation. With the implementation of **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1** , impacts from the exposure of people or structures to significant risks, including downslope or downstream flooding or landslides would be less than significant.

5.5.18.3 Crouch Avenue Alternative

Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project, no total road closures are proposed under the Crouch Avenue Alternative other than temporary movement of equipment. Portions of the alternative would be located along Skyway, which is a primary evacuation route. Closures within the ROW would be partial, however, in the event of a wildfire, all four lanes would be needed for evacuation along Skyway. Therefore, during construction impacts to an emergency response plan or emergency evacuation plan would be significant. The Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-3: Road Closure Restrictions, MM-HAZ-4: Rapid Demobilization Plan, MM-HAZ-5: Evacuation Warning Procedures** and **MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on an emergency response plan or emergency evacuation plan to a less than significant level.

Operations and maintenance activities would not involve the presence or operation of equipment on roads for extended periods of time. As described in Section, 3.16, Transportation, the addition of traffic associated with operation and maintenance of the Crouch Avenue Alternative would not affect roadway operations in the study area. As such, operation and maintenance activities would have no impact on an adopted emergency response plan or emergency evacuation route.

The level of impact would be the same as that for the Proposed Project because impacts on an emergency response plan or emergency evacuation plan would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Crouch Alternative.

Mitigation. To minimize potentially significant impacts on emergency response or emergency evacuation plan during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6** will be implemented.

MM-HAZ-3: Road Closure Restrictions (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-4: Rapid Demobilization Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-5: Evacuation Warning Procedures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6**, impacts on an adopted emergency response plan or emergency evacuation plan would be less than significant.

Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire (Less than Significant Impact with Mitigation Incorporated)

Portions of the Crouch Avenue Alternative are located in Very High FHSZs. Operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Hazardous materials would also be used, transported and disposed of during construction activities. The Town would comply with all relevant federal, state, and local statutes and regulations related to the transport, use, storage, or disposal of hazardous materials associated with construction activities, and all materials designated for disposal would be evaluated for appropriate state and federal hazardous waste criteria and properly disposed of according to their classifications. However, because the alternative is located in a Very High FHSZ, the potential for wildfire exists during construction. Therefore, this impact is considered significant. The Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level. Operations and maintenance would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Additionally, fire suppression equipment would be made available during operation and maintenance and Chico WPCP would continue to comply with existing fire codes. As a result, impacts from exacerbating fire risks during operation and maintenance would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts on wildfire risks due to slope, prevailing winds, or other factors would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Crouch Avenue Alternative.

Mitigation. To minimize potentially significant impacts from exacerbating wildfire risk in the study area during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from wildfire risk due to slope, prevailing winds, and other factors would be less than significant.

Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment (Less than Significant Impact with Mitigation Incorporated)

The Crouch Avenue Alternative would involve the construction of an Export Pipeline System. As discussed under Impact FIRE-2, portions of the study area are located in Very High FHSZs. Construction activities such as operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Therefore, impacts during construction would be significant. The Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level.

Operation and maintenance activities including the inspection of the Export Pipeline System and associated instrumentation, and flow data sampling would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Therefore, impacts from operation and maintenance of utility infrastructure would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts from the installation or maintenance of associated infrastructure that may exacerbate fire risk would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Crouch Avenue Alternative.

Mitigation. To minimize potentially significant impacts on wildfire from installation or maintenance of utility infrastructure during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from the installation or maintenance of associated infrastructure would be less than significant.

Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (Less than Significant Impact with Mitigation Incorporated)

Paradise is located on a broad and gently sloping ridge, while Chico is predominantly flat. Installation of the Export Pipeline System would require installation via trenching or open cut methods within the Town's roadway ROWs. Given the sloped topography of the Town and ground disturbing activities that could create runoff or temporarily alter drainage patterns, impacts would be significant during construction. The Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HYD-1: Stormwater Management and Treatment Plan, MM-HYD-3: Flood Protection Plan,** and **MM-GEO-1: Minimize Geologic Hazards**), which would reduce impacts to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not involve activities that create runoff or alter drainage. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. As a result, operations and maintenance of the Crouch Avenue Alternative would not expose people or structures to significant risks, including downslope or downstream flooding or landslides and there would be no impact.

The level of impact would be the same as that for the Proposed Project because impacts from exposing people or structure to significant risks, including downslope or downstream flooding or landslides would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Crouch Avenue Alternative.

Mitigation. To minimize significant impacts on post-fire slope instability, or drainage changes during construction of the Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1** will be implemented.

MM-HYD-1: Stormwater Management and Treatment Plan (see Section 3.10 Hydrology and Water Quality, for description)

MM-HYD-3: Flood Protection Plan (see Section 3.10, Hydrology and Water Quality, for description)

MM-GEO-1: Minimize Geologic Hazards (see Section 3.7, Geology, Soils, and Paleontological Resources, for description)

Significance after Mitigation. With the implementation of **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1**, impacts from the exposure of people or structures to significant risks, including downslope or downstream flooding or landslides would be less than significant.

5.5.18.4 Entler Avenue Hybrid and Crouch Avenue Alternative

Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan (Less than Significant Impact with Mitigation Incorporated)

Consistent with the Proposed Project, no total road closures are proposed under the Entler Avenue Hybrid and Crouch Avenue Alternative other than temporary movement of equipment. Portions of the alternative would be located along Skyway, which is a primary evacuation route. Closures within the ROW would be partial, however, in the event of a wildfire, all four lanes would be needed for evacuation along Skyway. Therefore, during construction impacts to an emergency response plan or emergency evacuation plan would be significant. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-3: Road Closure Restrictions, MM-HAZ-4: Rapid Demobilization Plan, MM-HAZ-5: Evacuation Warning Procedures** and **MM-HAZ-6: Traffic Management Plan**), which would reduce impacts on an emergency response plan or emergency evacuation plan to a less than significant level.

Operations and maintenance activities would not involve the presence or operation of equipment on roads for extended periods of time. As described in Section, 3.16, Transportation, the addition of traffic associated with operation and maintenance of the Crouch Avenue Alternative would not affect roadway operations in the study area. As such, operation and maintenance activities would have no impact on an adopted emergency response plan or emergency evacuation route.

The level of impact would be the same as that for the Proposed Project because impacts on an emergency response plan or emergency evacuation plan would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative.

Mitigation. To minimize potentially significant impacts on emergency response or emergency evacuation plan during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6** will be implemented.

MM-HAZ-3: Road Closure Restrictions (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-4: Rapid Demobilization Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-5: Evacuation Warning Procedures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-6: Traffic Management Plan (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-3**, **MM-HAZ-4**, **MM-HAZ-5**, and **MM-HAZ-6**, impacts on an emergency response or evacuation plan would be less than significant.

Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire (Less than Significant Impact with Mitigation Incorporated)

Portions of the Entler Avenue Hybrid and Crouch Avenue Alternative are located in Very High FHSZs. Operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Hazardous materials would also be used, transported and disposed of during construction activities. The Town would comply with all relevant federal, state, and local statutes and regulations related to the transport, use, storage, or disposal of hazardous materials associated with construction activities, and all materials designated for disposal would be evaluated for appropriate state and federal hazardous waste criteria and properly disposed of according to their classifications. However, because the alternative is located in a Very High FHSZ, the potential for wildfire exists during construction. Therefore, this impact is considered significant. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level.

Operations and maintenance would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Additionally, fire suppression equipment would be made available during operation and maintenance and Chico WPCP would continue to comply with existing fire codes. As a result, impacts from exacerbating fire risks during operation and maintenance would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts on wildfire risks due to slope, prevailing winds, or other factors would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative.

Mitigation. To minimize potentially significant impacts from exacerbating wildfire risk in the study area during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from wildfire risk due to slope, prevailing winds, and other factors would be less than significant.

Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment (Less than Significant Impact with Mitigation Incorporated)

The Entler Avenue Hybrid and Crouch Avenue Alternative would involve the construction of an Export Pipeline System. As discussed under Impact FIRE-2, portions of the study area are located in Very High FHSZs. Construction activities such as operation and fueling of construction equipment in Very High FHSZs could create fire hazards in the study area. Therefore, impacts during construction would be significant. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HAZ-1: Vehicle Equipment Access and Fueling, MM-HAZ-7: Incorporate Fire Prevention Measures, MM-HAZ-8: Incorporate Public Safety Measures**, and **MM-HAZ-9: Wildland Fire Area**), which would reduce impacts to a less than significant level.

Operation and maintenance activities including the inspection of the Export Pipeline System and associated instrumentation, and flow data sampling would not require the use of heavy equipment, fueling, or other activities likely to create an additional fire hazard. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. Therefore, impacts from operation and maintenance of utility infrastructure would be less than significant.

The level of impact would be the same as that for the Proposed Project because impacts from the installation or maintenance of associated infrastructure that may exacerbate fire risk would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative.

Mitigation. To minimize potentially significant impacts on wildfire from installation or maintenance of utility infrastructure during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9** will be implemented.

MM-HAZ-1: Vehicle Equipment Access and Fueling (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-7: Incorporate Fire Prevention Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-8: Incorporate Public Safety Measures (see Section 3.9, Hazards and Hazardous Materials, for description)

MM-HAZ-9. Wildland Fire Area (see Section 3.9, Hazards and Hazardous Materials, for description)

Significance after Mitigation. With the implementation of **MM-HAZ-1**, **MM-HAZ-7**, **MM-HAZ-8**, and **MM-HAZ-9**, impacts from the installation or maintenance of associated infrastructure that may exacerbate wildfire risk would be less than significant.

Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (Less than Significant Impact with Mitigation Incorporated)

Paradise is located on a broad and gently sloping ridge, while Chico is predominantly flat. Installation of the Export Pipeline System would require installation via trenching or open cut methods within the Town's roadway ROWs. Given the sloped topography of the Town and ground disturbing activities that could create runoff or temporarily alter drainage patterns, impacts would be significant during construction. The Entler Avenue Hybrid and Crouch Avenue Alternative would implement the same mitigation measures as the Proposed Project (**MM-HYD-1: Stormwater Management and Treatment Plan, MM-HYD-3: Flood Protection Plan,** and **MM-GEO-1: Minimize Geologic Hazards**), which would reduce impacts to a less than significant level.

Operation and maintenance activities, as described in Section 2.8, would not involve activities that create runoff or alter drainage. Additionally, operation and maintenance activities would not exacerbate wildfire risk in the study area because these activities would not occur adjacent to wildland areas. As a result, operations and maintenance of the Entler Avenue Hybrid and Crouch Avenue Alternative would not expose people or structures to significant risks, including downslope or downstream flooding or landslides and there would be no impact.

The level of impact would be the same as that for the Proposed Project because impacts from exposing people or structure to significant risks, including downslope or downstream flooding or landslides would be less than significant with mitigation incorporated for both the Proposed Project Entler Avenue alignment and the Entler Avenue Hybrid and Crouch Avenue Alternative.

Mitigation. To minimize significant impacts on post-fire slope instability, or drainage changes during construction of the Entler Avenue Hybrid and Crouch Avenue Alternative to a less than significant level, mitigation measures **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1** will be implemented.

MM-HYD-1: Stormwater Management and Treatment Plan (see Section 3.10, Hydrology and Water Quality, for description)

MM-HYD-3: Flood Protection Plan (see Section 3.10, Hydrology and Water Quality, for description)

MM-GEO-1: Minimize Geologic Hazards (see Section 3.7, Geology, Soils, and Paleontological Resources, for description)

Significance after Mitigation. With the implementation of **MM-HYD-1**, **MM-HYD-3**, and **MM-GEO-1**, impacts from the exposure of people or structures to significant risks, including downslope or downstream flooding or landslides would be less than significant.

5.5.18.5 Alternatives Impact Summary

Table 5.5-18 summarizes the wildfire impacts of the alternatives and a comparison to the Proposed Project.

Table 5.5-18. Alternatives Impacts Summary for Wildfire

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Notes: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.6 Comparison of Proposed Project and Alternative Impacts

Table 5.6-1 summarizes the impacts of the alternatives and compares it with the Proposed Project impacts.

Table 5.6-1. Comparison of Proposed Project and Alternative Impacts

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Agriculture and Forestry Resources					
Impact AG-1: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact AG-2: Conflict with existing zoning for agricultural use, or a Williamson Act contract	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact AG-3: Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact AG-4: Result in the loss of forest land or conversion of forest land to non-forest use	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact AG-5: Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forest land to non-forest use	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Air Quality					
Impact AIR-1: Conflict with or obstruct implementation of an applicable air quality plan	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact AIR-2: Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact AIR-3: Expose sensitive receptors to substantial pollutant concentrations	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact AIR-4: Result in other emissions, such as those leading to odors, adversely affecting a substantial number of people	LTS	LTS (+)	LTS (=)	LTS (=)	LTS (=)
Biological Resources					
Impact BIO-1: Substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS	S/M	NI (-)	S/M (+)	S/M (=)	S/M (+)
Impact BIO-2: Substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFW or USFWS	S/M	NI (-)	S/M (+)	S/M (=)	S/M (+)
Impact BIO-3: Substantial adverse effect on state or federally protected wetlands	S/M	NI (-)	NI (-)	S/M (+)	S/M (+)
Impact BIO-4: Interfere substantially with the movement of any native resident or migratory	NI	NI (=)	NI (=)	NI (=)	NI (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites					
Impact BIO-5: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact BIO-6: Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan	NI	NI (=)	NI (=)	NI (=)	NI (=)
Cultural Resources					
Impact CUL-1: Cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact CUL-2: Cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact CUL-3: Disturb any human remains, including those interred outside of formal cemeteries	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Energy					
Impact ENG-1: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact ENG-2: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency	NI	NI (=)	NI (=)	NI (=)	NI (=)
Geology, Soils, and Paleontological Resources					
Impact GEO-1(a): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact GEO-1(b): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Strong seismic ground shaking	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact GEO-1(c): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Seismic-related ground failure, including liquefaction	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact GEO-1(d): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Landslides	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact GEO-2: Result in substantial soil erosion or the loss of topsoil	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Impact GEO-3: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact GEO-4: Be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risk to life or property	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact GEO-5: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater	NI	SU (+)	NI (=)	NI (=)	NI (=)
Impact GEO-6: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Greenhouse Gas Emissions					
Impact GHG-1: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact GHG-2: Conflict with an applicable plan, policy, or regulation adopted for the purpose of reduction the emissions of GHG	NI	NI (=)	NI (=)	NI (=)	NI (=)
Hazards and Hazardous Materials					
Impact HAZ-1: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HAZ-2: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HAZ-3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HAZ-4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact HAZ-6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HAZ-7: Expose people or structures, either directly or indirectly, to a significant risk of	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
loss, injury or death involving wildland fires					
Hydrology and Water Quality					
Impact HYD-1: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality	S/M	SU (+)	S/M (=)	S/M (=)	S/M (=)
Impact HYD-2: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HYD-3(a): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Result in substantial erosion or siltation on or off-site	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HYD-3(b): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HYD-3(c): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Create or contribute runoff water that would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact HYD-3(d): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Impede or redirect flood flows	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HYD-4: In flood hazard, risk release of pollutants due to Project inundation	S/M	SU (+)	S/M (=)	S/M (=)	S/M (=)
Impact HYD-5: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan	S/M	SU (+)	S/M (=)	S/M (=)	S/M (=)
Land Use and Planning					
Impact LU-1: Physically divide an established community	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact LU-2: Cause any significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect	NI	NI (=)	NI (=)	NI (=)	NI (=)
Noise and Groundborne Vibration					
Impact NSE-1: Generate a substantial temporary or permanent increase in ambient noise	S/M	NI (-)	S/M (=)	S/M (-)	S/M (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or in applicable standards of other agencies					
Impact NSE-2: Generate excessive groundborne vibration or groundborne noise levels	S/M	NI (-)	S/M (=)	S/M (-)	S/M (=)
Impact NSE-3: Be located within the vicinity of a private airstrip or an airport land-use plan or, where such a plan has not been adopted, within two miles of a public airport or public-use airport, expose people residing or working in the Project area to excessive noise levels	LTS	NI (-)	NI (-)	LTS (+)	LTS (+)
Population and Housing					
Impact POP-1: Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere	NI	NI (=)	NI (=)	NI (=)	NI (=)
Public Services					
Impact PS-1(a): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Fire Protection	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(b): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Police Protection	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(c): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Schools	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact PS-1(d): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Other Public Facilities	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
Recreation					
Impact REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact REC-2: Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Transportation					
Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact TRA-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact TRA-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact TRA-4: Result in inadequate emergency access	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Tribal Cultural Resources					
Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: • Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k), or • A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Utilities and Service Systems					
Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact UTIL-2: Have sufficient water supplies available to serve the Project and reasonably	NI	NI (=)	NI (=)	NI (=)	NI (=)

Impact	Proposed Project	No Project Alternative	Entler Avenue Hybrid Alternative	Crouch Avenue Alternative	Entler Avenue Hybrid and Crouch Avenue Alternative
foreseeable future development during normal, dry and multiple dry years					
Impact UTIL-3: Result in a determination by the wastewater treatment provider, which serves or may serve the Project that it has inadequate capacity to serve the Project's projected demand in addition to the provider's existing commitments	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact UTIL-4: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals	NI	NI (=)	NI (=)	NI (=)	NI (=)
Impact UTIL-5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste	NI	NI (=)	NI (=)	NI (=)	NI (=)
Wildfire					
Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-2: Exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-3: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)
Impact FIRE-4: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes	S/M	NI (-)	S/M (=)	S/M (=)	S/M (=)

Note: LTS = Less than Significant Impact, NI = No Impact, N/A = Not Applicable, SU = Significant and Unavoidable Impact, S/M = Significant Impact but Mitigable to a Less than Significant Level, (+) indicates a greater level of impacts compared to the Proposed Project; (-) indicates less impacts compared the Proposed Project; (=) indicates the same level of impacts as the Proposed Project

5.7 Environmentally Superior Alternative

CEQA Guidelines Section 15126.6 requires that an "environmentally superior" alternative be selected among the alternatives that are evaluated in the EIR. Generally, the environmentally superior alternative is the alternative that would be expected to generate the fewest adverse impacts. For the purpose of this analysis, the alternatives considered are:

- Proposed Project
- No Project
- Entler Avenue Hybrid Alternative –Proposed Project with alternative pipeline alignment for crossing SR 99
- Crouch Avenue Alternative – Proposed Project with alternative export pipeline alignment for crossing Little Chico Creek.
- Entler Avenue Hybrid and Crouch Avenue Alternative – Proposed Project with alternative pipeline alignment for crossing SR 99 and alternative pipeline alignment for crossing Little Chico Creek.

While the No Project Alternative would result in the fewest number of impacts when compared to the Proposed Project and alternatives, the No Project Alternative was the only alternative that would result in significant and unavoidable impacts. Significant and unavoidable impacts from the No Project Alternative would occur under geology, soils, and paleontological resources; and hydrology and water quality. All impacts associated with the No Project Alternative are attributed to the risks associated with continued use of individual septic systems and the potential for system failures and leakages.

This section summarizes the different impacts from the Proposed Project and action alternatives (that is, Entler Avenue Hybrid Alternative, Crouch Avenue Alternative, and Entler Avenue Hybrid and Crouch Avenue Alternative). The comparison focuses on air quality, biological resources, and noise and groundborne vibration because these were the resources that resulted in minor differences in the level of impacts amongst alternatives. However, as shown in Table 5.6-1, with mitigation incorporated, the Proposed Project and all action alternatives result in less than significant impacts or no impact for all resource areas; there are no significant and unavoidable impacts identified for the Proposed Project or any of the action alternatives.

Air Quality. Impacts on air quality would be lowest under the Crouch Avenue Alternative because sensitive receptors would be located farther from construction activities and resulting construction emissions than the Proposed Project and other alternatives. Sensitive receptors are located within 60 feet of the Crouch Avenue Alternative, while sensitive receptors are located within 50 feet of the Proposed Project, Entler Avenue Hybrid Alternative, and the Entler Avenue Hybrid and Crouch Avenue Alternative. (Google Earth 2022) However, with implementation of the proposed mitigation measures, impacts under the Proposed Project and all action alternatives would be less than significant.

Noise and Groundborne Vibration. Similar to the results of the air quality analysis, noise and groundborne vibration impacts would be lowest under the Crouch Avenue Alternative when compared to the Proposed Project and other alternatives because of the distance of sensitive receptors from construction activities. As it relates to impacts from being located within two miles of an airport or within

an airport land use plan, the Entler Avenue Hybrid Alternative would result in the lowest level of impacts. The Entler Avenue Hybrid Alternative is not located within an airport land use plan or within two miles of a public or private airport, while the other alternatives would meet at least one of these criteria. (Google Earth 2022). However, with implementation of the proposed mitigation measures, impacts under the Proposed Project and all action alternatives would be less than significant.

Biological Resources. The Entler Avenue Hybrid Alternative and Entler Avenue Hybrid and Crouch Avenue Alternative would result in a greater level of impacts on special-status species and sensitive communities when compared to the Proposed Project and Crouch Avenue Alternative. The Export Pipeline System under the Entler Avenue Hybrid Alternative and Entler Avenue Hybrid and Crouch Avenue Alternative would cross approximately 0.4 mile of additional valley-foothill riparian habitat, which is a sensitive community, between Butte Creek and SR 99. Valley-foothill riparian is suitable habitat for multiple special-status species of plants and wildlife and is often used by wildlife as a movement corridor. Alternatively, impacts on state or federally protected wetlands would be the lowest under the Entler Avenue Hybrid Alternative as compared to the Proposed Project and other action alternatives because no aquatic features are present within the Entler Avenue Hybrid Alternative footprint. Based on available preliminary data, the Crouch Avenue Alternative and Entler Avenue Hybrid and Crouch Avenue Alternative would result in a greater level of impacts on state or federally protected wetlands than the Proposed Project.

Summary and Conclusion. Based on the results of the alternatives analysis, the Crouch Avenue Alternative would be the environmentally superior alternative because fewer impacts would occur on air quality, noise and groundborne vibration, and biological resources (special-status species and sensitive communities) when compared to the Proposed Project other action alternatives. However, as noted above, the Crouch Avenue Alternative would also result in a greater level of impacts on state or federally protected wetlands than the Proposed Project. Since impact findings for the Proposed Project and all action alternatives with mitigation incorporated show less than significant impacts or no impacts for all resource areas, selection of any of the three action alternatives would not significantly alter the potential for effects of implementing the Proposed Project.

6. List of Preparers

The following people participated in the production of this document.

Preparer	Role(s)
Town of Paradise	
Marc Mattox	Public Works Director & Town Engineer
Ashley Stanley	Principal Engineer
Susan Hartman	Community Development Director – Planning & Wastewater
Elizabeth Martyn, JD	

Preparer	Role(s)	Qualification	Experience
HDR			
John Buttz, PE	Project Manager	MS Civil Engineering	39 years
Leslie Tice, CEP	CEQA Lead	Certified Environmental Professional BS Environmental Science and Policy	23 years
Dawn Edwards	CEQA Lead	MS Environmental Sciences/Studies BS Business Administration	18 years
Amy Dammarell	Quality Control	MS Civil Engineering BS Ecology, Ethology and Evolution	26 years
Natalie Bogan	CEQA Document Lead Hydrology and Water Quality Recreation Wildfire	MS Environmental Management BA Psychology	7 years
Tanya Kalaskar	Agriculture and Forestry Resources Air Quality Energy Greenhouse Gas Emissions Noise and Groundborne Vibration Geology, Soils, and Paleontological Resources Public Services	MS Chemical Engineering BS Chemical Engineering	5 years
Jay Lloyd	Cultural Resources Lead Tribal Resources/AB 52 Lead	Registered Professional Archaeologist MA Linguistics BA Anthropology	19 years
Monica Ruth	Cultural and Tribal Resources	MA History BA Anthropology	9 years
Harrison Qiu	Land Use and Planning Utilities and Service Systems Population and Housing	BS Environmental Policy Analysis & Planning	3 years
Hilary Rolf	Hazards and Hazardous Materials	BS Geology and Geophysics	9 years
David Petree	Transportation	BS Civil Engineering	14 years
Dan Williams	Biological Resources Lead	BS Geography/Environmental Studies	18 years

Preparer	Role(s)	Qualification	Experience
Summer Pardo, PWS	Senior Biologist, Biological QC	MS Ornithology BS Biology	19 years
Kristin Smith	Biological Resources	MS Environmental Studies	10 years
Matthew Paquette	Recreation Resources – QC	BA Environmental Policy	19 years
Elizabeth Grover	Lead Technical Editor	MA English Composition and Rhetoric BS English Education	24 years
Andy Arnold	GIS	Associate of Applied Science, Geospatial Information Science - (GIS Certificate)	20 years
Sean Thomas	GIS	BA Geography	8 years

Paradise Sewer Project

EXHIBIT B

CEQA Findings Regarding Significant Environmental Impacts

Paradise, CA

November 7, 2022

Page Intentionally Blank

Exhibit B

CEQA Findings Regarding Significant Environmental Impacts

The Town of Paradise, California (Town), is the lead agency for the Paradise Sewer Project (the "Project" or "Proposed Project") under the California Environmental Quality Act, ("CEQA"). The City of Chico ("City"), Butte Local Agency Formation Commission ("Butte LAFCo") , Central Valley Regional Water Quality Control Board ("RWQCB"), Butte County ("County"), and California Department of Fish and Wildlife ("CDFW") are considered Responsible Agencies under CEQA based on their discretionary approval over aspects of the Proposed Project. The Proposed Project would be located in Paradise, Chico and unincorporated areas in Butte County, California.

As more fully explained in the PEIR, since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems have created public health and environmental issues and concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the Town in 2018, Paradise was the largest unsewered community in California. The Town has prepared numerous studies to address its need for a centralized wastewater treatment solution, and in its most recent study, the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 feasibility study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022.

The Town now the proposes the Paradise Sewer Project, consisting of the design, right of way acquisition and construction for the core collection system, extended collection system, export pipeline and connection to the City of Chico Water Pollution Control Plant ("Proposed Project" or "Project"). The Proposed Project would allow for the replacement of individual septic systems within the Town's sewer service area that are currently are managed, owned, and maintained by individual property owners. The abandonment of such individual septic systems is not within the scope of this Project or the PEIR. This Proposed Project further includes a regional approach through the provision of wastewater treatment services from the City of Chico to the Town, to be approved by Butte LAFCo.

The Proposed Project would consist of three primary components. The first two components are analyzed at a project level in the PEIR because sufficient information is available regarding the characteristics, timing, and locations of these proposed facilities. The third component is analyzed at a programmatic level. The three components include the following:

- **Core Collection System:** The Core Collection System would consist of pipelines and 28 small pump stations (also referred to as lift stations) to serve approximately 1,500 individual parcels within the Town's core sewer service area.
- **Export Pipeline System:** The 18-mile Export Pipeline System is proposed to convey wastewater from the Core Collection System to the Chico WPCP.
- **Extended Collection System:** The Extended Collection System would be an extension of the Core Collection System that would allow parcels within the Town limits to connect to the sewer system up to the capacity of the system infrastructure and the Town's allocation within the Chico WPCP capacity.

In order to approve these activities for the construction and operation of the Proposed Project, the Town has completed a PEIR in accordance with the California Environmental Quality Act (CEQA). This environmental review process focuses on the potential impacts caused by the Proposed Project on local resources.

The Town developed and implemented an extensive public outreach and education program for the public and other public agencies. The Town published the required documents for availability, distribution, and comments on the Draft PEIR, including a 45-day public review and comment period (July 14 through 5pm on August 29, 2022) and held three public meetings (August 8 (6:00 pm), August 10 (12:30 and 6:00 pm), 2022). All notices, materials and comments received at those meetings are included within the administrative records. Responsible and trustee agencies, involved federal agencies, interest groups, and members of the public were invited to provide input on the Draft PEIR. Comments were submitted in person, at Town Hall and through www.paradisesewer.com. All input received was documented and addressed in the Final Programmatic Environmental Impact Report.

As used here, "impacts" refers to one or more significant environmental effects of the project that have been identified in the PEIR process.

Pursuant to the requirements of CEQA Guidelines Section 15091 and specifically Section1 15091(a)(1) for each possible impact identified, the Town makes a finding of the changes or alternations required or incorporated into the Project that avoid or substantially lessen the significant environmental effect or impact.

In adopting these Findings, the Town also adopts a Mitigation Monitoring and Reporting Program pursuant to California Public Resources Code, Section 21081.6, and CEQA Guidelines, Section 15097. This program is designed to ensure that the project complies with the feasible mitigation measures identified below during implementation of the project. The program is set forth in the Paradise Sewer Project Mitigation Monitoring and Reporting Program, which is adopted by the Town concurrently with these Findings as Exhibit C.

Findings:

1. For the reasons set out in the PEIR, as specifically reviewed by the Town Council, the Town Council finds that adoption of a regional approach to the provision of sewer services to the Town of Paradise as detailed in the EIR as the approach which meets the Objectives and Goals for the Project.

2. The Town Council further finds that there are revisions in only three mitigation measures, as shown below in the Findings (Haz Mat 4-5).

3. The Town Council further findings that the significant environmental effects (also called "impacts") of the Project include conditions changes and alterations, as set out below and in the MMRP and PEIR, that avoid or substantially lessen the significant environmental effects where feasible and as identified in the PEIR; as a result, there are no significant impacts from implementation of the Project that were not mitigable by proposed Mitigation Measures (listed in the MMRP and PEIR).

Mitigation of Biological Resources Impacts

1. **Facts**. According to the EIR, the Project construction could create a substantial adverse effect, either directly or through habitat modifications, on the state or federally protected wetlands, riparian habitat, or other communities and any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the CDFW or USFWS: Special-Status Plant Species. However, this impact can be mitigated to a less than significant level when the project applicant implements the mitigation measures explained below:

    i. During site preparation for any segment of the Core Collection System, Export Pipeline System, or Extended Collection System, ground disturbance and vegetation clearing footprints, including along construction access routes or at temporary work areas, will be reduced to the smallest area feasible. In addition, prior to any ground disturbance, a qualified biologist hired by the Town will identify areas to be avoided during construction activities; these areas will be fenced and/or flagged as close to construction limits as feasible. This mitigation measure applies to all biological resources.

    ii. Before initiating the proposed ground disturbance or vegetation clearing, a qualified botanist will perform focused surveys to determine the presence or absence of special-status plant species with the potential to occur within a one-hundred feet radius of the proposed disturbance areas, as prescribed by CDFW. These surveys will be conducted per CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a), requiring rare plant surveys to be conducted during the proper time of the year when rare or endangered species are evident and identifiable. Surveys will be scheduled to coincide during known flowering periods and/or appropriate developmental periods necessary to identify the plant species of concern.

    iii. If any special-status plant species are found within one-hundred feet of ground disturbance or vegetation clearing areas, including construction access routes or temporary work areas, the following will be implemented:

        a. Suppose the area is not proposed to be disturbed or does not need to be cleared for construction. In that case, any special-status plant species will be protected by flagging, signage, orange plastic fence, and/or silt fence, as appropriate, based on site conditions. This will limit the effects of activities and material stockpiles on special-status plant species.

b. If activities could result in the loss of greater than ten percent of a population identified during surveys or occupied habitat for a special-status plant species, a qualified biologist will develop and implement a mitigation plan for the Town. The plan will include a program to transplant, salvage, cultivate, and reestablish the species at suitable sites (if feasible); means and methods to propagate affected special-status plants through vegetative or reproductive means as appropriate for the species; and transplant at suitable receiving sites as close to the existing population as possible. CDFW and any other agencies with jurisdiction will approve the plan over the species found prior to implementation of the plan and before the initiation of any construction-related activities. Propagation and transplantation will occur prior to the initiation of the activity. The receiving location will be evaluated and chosen based on similar conditions at the transplant source location. Site conditions to consider when choosing a receiving site will include aspect, substrate, hydrology, associated species, and canopy cover. A qualified biologist for the Town will monitor the transplanted plants for at least one year following transplantation. As part of the mitigation plan, a monitoring plan will be developed and approved by CDFW with propagation goals tailored to the species being transplanted. If propagation goals are not met after one year following transplantation, then adaptive management strategies will be developed in coordination with CDFW to achieve those goals.

c. The actual level of mitigation may vary depending on the sensitivity of the species, its prevalence in the area, the location of the occurrence, and the current state of knowledge about overall population trends and threats to its survival. However, at a minimum, the species and habitat will be replaced at a 1:1 ratio (individuals or acreage of occupied habitat). Ratios will be developed in coordination with and approved by CDFW.

iv. A qualified biologist will monitor construction activities that could potentially cause significant impacts on sensitive biological resources. The Town's qualified biologist will determine the amount and duration of monitoring depending on the activity. Monitoring will be required at any location where special status species have been identified within 100 feet of the vegetation clearing area. In addition, the Town will retain a qualified biologist to conduct mandatory awareness training for construction personnel regarding the identified location's sensitive biological resources, identifying species (visual and auditory) most likely to be present, the need to avoid impacts on biological resources (e.g., plants, wildlife, and jurisdictional waters), and the penalties for non-compliance with the mitigation requirements. If new construction

personnel are added to the Project, the contractor will ensure they receive the mandatory training before starting work. This mandatory training will be included in all contractor construction specs and required by the contract. This measure will apply to any biological resources for which complete avoidance cannot be attained through or resource-specific measures.

v. Following the construction of the Core Collection System, Export Pipeline System, or Extended Collection System, all exposed and/or disturbed areas resulting from ground-disturbing activities, including construction access routes or temporary work areas, will be returned to their original contour and grade, and restored using locally native grass and forb seeds, plugs, or a mix of the two. Areas will be seeded with species appropriate to their topographical and hydrological character and covered with broadcast straw and/or jute netted, as appropriate for specific habitat types. Several invasive and noxious weed species are known to occur in the study area, and 27 plant species classified by the California Invasive Plant Council as invasive were identified in the study area during field studies. To avoid the spread of invasive plant species in the study area, native species will be used for reseeding, and the Proposed Project will not allow any use of species listed as noxious weeds. Further, precautions will be taken to avoid the spread of invasive plant species. These include inspecting and cleaning construction equipment and implementing CDFW-approved eradication strategies should an invasion occur. This measure is focused on habitat but applies to all biological resources.

vi. No net loss of aquatic resources would be achieved through impact avoidance and minimization, covered under Section 1 through Section 4, and/or compensatory mitigation. The mitigation for permanent impacts on aquatic resources will be provided at a minimum 1:1 ratio. Mitigation will be achieved through onsite restoration, in-lieu fee payment, or purchase of mitigation credits at a USACE-, USFWS-, and/or CDFW-approved mitigation bank at the Town's expense. Mitigation will be applied to satisfy this measure as required in regulatory permits issued through CDFW, USACE, USFWS, and/or the RWQCB.

vii. If sensitive communities occur within 100 feet (250 feet for vernal pools as mandated by USFWS) of proposed ground disturbing activities, including construction access routes and temporary work areas, with no pre-existing barrier between them and the proposed ground disturbance, protective fencing, such as silt fencing, will be installed between habitats that are to be avoided and the construction limits to prevent accidental disturbance and to protect water quality during construction.

viii. Ground disturbing activities within 100 feet (250 feet for vernal pools) of aquatic resources will coincide with the driest time of year and will avoid occurring within 72 hours (before or after) a rain event, if feasible.

ix. If the proposed project impacts, including along construction access routes and temporary work areas, are to take place within 165 feet of a riparian corridor where elderberry shrubs are known to be present, then a full inventory of elderberry shrubs within 165 feet of the proposed disturbance, including an assessment of whether valley elderberry longhorn beetle exit holes are present, will be conducted under the Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle. Based on the inventory findings, the Town and USFWS will coordinate to determine whether formal consultation is required for the Project. If formal consultation is deemed required, the Town will submit inventory results in a Biological Assessment to USFWS. USFWS will review the proposed findings and mitigation, and respond in a Biological Opinion, which will finalize the elderberry mitigation required of the Town for the Proposed Project.

x. Elderberry shrubs that the Proposed Project would directly impact will be transplanted to a new suitable location. In addition, two credits would be purchased at a USFWS-approved bank for each shrub (2:1 ratio). Mitigation, as required in regulatory permits issued through USFWS, may be applied to satisfy this measure.

xi. Elderberry shrubs would be transplanted outside the flight season of the valley elderberry longhorn beetle (March to July) and follow the most current version of the American National Standards Institute A300 (Part 6) guidelines for transplanting (http://www.tcia.org/). Exit-hole surveys would be completed immediately before transplanting. The number of exit holes found, the GPS location of the plant to be relocated, and the GPS location of where the plant is transplanted would be reported to USFWS. A qualified biologist hired by the Town will be on site for the duration of transplanting activities to ensure compliance with avoidance and minimization measures and other conservation measures. In addition, the qualified biologist will monitor the transplanted shrubs during one growth season following the transplant to confirm shrub survival. No further monitoring or action would be necessary if the shrub(s) are deemed alive. If the shrub(s) are deemed dead, The Town will purchase an additional one credit per shrub from a USFWS-approved bank for the valley elderberry longhorn beetle.

xii. Activities that may indirectly damage or kill an elderberry shrub (trenching, paving, etc.) will require an avoidance area of at least 20 feet from a shrub's drip line, depending on the type of activity. All activities that could occur

within 165 feet of an elderberry shrub will also be conducted outside of the flight season of the valley elderberry longhorn beetle (March to July).

xiii. Herbicides will not be used within the drip line of the shrub. Insecticides will not be used within 98 feet (30 meters, as required by USFWS) of an elderberry shrub. If deemed necessary, all chemicals will be applied using a backpack sprayer or a similar direct application method.

xiv. Mechanical weed removal within the shrub's drip line would be limited to the season when adult-valley elderberry longhorn beetles are not active (August to February) and will be completed so as to not damage an elderberry shrub.

xv. Before construction, and as part of the specifications for the project included within the contractor agreement, the Town will require that its contractor prepare an Inadvertent Release Plan to address the inadvertent loss of inert drilling fluids in the event of a frac-out during HDD for each waterbody crossing. This plan will include Best Management Practices, monitoring, and contingency procedures. It will be developed, approved by a qualified biologist hired by the Town, and implemented by the contractor during construction to avoid or counteract potential impacts on water quality, fish, or other aquatic wildlife resulting from turbidity changes from the fluids.

xvi. A qualified biologist would conduct a preconstruction survey for western pond turtles within 24 hours before the onset of any ground-disturbing activities that would occur within 350 feet of the Ordinary High Water Mark (OHWM) of a creek or stream. If juvenile or adult turtles are found within the survey area, they would be moved by a qualified and CDFW-permitted biologist hired by the Town at least 500 feet away from the proposed disturbance area to a location with similar habitat. If a turtle nest is found within the survey area, construction activities will not occur within 100 feet of the nest until the turtles have hatched or the eggs have been moved to an appropriate location. Any egg relocation would be conducted by a qualified and CDFW-permitted biologist in coordination with CDFW.

xvii. Within 3-5 days before working within 300 feet radius of the OHWM of a creek or stream within the foothill yellow-legged frog range, per CDFW guidelines, a qualified and CDFW-permitted biologist will survey the Proposed Project site for foothill yellow-legged frogs (adults, subadults, tadpoles or egg masses), including construction access routes and at least 500 feet upstream and downstream (CDFW 2018b). Although unlikely, if the Project activities are expected to result in effects extending beyond 500 feet downstream (e.g., heavy sedimentation that could bury egg masses or tadpole rearing sites), the survey area will be expanded to encompass the expected affected area.

Suppose surface water is present during the work period. In that case, a qualified biologist hired by the Town will inspect the site daily for foothill yellow-legged frogs before work begins and during construction.

xviii. Within 3-5 days before working within 300 feet of the OHWM of a creek or within 300 feet of fresh emergent wetland habitat, a qualified and CDFW-permitted biologist will conduct a visual encounter survey of the Proposed Project site for California red-legged frogs (adults, subadults, tadpoles or egg masses).

xix. During biological monitoring (Section 4 above), the biologist will identify any suitable aquatic or upland habitat that may be used by giant garter snakes within or adjacent to areas where ground-disturbing and vegetation-clearing activities would occur. Construction activities within 200 feet of suitable giant garter snake aquatic (generally defined as sloughs, irrigation ditches, creeks, or slow-moving streams) or upland habitat (defined as grasslands or disturbed areas within 200 feet of an aquatic feature suitable for a giant garter snake) will be conducted during the snake's active period (May 1 through October 1). This minimizes the risk that the snakes will be underground and more susceptible to injury or death from ground-disturbing activities.

xx. Staging areas will be located more than 200 feet from any suitable giant garter snake aquatic or upland habitat as identified during monitoring by the biologist, or the area will be fenced with exclusion fencing before the start of construction. Vegetation clearing within 200 feet of the banks of suitable giant garter snake aquatic habitat will be limited to the minimum area necessary. The movement of heavy equipment within 200 feet of the banks of suitable giant garter snake aquatic habitat will be confined to designated haul routes to minimize habitat disturbance.

xxi. To the extent feasible, tree and vegetation clearing will be conducted outside the migratory bird nesting season (March 1 through August 31) in areas where the Town's biologist identifies potential nesting trees. However, if clearing and/or construction activities need to occur during the migratory bird nesting season in these locations, then preconstruction surveys to identify active migratory bird and/or raptor nests would be conducted by a qualified biologist within 14 calendar days before construction initiation. A qualified biologist must perform focused surveys to determine the presence or absence of active nest sites within the proposed impact area, including construction access routes with a 500-foot buffer, where feasible.

xxii. In the year that construction of the Proposed Project is planned to be initiated, a qualified biologist will conduct protocol surveys for Swainson's hawk in and

within 0.5-mile of all suitable habitats for the species in the Proposed Project footprint. These surveys will follow the protocol outlined in the Swainson's Hawk Technical Advisory Committee's Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley (CDFW 2000). Suppose any active Swainson's hawk nests are found. In that case, the biologist will determine an appropriately sized buffer around the nest in which construction activities will not be allowed to commence until the biologist has determined the nest to have reached the end of its cycle (fledged or failed). The size of the buffer will initially be 0.25-mile per CDFW standard requirements. However, it may be reduced in certain circumstances based on the opinion of the biologist regarding the observed sensitivity of the hawks to disturbance, visual screens between the nest and disturbance, and other factors.

xxiii. If active nests of any MBTA- and FGC-protected bird species are identified within the survey areas, a no-disturbance buffer would be established for all active nest sites before the commencement of any Proposed Project construction activities to avoid construction or access-related disturbances to migratory bird nesting activities. A no-disturbance buffer is a zone in which Proposed Project-related activities (vegetation removal, earth moving, noise generation, and construction) cannot occur. A qualified biologist would determine the size of the no-disturbance buffers based on the species, activities proposed near the nest, and topographic and other visual barriers.

xxiv. Before implementing Proposed Project-related activities in undisturbed portions of the Proposed Project site and in and around buildings or other human-made structures with recesses where bats could roost, a qualified biologist will conduct a daytime site reconnaissance of the area. The biologist, focusing on buildings and other human-made structures or trees with cavities or exfoliating bark, would look for bats and bat signs, including existing roost sites, bat guano deposits, and will listen for roosting bats. If the daytime survey does not identify the presence of potential bat roosts, no further mitigation is required. If potential roost sites are identified, a nighttime exit survey will be conducted to determine species of roosting bats, relative bat activity and to estimate the number of individual bats. This nighttime survey may be an active or passive acoustic monitoring survey. If occupied bat roost sites are identified, appropriate spatial and temporal buffers, as defined by the Town's biologist based on experience with bat species, would be implemented to minimize the impact on roosting bats during the construction of the Project.

xxv. Within 14 days before the implementation of Project-related activities in or adjacent to the American badger habitat (annual grassland, mixed chaparral, and blue oak-foothill pine), a qualified biologist will determine if American

badger dens are present within 500 feet of the proposed impact area, including construction access routes. If badger den(s) are observed, the following buffer distances, according to what type of den(s) the biologist determines it (them) to be, will be established before construction activities:

a. Potential den = 30 feet
b. Active (adults present) den = 250 feet
c. Natal (young present) den = 500 feet

Activities permitted within and the size of the no-disturbance buffers may be adjusted based on an evaluation by the qualified biologist. The buffer would be imposed until a qualified biologist determines the den is inactive.

xxvi. Compensatory mitigation for temporary and permanent impacts on state and/or federally protected wetlands that cannot be avoided through other mitigation measures will be purchased by the Town at a minimum 1:1 ratio, as defined by USACE through the Section 404 permit. Mitigation might include onsite restoration approved by the USACE, in-lieu fee payment, or purchasing mitigation credits at a USACE-approved mitigation bank. Mitigation may be applied to satisfy this measure as required in regulatory permits issued through the USACE and/or CDFW.

2. **Findings.** The Town Council finds that:

i. As outlined above, the measures recommended in the EIR to mitigate the creation of a substantial effect on candidate, sensitive, or special status species from construction activities have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate and reduce the impact on the candidate, sensitive, or special-status species created by construction and operation to a less than significant level during site preparation, before, during, and post-construction.

Mitigation of Cultural Resources Impacts

1. **Facts.** According to the EIR, project construction could cause a substantial adverse change in the significance of archaeological resources under Section 15064.5. However, this impact can be mitigated to a less than significant level if the project

applicant implements targeted archaeological monitoring and follow inadvertent discovery procedures. The mitigation measures are the following:

i. The archaeological survey did not include the proposed Export Pipeline System between Midway Road and Skyway due to a lack of landowner consent to access. Although not fully relocated, previous monitoring work along Skyway recorded a series of sparse lithic scatters demonstrating an elevation sensitivity for near-surface archaeological sites. Therefore, based on the lack of previous survey coverage and the number of previously documented archaeological sites in the vicinity, the Project alignment between Midway Road (on the west) and the intersection of Skyway and Neal Road (on the east) will be subject to a qualified professional archaeologist monitoring during the initial ground disturbance. The archaeologist will monitor the initial trenching of previously undisturbed deposits. However, the monitoring may vary based on the excavation rate, the materials excavated, and the absence/presence of artifacts and/or cultural features.

ii. Suppose unrecorded cultural resources are encountered during Project-related ground-disturbing activities, even without an onsite archaeological monitor. In that case, a qualified cultural resources specialist will be contacted to assess the potential significance of the finding. If an inadvertent discovery of cultural materials (e.g., unusual amounts of shell, animal bone, bottle glass, ceramics, structure remains) is made during Project-related construction activities, ground disturbances in the area of the find will be halted, and a qualified professional archaeologist will be notified of the discovery. The archaeologist will determine whether the resource is potentially significant per the CRHR and develop appropriate mitigation, such as avoidance or data recovery.

2. **Findings.** The Town Council finds that:

i. As outlined above, the measures recommended in the EIR to mitigate the creation of a substantial adverse change in the significance of an archaeological resource under Section 15064.5 from construction activities have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate and reduce the impact on the identified location's archaeological resource created by construction and operation to a less than significant level at the initial and during the ground disturbance.

Mitigation of Geology, Soils, and Paleontological Resources

1. **Facts.** According to the EIR, the project construction may cause potential substantial adverse effects including risk of loss, injury, or death involving strong seismic ground shaking, seismic-related ground failure, liquefaction, on or off-site landslides, lateral spreading, subsidence or collapse, and directly or indirectly destroy a unique paleontological resource, site or unique geologic feature. However, this impact can be mitigated to a less than significant level when the Town obtains the services of a qualified, licensed geotechnical engineer to prepare a design-level geotechnical report. The Town will review the geotechnical report with the geotechnical engineer to develop viable measures and require contractors to incorporate these measures into all construction plans and specifications.

   To minimize Geologic Hazards, the Town will obtain the services of a qualified, licensed geotechnical engineer before construction to prepare a design-level geotechnical report with specific recommendations to address geologic hazards, seismic safety, and soil conditions during construction. The Town will review the geotechnical report with the geotechnical engineer to develop viable measures that will avoid or minimize risks associated with ground shaking, liquefaction, landslides, unstable soils, and expansive soils during construction. The Town will require contractors to incorporate these measures into all construction plans and specifications.

   If paleontological resources are inadvertently discovered during earth-moving activities, the construction crew will immediately cease work within a 50-foot radius of the find and notify the Town's Project Manager. Construction work will be halted until the collection of fossil specimens has been completed. The collection and treatment actions will occur after recovery of specimens and once scientific value can be confirmed and documented. If fossils are found, treatment actions will include sampling for microfossils, conducting paleomagnetic analysis, identifying and preparing fossils, arranging for a repository, and preparing a final report.

2. **Findings.** The Town Council finds that:

   i. As state above, the measures recommended in the EIR to mitigate the potential adverse effects of potential risk of loss, injury, or death involving geological hazards and potential destruction of a unique paleontological resource from construction activities have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate and reduce the impact on the identified location's geological, soil, and paleontological resources to a less than significant level before the construction and during earth-moving activities.

Mitigation of Hazards and Hazardous Materials Impacts

1. **Facts.** According to the EIR, the project construction could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials and be located on a site under Government Code § 65962.5. In addition, the project construction may impair implementation or physically interfere with the emergency response or evacuation plan and expose people or structures to a significant risk of loss, injury, or death involving wildland fires. However, the Town can mitigate this impact to a less than significant level when the Town implements and requires contractors to incorporate the following measures (underlined and bolded text are updates made to the Final PEIR in response to agency comments):

   i. The Town will require and enforce, through encroachment permit conditions and construction documents, that all vehicle traffic associated with Proposed Project-related activities will be confined to established roads, staging areas, and parking areas during construction. Additionally, maintenance or refueling of vehicles or equipment must occur in designated areas and/or secondary containment away from waterbodies.

   ii. Before any work is to occur within 500 feet of the Cypress Lane Site, a parcel-specific contaminated soil management plan shall be prepared to address the known contamination at the site for submission to and approval by DTSC. The plan shall include specific hazards and provisions for managing soils and groundwater at the Cypress Lane Site. The plan shall provide requirements for soil testing and characterization, soil disposal protocols, protocols governing the discovery of unknown contaminants, and soil management. The plan shall also include health and safety provisions, including training requirements for site workers who may be handling contaminated material, including the transport and disposal of contaminated material; chemical exposure hazards in soil, groundwater, or soil vapor that are known to be present at the property; and mitigation and monitoring measures that are protective of the site worker and public health and safety. These health and safety provisions shall be prepared to meet OSHA requirements, Title 29 of the CFR 1910.120 and CCR Title 8, Section 5192, and all applicable federal, state, and local regulations and agency ordinances related to the proposed management, transport, and disposal of contaminated media during the implementation of work and field

activities. The plan shall be signed and sealed by a Certified Industrial Hygienist licensed by the American Board of Industrial Hygiene. The DTSC or another applicable regulator, included as a requirement of construction/in construction documents, shall enforce the plan.

iii. The Proposed Project will require a Butte County encroachment permit to mitigate the adverse effect on emergency services. The standard Butte County encroachment permit requires that "at least one lane of any public road…shall be kept open for travel by the general public at all times." Skyway consists of four lanes of traffic, two in each direction. Therefore, the Proposed Project will require a Town of Paradise encroachment permit for work within the Town limits. **In addition, the Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994)**. Further, to minimize the potential for impeding emergency response vehicles at any time during construction, the Proposed Project will only close one lane of traffic at any given time. A two-lane closure might be required only for short instances for the relocation of large equipment, which will be a requirement stated in the construction documents issued by the Town. Therefore, the three lanes of Skyway will always remain open.

iv. To implement a rapid demobilization plan, the Proposed Project **will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994)**. Further, the contractor will be required to prepare a rapid demobilization plan covering the one Skyway Lane it occupies in the construction documents issued by the Town. Demobilization would require the contractor to cover any open trench with metal plates sufficiently strong to carry vehicle traffic, patch cut pavement, remove traffic barrier rails (if used), and move construction equipment completely clear of the road. During fire season, the contractor will be required to have sufficient metal plating on-site to immediately cover any open trench. Conversely, the length of open trenching will be limited to the amount of metal plating on-site. The contractor will also need sufficient cold-mix asphalt on site to temporarily patch any cut road surface. The plan will be reviewed and approved by the Public Works Director and enforced by the Town.

v. **The Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994).** Further, to minimize the potential for

impeding emergency response vehicles and at the direction of the Town during an evacuation, the contractor will be required to demobilize off of Skyway (Hazard Mitigation, Section (iv)), leaving all four lanes clear for the public traffic and emergency crews within four hours if no traffic barrier rails are being used and within eight hours if traffic barrier rails are being used. Again, other than short instances where a two-lane closure might be required to relocate large equipment, three of the four lanes of Skyway will be continuously open during construction.

vi. During the final design, the Town will require that the engineering designer prepare a Traffic Management Plan that complies with Section 110.7 Traffic Control Plans of the Highway Design Manual (Caltrans 2020), which will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and the City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents. The plan will be prepared following professional engineering standards and will consist of, but not be limited to, the following requirements:

a) Schedule truck trips outside of peak traffic hours when feasible.

b) Store all equipment and materials in designated staging areas.

c) Use signage to guide vehicles, bicyclists, and pedestrians through and/or around the construction areas.

d) Install traffic control devices where traffic conditions warrant.

e) Provide safe detours to reroute vehicle, bicycle, and pedestrian traffic.

f) Encourage construction crews to park at staging areas to limit lane closures in the public right-of-way.

g) Consult with Butte Regional Transit before construction to coordinate bus stop relocations (as necessary).

h) Coordinate all construction activities with the emergency service providers in the area.

i) Stop all construction work during any period declared as a Red Flag Warning. The National Weather Service issues a Red Flag Warning for weather events that may produce an increased risk of fire danger.

j) Post notices and/or appropriate signage to notify the public of upcoming construction activities, including exact location, schedule, and duration. This will include alternative access routes

if a short-term full-lane closure will be required to transport equipment.

k) The Town of Paradise will enforce the Traffic Management Plan.

vii. The project should incorporate fire prevention measures that require construction crews and equipment to avoid circumstances that could cause wildfire and that crews and staff have access to fire-prevention equipment onsite. Specific fire prevention measures include: fire extinguishers or other approved fire suppressants be available at all times, proper storage of flammable materials, safe cutting and welding practices, proper installation of temporary electrical equipment, and use of dust-collecting apparatus on power equipment.

viii. The Town and construction contractor must ensure that the public will receive adequate warning of construction activities and any dangerous conditions that might result from the use of fences, barriers, lights, flagging, guards, and signs. This will be incorporated into the Traffic Management Plan.

ix. The construction Contractor will be advised before construction activities that the Town of Paradise is in a Wildland Fire Area and that fire hazard is EXTREME during the summer months.

2. **Findings.** The Town Council finds that:

i. The measures recommended in the EIR as outlined above to mitigate the potential adverse effects of the construction to the public or the environment through hazardous materials, interference with the emergency response or evacuation plan, and exposure of people or structures to wildland fires have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate the impact of the transport, use, or disposal of hazardous materials, interference with an emergency response or evacuation plan, and exposure to wildland fires to less than significant level through the implementation of mitigation plans set out above before and during construction activities and in the event of an emergency requiring evacuation.

Mitigation of Hydrology and Water Quality Impacts

1. **Facts.**. According to the EIR, the project construction could violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. The project could also substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces. The alteration would result in a substantial erosion or siltation on or off-site, substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, create or contribute runoff water that would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff. In flood hazard, tsunami or seiche zones risk the release of pollutants due to the project inundation. The project would conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

   However, this impact can be mitigated to a less than significant level if the project contractor prepares and implements flood protection, stormwater management and treatment plan. These mitigation measures include:

   i. The Town will require and enforce, through encroachment permit conditions and construction documents, that all vehicle traffic associated with Proposed Project-related activities will be confined to established roads, staging areas, and parking areas during construction. Additionally, maintenance or refueling of vehicles or equipment must occur in designated areas and/or secondary containment away from waterbodies.

   ii. The Town will require in the construction agreement that the contractor prepare and implement a Proposed Project-specific Stormwater Management and Treatment Plan that addresses construction-related activities. The plan will include all the SWPPP and Small MS4 permits, as well as the Construction Best Management Practices (explained below).

   iii. Prior to initiation of ground- disturbing activities within 250 feet of vernal pools or 100 feet of other aquatic resources, construction Best Management Practices ("BMPs") will be employed on-site to prevent degradation to on-site and off-site aquatic resources. Methods will include the use of appropriate measures to intercept and capture sediment prior to entering aquatic resources, as well as erosion control measures along the perimeter of all work areas to prevent the displacement of fill material. All BMPs will be in place prior to initiation of any construction activities and will remain until construction activities are completed. All erosion control methods will be maintained until all on-site soils are stabilized.

   iv. Before construction, and as part of the specifications for the project included within the contractor agreement, the Town will require that its contractor prepare an Inadvertent Release Plan to address the inadvertent loss of inert

drilling fluids in the event of a frac-out during HDD for each waterbody crossing. This plan will include Best Management Practices, monitoring, and contingency procedures. It will be developed, approved by a qualified biologist hired by the Town, and implemented by the contractor during construction to avoid or counteract potential impacts on water quality, fish, or other aquatic wildlife resulting from turbidity changes from the fluids.

v. Before construction, the Town will require the contractor to prepare and implement a Flood Protection Plan for the Proposed Project. The Flood Protection Plan must include evacuation routes in the event of a flood and will consist of the implementation of temporary flood barriers, such as sandbags, berms, or portable fence systems, to be set up around the perimeter of the construction work area in high flood hazard areas, as discussed in Section 3.10.1.5, Tsunami, Seiche and Flood Hazards.

2. **Findings.** The Town Council finds that:

   i. The measures recommended in the EIR as outlined above to mitigate the potential alteration of drainage patterns, violation of any water quality standards, waste discharge requirements, or otherwise substantially degrade surface or ground water quality which could result in a substantial erosion or siltation on or off-site have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

   ii. These measures will mitigate the impact of construction activities that could alter existing drainage patterns, including the alteration of the course of a stream or river, risk of floods, and conflict with water quality control plans to less than significant levels through the implementation of Flood Protection, Stormwater Management, and Treatment Plans set out above before construction activities.

Mitigation of Noise Impacts

1. **Facts.** According to the EIR, the project construction could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project above the standards established in the local general plan, noise ordinance, or applicable standards of other agencies, and an excessive ground-borne vibration or ground-borne noise levels. However, these impacts can be mitigated to a less than significant level if the Town and contractor minimize construction noise.

   Before construction, the Town will incorporate the following measures into all construction plans and agreements to reduce noise levels during construction:

a) Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

b) Locate stationary noise-generating equipment as far as possible from noise-sensitive receptors.

c) Use quiet air compressors and other stationary noise-generating equipment where appropriate technology exists and is feasible.

d) Maintain and tune all equipment following the manufacturer's recommendations to minimize noise emission.

e) Install temporary construction-site sound barriers near noise sources.

f) Prohibit unnecessary idling of internal combustion engines.

g) Limit the use of public address systems.

h) Post construction dates and times, as well as the designated representative's name and phone number to be contacted for noise-related concerns at the perimeter of the construction site.

i) Comply with county, city and/or town noise policies applicable to the location's jurisdiction.

2. **Findings.** The Town Council finds that:

i. The mitigation measures recommended in the EIR outlined above to mitigate the noise levels from construction activities have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate the impact of a substantial increase in the Project vicinity's noise levels and potential excessive ground-borne vibrations to a less than significant level.

Mitigation of Public Services Impacts

1. **Facts.** According to the EIR, project construction could result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for Fire and Police protection, schools, and other public facilities.

However, these impacts can be mitigated to a less than significant when the Town implements and requires contractors to incorporate the Traffic Management Plan explained below:

During the final design, the Town will require that the engineering designer prepare a Traffic Management Plan that complies with Section 110.7 Traffic Control Plans of the Highway Design Manual (Caltrans 2020), which will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and the City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents. The plan will be prepared following professional engineering standards and will consist of, but not be limited to, the following requirements:

a) Schedule truck trips outside of peak traffic hours when feasible. Store all equipment and materials in designated staging areas.

b) Use signage to guide vehicles, bicyclists, and pedestrians through and/or around the construction areas.

c) Install traffic control devices where traffic conditions warrant.

d) Provide safe detours to reroute vehicle, bicycle, and pedestrian traffic.

e) Encourage construction crews to park at staging areas to limit lane closures in the public right-of-way.

f) Consult with Butte Regional Transit before construction to coordinate bus stop relocations (as necessary).

g) Coordinate all construction activities with the emergency service providers in the area.

h) Stop all construction work during any period declared as a Red Flag Warning. The National Weather Service issues a Red Flag Warning for weather events that may produce an increased risk of fire danger.

i) Post notices and/or appropriate signage to notify the public of upcoming construction activities, including exact location, schedule, and duration. This will include alternative access routes if a short-term full-lane closure will be required to transport equipment.

j) The Town of Paradise will enforce the Traffic Management Plan.

2. **Findings**. The Town Council Finds that:

   i. The mitigation measures recommended in the EIR stated above to mitigate the potential adverse effects on public or government facilities and performance have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

   ii. These measures will mitigate the impact of construction-related activities to a less than significant level through the implementation of the Traffic Management Plan enforced by the Town.

Mitigation of Transportation Impacts

1. **Facts**. According to the EIR, the project construction could result in a conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. In addition, the project may result in inadequate emergency access. However, these impacts can be mitigated to a less than significant when the Town implements and requires contractors to incorporate the Traffic Management Plan explained below:

   During the final design, the Town will require that the engineering designer prepare a Traffic Management Plan that complies with Section 110.7 Traffic Control Plans of the Highway Design Manual (Caltrans 2020), which will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and the City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents. The plan will be prepared following professional engineering standards and will consist of, but not be limited to, the following requirements:

   a) Schedule truck trips outside of peak traffic hours when feasible. Store all equipment and materials in designated staging areas.
   b) Use signage to guide vehicles, bicyclists, and pedestrians through and/or around the construction areas.
   c) Install traffic control devices where traffic conditions warrant.
   d) Provide safe detours to reroute vehicle, bicycle, and pedestrian traffic.
   e) Encourage construction crews to park at staging areas to limit lane closures in the public right-of-way.

f) Consult with Butte Regional Transit before construction to coordinate bus stop relocations (as necessary).

g) Coordinate all construction activities with the emergency service providers in the area.

h) Stop all construction work during any period declared as a Red Flag Warning. The National Weather Service issues a Red Flag Warning for weather events that may produce an increased risk of fire danger.

i) Post notices and/or appropriate signage to notify the public of upcoming construction activities, including exact location, schedule, and duration. This will include alternative access routes if a short-term full-lane closure will be required to transport equipment.

j) The Town of Paradise will enforce the Traffic Management Plan.

2. **Findings**. The Town Council Finds that:

i. The mitigation measures recommended in the EIR stated above to mitigate the potential conflict with program, ordinance, or policy addressing transit systems and adverse effects on emergency access have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate the impact of construction-related activities to a less than significant level through the implementation of the Traffic Management Plan enforced by the Town.

Mitigation of Tribal Cultural Resources Impacts

1. **Facts** According to the EIR, the project construction could cause a substantial adverse change in the significance of tribal cultural resources, defined in PRC Section 21074 as either a site, feature, place, or cultural landscape geographically defined in size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources or a local register of historical resources as defined in PRC Section 5020.1(k); or
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant according to the criteria set forth in subdivision (c) of PRC Section 5024.1. In

applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe.

However, these impacts can be mitigated to less than significant level when the Town coordinates efforts with the Konkow Valley Band of Maidu, and Mechoopda Indian Tribe explained below:

i. During the final design, the Town will continue to consult and coordinate with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe to identify sensitive areas to be protected during construction work and appropriate methods to protect those areas.

ii. Before construction, the Town will coordinate with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe in identifying a Tribal Cultural Monitor, as deemed necessary by either/both Tribes, to be present during ground disturbance work within areas designated as sensitive for tribal cultural resources.

2. **Findings**. The Town Council Finds that:

i. The mitigation measures recommended in the EIR, as outlined above, to mitigate the potential adverse effect on the significance of trial cultural resources have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

ii. These measures will mitigate the impact of construction-related activities to a less than significant level through the Town's coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe during the final design of the project, before and during construction activities.

Mitigation of Utilities and Service Systems Impacts

1. **Facts.** According to the EIR, the project construction could require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunications facilities which could result in significant environmental effects. However, these impacts can be mitigated to less than significant when the Town prepares and implement a Utility conflict and coordination plan.

   During the final design, to minimize disruptions to utility services, the Town will prepare a Utility Conflict and Coordination Plan that identifies outages that could affect residents and businesses, including fiber-optic/communications, water, power, and gas. As part of that plan, the public and stakeholders will be notified

by signage and on the Town's website of any potential service interruptions at least two weeks before construction work.

2. **Findings**. The Town Council Finds that:

   i. As stated above, the mitigation measures recommended in the EIR to mitigate the potential adverse effect on the environment through the relocation or construction of utilities and service systems have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

   ii. These measures will mitigate the impact of construction-related activities to a less than significant level through the Town's preparation and implementation of a utility coordination plan during the final project's final design.

Mitigation of Wildfire Impacts

1. **Facts**. According to the EIR, the project construction could substantially impair an adopted emergency response or evacuation plan and exacerbate wildfire risks due to slopes, prevailing winds, and other factors, thereby exposing project occupants to pollutant concentrations from or the uncontrolled spread of a wildfire. In addition, the project may require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or result in temporary or ongoing impacts on the environment. This could also expose people or structures to significant risks, including downslope or downstream flooding or landslides resulting from runoff, post-fire slope instability, or drainage changes.

   As explained in the MMRP, mitigation measures include:

   i. The Proposed Project will require a Butte County encroachment permit to mitigate the adverse effect on emergency services. The standard Butte County encroachment permit requires that "at least one lane of any public road…shall be kept open for travel by the general public at all times." Skyway consists of four lanes of traffic, two in each direction. Therefore, the Proposed Project will require a Town of Paradise encroachment permit for work within the Town limits. In addition, the Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994). Further, to minimize the potential for impeding emergency response vehicles at any time during construction, the Proposed Project will only close one lane of traffic at any given time. A two-lane closure might

be required only for short instances for the relocation of large equipment, which will be a requirement stated in the construction documents issued by the Town. Therefore, the three lanes of Skyway will always remain open.

ii. To implement a rapid demobilization plan, the Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994). Further, the contractor will be required to prepare a rapid demobilization plan covering the one Skyway Lane it occupies in the construction documents issued by the Town. Demobilization would require the contractor to cover any open trench with metal plates sufficiently strong to carry vehicle traffic, patch cut pavement, remove traffic barrier rails (if used), and move construction equipment completely clear of the road. During fire season, the contractor will be required to have sufficient metal plating on-site to immediately cover any open trench. Conversely, the length of open trenching will be limited to the amount of metal plating on-site. The contractor will also need sufficient cold-mix asphalt on site to temporarily patch any cut road surface. The plan will be reviewed and approved by the Public Works Director and enforced by the Town.

iii. The Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (1994) and Hazardous Waste Management Element (1994). Further, to minimize the potential for impeding emergency response vehicles and at the direction of the Town during an evacuation, the contractor will be required to demobilize off Skyway (Hazard Mitigation, Section (iv)), leaving all four lanes clear for the public traffic and emergency crews within four hours if no traffic barrier rails are being used and within eight hours if traffic barrier rails are being used. Again, other than short instances where a two-lane closure might be required to relocate large equipment, three of the four lanes of Skyway will be continuously open during construction.

iv. During the final design, the Town will require that the engineering designer prepare a Traffic Management Plan that complies with Section 110.7 Traffic Control Plans of the Highway Design Manual (Caltrans 2020), which will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and the City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents. The plan will be prepared following professional engineering standards and will consist of, but not be limited to, the following requirements:

l) Schedule truck trips outside of peak traffic hours when feasible.

m) Store all equipment and materials in designated staging areas.

n) Use signage to guide vehicles, bicyclists, and pedestrians through and/or around the construction areas.

o) Install traffic control devices where traffic conditions warrant.

p) Provide safe detours to reroute vehicle, bicycle, and pedestrian traffic.

q) Encourage construction crews to park at staging areas to limit lane closures in the public right-of-way.

r) Consult with Butte Regional Transit before construction to coordinate bus stop relocations (as necessary).

s) Coordinate all construction activities with the emergency service providers in the area.

t) Stop all construction work during any period declared as a Red Flag Warning. The National Weather Service issues a Red Flag Warning for weather events that may produce an increased risk of fire danger.

u) Post notices and/or appropriate signage to notify the public of upcoming construction activities, including exact location, schedule, and duration. This will include alternative access routes if a short-term full-lane closure will be required to transport equipment.

v) The Town of Paradise will enforce the Traffic Management Plan.

v. The Town will require and enforce, through encroachment permit conditions and construction documents, that all vehicle traffic associated with Proposed Project-related activities will be confined to established roads, staging areas, and parking areas during construction. Additionally, maintenance or refueling of vehicles or equipment must occur in designated areas and/or secondary containment away from waterbodies.

vi. The project should incorporate fire prevention measures that require construction crews and equipment to avoid circumstances that could cause wildfire and that crews and staff have access to fire-prevention equipment onsite. Specific fire prevention measures include: fire extinguishers or other approved fire suppressants be available at all times, proper storage of flammable materials, safe cutting and welding practices, proper installation of temporary electrical equipment, and use of dust-collecting apparatus on power equipment.

vii. The Town and construction contractor must ensure that the public will receive adequate warning of construction activities and any dangerous conditions that might result from the use of fences, barriers, lights, flagging, guards, and signs. This will be incorporated into the Traffic Management Plan.

viii. The construction Contractor will be advised before construction activities that the Town of Paradise is in a Wildland Fire Area and that fire hazard is EXTREME during the summer months.

ix. The Town will require in the construction agreement that the contractor prepare and implement a Proposed Project-specific Stormwater Management and Treatment Plan that addresses construction-related activities. The plan will include all the SWPPP and Small MS4 permits, as well as the Construction Best Management Practices (explained below).

Prior to initiation of ground- disturbing activities within 250 feet of vernal pools or 100 feet of other aquatic resources, construction Best Management Practices ("BMPs") will be employed on-site to prevent degradation to on-site and off-site aquatic resources. Methods will include the use of appropriate measures to intercept and capture sediment prior to entering aquatic resources, as well as erosion control measures along the perimeter of all work areas to prevent the displacement of fill material. All BMPs will be in place prior to initiation of any construction activities and will remain until construction activities are completed. All erosion control methods will be maintained until all on-site soils are stabilized.

x. Before construction, the Town will require the contractor to prepare and implement a Flood Protection Plan for the Proposed Project. The Flood Protection Plan must include evacuation routes in the event of a flood and will consist of the implementation of temporary flood barriers, such as sandbags, berms, or portable fence systems, to be set up around the perimeter of the construction work area in high flood hazard areas, as discussed in Section 3.10.1.5, Tsunami, Seiche and Flood Hazards.

xi. To minimize Geologic Hazards, the Town will obtain the services of a qualified, licensed geotechnical engineer before construction to prepare a design-level geotechnical report with specific recommendations to address geologic hazards, seismic safety, and soil conditions during construction. The Town will review the geotechnical report with the geotechnical engineer to develop viable measures that will avoid or minimize risks associated with ground shaking, liquefaction, landslides, unstable soils, and expansive soils during construction. The Town will require contractors to incorporate these measures into all construction plans and specifications.

2. **Findings**. The Town Council Finds that:

   i. As outlined above, the mitigation measures recommended in the EIR to mitigate the potential adverse effect of the Project Construction on an adopted emergency response or evacuation plan and the risks associated with wildfires through the installation or maintenance of associate structures have been adopted as stated in the approval resolution, project development guidelines, and the Monitoring and Reporting Plan.

   ii. These measures will mitigate the impact of construction-related activities on emergency response plans and wildfire risks to a less than significant level.

Paradise Sewer Project

Mitigation, Monitoring and Reporting Program

Paradise, CA

November 4, 2022

Page Intentionally Blank

Mitigation Monitoring and Reporting Program

The Town of Paradise, California (Town), is the lead agency for the Paradise Sewer Project under CEQA. The City of Chico (City), Butte Local Agency Formation Commission (Butte LAFCo), Central Valley Regional Water Quality Control Board (RWQCB), Butte County (County), and California Department of Fish and Wildlife (CDFW) are considered Responsible Agencies under CEQA based on their discretionary approval over aspects of the Proposed Project. The Proposed Project would be located in Paradise, Chico and unincorporated areas in Butte County, California.

The Town is proposing to construct, operate, and maintain a new sewer collection system within the Town limits, with an export pipeline from the Town to the Chico Water Pollution Control Plant (WPCP). The Proposed Project would allow for the replacement of individual septic systems within the Town's sewer service area that are managed, owned, and maintained by individual property owners. The abandonment of such individual septic systems is not within the scope of this Program Environmental Impact Report (PEIR). This Proposed Project further includes the provision of wastewater treatment services from the City to the Town, to be approved by Butte LAFCo.

Specifically, the Proposed Project would consist of three primary components. The first two components are analyzed at a project level in the PEIR because sufficient information is available regarding the characteristics, timing, and locations of these proposed facilities. The third component is analyzed at a programmatic level. The three components include the following:

- **Core Collection System:** The Core Collection System would consist of pipelines and 28 small pump stations (also referred to as lift stations) to serve approximately 1,500 individual parcels within the Town's core sewer service area.
- **Export Pipeline System:** The 18-mile Export Pipeline System is proposed to convey wastewater from the Core Collection System to the Chico WPCP.
- **Extended Collection System:** The Extended Collection System would be an extension of the Core Collection System that would allow parcels within the Town limits to connect to the sewer system up to the capacity of the system infrastructure and the Town's allocation within the Chico WPCP capacity.

In order to approve these activities for the construction and operation of the Proposed Project, the Town has completed a PEIR in accordance with the California Environmental Quality Act (CEQA). This environmental review process focuses on the potential impacts caused by the Proposed Project on local resources.

In accordance with Section 21083, Public Resources Code (CEQA Guidelines Section 15097 [a]), "a public agency shall adopt a program for monitoring or reporting on the revisions which it has required and the measures it has imposed to mitigate or avoid significant environmental effects. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity which accepts the delegation; however, until mitigation measures have been completed, the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program" (CEQA Guidelines Section 15097 (a)).

This Mitigation Monitoring and Reporting Program (MMRP) addresses the requirement. Unless noted otherwise, the Town would be the enforcing entity for all mitigation requirements, including but not limited to contractors, are responsible for implementation. Measures identified as the responsibility of contractors would be included as requirements in Town contracting agreements and construction specs.

Page Intentionally Blank

Table 1. Mitigation Monitoring and Reporting Program

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Biological Resources					
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Special-Status Plant Species	**MM-BIO-1: Minimize Disturbance Footprint.** During site preparation for any segment of the Core Collection System, Export Pipeline System, or Extended Collection System, ground disturbance and vegetation clearing footprints, including along construction access routes or at temporary work areas, will be reduced to the smallest area feasible. Prior to any ground disturbance, a qualified biologist hired by the Town will identify areas to be avoided during construction activities; these areas will be fenced and/or flagged as close to construction limits as feasible. This mitigation measure is coordinated with **MM-BIO-2** but applies to all biological resources.	Significant Impact	Less-than-Significant Impact	A qualified biologist will identify areas to be avoided during construction activities.	During site preparation, prior to construction.
	MM-BIO-2: Special-status Plant Surveys. Prior to initiating proposed ground disturbance or vegetation clearing, including along construction access routes or at temporary work areas, a qualified botanist will perform focused surveys to determine the presence or absence of special-status plant species with potential to occur in and adjacent to (within a radius of 100 feet, as prescribed by CDFW) proposed disturbance areas. These surveys will be conducted in accordance with CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a), which requires rare plant surveys be conducted at the proper time of year when rare or endangered species are both evident and identifiable. Surveys will be scheduled to coincide with known flowering periods, and/or during appropriate developmental periods that are necessary to identify the plant species of concern. If special-status plants are identified during surveys, then **MM-BIO-3** will be implemented.			A qualified botanist will perform focused surveys to determine the presence or absence of special-status plant species with potential to occur in and adjacent to proposed disturbance areas. These surveys will be conducted in accordance with CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities/Town, CDFW	Prior to ground disturbance or vegetation clearing.
	MM-BIO-3: Special-status Plant Avoidance. If any special-status plant species are found within 100 feet of ground disturbance or vegetation clearing areas, including construction access routes or temporary work areas, during **MM-BIO-2,** the following will be implemented: • Any special-status plant species that are identified within 100 feet of proposed ground disturbance or vegetation clearing areas, including construction access routes or temporary work areas, but are not proposed to be disturbed (that is, the area doesn't need to be cleared for construction), will be protected by flagging, signage, orange plastic fence, and/or silt fence, as appropriate based on site conditions, to limit the effects of activities and material stockpiles on special-status plant species. • If activities could result in the loss of greater than 10 percent of a population identified during surveys or occupied habitat for a special-status plant species, a mitigation plan will be developed and implemented by a qualified biologist for the Town that will include a program to transplant, salvage, cultivate, and reestablish the species at suitable sites (if feasible); means and methods to propagate affected special-status plants through vegetative or reproductive means (for example, harvesting of seed or seed bank through topsoil collection, salvaging and transplanting or collecting of cuttings), as appropriate for the species, and transplant at suitable receiving sites as close to the existing population as possible. The plan will be approved by CDFW and any other agencies with jurisdiction over the species found to be present prior to implementation of the plan and before initiation of any construction related activities. Propagation and transplantation will occur prior to initiation of the activity. The receiving location will be evaluated and chosen based on similarity to conditions at the transplant source location. Site conditions to consider when choosing a receiving site will include aspect, substrate, hydrology, associated species, and canopy cover. The transplanted plants will be monitored by a qualified biologist for the Town for at least 1 year following transplantation. As part of the mitigation plan, a monitoring plan will be developed and approved by CDFW with propagation goals tailored to the species that are being transplanted. If propagation goals are not met after 1 year following transplantation, then adaptive management strategies will be developed in coordination with CDFW to achieve those goals. • The actual level of mitigation may vary depending on the sensitivity of the species, its prevalence in the area, the location of the occurrence, and the current state of knowledge about overall population trends and threats to its survival; however, at a minimum, the species and habitat will be replaced at a 1:1 ratio (individuals or acreage of occupied habitat). Ratios will be developed in coordination with and approved by CDFW.			A mitigation plan will be developed and implemented by a qualified biologist for the Town or designated Contractor. The plan will be approved by CDFW and any other agencies with jurisdiction over the species found to be present prior to implementation of the plan and before initiation of any construction related activities. As part of the mitigation plan, a monitoring plan will be developed and approved by CDFW. If propagation goals are not met after 1 year following transplantation, then adaptive management strategies will be developed in coordination with CDFW to achieve those goals/CDFW and other jurisdictional agencies./Town, CDFW	Prior to ground disturbance or vegetation clearing; during construction activities; and after 1 year of initiation of a mitigation plan.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
	MM-BIO-4: Biological Monitoring and Worker Environmental Awareness Training. A qualified biologist will monitor construction activities that could potentially cause significant impacts on sensitive biological resources. The amount and duration of monitoring will depend on the activity and will be determined by a qualified biologist for the Town. Monitoring will be required at any location where special status species have been identified within 100 feet of vegetation clearing area. In addition, a qualified biologist will be retained by the Town to conduct mandatory contractor/worker awareness training for construction personnel to brief them on the identified location of sensitive biological resources, including how to identify species (visual and auditory) most likely to be present, the need to avoid impacts on biological resources (e.g., plants, wildlife, and jurisdictional waters), and on the penalties for not complying with biological mitigation requirements. If new construction personnel are added to the Project, the contractor will ensure that they receive the mandatory training before starting work. This mandatory training will be included in all contractor construction specs and required by contract. This measure will apply to any biological resources for which complete avoidance cannot be attained through **MM-BIO-1** or resource-specific measures.			A qualified biologist will monitor construction activities that could potentially cause significant impacts on sensitive biological resources. A qualified biologist will conduct mandatory contractor/worker awareness training for construction personnel. If new construction personnel are added to the Project, the Contractor will ensure that they receive the mandatory training before starting work.	During construction activities.
	MM-BIO-5: Restoration of Temporarily Disturbed Areas and Invasive Weed Control. Following construction of the Core Collection System, Export Pipeline System, or Extended Collection System, all exposed and/or disturbed areas resulting from ground disturbing activities, including construction access routes or temporary work areas, will be returned to their original contour and grade, and restored using locally native grass and forb seeds, plugs, or a mix of the two. Areas will be seeded with species appropriate to their topographical and hydrological character and covered with broadcast straw and/or jute netted, as appropriate for specific habitat type. For example, temporarily disturbed wetlands will be seeded with native hydrophytic species typical to the region, whereas upland areas will be seeded with an upland grass and forb mix. Several invasive and noxious weed species are known to occur in the study area, and 27 plant species classified by the California Invasive Plant Council as invasive were identified in the study area during field studies (Appendix G). In order to avoid the spread of invasive plant species in the study area, native species will be used for reseeding, and the Proposed Project will not allow any use of species listed as noxious weeds. Further, precautions will be taken to avoid the spread of invasive plant species. These include the inspection and cleaning of construction equipment and implementation of CDFW-approved eradication strategies should an invasion occur. This measure is focused on habitat, but applies to all biological resources (e.g., special status species dependent on specific habitat).			The construction contractor will be responsible for implementation.	Post-construction.
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Vernal Pool Crustaceans	MM-BIO-1: Minimize Disturbance Footprint. See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-6: No Net Loss of Aquatic Resources. No net loss of aquatic resources would be achieved through impact avoidance, minimization, which are both covered under MM-BIO-1 through MM-BIO-4, and/or compensatory mitigation. Mitigation for permanent impacts on aquatic resources will be provided at a minimum 1:1 ratio. Mitigation will be achieved through onsite restoration, in-lieu fee payment, or purchase of mitigation credits at a USACE-, USFWS-, and/or CDFW-approved mitigation bank at the expense of the Town. Mitigation, as required in regulatory permits issued through CDFW, USACE, USFWS, and/or the RWQCB will be applied to satisfy this measure.			Mitigation will be achieved through onsite restoration, in-lieu fee payment, or purchase of mitigation credits at a USACE-, USFWS-, and/or CDFW-approved mitigation bank at the expense of the Town. Mitigation, as required in regulatory permits issued through CDFW, USACE, USFWS, and/or the RWQCB will be applied to satisfy this measure./Town, CDFW, USACE, USFWS, RWQCB	During construction activities and post-construction.
	MM-BIO-7: Sensitive Community Fencing. If sensitive communities occur within 100 feet (250 feet for vernal pools as mandated by USFWS) of proposed ground disturbing activities, including construction access routes and temporary work areas, with no pre-existing barrier between them and the proposed ground disturbance, protective fencing, such as silt fencing, will be installed between habitats that are to be avoided and the construction limits to prevent accidental disturbance and to protect water quality during construction.			The construction contractor will be responsible for implementation of this mitigation in accordance with USFWS standards.	Prior to construction activities.
	MM-BIO-8: Dry Work Areas. Ground disturbing activities within 100 feet (250 feet for vernal pools) of aquatic resources will coincide with the driest time of year and will avoid occurring within 72 hours (before or after) a rain event, if feasible.			The construction contractor will be responsible for implementation of this mitigation.	At the driest time of year and will avoid occurring within 72 hours (before or after) a rain event, if feasible.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Valley Elderberry Longhorn Beetle	**MM-BIO-1. Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-9: Mapping of Elderberry Shrubs and USFWS Section 7 Consultation. If Proposed Project impacts, including along construction access routes and temporary work areas, are to take place within 165 feet of a riparian corridor where elderberry shrubs are known to be present, then a full inventory of elderberry shrubs within 165 feet of the proposed disturbance, including an assessment of whether valley elderberry longhorn beetle exit holes are present, will be conducted pursuant to the *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle*. Based on the inventory findings, the Town and USFWS will coordinate to determine whether formal consultation is required for the Project. If formal consultation is deemed required, results of the inventory will be submitted by the Town in a Biological Assessment to USFWS. USFWS will review proposed findings and mitigation, and respond in a Biological Opinion, which will finalize elderberry mitigation that will be required of the Town for the Proposed Project.			An inventory of elderberry shrubs will be conducted by a qualified biologist. The Town and USFWS will coordinate to determine whether formal consultation is required for the Project. If formal consultation is deemed required, results of the inventory will be submitted by the Town in a Biological Assessment to USFWS. USFWS will review proposed findings and mitigation, and respond in a Biological Opinion, which will finalize elderberry mitigation that will be required of the Town for the Proposed Project./Town, USFWS	Prior to ground disturbance and vegetation clearing.
	MM-BIO-10: No Net Loss of Elderberry Shrubs. Elderberry shrubs that would be directly impacted by the Proposed Project will be transplanted to a new suitable location. In addition, two credits would be purchased at a USFWS-approved bank for each shrub (2:1 ratio). Mitigation as required in regulatory permits issued through USFWS may be applied to satisfy this measure.			A qualified will be on site for the duration of transplanting activities The Town will obtain regulatory permits issued through USFWS./Town, USFWS	Prior to ground disturbance and vegetation clearing.
	MM-BIO-11: Elderberry Transplanting. Elderberry shrubs would be transplanted outside the flight season of the valley elderberry longhorn beetle (March to July) and follow the most current version of the American National Standards Institute A300 (Part 6) guidelines for transplanting (http://www.tcia.org/). Exit-hole surveys would be completed immediately before transplanting. The number of exit holes found, GPS location of the plant to be relocated, and the GPS location of where the plant is transplanted would be reported to USFWS. A qualified biologist hired by the Town will be on site for the duration of transplanting activities to ensure compliance with avoidance and minimization measures and other conservation measures. The transplanted shrubs will be monitored by a qualified biologist during one growth season following transplant to confirm shrub survival. If the shrub(s) are deemed alive, no further monitoring or action would be necessary. If the shrub(s) are deemed dead, an additional one credit per shrub would be purchased by the Town from a USFWS-approved bank for valley elderberry longhorn beetle.			A qualified biologist will be on site for the duration of transplanting activities to ensure compliance with avoidance and minimization measures and other conservation measures. The transplanted shrubs will be monitored by a qualified biologist during one growth season following transplant to confirm shrub survival./Town, USFWS	Elderberry shrubs would be transplanted outside the flight season of the valley elderberry longhorn beetle (March to July).
	MM-BIO-12: MM-BIO-12: Avoidance Areas. Activities that may indirectly damage or kill an elderberry shrub (trenching, paving, etc.) will require an avoidance area of at least 20 feet from a shrub's drip line, as appropriate, depending on the type of activity. All activities that could occur within 165 feet of an elderberry shrub will also be conducted outside of the flight season of the valley elderberry longhorn beetle (March to July).			The construction contractor will be responsible for implementation of this mitigation.	All activities that could occur within 165 feet of an elderberry shrub will also be conducted outside of the flight season of the valley elderberry longhorn beetle (March to July).
	MM-BIO-13: Chemical Use. Herbicides will not be used within the drip line of the shrub. Insecticides will not be used within 98 feet (30 meters, as required by USFWS) of an elderberry shrub. If deemed necessary, all chemicals will be applied using a backpack sprayer or similar direct application method.			The construction contractor will be responsible for implementation of this mitigation.	Prior to and during construction.
	MM-BIO-14: Mowing. Mechanical weed removal within the drip line of the shrub would be limited to the season when adult- valley elderberry longhorn beetles are not active (August to February) and will be completed so as to not damage an elderberry shrub.			The construction contractor will be responsible for the implementation of this mitigation.	Implementation of this mitigation will be limited to the season when adult- valley elderberry longhorn beetles are not active (August to February).
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Special-Status Fishes	**MM-BIO-15: Frac-Out-Plan**. Prior to construction, and as part of the specifications for the project included within the contractor agreement, the Town will require that its contractor prepare an Inadvertent Release Plan to address inadvertent loss of inert drilling fluids in the event of a frac-out during HDD for each waterbody crossing. This plan will include Best Management Practices, monitoring, and contingency procedures, and will be developed, approved by a qualified biologist hired by the Town, and implemented by the contractor during construction to avoid or counteract potential impacts on water quality, fish, or other aquatic wildlife resulting from turbidity changes from the fluids.	Significant Impact	Less-than-Significant Impact	The Town will require that its contractor prepare an Inadvertent Release Plan to address inadvertent loss of inert drilling fluids in the event of a frac-out during HDD for each waterbody crossing./Town, RWQCB, CDFW, USFWS	Prior to construction.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Special-status Amphibians and Reptiles	**MM-BIO-1: Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-6: No Net Loss of Aquatic Resources. See description above.			See description above.	See description above.
	MM-BIO-7: Sensitive Community Fencing. See description above.			See description above.	See description above.
	MM-BIO-8: Dry Work Areas. See description above.			See description above.	See description above.
	MM-BIO-16: Western Pond Turtle Visual Encounter Surveys. A preconstruction survey for western pond turtle would be conducted by a qualified biologist within 24 hours prior to the onset of any ground disturbing activities that would occur within 350 feet of the Ordinary High Water Mark (OHWM) of a creek or stream. If juvenile or adult turtles are found within the survey area, they would be moved by a qualified and CDFW-permitted biologist hired by the Town at least 500 feet away from the proposed disturbance area to a location with similar habitat. If a turtle nest is found within the survey area, construction activities would not take place within 100 feet of the nest until the turtles have hatched or the eggs have been moved to an appropriate location. Any egg relocation would be conducted by a qualified and CDFW-permitted biologist in coordination with CDFW.			A preconstruction survey for western pond turtle would be conducted by a qualified biologist./Town, CDFW	Within 24 hours prior to the onset of any ground disturbing activities that would occur within 350 feet of the Ordinary High Water Mark (OHWM) of a creek or stream.
	MM-BIO-17: Foothill Yellow-legged Frog Surveys. Within 3-5 days prior to working within 300 feet radius of the OHWM of a creek or stream within the foothill yellow-legged frog range, per CDFW guidelines, a qualified and CDFW-permitted biologist will survey the Proposed Project site for foothill yellow-legged frogs (adults, subadults, tadpoles or egg masses), including construction access routes and at least 500 feet upstream and downstream (CDFW 2018b). Although unlikely, if the Project activities are expected to result in effects extending beyond 500 feet downstream (e.g., heavy sedimentation that could bury egg masses or tadpole rearing sites), the survey area will be expanded to encompass the expected affected area. If surface water is present during the work period, a qualified biologist hired by the Town will inspect the work area daily for foothill yellow-legged frogs before work begins and during construction.			A qualified and CDFW-permitted biologist will survey the Proposed Project site for foothill yellow-legged frogs. If surface water is present during the work period, a qualified biologist hired by the Town will inspect the work area daily for foothill yellow-legged frogs before work begins and during construction./Town, CDFW	Within 3-5 days prior to working within 300 feet radius of the OHWM of a creek or stream within the foothill yellow-legged frog range. If surface water is present during the work period, a qualified biologist hired by the Town will inspect the work area daily for foothill yellow-legged frogs before work begins and during construction.
	MM-BIO-18: California Red-legged Frog Surveys. Within 3-5 days prior to working within 300 feet of the OHWM of a creek or within 300 feet of fresh emergent wetland habitat, a qualified and CDFW-permitted biologist will conduct a visual encounter survey of the Proposed Project site for California red-legged frogs (adults, subadults, tadpoles or egg masses).			A qualified and CDFW-permitted biologist will conduct a visual encounter survey of the Proposed Project site for California red-legged frogs./Town, CDFW	Within 3-5 days prior to working within 300 feet of the OHWM of a creek or within 300 feet of fresh emergent wetland habitat.
	MM-BIO-19: Conduct Construction Activities during the Active Period for Giant Garter Snakes. During biological monitoring (MM-BIO-4), the biologist will identify any suitable aquatic or upland habitat that may be used by giant garter snake within or adjacent to areas where ground disturbing and vegetation clearing activities would occur. All construction activity within 200 feet of suitable giant garter snake aquatic (generally defined as sloughs, irrigation ditches, creeks or slow-moving streams) or upland habitat (defined as grasslands or disturbed areas within 200 feet of an aquatic feature suitable for a giant garter snake) will be conducted during the snake's active period (May 1 through October 1) in order to minimize the risk that the snakes will be underground and more susceptible to injury or death from ground disturbing activities.			A qualified biologist will be responsible for identifying any suitable aquatic or upland habitat that may be used by giant garter snake./Town, CDFW	During biological monitoring, prior to ground disturbance and vegetation clearing. All construction activity within 200 feet of suitable giant garter snake aquatic will be conducted during the snake's active period (May 1 through October 1)
	MM-BIO-20: Minimize Potential Effects on Giant Garter Snake Habitat. Staging areas will be located more than 200 feet from any suitable giant garter snake aquatic or upland habitat as identified during monitoring by the biologist, or the area will be fenced with exclusion fencing prior to the start of construction. Vegetation clearing within 200 feet of the banks of suitable giant garter snake aquatic habitat will be limited to the minimum area necessary. The movement of heavy equipment within 200 feet of the banks of suitable giant garter snake aquatic habitat will be confined to designated haul routes to minimize habitat disturbance.			Monitoring will be performed by a qualified biologist. The construction contractor will be responsible for implementation of the mitigation.	Prior to construction, during biological monitoring.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: MBTA and FGC-Protected Birds and Raptors	**MM-BIO-1: Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-21: MBTA- and FGC-Protected Bird and Raptor Surveys. To the extent feasible, tree and vegetation clearing will be conducted outside the migratory bird nesting season (March 1 through August 31) in areas where the Town's biologist identifies potential nesting trees. However, if clearing and/or construction activities need to occur during the migratory bird nesting season in these locations, then preconstruction surveys to identify active migratory bird and/or raptor nests would be conducted by a qualified biologist within 14 calendar days prior to construction initiation. Focused surveys must be performed by a qualified biologist for the purposes of determining presence or absence of active nest sites within the proposed impact area, including construction access routes with a 500-foot buffer, where feasible.			The Town's biologist would be responsible for surveys and identifying potential nesting trees./Town, CDFW	To the extent feasible, tree and vegetation clearing will be conducted outside the migratory bird nesting season (March 1 through August 31). However, if clearing and/or construction activities need to occur during the migratory bird nesting season in these locations, then preconstruction surveys to identify active migratory bird and/or raptor nests would be conducted by a qualified biologist within 14 calendar days prior to construction initiation.
	MM-BIO-22: Protocol Swainson's Hawk Surveys. In the year that construction of the Proposed Project is planned to be initiated, a qualified biologist will conduct protocol surveys for Swainson's hawk in and within 0.5-mile of all suitable habitat for the species in the Proposed Project footprint. These surveys will follow the protocol outlined in the Swainson's Hawk Technical Advisory Committee's *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (CDFW 2000). If any active Swainson's hawk nests are found, the biologist will determine an appropriately sized buffer around the nest in which construction activities will not be allowed to commence until which time the nest has been determined by the biologist to have reached the end of its cycle (fledged or failed). The size of the buffer will initially be 0.25-mile per CDFW standard requirements but may be reduced in certain circumstances based on the opinion of the biologist regarding observed sensitivity of the hawks to disturbance, visual screens between the nest and disturbance, and other factors.			A qualified biologist will conduct protocol surveys for Swainson's hawk./Town, CDFW	In the year that construction of the Proposed Project is planned to be initiated.
	MM-BIO-23: Nest Avoidance. If active nests of any MBTA- and FGC-protected bird species are identified within the survey areas, a no-disturbance buffer would be established for all active nest sites prior to commencement of any Proposed Project construction activities to avoid construction or access-related disturbances to migratory bird nesting activities. A no disturbance buffer is a zone in which Proposed Project-related activities (that is, vegetation removal, earth moving, noise generation, and construction) cannot occur. The size of the no disturbance buffers would be determined by a qualified biologist based on the species, activities proposed near the nest, and topographic and other visual barriers.			The construction contractor will be responsible for implementation of the mitigation. The size of the no disturbance buffers would be determined by a qualified biologist./Town, CDFW	Prior to construction activities.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: Special-Status Bats	**MM-BIO-1. Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-24: Bat Surveys. Prior to implementation of Proposed Project-related activities in undisturbed portions of the Proposed Project site and in and around buildings or other human-made structures with recesses where bats could potentially roost, a qualified biologist will conduct a daytime site reconnaissance of the area. The biologist, focusing on buildings and other human-made structures or trees with cavities or exfoliating bark, would look for bats and bat signs including existing roost sites, bat guano deposits, and will listen for roosting bats. If the daytime survey does not identify the presence of potential bat roosts, no further mitigation is required. If potential roost sites are identified, an exit nighttime survey will be conducted to determine species of roosting bats, relative bat activity, and to estimate the number of individual bats. This nighttime survey may be an active or passive acoustic monitoring survey. If occupied bat roost sites are identified, appropriate spatial and temporal buffers, as defined by the Town's biologist based on experience with bat species, would be implemented to minimize impact on roosting bats during construction of the Project.			A qualified biologist will conduct a daytime site reconnaissance of the area./Town, CDFW	Prior to construction activities.
Impact BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS: American Badger	**MM-BIO-1. Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-25: American Badger Detection Surveys. Within 14 days prior to implementation of Proposed Project-related activities in or adjacent to American badger habitat (annual grassland, mixed chaparral, and blue oak-foothill pine), a qualified biologist will determine if American badger dens are present within 500 feet of the proposed impact area, including construction access routes. If badger den(s) are observed, the following buffer distances, according to what type of den(s) the biologist determines it (them) to be, will be established prior to construction activities: • potential den = 30 feet • active (adults present) den = 250 feet • natal (young present) den = 500 feet Activities permitted within and the size of the no disturbance buffers may be adjusted based on an evaluation by the qualified biologist. The buffer would be imposed until a qualified biologist determines the den is inactive.			A qualified biologist will determine if American badger dens are present within 500 feet of the proposed impact area./Town, CDFW	Within 14 days prior to implementation of Proposed Project-related activities in or adjacent to American badger habitat.
Impact BIO-2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFW or USFWS	**MM-BIO-1: Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-5: **Restoration of Temporarily Disturbed Areas and Invasive Weed Control.** See description above.			See description above.	See description above.
	MM-BIO-6: No Net Loss of Aquatic Resources. See description above.			See description above.	See description above.
	MM-BIO-7: Sensitive Community Fencing. See description above.			See description above.	See description above.
	MM-BIO-8: **Dry Work Areas. See description above.**			See description above.	See description above.
Impact BIO-3: Have a substantial adverse effect on state or federally protected wetlands	**MM-BIO-1: Minimize Disturbance Footprint.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-BIO-5: **Restoration of Temporarily Disturbed Areas and Invasive Weed Control.** See description above.			See description above.	See description above.
	MM-BIO-6: No Net Loss of Aquatic Resources. See description above.			See description above.	See description above.
	MM-BIO-7: Sensitive Community Fencing. See description above.			See description above.	See description above.
	MM-BIO-8: **Dry Work Areas. See description above.**			See description above.	See description above.
	MM-BIO-26: State or Federally Protected Wetlands Mitigation. Compensatory mitigation for temporary and permanent impacts on state and/or federally protected wetlands that cannot be avoided through other mitigation measures will be purchased by the Town at a minimum 1:1 ratio, as defined by USACE through the Section 404 permit. Mitigation might include onsite restoration approved by the USACE, in-lieu fee payment, or purchase of mitigation credits at a USACE approved mitigation bank. Mitigation as required in regulatory permits issued through the USACE and/or CDFW may be applied to satisfy this measure.			Compensatory mitigation for temporary and permanent impacts on state and/or federally protected wetlands that cannot be avoided through other mitigation measures will be purchased by the Town, in accordance with USACE 404 permitting./Town, USACE, CDFW	During and post-construction activities.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Cultural Resources					
Impact CUL-2: Cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5	**MM-CUL-1: Targeted Archaeological Monitoring.** As described above, the archaeological survey did not include the proposed Export Pipeline System between Midway Road and Skyway due to lack of landowner consent to access. Additionally, although not fully relocated, previous monitoring work along Skyway recorded a series of sparse lithic scatters demonstrating an elevation sensitivity for near-surface archaeological sites. Therefore, based on the lack of previous survey coverage and the number of previously documented archaeological sites in the vicinity, the Project alignment between Midway Road (on the west) and the intersection of Skyway and Neal Road (on the east) will be subject to monitoring during initial ground disturbance by a qualified professional archaeologist. The archaeologist will monitor initial trenching of previously undisturbed deposits, but the monitoring may vary based on the rate of excavation, the materials excavated, and the absence/presence of artifacts and/or cultural features. In the event of an inadvertent discovery during monitoring, the procedures noted in **MM-CUL-2** will be implemented.	Significant Impact	Less-than-Significant Impact	Monitoring will be performed by a qualified archeologist.	During initial ground disturbance.
	MM-CUL-2: Follow Inadvertent Discovery Procedures. If unrecorded cultural resources are encountered during Project-related ground-disturbing activities, even in the absence of an onsite archaeological monitor, a qualified cultural resources specialist will be contacted to assess the potential significance of the find. If an inadvertent discovery of cultural materials (e.g., unusual amounts of shell, animal bone, bottle glass, ceramics, structure/building remains) is made during Project-related construction activities, ground disturbances in the area of the find will be halted, and a qualified professional archaeologist will be notified regarding the discovery. The archaeologist will determine whether the resource is potentially significant per the CRHR and develop appropriate mitigation, such as avoidance or data recovery.			A qualified cultural resources specialist will be contacted to assess the potential significance of unrecorded cultural resources. A qualified archaeologist will be notified regarding any inadvertent discovery of cultural resources.	During project-related ground-disturbing activities.
Geology, Soils, and Paleontological Resources					
Impact GEO-1(b): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Strong seismic ground shaking	**MM-GEO-1: Minimize Geologic Hazards.** Prior to construction, the Town will obtain the services of a qualified, licensed geotechnical engineer to prepare a design-level geotechnical report with specific recommendations to address geologic hazards, seismic safety, and soil conditions during construction. The Town will review the geotechnical report with the geotechnical engineer to develop viable measures that will avoid or minimize risks associated with ground shaking, liquefaction, landslides, unstable soils, and expansive soils during construction. The Town will require contractors to incorporate these measures into all construction plans and specifications.	Significant Impact	Less-than-Significant Impact	The Town will obtain the services of a qualified, licensed geotechnical engineer to prepare a design-level geotechnical report. The Town will review the geotechnical report with the geotechnical engineer to develop viable measures. The Town will require contractors to incorporate these measures into all construction plans and specifications.	Prior to construction activities.
Impact GEO-1(c): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Seismic-related ground failure, including liquefaction	**MM-GEO-1: Minimize Geologic Hazards.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Impact GEO-1(d): Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: Landslides	**MM-GEO-1: Minimize Geologic Hazards.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Impact GEO-3: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse	**MM-GEO-1: Minimize Geologic Hazards.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Impact GEO-4: Be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risk to life or property	**MM-GEO-1: Minimize Geologic Hazards.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact GEO-6: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature	**MM-GEO-2: Inadvertent Discovery Protocol**. If paleontological resources are discovered during earth-moving activities, the construction crew will immediately cease work within a 50-foot radius of the find and notify the Town's Project Manager. Construction work will be halted until the collection of fossil specimens has been completed. The collection and treatment actions will occur after recovery of specimens and once scientific value can be confirmed and documented. If fossils are found, treatment actions will include sampling for microfossils, conducting paleomagnetic analysis, identifying and preparing fossils, arranging for a repository, and preparing a final report.	Significant Impact	Less-than-Significant Impact	If paleontological resources are discovered during earth-moving activities, the construction crew will immediately cease work and notify the Town's Project Manager.	During earth-moving activities.
Hazards and Hazardous Materials					
Impact HAZ-1: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials	**MM-HAZ-1: Vehicle Equipment Access and Fueling:** During construction, the Town will require and enforce through encroachment permit conditions and construction documents that all vehicle traffic associated with Proposed Project-related activities will be confined to established roads, staging areas, and parking areas. Additionally, maintenance or refueling of vehicles or equipment must occur in designated areas and/or secondary containment away from waterbodies.	Significant Impact	Less-than-Significant Impact	The Town will be responsible for mitigation enforcement through encroachment permit conditions.	During construction activities.
Impact HAZ-4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment	**MM-HAZ-2: Cypress Lane Site Specific Contaminated Soil Management Plan.** Prior to any work set to occur within 500 feet of the Cypress Lane Site, a parcel-specific contaminated soil management plan shall be prepared to address the known contamination at the site for submittal to and approval by DTSC. The plan shall include specific hazards and provisions for how soils and groundwater will be managed at the Cypress Lane Site. The plan shall provide requirements for soil testing and characterization, soil disposal protocols, protocols governing the discovery of unknown contaminants, and soil management. The plan shall also include health and safety provisions including training requirements for site workers who may be handling contaminated material, including the transport and disposal of contaminated material; chemical exposure hazards in soil, groundwater, or soil vapor that are known to be present at the property; and mitigation and monitoring measures that are protective of the site worker and public health and safety. These health and safety provisions shall be prepared to meet OSHA requirements, Title 29 of the CFR 1910.120 and CCR Title 8, Section 5192, and all applicable federal, state, and local regulations and agency ordinances related to the proposed management, transport, and disposal of contaminated media during implementation of work and field activities. The plan shall be signed and sealed by a Certified Industrial Hygienist, who is licensed by the American Board of Industrial Hygiene. The plan shall be enforced by DTSC or another applicable regulator and included as a requirement of construction/in construction documents.	Significant Impact	Less-than-Significant Impact	The construction contractor will be responsible for implementation of a soil management plan, which will be submitted and approved by DTSC. The plan shall be signed and sealed by a Certified Industrial Hygienist who is licensed by the American Board of Industrial Hygiene. The plan shall be enforced by DTSC or another applicable regulator and included as a requirement of construction/in construction documents./Town, DTSC or other regulator	Prior to any work set to occur within 500 feet of the Cypress Lane Site.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact HAZ-6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	**MM-HAZ-3: Road Closure Restrictions.** The Proposed Project will require a Butte County encroachment permit. The standard Butte County encroachment permit requires that "at least one lane of any public road…shall be kept open for travel by the general public at all times." Skyway consists of four lanes of traffic, two in each direction. The Proposed Project will require a Town of Paradise encroachment permit for work within the Town limits. **The Proposed Project will be held accountable to the *Butte County Local Hazard Mitigation Plan Update* and policies included in the *Butte County General Plan* and the Town's draft *Safety Element* (1994) and *Hazardous Waste Management Element* (1994). Further, during construction, to minimize the potential for impeding emergency response vehicles at any time,** the Proposed Project will only close one lane of traffic at any given time, other than short instances where a two-lane closure might be required for relocation of large equipment; this will be a requirement stated in the construction documents issued by the Town. Therefore, three lanes of Skyway will always remain open.	Significant Impact	Less-than-Significant Impact	The Town will be responsible for obtaining a Butte County construction encroachment permit. Butte County will have authority to enforce this mitigation./Town, Butte County	
	MM-HAZ-4: Rapid Demobilization Plan. **The Proposed Project will be held accountable to the *Butte County Local Hazard Mitigation Plan Update* and policies included in the *Butte County General Plan* and the Town's draft *Safety Element* (1994) and *Hazardous Waste Management Element* (1994). Further, in** the construction documents issued by the Town, the contractor will be required to prepare a rapid demobilization plan covering the one Skyway lane it occupies. **D**emobilization **would require** the contractor cover any open trench with metal plates sufficiently strong to carry vehicle traffic, patching cut pavement, removing traffic barrier rails (if used), and moving construction equipment completely clear of the road. During fire season, the contractor will be required to have sufficient metal plating on-site to immediately cover any open trench, and conversely the length of open trenching will be limited to the amount of metal plating on-site. The contractor will also be required to have sufficient cold-mix asphalt on site to temporarily patch any cut road surface. The plan will be reviewed and approved by the Public Works Director and enforced by the Town.			The contractor will be required to prepare a rapid demobilization plan and obtain necessary materials. The plan will be reviewed and approved by the Public Works Director and enforced by the Town.	The rapid demobilization plan will be prepared prior to construction.
	MM-HAZ-5: Evacuation Warning Procedures. The Proposed Project will be held accountable to the *Butte County Local Hazard Mitigation Plan Update* and policies included in the *Butte County General Plan* and the Town's draft *Safety Element* (1994) and *Hazardous Waste Management Element* (1994). Further, to minimize the potential for impeding emergency response vehicles and at the direction of the Town **during an evacuation**, the contractor will be required to demobilize off of Skyway **(MM-HAZ-4)**, leaving all four lanes clear for public traffic and emergency crews, within four hours if no traffic barrier rails are being used and within eight hours if traffic barrier rails are being used. Again, other than short instances where a two-lane closure might be required for relocation of large equipment, during construction, three of the four lanes of Skyway will be continuously open.			At the direction of the Town, the contractor will cease all construction operations and implement the rapid demobilization plan. As part of the rapid demobilization plan approved by the Public Works Director and enforced by the Town, the contractor will be required to demobilize off of Skyway.	In the event of an emergency requiring evacuation.
	MM-HAZ-6: Traffic Management Plan. During final design, the Town will require that the engineering designer prepare a Traffic Management Plan that complies with Section 110.7 Traffic Control Plans of the *Highway Design Manual* (Caltrans 2020), that will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents. The plan will be prepared in accordance with professional engineering standards and will include, but not be limited to, the following requirements: • Schedule truck trips outside of the peak traffic hours, when feasible. • Store all equipment and materials in designated staging areas. • Use of signage to guide vehicles, bicyclists, and pedestrians through and/or around the construction areas. • Install traffic control devices where traffic conditions warrant. • Provide safe detours to reroute vehicle, bicycle, and pedestrian traffic. • Encourage construction crews to park at staging areas to limit lane closures in the public right-of-way. • Consult with Butte Regional Transit prior to construction to coordinate bus stop relocations (as necessary). • Coordinate all construction activities with the emergency service providers in the area. • Stop all construction work during any period of time declared as a Red Flag Warning. A Red Flag Warning is issued by the National Weather Service for weather events that may produce an increased risk of fire danger. • Post notices and/or appropriate signage to notify the public of upcoming construction activities, including exact location, schedule, and duration. This will include alternative access routes if a short-term full-lane			The Town will require that the engineering designer prepare a Traffic Management Plan, that will be included in the construction documents and implemented by the construction contractor. The designer will submit the plan to the Town of Paradise, Butte County, and City of Chico's transportation and engineering departments for review and approval before it is included in the construction documents./Town, County, City	During final design, the Town will require that the engineering designer prepare a Traffic Management Plan.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
	closure will be required to transport equipment. • The Traffic Management Plan will be enforced by the Town of Paradise.				
Impact HAZ-7: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires	**MM-HAZ-1: Vehicle Equipment Access and Fueling** .See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-HAZ-7: **Incorporate Fire Prevention Measures**. Require that construction crews and equipment avoid circumstances that could cause wildfire and that crews and staff have access to fire-prevention equipment onsite. Specific fire prevention measures include: fire extinguishers or other approved fire suppressants are to be available at all times, proper storage of flammable materials, safe cutting and welding practices, proper installation of temporary electrical equipment, and use of dust-collecting apparatus on power equipment.			The construction contractor will be responsible for implementation of this mitigation.	Prior to and during construction activities.
	MM-HAZ-8: Incorporate Public Safety Measures. Requires that the public will receive adequate warning of construction activities and any dangerous condition that might result from the use of fences, barriers, lights, flagging, guards, and signs. This will be incorporated into the Traffic Management Plan.			The Town and construction contractor will be responsible for implementation of this mitigation.	Prior to construction activities.
	MM-HAZ-9: Wildland Fire Area. The Contractor will be advised that the Town of Paradise is in a Wildland Fire Area and during the summer months the fire hazard is EXTREME.			The construction contractor is responsible for implementation of this mitigation.	Prior to construction activities.
Hydrology and Water Quality					
Impact HYD-1: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality	**MM-HAZ-1: Vehicle and Equipment Access and Fueling.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
	MM-HYD-1: Stormwater Management and Treatment Plan. The Town will require in the construction agreement that the contractor prepare and implement a Proposed Project-specific Stormwater Management and Treatment Plan that addresses construction-related activities. The plan will include all of the SWPPP and Small MS4 permits, as well as the Construction BMPs included in **MM-HYD-2**.			Town will require in the construction agreement that the contractor prepare and implement a Proposed Project-specific Stormwater Management and Treatment Plan./Town, RWQCB	Prior to construction activities.
	MM-HYD-2: Construction Best Management Practices: Prior to initiation of ground- disturbing activities within 250 feet of vernal pools or 100 feet of other aquatic resources, construction BMPs will be employed on-site to prevent degradation to on-site and off-site aquatic resources. Methods will include the use of appropriate measures to intercept and capture sediment prior to entering aquatic resources, as well as erosion control measures along the perimeter of all work areas to prevent the displacement of fill material. All BMPs will be in place prior to initiation of any construction activities and will remain until construction activities are completed. All erosion control methods will be maintained until all on-site soils are stabilized.			The construction contractor would be responsible for the implementation of this mitigation.	Prior to initiation of ground disturbing activities.
	MM-BIO-15: Frac-Out-Plan. See description under Biological Resources, above.			See description under Biological Resources, above.	See description under Biological Resources, above.
Impact HYD-3(a): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Result in substantial erosion or siltation on or off-site	**MM-HYD-1: Stormwater Management and Treatment Plan.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Impact HYD-3(b): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site	**MM-HYD-1: Stormwater Management and Treatment Plan.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
	MM-HYD-3: Flood Protection Plan. Prior to construction, the Town will require that the contractor prepare and implement a Flood Protection Plan for the Proposed Project. The Flood Protection Plan must include evacuation routes in the event of a flood, and will include the implementation of temporary flood barriers, such as sandbags, berms or portable fence systems, to be set up around the perimeter of the construction work area in high flood hazard areas, as discussed in Section 3.10.1.5, Tsunami, Seiche and Flood Hazards.			The Town will require that the contractor prepare and implement a Flood Protection Plan for the Proposed Project./Town, RWQCB	Prior to construction activities.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Impact HYD-3(c): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Create or contribute runoff water that would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff	**MM-HYD-1: Stormwater Management and Treatment Plan.** See description above. **MM-HYD-3: Flood Protection Plan.** See description above.	Significant Impact	Less-than-significant Impact	See description above. See description above.	See description above See description above
Impact HYD-4: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to Project inundation	**MM-HYD-3: Flood Protection Plan.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above
Impact HYD-5: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan	**MM-HYD-1: Stormwater Management and Treatment Plan.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Noise					
Impact NSE-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or in applicable standards of other agencies	**MM-NSE-1: Minimize Construction Noise.** Prior to construction, the Town will incorporate the following measures into all construction plans and agreements to reduce noise levels during construction: • Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment. • Locate stationary noise-generating equipment as far as possible from noise-sensitive receptors. • Use quiet air compressors and other stationary noise-generating equipment where appropriate technology exists and is feasible. • Maintain and tune all equipment in accordance with the manufacturer's recommendations to minimize noise emission. • Install temporary construction-site sound barriers near noise sources. • Prohibit unnecessary idling of internal combustion engines. • Limit use of public address systems. • Post the days and hours of construction as well as the name and phone number of a designated representative to be contacted for noise-related concerns at the perimeter of the construction site. • Comply with county, city and/or town noise policies applicable to the location's jurisdiction.	Significant Impact	Less-than-Significant Impact	The Town and construction contractor will be responsible for implementation of this mitigation.	Prior to construction.
Impact NSE-2: Generate excessive groundborne vibration or groundborne noise levels	**MM-NSE-1: Minimize Construction Noise.** See description above.	Significant Impact	Less-than-Significant Impact	See description above.	See description above.
Public Services					
Impact PS-1(a): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Fire Protection	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
Impact PS-1(b): Result in substantial	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant	Less-than-	See description under Hazards and Hazardous	See description under Hazards

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Police Protection		Impact	Significant Impact	Materials, above.	and Hazardous Materials, above.
Impact PS-1(c): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Schools	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
Impact PS-1(d): Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: Other Public Facilities	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
Transportation					
Impact TRA-1: Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
Impact TRA-4: Result in inadequate emergency access	**MM-HAZ-6: Traffic Management Plan.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.

CEQA Mitigation Designation	Mitigation and/or Monitoring Reporting Description	Impact Level Prior to Mitigation	Impact Level with Mitigation	Responsibilities/Enforcement	Timeframe
Tribal Cultural Resources					
Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: • **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k), or** • **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe**	**MM-TCR-1:** Coordination with Konkow Valley Band of Maidu and Mechoopda Indian Tribe. During final design, the Town will continue to consult and coordinate with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe to identify sensitive areas to be protected during construction work and appropriate methods to protect those areas.	Significant Impact	Less-than-Significant Impact	The Town will be responsible for coordination efforts with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe.	During final design.
	MM-TRC-2: Tribal Cultural Monitoring. Prior to construction, the Town will coordinate with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe to identify a Tribal Cultural Monitor, as deemed necessary by either/both Tribes, to be present during ground disturbance work within areas designated as sensitive for tribal cultural resources.			The Town will coordinate with the Konkow Valley Band of Maidu and Mechoopda Indian Tribe to identify a Tribal Cultural Monitor.	Prior to and during construction activities.
Utilities and Service Systems					
Impact UTIL-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects	**MM-UTIL-1: Minimize Utility and Service System Disruptions.** During final design, to minimize disruptions to utility services, the Town will prepare a Utility Conflict and Coordination Plan that identifies outages that could affect residents and businesses, including fiber-optic/communications, water, power, and gas. As part of that plan, the public and stakeholders will be notified by signage and on Town's website of any potential service interruptions at least 2 weeks prior to construction work.			The Town will prepare a Utility conflict and Coordination Plan and will be responsible for its implementation.	During final design.
Wildfire					
Impact FIRE-1: Substantially impair an adopted emergency response plan or emergency evacuation plan	**MM-HAZ-3: Road Closure Restrictions.** See description under Hazards and Hazardous Materials, above.	Significant Impact	Less-than-Significant Impact	See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.
	MM-HAZ-4: Rapid Demobilization Plan. See description under Hazards and Hazardous Materials, above.			See description under Hazards and Hazardous Materials, above.	See description under Hazards and Hazardous Materials, above.

EIR PUBLIC SCOPING SUMMARY REPORT

Public Comment Period: May 3 - June 3, 2021

TOWN OF PARADISE
SEWER PROJECT

Introduction

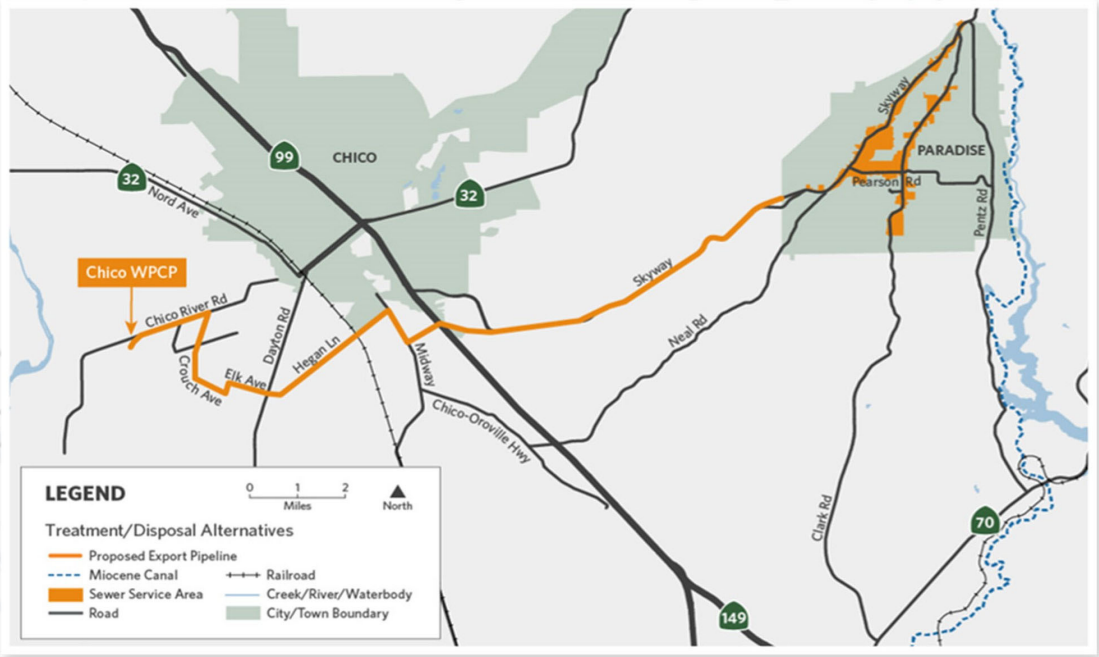
The Town of Paradise, California, (Town) is proposing a new wastewater management system for the residents of Paradise. Currently, all wastewater within the Town is treated by individual, on-site septic systems. The Paradise Sewer Project would bring long-term and reliable wastewater management to Paradise that would be both economically and socially beneficial. Specifically, local businesses would have better opportunities to expand and thrive, which would provide more economic stability for Paradise as well as more job opportunities for residents. Residents and visitors would also have the potential for an overall better quality of life because there would be fewer potential health risks from the existing septic systems. With the new wastewater system, residential parcels could be developed more densely, including multi-family housing, which would allow for more low-income housing opportunities.

Overview

Project Purpose

The proposed project involves two major components: a wastewater collection system that would provide service connections to individual parcels within the designated sewer service area, and an 18-mile-long export pipeline to carry wastewater to the Chico Water Pollution Control Plant (WPCP), as shown in Figure 1. The project would provide long-term wastewater management to the residents of Paradise.

Figure 1. Study Area Map



Project Benefits

The Paradise Sewer Project would bring many benefits to Paradise and the region, including:

- providing wastewater disposal surety to help businesses and jobs return to Paradise and spur economic recovery;
- improving Paradise groundwater quality by decreasing septic tank discharges;
- allowing for more densely populated residential development in Paradise to increase affordable/multi-family housing;
- creating a wastewater solution supported by the Central Valley Regional Water Quality Control Board and partner agencies to help create opportunities for additional funding.

Notice of Preparation

On May 3, 2021, the Town, acting as the California Environmental Quality Act (CEQA) Lead Agency, launched the environmental process for the proposed Paradise Sewer Project with a Notice of Preparation (NOP) of an Environmental Impact Report (EIR) and virtual public scoping meetings. The first step in the EIR process was to solicit public input regarding the scope and content of environmental information to be included in the EIR. The NOP was posted at the State Clearinghouse (SCH# 2021050008) and circulated to public agencies and other interested parties in compliance with CEQA Guidelines, Section 15082(a). The NOP notified the public that the EIR is being prepared and provided information on how the public could provide comments on the scope of the EIR. Issuance of the NOP started the 30-day public comment period, which was open from May 3 to June 3, 2021.

The NOP provided information about the public comment period, project location, project background, project description, and the probable environmental effects of the proposed project. The NOP was posted on the project website at www.paradisesewer.com. The NOP package can be found in **Attachment A** of this document and includes the NOP, the distribution list, and the Notice of Completion and Environmental Document Transmittal.

Public Notification and Outreach

Several methods were used to build awareness about the Paradise Sewer Project, the NOP, and the subsequent public comment period and scoping meetings. Using the established project website (www.paradisesewer.com) and the Town's social media accounts (Facebook and YouTube), the project team posted key information online to direct viewers to the project website and to promote the initial project activities and environmental milestones. Additionally, the project team submitted notices in local Paradise and Chico media publications, and conducted public and Town Council engagement meetings.

Public Notice Advertisements

Public notices for the public comment period were published in the *Paradise Post* on May 1, 2021, and in the *Enterprise-Record* on May 3, 2021. Copies of the public notice advertisements are included in **Attachment B.**

Media Relations

One press release was sent on May 3, 2021, to n the surrounding project area. A copy of the media release is included in **Attachment C.**

TOWN OF PARADISE
SEWER PROJECT

Website

The project website (www.paradisesewer.com), which was revamped on April 9th, 2021 continued to act as the main information hub for the public to learn about the project and get updated information at milestones throughout the environmental phase. The website includes the following pages and sections:

Page	Sections
Project Overview	- Project Components - Project Area Map (static map) - Project Costs - Find My Property (interactive map) - Project Benefits - Project Schedule
Public Engagement	- News - Events - Key Activities
Environmental	- Environmental Review - CEQA Process - Environmental Key Activities
Advisory Committee	- Overview - Advisory Committee Members - Advisory Committee Meetings
Project Materials	- Frequently Asked Questions - Project Documents - Technical Documents - Related Links
Contact	- Mailing information and Phone Number Comment Submittal Form

The website is updated regularly to provide timely information on outreach and engagement activities. All comments received via the website were documented and recorded for the scoping process. Screenshots of the project website can be found in **Attachment D.**

E-Blasts

Four e-blasts were distributed during the 30-day public comment period. The e-blasts provided reminders of the virtual public meetings and public comment period and included the project website address. Copies of the e-blasts are included in **Attachment E.**

Social Media

Throughout the public comment period, social media was used to educate and inform the public about the Paradise Sewer Project. The project team used both the Town's Facebook and YouTube pages. The Town's Facebook page provided the public with information about community meetings, reminders of the virtual public scoping meetings, and directions on how to submit comments. The YouTube page provided the public with council meeting recordings. Copies of social media posts are provided in **Attachment F.**

Public and Stakeholder Engagement

Virtual Public Meetings

For public convenience and to allow participation in a safe environment, two virtual public meetings were held via Webex during the public comment period. The meetings provided a brief overview of the proposed project and the EIR process and encouraged the public to provide comments about the scope of the EIR effort. The first virtual public meeting took place on May 13, 2021, and had 40 attendees—11 project team members and 29 public attendees. The second virtual public meeting took place on May 25, 2021, and had 26 attendees—12 project team members and 14 public attendees. Those who needed additional accessibility preferences were directed to post a message on the project website (www.paradisesewer.com/contact). Any persons who are deaf, hard of hearing or speech impaired (TDD) were also encouraged to contact the California Relay Service TTY and/or Voice Line at 1-800-735-2929, or 711. The PowerPoint presentations from the virtual public meetings are provided in **Attachment G.**

Sewer Regionalization Project Advisory Committee

In addition to the virtual public meetings, the project team participated in monthly Sewer Regionalization Project Advisory Committee meetings starting in April 2021. The purpose of the committee meetings is to develop an agreement between the Town of Paradise and the City of Chico regarding potential future discharge of the Town's wastewater to the Chico WPCP, and to monitor the progress of the Paradise Sewer Project EIR. Information about the committee, including meeting minutes, can be found on the project website (www.paradisesewer.com/advisory-committee).

Comment Submittal

To encourage public comments, a number of submittal methods were provided. Comments could be submitted by direct mail, email, on the project website (www.paradisesewer.com/contact), during the two virtual public meetings, and by phone. Overall, 75 comments were submitted by 27 individual commenters during the project scoping period. A few commenters made multiple comment submittals during the public comment period. A comment matrix including all comments received during the public comment period can be found in **Attachment H.**

The following summarizes the number of comments received by each submittal method:

- 6 letters (from the Native American Heritage Commission, Butte Local Agency Formation Commission, Paradise Irrigation District, California Department of Fish and Wildlife, Central Valley Flood Protection Board, and Butte County Department of Development Services)
- 1 email
- 9 virtual public meeting comment submittals
- 14 website comment submittals

Virtual Public Meeting Comments

As mentioned previously, two virtual public meetings were held via Webex during the public comment period. Attendees of the public meetings were encouraged to ask questions and provide input on the project and process. Nine comments were provided during the public meetings. Commonly asked questions were about any potential project costs to property owners and if the project would be able to handle future growth in Paradise. Additionally, several commenters requested more project information about current funding sources for the project, the export

pipeline route, and recommendations for property owners considering constructing septic tank systems before construction of the new sewer system.

Comment Documentation and Review

The final step during the public comment period is the collection, categorization, and review of all comments received. Comments submitted during the 30-day public comment period were documented and organized by category to allow for easy review by the project team and the respective technical disciplines. Afterwards, the process will be to consider the comments as the project team continues its environmental analysis.

Comment Themes

There were 27 individual commenters who submitted a total of 75 comments. Of the 75 comments submitted during the public comment period, the following themes were identified (some of the comments were outside the scope of the Paradise Sewer Project). The sub-bullets below each theme were specific items addressed by the public:

- Administrative (jurisdiction, rights, and oversight)
  - Provide post-construction recommendations to property owners after project completion
  - Consider addition of properties to the proposed sewer service area
  - Provide a subcontractor bidding schedule
- Aesthetics
  - Coordinate project construction with road rebuilding efforts
  - Provide a physical description of the export pipeline
- Agency Coordination
  - Coordinate efforts with the Native American Heritage Commission (NAHC)
  - Coordinate efforts with the California Department of Fish and Wildlife (CDFW)
  - Coordinate efforts with the Central Valley Flood Protection Board (CVFPB) if Title 23 standards are not followed
  - Coordinate efforts with Paradise Irrigation District (PID)
- Biological Resources
  - Assess biological resources
  - Analyze direct, indirect, and cumulative impacts to biological resources
  - Include appropriate and adequate mitigation measures for project impacts to biological resources
- Concepts/Alternatives
  - Consider smaller and de-centralized alternatives
  - Consider a separate Town of Paradise wastewater system
  - Confirm the export pipeline route
  - Confirm the project boundary
  - Provide better plans/designs/maps depicting the project
- Funding/Costs
  - Inform project funding sources
  - Inform potential costs to residents and rate payers in the City of Chico
  - Inform potential costs to Paradise residents and property owners not within the sewer service area
- Health/Safety
  - Consider risks to public safety when developing the project

- Land Use
  - Clarify export pipeline alignment outside of right-of-way
  - Assess potential crossing of prime agricultural land
- Outreach/Communications
  - Consult with respective stakeholders
- Tribal/Cultural Resources
  - Consult with Native American tribes
  - Assess cultural resources
- Urban Growth
  - Address the increase of population in the Town of Paradise, City of Chico, and surrounding region
- Outreach/Communications
  - Consult with respective stakeholders
- Water Quality
  - Assess potential water quality impacts of all respective water bodies
- Wildfire
  - Consider the potential fire hazard associated with pipe materials
  - Consider the potential for increased exposure to fire risks

Next Steps

The Town will review and, as appropriate, incorporate input received during the public comment period into the Draft EIR. The Draft EIR will contain the results of the alternatives analysis, an assessment of environmental impacts, and identification of mitigation measures. The next key project milestone will be the release of the Draft EIR for public review in early 2022.

Attachment A
Notice of Preparation

April 30, 2021

Notice of Preparation of an Environmental Impact Report and Public Scoping Meeting Notice

RE: Paradise Sewer Project

To Interested Agencies and Persons:

The Town of Paradise (Town) as the Lead Agency for the Paradise Sewer Project (Proposed Project) has issued this Notice of Preparation (NOP) pursuant to the California Environmental Quality Act (CEQA) to notify responsible and trustee agencies and other interested parties that an Environmental Impact Report (EIR) will be prepared to evaluate potential environmental impacts of the Proposed Project. The Town is soliciting public input regarding the scope and content of environmental information to be included in the EIR.

The NOP provides information about the public review and comment period, project location, project description, and the probable environmental effects of the Proposed Project, and is posted on the Town's website at www.paradisesewer.com.

Agency and Public Review and Comment

The Town is interested in receiving input from agencies, stakeholders, and the public regarding the Proposed Project. Your agency may need to use the EIR prepared by our agency when considering your permit or other approval for the Proposed Project, if any is required. Please respond with written comments regarding the proposed scope and the intended content of the EIR as it relates to your agency's area of statutory responsibility or your areas of concern or expertise. We are requesting that all comments be provided in writing to enable us to address the comments as intended in the EIR. Written comments are also requested from organizations and other interested parties regarding the scope and evaluation of potential environmental issues associated with the Proposed Project.

Written responses are due within 30 days of the receipt of this NOP, as provided by state law. As such, a 30-day public review and scoping period is established from May 3 to June 3, 2021. Comments may be submitted by mail or email, or by attending the public scoping meeting (see details below) and submitting a written comment. All comments should indicate a contact person for the agency or organization.

Two virtual public scoping meetings regarding the Proposed Project and EIR will be held. You, members of your agency or organization, and the public are invited to attend to provide written comments on the scope and content of environmental information to be included in the EIR. These meetings will include a brief overview of the Proposed Project and EIR process, and will allow time for questions about the project and process.

The Town will hold these public scoping meetings on May 13 with an approximately 30-minute presentation starting at 6:00 p.m. and on May 25 with an approximately 30-minute presentation starting at 12:00 p.m. In light of the COVID-19 pandemic, the meetings will be held virtually for remote public participation. The meeting links and call-in number for the presentation are provided below.

Thursday, May 13, at 6:00 p.m.	**Tuesday, May 25, at 12:00 p.m.**
WebEx Link: bit.ly/Paradise_Sewer_Mtg1 **WebEx Password:** Paradise **Dial In #:** 408-418-9388 **Code:** 123 202 6837	**WebEx Link:** bit.ly/Paradise_Sewer_Mtg2 **WebEx Password:** Paradise **Dial In #:** 408-418-9388 **Code:** 123 877 2748

For additional accessibility preferences, please post a message on the project website at paradisesewer.com/contact (from subject dropdown menu, select “Submit a comment on Environmental Impact Report”). Persons who are deaf, hard of hearing, or speech impaired (TDD) may contact the California Relay Service TTY and/or Voice Line at 1-800-735-2929, or 711.

We value your input and look forward to hearing from you. For your convenience, we have a number of ways for you to provide comments at any time during the 30-day comment period ending at 5:00 p.m. on June 3, 2021. Comments can be submitted the following ways:

- Direct Mail:
  Colette Curtis, Public Information Officer
  Town of Paradise
  5555 Skyway
  Paradise, CA 95969
- Website and Virtual Meeting comment submittal: paradisesewer.com/contact (from subject dropdown menu, select “Submit a comment on Environmental Impact Report”).
- Telephone: 530-872-6291, ext. 112

If you are an authorized representative of a Responsible Agency or a Trustee Agency, the Town needs to know the views of your agency regarding the scope and content of the environmental information that is relevant to your agency’s statutory responsibilities in connection with the Proposed Project. Your agency will need to use the EIR when considering whether to permit or otherwise approve the Proposed Project. Comments received from State of California agencies should address (1) whether the agency will be a Responsible Agency or a Trustee Agency for the Proposed Project, and (2) if the agency is a Responsible Agency, the significant environmental issues and reasonable alternatives and mitigation measures that the Responsible Agency will need to have explored in the analysis. We will also need the name, address, telephone number, and email address of the contact person for your agency.

Project Location

Paradise is in eastern Butte County, in the western foothills of the Sierra Nevada Mountains. The topography of Paradise is characterized by intervening ridges and valleys sloping to the southwest, with elevations ranging from 1,080 to 2,320 feet. Paradise is bordered on the east by the west branch of the Feather River and on the west by Little Butte Creek. Paradise is approximately 12 miles east of the City of Chico, California; 20 miles northwest of the City of Oroville, California; and 90 miles north of the City of Sacramento California. The primary entrances to Paradise are Skyway and Highway 191 (Clark Road). Paradise is connected to Chico via Skyway and to Oroville via Highway 191, which is known as Clark Road upon entering Paradise.

Chico, also in Butte County, sits on the Sacramento Valley floor close to the foothills of the Sierra Nevada range to the east. Chico's terrain is generally flat, with increasingly hilly terrain beginning at the eastern city limits. The city is traversed by two creeks, Big Chico Creek and Little Chico Creek, and the Lindo channel, all of which feed into the Sacramento River. Highways 32 and 99 comprise Chico's regional transportation network. Highway 32 connects Chico residents to Glenn and Plumas Counties to the west and east, respectively. Highway 99 connects residents to Tehama and Sutter Counties to the north and south, respectively (see Figure 1, map inset).

Project Background

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California.

The Town has supported numerous studies to address its need for a centralized wastewater treatment solution, and in its most recent study,[1] the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022.

Existing Facilities

Wastewater treatment facilities in Paradise consist of individual, privately owned septic tanks and soil absorption disposal systems known as leach fields, together with several engineered subsurface disposal systems serving commercial and institutional facilities. Businesses and residences near the future sewer system continue to rely on septic tanks and leach field systems for wastewater treatment and disposal.

The Chico Water Pollution Control Plant (WPCP) is approximately 5 miles southwest of Chico on 120 acres of land owned by the City of Chico. The City of Chico owns and operates the Chico WPCP, which provides wastewater treatment and disposal for the greater Chico area. The Chico WPCP service area comprises the incorporated area of Chico and small parcels of unincorporated Butte County.

The Chico WPCP treatment system consists of screening for removal of large solids, grit removal, primary clarification, activated sludge treatment with secondary clarification, and chlorination/dechlorination. Sludge is treated by anaerobic digestion followed by mechanical dewatering. Biosolids are hauled directly from the centrifuge building for land application in unincorporated Sacramento County, California. The treated wastewater from the Chico WPCP is discharged to the Sacramento River through a submerged outfall diffuser and is regulated in accordance with the National Pollutant Discharge Elimination System (NPDES) Permit No. CA0079081 (Order No. R5-2016-0023). This order permits an average dry weather flow effluent flow of 12 million gallons per day (gpd).

Project Description

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

Sewer Service Area

The sewer service area (SSA) would serve approximately 1,500 parcels (out of the 11,000 total parcels in Paradise) along the Skyway, Clark Road, and Pearson Road corridors (see Figure 2). The SSA also would serve most businesses in Paradise and would enable future construction of affordable multi-family housing, which is limited because of multiple septic system constraints such as high groundwater, poor soils, and limited parcel sizes.

At the time of initial operation, an estimated 360 occupied parcels within the SSA would be generating an average wastewater flow of 109,000 gpd. It is estimated that it could take 30 years for the entire SSA to be occupied, at which time the average wastewater flow would be 448,000 gpd. The Town is considering this level of development and wastewater flow in planning its wastewater treatment solutions.

PARADISE SEWER PROJECT
FIGURE 2
APRIL 2021

Collection System

The collection system would serve all parcels within the SSA, and would consist of a system of gravity sewers, small pump stations, and force mains. This collection system would enable properties within the SSA to have existing septic tanks and leach line systems abandoned altogether and would remove future onsite wastewater treatment and dispersal requirements. Because of the varied topography within the SSA, a number of pump stations and pressurized force mains would be required to pump flows out of valleys and swales, and back up to an adjacent gravity sewer. The collection system would consist of approximately 157,000 feet of 2- to 4-inch-diameter force mains, 29,000 feet of 8-inch-diameter gravity trunk lines, and 28 pump stations, all within public right-of-way. The gravity sewers would come together at the southwest edge of town, on Skyway, where they would transition to the export pipeline to the Chico WPCP.

Export Pipeline

The proposed export pipeline would start along Skyway at the south end of the Paradise collection system and would continue southwest along Skyway. Near Chico, at the bend where Skyway turns north, the pipeline would continue west, heading cross-country with crossings of Butte Creek and Highway 99 until reaching Midway, and would proceed into Chico and end at the Chico WPCP. The connection to the Chico WPCP is not associated with other ongoing facility upgrades. Figure 1 shows the proposed export pipeline route and connection to the Chico WPCP.

Operation and Maintenance

Operation and maintenance activities would occur with the facilities that comprise the Proposed Project. This would include various inspections, servicing, and replacement of pertinent Proposed Project facility elements at designated intervals.

Probable Environmental Effects of the Proposed Project

After completing a preliminary review of the Proposed Project, as described in Section 15060(d) of the CEQA Guidelines, the Town has determined that an EIR should be prepared to assess the potentially significant environmental impacts of the Proposed Project.

The EIR will address environmental impacts of the Proposed Project's construction and operation activities and will propose mitigation measures to address significant impacts that are identified. The following describes the anticipated environmental issues that may be addressed in the EIR:

- **Aesthetics**. Potential impacts on aesthetics during construction and operation of the Proposed Project will be considered. Although temporary impacts may occur during construction, no permanent change in the visual landscape or viewshed is expected.
- **Agriculture and Forestry Resources**. Given the rural conditions, impacts on agriculture and forestry resources will be considered. However, it is anticipated that the Proposed Project would not result in impacts on prime agriculture and forestry resources that cannot be avoided.

- **Air Quality and Greenhouse Gas Emissions.** Criteria air pollutants generated during construction and operation of the Proposed Project would be estimated using the California Emissions Estimator Model (CalEEMod). Potential impacts on air quality will be assessed by comparing the Proposed Project's criteria air pollutant emissions with the thresholds of significance for criteria air pollutants in the Butte County Air Quality Management District's (BCAQMD) *CEQA Air Quality Handbook*.

  Construction would be the main source of greenhouse gas (GHG) emissions. GHG emissions during construction of the Proposed Project would be estimated using CalEEMod. Impacts associated with GHG emissions would be determined by comparing project GHG emissions during construction to BCAQMD's recommended thresholds for GHG emissions contained in the *CEQA Air Quality Handbook*.

- **Biological Resources**. The Town is completing field surveys to catalogue protected species and habitat conditions including wetlands and vernal pools. The EIR will consider impacts of proposed trenching and trenchless construction methods on biological resources.

- **Cultural Resources**. Potential impacts on cultural resources that could occur during ground-disturbing construction activities will be evaluated. An initial historic records search was completed, and intensive pedestrian surveys are being completed as part of this planning process. The findings from these studies will be used to analyze the potential physical impacts on historic, pre-historic, archaeological, and cultural resources that could result from proposed construction activities.

- **Energy**. A temporary increase in the consumption of energy would be required during construction, and a long-term increase in the use of energy would be required for operation of the Proposed Project. The impact analysis will assess if the Proposed Project would result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources during construction or operation, or would conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

- **Geology and Soils**. Construction of the Proposed Project could result in site-specific impacts on or from local geology and soils conditions. Potential impacts related to geologic, seismic, and soils constraints will be assessed. Potential impacts on paleontological resources and mineral resources will also be considered.

- **Hazards and Hazardous Materials.** Potential impacts related to hazards and hazardous materials will be evaluated, including the potential hazardous materials associated with transport, use, and disposal of hazardous materials during construction and potential hazardous emissions or hazardous materials used during construction and operation of the Proposed Project.

- **Hydrology and Water Quality.** Potential impacts on hydrology and water quality will be described based on qualitative assessment of Project construction activities. No permanent changes to hydrology are expected to result from the Proposed Project.

- **Land Use and Planning.** Although the Proposed Project is not expected to change existing land use, the EIR will evaluate zoning within the sewer service area in relation to current and future development.
- **Noise.** Potential construction-period noise and vibration impacts on sensitive receptors (residences) near the Proposed Project will be assessed. Operational noise will also be analyzed in the EIR.
- **Population and Housing**. While the Proposed Project is not a response to the recovery effort from population and housing loss associated with the 2018 Camp Fire, the Proposed Project could lead to new opportunities for population and housing in the sewer service area. It is not anticipated that siting of the Proposed Project would lead to housing displacement. The balance of current and planned housing in the sewer service area would be considered against the Chico WPCP capacity.
- **Public Services**. Impacts on fire protection services, law enforcement services, schools, and other public services will be evaluated based on available information.
- **Recreation**. Potential impacts on existing recreational resources will be evaluated. It is not anticipated that the Proposed Project would affect existing recreational facilities or activities.
- **Transportation**. Because much of the proposed collection and export pipeline would be constructed in or adjacent to existing roadways, impacts on transportation are expected. Construction-related vehicle trips will be estimated, and temporary construction-related traffic will be evaluated to identify any hazardous conditions on roadways or inadequacies in emergency access that may result during construction of the Proposed Project.
- **Tribal Cultural Resources**. The Town is coordinating with interested tribes in accordance with Assembly Bill 52. Impacts on tribal cultural resources will be evaluated based on discussions with tribes regarding the relationship of the Proposed Project to the ongoing practice of traditional life ways.
- **Utilities and Service Systems**. The Proposed Project would introduce a new utility and service system, which will be analyzed. Construction and operation of the Proposed Project would raise demands on water supply and power utilities.
- **Wildfire**. The Proposed Project is in a state responsibility area, traversing moderate and high fire hazard severity zones. Therefore, this evaluation will focus on the potential for construction activities to impair an emergency response or evacuation plan, exacerbate wildfire risks, and expose people to risks due to post-fire effects, consistent with standards in the CEQA Guidelines Appendix G. The focus will be on elements of construction that could exacerbate fire hazard risks; however, once construction is completed, the underground pipeline would not create conditions that would affect wildland fire risks.
- **Other Sections**. The EIR will include additional topics as required by the CEQA Guidelines, including significant irreversible environmental changes, growth inducement, cumulative

impacts, and alternatives. The EIR will describe and evaluate a reasonable range of alternatives to the Proposed Project that would feasibly attain most or all of the Proposed Project's basic objectives while avoiding or substantially lessening any significant effects of the Proposed Project. These alternatives may include alternative pipeline routes. For each alternative, the EIR will assess the degree to which it might reduce one or more identified significant project impacts, whether it could result in other new or increased impacts, its feasibility, and the degree to which it is consistent with the Proposed Project objectives. The "No Project" alternative will also be evaluated as required by CEQA.

Further Information

For environmental review information or questions about the Proposed Project, please contact us at through our project website at paradisesewer.com/contact (from subject dropdown menu, select "Submit a comment on Environmental Impact Report") or by calling us at 530-872-6291, ext. 112

Sincerely,

4/23/2021

Marc Mattox

Town of Paradise Director of Public Works

Public Notice Advertisement

PUBLIC NOTICE

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING NOTICE

The Town of Paradise (Town) as the Lead Agency for the Paradise Sewer Project (Proposed Project) has issued this Notice of Preparation (NOP) pursuant to the California Environmental Quality Act (CEQA) to notify responsible and trustee agencies and other interested parties that an Environmental Impact Report (EIR) will be prepared to evaluate potential environmental impacts of the Proposed Project. The Town is soliciting public input regarding the scope and content of environmental information to be included in the EIR. The NOP provides information about the public review and comment period, project location, project description, and the probable environmental effects of the Proposed Project, and is posted on the Town's website at **paradisesewer.com**.

PUBLIC REVIEW & COMMENT PERIOD: May 3 to June 3, 2021

PROJECT OVERVIEW

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. The Town has supported numerous studies to address its need for a centralized wastewater treatment solution, and in its most recent study, the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

POTENTIAL ENVIRONMENTAL IMPACTS

The EIR process will assess the potential environmental impacts of the proposed Project on the physical, human, and natural environment. A wide variety of resource areas will be studied during the environmental review to identify potential impacts, including aesthetics, agriculture and forestry resources, air quality and greenhouse gas emissions, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, transportation, tribal cultural resources, utilities and service systems, wildfire, and additional topics as required by the CEQA Guidelines including significant irreversible environmental changes, growth inducement, cumulative impacts, and alternatives. Measures to avoid, minimize, and mitigate any potential adverse impacts will be identified and evaluated in the EIR.

VIRTUAL PUBLIC SCOPING MEETINGS

A 30-day public scoping process is being initiated with this notice. Responsible and Trustee Agencies, involved federal agencies, interest groups, and members of the public are invited to participate and provide valuable input into the scope of the EIR. For your convenience, and to allow participation in a safe environment while social distancing, two virtual public scoping meetings will be held during the project's 30-day scoping period. Please join us at one of the following meetings to learn about the project, interact with project team members, ask questions, and submit formal comments.

THURSDAY, MAY 13, 2021 | 6 P.M.

TOWN OF PARADISE
SEWER PROJECT

Town of Paradise Launches Environmental Review for Paradise Sewer Project

Public input solicited on environmental scope and content of EIR

Paradise, CA – On Monday, May 3, the Town of Paradise (Town), and the California Environmental Quality Act (CEQA) Lead Agency, officially launched the environmental review process for the Paradise Sewer Project with a **Notice of Preparation (NOP) of an Environmental Impact Report (EIR) and Virtual Public Scoping Meetings.** The Town is soliciting public input regarding the scope and content of environmental information to be included in the EIR.

PROJECT OVERVIEW
Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. Numerous studies have supported the need for a centralized wastewater treatment solution, and in its most recent study, the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022. A map of the proposed sewer service area can be found on the project website here.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico Water Pollution Control Plant (WPCP), and connection to the WPCP — and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and existing Chico WPCP rate payers as a result of the Proposed Project. This long-term wastewater solution will allow for sustainable housing and business activity in Town, supporting the community's economic recovery and vitality.

LEARN MORE AT UPCOMING VIRTUAL PUBLIC SCOPING MEETINGS
As an initial step within the CEQA process, project scoping allows the Town to seek public and stakeholder input on the environmental scope of the project. To provide convenient participation in a safe environment while social distancing, the Town is hosting two virtual public scoping meetings during the project's 30-day public comment period to allow attendees to learn about the project, interact with project team members, ask questions and submit formal comments.

ENVIRONMENTAL REVIEW
The Paradise Sewer Project is currently in the environmental review phase, wherein the Town of Paradise is preparing an Environmental Impact Report (EIR) pursuant to the California Environmental Quality Act (CEQA) to analyze the potential environmental impacts of constructing and operating a sewer connection from the Town to the City of Chico Water Pollution Control Plant (WPCP). The EIR will include an evaluation of resource topics as prescribed by CEQA Guidelines.
The Town welcomes public input throughout the environmental process in addition to formal public comment periods. Make sure to visit the Public Engagement page to stay updated and the Contact page to submit a comment or ask a question.
NOTICE OF PREPARATION – LAUNCHED MAY 3, 2021
A Notice of Preparation (NOP) of an Environmental Impact Report (EIR) launched in early May 2021. Promotion of the NOP included advertisements in local papers (Enterprise Record and Paradise Post), e-blast, press release and social media posts. Suggestions and comments on the scope and content of the EIR were invited from all interested parties for a period of 30 days from May 3 to June 3, 2021. Feedback received during the project's public comment period are currently being reviewed by the project team as a feasible concept is identified. Click here to view the Public Scoping Summary Report.
CEQA PROCESS
The Town, which is serving as the state lead agency pursuant to CEQA, is preparing an EIR to evaluate the potential environmental impacts of construction and operation of the Paradise Sewer Project. The CEQA process steps are described below.

OVERVIEW
The Councils of the Town of Paradise and City of Chico have formed a Sewer Regionalization Project Advisory Committee (Advisory Committee) for the Paradise Sewer Project. The role of the Advisory Committee is to develop principles of agreement for the City to provide the Town with wastewater treatment services. The Advisory Committee will also monitor overall progress of the project including the EIR process and associated public comment periods as well as provide updates and recommendations back to the two Councils.
CALIFORNIA WATER BOARDS Central Valley - R5
Activities and meetings for the Advisory Committee are being facilitated by the Central Valley Regional Water Quality Control Board.
ADVISORY COMMITTEE MEETINGS
As of May 4, 2022, the Advisory Committee has completed its work on the Principles of Agreement and is on hiatus while the Inter-Municipal Agreement (IMA) between the Town and City is drafted. Please check the Town of Paradise Council and City of Chico Council agendas for other activities related to the IMA.

Subject: Paradise Sewer Project Environmental Scoping & Virtual Public Meetings

TOWN OF PARADISE
SEWER PROJECT

ENVIRONMENTAL SCOPING INFORMATION & VIRTUAL PUBLIC MEETINGS

The Town of Paradise (Town), the California Environmental Quality Act (CEQA) Lead Agency, officially launched the environmental review process for the Paradise Sewer Project with this Notice of Preparation (NOP) of an Environmental Impact Report (EIR) and Virtual Public Scoping Meetings. The Town is soliciting public input regarding the scope and content of environmental information to be included in the EIR.

LEARN MORE AT UPCOMING VIRTUAL PUBLIC MEETINGS

For your convenience, and to allow participation in a safe environment while social distancing, two virtual public meetings will be held during the project's 30-day scoping period to allow attendees to learn about the project, interact with project team members, ask questions and submit formal comments.

Paradise Sewer Project - Environmental Review Update

We have kicked o ff the environment al review of the Paradise Sewer Project and want your input. This vital proposed Project will provide a long-term solution for wastewater collection, transport and treatment from properties identified in the proposed sewer service area, which is encompassed mostly by Clark Road, Skyway and Pearson Road. This long-term wastewater solution will allow for sustainable housing and business activity in Town, supporting the community's economic recovery and vitality.

Visit paradisesewer.com to learn more about the environmental review process and this initial public comment period that will end at 5 p.m. PDT on June 3.

TOWN OF PARADISE
SEWER PROJECT

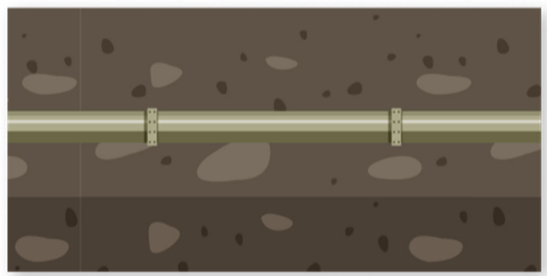
Project Overview

TOWN OF PARADISE
SEWER PROJECT

Project Components

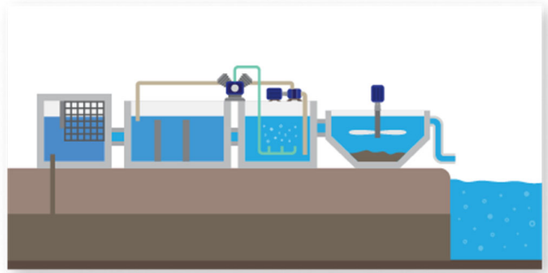
COLLECTION

A series of gravity sewers, small pump stations, and pressure lines will collect wastewater from the Sewer Service Area and convey it to the southwest edge of Paradise.



TRANSPORT

A single pipeline will convey Paradise wastewater down Skyway and across south Chico to the Chico Water Pollution Control Plant (WPCP).



TREATMENT

At the Chico WPCP, Paradise wastewater will blend with Chico wastewater. The combined flow will receive high-level treatment before discharging to the Sacramento River.

Project Costs

Proposed project currently estimated to cost approximately **$184 million**

$2M

EIR

(*fully funded*)

$30M

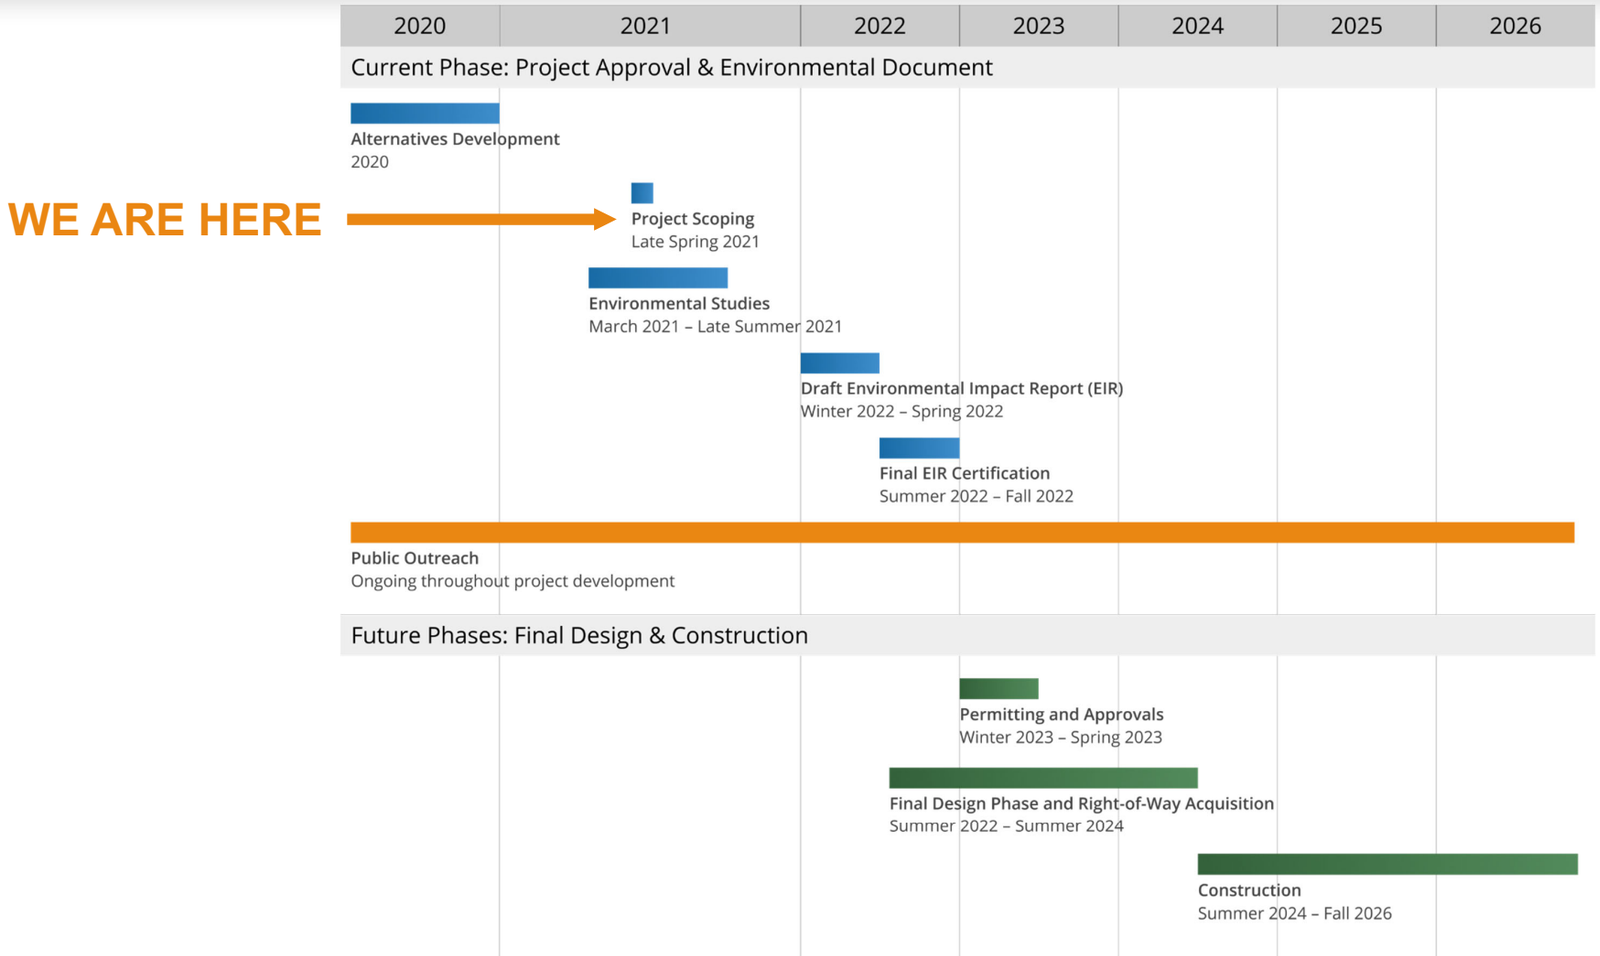
Design and Right-of-way

$152M

Construction

TOWN OF PARADISE
SEWER PROJECT

Project Schedule



TOWN OF PARADISE
SEWER PROJECT

Project Benefits

Paradise Sewer Project will bring many benefits to the region:

Provide wastewater disposal surety to help businesses and jobs return to Paradise and spur economic recovery

Improve Paradise groundwater quality by decreasing septic tank discharges

Allow for more densely-populated residential development in the Town to increase affordable/multi-family housing

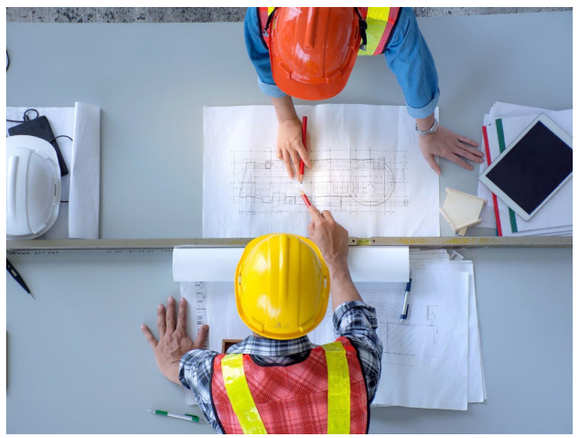
Create a wastewater solution supported by the Central Valley Regional Water Quality Control Board and partner agencies to help create opportunities for additional funding

TOWN OF PARADISE
SEWER PROJECT

CEQA Overview

TOWN OF PARADISE
SEWER PROJECT

California Environmental Quality Act (CEQA)



PROJECT

A discretionary action by a public agency that has the potential to result in a physical change in the environment, either directly or indirectly

TOWN OF PARADISE
SEWER PROJECT

CEQA *(continued)*

Purpose of CEQA

Inform agency decision-makers and the public of significant project environmental effects

Identify feasible ways to avoid or reduce significant impacts, including mitigation measures and alternatives

Provide an opportunity for the public and agencies to comment on the environmental analyses

TOWN OF PARADISE
SEWER PROJECT

CEQA *(continued)*

SIGNIFICANT EFFECT ON THE ENVIRONMENT

A substantial, or potentially substantial, adverse change in physical conditions within the project area

TOWN OF PARADISE
SEWER PROJECT

CEQA *(continued)*

TECHNICAL RESOURCES BEING CONSIDERED:

- Land Use
- Agriculture
- Recreation
- Aesthetics & Visual Resources
- Air Quality
- Greenhouse Gas Emissions
- Noise
- Energy
- Geology and Soils
- Hydrology & Water Quality
- Biological Resources
- Cultural Resources
- Tribal Cultural Resources
- Hazards & Hazardous Materials
- Public Services & Utilities
- Population & Housing
- Transportation
- Wildfire

Other CEQA Topics:

- Growth Inducement
- Cumulative Impacts
- Alternatives
- Impacts Not Significant
- Summary of Impacts

TOWN OF PARADISE
SEWER PROJECT

Key Decision Makers

CEQA LEAD AGENCY

TOWN OF PARADISE CALIFORNIA
Incorporated November 27, 1979

RESPONSIBLE AGENCIES

CITY OF CHICO
INC. 1872

BUTTE LAFCO

Other Responsible or Trustee Agencies may be identified through planning process. The Town has initiated tribal notifications in accordance with Assembly Bill 52.

TOWN OF PARADISE
SEWER PROJECT

CEQA Process

1 Notice of Preparation (NOP) of EIR
LAUNCHED | MAY 3, 2021

2 Scoping & Minimum 30-Day Public Comment Period — Public Scoping Meeting
PUBLIC REVIEW & COMMENT PERIOD | MAY 3 – JUNE 3, 2021

3 Draft EIR Development
MAY / JUNE 2021

4 Draft EIR Minimum 45-Day Circulation for Public/Agency Review & Comment — Public Meeting
PUBLIC ENGAGEMENT OPPORTUNITY | WINTER 2022

5 Final EIR, Mitigation Monitoring & Reporting Program
SUMMER 2022

6 Decision/Notice of Determination — Public Hearing
PUBLIC ENGAGEMENT OPPORTUNITY | SUMMER 2022

TOWN OF PARADISE
SEWER PROJECT

Proactive Public Engagement

Public engagement program designed to:

- Provide convenient and timely information
- Educate and inform about the project
- Seek public participation throughout environmental planning process

How to Provide Comments

Provide comments during today's meeting

paradisesewer.com
(from subject dropdown menu, select "Submit a comment on Environmental Impact Report")

(530) 872-6291, ext. 112

Colette Curtis
Public Information Officer
Town of Paradise
5555 Skyway
Paradise, CA 95969

We invite your comments on:

- Environmental issues that should be studied
- Nature and extent of potential environmental impacts
- Methods of analysis
- Measures that could reduce environmental impacts
- Alternatives that could avoid or reduce impacts

Suggestions & comments accepted until 5 p.m. PDT on June 3, 2021

TOWN OF PARADISE

Q&A Session: How to Participate

RAISE YOUR HAND

- Select raise hand
  - **Internet Browser:** , then
  - **Webex Software:** , then
  - **Mobile App:** , then
- Wait to be called upon and unmuted
- Lower hand after speaking

DIALED-IN BY PHONE

- Press *3 to “Raise/Lower Hand”

TIME LIMIT: 2 minutes per person

SUBMIT QUESTIONS

- Select appropriate icon
  - **Internet Browser:**
  - **Webex Software:** “ Q&A”
  - **Mobile App:** , then
- Type question/comment into Q&A box
- Moderator will read question/comment aloud for panelists’ response
- Chat box will be disabled during meeting

If unable to answer questions or run out of time, we’ll follow-up with all Q&A in writing

4/8/21 11:06 a.m.	Myron Coleman Coleman Pipelines 6300 Stiffer Rd Magalia, CA 95954 530-413-3490 excavatorhand@gmail.com	Website	Good morning my name is Myron Coleman owner of Coleman Pipelines. I was wondering when will the bids be coming for subcontractors. Any information would be greatly appreciated. Thank you.	
4/20/21 8:26 a.m.	Matt Rogers 1115 E Ewald Ct, Suite A Paradise, CA 95969 matt@rfrcustomfab.com	Website	Good morning. Are there any estimates of how much it will cost individual properties to hook up to the proposed sewer line?	
4/28/21 10:21 a.m.	Jacquelyn 6777 Moore Rd Paradise, CA 95969 jackiemw1224@yahoo.com	Website	My home is being rebuilt at 6777 Moore rd. It looks like I am aligned to get the sewer but have concerns. I am downslope from skyway and worry about hydrologic pressure and needing it to flow uphill. My homes septic is downslope from my house too I worry about what the monthly charge as I am a senior on a fixed income	
5/3/21 12:02 p.m.	Sasha Poe 1043 Central park Dr Paradise, CA 95969 sasha@kmsgrinding.com	Website	I have asked numerous times for our Community Commercial to be included in Sewer Plans. No one has responded. My lot 1043 Central Park should be included in sewer district addresses as it is community commercial!! Please call me 530-327-4949	
5/3/21	Nancy Gonzalez-Lopez Cultural Resources Analyst Native American Heritage Commission 1550 Harbor Boulevard, Suite 100 West Sacramento, CA 95691 (916) 373-3710 Nancy.Gonzalez-Lopez@nahc.ca.gov	Letter	May 3, 2021 Colette Curtis Town of Paradise 5555 Skyway Paradise, CA 95969 **Re: 2021050008, Paradise Sewer Project, Butte County** Dear Ms. Curtis: The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			need to determine whether there are historical resources within the area of potential effect (APE). CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply. The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**. <u>AB 52</u> AB 52 has added to CEQA the additional requirements listed below, along with many other requirements: **1.** <u>Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project:</u> Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes: **a.** A brief description of the project. **b.** The lead agency contact information.	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)). **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073). **2.** Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)). **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)). **3.** Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation: **a.** Alternatives to the project**.** **b.** Recommended mitigation measures. **c.** Significant effects**.** (Pub. Resources Code §21080.3.2 (a)). **4.** Discretionary Topics of Consultation: The following topics are discretionary topics of consultation: **a.** Type of environmental review necessary. **b.** Significance of the tribal cultural resources. **c.** Significance of the project's impacts on tribal cultural resources. **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)). **5.** Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following: **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource. **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)). **7.** Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs: **a.** The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or **b.** A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)). **8.** Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)). **9.** Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)). **10.** Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources: **a.** Avoidance and preservation of the resources in place, including, but not limited to: **i.** Planning and construction to avoid the resources and protect the cultural and natural context. **ii.** Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following: **i.** Protecting the cultural character and integrity of the resource. **ii.** Protecting the traditional use of the resource. **iii.** Protecting the confidentiality of the resource. **c.** Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places. **d.** Protecting the resource. (Pub. Resource Code §21084.3 (b)). **e.** Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)). **f.** Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991). **11.** Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs: **a.** The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2. **b.** The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process. **c.** The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)). The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf SB 18 SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf. Some of SB 18's provisions include: **1.** Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)). **2.** No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation. **3.** Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)). **4.** Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which: **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18). Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/. NAHC Recommendations for Cultural Resources Assessments To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine: **a.** If part or all of the APE has been previously surveyed for cultural resources. **b.** If any known cultural resources have already been recorded on or adjacent to the APE. **c.** If the probability is low, moderate, or high that cultural resources are located in the APE. **d.** If a survey is required to determine whether previously unrecorded cultural resources are present. **2.** If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey. **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure. **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center. **3.** Contact the NAHC for: **a.** A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE. **b.** A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures. **4.** Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence. **a.** Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities. **b.** Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

			c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery. If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov. Sincerely, Nancy Gonzalez-Lopez Cultural Resources Analyst cc: State Clearinghouse 2021050008_NAHC Comment.pdf	
5/11/21	Sandra Peltola Box 501 Fort Bragg, CA 95437 Roof1@aol.com	Website	What will be the cost be to each property owner? How will it be charged to the property owners? A tax bond? Do Owners get to vote on whether they want sewers in Paradise? What if they want to opt out, if it goes through? After all the community has been through, I think it should be shelved until at least 10 years has passed since the horrific and life changing fire. Bring it up after people have either been paid by PGE lawsuit, rebuilt, or sold their properties. It would be heartless to expect owners to pay for this measure, and possibly never see the project finished, or be able to use it as they have not re-built. I vote NO on Paradise Sewer Project!

5/13/21 4:04 p.m.	Richard Harriman General Counsel Northern California Environmental Defense Center 1078 Via Verona Drive Chico, CA 95973-1031 richardharrimanattorney@gmail.com	Website	1. The most important issues regarding this proposed project are the Project Description and the Alternatives Analysis. 2. The stated purpose of the project is to redevelop the Town of Paradise and restore housing opportunities for the TOP, which will also cause accelerated growth and potentially significant indirect and secondary unplanned adverse environmental effects in the unincorporated areas of the County. However, project consultants have stated in open public meetings that this project will notbe completed for between 5-10 years. 3. This fact raises significant questions regarding the true purpose and intent of the proposed project, which are to accelerate and increase urban growth and development in the City of Chico. This will require a comprehensive update of the City of Chico's General Plan and the certification of a new EIR for the General Plan update. This will require substantially more time to complete the proposed project and will significantly increase the cost of the project, which is currently estimated at approximately $180 million dollars. 4. The project, as proposed, cannot, and will not, achieve the purpose of expediting the redevelopment of the TOP, and will greatly increase unplanned growth in the City of Chico and in the County's jurisdiction surrounding the City of Chico. The project as described is inconsistent with the purpose, goal, and objective of the project. 5. Therefore, the Project Description needs to be re-defined and re-stated to be stable, finite, and ACCURATE. 6. Further, other alternatives for smaller de-centralized specially designed and engineered treatment facilities must be re-analyzed and re-considered and included in the Project Alternatives analysis. 7. Finally, given the fact that the City of Chico's Capital Improvement Program has not publicly disclosed what the cost of the project will be to the residents and rate payers of the City of Chico and how the new infrastructure necessary to provide an increased supply of potable and re-cycled water and transportation infrastructure and Operation & Maintenance expenses will be paid by the residents and rate payers of the City of Chico. Please include these comments in the record of proceedings for the Scoping Meeting for the proposed project. Thank you for the opportunity to comment. Very truly yours.	
5/13/21 6:59 p.m.	Darrell Hilton 117 Summerbreeze Ln Grangeville, Idaho 83530 1biglazyd@gmail.com	Website	My property is on Oak Way off of Billie. According to the service map the service area runs along Skyway and along Clark. But nothing in between skyway & Clark. It would be very helpful to property owners, like myself to be able to see how far off of skyway & off of Clark the service area runs. Listing street names in the general service area between Clark and skyway would be helpful	5/14/21 (3:39 p.m.): M. Norris responded via email: Good morning Darrell,

5/14/21 3:11 p.m.	Kathy Roessler 5802 Acorn Ridge Dr Paradise, CA 95969 kkroessler@gmail.com	Website	We think that the sewer project should consider future growth and put in a bigger pipe line going down to Chico than what the current needs call for.	
5/20/21 1:52 p.m.	Stephen Lucas Executive Officer Butte Local Agency Formation Commission 1453 Downer Street, Suite C Oroville, CA 95965 530-53806819 slucas@buttecounty.net	Email	Hello Ms. Curtis, Please find attached comments from the Butte LAFCo concerning the Town of Paradise Sewer Service Project EIR Notice of Preparation. Cheers, Steve Submitted Via Website: ccurtis@townofparadise.org Collette Curtis, Public Information Officer Town of Paradise 5555 Skyway Paradise, CA 95969 Re: Town of Paradise Sewer Project – Notice of Preparation of Environmental Impact Report Dear Ms. Curtis: The Butte Local Agency Formation Commission (LAFCo) appreciates the opportunity to provide input for the Town of Paradise Sewer Project – Notice of Preparation of Environmental Impact Report that will support the proposed sewer line extension from the City of Chico Water Pollution Control Plant (WPCP) to the Town of Paradise. This will also require the approval of an extension of services application by LAFCo as the service extension is proposed to be outside of the City's jurisdictional and Sphere of Influence boundaries. The primary concern of LAFCo as a responsible agency with permitting authority is to ensure that the Commission is regularly consulted by affected agencies to avoid the matter *being presented to the Commission for action after important decisions and milestones have been locked in*. It is our understanding that coordination with LAFCo is identified as a Phase 2 implementation issue under the Preparation of an Environmental Impact Report (EIR) covering the selected alternative. **LAFCO's Role** Government Code Section 56133(a)(b)(c) mandates that A city or district may provide new or extended services by contract or agreement outside its jurisdictional boundary **only if it**	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			first requests and receives written approval from the commission. The commission may authorize a city or district to provide new or extended services outside its jurisdictional boundary outside its jurisdictional boundary and outside its sphere of influence to respond to an existing or impending threat to the health or safety of the public or the residents of the affected territory, if the entity applying for approval has provided the commission with documentation of a threat to the health and safety of the public or the affected residents. The proposal for the City to extend its sewage collection and/or wastewater treatment facilities to the Town falls under the purview of Section 56133 and therefore, LAFCo. Should the sewer service extension be approved by LAFCo for the proposed sewer service area boundary identified by the Town, any future adjustments to that boundary or additional sewer connections will require the consent the City as the contracted provider and LAFCo as the approving authority for the service extension request. Provisions for extension of service requests are found in Government Code §56133 and in Section 4.5 of the Commission Policies and Procedures. Service extensions outside of an agency's Sphere of Influence may only be approved by LAFCo if there is "an existing or impending threat to the health or safety of the public or the residents of the affected territory. (§56133(c)) *Support Documents* The City/Town will need to provide documentation/justification of the existing or impending public health and safety threat the extension of services would address. This is a critical prerequisite to the project as it is the only legally permissible justification available to the LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence. Additionally, the City will have to demonstrate how such an arrangement will not impact its current residents or its responsibility to serve the existing parcels within its jurisdictional boundaries/service area who are not currently sewered and utilize on-site septic systems. This would include the remaining approximately 3,000 parcels that are not currently connected to the City's sewer infrastructure but fall under are under the Chico Urban Area Nitrate Compliance Plan which calls for the termination of on-site septic systems as a contributor to ground water nitrate contamination. It is fundamentally critical that the City ensure that it retains adequate WCPP capacity for future service demands from it residents. Along with a determination of capacity, LAFCo will also have to review the fiscal viability of the proposed extension, particularly the projected cost to Paradise residents of such service and the assurances that City residents do not in any way subsidize the proposed service.	

Town of Paradise Sewer Project

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			EIR-NOP Observations/Comments: 1. **Project Description** - The proposed project for the purposes of the EIR, should be adequately described to include not only the sewer infrastructure analysis, but the necessary Extension of Services Application that is expected to be initiated by the City of Chico and considered for approval by LAFCo. It is vitally important to recognize that limiting the "project description" to only the sewer infrastructure project will make associated regulatory agency approvals such as LAFCo's more complicated. This raises the important question of just what type of governance is anticipated now by the Town and what type of governance oversight may be useful in the future such a special district or subsidiary district? For the EIR to be of the greatest value, it should consider all alternatives that may be desired now or in the future. 2. **Proposed Sewer Service Area** – The proposal describes the intended Sewer Service Area, which is limited primarily to the commercial and industrial land uses along Skyway, Pearson and Clark Roads. How would future sewer connection requests within the Town Sewer Service Area (not along the pipe to Chico) be addressed? There are small lot residential neighborhoods immediately adjacent to the proposed Town Sewer Service area, It seems reasonable based on early public comments to anticipate that landowners contiguous to the Town's Sewer Service Area/collection system with a developed use and failing septic system would desire to connect rather than repair an existing system. This is a different scenario from new development. Butte County Environmental Health Division regulations require a landowner with a failed septic system to connect to a public sewer if the access is within 250 feet of the affected parcel. How will additional requests for access to sewer services be addressed? 3. **Post Treatment (Recycled) Water** – The Town will be sending significant quantities of effluent to the City's WPCP, which will be treated, and under current conditions, discharged to the Sacramento River. Given the extreme focus on drought planning, the reuse of treated effluent is an ever more important source of scarce water supplies. At some point, the City of Chico may determine that moving to tertiary treatment and reusing this valuable resource is a priority. The question is: Who will retain the rights to treated water discharged from the ChicoWPCP? Will the Town receive credit/compensation for its share of the treated effluent? 4. **WPCP Concerns** – How will the City and Town address future WPCP issues such as plant expansions, conversion to tertiary treatment and violations at the WPCP be addressed. 5. **Administration** - Who will provide overall administration of the proposed sewer extension to the Town? How will customer relations such as billing, maintenance, and new connections be accomplished? 6. **Governance Alternatives** – Should the sewer service extension be found unworkable, or if LAFCo cannot determine a legally supportable exemption from the requirements found in GC56133, what other alternatives would be considered (such as the creation of a separate subsidiary district to provide sewer service to	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			both cities)? Such a reorganization would make 56133 no longer applicable, as the new district will have its own sphere. 7. **Growth Inducement** - Depending on the design capacity of the pipeline, its location, and its potential users, it is likely that additional development within the Town could become possible. Current on-site wastewater treatment systems greatly limit development potential. Once sewer becomes available, those growth limitations no longer apply. This analysis may be difficult to accurately assess given the age of the Town General Plan adopted in 1994. Ideally, the 1994 General Plan would be updated based on current conditions prior to estimating future sewerage flows. Additionally, other landowners outside the City boundaries in proximity to such a sewer line may request or expect that the development of those lands be permitted to utilize the new sewer line. The potential environmental impacts of such development needs to be analyzed in the EIR unless a firm prohibition on such connections is included in the project, if not, LAFCo may consider conditions of approval that would restrict access to the sewer line to parcels only within the Town's defined sewer service area. 8. **Chico Urban Area Nitrate Compliance Plan** – The Nitrate Compliance Plan was adopted in 2000 as a result of the Central Valley Regional Water Quality Control Board Prohibition Orders No. 90-126 and 905-024 which addressed the nitrate contamination in the groundwater linked to on-site septic systems in the Chico Urban Area. The orders called for existing septic systems be discontinued and connections to the City sewer system be required. Much effort and resources were spent on this program and the City has installed significant new sewage collection infrastructure over the past decade to allow all affected parcels to connect. How will the City ensure that the WPCP maintains/reserves the capacity to accommodate these remaining approximately 3,000 uses on septic systems? 9. **Increased Exposure to Severe Fire Hazard.** Development of the project is intended to encourage the growth and redevelopment of the Town of Paradise. While this has many desirable benefits, the EIR cannot ignore the serious adverse fire risk impact of the project. As the fire demonstrated, Paradise is clearly located in a severe fire zone with limited access for evacuation. Encouraging redevelopment and growth in that area will inevitably result in increased exposure of the new structures and residents to the severe fire risk. This impact is likely to be significant over the long run. It must be analyzed and mitigation measures explored to mitigate the risk. For example, is an additional evacuation route feasible? LAFCo is eager to be cooperative partner in the effort to bring sewer service to the Town as the project is likely to greatly assist the Town to address a serious long-term problem and augment the Town's ability to rebuild a sustainable and viable commercial district. However, we are all bound to comply with the law, even where it may hinder achievement of a desirable objective. We look forward to working with the City and Town and its partners in development of this proposal in order to determine if a legally permissible

			path forward can be found for LAFCo to approve the extension of services. Please do not hesitate to contact me should you have any questions Sincerely, Steve Lucas Executive Officer cc: LAFCO Paradise Sewer NOP Comments 5-20	
5/21/21 5:30 p.m.	Pam Galloway 6083 Maxwood Dr Paradise, CA 95969 jpgalloway3@att.net	Website	This project is a waste of time, effort and money for the town and citizens of Paradise. I think the project should be put to stopped as there are better uses of the towns money. Just a concerned citizens comment.	
5/24/21 4 p.m.	Janet Peterson 1080 Buschman Rd Paradise, CA 95969 janetkpeterson@aol.com	Website	I own the property at 1080 Buschman Rd adjacent to the proposed boundary at Clark Rd. I had twenty-four 1 bedroom units which were destroyed in 2018. I tried to rebuild but the costs, slope, ADA requirements made it impossible. The flat land on my parcel is where the septic field is. Being able to have sewer would allow me to build affordable. Can I request to be considered for hookup? Much thanks, Janet Peterson	
5/24/21	Melissa Murphy Senior Environmental Scientist State of California Department of Fish and Wildlife 1701 Nimbus Road, Suite A Rancho Cordova, CA 95670 (916) 597-6417 melissa.murphy@wildlife.ca.gov	Letter	May 24, 2021 Colette Curtis Town of Paradise 5555 Skyway Paradise, CA 95969 ccurtis@townofparadise.com Subject: Paradise Sewer Project – Notice of Preparation of an Environmental Impact Report SCH# 2021050008 Dear Ms. Curtis: The California Department of Fish and Wildlife (CDFW) received and reviewed the Notice of Preparation of an Environmental Impact Report (EIR) from the Town of Paradise for the Paradise Sewer Project (Project) in Butte County pursuant the California Environmental Quality Act (CEQA) statute and guidelines. Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish, wildlife, plants and their habitats. Likewise, we appreciate the opportunity to provide comments regarding those	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			aspects of the Project that CDFW, by law, may need to exercise its own regulatory authority under the Fish and Game Code (Fish & G. Code). **CDFW ROLE** CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802.). Similarly, for purposes of CEQA, CDFW provides, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources. CDFW may also act as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code. **PROJECT DESCRIPTION SUMMARY** The Project site is located within the Town of Paradise, the City of Chico, and the sections of unincorporated Butte County that connect Paradise and Chico. The Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico Water Pollution Control Plant (WPCP), and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Project description should include the whole action as defined in the CEQA Guidelines § 15378 and should include appropriate detailed exhibits disclosing the Project area including temporary impacted areas such as equipment stage area, spoils areas, adjacent infrastructure development, staging areas and access and haul roads if applicable. As required by § 15126.6 of the CEQA Guidelines, the EIR should include an appropriate range of reasonable and feasible alternatives that would attain most of the basic Project objectives and avoid or minimize significant impacts to resources under CDFW's jurisdiction.

			COMMENTS AND RECOMMENDATIONS CDFW offers the comments and recommendations presented below to assist the Town of Paradise in adequately identifying and/or mitigating the Project's significant, or potentially significant, impacts on biological resources. The comments and recommendations are also offered to enable CDFW to adequately review and comment on the proposed Project with respect to impacts on biological resources. CDFW recommends that the forthcoming EIR address the following: **Assessment of Biological Resources** Section 15125(c) of the CEQA Guidelines states that knowledge of the regional setting of a project is critical to the assessment of environmental impacts and that special emphasis should be placed on environmental resources that are rare or unique to the region. To enable CDFW staff to adequately review and comment on the Project, the EIR should include a complete assessment of the flora and fauna within and adjacent to the Project footprint, with emphasis on identifying rare, threatened, endangered, and other sensitive species and their associated habitats. CDFW recommends the EIR specifically include: 1. An assessment of all habitat types located within the Project footprint, and a map that identifies the location of each habitat type. CDFW recommends that floristic, alliance- and/or association-based mapping and assessment be completed following, *The Manual of California Vegetation*, second edition (Sawyer 2009). Adjoining habitat areas should also be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions. 2. A general biological inventory of the fish, amphibian, reptile, bird, and mammal species that are present or have the potential to be present within each habitat type onsite and within adjacent areas that could be affected by the Project. CDFW recommends that the California Natural Diversity Database (CNDDB), as well as previous studies performed in the area, be consulted to assess the potential presence of sensitive species and habitats. A nine United States Geologic Survey (USGS) 7.5-minute quadrangle search is recommended to determine what may occur in the region, larger if the Project area extends past one quad (see *Data Use Guidelines* on the Department webpage www.wildlife.ca.gov/Data/CNDDB/Maps-and-Data). Please review the webpage for information on how to access the database to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code, in the vicinity of the Project. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. Please note that CDFW's CNDDB is not exhaustive in terms of the data it houses, nor is it an absence database. CDFW recommends that it be used as a starting point in	

Town of Paradise Sewer Project

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			gathering information about the potential presence of species within the general area of the Project site. Other sources for identification of species and habitats near or adjacent to the Project area should include, but may not be limited to, State and federal resource agency lists, California Wildlife Habitat Relationship (CWHR) System, California Native Plant Society (CNPS) Inventory, agency contacts, environmental documents for other projects in the vicinity, academics, and professional or scientific organizations. 3. A complete and recent inventory of rare, threatened, endangered, and other sensitive species located within the Project footprint and within offsite areas with the potential to be affected, including California Species of Special Concern and California Fully Protected Species (Fish & G. Code § 3511). Species to be addressed should include all those which meet the CEQA definition (CEQA Guidelines § 15380). The inventory should address seasonal variations in use of the Project area and should not be limited to resident species. The EIR should include the results of focused species-specific surveys, completed by a qualified biologist and conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable. Species-specific surveys should be conducted in order to ascertain the presence of species with the potential to be directly, indirectly, on or within a reasonable distance of the Project activities. CDFW recommends the lead agency rely on survey and monitoring protocols and guidelines available at: www.wildlife.ca.gov/Conservation/Survey-Protocols. Alternative survey protocols may be warranted; justification should be provided to substantiate why an alternative protocol is necessary. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the U.S. Fish and Wildlife Service, where necessary. Some aspects of the Project may warrant periodic updated surveys for certain sensitive taxa, particularly if the Project is proposed to occur over a protracted time frame, or in phases, or if surveys are completed during periods of drought or deluge. 4. A thorough, recent (within the last two years), floristic-based assessment of special-status plants and natural communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (see www.wildlife.ca.gov/Conservation/Plants). 5. Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region (CEQA Guidelines § 15125[c]). **Analysis of Direct, Indirect, and Cumulative Impacts to Biological Resources** The EIR should provide a thorough discussion of the Project's potential direct, indirect, and cumulative impacts on biological resources. To ensure that Project impacts on biological resources are fully analyzed, the following information should be included in the EIR: 1. The EIR should define the threshold of significance for each impact and describe the criteria used to determine whether the impacts are significant (CEQA Guidelines, §	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			15064, subd. (f)). The EIR must demonstrate that the significant environmental impacts of the Project were adequately investigated and discussed, and it must permit the significant effects of the Project to be considered in the full environmental context. 2. A discussion of potential impacts from lighting, noise, human activity, and wildlife-human interactions created by Project activities especially those adjacent to natural areas, exotic and/or invasive species occurrences, and drainages. The EIR should address Project-related changes to drainage patterns and water quality within, upstream, and downstream of the Project site, including: volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site. 3. A discussion of potential indirect Project impacts on biological resources, including resources in areas adjacent to the Project footprint, such as nearby public lands (e.g. National Forests, State Parks, etc.), open space, adjacent natural habitats, riparian ecosystems, wildlife corridors, and any designated and/or proposed reserve or mitigation lands (e.g., preserved lands associated with a Conservation or Recovery Plan, or other conserved lands). 4. A cumulative effects analysis developed as described under CEQA Guidelines section 15130. The EIR should discuss the Project's cumulative impacts to natural resources and determine if that contribution would result in a significant impact. The EIR should include a list of present, past, and probable future projects producing related impacts to biological resources or shall include a summary of the projections contained in an adopted local, regional, or statewide plan, that consider conditions contributing to a cumulative effect. The cumulative analysis shall include impact analysis of vegetation and habitat reductions within the area and their potential cumulative effects. Please include all potential direct and indirect Project-related impacts to riparian areas, wetlands, wildlife corridors or wildlife movement areas, aquatic habitats, sensitive species and/or special-status species, open space, and adjacent natural habitats in the cumulative effects analysis. **Mitigation Measures for Project Impacts to Biological Resources** The EIR should include appropriate and adequate avoidance, minimization, and/or mitigation measures for all direct, indirect, and cumulative impacts that are expected to occur as a result of the construction and long-term operation and maintenance of the Project. CDFW also recommends the environmental documentation provide scientifically supported discussion regarding adequate avoidance, minimization, and/or mitigation measures to address the Project's significant impacts upon fish and wildlife and their habitat. For individual projects, mitigation must be roughly proportional to the level of impacts, including cumulative impacts, in accordance with the provisions of CEQA (Guidelines § § 15126.4(a)(4)(B), 15064, 15065, and 16355). In order for mitigation measures to be effective, they must be specific, enforceable, and feasible actions that will improve environmental conditions. When proposing measures to avoid, minimize, or	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			mitigate impacts, CDFW recommends consideration of the following: 1. *Fully Protected Species*: Several Fully Protected Species (Fish & G. Code § 3511) have the potential to occur within or adjacent to the Project area, including, but not limited to: white-tailed kite (*Elanus leucurus*), American peregrine falcon (*Falco peregrinus anatum*), bald eagle (*Haliaeetus leucocephalus*), and California blackrail (*Laterallus jamaicensis coturniculus*). Fully protected species may not be taken or possessed at any time. Project activities described in the EIR should be designed to completely avoid any fully protected species that have the potential to be present within or adjacent to the Project area. CDFW also recommends the EIR fully analyze potential adverse impacts to fully protected species due to habitat modification, loss of foraging habitat, and/or interruption of migratory and breeding behaviors. CDFW recommends that the Town of Paradise include in the analysis how appropriate avoidance, minimization and mitigation measures will reduce indirect impacts to fully protected species. 2. *Sensitive Plant Communities*: CDFW considers sensitive plant communities to be imperiled habitats having both local and regional significance. Plant communities, alliances, and associations with a statewide ranking of S-1, S-2, S-3, and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by querying the CNDDB and are included in *The Manual of California Vegetation* (Sawyer 2009). The EIR should include measures to fully avoid and otherwise protect sensitive plant communities from Project-related direct and indirect impacts. 3. *Mitigation*: CDFW considers adverse Project-related impacts to sensitive species and habitats to be significant to both local and regional ecosystems, and the EIR should include mitigation measures for adverse Project-related impacts to these resources. Mitigation measures should emphasize avoidance and reduction of Project impacts. For unavoidable impacts, onsite habitat restoration, enhancement, or permanent protection should be evaluated and discussed in detail. If onsite mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, offsite mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. The EIR should include measures to perpetually protect the targeted habitat values within mitigation areas from direct and indirect adverse impacts in order to meet mitigation objectives to offset Project-induced qualitative and quantitative losses of biological values. Specific issues that should be addressed include restrictions on access, proposed land dedications, long-term monitoring and management programs, control of illegal dumping, water pollution, increased human intrusion, etc. 4. *Habitat Revegetation/Restoration Plans*: Plans for restoration and revegetation should be prepared by persons with expertise in the regional ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought. CDFW recommends that local onsite propagules from the Project area and nearby vicinity be collected and used for restoration purposes. Onsite seed collection should be appropriately timed to ensure the viability of the seeds when planted. Onsite vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various Project components as appropriate. Restoration objectives should include protecting special habitat elements or re-creating them in areas affected by the Project. Examples may include retention of woody material, logs, snags, rocks, and brush piles. Fish and Game Code sections 1002, 1002.5 and 1003 authorize CDFW to issue permits for the take or possession of plants and wildlife for scientific, educational, and propagation purposes. Please see our website for more information on Scientific Collecting Permits at www.wildlife.ca.gov/Licensing/Scientific-Collecting#53949678-regulations-. 5. *Nesting Birds*: Please note that it is the Project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Migratory non-game native bird species are protected by international treaty under the federal Migratory Bird Treaty Act (MBTA) of 1918, as amended (16 U.S.C. 703 et seq.). CDFW implemented the MBTA by adopting the Fish and Game Code section 3513. Fish and Game Code sections 3503, 3503.5 and 3800 provide additional protection to nongame birds, birds of prey, their nests and eggs. Sections 3503, 3503.5, and 3513 of the Fish and Game Code afford protective measures as follows: section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the Fish and Game Code or any regulation made pursuant thereto; section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the Fish and Game Code or any regulation adopted pursuant thereto; and section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			Interior under provisions of the MBTA. Potential habitat for nesting birds and birds of prey is present within the Project area. The Project should disclose all potential activities that may incur a direct or indirect take to nongame nesting birds within the Project footprint and its vicinity. Appropriate avoidance, minimization, and/or mitigation measures to avoid take must be included in the EIR. CDFW recommends the EIR include specific avoidance and minimization measures to ensure that impacts to nesting birds or their nests do not occur. Project-specific avoidance and minimization measures may include, but not be limited to: Project phasing and timing, monitoring of Project-related noise (where applicable), sound walls, and buffers, where appropriate. The EIR should also include specific avoidance and minimization measures that will be implemented should a nest be located within the Project site. In addition to larger, protocol level survey efforts (e.g. Swainson's hawk surveys) and scientific assessments, CDFW recommends a final preconstruction survey be required no more than three (3) days prior to vegetation clearing or ground disturbance activities, as instances of nesting could be missed if surveys are conducted earlier. 6. *Moving out of Harm's Way*: The Project is anticipated to result in the clearing of natural habitats that support native species. To avoid direct mortality, the Town of Paradise should state in the EIR to require that a qualified biologist with the proper handling permits, will be retained to be onsite prior to and during all ground- and habitat-disturbing activities. Furthermore, the EIR should describe that the qualified biologist with the proper permits may move out of harm's way special-status species or other wildlife of low or limited mobility that would otherwise be injured or killed from Project-related activities, as needed. The EIR should also describe qualified biologist qualifications and authorities to stop work to prevent direct mortality of special-status species. CDFW recommends fish and wildlife species be allowed to move out of harm's way on their own volition, if possible, and to assist their relocation as a last resort. It should be noted that the temporary relocation of onsite wildlife does not constitute effective mitigation for habitat loss. 7. *Translocation of Species*: CDFW generally does not support the use of relocation, salvage, and/or transplantation as the sole mitigation for impacts to rare, threatened, or endangered species as these efforts are generally experimental in nature and largely unsuccessful. Therefore, the EIR should describe additional mitigation measures utilizing habitat restoration, conservation, and/or preservation, in addition to avoidance and minimization measures, if it is determined that there may be impacts to rare, threatened, or endangered species. The EIR should incorporate mitigation performance standards that would ensure that impacts are reduced to a less-than-significant level. Mitigation measures proposed in the EIR should be made a condition of approval of the Project. Please note that obtaining a	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			permit from CDFW by itself with no other mitigation proposal may constitute mitigation deferral. CEQA Guidelines section 15126.4, subdivision (a)(1)(B) states that formulation of mitigation measures should not be deferred until some future time. To avoid deferring mitigation in this way, the EIR should describe avoidance, minimization and mitigation measures that would be implemented should the impact occur. **California Endangered Species Act** CDFW is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to the California Endangered Species Act (CESA). CDFW recommends that a CESA Incidental Take Permit (ITP) be obtained if the Project has the potential to result in "take" (Fish & G. Code § 86 defines "take" as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") of state-listed CESA species, either through construction or over the life of the Project. State-listed species with the potential to occur in the area include, but are not limited to: foothill yellow-legged frog (*Rana boylii*), cascades frog (*Rana cascadae*), Sierra Nevada yellow-legged frog (*Rana sierrae*), Swainson's hawk (*Buteo swansonii*), giant garter snake (*Thamnophis gigas*), least bell's vireo (*Vireo bellii pusillus*), tricolored blackbird (*Agelaius tricolor*), western yellow-billed cuckoo (*Coccyzus americanus occidentalis*), willow flycatcher (*Empidonax traillii*), bald eagle (*Haliaeetus leucocephalus*), California black rail (*Laterallus jamaicensis coturniculus*), bank swallow (*Riparia riparia*), spring-run Chinook salmon (*Oncorhynchus tshawytscha*), Butte County meadowfoam (*Limnanthes floccosa ssp. californica*), and slender Orcutt grass (*Orcuttia tenuis*). The EIR should disclose the potential of the Project to take State-listed species and how the impacts will be avoided, minimized, and mitigated. Please note that mitigation measures that are adequate to reduce impacts to a less-than significant level to meet CEQA requirements may not be enough for the issuance of an ITP. To facilitate the issuance of an ITP, if applicable, CDFW recommends the EIR include measures to minimize and fully mitigate the impacts to any state-listed species the Project has potential to take. CDFW encourages early consultation with staff to determine appropriate measures to facilitate future permitting processes and to engage with the U.S. Fish and Wildlife Service and/or National Marine Fisheries Service to coordinate specific measures if both State and federally listed species may be present within the Project vicinity. **Native Plant Protection Act** The Native Plant Protection Act (Fish & G. Code §1900 et seq.) prohibits the take or possession of state-listed rare and endangered plants, including any part or product thereof, unless authorized by CDFW or in certain limited circumstances. Take of state- listed rare and/or endangered plants due to Project activities may only be permitted through an ITP or other authorization issued by CDFW pursuant to California Code of Regulations, Title 14, section 786.9 subdivision (b).

			Lake and Streambed Alteration Program The EIR should identify all perennial, intermittent, and ephemeral rivers, streams, lakes, other hydrologically connected aquatic features, and any associated biological resources/habitats present within the entire Project footprint (including utilities, access and staging areas). The environmental document should analyze all potential temporary, permanent, direct, indirect and/or cumulative impacts to the above-mentioned features and associated biological resources/habitats that may occur because of the Project. If it is determined the Project will result in significant impacts to these resources the EIR shall propose appropriate avoidance, minimization and/or mitigation measures to reduce impacts to a less-than-significant level. Section 1602 of the Fish and Game Code requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following: substantially divert or obstruct the natural flow of any river, stream or lake; substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or deposit debris, waste or other materials that could pass into any river, stream or lake. Please note that "any river, stream or lake" includes those that are episodic (i.e., those that are dry for periods of time) as well as those that are perennial (i.e., those that flow year-round). This includes ephemeral streams and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water. If CDFW determines that the Project activities may substantially adversely affect an existing fish or wildlife resource, a Lake and Streambed Alteration (LSA) Agreement will be issued which will include reasonable measures necessary to protect the resource. CDFW's issuance of an LSA Agreement is a "project" subject to CEQA (see Pub. Resources Code 21065). To facilitate issuance of an LSA Agreement, if one is necessary, the EIR should fully identify the potential impacts to the lake, stream, or riparian resources, and provide adequate avoidance, mitigation, and monitoring and reporting commitments. Early consultation with CDFW is recommended, since modification of the Project may avoid or reduce impacts to fish and wildlife resources. To obtain an LSA notification package, please go to https://www.wildlife.ca.gov/Conservation/LSA/Forms. Please note that other agencies may use specific methods and definitions to determine impacts to areas subject to their authorities. These methods and definitions often do not include all needed information for CDFW to determine the extent of fish and wildlife resources affected by activities subject to Notification under Fish and Game Code section1602. Therefore, CDFW does not recommend relying solely on methods developed specifically for delineating areas subject to other agencies' jurisdiction (such as United States Army Corps of Engineers) when mapping lakes, streams, wetlands, floodplains, riparian areas, etc. in preparation for submitting a Notification of an LSA. CDFW relies on the lead agency environmental document analysis when acting as a

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			responsible agency issuing an LSA Agreement. CDFW recommends lead agencies coordinate with us as early as possible, since potential modification of the proposed Project may avoid or reduce impacts to fish and wildlife resources and expedite the Project approval process. The following information will be required for the processing of an LSA Notification and CDFW recommends incorporating this information into any forthcoming CEQA document(s) to avoid subsequent documentation and Project delays: 1. Mapping and quantification of lakes, streams, and associated fish and wildlife habitat (e.g., riparian habitat, freshwater wetlands, etc.) that will be temporarily and/or permanently impacted by the Project, including impacts from access and staging areas. Please include an estimate of impact to each habitat type. 2. Discussion of specific avoidance, minimization, and mitigation measures to reduce Project impacts to fish and wildlife resources to a less-than-significant level. Please refer to section 15370 of the CEQA Guidelines. Based on review of Project materials, aerial photography and observation of the site from public roadways, the Project site supports Butte Creek, Comanche Creek, and Little Chico Creek, unnamed tributaries to these creeks, and their associated riparian habitats. CDFW recommends the EIR fully identify the Project's potential impacts to these streams and/or their associated vegetation and wetlands. **ENVIRONMENTAL DATA** CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database, which may be used to make subsequent or supplemental environmental determinations (Pub. Resources Code, § 21003, subd. (e)). Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be submitted online or mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. **FILING FEES** The Project, as proposed, would have an effect on fish and wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code § 711.4; Pub. Resources Code, § 21089.) **CONCLUSION** Pursuant to Public Resources Code sections 21092 and 21092.2, CDFW requests written

5/25/21	Anonymous (Caller)	Virtual Public Meeting #2	Hi, thank you for taking my call and I apologize if this was covered. I missed a portion of your presentation. If the location that we currently have is within the proposed service area, but it's currently under septic, what advice are you providing to the property owners or what websites or information areas do you recommend in order to understand what would be the proper steps in evaluating whether or not we are required to connect with the sewer system versus having the existing septic system function? That's the biggest question I guess for a lot of people that I know is what are our requirements versus what what's nice to have versus what's required to do.	
5/25/21	Anonymous (Caller)	Virtual Public Meeting #2	I'm actually calling from Lane County, emergency management over here in Oregon and so if it's a better conversation to have offline, I'm happy to do that, but really you guys are so much farther ahead than we are with fire recovery. I was just looking to get a better understanding of pitfalls and hurdles that we might be looking out for in the future as we move towards getting a little bit closer to where you guys are, because you guys have been inspirational in your recovery process.

5/25/21	Mike Garcia-Forterra Pipe & Precast	Virtual Public Meeting #2	Have the pipe material options been listed, and if so, are you eliminating thermoplastic pipes due to issues of flammable concerns.	
5/25/21 12:10 p.m.	Dennis Ivey creare@comcast.net cc: Gwen Nordgren gwennord8@gmail.com	Email	Mark - Sorry that I couldn't join you today. I wan unable to load your meeting software on my Mac - probably a Boomer thing! I submitted a question to the consultants regarding connection fees and payment. To date, I've not heard back. I'm asking on behalf of Paradise Lutheran Church on Luther Drive, next to Terry Ashe Park. I assume it is still too early to know the dollar amount of the connection fee, but can you tell me how they will be determined and the anticipated payment policy for the connection fees. Your answer will be helpful to the church as they move forward in their recovery process. Thank you for your time and assistance.	5/25/21 (1:33 p.m.): M. Mattox responded via email: Good afternoon Dennis! Great question – we actually received one just like it during the webinar… In short, we do not have the answer…yet. What I mean is that as we are in the EIR phase, we do not have certainty the project will indeed move forward. However, if it does, administration of items like this are key in project success. Our goal would be to provide a heavily incentivized opportunity to connect at the initial startup construction. Absent of that, we would be tough to find another approach other than requiring connections at a time when the system fails… Meaning if you install a system in 2021 and it doesn't fail until 2041, a connection may not be required until 2041. From the lens of recovery and planning today, it may be most prudent to assume no project and move forward – although, I have heard of property owners installing a stubbed lateral which could be intertied in the future, this may be attractive for the church. Hope this helps! Best of luck!

5/27/21	Paula M. Daneluk Director Butte County Department of Development Services 7 County Center Drive Oroville, California 95965 T: 530-552-3700 F: 530-538-7785 buttecounty.net/dds T: 530-552-3656 PDaneluk@buttecounty.net	Letter	May 27, 2021 Colette Curtis Public Information Officer Town of Paradise 5555 Skyway Rd. Paradise, CA 95969 Subject: Notice of Preparation of an Environmental Impact Report for the Paradise Sewer Project Dear Ms. Curtis, We have reviewed the above-referenced Notice of Preparation (NOP), dated April 30, 2021. The following statements and comments have been prepared pursuant to Butte County's authority as a Responsible Agency with jurisdiction over land affected by the project. The Paradise Sewer Project comprises three components: a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico Water Pollution Control Plant (WPCP), and a connection to the WPCP facility. The export pipeline would be located between the Town of Paradise and the City of Chico, the majority of this development area falling under Butte County's jurisdiction. The following are issues that should be included and analyzed in the EIR for the Paradise Sewer Project: 1. The project description for the "Export Pipeline" component of the project within the above- referenced NOP is lacking critical information required for a full and thorough analysis. Technical details regarding the export pipeline should be provided within the EIR. Specific information such as the pipeline's dimensions (including length and diameter of the pipe), the number of proposed lift or pump stations, as well as the alignment of the pipeline need to be identified to adequately describe the project for analysis. 2. Due to a lack of spatial information, the extent to which the export pipeline will be contained within the County right-of-way (ROW) as opposed to crossing private land is unclear. There is concern about the potential necessity of cross-country alignments outside of the ROW. Will the pipeline cross agricultural lands or the Agricultural "Green Line", which could result in potentially significant impacts to prime agricultural land? Clarification is needed to clearly site this component in relation to the ROW and agricultural resources. 3. Clearly describe in detail any and all proposed undergrounding of the export pipeline. Analysis should include potential impacts to aesthetics if not undergrounded and geological impacts if undergrounded. 4. The environmental analysis should address water quality and the proposed export

Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			pipeline's impacts to Butte Creek, vernal pools, and multiple water basins across the project alignment, as well as analysis of leak potential and resulting impacts. The biological resources analysis should include a wetland delineation and analysis of impacts to the area and any associated riparian habitats. 5. Noise analysis should identify lift stations and associated generator noise impacts to biological resources as well as sensitive receptors along the route. 6. Specify in the project description any easements proposed across areas with existing recreational or trail systems. 7. Analyze the impacts of possible contamination from leaks or spills due to long-term operation of the export pipeline and short-term construction. 8. The Butte County Department of Public Works will require either a franchise agreement or encroachment maintenance agreement. Additionally, the County will require pavement restoration to bring the impacted roadways to an as-equal or better condition. Please include details within the project description analyzing these impacts. We appreciate the opportunity to comment on the NOP. Questions regarding this letter should be directed to Paula M. Daneluk, AICP at 530.552.3656 or PDaneluk@buttecounty.net. Sincerely, Paula M. Daneluk, AICP Director, Butte County Department of Development Services	
5/27/21 5:33 p.m.	Sasha Poe 1043 Central Park Dr Paradise, CA 95969 530-326-4949 ssaasshhaa@hotmail.com	Website	I have emailed 5 times asking for my commercial property to be added to the sewer plan.	6/2/21 (1:15 p.m.): M. Mattox responded via email: Hi Sasha: I apologize for the delayed response. We have received your request for the project to include your property. At this moment, we are unable to administratively add this to the area – however, we will keep your request in the public comment file and be sure to explore it further. Thanks for reaching out!

	James Herota 916-574-0651 James.Herota@cvflood.ca.gov		**Subject: Comments on the Paradise Sewer Project, Notice of Preparation of an Environmental Impact Report (SCH No. 2021050008)** Dear Mr. Mattox, The Central Valley Flood Protection Board (Board) appreciates the opportunity to comment on the Notice of Preparation of an Environmental Impact Report for the proposed Paradise Sewer Project. The EIR will be prepared to disclose and address potential environmental impacts associated with the proposed project. The proposed project is located in Butte County and involves construction of a sewer pipeline crossing the Butte Creek and Little Chico Creek. **Responsibility of the Central Valley Flood Protection Board** The Board is the State's regulatory agency responsible for ensuring appropriate standards are met for the construction, maintenance, and operation of the flood control system that protects life, property, and habitat in California's Central Valley. The Board serves as the State coordinator between local flood management agencies and the federal government, with the goal of providing the highest level of flood protection possible to California's Central Valley. The Board operates under authorities as described in California Water Code (Water Code), which requires the Board to oversee future modifications or additions to facilities of the State Plan of Flood Control (SPFC). In addition, pursuant to assurances provided to the United States Army Corps of Engineers (USACE) by the Board on behalf of the State, the USACE Operation and Maintenance Manuals, Code of Federal Regulations, Title 33, § 208.10, and United States Code, Title 33, § 408, the Board is responsible for the operation and maintenance of the SPFC facilities. The USACE requires the Board to serve as the lead non-Federal sponsor for projects to improve or alter facilities of the SPFC pursuant to Code of Federal Regulations, Title 33, § 408. The State's objectives include fulfilling the USACE's expectations pursuant to the assurances provided to the USACE. **Encroachment Permit** Per California Code of Regulations, Title 23, Waters, Division 1 (Title 23), Section 6, approval by the Board is required for all proposed work or uses, including the alteration oflevees within any area for which there is an Adopted Plan of Flood Control within the Board's jurisdiction. In addition, Board approval is required for all proposed encroachments within a floodway, on adjacent levees, and within any Regulated Stream identified in Title 23, Table 8.1. Specifically, Board jurisdiction includes the levee section, the waterward area between project levees, a minimum 10-foot-wide strip adjacent to thelandward levee toe, the area within 30 feet from the top of bank(s) of Regulated Streams, and inside Board's Designated Floodways. Activities outside of these limits which could adversely affect Federal-State flood control facilities, as determined by Board staff, are also under the Board's jurisdiction. Permits may also be required for existing unpermitted encroachments or where it is necessary to establish the conditions normally imposed by permitting, including where responsibility for the encroachment has not been clearly established or ownership or uses have been changed. This proposed project is located within the Board's permitting authority, thereby requiring an encroachment permit.	

Town of Paradise Sewer Project
Comments Matrix

DATE	CONTACT INFO	SOURCE	COMMENTS/QUESTIONS	RESPONSE/ACTION
			Federal permits, including USACE Section 404 and Section 10 regulatory permits and Section 408 Permission, in conjunction with a Board permit, may be required for the proposed project. In addition to federal permits, state and local agency permits, certification, or approvals may also be required. State approvals may include, but are not limited to, California Department of Fish and Wildlife's Lake and Streamed Alteration Agreement and Regional Water Quality Control Board's Section 401 Water Quality Certification. The Applicant must obtain all authorizations that the proposed project may require. **Flood Impacts Analysis** Pursuant to Section 15 of Title 23, the Board may deny an encroachment permit if the proposed project could: • Jeopardize directly or indirectly the physical integrity of levees or other works; • Obstruct, divert, redirect, or raise the surface level of design floods or flows, or the lesser flows for which protection is provided; • Cause significant adverse changes in water velocity or flow regimen; • Impair the inspection of floodways or project works; • Interfere with the maintenance of floodways or project works; • Interfere with the ability to engage in flood fighting, patrolling, or other flood emergency activities; • Increase the damaging effects of flood flows; • Be injurious to, or interfere with, the successful execution, functioning, or operation of any adopted plan of flood control; or • Adversely affect the State Plan of Flood Control, as defined in the California Water Code. As a responsible agency under the California Environmental Quality Act (CEQA), the Board will need to have adequate information in order to evaluate whether to issue a permit at a future date. Accordingly, please be prepared to provide specific analyses to determine if the proposed project could result in any potential impacts listed above. This includes direct impacts to facilities under construction, as well as indirect impacts from the project to surrounding facilities. This encompasses any proposed work that contemplates modifications to a SPFC Facility, Lower San Joaquin Levee District Facility, or operation of any adopted plan of flood control or the hydrology of the water ways including increases or decreases in water surface elevation due to construction activities and encroachments; any work including dewatering and vibrations from both pile driving and heavy machinery that may destabilize the SPFC levees; and potential levee damage resulting from heavy machinery construction activities and associated haul routes. It is therefore recommended that the environmental document include a specific flood facility impacts analysis section. **Document Specific Comments**

			According to page 4, Figure 1 Paradise Export Pipeline, shows that the proposed pipeline is within Butte Creek and Little Chico Creek. Title 23 provides standards that govern the design and construction of projects that affect the flood control works and floodways. Board staff recommends that you review Title 23 Standards, including but not limited to Sections 115 (Dredged, Spoil, and Waste Material), 120 (Levees), and 130 (Patrol Roads and Access Ramps), 123 (Pipelines, Conduits, and Utility Lines). Any deviation (or variation) from these standards will require approval from the Board. **Closing** The potential risks to public safety, including increased flood risks, need to be considered when developing proposed projects that seek to modify flood control works or the hydrology of the water ways. Board staff is available to discuss any questions you have regarding the above comments. Please contact James Herota at (916) 574-0651, or via email at James.Herota@CVFlood.ca.gov if you have any questions. Sincerely, Andrea Buckley Environmental Services and Land Management Branch Chief cc: Office of Planning and Research | State.Clearinghouse@opr.ca.gov	
6/3/21 2:59 p.m.	Nick Avdis 455 Capitol Mall, Suite 801 Sacramento, CA 95814 navdis@thomaslaw.com	Website	This firm represents Tuscan Ridge Associates LLC and their interests in the development projects known as "Tuscan Ridge" located at 3100 Skyway in unincorporated Butte County. The Tuscan Ridge project to has submitted an initial planning application with Butte County. The EIR for the Town of Paradise to City of Chico sewer project should include analysis of providing sewer service to the Tuscan Ridge project. Please put me on the notification list for any upcoming meetings or otherwise. Thank you.	
6/4/21	Tom Lando District Manager, Paradise Irrigation District Paradise Irrigation District 6332 Clark Rd Paradise, CA 95969 530-877-4971	Letter	June 4, 2021 Colette Curtis, Public Information Officer Town of Paradise 5555 Skyway Paradise, CA 95969 RE: Request for comments regarding the scope of the EIR for a proposed sewer system Paradise Irrigation District (“PID”) is informed that the Town of Paradise is seeking a formal wastewater treatment solution and has identified a proposed sewer service area. The proposed sewer service area includes geographic areas within PID’s current water distribution service area. As an irrigation district, PID has latent authority to own, operate and maintain a sewer system. Additionally, PID has the equipment and infrastructure to manage the proposed project as well as the personnel, expertise and administrative

DATE	OUTREACH TYPE	# OF CONTACTS	MEETING INFO	NOTES
2/8/21	Media Article			ACTION NEWS NOW · Coverage you can count on! **CHICO, PARADISE SEWER PROJECT UNANIMOUSLY REACHES SECOND PHASE** Paradise Sewer Project moves on to an 18-month Environmental Impact Review and will be grant-funded. Posted: Feb 8, 2021 7:43 PM | Brandon Downs **PARADISE, Calif.** - Chico City Council unanimously voted to analyze and study the current and future needs for the Chico Water Pollution Control Plant (WPCP) to develop a regional sewer connection to Paradise, according to the Town of Paradise. The connection will be from a specified area in Paradise, called the Sewer Service Area, and will include many parcels along Skyway, Pearson, and Clark Road. Chico City Council appointed their Mayor and Vice Mayor to a Sewer Regionalization Project Advisory Committee. This includes the Mayor and Vice Mayor of Paradise and will be facilitated by the Regional Water Quality Control board over the course of the planned 18-month Environmental Impact Review (EIR). “We look forward to seeing what develops during this 18-month EIR process and certainly support efforts to improve our regional economy and the wastewater infrastructure in Chico,” said Chico Mayor Andrew Coolidge. The Town of Paradise said the Paradise Sewer Project has been studied for over 50 years and is a Tier 1 Town-Led Priority Project in the Long-Term Community Recovery Plan. The EIR will be phase II of the project and is fully funded by a grant. This will not cost the City of Chico or Town of Paradise. A copy of the Phase I report can be found here. “Now, with the Phase II Environmental Impact Review process of a regional sewer connection between Paradise and Chico, we are just beginning the true vetting process with a Cooperative Work Agreement with the Town and a grant-funded opportunity to study the impacts and opportunities for Chico’s Water Pollution Control Plant,” said Mayor Coolidge. Paradise has been in need of wastewater solutions for years due to high groundwater, limited land available and poor soils. This restricts multi-family housing and commercial operations that rely on water usage, like restaurants.

				"The Paradise Sewer Project is vitally important for the recovery of Paradise after the Camp Fire," said Paradise Mayor Steve Crowder. "There are also substantial benefits for the City of Chico to regionalize their Water Pollution Control Plant." The Paradise Sewer Project is one of the largest infrastructure projects in California. It is the largest in the Central Valley Region and the largest, by far, in the North State. For more information and regular updates on the Paradise Sewer Project, including committee meeting dates and times, visit www.paradisesewer.com. https://www.actionnewsnow.com/content/news/Chico-Paradise-sewer-project-unanimously-reaches-second-phase-573755081.html
3/7/21	Media Article			*Serving Chico and the north state since 1853* ENTERPRISE-RECORD **Study the sewer, PID pipes then decide what's next** By **EDITORIAL BOARD** | March 7, 2021 at 3:16 a.m. When the Camp Fire roared through Butte County in 2018, destroying 90 percent of the structures within its path and burning more than 153,000 acres, the Paradise Irrigation District lost all of its customer base. The Town of Paradise and Paradise Unified School District each got backfill funding from the state for three years to stay afloat. Additionally, the town got $250 million in damages from PG&E. The PID, which has yet to receive any settlement funding from PG&E, received its backfill funding contingent upon a plan to create new revenue to make up for the lost customer base. At a minimum, the PID needed to show the state it was working towards a solution to the problem. One solution that was proposed was an intertie from Paradise to Chico. It is an idea that the PID wanted to study, along with Butte County. In 2019, in order to get the study started, the county needed a 4/5ths vote from the Butte County Board of Supervisors because it was a budget adjustment. It was an adjustment that at first supervisor Debra Lucero supported, but changed her mind after saying the Board of Supervisors was not given vital documents prior to the initial vote. That vote, along with Tami Ritter's "no" vote, sank the study.

				Since then a Sacramento State University study has begun on the issue and is a mandated requirement to ensure that PID can obtain funding for its drinking water system improvements from the California State Legislature. It's important to note that nothing is going to be built, whether it be a sewer or a PID pipe, unless the studies prove that they can work. From there the local entities, the town of Paradise, PID, City of Chico and LAFCO have to agree — and much of that depends on public support. Not only has PID been working towards a pipe to Chico but so has the town of Paradise. The Paradise sewer pipe would be connected to Chico's wastewater plant west of Chico. The other option that was in front of the town council was building a wastewater plant within the town limits. But the Chico option has always been favored by town and city staff because it is a cheaper option. The sewer pipe has the support of the Central Valley Regional Water Quality Control Board, which is in fact leading a board made up of councilors from both cities — and that meets for the first time this coming week. Studying the pipes to Chico is worth doing and in fact, Chico appears to agree. The town of Paradise has been struggling to develop a viable business community, particularly those surrounding restaurants, for decades — long before the Camp Fire. Its rebuild might well rest on both a sewer and PID pipe. But it's only by studying both options that can we learn if they are beneficial financially or environmentally for the county as a whole. And in the end it is the science that comes out of the environmental impact reports and Sacramento State University study that should guide our next moves. https://www.chicoer.com/2021/03/07/study-the-sewer-pid-pipes-then-decide-whats-next/

5/1/21	Public Notice Advertisement (Paradise Post)			**PUBLIC NOTICE** **NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING NOTICE** The Town of Paradise (Town) as the Lead Agency for the Paradise Sewer Project (Proposed Project) has issued this Notice of Preparation (NOP) pursuant to the California Environmental Quality Act (CEQA) to notify responsible and trustee agencies and other interested parties that an Environmental Impact Report (EIR) will be prepared to evaluate potential environmental impacts of the Proposed Project. The Town is soliciting public input regarding the scope and content of environmental information to be included in the EIR. The NOP provides information about the public review and comment period, project location, project description, and the probable environmental effects of the Proposed Project, and is posted on the Town's website at **paradisesewer.com**. **PUBLIC REVIEW & COMMENT PERIOD:** May 3 to June 3, 2021 ***PROJECT OVERVIEW*** Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. The Town has supported numerous studies to address its need for a centralized wastewater treatment solution, and in its most recent study, the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022. The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project. ***POTENTIAL ENVIRONMENTAL IMPACTS*** The EIR process will assess the potential environmental impacts of the proposed Project on the physical, human, and natural environment. A wide variety of resource areas will be studied during the environmental review to identify potential impacts, including aesthetics, agriculture and forestry resources, air quality and greenhouse gas emissions, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, transportation, tribal cultural resources, utilities and service systems, wildfire, and additional topics as required by the CEQA Guidelines including significant irreversible environmental changes, growth inducement, cumulative impacts, and alternatives. Measures to avoid, minimize, and mitigate any potential adverse impacts will be identified and evaluated in the EIR. ***VIRTUAL PUBLIC SCOPING MEETINGS*** A 30-day public scoping process is being initiated with this notice. Responsible and Trustee Agencies, involved federal agencies, interest groups, and members of the public are invited to participate and provide valuable input into the scope of the EIR. For your convenience, and to allow participation in a safe environment while social distancing, two virtual public scoping meetings will be held during the project's 30-day scoping period. Please join us at one of the following meetings to learn about the project, interact with project team members, ask questions, and submit formal comments. **THURSDAY, MAY 13, 2021 | 6 P.M.** **Webex:** bit.ly/Paradise_Sewer_Mtg1 **Webex Password:** Paradise **Dial-in #:** 408-418-9388 | **Code:** 123 202 6837 **TUESDAY, MAY 25, 2021 | 12 P.M.** **Webex:** bit.ly/Paradise_Sewer_Mtg2 **Webex Password:** Paradise **Dial-in #:** 408-418-9388 | **Code:** 123 877 2748 ***SUBMITTING COMMENTS*** Submission of comments on the environmental scope of the Project are invited from all interested parties from May 3, 2021 until **5 p.m. PST on June 3, 2021**. Comments can be submitted via the website at **paradisesewer.com/contact** (from subject dropdown menu, select "Submit a comment on Environmental Impact Report") or via the following options: **Telephone:** 530-872-6291, ext. 112 **Mail:** Colette Curtis, Public Information Officer Town of Paradise 5555 Skyway, Paradise, CA 95969 ***SPECIAL MEETING ACCOMMODATIONS*** For additional accessibility preferences, please submit a message on the project website at **paradisesewer.com/contact** (from subject dropdown menu, select "Submit a comment on Environmental Impact Report"). Persons who are deaf, hard of hearing, or speech impaired (TDD) may contact the California Relay Service TTY and/or Voice Line at 1-800-735-2929, or 711.

REMINDER: FIRST VIRTUAL PUBLIC MEETING HAPPENING THIS WEEK

Don’t forget, our first virtual public meeting for the Paradise Sewer Project is this Thursday. Join us to learn more about the project, interact with team members, ask questions and submit formal comments.

JOIN ONLINE OR BY PHONE
You can participate in the meetings online <u>or</u> by phone to remain safe while social distancing. Your participation matters!

THURSDAY, MAY 13, 2021 | 6 P.M.
ONLINE:
• Webex: bit.ly/Paradise_Sewer_Mtg1
• Webex Password: Paradise

BY PHONE:
• Dial-in #: 408-418-9388
• Code: 123 202 6837

TUESDAY, MAY 25, 2021 | 12 P.M.
ONLINE:
• Webex: bit.ly/Paradise_Sewer_Mtg2
• Webex Password: Paradise

BY PHONE:
• Dial-in #: 408-418-9388
• Code: 123 877 2748

SUBMITTING COMMENTS
Even if you can’t make the meetings, suggestions/comments on the scope and content of the EIR are invited from all interested parties anytime until 5 p.m. on June 3, 2021. Written or verbal comments concerning the proposed project’s environmental scope can be submitted via the following options.

Website: paradisesewer.com/contact (from subject dropdown menu, select “Submit a comment on Environmental Impact Report”)

MEMORANDUM

AGENDA NO: 6(a)

FROM: Craig Baker, Community Development Director

TO: Lauren Gill, Interim Town Manager
Dwight Moore, Town Attorney

DATE: August 12, 2013

SUBJECT: Consideration of a Resolution Document Finding that the 1994 Paradise General Plan Substantially Complies With the Statutory Mandates of Government Code Section 65302

COMMISSION ACTION REQUESTED: Adopt Resolution No. 13-04, "A Resolution of the Town of Paradise Planning Commission Finding the 1994 Paradise General Plan Substantially Complies with the Statutory Mandates Under Government Code Section 65302."

BACKGROUND: The general plan is at the top of a city or county's land use regulation hierarchy. Each California city and county is required to have a comprehensive, long-term general plan that includes specific mandatory elements which set forth the objectives, policies, principals, standards and plan proposals for the physical development of the city or county. Pursuant to Government Code section 65302, each general plan must include the following elements:

- Land Use
- Circulation
- Housing
- Conservation
- Open Space
- Noise
- Safety

The 1994 Paradise General Plan was adopted by the Paradise Town Council on October 4, 1994. The process of developing the new, revised plan took approximately four years of work by the Town's hired consultant, five separate citizen subcommittees, the Planning Commission, the Town Council and Town staff. The document is the third general plan adopted by the Town since its incorporation in 1979 and is organized into three separate volumes: Volume I – Policy Document, Volume II - Environmental Impact Report and Volume III – Environmental Setting. Volume I, the Policy Document, contains a comprehensive assemblage of all mandatory general plan elements and an additional, non-mandatory Education and Social Services element. The 1994 plan was intended to chart and direct future land use decision making for the Town of Paradise over a fifteen year period to October, 2009.

With the exception of the Housing Element, no comprehensive updates have been completed since the plan's adoption in 1994, although the Town has adopted ten focused text amendments and twenty-six individual General Plan Land Use Map amendments since then. Pursuant to

Planning Commission
Agenda No. 6(a)

Government Code section 65588(b) the Housing Element is required to be updated every five years. The 1994 Paradise General Plan Housing Element was last revised in 2009 and is not due for another revision until June 30, 2014. Town staff is currently developing a request for proposals (RFP) for the purpose of selecting a consultant to assist in that work effort.

Government Code section 65400 requires every local planning agency to annually review and provide a report to the local legislative body (Town Council) concerning progress achieved toward the implementation of its general plan and a separate review and report specifically concerning progress toward the implementation of its general Housing Element. Town staff has developed these reports on an annual basis for review by the Planning Commission, acceptance by the Town Council and submittal to the California Department of Housing and Community Development as required by section 65400. In addition, Government Code section 65103(a) requires the Town Planning Commission to periodically review and revise the general plan, as necessary.

ANALYSIS

Government Code statutes associated with the requirements for a legally adequate general plan do not provide a mandatory minimum timeframe for revision of elements, except for the housing element. In order to be found to be legally adequate, a general plan must first be complete. As discussed previously, the 1994 Paradise General Plan is comprised of all seven required general plan elements and is therefore complete from that perspective.

Secondly, general plans must be internally consistent. That is, all elements must be integrated and compatible. The generation of annual implementation status reports not only satisfies a State requirement for tracking implementation, but also provides the Town with a periodic opportunity to examine the document for inconsistencies or conflicts. The latest annual reports for 2013 not only failed to identify any notable inconsistencies or conflicting policy directives, objectives or implementation measures, Town staff was also able to conclude that, despite periodic and at times chronic funding and staffing shortages, the 1994 Paradise General Plan continues to be increasingly implemented.

Although the Town does collect a 12% surcharge on most building, planning and wastewater permits to be used for updating the general plan, the fund balance is not currently sufficient at this time. However, there is sufficient funding from this source to complete the required housing element update.

Included within the various findings necessary to be made by a planning agency when approving a development project is a finding that the project is compatible with the objectives, policies, general land uses and programs specified in the agency's general plan.

A planning agency's general plan should be a reflection of the character of the community for which it was prepared and adopted. The Town of Paradise still bears substantial similarity to the community that existed here in 1994, and perhaps before. There have been no significant annexations since the general plan was adopted. The Town boundary is essentially the same as

Planning Commission
Agenda No. 6(a)

in 1994 and, in fact, bears a remarkable resemblance to the 1994 boundary of the Paradise Irrigation District. Based upon U.S. Census data, the Town's population increased by only 3% between 1990 and 2010 (Interestingly, the 1994 Paradise General Plan predicted that the Town's population would increase by approximately 20% by the year 2008). There is still no large-scale wastewater disposal system serving the community. Since 1989, traffic counts have remained fairly static in most areas but show a general decline from 2003 to 2010 over the last ten years (Butte County Association of Governments). These observations lend support to the notion that the Paradise community has not changed to any great degree in terms of its character, environmental setting and function since 1994 and that the Town's current general plan can still be found to be adequate as a document to guide the future development of the community.

CONCLUSION AND RECOMMENDATION

It is the position of the Town Planning Director and the Town Attorney that based upon the circumstances outline within the preceding discussion, the 1994 General Plan is not outdated or legally inadequate. In consideration of this finding, the attached Planning Commission Resolution No. 13.04 has been prepared for your consideration and recommended adoption. Planning Commission adoption of the resolution document is intended to formally affirm the relevance and adequacy of the 1994 Paradise General Plan. Please be prepared to discuss this matter with staff and other Planning Commission members. Town Attorney Dwight Moore will be in attendance at the meeting to provide guidance and assistance and to answer questions that may arise during the discussion.

TOWN COUNCIL
Meeting Minutes

6:00 PM – April 12, 2022

1. OPENING

The Regular meeting of the Paradise Town Council was called to order by Mayor Crowder at 6:06 p.m. in the Town Council Chamber located at 5555 Skyway, Paradise, California who led the Pledge of Allegiance to the Flag of the United States of America. An invocation was offered by Council Member Steve "Woody" Culleton.

COUNCIL MEMBERS PRESENT: Greg Bolin, Steve "Woody" Culleton, Jody Jones, Rose Tryon and Steve Crowder, Mayor.

COUNCIL MEMBERS ABSENT: None

STAFF PRESENT: Town Manager Kevin Phillips, Town Attorney Scott E. Huber, Town Clerk Dina Volenski, Town Engineer/Public Works Director Marc Mattox, Finance Director/Town Treasurer Ross Gilb, Community Development Director Susan Hartman, Community Development Director Tony Lindsey, Information Systems Director Luis Marquez, Business and Housing Manager Kate Anderson, Recovery and Economic Development Director Colette Curtis, Police Chief Eric Reinbold, Police Lieutenant Cameron Kovacs and Police Lieutenant Anthony Borgman.

1e. Mayor Crowder read the proclamation recognizing Congressman Doug LaMalfa, Senator Dianne Feinstein and Senator Alex Padilla for their assistance in securing funding to benefit the Paradise Police Department. (180-40-027)

Congressman LaMalfa accepted the Proclamation in person.

1f. Mayor Crowder read the Proclamation recognizing Jake Early for creating the new seal representing the Town of Paradise. (180-40-027)

1g. Camp Fire Recovery Updates - Written reports are included in the agenda packet.

- Colette Curtis, Recovery and Economic Development Director - Recovery projects, Advocacy, Economic Recovery and Development, Communications and Emergency Operations.
- Marc Mattox, Public Works Director/Town Engineer - Infrastructure and Sewer Update.
- Tony Lindsey, CDD-Building and Code Enforcement Update.

2. CONSENT CALENDAR

MOTION by Bolin, seconded by Culleton, approved consent calendar items 2a through 2j with the addition to item 2j to include compensation of $1,000 for each easement. Roll call vote was unanimous.

2a. Approved minutes of the March 8, 2022 Special and Regular Town Council meetings.

2b. Approved March 2022 Cash Disbursements in the amount of $3,262,687.15. (310-10-034)

2c. Waived second reading of the entire Town Ordinance No. 615 and approved reading by title only; and, Adopted Town Ordinance No. 615, "An Ordinance Adding Section 9.70 to the Paradise Municipal Code Relating to Military Equipment Use." (540-16-184)

- 2d. 1. Concurred with staff's recommendation of Northstar and Rolls Anderson Rolls to perform On Call Surveying Services for the Town's survey needs to support Public Works and Development services; and, 2. Approved the Professional Services Agreement with Northstar Engineering and Rolls Anderson Rolls and authorized the Town Manager to execute a two-year contract, with three one-year optional extensions. (510-20-339 & 510-20-340)

2e. Approved Program Supplement Agreements for Emergency Relief projects to Administering Agency-State Agreement for Federal-Aid Projects, Agreement No. 03-5425F15:

- PSA No. F028 for Project ER-38Y0(014) Emergency Opening Guardrail Repair (950-40-065)
- PSA No. F029 for Project ER-38Y0(015) Emergency Opening Culvert Repair; and, (950-40-066)

Adopted Resolution No. 2022-17, A Resolution of the Town Council of the Town of Paradise authorizing the Town Manager, or designee, to sign the above listed Program Supplement Agreement to Administering Agency-State Agreement for Federal-Aid Projects, Agreement No. 03-5425F15.

2f. Authorized the Town Manager to enter into a three-year agreement for financial audit services with Richardson & Company, LLP. (510-20-341)

2g. Adopted Town of Paradise Resolution No. 2022-18, "Resolution of the Town Council of the Town of Paradise requesting extension of the Vehicle Abatement Program and associated fees and authorizing continued participation in a Service Authority for Abandoned Vehicle Abatement pursuant to California Vehicle Code section 9250.7 and 22710." (540-15-012)

2h. Adopted Resolution No.22-19, A Resolution of the Town Council of the Town of Paradise approving the plans and specifications for the Off-

System Culvert Replacement Project and authorizing advertisement for bids on the project. (950-40-060 & 910-30-004)

2i. Adopted Resolution No. 2022-20, A Resolution of the Town Council of the Town of Paradise accepting Contract No. 9380.CON, Ponderosa Elementary Safe Routes to School Project, performed by All-American Construction, Inc., Live Oak, CA. (950-40-032 & 510-20-299)

2j. Adopted Resolution No. 2022-21, A Resolution of the Town Council of the Town of Paradise authorizing a permanent easement at 6225 and 6295 Skyway to Pacific Gas and Electric Company with compensation of $1,000 for each easement. (950-90-004, 850-20-011)

3. ITEMS REMOVED FROM CONSENT CALENDAR - None

4. PUBLIC COMMUNICATION

1. Ed Schilling would like to see the Bike Path beautified and thinks the Town should have its own sewer plant, doesn't think the connection to Chico makes sense.

2. Jon Remalia would like to see the Planning Commissioners page on the Town Website updated.

5. PUBLIC HEARINGS

5a. Business and Housing Manager Kate Anderson provided the Town Council with an overview of the Draft 2022-2023 Annual Action Plan and requested Council to conduct the second public hearing to solicit comments and/or suggestions regarding the Draft 2022-2023 Annual Action Plan; and, Adopt the Draft 2022-2023 Annual Action Plan as submitted; or, Revise the Draft 2022-2023 Annual Action Plan as submitted; and, Authorize staff to submit the adopted 2022-2023 Annual Action Plan to the U.S. Department of Housing and Urban Development should no public comment be received.

Mayor Crowder opened the public hearing at 6:43 p.m.

There were no public comments.

Mayor Crowder closed the public hearing at 6:44 p.m.

MOTION by Jones, seconded by Bolin, adopted the Draft 2022-2023 Annual Action Plan as submitted and authorized staff to submit the adopted 2022-2023 Annual Action Plan to the U.S. Department of Housing and Urban Development since there were no public comments. Roll call vote was unanimous. (710-10-100)

5b. Community Development Director Susan Hartman provided the Town Council with an overview of the Updated Design Standards for the Downtown and Clark Road/Community Commercial Development Areas and Rescinding the Greater RDA Project Area Design District Standards that no long exist due to the dissolution of the RDA in 2012 and requested the Town Council to conduct the duly noticed and scheduled public hearing regarding the Updated Design Standards.

Mayor Crowder opened the public hearing at 7:01 p.m.

1. Jon Remalia thinks there's an issue if someone has a zero setback lot and they have to provide landscaping from the side they lose a lot of property.

Mayor Crowder closed the public hearing at 7:02 p.m.

MOTION by Bolin, seconded by Jones, concurred with the project "CEQA determination" finding presented and considered by the Planning Commission on March 15, 2022, and embodied within Planning Commission Resolution No. 2022-01; and, concurred with the project recommended adoption and zoning ordinance amendment adopted by the Planning Commission on March 15, 2022, and embodied within Planning Commission Resolution No. 2022-01; and, Adopted Town of Paradise Resolution No. 2022-22, "A Resolution of the Town Council of the Town of Paradise Adopting Updated Design Standards for the Downtown and Clark Road/Community Commercial Development Areas of the 2010 Design Standards and Rescinding the Greater RDA Project Area Design District Standards", and, waived the first reading of Town Ordinance No.616 and read by title only; and, Introduced Town of Paradise Ordinance No.616, "An Ordinance Amending Text Regulations with Paradise Municipal Code Chapter 17.41 [Design Standards and Design Review] Relative to Updated Adoption Dates". Roll call vote was unanimous. (710-80-012 & 540-16-185)

6. COUNCIL CONSIDERATION

6a. Chief Reinbold introduced Lieutenant Kovacs who provided Council with an overview of the proposed purchase of Body Worn Cameras, Vehicle Cameras and Data Management Products and Services for Bodyworn by Utility Associates. Lt. Kovacs introduced David Burns from Bodyworn by Utility Associates, Inc. who provided additional information to the Council about the products.

MOTION by Crowder, seconded by Culleton, adopted Resolution No. 2022-23, a Resolution of The Town Council of The Town of Paradise Making Findings Concerning Sole Vendor For The Purchase of Body Worn Cameras, Vehicle Cameras, and Data Management Products and Services from Bodyworn, by Utility Associates, Inc. Body Worn Cameras, Vehicle Cameras, and Data Management Products and Services from

Bodyworn, by Utility Associates, Inc. Pursuant To Paradise Municipal Code Sections 2.45.070B, 245.070C, and 245.070G. Roll call vote was unanimous. (480-35-002)

6b. **MOTION by Jones, seconded by Culleton,** authorized the Town Manager to enter into a contract with CDX Wireless for Project Management of the Town's two-way radio system restoration. Roll call vote was unanimous. (480-35-002)

6c. **MOTION by Culleton, seconded by Jones,** authorized the Police Department to purchase three (3) 2022 or 2023 Chevrolet Tahoe PPV vehicles under California State Contract pricing through Elk Grove Auto / Winner Chevrolet; and, authorized the Police Department to purchase required upfit and emergency equipment from Lehr, under the existing, publicly bid, Placer County contract with Lehr Auto, to upfit the Tahoes into two (2) Patrol vehicles and one (1) K9 Patrol vehicle. Roll call vote was unanimous. (480-35-002)

6d. **MOTION by Jones, seconded by Crowder,** adopted Town of Paradise Resolution No. 2022-24, "A Resolution of the Town Council of the Town of Paradise Adopting CEQA Findings, Adopting the Town of Paradise's Statement of Overriding Considerations, and Thereafter Approving Its Vehicle Miles Traveled Policies." Roll call vote was unanimous. (720-10-002, 770-40-009)

6e. **MOTION by Bolin, seconded by Crowder** concurred with staff recommendation to award communication services contract to Blue Flamingo Marketing; and, authorized the Town Manager to execute a 3-year contract with Blue Flamingo Marketing. Roll call vote was unanimous. (510-20-234)

6f. Community Development Director Tony Lindsey provided the Town Council with and overview of the proposed Ordinance amending Section 8.58.080 of the Paradise Municipal Code relating to Defensible Space and Hazardous Fuel Management that would allow an issued Certificate of Compliance to remain valid for 90 days from the inspection date.

MOTION by Bolin, seconded by Culleton, waived the first reading of Town Ordinance No. 617 and read by title only; and, Introduced Town Ordinance No. 617. "An Ordinance Amending Paradise Municipal Code Section 8.58.060 Relating to Defensible Space and Hazardous Fuel Management". Roll call vote was unanimous. (480-35-002)

6g. At 8:24 p.m. Vice Mayor Greg Bolin recused himself from the dais regarding this agenda item due to a potential conflict of interest.

Public Works Director/Town Engineer Marc Mattox provided the Town Council with an overview of the Draft Principals of Agreement between the

Town of Paradise and the City of Chico that the Sewer Regionalization Project Advisory Committee has been working on.

Council discussed the Draft Principals Agreement between the Town of Paradise and City of Chico developed by the Sewer Regionalization Project Advisory Committee and provide no additional comments.
Vice Mayor Bolin returned to the dais at 8:48 p.m.

7. COUNCIL INITIATED ITEMS AND REPORTS

7a. Council initiated agenda items

7a1. Consider discussing road construction projects in Town and requesting identifying plaques for the contractors and putting construction maps on social media so citizens can see where road construction is in Town. (CULLETON)

Council Member Culleton talked with PG&E and they stated there are other contractors working on the roadways in Paradise; PG&E now provides a map of where construction is going on in Town so the public can be informed of what the best routes are for driving in town. The Town is also working on identifying where other contractors are working in Town.

Marc Mattox stated that Paradise is one of the largest construction sites in the country and temporary construction sites are difficult to manage because job sites change on a daily basis, but the Town is working on providing more information to the public.

7a2. Discuss changes to Ordinance 612 regarding citations issued to property owners instead of violators living on the property. (CULLETON)

Council Member Culleton was concerned with the Ordinance only citing the property Owner and not the actual violator on the property, but had a discussion with staff and learned that the Ordinance allows staff the ability and tools to cite the property owner and violator.

7b. Council reports on committee representation

Council Member Jones attended Sewer Regional Project Advisory Committee (SRPAC), Butte County Association of Governments and Butte County Air Quality Management District meetings.

Council Member Culleton attended Solid Waste Committee and CDBG Partnership program to award money to Service organizations

Council Member Tryon attended meetings with Broad and Guzman, CDBG Partnership Program, Waste Management; and announced that potentially the green waste yard, buy back center and Household Hazardous Waste (HHW) center could be available in the near future.

Mayor Crowder attended SRPAC, Congressman LaMalfa press conference, labor negotiations with Generals and POA and Chamber Business walk.

7c. Future Agenda Items - None

8. STAFF COMMUNICATION

8a. Town Manager Report

Town Manager Phillips reported on meeting with PASH; ICS 300 training with Jim Broshears; Counselors of Real Estate meeting; discussion to enhance Yellowstone Kelly trail with mountain biking amenities; announced the Town will be hosting HUD for a Roundtable meeting/discussion and will be hosting the Sacramento Valley City Mangers meeting.

Town Manger Phillips announced the City Clerks Association of California 2022 Clerk of the Year award was presented to Town Clerk Dina Volenski in San Francisco.

Community Development Director (CDD) Update

CDD Director Tony Lindsey informed the Town Council that the department has been hosting Stakeholders meetings on the first Monday of each month; Community Enhancement Outreach Team has contacted 40 community members last month and generated 85 clients for the Business and Housing Department; exploring opportunities for residents to receive affordable insurance through IBHS which focus on Wildfire preparedness and is supported by National Institute of Standards and Technology (NIST); and, introduced an interactive Wildfire Ready app to assist residents.

9. CLOSED SESSION - None

10. ADJOURNMENT

Mayor Crowder adjourned the meeting at 9:27 p.m.

Date approved: May 10, 2022

By: Attest:

TOWN OF PARADISE
PLANNING COMMISSION

RESOLUTION NO. 13-04

A RESOLUTION OF THE TOWN OF PARADISE PLANNING COMMISSION FINDING THE 1994 PARADISE GENERAL PLAN SUBSTANTIALLY COMPLIES WITH THE STATUTORY MANDATES UNDER GOVERNMENT CODE SECTION 65302

WHEREAS, each California city and county is required to have a general plan that includes specific mandatory elements, which set forth the objectives, policies, principles, standards and plan proposals for the physical development of the city or county. See Government Code sections 65300 and 65302 attached. There are seven mandatory general plan elements that must be included in each general plan; and

WHEREAS, under Government Code section 65302, the general plan is required to include the following elements:

(a) **Land Use** – designates proposed general location, distribution and extent of land uses; includes standards of population density and building intensity.

(b) **Circulation** – consists of general location and extent of transportation facilities and public utilities all correlated with the land use element.

(c) **Housing** – provides for housing development, improvement and site adequacy for all economic segments of the community.

(d) **Conservation** – for the conservation, development, and utilization of all natural resources.

(e) **Open Space** – plans for open space for preservation and managed production of natural resources, outdoor recreation and public health and safety.

(f) **Noise** – identification and appraisal of noise problems in the community. It shall include implementation measures and possible solutions that address existing and foreseeable noise problems, if any. Noise contours shall be used as a guide for establishing a pattern of land uses in the land use element.

(g) **Safety** – protection of community from fires, seismic and geological hazards; and

WHEREAS, pursuant to Government Code section 65103(a), the Planning Commission, as the Town of Paradise planning agency, is required to periodically review and revise, as necessary, the Town General Plan; and

WHEREAS, the Community Development Director has reviewed the Town's 1994 General Plan for the purpose of determining whether it still substantially complies with all the requirements of Government Code section 65302; and

WHEREAS, as a result of the Community Development Director's review, he has determined that the Town's 1994 General Plan and the current Housing Element substantially satisfy the statutory mandates under Government Code section 65302; and

WHEREAS, if there are no amendments to the 1994 General Plan, the determination would not be a project under the California Environmental Quality Act.

NOW, THEREFORE, THE TOWN OF PARADISE PLANNING COMMISSION hereby resolves as follows:

Section 1. The above statements are true and correct.

Section 2. The Planning Commission has reviewed the staff report relating to the status of the Town's 1994 General Plan.

Section 3. Based on such review, the Planning Commission hereby finds that the Town's 1994 General Plan contains all of the mandatory elements required by State law, including the current Housing Element, and that it substantially complies with the requirements of Government Code section 65302.

Section 4. The Planning Commission hereby determines that the adoption of this resolution is not a "project" under Public Resources Code section 21065 and Title 14 CCR section 15378 of the CEQA Guidelines based on the fact it is merely a finding that the Town's 1994 General Plan substantially complies with State law.

Section 5. The Planning Commission directs the Community Development Director to post a Notice of Determination relating to the exemption from the requirements of the California Environmental Quality Act.

PASSED AND ADOPTED by the Planning Commission of the Town of Paradise this 27th day of August, 2013, by the following vote:

AYES:	Stephanie Neumann, Dan Wentland, Michael Zuccolillo and Jody Jones, Chair
NOES:	None
ABSENT:	James Clarkson
NOT VOTING:	None

Joanna Gutierrez, Town Clerk

ARTICLE 5. Authority for and Scope of General Plans [65300. - 65303.4.]
(Article 5 added by Stats. 1965, Ch. 1880.)

65300.

Each planning agency shall prepare and the legislative body of each county and city shall adopt a comprehensive, long-term general plan for the physical development of the county or city, and of any land outside its boundaries which in the planning agency's judgment bears relation to its planning. Chartered cities shall adopt general plans which contain the mandatory elements specified in Section 65302.

(Amended by Stats. 1984, Ch. 1009, Sec. 3.)

(Added by Stats. 1980, Ch. 837.)

65302.

The general plan shall consist of a statement of development policies and shall include a diagram or diagrams and text setting forth objectives, principles, standards, and plan proposals. The plan shall include the following elements:

(a) A land use element that designates the proposed general distribution and general location and extent of the uses of the land for housing, business, industry, open space, including agriculture, natural resources, recreation, and enjoyment of scenic beauty, education, public buildings and grounds, solid and liquid waste disposal facilities, and other categories of public and private uses of land. The location and designation of the extent of the uses of the land for public and private uses shall consider the identification of land and natural resources pursuant to paragraph (3) of subdivision (d). The land use element shall include a statement of the standards of population density and building intensity recommended for the various districts and other territory covered by the plan. The land use element shall identify and annually review those areas covered by the plan that are subject to flooding identified by flood plain mapping prepared by the Federal Emergency Management Agency (FEMA) or the Department of Water Resources. The land use element shall also do both of the following:

(1) Designate in a land use category that provides for timber production those parcels of real property zoned for timberland production pursuant to the California Timberland Productivity Act of 1982 (Chapter 6.7 (commencing with Section 51100) of Part 1 of Division 1 of Title 5).

(2) Consider the impact of new growth on military readiness activities carried out on military bases, installations, and operating and training areas, when proposing zoning ordinances or designating land uses covered by the general plan for land, or other territory adjacent to military facilities, or underlying designated military aviation routes and airspace.

(A) In determining the impact of new growth on military readiness activities, information provided by military facilities shall be considered. Cities and counties shall address military impacts based on information from the military and other sources.

(B) The following definitions govern this paragraph:

(i) "Military readiness activities" mean all of the following:

(I) Training, support, and operations that prepare the men and women of the military for combat.

(II) Operation, maintenance, and security of any military installation.

(III) Testing of military equipment, vehicles, weapons, and sensors for proper operation or suitability for combat use.

(ii) "Military installation" means a base, camp, post, station, yard, center, homeport facility for any ship, or other activity under the jurisdiction of the United States Department of Defense as defined in paragraph (1) of subsection (e) of Section 2687 of Title 10 of the United States Code.

(b) (1) A circulation element consisting of the general location and extent of existing and proposed major thoroughfares, transportation routes, terminals, any military airports and ports, and other local public utilities and facilities, all correlated with the land use element of the plan.

(2) (A) Commencing January 1, 2011, upon any substantive revision of the circulation element, the legislative body shall modify the circulation element to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways for safe and convenient travel in a manner that is suitable to the rural, suburban, or urban context of the general plan.

(B) For purposes of this paragraph, "users of streets, roads, and highways" mean bicyclists, children, persons with disabilities, motorists, movers of commercial goods, pedestrians, users of public transportation, and seniors.

(c) A housing element as provided in Article 10.6 (commencing with Section 65580).

(d) (1) A conservation element for the conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. The conservation element shall consider the effect of development within the jurisdiction, as described in the land use element, on natural resources located on public lands, including military installations. That portion of the conservation element including waters shall be developed in coordination with any countywide water agency and with all district and city agencies, including flood management, water conservation, or groundwater agencies that have developed, served, controlled, managed, or conserved water of any type for any purpose in the county or city for which the plan is prepared. Coordination shall include the discussion and evaluation of any water supply and demand information described in Section 65352.5, if that information has been submitted by the water agency to the city or county.

(2) The conservation element may also cover all of the following:

(A) The reclamation of land and waters.

(B) Prevention and control of the pollution of streams and other waters.

(C) Regulation of the use of land in stream channels and other areas required for the accomplishment of the conservation plan.

(D) Prevention, control, and correction of the erosion of soils, beaches, and shores.

(E) Protection of watersheds.

(F) The location, quantity and quality of the rock, sand, and gravel resources.

(3) Upon the next revision of the housing element on or after January 1, 2009, the conservation element shall identify rivers, creeks, streams, flood corridors, riparian habitats, and land that may accommodate floodwater for purposes of groundwater recharge and stormwater management.

(e) An open-space element as provided in Article 10.5 (commencing with Section 65560).

(f) (1) A noise element that shall identify and appraise noise problems in the community. The noise element shall recognize the guidelines established by the Office of Noise Control and shall analyze and quantify, to the extent practicable, as determined by the legislative body, current and projected noise levels for all of the following sources:

(A) Highways and freeways.

(B) Primary arterials and major local streets.

(C) Passenger and freight online railroad operations and ground rapid transit systems.

(D) Commercial, general aviation, heliport, helistop, and military airport operations, aircraft overflights, jet engine test stands, and all other ground facilities and maintenance functions related to airport operation.

(E) Local industrial plants, including, but not limited to, railroad classification yards.

(F) Other ground stationary noise sources, including, but not limited to, military installations, identified by local agencies as contributing to the community noise environment.

(2) Noise contours shall be shown for all of these sources and stated in terms of community noise equivalent level (CNEL) or day-night average level (Ldn). The noise contours shall be prepared on the basis of noise monitoring or following generally accepted noise modeling techniques for the various sources identified in paragraphs (1) to (6), inclusive.

(3) The noise contours shall be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise.

(4) The noise element shall include implementation measures and possible solutions that address existing and foreseeable noise problems, if any. The adopted noise element shall serve as a guideline for compliance with the state's noise insulation standards.

(g) (1) A safety element for the protection of the community from any unreasonable risks associated with the effects of seismically induced surface rupture, ground shaking, ground failure, tsunami, seiche, and dam failure; slope instability leading to mudslides and landslides; subsidence; liquefaction; and other seismic hazards identified pursuant to Chapter 7.8 (commencing with Section 2690) of Division 2 of the Public Resources Code, and other geologic hazards known to the legislative body; flooding; and wildland and urban fires. The safety element shall include mapping of known seismic and other geologic hazards. It shall also address evacuation routes, military installations, peakload water supply requirements, and minimum road widths and clearances around structures, as those items relate to identified fire and geologic hazards.

(2) The safety element, upon the next revision of the housing element on or after January 1, 2009, shall also do the following:

(A) Identify information regarding flood hazards, including, but not limited to, the following:

(i) Flood hazard zones. As used in this subdivision, "flood hazard zone" means an area subject to flooding that is delineated as either a special hazard area or an area of moderate or minimal hazard on an official flood insurance rate map issued by the Federal Emergency Management Agency (FEMA). The identification of a flood hazard zone does not imply that areas outside the flood hazard zones or uses permitted within flood hazard zones will be free from flooding or flood damage.

(ii) National Flood Insurance Program maps published by FEMA.

(iii) Information about flood hazards that is available from the United States Army Corps of Engineers.

(iv) Designated floodway maps that are available from the Central Valley Flood Protection Board.

(v) Dam failure inundation maps prepared pursuant to Section 8589.5 that are available from the California Emergency Management Agency.

(vi) Awareness Floodplain Mapping Program maps and 200-year flood plain maps that are or may be available from, or accepted by, the Department of Water Resources.

(vii) Maps of levee protection zones.

(viii) Areas subject to inundation in the event of the failure of project or nonproject levees or floodwalls.

(ix) Historical data on flooding, including locally prepared maps of areas that are subject to flooding, areas that are vulnerable to flooding after wildfires, and sites that have been repeatedly damaged by flooding.

(x) Existing and planned development in flood hazard zones, including structures, roads, utilities, and essential public facilities.

(xi) Local, state, and federal agencies with responsibility for flood protection, including special districts and local offices of emergency services.

(B) Establish a set of comprehensive goals, policies, and objectives based on the information identified pursuant to subparagraph (A), for the protection of the community from the unreasonable risks of flooding, including, but not limited to:

(i) Avoiding or minimizing the risks of flooding to new development.

(ii) Evaluating whether new development should be located in flood hazard zones, and identifying construction methods or other methods to minimize damage if new development is located in flood hazard zones.

(iii) Maintaining the structural and operational integrity of essential public facilities during flooding.

(iv) Locating, when feasible, new essential public facilities outside of flood hazard zones, including hospitals and health care facilities, emergency shelters, fire stations, emergency command centers, and emergency communications facilities or identifying construction methods or other methods to minimize damage if these facilities are located in flood hazard zones.

(v) Establishing cooperative working relationships among public agencies with responsibility for flood protection.

(C) Establish a set of feasible implementation measures designed to carry out the goals, policies, and objectives established pursuant to subparagraph (B).

(3) Upon the next revision of the housing element on or after January 1, 2014, the safety element shall be reviewed and updated as necessary to address the risk of fire for land classified as state responsibility areas, as defined in Section 4102 of the Public Resources Code, and land classified as very high fire hazard severity zones, as defined in Section 51177. This review shall consider the advice included in the Office of Planning and Research's most recent publication of "Fire Hazard Planning, General Technical Advice Series" and shall also include all of the following:

(A) Information regarding fire hazards, including, but not limited to, all of the following:

(i) Fire hazard severity zone maps available from the Department of Forestry and Fire Protection.

(ii) Any historical data on wildfires available from local agencies or a reference to where the data can be found.

(iii) Information about wildfire hazard areas that may be available from the United States Geological Survey.

(iv) General location and distribution of existing and planned uses of land in very high fire hazard severity zones and in state responsibility areas, including structures, roads, utilities, and essential public facilities. The location and distribution of planned uses of land shall not require defensible space compliance

measures required by state law or local ordinance to occur on publicly owned lands or open space designations of homeowner associations.

(v) Local, state, and federal agencies with responsibility for fire protection, including special districts and local offices of emergency services.

(B) A set of goals, policies, and objectives based on the information identified pursuant to subparagraph (A) for the protection of the community from the unreasonable risk of wildfire.

(C) A set of feasible implementation measures designed to carry out the goals, policies, and objectives based on the information identified pursuant to subparagraph (B) including, but not limited to, all of the following:

(i) Avoiding or minimizing the wildfire hazards associated with new uses of land.

(ii) Locating, when feasible, new essential public facilities outside of high fire risk areas, including, but not limited to, hospitals and health care facilities, emergency shelters, emergency command centers, and emergency communications facilities, or identifying construction methods or other methods to minimize damage if these facilities are located in a state responsibility area or very high fire hazard severity zone.

(iii) Designing adequate infrastructure if a new development is located in a state responsibility area or in a very high fire hazard severity zone, including safe access for emergency response vehicles, visible street signs, and water supplies for structural fire suppression.

(iv) Working cooperatively with public agencies with responsibility for fire protection.

(D) If a city or county has adopted a fire safety plan or document separate from the general plan, an attachment of, or reference to, a city or county's adopted fire safety plan or document that fulfills commensurate goals and objectives and contains information required pursuant to this paragraph.

(4) After the initial revision of the safety element pursuant to paragraphs (2) and (3), upon each revision of the housing element, the planning agency shall review and, if necessary, revise the safety element to identify new information that was not available during the previous revision of the safety element.

(5) Cities and counties that have flood plain management ordinances that have been approved by FEMA that substantially comply with this section, or have substantially equivalent provisions to this subdivision in their general plans, may use that information in the safety element to comply with this subdivision, and shall

summarize and incorporate by reference into the safety element the other general plan provisions or the flood plain ordinance, specifically showing how each requirement of this subdivision has been met.

(6) Prior to the periodic review of its general plan and prior to preparing or revising its safety element, each city and county shall consult the California Geological Survey of the Department of Conservation, the Central Valley Flood Protection Board, if the city or county is located within the boundaries of the Sacramento and San Joaquin Drainage District, as set forth in Section 8501 of the Water Code, and the California Emergency Management Agency for the purpose of including information known by and available to the department, the agency, and the board required by this subdivision.

(7) To the extent that a county's safety element is sufficiently detailed and contains appropriate policies and programs for adoption by a city, a city may adopt that portion of the county's safety element that pertains to the city's planning area in satisfaction of the requirement imposed by this subdivision.

(Amended by Stats. 2012, Ch. 311, Sec. 2. Effective January 1, 2013.)

Town of Paradise
Planning Commission
Special Meeting Agenda
6:00 PM – May 24, 2022

Town of Paradise Council Chamber – 5555 Skyway, Paradise, CA

Planning Commission Staff:
Susan Hartman, Community Development Director

Planning Commission Members:
Carissa Garrard, Chair
Ron Lassonde, Vice Chair
Lynn Costa, Commissioner
Kim Morris, Commissioner
Zeb Reynolds, Commissioner

In accordance with the Americans with Disabilities Act, if you need a special accommodation to participate, please contact Community Development Director Hartman, at 872-6291 ext. 417 at least 48 hours in advance of the meeting. Hearing assistance devices for the hearing impaired are available from the Presiding Clerk. Members of the public may address the Planning Commission on any agenda item. If you wish to address the Planning Commission on any matter on the Agenda, it is requested that you complete a "Request to Address Council/Commission" card and give it to the Presiding Clerk prior to the beginning of the Meeting. All writingsor documents which are related to any item on an open session agenda and which are distributed to a majorityof the Planning Commission within 72 hours of a Regular Meeting will be available for public inspection at theTown Hall in the Town Clerk or Community Development Services Department located at 5555 Skyway, at thetime the subject writing or document is distributed to a majority of the subject body. Regular business hoursare Monday through Thursday from 8:00 a.m. to 5:00 p.m.

Planning Commission Agenda Summary **Agenda Item: 1(a)**

Date: May 24, 2022

ORIGINATED BY: Susan Hartman, Community Development Director – Planning & Wastewater

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: Review the Final Revised 2022-2030 Housing Element Update and Consider Adoption of a Resolution Recommending Town Council Adoption of a Town of Paradise 2022-2030 Housing Element Update and Certification of its Associated Negative Declaration Environmental Document

COMMISSION ACTION REQUESTED:

1. Conduct the duly noticed and scheduled public hearing regarding the proposed Town of Paradise Housing Element 2022 update; and, 2. Consider adopting Planning Commission Resolution No. 2022-02, thereby recommending that the Town Council take the following actions: a) Certify and adopt the proposed Initial Study and Negative Declaration document as it relates to the proposed Town of Paradise Housing Element 2022 Update, and b) Adopt the amendments to the Housing (2022-2030 Housing Element) of the 1994 Paradise General Plan known as the Town of Paradise Housing Element 2022 Update in order to make the Paradise Housing Element consistent with the RHNA and current State housing element law. (ROLL CALL VOTE)

Background:

The Housing Element is one of seven mandatory elements that comprise a local agency's General Plan according to Section 65302(c) of the California Government Code. The Housing Element is considered to be the primary policy document for a community to guide the development, rehabilitation and preservation of its housing for all economic segments of the local population.

In February 2021, Urban Planning Partners, Inc. (UPP) was selected as the Town's consultant and began the process of reviewing the 2014-2022 Housing Element, collecting, and analyzing housing data such as population, housing and employment characteristics, the regional allocation of housing units, the characteristics of the housing market, and the housing needs of special populations to begin the preparation of the 2022-2030 Housing Element.

On December 3, 2021, the Public Draft Housing Element was made available for public review and comment with written comments being accepted through 5:00 p.m., January 4, 2022. Only grammatical corrections/typos were received from the public during that timeframe.

On January 18, 2022, the Draft Housing Element was forwarded to the State Dept of Housing & Community Development (HCD) for their initial 90-day review. A virtual meeting was conducted

with HCD staff regarding their preliminary review worksheet on March 18, 2022. As a result of that conversation, additional information was provided to HCD for their housing element review. Their final draft comments were received by staff on April 18, 2022. Two subsequent virtual meetings were held with HCD to review the comments in detail before beginning on the additional data analysis required in order to secure final certification of the Housing Element from HCD.

On April 15, 2022, the 30-day review period began for the Initial Study and Negative Declaration which was noticed in the newspaper and uploaded to the State Clearinghouse. The Initial Study & Negative Declaration covered both the Housing Element & the Safety Element Updates (still in initial review with Cal Fire). Comments were accepted until 12:00 p.m. on Monday May 16, 2022. There were no comments received from the public.

Analysis:

The draft housing element letter from HCD staff, received on April 18, 2022, indicated that the draft 2022-2030 Housing Element update would meet the statutory requirements of State Housing Element law with the additional analysis and program timeframe updates requested. Therefore, a final version of the Housing Element update is being presented to the Planning Commission, incorporating those items, for consideration and a recommendation to the Town Council for its adoption. Upon adoption, the Final Housing Element will be submitted to HCD for final certification.

Attached with the staff report for your review and consideration are copies of 1) the proposed final Town of Paradise 2022-2030 Housing Element Update and 2) its related proposed Initial Study and Negative Declaration document dated April 2022. In addition, a Planning Commission Resolution and several other documents are attached for your review and consideration.

Financial Impact:

There is no financial impact to the Town's General Fund to adopt a Resolution recommending Town Council adoption of the 2022-2030 Housing Element Update and associated Negative Declaration environmental document. If ultimately adopted by the Town Council, the cost associated with filing the Notice of Determination with the County Clerk for the Negative Declaration will be paid for out of the General Plan Update fund.

- Final Adoption Draft of the Town of Paradise Updated 2022-2030 Housing Element.

NOTICE OF PUBLIC HEARING
PARADISE PLANNING COMMISSION

NOTICE IS HEREBY GIVEN BY THE Paradise Planning Commission that a public hearing will be held on **May 24, 2022 at 6:00 p.m.** in the Paradise Town Council Chambers at Paradise Town Hall located at 5555 Skyway, Paradise, CA regarding the matter described below:

a. Item for which a Negative Declaration is proposed to be adopted

Town of Paradise Housing Element Update – The Planning Commission will hold a public hearing regarding the proposed Final Town of Paradise General Plan Housing Element update. The updated Housing Element is intended to address the housing needs of the Town of Paradise from 2022 to 2030. The State of California requires periodic updates of Housing Elements to address the necessary conditions for developing and preserving an adequate supply of housing for all income categories. The proposed Final Housing Element update analyzed the post-fire housing needs of the Town and aimed to develop goals, policies, and programs which create a more wildfire resilient housing inventory. It is the intent of Town staff to seek Town Council adoption of the updated Housing Element by June 15, 2022, and subsequently submit the adopted 2022-2030 Housing Element Update to the California State Department of Housing and Community Development for final certification.

The draft Housing Element and associated environmental document can be found online at https://www.townofparadise.com/planning/page/housing-element-2022 or a public view copy is available at the Building Resiliency Center located at 6295 Skyway. If you challenge this project in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the Paradise Planning Commission at, or prior to, the public hearing. For further information please contact the Planning Division at (530) 872-6291, extension 424.

Susan Hartman
Community Development Director

TOWN OF PARADISE

Date: April 13, 2022

Notice of Intent to Adopt a Negative Declaration/Initial Study for the Paradise Housing Element & Safety Element Update Projects

NOTICE IS HEREBY GIVEN by the Planning Director that a public hearing will be held on Tuesday, May 24, 2022 at 6:00 p.m. in the Town Hall Council Chambers, 5555 Skyway, Paradise, California, regarding the following project:

Lead Agency: Town of Paradise
5555 Skyway
Paradise, CA 95969

Project Title: **Town of Paradise Housing Element Update**

Project Location: The Town of Paradise is located in north central Butte County where the western slopes of the Cascade and Sierra Nevada ranges meet. The topography in the area is composed of mostly steeper canyons from the major drainages. The Town is situated at an elevation of between 1,500 and 2,200 feet.

Project Description: The Town of Paradise Housing Element update would revise the Town's Housing Element consistent with the requirements of state law.

Findings/Determination: The Town has reviewed and considered the proposed project and has determined that the project will not have a significant effect on the environment, with substantial supporting evidence provided in the Initial Study. The Town hereby prepares and proposes to adopt a Negative Declaration for this project.

Public Review Period: A 30-day public review period for the Negative Declaration/ Initial Study, which covers both the Housing Element & Safety Element updates, commenced on April 15, 2022 and will end on May 15, 2022 for interested individuals and public agencies to submit written comments on the document. Written comments on the Initial Study/ Negative Declaration should be sent to the attention of Susan Hartman, Community Development Director and must be received at 5555 Skyway, Paradise, CA 95969 by 12:00 PM on May 16, 2022. Copies of the Negative Declaration/Initial Study and the draft Town of Paradise Housing Element Update are available for review at the Town of Paradise Building Resiliency Center at 6295 Skyway, Paradise, CA 95969 or online at www.townofparadise.com/planning/page/housing-element-2022.

PARADISE PLANNING COMMISSION
RESOLUTION NO. 2022-02

A RESOLUTION OF THE PLANNING COMMISSION OF THE TOWN OF PARADISE RECOMMENDING TOWN COUNCIL ADOPTION OF THE TEXT AMENDMENT TO THE HOUSING ELEMENT (2022-2030 HOUSING ELEMENT) OF THE 1994 PARADISE GENERAL PLAN (Town of Paradise Housing Element 2022 Update)

WHEREAS, on December 10, 2020, the Butte County Association of Governments (BCAG) adopted the Butte County Regional Housing Needs Plan (RHNP): December 31, 2021 – June 15, 2030, establishing a housing allocation for the Town of Paradise that needs to be incorporated and appropriately addressed within the Housing Element of the 1994 Paradise General Plan, and;

WHEREAS, existing State housing element law requires the Town of Paradise to amend the Housing Element of its 1994 Paradise General Plan not only to make it consistent with the RHNP but also to become consistent with changes to State housing element law adopted from 2014 to 2022; and

WHEREAS, it is in the best interests of the Paradise citizenry that the 1994 Paradise General Plan include a Housing Element that is updated to be consistent with the RHNP and that has been determined by the State Department of Housing and Community Development (HCD) to be in compliance with State housing element law; and

WHEREAS, town staff with the assistance of a planning consultant hired by the Town of Paradise has generated a proposed 1994 Paradise General Plan amendment document (Housing Element 2022 Update) that proposes adoption of the 2022-2030 Housing Element as a text amendment to the 2014-2022 Housing Element in order to make it consistent with the RHNP and in compliance with current State housing element law; and

WHEREAS, the proposed 2022-2030 Housing Element has been circulated for review by the public and HCD consistent with the requirements of State housing element law; and

WHEREAS, the Town of Paradise determined that the Housing Element Update was subject to the California Environmental Quality Act (CEQA) and circulated a Notice of Intent to Adopt a Negative Declaration for the Housing Element and an Initial Study for public review; and

WHEREAS, the Paradise Planning Commission has conducted a public hearing, pursuant to California planning and zoning law concerning a proposed amendment to the 2014-2022 Housing Element text of the 1994 Paradise General Plan; and

WHEREAS, such public hearing also included review of potential environmental impacts associated with said amendment to the Paradise General Plan, pursuant to the requirements of the California Environmental Quality Act (CEQA); and

TOWN OF PARADISE
PARADISE PLANNING COMMISSION
RESOLUTION NO. 2022-02

WHEREAS, California Government Code Sections 65353 and 65354 require the Planning Commission to conduct a public hearing and notify the Town Council in writing of its recommendation; and

WHEREAS, the Planning Commission has considered the analysis and recommendations of town staff; has considered the 2022-2030 Housing Element, as revised in response to recent comments received from the State Department of Housing and Community Development; and has considered comments made at a public hearing conducted by the Planning Commission; and on the basis thereof has determined pursuant to Government Code Section 65358 that a certain amendment to the 1994 Paradise General Plan that would replace the 2014-2022 Housing Element with the 2022-2030 Housing Element in order to attain compliance consistency with the RHNP as well as with current State housing element law is not only in the public interest but also would be internally consistent with the remainder of the Paradise General Plan.

NOW, THEREFORE, BE IT RESOLVED BY THE PARADISE PLANNING COMMISSION AS FOLLOWS:

SECTION 1. The Planning Commission hereby recommends that the Town Council certify and adopt the proposed Initial Study and Negative Declaration document as it relates to the proposed Town of Paradise Housing Element 2022 Update; and

SECTION 2. The Planning Commission further recommends that the Town Council adopt the amendment to the Housing Element (2022-2030 Housing Element) of the 1994 Paradise General Plan known as Town of Paradise Housing Element 2022 Update in order to make the Paradise Housing Element consistent with the RHNP and current State housing element law, which amendment is set forth in Exhibit "A" attached hereto.

PASSED AND ADOPTED by the Planning Commission of the Town of Paradise this 24th day of May, 2022, by the following vote:

Town of Paradise
Town Council Meeting Agenda
6:00 PM – June 14, 2022

Town of Paradise Council Chamber – 5555 Skyway, Paradise, CA

Mayor, Steve Crowder
Vice Mayor, Greg Bolin
Council Member, Steve "Woody" Culleton
Council Member, Jody Jones
Council Member, Rose Tryon

Town Manager, Kevin Phillips
Town Attorney, Scott E. Huber
Town Clerk, Dina Volenski
CDD, Planning & Onsite, Susan Hartman
CDD, Building & Code Enforcement, Tony Lindsey
Finance Director/Town Treasurer – Ross Gilb
Public Works Director/Town Engineer, Marc Mattox
Division Chief, CAL FIRE/Paradise Fire, Garrett Sjolund
Chief of Police, Eric Reinbold
Recovery & Economic Development Director, Colette Curtis
Human Resources & Risk Management Director, Crystal Peters
Information Systems Director, Luis Marquez

Meeting Procedures

I. The Mayor is the Presiding Chair and is responsible for maintaining an orderly meeting. The Mayor calls the meeting to order and introduces each item on the agenda.

II. The Town staff then provides a report to Council and answers questions from the Council.

III. Citizens are encouraged to participate in the meeting process and are provided several opportunities to address Council. Any speaker addressing the Council is limited to three minutes per speaker - fifteen minutes per agenda item

A. If you wish to address the Council regarding a specific agenda item, please complete a "Request to Address Council" card and give it to the Town Clerk prior to the beginning of the meeting. This process is voluntary and allows for citizens to be called to the speaker podium in alphabetical order. Comments and questions from the public must be directed to the Presiding Chair and Town Council Members (please do not address staff.) Town staff is available to address citizen concerns Monday through Thursday at Town Hall between the hours of 8am and 5pm.

B. If you wish to address Council regarding an item not on the agenda, you may do so under Item 4, "Public Communication." Again, please fill out a card and give it to the Town Clerk before the meeting. State Law prohibits Council action on items not listed on a public agenda.

In compliance with the Americans with Disabilities Act (ADA) Compliance, persons who need special accommodations to participate in the Town Council meeting may contact the Town Clerk at least three business days prior to the date of the meeting to provide time for any such accommodation.

1. OPENING

1a. Call to Order
1b. Pledge of Allegiance to the Flag of the United States of America
1c. Invocation
1d. Roll Call

1e. Presentation by CalFire/Paradise Fire Chief - Patrick Purvis

1f. Camp Fire recovery updates - Written reports are included in the agenda packet:

P5 Colette Curtis, Recovery and Economic Development Director - Recovery projects, Advocacy, Economic Recovery and Development, Communications and Emergency Operations.

P8 Marc Mattox, Public Works Director/Town Engineer - Infrastructure and Sewer Update

p10Tony Lindsey, CDD-Building and Code Enforcement - Code Enforcement Update

2. CONSENT CALENDAR

One roll call vote is taken for all items. Consent items are considered to be routine business that does not call for discussion.

2a. p14 Approve minutes from the May 10, 2022, Special and Regular meetings and the May 31, 2022 Special meeting.

2b. p25 Approve May 2022 Cash Disbursements in the amount of $3,398,869.57.

2c. p33 1. Adopt Resolution No. 2022-____, “A Resolution of Intention of the Town Council of the Town of Paradise to Set a Public Hearing to Consider Naming an Existing Private Access Easement off Pentz Road, Located in the Town of Paradise. Petitioner: Travis Thomsen, et al”; or, 2. Adopt a motion to continue the matter to a date certain and direct staff to provide any additional desired information pertaining to the requested road name; or, 3. Adopt a motion to deny adoption of Town Resolution No. 2022-____.

2d. p37 Waive second reading of Town Ordinance No. 618 and approve reading by title only; and, Adopt Town Ordinance No. 618, "An Ordinance Amending Chapter 8.58.060 to the Paradise Municipal Code Relating to Defensible Space and Hazardous Fuel Management".

2e. Approve an amended and restated professional services agreement with Kevin Phillips for Town Manager services with an expiration date of June 30, 2025 and authorize the Mayor to execute the agreement.

3. ITEMS REMOVED FROM CONSENT CALENDAR

4. PUBLIC COMMUNICATION

For matters that are not on the Council business agenda, speakers are allowed three (3) minutes to address the Council. The Town Council is prohibited from taking action on matters that are not listed on the public agenda. The Council may briefly respond for clarification and may refer the matter to the Town staff.

5. PUBLIC HEARINGS

For items that require a published legal notice and/or a mailed notice.

Public Hearing Procedure:

A. Staff Report
B. Mayor opens the hearing for public comment in the following order:
    i. Project proponents (in favor of proposal)
    ii. Project opponents (against proposal)
    iii. Rebuttals – if requested
C. Mayor closes the hearing
D. Council discussion and vote

5a. p46 1. Conduct the duly noticed and scheduled public hearing and concur with the recommended actions adopted by the Planning Commission of May 24, 2022, and embodied within Planning Commission Resolution No. 2022-02; and, 2. Certify and adopt the proposed Initial Study and Negative Declaration document as it relates to the proposed 2022-2030 Town of Paradise Housing Element Update; and, 3. Adopt Town of Paradise Resolution No. 2022-_____, "A Resolution of the Town Council of the Town of Paradise Adopting an Amendment to the Housing Element (2022-2030 Housing Element) of the 1994 Paradise General Plan"; or, 4. Provide alternative direction to town staff. (ROLL CALL VOTE)

6. COUNCIL CONSIDERATION

Action items are presented by staff and the vote of each Council Member must be announced. A roll call vote is taken for each item on the action calendar. Citizens are allowed three (3) minutes to comment on agenda items.

6a. p. 424 After discussion consider waiving the first reading of Town Ordinance No. ____ and read by title only [roll call vote]; and, 1. Introduce Town Ordinance No. ____, "An Ordinance of the Town Council of the Town of Paradise Amending Text Regulations within Paradise Municipal Code Chapter 8.08 [Solid Waste] and Adding Article 1 Regarding Mandatory Municipal MSW, Recyclable Material, and Organic Waste Disposal Reduction Consistent with New State Law Requirements"; or 2. Provide alternative direction to town staff. (ROLL CALL VOTE)

6b. p474 Discuss and consider concurring with staff's recommendation to select P31 Enterprises of Oroville, CA to perform arborist services for the Category 4 Tree Removal Program; and, approve the attached Professional Services Agreement with P31 Enterprises and authorize the Town Manager and Town Mayor to execute the agreement. (ROLL CALL VOTE)

6c. p491 Discuss and consider approving the Principals of Agreement between the Town of Paradise and City of Chico developed by the Sewer Regionalization Project Advisory Committee. The Inter-Municipal Agreement between the Town and City will utilize the approved Principals of Agreement. (ROLL CALL VOTE)

6d. p503 Consider approving the 2022 Storm Drain Master Plan (SDMP) prepared by Wood Rodgers, including deliverables of the Town-wide Master Drainage Study, field evaluation and monitoring of storm drain systems and drainageways, Flood Risk Modeling, field condition

assessment, data computation, project prioritization criteria, updating and expanding flood risk modeling for 10 and 100-year storm events (Special Permit Zones), the evaluation of drainage system condition and capacity deficiencies, and a prioritized project list and costs. (ROLL CALL VOTE) The Storm Drain Master Plan is too large to include in the agenda packet. Below is a link to review the document online. A public view copy is available at the Town Clerk's window at Town Hall, 5555 Skyway, Paradise, CA 95969, for review. Link to the SDMP: https://bit.ly/3trfPEB

6e. p509 Consider adopting the attached Resolution No. 2022- ___, "A Resolution of the Town Council of the Town of Paradise Declaring An Emergency And Authorizing Repair or Replacement of The Stearns Road 72" Culvert Without Observance Of Public Bidding Requirements"; and Authorize the Town Manager to execute agreements for a contractor and/or materials for the subject project. (ROLL CALL VOTE)

6f. p516 Consider adopting Resolution No. 2022-__, "A resolution of the Town Council of the Town of Paradise Awarding Contract No. 7303.21.CON, On-System Roadway Rehabilitation –Skyway (Phase 1) to Baldwin Contracting Company, Inc. dba Knife River Construction in the amount of their base bid plus additive bid #1; and, Authorize the Town Manager to execute an agreement with Baldwin Contracting Company, Inc. dba Knife River Construction in the amount of their base bid plus additive bid #1 relating to Contract No. 7303.1.CON and to approve contingency expenditures not exceeding 10%. (ROLL CALL VOTE)

7. COUNCIL INITIATED ITEMS AND REPORTS

7a. Council initiated agenda items

7a1. Discuss changing the Town of Paradise Ordinance No. 618 prohibiting the use of power tools, potentially defined as metal bladed power tools that could cause combustion during a red flag warning issued by the Weather Service. (CROWDER)

7b. Council reports on committee representation

7c. Future Agenda Items

8. STAFF COMMUNICATION

8a. Town Manager Report

8b. Community Development Director

9. CLOSED SESSION - None

10. ADJOURNMENT

STATE OF CALIFORNIA) SS.
COUNTY OF BUTTE)

I declare under penalty of perjury that I am employed by the Town of Paradise in the Town Clerk's Department and that I posted this Agenda on the bulletin Board both inside and outside of Town Hall on the following date:

_____

_____
TOWN/ASSISTANT TOWN CLERK SIGNATURE

TOWN OF PARADISE
RESOLUTION NO. 2022-39

A RESOLUTION OF THE TOWN COUNCIL OF THE TOWN OF PARADISE ADOPTING AN AMENDMENT TO THE HOUSING ELEMENT (2022-2030 HOUSING ELEMENT) OF THE 1994 PARADISE GENERAL PLAN: TOWN OF PARADISE HOUSING ELEMENT 2022

WHEREAS, on December 10, 2020, the Butte County Association of Governments (BCAG) adopted the Butte County Regional Housing Needs Plan (RHNP): December 31, 2021 – June 15, 2030, establishing a housing allocation for the Town of Paradise that needs to be incorporated and appropriately addressed within the Housing Element of the 1994 Paradise General Plan, and;

WHEREAS, existing State housing element law requires the Town of Paradise to amend the Housing Element of its 1994 Paradise General Plan not only to make it consistent with the RHNP but also to become consistent with changes to State housing element law adopted from 2014 to 2022; and

WHEREAS, it is in the best interests of the Paradise citizenry that the 1994 Paradise General Plan include a Housing Element that is updated to be consistent with the RHNP and that has been determined by the State Department of Housing and Community Development (HCD) to be in compliance with State housing element law; and

WHEREAS, town staff with the assistance of a planning consultant hired by the Town of Paradise has generated a proposed 1994 Paradise General Plan amendment document (2022-2030 Housing Element) that proposes adoption of the 2022-2030 Housing Element as a text amendment to the 2014-2022 Housing Element in order to make it consistent with the RHNP and in compliance with current State housing element law; and

WHEREAS, the Paradise Planning Commission and the Paradise Town Council have conducted public hearings, pursuant to California planning and zoning law concerning a proposed amendment to the 2014-2022 Housing Element text of the 1994 Paradise General Plan; and

WHEREAS, such public hearing also included review of potential environmental impacts associated with said amendment to the Paradise General Plan, pursuant to the requirements of the California Environmental Quality Act (CEQA); and

WHEREAS, California Government Code Sections 65358 allows a legislative body to amend its General Plan; and

WHEREAS, the action of the Town Council is pursuant to the requirements of Government Code Sections 65090 and 65355; and

WHEREAS, the Town Council has considered the analysis and recommendations of town staff; has received and considered the recommendation of the Planning Commission via adopted Planning Commission Resolution No. 2022-02 in response to recent comments

TOWN OF PARADISE
RESOLUTION NO. 2022-39

received from the State Department of Housing and Community Development; and has considered comments made at a public hearing conducted by the Town Council; and on the basis thereof has determined pursuant to Government Code Section 65358 that a certain amendment to the 1994 Paradise General Plan that would replace the 2014-2022 Housing Element with the 2022-2030 Housing Element in order to attain compliance consistency with the RHNP as well as with current State housing element law is not only in the public interest but also would be internally consistent with the remainder of the Paradise General Plan.

NOW, THEREFORE, BE IT RESOLVED BY THE PARADISE TOWN COUNCIL AS FOLLOWS:

SECTION 1. The Town Council hereby adopts and certifies that the Initial Study and Negative Declaration document as it relates to the proposed Town of Paradise Housing Element 2022 Update has been completed in compliance with CEQA; and

SECTION 2. The Town Council hereby adopts the amendment to the Housing Element (2022-2030 Housing Element) of the 1994 Paradise General Plan known as Town of Paradise Housing Element 2022 Update in order to make the Paradise Housing Element consistent with the RHNP and current State housing element law, which amendment is set forth in Exhibit "A" attached hereto. Town Council authorizes the Town Manager, or his designee, to make non-substantive changes to any additional edits requested by HCD for certification.

PASSED AND ADOPTED by the Town Council of the Town of Paradise this 14th day of June, 2022, by the following vote:

AYES:	Greg Bolin, Steve "Woody" Culleton, Jody Jones, Rose Tryon and Steve Crowder, Mayor
NOES:	None

C

Regulatory Framework

C Regulatory Framework

C.1 Introduction

This regulatory framework presents the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to each environmental resource topic analyzed in the Paradise Sewer Project Environmental Impact Report (EIR), Chapter 3, Environmental Impact Analysis. This regulatory framework is applicable to construction, operation, and maintenance of the Proposed Project. This regulatory framework is needed provide regulatory context and background for each resource area in order to determine if the Proposed Project would be consistent with federal state and local regulations and to assess environmental impacts.

C.2 Agriculture and Forestry Resources

This section summarizes the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of agriculture and forestry resources in the EIR, Section 3.2.

C.2.1 Federal

Farmland Protection Policy Act

Congress enacted the Farmland Protection Policy Act (FPPA) as part of the Agriculture and Food Act of 1981. The US Department of Agriculture's Natural Resources Conservation Service is responsible for implementation of the FPPA. The FPPA is intended to minimize the impact federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. The FPPA assures that federal programs are administered in a manner that is compatible with state, local, and private programs designed to protect farmland. Federal agencies are required to develop and review their policies and procedures to implement the FPPA every two years. The FPPA does not authorize the federal government to regulate the use of private or non-federal land or, in any way, affect the property rights of owners.

For the purposes of the FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to the FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land.

Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency. Activities that may be subject to FPPA include:

- State highway construction projects (through the Federal Highway Administration)
- Airport expansions
- Electric cooperative construction projects
- Railroad construction projects

- Telephone company construction projects
- Reservoir and hydroelectric projects
- Federal agency projects that convert farmland
- Other projects completed with federal assistance

C.2.2 State

California Department of Conservation

The California Department of Conservation (DOC) provides services and information that promote environmental health, economic vitality, informed land-use decisions, and sound management of the state's natural resources. The DOC administers and supports a number of programs, including the Williamson Act, the California Farmland Conservancy Program, the Williamson Act Easement Exchange Program, and the Farmland Mapping and Monitoring Program (FMMP). These programs are designed to preserve agricultural land and provide data on conversion of agricultural land to urban use.

Farmland Mapping and Monitoring Program

The FMMP produces maps and statistical data used for analyzing impacts on California's agricultural resources. The maps are updated every 2 years using a computer mapping system, aerial imagery, public review, and field reconnaissance. Agricultural land is rated according to soil quality and irrigation status. The following categories are mapped by the DOC (DOC 2021b):

The FMMP categories mapped by the DOC include the following (DOC 2021a):

- **Prime Farmland:** This farmland has the best combination of physical and chemical features able to sustain long-term agricultural production. Prime Farmland has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agriculture production at some time during the 4 years prior to the mapping date.
- **Farmland of Statewide Importance:** This farmland is similar to Prime Farmland, but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
- **Unique Farmland:** Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the 4 years prior to the mapping date.
- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
- **Grazing Land:** Land on which the existing vegetation is suited to the grazing of livestock.

- **Urban and Built-up Land:** Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. This land is used for residential, industrial, commercial, construction, institutional, public administration, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, water control structures, and other developed purposes.
- **Other Land:** Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines, borrow pits; and waterbodies smaller than forty acres. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land.

Williamson Act

The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, is a non-mandated state program, administered by counties and cities to preserve agricultural land and discourage the premature conversion of agricultural land to urban uses. The act authorizes local governments and property owners to (voluntarily) enter into contracts to commit agricultural land to specified uses for 10 or more years. Once restricted, the land is valued for taxation based on its agricultural income rather than unrestricted market value, resulting in a lower tax rate for owners. In return, the owners guarantee that these properties remain under agricultural production for an initial 10-year period. The contract is renewed automatically unless the owner files a notice of nonrenewal, thereby maintaining a constant 10-year contract.

Z'berg-Nejedly Forest Practice Act

The Z'berg-Nejedly Forest Practice Act of 1973 established a set of rules known as the Forest Practice Rules to be applied to forest management-related activities (e.g., timber harvests, timberland conversions, fire hazard removal) on privately owned timberlands in California. They are intended to ensure that timber harvesting is conducted in a manner that will preserve and protect fish, wildlife, forests, and streams. Under the Forest Practice Act, a Timber Harvesting Plan is submitted to the California Department of Forestry and Fire Protection by the landowner outlining what timber is proposed to be harvested, the harvesting method, and the steps that will be taken to prevent damage to the environment.

C.2.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* includes the following agriculture-related policies:

- **Policy OCEP-31:** Retention of agricultural lands within the town limits should be encouraged while recognizing that changing circumstances may necessitate a change in use for some lands.
- **Policy OCEP-32:** Significantly important agricultural and timber production lands, particularly those located in the secondary and tertiary planning areas, shall be identified and protected from incompatible development.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to agriculture and forestry resources:

- **Policy LU-P13.1:** Maintain the Chico Area Greenline, which shall be located as shown on Figure LU-7.
- **Policy LU-P13.3:** Recognize the Chico Area Greenline as the boundary between the "Urban Side of the Chico Area Greenline" and the "Agricultural Side of the Chico Area Greenline."
- **Policy LU-P13.7:** Conserve and protect for agricultural use the lands in the Chico area that are situated on the Agricultural Side of the Chico Area Greenline.
- **Policy COS-P11.3:** Urban development shall not limit the financial sustainability of timber operations.
- **Policy COS-P11.6:** Public facilities shall generally not be located in the Timber Production Zone if the facility would have a significant adverse effect on the production of timber unless alternative sites for an essential public use cannot be located elsewhere.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policies related to agriculture:

- **Policy OS-5.1, Urban/Rural Boundary:** Protect agriculture by maintaining the Greenline between urban and rural uses.
- **Policy OS-5.2, Agricultural Resources:** Minimize conflicts between urban and agricultural uses by requiring buffers or use restrictions.
    - **Action OS-5.2.1, Agricultural Buffers:** Require buffers for development adjacent to active agricultural operations along the Greenline to reduce incompatibilities and explore opportunities for public uses within buffers.

C.3 Air Quality

This section summarizes the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of air quality in the EIR, Section 3.3.

C.3.1 Federal

Federal Clean Air Act and National Ambient Air Quality Standards

The Federal Clean Air Act (FCAA; 42 USC Section 7401), as amended, is the primary federal law governing air quality. The FCAA is regulated by the USEPA, which sets standards for the concentration of pollutants in the air. At the federal level, these standards are called National Ambient Air Quality Standards (NAAQS). NAAQS standards have been established for six criteria air pollutants that have been linked to potential health concerns: CO, NO_2, O_3, SO_2, PM_{10}, $PM_{2.5}$. In addition, national standards exist for Pb. The NAAQS standards are set at levels that protect public

health with a margin of safety and are subject to periodic review and revision. The federal regulatory schemes also cover TACs.

The FCAA requires USEPA to designate areas as attainment, nonattainment, or maintenance (an area that was previously nonattainment and is currently attainment) for each criteria pollutant based on whether the NAAQS have been achieved. The federal standards are summarized in Table C.3-1.

The FCAA requires each state to prepare an air quality control plan referred to as the State Implementation Plan (SIP). USEPA is responsible for implementing the programs established under the FCAA, programs such as establishing and reviewing the federal ambient air quality standards and judging the adequacy of SIPs. If a state contains areas that violate the national standards, the FCAA requires the State to revise its SIP to incorporate additional control measures to reduce air pollution. USEPA has authorized States such as California with air programs that meet or exceed federal standards to implement many of the federal programs while retaining an oversight role.

Table C.3-1. State and Federal Ambient Air Quality Attainment Status for Butte County

Pollutant	Averaging Time	State Standard[1]	Federal Standard[2]	SVAB Attainment Status
O_3 [3]	1 hour 8 hours	0.09 ppm 0.070 ppm	--- 0.070 ppm (4thhighest in 3 years)	Federal: Nonattainment (8-hour) State: Nonattainment (1-hour and 8-hour)
CO	1 hour 8 hours 8 hours (Lake Tahoe)	20 ppm 9.0 ppm 6 ppm	35 ppm 9 ppm ---	Federal: Attainment State: Attainment
PM_{10} [4]	24 hours Annual	50 µg/m^3 20 µg/m^3	150 µg/m^3 ---	Federal: Attainment (24-hour) No Standard (Annual) State: Nonattainment (24-hour) Attainment (Annual)
$PM_{2.5}$ [4]	24 hours Annual Secondary Standard (annual)	--- 12 µg/m^3 ---	35 µg/m^3 12.0 µg/m^3 15 µg/m^3 (98th percentile over 3 years)	Federal: Attainment (24-hour and Annual) State: No standard (24-hour) Nonattainment (Annual)
NO_2 [5]	1 hour Annual	0.18 ppm 0.030 ppm	100 ppb (98th percentile over 3 years) 0.053 ppm	Federal: Attainment State: Attainment
SO_2 [6]	1 hour 3 hours 24 hours Annual Arithmetic	0.25 ppm ---- 0.04 ppm ----	75 ppb (99th percentile over 3 years) 0.5 ppm 0.14 ppm [6]	Federal: Attainment State: Attainment

Pollutant	Averaging Time	State Standard[1]	Federal Standard[2]	SVAB Attainment Status
	Mean		0.03 ppm [6]	
Pb [7,8]	Monthly Calendar Quarter Rolling 3-month average	1.5 µg/m^3 ---- ----	---- 1.5 µg/m^3 [7] 0.15 µg/m^3	Federal: Attainment State: Attainment
Sulfate	24 hours	25 µg/m^3	No federal standards	Federal: N/A State: Attainment
Hydrogen Sulfide	1 hour	0.03 ppm	No federal standards	Federal: N/A State: Unclassified
Vinyl Chloride[7]	24 hours	0.01 ppm	No federal standards	Federal: N/A State: No designation
Visibility Reducing Particles[9]	8 hours	See footnote 9	No federal standards	Federal: N/A State: Unclassified

Sources: ARB 2016, ARB 2021, BCAQMD 2018.

1 California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2 National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the USEPA for further clarification and current national policies.

3 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 ppm to 0.070 ppm.

4 On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

5 To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

6 On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

[7] The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[8] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[9] In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

NAAQS = National Ambient Air Quality Standards; DPM = diesel particulate matter; CO = carbon monoxide; NO_2 = nitrogen dioxide; NO_X = oxides of nitrogen; O_3 = ozone; Pb = lead; $PM_{2.5}$ = particles of 2.5 micrometers and smaller; PM_{10} = particles of 10 micrometers and smaller; SO_2 = sulfur dioxide; SO_X = sulfur oxides; $\mu g/m^3$ = micrograms per cubic meter; ppb = parts per billion; ppm = parts per million; SVAB = Sacramento Valley Air Basin; SIP = state implementation plan; TACs = toxic air contaminants, N/A = not applicable

Non-Road Diesel New Engine and Fuel Standards

The USEPA has adopted multiple tiers of emission standards for non-road (or off-road) diesel engines. The non-road standards cover mobile non-road diesel engines of all sizes used in a wide range of construction, agricultural and industrial equipment. The first federal standards, Tier 1, were adopted in 1994. Tier 2 standards were adopted in 2001, Tier 3 in 2006, and final Tier 4 standards in 2014. The federal emission standards for non-road diesel engines are established in advancing tiers that progressively become more stringent (i.e., the higher the tier, the lower the emissions). Currently, the most stringent is Tier 4. The Tier 4 emissions standards have more stringent NO_X, particulate matter, and hydrocarbon limits than the lower tiers. The CO emission limits for Tier 4 standards remain unchanged from the Tier 2 and Tier 3 standards.

National Emission Standards for Hazardous Air Pollutants

National Emission Standards for Hazardous Air Pollutants are stationary source standards for hazardous air pollutants (40 CFR 63). Hazardous air pollutants are those pollutants that are known or suspected to cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental effects (USEPA 2021d).

C.3.2 State

California Clean Air Act and California Ambient Air Quality Standards

In California, the California Clean Air Act (CCAA) is administered by the ARB at the state level and by the air quality management districts and air pollution control districts at the regional and local levels (air districts). ARB is responsible for meeting the state requirements of the FCAA, administering the CCAA, establishing the California Ambient Air Quality Standards (CAAQS), and establishing motor vehicle emissions standards. The CCAA requires all air districts in the state to endeavor to achieve and maintain the CAAQS.

CAAQS are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. ARB is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. ARB also establishes passenger vehicle fuel specifications. ARB oversees the functions of air districts, which in turn

administer air quality activities at the regional and county levels. The state standards are summarized in Table C.5-1.

The CCAA requires ARB to designate areas in California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data show that a state standard for the pollutant was violated at least once during the previous 3 calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment.

California State Implementation Plan

The 1990 amendments to the FCAA set new deadlines for attainment based on the severity of the pollution problem and launched a comprehensive planning process for attaining the NAAQS. The promulgation of the national 8-hour ozone standard and the fine particulate matter standards in 1997 resulted in additional statewide air quality planning efforts. In response to new federal regulations, SIPs began to address ways to improve visibility in national parks and wilderness areas. SIPs are not single documents, but rather a compilation of new and previously submitted plans, programs, district rules, state regulations, and federal controls.

Many of California's SIPs rely on the same core set of control strategies, including emission standards for cars and heavy trucks, fuel regulations, and limits on emissions from consumer products. State law makes ARB the lead agency for all purposes related to the SIPs. Local air districts and other agencies prepare SIP elements and submit them to ARB for review and approval. ARB then forwards SIP revisions to EPA for approval and publication in the *Federal Register*. CFR Title 40, Chapter I, Part 52, Subpart F, Section 52.220 lists all of the items that are included in the California SIP.

Health Impacts of Regional Criteria Air Pollutants

In December 2018, the California Supreme Court released a decision in *Sierra Club v. County of Fresno*, 6 Cal. 5th 502, also known as the Friant Ranch Case, finding that CEQA requires that a connection be drawn between project emissions and human health impacts.

As explained in the amicus curiae brief submitted by the San Joaquin Valley Air Pollution Control District for the Friant Ranch case, air district significance thresholds were set at emissions levels tied to the region's attainment status; they are emissions levels at which stationary pollution sources permitted by air districts must offset their emissions and CEQA projects must use feasible mitigation measures, and they are not intended to indicate any localized human health impact that a project may have. Therefore, a project's exceedance of the air district's mass regional emission thresholds does not necessarily indicate that the project would cause or contribute to the exposure of sensitive receptors to ground-level concentrations of ozone greater than health-protective levels.

As suggested in the amicus curiae brief submitted for the Friant Ranch case, given the complexity of ozone formation and the current state of environmental science modeling, it is infeasible to determine whether, or the extent to which, a single project's emissions of precursors (NOX and ROG) would result in the formation of secondary ground-level ozone, and to identify the geographic and temporal distribution of such secondary formed emissions. Furthermore, available models today are designed to determine regional, population-wide health impacts, and cannot accurately quantify

ozone-related health impacts caused by project-related NOX or ROG emissions on the local (project) level. Therefore, it is infeasible to connect ozone precursor emissions at a project level to ozone-related health impacts.

Mobile Source Toxics and Toxic Air Contaminants

California regulates TACs primarily through Assembly Bill (AB) 1807, Toxic Air Contaminant Identification and Control Act (Tanner Act) and AB 2588, Air Toxics “Hot Spots” Information and Assessment Act of 1987 (Hot Spots Act). The Tanner Act sets forth a formal procedure for ARB to designate substances as toxic air contaminants (TAC). Once a TAC is identified, ARB adopts an “airborne toxics control measure” for sources that emit designated TACs. If there is a safe threshold for a substance (a point below which there is no toxic effect), the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate best available toxics control technology to minimize emissions.

Under the Hot Spots Act, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High-priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

The ARB adopted a comprehensive Diesel Risk Reduction Plan in September 2000 to reduce emissions from both new and existing diesel-fueled engines and vehicles. The ARB has also adopted regulations to reduce emissions from both on-road and off-road heavy-duty diesel vehicles (for example, equipment used in construction). These regulations, known as airborne toxic control measures, reduce the idling of school buses and other commercial vehicles, control DPM, and limit the emissions of ocean-going vessels in California waters. The regulations also include measures to control emissions of air toxics from stationary sources.

C.3.3 Regional and Local

Butte County Air Quality Management District

BCAQMD is the air quality regulating authority in Butte County, which adopts and enforces controls on stationary sources of air pollutants through its permit and inspection programs. BCAQMD is responsible for ensuring that NAAQS and CAAQS are not violated within Butte County. Responsibilities of BCAQMD include monitoring air quality, preparing clean air plans, and responding to citizen complaints concerning air quality.

Air Quality Attainment Plan**.** The *Northern Sacramento Valley Planning Area 2018 Triennial Air Quality Attainment Plan* (2018 Air Quality Attainment Plan) (Sacramento Valley Air Quality Engineering and Enforcement Professionals [SVAQEEP] 2018) is the most recent air quality attainment plan applicable to Butte County. The air districts for the counties located in the northern portion of the Sacramento Valley together establish the Northern Sacramento Valley Planning Area. The Northern Sacramento Valley Planning Area air districts were designated as nonattainment for the ozone CAAQS and agreed to jointly prepare the 2018 Air Quality Attainment Plan. The plan assesses the progress made in implementing the previous triennial update and proposes modifications to the strategies necessary to attain the CAAQS by the earliest practicable date. The 2018 Air Quality Attainment Plan includes an assessment of progress towards achieving the control

measure commitments in the previous triennial plan, a summary of the last 3 years of ozone data, a comparison of the expected versus actual emission reductions for each measure committed to in the previous triennial plan, updated control measure commitments, and updated growth rates of population, industry, and vehicle related emissions.

Regulations and Rules. The BCAQMD develops regulations to improve air quality and protect the health and welfare of Butte County residents and their environment. BCAQMD rules and regulations (BCAQMD 2014) applicable to the Proposed Project include, but are not limited to, the following:

- **Regulation II, Rule 200, Nuisance:** No person shall discharge from any non-vehicular source such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health, or safety of any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property.

- **Regulation II, Rule 201, Visible Emissions:** A person shall not discharge into the atmosphere from any single source of emission whatsoever, any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

    - As dark or darker in shade as that designated as No. 2 on the Ringelmann Chart, as published by the U.S. Bureau of Mines, or

    - Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described above.

- **Regulation II, Rule 202, Particulate Matter Concentration:** A person shall not discharge into the atmosphere from any source particulate matter in excess of 0.3 grains per cubic foot of gas at standard conditions.

- **Regulation II, Rule 205, Fugitive Dust Emissions:** No person shall cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area such that:

- **Regulation IV, Rule 400, Permit Requirements:** Requires any person constructing, altering, or operating a source that emits or may emit air contaminants to obtain an Authority to Construct or Permit to Operate from the Air Pollution Control Officer and to provide an orderly procedure for application, review, and authorization of new sources and of the modification and operation of existing sources of air pollution.

- **Regulation IV, Rule 430, State New Source Rule:** Establishes pre-construction review requirements for new and modified stationary sources of air pollution for use of Best Available Control Technology (BACT), offsets, and analysis of air quality impacts, and to ensure that the operation of such sources does not interfere with the attainment or maintenance of ambient air quality standards and complies with all other applicable BCAQMD Rules and Regulations.

CEQA Guidelines. The *CEQA Air Quality Handbook* (BCAQMD 2014) includes analysis requirements for construction and operational emissions. Table C.3-2 summarizes BCAQMD's thresholds for criteria air pollutants and TACs. Thresholds for criteria air pollutants are based upon

BCAQMD's Rule 430, State New Source Review, which incorporates stationary permitting significance thresholds for ambient air quality standards as required by California Health and Safety Code Section 40918. BCAQMD has only established thresholds of significance for criteria air pollutants; while it provides guidance with regards to impacts related to TACs.

Table C.3-2. BCAQMD Thresholds of Significance

Pollutant	Construction-related	Operational-Related
ROG	137 lb/day, not to exceed 4.5 tons/year	25 lb/day
NO_X	137 lb/day, not to exceed 4.5 tons/year	25 lb/day
PM_{10}	80 lb/day	80 lb/day
New Source TAC Risk and Hazards – Individual Project	Same as Recommended Operational Thresholds	No Adopted Threshold. Recommended Thresholds: Increased Cancer Risk > 10 in one million Increased Non-Cancer Risk of > 1.0 Hazard Index (Chronic or Acute) Ambient Diesel $PM_{2.5}$ > 0.3 µg/m^3 annual average Zone of Influence: 1,000-foot radius from parcel(s) of source or receptor
New Source TAC Risk and Hazards – Cumulative Impacts	Same as Recommended Operational Thresholds	No Adopted Threshold. Recommended Thresholds: Cancer Risk > 10 in a million from all local sources Non-Cancer Risk > 1.0 Hazard Index (from all local sources – chronic) Diesel $PM_{2.5}$ > 0.8 µg/m^3 annual average Zone of Influence: 1,000-foot radius from parcel(s) of sources or receptors

Source: BCAQMD 2014

Notes: ROG = reactive organic gases, NO_X = nitrogen oxides, PM_{10} = particles of 10 micrometers and smaller, $PM_{2.5}$ = particles of 2.5 micrometers and smaller, TAC = toxic air contaminant, lb = pounds, µg/m^3 = micrograms per cubic meter

Odors. Offensive or strong odors may come from a wide variety of temporary and more or less permanent sources: exhaust from heavy equipment, garbage dumpsters, restaurants, animal boarding facilities, feed lots and general agricultural operations, food processing, compost/green waste and wastewater treatment facilities, rendering plants, various industrial processes, landfills, painting/coating operations, and others.

Pollutants associated with odors such as sulfur compounds and methane can be a nuisance to healthy people and can trigger asthmatic conditions in people with sensitive airways. Given the somewhat subjective nature of human response to odors, BCAQMD does not provide quantitative or formulaic methods to evaluate the presence of an impact. While most odors are highly dispersive, the significance of an odor impact is generally related to its intensity with distance from the source. Table C.3-3 presents BCAQMD's screening distances for various odors sources.

Table C.3-3. BCAQMD Screening Levels for Potential Odor Sources

Type of Facility	Screening Distance (miles)
Wastewater Treatment Plant	2
Wastewater Pumping Facilities	1
Sanitary Landfill	1
Transfer Station	1

Type of Facility	Screening Distance (miles)
Composting Facility	2
Petroleum Refinery	2
Asphalt Batch Plant	2
Chemical Manufacturing	1
Fiberglass Manufacturing	1
Painting/Coating Operations	1
Rendering Plant	4
Coffee Roaster	1
Food Processing Facility	1
Feed Lot/Dairy	1
Green Waste and Recycling Operations	2
Metal Smelting Plants	1

Town of Paradise 1994 General Plan

The Open Space/Conservation/Energy Element of the *Town of Paradise 1994 General Plan* includes the following goals and objective pertaining to air quality:

- **Goal CG-5**: Maintain and improve local and regional air quality.
- **Objective OCEO-8**: Comply with the standards, provisions, and objectives of the Butte County Air Quality Attainment Plan.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to air quality:

- **Policy COS-P5.2:** Developers shall implement best available mitigation measures to reduce air pollutant emissions associated with the construction and operation of development projects.
- **Policy COS-P5.6:** New sources of toxic air pollutants shall comply with the permitting requirements of the BCAQMD and Section 44300 et. Seq. of the California Health and Safety Code.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policy and actions related to air quality:

- **Policy OS-4.1, Air Quality Standards:** Work to comply with state and federal ambient air quality standards and to meet mandated annual air quality reduction targets.
    - **Action OS-4.1.1, Air Quality Impact Mitigation:** During project and environmental review, evaluate air quality impacts and incorporate applicable mitigations, including payment of air quality impact fees, to reduce impacts consistent with the BCAQMD's CEQA Air Quality Handbook.

C.4 Biological Resources

This section identifies the federal, state, nongovernmental agency, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of biological resources in the EIR, Section 3.4.

C.4.1 Federal

Endangered Species Act

The Endangered Species Act (ESA) provides protective measures for federally listed threatened and endangered species, including their habitats, from unlawful take (16 United States Code [USC] §§ 1531–1544). The ESA defines take to mean "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Title 50, § 222, of the CFR (50 CFR § 222) further defined harm to include an act that kills or injures fish or wildlife via significant habitat modification or degradation.

ESA Section 7(a)(1) requires federal agencies to use their authority to further the conservation of listed species. ESA Section 7(a)(2) requires consultation with the United States Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) if a federal agency undertakes, funds, permits, or authorizes any action that may impact endangered or threatened species or designated critical habitat. For projects that may result in the incidental take of threatened or endangered species, or critical habitat, and that lack a federal nexus, a Section 10(a)(1)(b) incidental take permit may be obtained from USFWS and/or NMFS.

Clean Water Act

The Federal Water Pollution Control Act of 1948 was the first major United States law to address water pollution. Upon sweeping amendments made in 1972, the law became commonly known as the Clean Water Act (CWA) (33 USC § 1251). The CWA established the structure for regulating discharge of pollutants into waters of the United States and regulating quality standards for surface waters.

Clean Water Act Section 404

CWA Section 404 (33 USC § 1344) enables regulation of the discharge of dredged or fill material into waters of the United States, including wetlands. The basic premise of the program is that no discharge of dredged or fill material may be permitted if: (1) a practicable alternative exists that is less damaging to the aquatic environment or (2) the nation's waters would be significantly degraded. To comply with these objectives, a permittee must document the measures taken to avoid and minimize impacts on waters of the United States and provide compensatory mitigation for any unavoidable impacts.

Clean Water Act Section 401

Under CWA Section 401 (33 USC § 1341), federal agencies are not authorized to issue a permit or license for any activity that may result in discharges to waters of the United States, unless a state or tribe where the discharge originates either grants, waives or denies CWA Section 401 certification. Granting certification, with or without conditions, allows the federal permit or license to be issued and

remain consistent with any conditions set forth in the CWA Section 401 certification. Decisions made by states or tribes are based on the proposed project's compliance with USEPA water quality standards as well as applicable effluent limitations guidelines, new source performance standards, toxic pollutant restrictions, and any other appropriate requirements of state or tribal law. In California, the State Water Resources Control Board is the primary regulatory authority for CWA Section 401 requirements (additional details are provided in the following subsections).

Section 14 of the Rivers and Harbors Appropriation Act of 1899, Section 408

Under Section 408 (33 USC § 408), any use or alteration of a Civil Works project is subject to the approval of USACE. This requirement was established in Section 14 of the Rivers and Harbors Act of 1899. Section 408 provides that USACE may grant permission for another party to alter a Civil Works project upon a determination that the alteration proposed will not be injurious to the public interest and will not impair the usefulness of the Civil Works project.

Magnuson-Stevens Fishery Conservation and Management Act

Magnuson-Stevens Act of 1976 (revised in 1996 and reauthorized 2007) is the primary law governing marine fisheries management in US federal waters. The primary objectives of the Magnuson-Stevens Act are to prevent overfishing, rebuild overfished stocks, increase long-term economic and social benefits, and ensure a safe and sustainable supply of seafood. To this end, the federal government is responsible for considering direct and indirect habitat losses, or other impacts that may result in a diminished capacity to support existing populations and stocks.

Among other items, the Sustainable Fisheries Act revision in 1996 specifically outlined the responsibility of the United States to conserve and facilitate long-term protection of EFH, defined as "*those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity*." (*16 U.S.C. 1801*). The 1996 revision also designated HAPCs, which are subsets of EFH for more focused consideration.

Under the act, federal agencies that fund, permit, or carry out activities that may adversely impact EFH or HAPCs are required to consult with NMFS regarding the potential adverse effects of Project activities, as well as respond in writing to NMFS Project-specific recommendations.

Migratory Bird Treaty Act of 1918

Migratory birds are protected under the Migratory Bird Treaty Act of 1918 (MBTA) (16 USC §§ 703–711). The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed in 50 CFR § 10, including feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 CFR § 21). Solicitor's Opinion M 37050 was released on December 22, 2017, stating the MBTA does not prohibit incidentally killing birds. Thus, the statute's prohibitions on pursuing, hunting, capturing, taking, killing, or attempting to do any of the aforementioned, apply only to affirmative actions that have as their purpose the taking or killing of migratory birds, their nests, or their eggs.

Executive Order 13112 – Invasive Species

Executive Order 13112 directs all federal agencies to refrain from authorizing, funding, or carrying out actions or projects that may spread invasive species. The order further directs federal agencies

to prevent the introduction of invasive species, control and monitor existing invasive species populations, restore native species to invaded ecosystems, research and develop prevention and control methods for invasive species, and promote public education on invasive species. As part of the proposed action, USFWS and USACE would issue permits and, therefore, would be responsible for ensuring that the proposed action complies with Executive Order 13112 and does not contribute to the spread of invasive species.

Executive Order 11990 – Protection of Wetlands

Executive Order 11990 (42 Federal Register [FR] 26961) requires federal agencies to provide leadership and take action to minimize destruction, loss, or degradation of wetlands and to preserve and enhance the natural qualities of these lands. Federal agencies are required to avoid undertaking or providing support for new construction located in wetlands unless 1) no practicable alternative exists and 2) all practical measures have been taken to minimize harm to wetlands.

C.4.2 State

California Endangered Species Act

Under the California Endangered Species Act (CESA), the California Department of Fish and Wildlife (CDFW) is responsible for maintaining a list of endangered and threatened species (Fish and Game Code [FGC] § 2070). CDFW also maintains a list of candidate species, which are species under formal review for potential addition to the list of endangered or threatened species. And CDFW maintains a list of species of special concern, which are species that may be added to the list of candidate species.

Pursuant to the requirements of the CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any state-listed endangered or threatened species may be present and determine whether the proposed project will have a potentially significant impact on such species. In addition, CDFW encourages informal consultation on any proposed project that may impact a candidate species.

Proposed project-related impacts on species on the CESA endangered or threatened list would be considered significant. State-listed species are fully protected under the mandates of the CESA. Take of protected species incidental to otherwise lawful management activities may be authorized under FGC Section 206.591. Authorization from CDFW would be in the form of an incidental take permit.

California Fish and Game Code – Native Plant Protection Act

The Native Plant Protection Act (FGC §§ 1900–1913) prohibits the taking, possession, or sale within the state of any plants with a state designation of rare, threatened, or endangered as defined by CDFW. An exception in the act allows landowners, under specified circumstances, to take listed plant species, if they first notify CDFW and give that state agency at least 10 days to retrieve the plants before they are plowed under or otherwise destroyed (FGC § 1913). Project impacts on these species are not considered significant unless the species are known to have a high potential to occur within the area of disturbance associated with construction of the proposed project.

California Fish and Game Code §§ 3503 and 3503.5

Sections 3503 and 3503.5 of the FGC provide regulatory protection to resident and migratory birds and all birds of prey within the state of California, including the prohibition of the taking of nests and eggs, unless otherwise provided for by the FGC. Specifically, these sections of the FGC make it unlawful to take, possess, or needlessly destroy the nests or eggs of any bird, except as otherwise provided by this code.

California Fish and Game Code – Fully Protected Species

California statutes afford fully protected status to several specifically identified birds, mammals, reptiles, and amphibians. These species cannot be taken, even with an incidental take permit. FGC § 3505 makes it unlawful to take "any aigrette or egret, osprey, bird of paradise, goura, numidi, or any part of such a bird". FGC § 3511 protects from take the following fully protected birds: 1) American peregrine falcon (*Falco peregrinus anatum*); 2) brown pelican (*Pelecanus occidentalis*); 3) California black rail (*Laterallus jamaicensis coturniculus*); 4) California clapper rail (*Rallus longirostris obsoletus*); 5) California condor (*Gymnogyps californianus*); 6) California least tern (*Sterna albifrons browni*); 7) golden eagle; (*Aquila chrysaetos*); 8) greater sandhill crane (*Grus canadensis tabida*); 9) light-footed clapper rail (*Rallus longirostris levipes*); 10) southern bald eagle (*Haliaeetus leucocephalus leucocephalus*); 11) trumpeter swan (*Cygnus buccinator*); 12) white-tailed kite (*Elanus leucurus*); and 13) Yuma clapper rail (*Rallus longirostris yumanensis*).

FGC § 4700 identifies the following fully protected mammals that cannot be taken: 1) Morro Bay kangaroo rat (*Dipodomys heermanni morroensis*); 2) bighorn sheep (*Ovis canadensis*), except Nelson bighorn sheep (*Ovis canadensis nelsoni*); 3) Guadalupe fur seal (*Arctocephalus townsendi*); 4) ring-tailed cat (*Bassariscus* sp.); 4) Pacific right whale (*Eubalaena sieboldi*); 6) salt-marsh harvest mouse (*Reithrodontomys raviventris*); 7) southern sea otter (*Enhydra lutris nereis*); and 8) wolverine (*Gulo gulo*).

FGC § 5050 protects from take the following fully protected reptiles and amphibians: 1) blunt-nosed leopard lizard (*Crotaphytus wislizenii silus*); 2) San Francisco garter snake (*Thamnophis sirtalis tetrataenia*); 3) Santa Cruz long-toed salamander (*Ambystoma macrodactylum croceum*); 4) limestone salamander (*Hydromantes brunus*); and 5) black toad (*Bufo boreas exsul*).

FGC § 5515 identifies certain fully protected fish that cannot lawfully be taken, even with an incidental take permit. The following species are protected in this fashion: 1) Colorado River squawfish (*Ptychocheilus lucius*); 2) thicktail chub (*Gila crassicauda*); 3) Mohave chub (*Gila mohavensis*); 4) Lost River sucker (*Catostomus luxatus*); 5) Modoc sucker (*Catostomus microps*); 6) shortnose sucker (*Chasmistes brevirostris*); 7) humpback sucker (*Xyrauchen texanus*); 8) Owens River pupfish (*Cyprinoden radiosus*); 9) unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*); and 10) rough sculpin (*Cottus asperrimus*).

California Wetlands and Other Policies

The California Natural Resources Agency and its various departments, which includes CDFW and the Department of Water Resources, do not authorize or approve projects that fill or otherwise harm or destroy coastal, estuarine, or inland wetlands. Exceptions may be granted if all the following conditions are met:

1. The project is water dependent.
2. No other feasible alternative is available.
3. The public trust is not adversely affected.
4. Adequate compensation is proposed as part of the project.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne) of 1966 (California Water Code Section 13000 et seq.; CCR Title 23, Chapter 3, Subchapter 15) is the primary state regulation that addresses water quality. The requirements of the act are implemented by the State Water Resources Control Board at the state level and the Regional Water Quality Control Board (RWQCB) within the nine regions designated. The RWQCB carries out planning, permitting, and enforcement activities related to water quality in California. The RWQCB is responsible for controlling discharges to surface waters of the state by issuing waste discharge requirements or conditional waivers to waste discharge requirements. Waste discharge requirements are required by the RWQCB for activities that may affect water quality.

Clean Water Act Section 401 Water Quality Certification

A CWA Section 401 water quality certification is required for activities that require CWA Section 404 permits issued by USACE. As mentioned above, the State Water Resources Control Board has primary regulatory authority for CWA Section 401 requirements for protecting water resources. Enforcement of these requirements is also handled by the nine RWQCBs depending upon location of the potential impacts. The Central Valley RWQCB will be responsible for CWA Section 401 for this project.

State Definition of Covered Waters

Under California state law, waters of the state means “any surface water or groundwater, including saline waters, within the boundaries of the state” (California Water Code Section 13050). Therefore, water quality laws apply to both surface water and groundwater. After the United States Supreme Court decision in Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers, 531 U.S. 159 (2001), the Office of Chief Counsel of the State Water Resources Control Board released a legal memorandum confirming the state’s jurisdiction over isolated wetlands. The memorandum stated that under the California Porter-Cologne Water Quality Control Act (Porter-Cologne), discharges to wetlands and other waters of the state are subject to state regulation, and this includes isolated wetlands. In general, the State Water Resources Control Board regulates discharges to isolated waters in much the same way as they do for waters of the United States, but the regulation is via Porter-Cologne rather than the CWA.

C.4.3 Nongovernmental Agencies

California Native Plant Society

The California Native Plant Society (CNPS) is a nongovernmental agency that classifies native plant species according to current population distribution and threat level concerning extinction. These data are used by the CNPS to create and maintain a list of native California plants that have low

numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California (CNPS 2021). Potential impacts on populations of CNPS-listed plants receive consideration under CEQA review.

The following identifies the definitions of the CNPS listings:

- List 1A: Plants believed to be extinct
- List 1B: Plants that are rare, threatened, or endangered in California and elsewhere
- List 2: Plants that are rare, threatened, or endangered in California, but are more numerous elsewhere.

All of the plant species on Lists 1 and 2 meet the requirements of the Native Plant Protection Act Section 1901, Chapter 10, or FGC Section 2062 and Section 2067, and are eligible for state listing. Plants appearing on Lists 1 or 2 are considered to meet the criteria of CEQA Section 15380, and effects on these species are considered significant. Classifications for plants on List 3 (plants about which we need more information) and/or List 4 (plants of limited distribution), as defined by the CNPS, are not currently protected under state or federal law. Therefore, no detailed descriptions or impact analysis was performed on species with these classifications.

C.4.4 Regional and Local

Town of Paradise 1994 General Plan

The Open Space/Conservation/Energy Element of the *Town of Paradise 1994 General Plan* includes the following goals and policies pertaining to biological resources:

- **Goal OCEG-6**: Preserve and protect naturally sensitive areas, and significant natural features in Paradise such as trees, views, stream courses, wildlife habitat, and clean air.
- **Policy OCEP-15**: Existing, significantly important natural habitat areas having high value for birds and other wildlife should be preserved for future generations through careful land use planning and public participation.
- **Policy OCEP-16**: Area fisheries shall be protected, and the cooperation of responsible agencies shall be sought to assure minimum stream flow and restore fisheries.

Town of Paradise Tree Preservation Ordinance

The Town of Paradise Tree Preservation Ordinance (Chapter 8.12 of the Town's municipal code) intends to limit the indiscriminate destruction of healthy trees, preserve natural beauty, maintain healthy forests, and promote proper tree management through education. This section of code prohibits felling of any qualifying trees without a permit. Certain activities are exempt from the tree felling permit program including the reparation, maintenance, or installation of service lines and the establishment of a town-funded capital improvement project. Tree felling permits may be issued to accommodate certain activities including the repair or installation of a town-authorized wastewater treatment and disposal system.

Butte County General Plan 2030

The Conservation and Open Space Element of the *Butte County General Plan 2030* includes the following goals and policies related to biological resources:

- **Goal COS-7**: Conserve and enhance habitat for protected species and sensitive biological communities.
- **Policy COS-P7.3**: Creeks shall be maintained in their natural state whenever possible, and creeks and floodways shall be allowed to function as natural flood protection features during storms.
- **Policy COS-P7.4**: New development projects shall mitigate their impacts in habitat areas for protected species through on- or off-site habitat restoration, clustering of development, and/or project design and through the provisions of the Butte Regional Habitat Conservation Plan (HCP) and Natural Community Conservation Plan (NCCP) within the HCP/NCCP Planning Area, upon the future adoption of the HCP/NCCP.
- **Policy COS-P7.5**: No new development projects shall occur in wetlands or within significant riparian habitats, except within the Butte Regional Habitat Conservation Plan (HCP) and Natural Community Conservation Plan (NCCP) Planning Area where such development is consistent with the conditions of the HCP/NCCP, upon the future adoption of the HCP/NCCP.
- **Policy COS-P7.6**: New development projects shall include setbacks and buffers along riparian corridors and adjacent to habitat for protected species, except where permitted in the Butte Regional Habitat Conservation Plan (HCP) and Natural Community Conservation Plan (NCCP) Planning Area and where such development is consistent with the conditions of the HCP/NCCP, upon the future adoption of the HCP/NCCP.
- **Policy COS-P7.7**: Construction barrier fencing shall be installed around sensitive resources on or adjacent to construction sites. Fencing shall be installed prior to construction activities and maintained throughout the construction period.
- **Policy COS-P7.8**: Where sensitive on-site biological resources have been identified, construction employees operating equipment or engaged in any development-associated activities involving vegetation removal or ground disturbing activities in sensitive resource areas shall be trained by a qualified biologist and/or botanist who will provide information on the on-site biological resources (sensitive natural communities, special-status plant and wildlife habitats, nests of special-status birds, etc.), avoidance of invasive plant introduction and spread, and the penalties for not complying with biological mitigation requirements and other State and federal regulations.
- **Policy COS-P7.9**: A biologist shall be retained to conduct construction monitoring in and adjacent to all habitats for protected species when construction is taking place near such habitat areas.
- **Goal COS-8**: Maintain and promote native vegetation.

- **Policy COS-P8.1**: Native plant species shall be protected and planting and regeneration of native plant species shall be encouraged, wherever possible, in undisturbed portions of development sites.
- **Policy COS-P8.4**: Introduction or spread of invasive plant species during construction of development projects shall be avoided by minimizing surface disturbance; seeding and mulching disturbed areas with certified weed-free native mixes; and using native, noninvasive species in erosion control plantings.
- **Goal COS-9**: Protect identified special-status plant and animal species.
- **Policy COS-P9.1**: A biological resources assessment shall be required for any proposed development project where special-status species or critical habitat may be present. Assessments shall be carried out under the direction of Butte County. Additional focused surveys shall be conducted during the appropriate season if necessary. Upon adoption of the Butte Regional Habitat Conservation Plan (HCP) and Natural Community Conservation Plan (NCCP), assessment requirements of the HCP/NCCP shall be implemented for development projects within the HCP/NCCP area.
- **Policy COS-P9.2**: If special-status plant or animal species are found to be located within a development site, proponents of the project shall engage in consultation with the appropriate federal, State and regional agencies and mitigate project impacts in accordance with State and federal law. Upon adoption of the Butte Regional Habitat Conservation Plan (HCP) and Natural Community Conservation Plan (NCCP), mitigation requirements of the HCP/NCCP shall be implemented for development projects within the HCP/NCCP area. Examples of mitigation may include:
    - Design the proposed project to avoid and minimize impacts.
    - Restrict construction to specific seasons based on project-specific special-status species issues (e.g., minimizing impacts to special-status nesting birds by constructing outside of the nesting season).
    - Confine construction disturbance to the minimum area necessary to complete the work.
    - Mitigate for the loss of special-status species by purchasing credits at an approved conservation bank (if a bank exists for the species in question), funding restoration or habitat improvement projects at existing preserves in Butte County, or purchasing or donating mitigation lands of substantially similar habitat.
    - Maintain a minimum 100-foot buffer on each side of all riparian corridors, creeks and streams for special-status and common wildlife.
    - Establish setbacks from the outer edge of special-status species habitat areas.
    - Construct barriers to prevent compaction damage by foot or vehicular traffic.

Chico 2030 General Plan

The Open Space and Environment Element of the *Chico 2030 General Plan* includes the following goals and policies related to biological resources:

- **Goal OS-1**: Protect and conserve native species and habitats.
- **Policy OS-1.1, Native Habitats and Species**: Preserve native species and habitat through land use planning, cooperation, and collaboration.
- **Policy OS-1.2, Regulatory Compliance**: Protect special-status plant and animal species, including their habitats, in compliance with all applicable state, federal and other laws and regulations.
- **Policy OS-2.5, Creeks and Riparian Corridors**: Preserve and enhance Chico's creeks and riparian corridors as open space for their aesthetic, drainage, habitat, flood control, and water quality values.
- **Policy OS-2.6, Oak Woodlands**: Protect oak woodlands as open space for sensitive species and habitat.

City of Chico Tree Preservation Regulations

Chapter 16.66 Tree Preservation Regulations of Chico's municipal code requires that a tree removal permit be obtained from the director of the public works department before removing any trees within the city. A permit is not required for removal of a tree that presents an immediate hazard to life or property, as determined by the city manager, director, police chief, fire chief, public works director, community development director, urban forest manager, code enforcement officer, public utility companies, or their designees. This chapter of the code requires preparation of a tree protection plan that complies with the city's "Best Practices Technical Manual: Tree Preservation Measures" prior to the issuance of demolition permits, grading permits, building permits, use permits, planned development permits, or parcel or tentative subdivision maps.

C.5 Cultural Resources

This section identifies the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of cultural resources in the EIR, Section 3.5.

Section 3.5 includes references to the CEQA Guidelines Section 15064.5 and terminology such as "historic resource" and "archaeological resource," which include in their definition "unique archaeological resources." As such, the following regulations, plans, and/or policies provide relevant definitions and regulatory context for the impact discussion in Section 3.5.

C.5.1 Federal

National Historic Preservation Act

Section 106 of the National Historic Preservation Act (NHPA) requires federal undertakings to consider the effects of the action on historic properties. Historic properties are defined by the Advisory Council on Historic Preservation (ACHP) regulations (36 Code of Federal Regulations [CFR] Part 800) and consist of any prehistoric or historical archaeological site, building, structure,

historic district, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP) maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization that meet the National Register criteria (36 CFR Part 800.16[l]).

To determine whether an undertaking could affect NRHP-eligible properties, cultural resources (including archaeological, historical, and architectural properties) must be inventoried and evaluated for listing in the NRHP.

For projects involving a lead federal agency, cultural resource significance is evaluated in terms of eligibility for listing in the NRHP. For a property to be considered for inclusion in the NRHP, it must be at least 50 years old and meet the criteria for evaluation set forth in 36 CFR Part 60.4.

The quality of significance in American history, architecture, archaeology, engineering, and culture must be present in districts, sites, buildings, structures, and objects that possess integrity of design, setting, materials, workmanship, feeling, and association. They must also meet one or more of the four criteria for inclusion on the NRHP:

- Criterion A, Association with events that have made a significant contribution to the broad patterns of history;
- Criterion B, Association with the lives of persons significant in the past;
- Criterion C, Embodiment of distinctive characteristics of a type, period, or method of construction, the work of a master, high artistic values, or a significant and distinguishable entity whose components may lack individual distinction; or
- Criterion D, History of yielding, or the potential to yield, information important in prehistory or history.

If a cultural resources professional meeting the Secretary of Interior's Qualification Standards determines a particular resource meets one of these criteria, it is considered as an eligible historic property for listing in the NRHP. Among other criteria considerations, a property that has achieved significance within the last 50 years is not considered eligible for inclusion in the NRHP unless certain exceptional conditions are met.

Antiquities Act

The Antiquities Act of 1906 (54 USC 320301–320303) provides for fines or imprisonment of any person convicted of appropriating, excavating, injuring, or destroying any historic or prehistoric ruin or monument or other object of antiquity that falls under the jurisdiction of the federal government.

Archaeological Resources Protection Act

The Archaeological Resources Protection Act of 1979 (16 USC 470aa et seq.) amended the Antiquities Act, set a broad policy stating that archaeological resources are important to the nation and should be protected, and required special permits before the excavation or removal of archaeological resources from public or Indian lands.

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act of 1990 (25 USC 3001 et seq.) was intended to ensure the protection and rightful disposition of Native American cultural items and burials located on federal or tribal trust lands, and in the possession or control of the federal government. The act requires that an inventory of Native American human remains, and funerary objects must be compiled by federal funded agencies and all museums and educational institutions receiving federal funds. Additionally, this act makes it illegal to traffic Native American remains and cultural items without the right of possession, whether or not they derive from federal or Native American lands.

Also, all Indian tribes and representatives identified by the Native American Heritage Commission (NAHC) must be consulted whenever archaeological investigations encounter, or are expected to encounter, Native American cultural items or when such items are unexpectedly discovered on federal or tribal lands. Excavation or removal of any such items also must be done under procedures required by the Archaeological Resources Protection Act.

The Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation

These standards, effective as of 1983, provide technical advice for archaeological and historic preservation practices. Their purposes are (1) to organize the information gathered about preservation activities; (2) to describe results to be achieved by federal agencies, states, and others when planning for the identification, evaluation, registration, and treatment of historic properties; and (3) to integrate the diverse efforts of many entities performing historic preservation into a systemic effort to preserve the nation's culture heritage (48 Federal Register 44716).

The Secretary of the Interior's Standards for Rehabilitation

These standards were established by the Secretary of the Interior in 1986 as a way to homogenize rehabilitation efforts of nationally significant historic properties and buildings. These standards pertain to actions involved in returning a property to a state of utility through repair or alteration. This allows for the preservation of historic and cultural values of the property, while giving it an efficient contemporary use (36 CFR 67).

The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings

The Standards for the Treatment of Historic Properties are a compilation of 34 guidelines to promote the responsible preservation of U.S. historic cultural resources. The standards specifically address preservation, rehabilitation, restoration, and reconstruction of historic materials. The standards are not intended to be the sole basis for decision-making in regard to whether a historic property should be saved, but rather are intended to provide consistency in conservation and restoration practice (36 CFR 68).

C.5.2 State

CEQA Statute and Guidelines

CEQA and the CEQA Guidelines include procedures for identifying, analyzing, and disclosing potential adverse impacts to cultural resources. For archaeological sites, the CEQA Guidelines [Section 15064.5(c)(1)] require that the lead agency first determine whether the site is a "historical resource" as defined in Section 15064.5(a) (see below definition). If the site qualifies as a historical resource, potential adverse impacts must be considered in the same manner as a historical resource, as described below [CEQA Guidelines Section 15064.5(c)(2)]. If the archaeological site does not qualify as a historical resource but does qualify as a "unique archaeological resource," then the archaeological site is treated in accordance with CEQA Public Resources Code Section 21083.2, which places certain limits on permissible mitigation measures [CEQA Guidelines Section 15064.5(c)(3)]. In practice, most archaeological sites that meet the definition of a unique archaeological resource will also meet the definition of a historical resource.

The CEQA Guidelines [Section 15064.5(a)] define a "historical resource" as including the following:

- A resource listed in, or eligible for listing in, the CRHR;
- A resource listed in a local register of historical resources (as defined at PRC Section 5020.1(k)];
- A resource identified as significant in a historical resources survey meeting the requirements of PRC Section 5024.1(g); or
- Any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California (Generally, a resource is considered by the lead agency to be "historically significant" if the resource meets the criteria for listing in the CRHR).

A project that causes a "substantial adverse change" in the significance of a historical resource may have a significant effect on the environment [CEQA Guidelines Section 15064.5(b)]. The CEQA Guidelines [Section 15064.5(b)(1)] define "substantial adverse change" as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired." Generally, the significance of a historical resource is "materially impaired" when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in or eligibility for the CRHR, or its inclusion in a local register of historical resources [CEQA Guidelines Section 15064.5(b)(2)].

Mitigation measures are discussed in CEQA Guidelines Section 15126.4. Generally, by following the Secretary of the Interior's Standards for the Treatment of Historic Properties or the Secretary of the Interior's Standards for Rehabilitation, impacts can be considered as mitigated to a less-than-significant level [CEQA Guidelines Section 15064.5(b)]. For archaeological resources, the CEQA Guidelines [Section 15126.4(b)(3)] provide that a public agency should, whenever feasible, seek to avoid damaging effects on any historical resource of an archaeological nature. The CEQA

Guidelines also require consideration of preservation in place as the preferred manner of mitigation. Mitigation by data recovery is recommended only if preservation is not feasible.

California Register of Historical Resources: Public Resources Code Section 5024.1

The CRHR includes resources that are listed in or formally determined eligible for listing in the NRHP, as well as some designated California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts) or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR.

California Native American Heritage Commission: Public Resources Code Sections 5097.91 through 5097.98

The California NAHC identifies and catalogs places of special religious or social significance to Native Americans and known graves and cemeteries of Native Americans on private lands. Section 5097 was amended in 1987 (5097.9) to require consultation with the California NAHC whenever Native American graves are found. When the NAHC is notified of human remains, it shall immediately notify those persons it believes to be the most likely descendants. Section 5097.98 1(b) states:

Upon the discovery of the Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this section, with the most likely descendants regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.

It also states possible preferences the most likely descendants may have for said treatment, including preservation in place, nondestructive removal and analysis, relinquishment to the most likely descendants, or other appropriate treatment. Conferral or discussion between the most likely descendant and landowner is described in Section 5097.98 2(c) as “meaningful and timely discussion and careful consideration of the views of each party, in a manner that is cognizant of all parties’ cultural values, and where feasible, seeking agreement.”

Unique Archeological Resources

The Public Resources Code Section 21083.2[a] also requires the Lead Agency to determine whether or not a project would have a significant effect on unique archaeological resources.

The Public Resources Code defines a unique archaeological resource as follows.

- An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
    - Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;

- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC § 21083.2).

In most situations, resources that meet the definition of a unique archaeological resource also meet the definition of a historical resource. As a result, it is current professional practice to evaluate cultural resources for significance based on their eligibility for listing in the CRHR.

Health and Safety Code Section 7050.5: Removal of Human Remains

Regarding the discovery of human remains on non-federal lands, Section 7050.5 of the California Health and Safety Code (CHSC) states the following:

a) Every person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes any human remains in or from any location other than a dedicated cemetery without authority of law is guilty of a misdemeanor, except as provided in Section 5097.99 of the [PRC]. The provisions of this subdivision shall not apply to any person carrying out an agreement developed pursuant to subdivision (l) of Section 5097.94 of the [PRC] or to any person authorized to implement Section 5097.98 of the [PRC].

b) In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the California Government Code [CGC], that the remains are not subject to the provisions of Section 27491 of the CGC or any other related provisions of law concerning investigation of the circumstances, manner and cause of any death, and the recommendations concerning the treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the PRC. The coroner shall make his or her determination within 2 working days from the time the person responsible for the excavation, or his or her authorized representative, notifies the coroner of the discovery or recognition of the human remains.

c) If the coroner determines that the remains are not subject to his or her authority and if the coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission (NAHC) (CHSC Section 7050.5).

Of particular note to cultural resources is subsection c). After notification, NAHC would follow the procedures outlined in PRC § 5097.98, which include notification of most likely descendants, if possible, and recommendations for treatment of the remains. The most likely descendants would have 24 hours after notification by the NAHC to make their recommendation (PRC § 5097.98). In addition, knowing or willful possession of Native American human remains or artifacts taken from a grave or cairn is a felony under State law (PRC § 5097.99).

California Graves Protection and Repatriation Act

Section 8010 and 8011 of the Health and Safety Code also address the protection of Native American human remains and cultural items and state:

- Section 8010. This chapter shall be known and may be cited as the California Native American Graves Protection and Repatriation Act of 2001.
- Section 8011. It is the intent of the Legislature to do all of the following:

  (a) Provide a seamless and consistent state policy to ensure that all California Indian human remains and cultural items be treated with dignity and respect.

  (b) Apply the state's repatriation policy consistently with the provisions of the Native American Graves Protection and Repatriation Act (25 U.S.C. Sec. 3001 et seq.), which was enacted in 1990.

  (c) Facilitate the implementation of the provisions of Native American Graves Protection and Repatriation Act with respect to publicly funded agencies and museums in California.

  (d) Encourage voluntary disclosure and return of remains and cultural items by an agency or museum.

  (e) the Provide a mechanism whereby lineal descendants and culturally affiliated California Indian tribes that file repatriation claims for human remains and cultural items under the Native American Graves Protection and Repatriation Act (25 U.S.C. Sec. 3001 et seq.) or under this chapter with California state agencies and museums may request assistance from the commission in ensuring that state agencies and museums are responding to those claims in a timely manner and in facilitating the resolution of disputes regarding those claims.

  (f) Provide a mechanism whereby California tribes that are not federally recognized may file claims with agencies and museums for repatriation of human remains and cultural items.

C.5.3 Regional and Local

Town of Paradise 1994 General Plan

Section 3.15 (Scenic and Cultural Resources) of the *Town of Paradise 1994 General Plan* details the Town's procedures for complying with the state and federal policies outlined above. The General Plan includes the following goals, policies, and implementation measures related to cultural resources:

- **Goal OCEG-9**: Identify, record, preserve, and protect historical and archeological resources.
- **Policy OCEP-36**: The *Land Use Constraints Diagram* identifies areas of potential archaeological sensitivity. Proposed development or public works projects within this area shall be required to undertake an archaeological survey prior to project approval. Proposed projects outside this area, in locations that have not been significantly disturbed, shall be referred to the California Archaeological Inventory, Northeast Information Center, California

State University, Chico to undertake an archaeological survey prior to project approval upon recommendation by the Center.

- **Implementation Measure OCEI-18**: Require compliance of all development projects with Appendix K (archeological impacts) of the *Guidelines for Implementation of the California Environmental Quality Act*.
- **Implementation Measure OCEI-19**: When an archaeological survey is required by the Town or recommended by the California Archaeological Inventory, Northeast Information Center, the survey shall be undertaken by a qualified professional archaeologist who is certified by the Society of Professional Archaeologists or has equivalent qualifications.
- **Implementation Measure OCEI-20**: Should any historic or pre-historic artifacts be discovered during construction, all work shall cease until a qualified professional archaeologist views the site, provides recommendations and gives clearance to continue.

Chico 2030 General Plan

The Chapter 11 (Cultural Resources and Historic Preservation) element of the *Chico 2030 General Plan* identifies important local cultural, archaeological, and historic resources and establishes goals, policies, and actions for the protection and preservation of those resources. Importantly, the element supports a Memorandum of Understanding adopted in June 2008 between the City of Chico and the Mechoopda Indian Tribe of the Chico Rancheria. The element also establishes the policy guidance for the City of Chico's comprehensive Historic Preservation Program. To this end, the City of Chico adopted three goals specific to cultural resources in the General Plan:

- **Goal CRHP-1:** Protect and preserve archaeological, historical, and other cultural resources to serve as significant reminders of the City's heritage and values.
- **Goal CRHP-2:** Reinvest in the archaeological, historical, and other cultural resources that frame Chico's character and identity.
- **Goal CRHP-3:** Engage in and facilitate preservation efforts with local preservation and cultural entities.

The General Plan includes the following policies related to cultural resources:

- **Policy CRHP-1.1, Historic Preservation Program**: Maintain a comprehensive Historic Preservation Program that includes policies and regulations which protect and preserve the archeological, historical, and cultural resources of Chico.
- **Policy CRHP-2.1, Infill and Historic Preservation**: Integrate the values of historic preservation with infill development and adaptive reuse.
- **Policy CRHP-2.2, Adaptive Reuse**: Encourage the adaptive reuse of historic buildings when the original use of the structure is no longer feasible.
- **Policy CRHP-2.3, Demolition as Last Resort**: Limit the demolition of historic resources to an act of last resort, to be permitted only if: 1) rehabilitation of the resource is not feasible; 2)

demolition is necessary to protect the health, safety, and welfare of its residents; or 3) the public benefits outweigh the loss of the historic resource.

- **Policy CRHP-2.4, Public Awareness of Heritage Resources**: Encourage public awareness of the heritage resources that helped shape the history of Chico.
- **Policy CRHP-2.5, Purchase of Historically Significant Buildings**: Explore grant funding, partnerships, and other opportunities to purchase historically significant buildings or sites that are eligible for State or National Registers as they become available.
- **Policy CRHP-3.1, Partnerships to Preserve Heritage Resources**: Foster partnerships with interested parties to preserve heritage resources.

These policies detail the City of Chico's protocols to, among others, identify, avoid, and mitigate impacts to archaeological, tribal, and built environment resources; integrate historic preservation into infill development; encourage public awareness of heritage resources; and establish partnerships with interested parties.

City of Chico Historic Preservation Ordinance

The historic preservation ordinance of the City of Chico's Municipal Code (Chapter 19.37) specifically affords protection for properties listed on the City of Chico's Historic Resources Inventory and provides a mechanism to add historic properties to the Inventory through Landmark Overlay zoning districts. The ordinance also provides development incentives to owners of designated historic property and establishes a number of exempt activities such as ordinary maintenance and repair. Proposals to significantly alter or demolish structures listed on the City of Chico's Historic Resources Inventory are reviewed by the City of Chico's five-member Architectural Review and Historic Preservation Board. The Board also reviews nominations to the City of Chico's Inventory and forwards recommendations to the City Council for a final determination of listing.

Butte County General Plan 2030

Chapter 9 of the *Butte County General Plan 2030* details Butte County's protocols aligning Butte County's efforts to identify, protect, and preserve important prehistoric and historic resources with state and federal regulations and specifies the mandated steps to identify, avoid, and mitigate (if necessary) cultural resources. To this end, the Butte County adopted three goals specific to cultural resources in the General Plan:

- **Goal COS-14:** Preserve important cultural resources
- **Goal COS-15:** Ensure that new development does not adversely impact cultural resources.
- **Goal COS-16:** Respect Native American culture and planning concerns

In support of these policies, the General Plan includes the following policies:

- **Policy COS-P14.1**: Historic and cultural resources management shall be coordinated with nearby jurisdictions, including the five incorporated municipalities, the Lassen and Plumas National Forests, other planning and regulatory agencies, and local tribes.

- **Policy COS-P14.2**: As part of CEQA and NEPA projects, evaluations of surface and subsurface cultural resources in the county shall be conducted. Such evaluations should involve consultation with the Northeast Information Center.
- **Policy COS-P14.3**: The Northeast Information Center and appropriate historic and preservation professionals shall be consulted when considering reuse of historic sites.
- **Policy COS-P15.1**: Areas found during construction to contain significant historic or prehistoric archaeological artifacts shall be examined by a qualified consulting archaeologist or historian for appropriate protection and preservation. Historic or prehistoric artifacts found during construction shall be examined by a qualified consulting archaeologist or historian to determine their significance and develop appropriate protection and preservation measures.
- **Policy COS-P15.2**: Any archaeological or paleontological resources on a development project site shall be either preserved in their sites or adequately documented as a condition of removal. When a development project has sufficient flexibility, avoidance and preservation of the resource shall be the primary mitigation measure.
- **Policy COS-P15.3**: Demolition permit application on potentially important historic sites shall be subject to discretionary review.
- **Policy COS-P16.2**: Impacts to the traditional Native American landscape shall be considered during California Environmental Quality Act or National Environmental Protection Act review of development proposals.
- **Policy COS-P16.3**: Human remains discovered during implementation of public and private development projects shall be treated with dignity and respect. Such treatment shall fully comply with the federal Native American Graves Protection and Repatriation Act and other appropriate laws.
- **Policy COS-P16.4**: If human remains are located during any ground disturbing activity, work shall stop until the County Coroner has been contacted, and, if the human remains are determined to be of Native American origin, the NAHC and most likely descendant have been consulted.
- **Policy COS-P16.5**: Consistent with State local and tribal intergovernmental consultation requirements such as SB 18, the County shall consult with Native American tribes that may be interested in proposed new development projects and land use policy changes.

C.6 Energy

This section summarizes the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of energy in the EIR, Section 3.6.

C.6.1 Federal

Corporate Average Fuel Economy

The Corporate Average Fuel Economy (CAFE) standards were first introduced by Congress in 1975 to help reduce the country's dependence on foreign oil. CAFE standards are regulated by Department of Transportation's National Highway Traffic and Safety Administration (NHTSA). NHTSA sets and enforces the CAFE standards, while the United States Environmental Protection Agency (USEPA) calculates average fuel economy levels for manufacturers, and also sets related GHG standards. The regulations have become more stringent over time. The regulations at first applied only to passenger cars in 1978, then included light duty trucks up to 6,000 pounds in 1980, and finally increased to all vehicles up to 8,500 pounds the next year. Regulations varied during the 1980s for both cars and trucks before reaching a steady target for cars in 1990 through 2010, with trucks moderately increasing during the period from 20 to 21 miles per gallon (mpg) through 2005, then reaching 23.5 mpg by 2010.

On April 1, 2010, under the Obama Administration, the USEPA and the NHTSA announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the United States. The first phase of the national program applied to passenger cars, light-duty trucks, and medium-duty passenger vehicles for model years 2012 through 2016. This phase required these vehicles to meet a fuel economy standard of 35.5 mpg. The second phase applied to passenger cars, light-duty trucks, and medium-duty passenger vehicles for model years 2017 through 2025. This phase required these vehicles to meet an estimated fuel economy standard of 54.5 mpg.

On September 15, 2011, the USEPA and NHTSA issued a final rule for the first national standards to improve fuel efficiency of medium- and heavy-duty trucks and buses, model years 2014 through 2018 by up to 20 percent.

On October 25, 2016, the USEPA and NHTSA issued Phase 2 of the national standards to improve fuel efficiency standards for medium- and heavy-duty trucks and buses for model years 2021 through 2027 to achieve vehicle fuel savings as high as 25 percent, depending on the vehicle category.

On March 31, 2020, under the Trump administration, the USEPA and NHTSA, issued the Safer Affordable Fuel Efficient (SAFE) Vehicles Rule. The SAFE Vehicles Rule set new CAFE targets and tailpipe carbon dioxide emissions standards for passenger cars and lights trucks that increase 1.5 percent in stringency each year from model years 2021 through 2026.

The current Biden administration intends to set new fuel efficiency standards. In August 2021, NHTSA released its Notice of Proposed Rulemaking offering new standards for the 2024–2026 model years. The new standards would increase fuel efficiency 8 percent annually for model years 2024-2026 and increase the estimated fleetwide average by 12 mpg for model year 2026, relative to model year 2021. President Biden issued Executive Order (EO) 14037 on August 5, 2021, which requires NHTSA to develop fuel economy standards for passenger cars and light duty trucks for model years 2027-2030. In addition, NHTSA will develop medium and heavy-duty fuel efficiency standards beginning as early as model year 2027. At the time of EIR preparation, new CAFE standards have not been adopted.

National Energy Policy Act of 2005

The National Energy Policy Act of 2005 set equipment energy efficiency standards. The law seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under the National Energy Policy Act, consumers and businesses can obtain federal tax credits for purchasing fuel-efficient appliances and products, including hybrid vehicles; constructing energy-efficient buildings; and improving the energy efficiency of commercial buildings. Tax credits are also available for installing qualified fuel cells, stationary microturbine power plants, and solar power equipment.

Executive Order 13423 (Strengthening Federal Environmental, Energy, and Transportation Management), signed by President George W. Bush in 2007, strengthened the federal government's key energy management goals and set more challenging goals than the National Energy Policy Act of 2005. The energy reduction and environmental performance requirements of Executive Order 13423 were expanded upon in Executive Order 13514 (Federal Leadership in Environmental, Energy, and Economic Performance), signed by President Barack Obama in 2009.

The Renewable Fuel Standard (RFS) program was created under the National Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. The program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders. This RFS program under this act, commonly referred to as "RFS1", required 4.0 billion gallons of renewable fuel to be blended into gasoline by 2006, ascending to 7.5 billion gallons by 2012.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 is designed to achieve energy security in the United States by increasing renewable fuel production, improving energy efficiency and performance, protecting consumers, improving vehicle fuel economy, and promoting research on GHG capture and storage. Under this act, RFS program was expanded in several ways that lay the foundation for achieving significant reductions in GHG emissions from the use of renewable fuels, reducing imported petroleum, and encouraging the development and expansion of the renewable fuels sector in the United States. The updated program is referred to as "RFS2" and includes the following:

- Expanded the RFS program to include diesel, in addition to gasoline
- Increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022
- Established new categories of renewable fuel and set separate volume requirements for each
- Required the USEPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces

C.6.2 State

California Energy Commission

The Warren-Alquist Act of 1974 established the California Energy Commission (CEC), which is California's primary energy policy and energy planning agency. CEC's core responsibilities include advancing the state's energy policy, achieving energy efficiency, investing in energy innovation, developing renewable energy, transforming transportation, overseeing energy infrastructure, and preparing for energy emergencies.

Energy Action Plan

The California Public Utilities Commission approved the State's first Energy Action Plan in 2003 followed by the Energy Action Plan II in 2005. The current plan, Energy Action Plan II, is California's principal energy planning and policy document. The plan examines the state's ongoing actions in the context of global climate change, describes a coordinated implementation plan for state energy policies, and identifies specific actions to ensure that California's energy resources are adequate, reliable, and reasonably-priced. The plan identifies policies, strategies, and actions that are cost-effective and environmentally-sound for California's consumers and taxpayers.

Greenhouse Gas Regulations

In 2006, the Legislature enacted AB 32, the California Global Warming Solutions Act of 2006, which required California to reduce its GHG emissions to 1990 levels by 2020. In 2016, the Legislature enacted SB 32, which extended the horizon year of the state's codified GHG reduction planning targets from 2020 to 2030, requiring California to reduce its GHG emissions to 40% below 1990 levels by 2030. In accordance with AB 32 and SB 32, ARB prepares scoping plans to guide the development of statewide policies and regulations for the reduction of GHG emissions. Many of the policy and regulatory concepts identified in the scoping plans focused on increasing energy efficiencies and the use of renewable resources and reducing the consumption of petroleum-based fuels (such as gasoline and diesel). As such, the state's GHG emissions reduction planning framework creates co-benefits for energy-related resources. Additional information on Climate Change Scoping Plans is provided in Section C.8.2.

Renewable Energy Regulations

SB 1078 (2002) established the California Renewable Portfolio Standard (RPS) Program and required that a retail seller of electricity purchase a specified minimum percentage of electricity generated by eligible renewable energy resources as defined in any given year, culminating in a 20 percent standard by December 31, 2017. These retail sellers include electrical corporations, community choice aggregators, and electric service providers.

SB 107 (2006) accelerated the RPS established by SB 1078 by requiring that 20 percent of electricity retail sales be served by renewable energy resources by 2010 (not 2017).

SB X1-2 (2011) required all California utilities to generate 33 percent of their electricity from eligible renewable energy resources by 2020. Specifically, SB X1-2 set a three-stage compliance period: 20 percent electricity from renewables by December 31, 2013; 25 percent from renewables by December 31, 2016; and 33 percent from renewables by December 31, 2020.

SB 350 (2015) accelerated the RPS by requiring retail seller and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030, with interim goals of 40 percent by 2024 and 45 percent by 2027.

SB 100 (2018) accelerated and expanded the standards set forth in SB 350 by establishing that 44 percent of the total electricity sold to retail customers in California per year by December 31, 2024, 52 percent by December 31, 2027, and 60 percent by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 also states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100 percent of the retail sales of electricity to California. This bill requires that the achievement of 100 percent zero-carbon electricity resources does not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

EO B-55-18 (2018) established a new statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. The EO requires the ARB to work with relevant State agencies to develop a framework for implementation and accounting that tracks the progress toward this goal. ARB will also be required to work with relevant State agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal.

Assembly Bill 1007

AB 1007 (2005) required CEC to prepare a statewide plan to increase the use of alternative fuels in California. CEC prepared the State Alternative Fuels Plan in partnership with ARB and in consultation with other State, federal, and local agencies. The plan presents strategies and actions California must take to increase the use of nonpetroleum fuels in a manner that minimizes the costs to California and maximizes the economic benefits of in-state production. The plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuel use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation to public health and environmental quality.

Assembly Bill 1493

AB 1493 (2002) required ARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles whose primary use is non-commercial personal transportation in the state. AB 1493 required that ARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years.

Advanced Clean Cars

In 2012, ARB approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot, and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards called Advanced Clean Cars.

In-Use Off-Road Diesel-Fueled Fleets Regulation

All self-propelled off-road diesel vehicles 25 horsepower or greater used in California (such as bulldozers, loaders, backhoes, forklifts, etc.) and most two-engine vehicles (except on-road two-engine sweepers) are subject to the Regulation for In-Use Off-Road Diesel-Fueled Fleets (Off-Road Diesel Regulation). Adopted by the ARB on July 26, 2007, this regulation aims to reduce NOX and particulate matter from off-road diesel vehicles operating within California by retiring, replacing, or

repowering older engines, or installing diesel exhaust retrofits. The compliance schedule requires full implementation by 2023 in all vehicles for large and medium fleets and by 2028 for small fleets.

Vehicles or engines subject to this regulation must limit their idling to five minutes. The idling limit does not apply to vehicles that need to idle to accomplish the work it was designed for (such as operating a crane), vehicles that need to idle for safe operation, vehicles being serviced or tested, or vehicles in a queue waiting for work. While the goal of this regulation is primarily to reduce emissions from diesel vehicles, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

Sustainable Communities Strategy

The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet its GHG emissions reduction mandates. As codified in California Government Code, Section 65080, SB 375 requires metropolitan planning organizations (such as the Butte County Association of Governments) to include a Sustainable Communities Strategy in its regional transportation plan. The main focus of the Sustainable Communities Strategy is to plan for growth in a fashion that will ultimately reduce GHG emissions, but the strategy is also a part of a bigger effort to address other development issues within the general vicinity, including transit and VMT, which influence the consumption of petroleum-based fuels.

C.6.3 Regional and Local

Town of Paradise 1994 General Plan

The Open Space/Conservation/Energy Element of the *Town of Paradise 1994 General Plan* includes the following goals related to energy:

- **Goal OCEG-10**: Maximize Paradise's energy efficiency.
- **Goal OCEG-11**: Become a regional leader in the approach to energy conservation.

The general plan contains the following objective related to energy – OCEO-14: Significantly reduce town-wide energy consumption.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to energy:

- **Policy H-P6.1**: Continue to implement state energy efficiency standards.
- **Policy COS-P3.4**: Solar-oriented and renewable design and grid-neutral development shall be encouraged.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policies related to energy:

- **Policy SUS-3.2, Municipal Energy Use**: Reduce energy and water use in municipal operations.
- **Policy SUS-3.4, Sustainable Fleet**: Support sustainable City vehicles and equipment.
- **Policy SUS-4.1, Green Public Facilities**: Incorporate green building techniques in the site design, construction, and renovation of public projects.
- **Policy SUS-5.2, Energy Efficient Design**: Support the inclusion of energy efficient design and renewable energy technologies in public and private projects.

Butte County 2021 Climate Action Plan

The *Butte County 2021 Climate Action Plan* was adopted on December 14, 2021. Strategies in the climate action plan not only result in a reduction of GHG emissions countywide, but they increase overall sustainability and quality of life in the county by facilitating increased access to transportation and services, upgrades to infrastructure that build resiliency for the entire community, energy independence and affordability, and supporting broader economic development initiatives. Additional information on the climate action plan is provided in Section C.8.3.

City of Chico Climate Action Plan Update

The *City of Chico Climate Action Plan Update* (Rincon Consultants 2021) was adopted on October 19, 2021. Measures in the climate action plan that would result in a reduction of GHG emissions are related to energy efficiency, renewable energy, sustainable transportation, development patterns, solid waste, water, urban trees and greenspace, and community engagement. Additional information on the climate action plan is provided in Section C.8.3.

C.7 Geology, Soils, and Paleontological Resources

This section summarizes the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of geology, soils, and paleontological resources in the EIR, Section 3.7.

C.7.1 Federal

Earthquake Hazards Reduction Act

In October 1977, the United States Congress passed the Earthquake Hazards Reduction Act to reduce the risks to life and property from future earthquakes in the United States. The Earthquake Hazards Reduction Act established the National Earthquake Hazard Reduction Program. The purpose of this program is to reduce the risks to life and property in the United States from earthquakes through the establishment and maintenance of an effective national earthquake risk reduction program. Member agencies in the National Earthquake Hazard Reduction Program are the US Geological Survey, the National Science Foundation, the Federal Emergency Management Agency, and the National Institute of Standards and Technology.

In November 1990, the National Earthquake Hazards Reduction Reauthorization Program Act amended the Earthquake Hazards Reduction Act of 1977 significantly by refining the description of agency responsibilities, program goals, and objectives.

The Earthquake Hazards Reduction Act's aims include improved understanding, characterization, and prediction of hazards and vulnerabilities; improved building codes and land use practices; reduced earthquake risks through post-earthquake investigations and education; development and improvement of design and construction techniques; improved mitigation capacity; and accelerated application of research results (US Geological Survey 2015).

Paleontological Resources Preservation Act

The Paleontological Resources Preservation Act was passed on March 30, 2009. The Paleontological Resources Preservation Act is intended to preserve, manage, and protect paleontological resources on lands administered by the Bureau of Land Management, the Bureau of Reclamation, the National Parks Service, and the US Fish and Wildlife Service. The Paleontological Resources Preservation Act addresses the management, collection, and curation of paleontological resources from federal lands and authorizes civil and criminal penalties for illegally collecting, damaging, defacing, or selling paleontological resources.

C.7.2 State

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act) (California Public Resources Code [PRC] §§ 2621–2630) was enacted in 1972 to reduce the hazard of surface faulting to structures designed for human occupancy. The main purpose of the law is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The law addresses only the hazard of surface fault rupture and is not directed toward other earthquake hazards. The Alquist-Priolo Act requires the State Geologist to establish regulatory zones known as Earthquake Fault Zones around the surface traces of active faults and issue appropriate maps, which are distributed to all affected cities, counties, and state agencies for their use in planning efforts. Before a project can be permitted in a designated Alquist-Priolo Earthquake Fault Zone, the permitting agency must require a geologic investigation to demonstrate that buildings intended for human habitation would not be constructed on active faults.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (PRC, Chapter 7.8, Sections 2690 to 2699.6) directs the DOC, CGS to identify and map areas prone to earthquake liquefaction hazards, earthquake-induced landslides, and amplified ground shaking. The Seismic Hazards Mapping Act is intended to reduce the threat to public safety and to minimize the loss of life and property by identifying and mitigating these seismic hazards. The Seismic Hazards Mapping Act requires the State Geologist to establish regulatory zones (Zones of Required Investigation) and to issue appropriate maps (Seismic Hazard Zone maps). These maps are distributed to all affected cities, counties, and state agencies for their use in planning and controlling construction and development.

General Permit for Construction Activities

The State of California adopted the Construction General Permit, Order No. 2012 0006 DWQ, amending Order No. 2009 0009 DWQ, effective July 17, 2012. The State Water Resources Control Board (SWRCB) Water Quality Order 2012 0006 DWQ (Construction General Permit) regulates construction site stormwater management. Dischargers whose projects disturb 1 or more acres of soil, or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under the general permit for discharges of stormwater associated with construction activity. This requirement includes linear projects that disturb 1 or more acres. Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility.

Permit applicants are required to submit a Notice of Intent to SWRCB and to prepare a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP identifies best management practices (BMPs) that must be implemented to reduce construction effects on receiving water quality based on pollutants. The BMPs identified are directed at implementing both sediment and erosion control measures and other measures to control chemical contaminants. The SWPPP must also include descriptions of the BMPs to reduce pollutants in stormwater discharges after all construction phases have been completed at the site (post construction BMPs). The SWPPP must contain a visual monitoring program, a chemical monitoring program for “nonvisible” pollutants to be implemented if there is a failure of BMPs, and a sediment monitoring plan if the site discharges directly to a waterbody listed on the CWA 303(d) list for sediment.

Paleontological Resources

CEQA includes in its definition of historical resources “…any object [or] site …that has yielded or may be likely to yield information important in prehistory…” (14 CCR § 15064.5[a][3]), which is typically interpreted as including fossils and other paleontological resources. More specifically, destruction of a “…unique paleontological resource or site or unique geologic feature…” constitutes a significant impact under CEQA pursuant to CEQA Guidelines in Appendix G. Treatment of paleontological resources under CEQA is generally similar to treatment of cultural resources, requiring evaluation of resources in the project; assessment of potential impacts on significant or unique resources; and development of mitigation measures for potentially significant impacts, which may include monitoring, data recovery excavation, and/or avoidance.

Public Resources Code Section 5097.5

PRC § 5097.5 states that no person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological, or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor. As used in this section, "public lands" means lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.

Society of Vertebrate Paleontology

The Society of Vertebrate Paleontology has guidance for assessing and mitigating paleontological resources that could potentially be impacted from land development. This guidance is included in the *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources* (Society of Vertebrate Paleontology 2010). As part of the assessment process for paleontological resources, the Society of Vertebrate Paleontology's guidance groups rock units into a high, undetermined, low, or no potential category for containing significant paleontological resources. These categories then determine the level of mitigation required, or further assessment prior to construction, for adequate protection or salvage of paleontological resources within a project area.

C.7.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* includes the following policies related to geology and soils:

- **Policy SP-15:** Development projects should be designed to minimize soil erosion and shall be required to comply with all Town of Paradise-adopted soil erosion standards maintained by the Paradise Community Development Department.
- **Policy SP-16:** The town should require all development proposals on sites that contain slopes exceeding 20 percent, and/or which border or include significant and sensitive stream courses or natural drainageways, to include programs for replanting and slope stabilization, erosion control plans, and to incorporate designs which minimize grading and cut-and-fill.
- **Policy SP-17:** Building on slopes in excess of 30 percent should not be permitted.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to geology, soils, and paleontological resources:

- **Policy HS-P6.1:** Appropriate detailed seismic investigations shall be completed for all public and private development projects in accordance with the Alquist-Priolo Earthquake Fault Zoning Act.
- **Policy HS-P7.1:** Site-specific geotechnical investigations shall be required to assess landslide potential for private development and public facilities projects in areas rated "Moderate to High" and "High" in Figure HS-4 or the most current available mapping
- **Policy HS-P8.1:** Site-specific geotechnical investigations shall be required to assess erosion potential for private development projects and public facilities in areas rated "Very High" in Figure HS-7 or the most current available mapping.
- **Policy HS-P9.1:** Site-specific geotechnical investigations shall be required to assess risks from expansive soils for private development projects and public facilities in areas rated "High" in Figure HS-8 or the most current available mapping.

- **Policy COS-P14.2:** As part of CEQA and NEPA projects, evaluations of surface and subsurface cultural resources in the county shall be conducted. Such evaluations should involve consultation with the Northeast Information Center.

- **Policy COS-P15.2:** Any archaeological or paleontological resources on a development project site shall be either preserved in their sites or adequately documented as a condition of removal. When a development project has sufficient flexibility, avoidance and preservation of the resource shall be the primary mitigation measure.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policies and actions related to seismic and geologic hazards:

- **Policy S-3.1, Potential Structural Damage:** Prevent damage to new structures caused by seismic, geologic, or soil conditions.

    - **Action S-3.1.2, Potential Soil Hazards:** In areas with highly expansive soils, require appropriate studies and structural precautions through project review.

Grading Ordinances

Chapter 15.02, 2019 California Building Standards Code, of the Town's municipal code requires that a grading permit be obtained from the Town Engineer before any grading, clearing, or grubbing activities. Application for a grading permit requires submittal of a grading plan. The grading plan, and accompanying site map, shall show the following: existing and proposed contours, proposed limits of cuts and fills and other earthwork, existing off-site structures and other off-site improvements, public and private easements of record, typical sections of areas to be graded, all proposed uses for the site, and any other special features.

Chapter 13, Grading and Mining, of the Butte County's municipal code states that the application for a grading permit shall include the following: location map, plot plan, description of the work to be done and materials to be used, location of all drainage to and from the site, location of culverts and natural watercourses, details of proposed drainage structures, description of the methods to be used for erosion and sediment control, and locations of anticipated stockpile areas.

Chapter 16.28, Grading Regulations – Permits, of the Chico Municipal Code states that application for a grading permit requires submittal of a grading plan. The grading plan shall include detailed plans, dimensions, and grading specifications. If required by the building official, a soils engineering report and/or engineering geology report must be prepared, and any recommendations included in these reports shall be a part of the grading plan submittal.

C.8 Greenhouse Gas Emissions

This section summarizes the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of GHG emissions in the EIR, Section 3.8.

C.8.1 Federal

United States Environmental Protection Agency

On April 2, 2007, in *Massachusetts v. Environmental Protection Agency*, 549 U.S. 497, the U.S. Supreme Court found that GHGs are air pollutants covered by the Federal Clean Air Act. The court held that USEPA must determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. The Supreme Court's decision resulted from a petition for rulemaking under section 202(a) filed by more than a dozen environmental, renewable energy, and other organizations.

C.8.2 State

Executive Order S-3-05

In June 2005, Governor Schwarzenegger issued Executive Order (EO) S-3-05, which established the following GHG emissions reduction targets: 1) reduce GHG emissions to 2000 levels by 2010, 2) reduce GHG emissions to 1990 levels by 2020, and 3) reduce GHG emissions to 80 percent below 1990 levels by 2050.

Assembly Bill 32 (Global Warming Solutions Act)

In September 2006, the California State Legislature enacted the California Global Warming Solutions Act of 2006, also known as AB 32. AB 32 required that statewide GHG emissions be reduced to 1990 levels by 2020. California met its 2020 reduction goal in 2018.

Executive Order B-30-15

On April 20, 2015, Governor Brown signed EO B-30-15 to establish a California GHG reduction target of 40 percent below 1990 levels by 2030. California's emission reduction target of 40 percent below 1990 levels by 2030 will make it possible to reach the ultimate goal of reducing emissions 80 percent below 1990 levels by 2050. This is in line with the scientifically established levels needed in the United States to limit global warming below 2 degrees Celsius, the warming threshold at which there will likely be major climate disruptions such as super droughts and rising sea levels.

Senate Bill 32

Senate Bill (SB) 32 was signed into law on September 8, 2016, and expands upon AB 32 to reduce GHG emissions. SB 32 sets into law the mandated GHG emissions target of 40 percent below 1990 levels by 2030 written into EO B-30-15.

Climate Change Scoping Plan

In December 2008, the ARB adopted the *Climate Change Scoping Plan* (2008 Scoping Plan) to achieve the goals outlined in AB 32. The 2008 Scoping Plan, developed by ARB in coordination with the Climate Action Team, proposed a comprehensive set of actions designed to reduce overall GHG emissions in California, improve the environment, reduce dependence on oil, diversify the state's energy sources, save energy, create new jobs, and enhance public health. According to the 2008 Scoping Plan, California will implement strategies to achieve a reduction of approximately 118

million metric tons (MT) of CO_2e, or approximately 22 percent from the State's projected 2020 emission level of 545 million MT of CO_2e under a business-as-usual scenario. This is a reduction of 47 million MT CO_2e, or almost 10 percent, from 2008 emissions (ARB 2008). The ARB's original 2020 projection was 596 million MT CO_2e, but this revised 2020 projection considered the economic downturn that occurred in 2008.

The *First Update to the Climate Change Scoping Plan* (2014 Scoping Plan) was approved by the ARB in May 2014 and built upon the 2008 Scoping Plan with new strategies and recommendations. The 2014 Scoping Plan contained the main strategies California will implement to achieve a reduction of 80 million MT of CO_2e emissions, or approximately 16 percent, from the state's projected 2020 emission level of 507 million MT of CO_2e under the business-as-usual scenario defined in the 2014 Scoping Plan (ARB 2014). The 2014 Scoping Plan also included a breakdown of the amount of GHG reductions ARB recommended for each emissions sector of the state's GHG inventory. Several strategies to reduce GHG emissions were included: Low Carbon Fuel Standard, Pavley Rule, Advanced Clean Cars program, Renewable Portfolio Standard, and Sustainable Communities Strategy.

In 2016, the Legislature passed SB 32, which codified a 2030 GHG emissions reduction target of 40 percent below 1990 levels. With the passage of SB 32, the Legislature passed companion legislation AB 197, which provided additional direction for developing the Scoping Plan. The ARB adopted *California's 2017 Climate Change Scoping Plan* (2017 Scoping Plan) in November 2017. The 2017 Scoping Plan represents a second update to the scoping plan to reflect the 2030 target as codified by SB 32. According to the 2017 Scoping Plan, the 2030 target of 260 million MT of CO_2e requires the reduction of 129 million MT of CO_2e, or approximately 33.2 percent, from the state's projected 2030 business-as-usual scenario emissions level of 389 million MT of CO_2e (ARB 2017).

Assembly Bill 1493 (Pavley Clean Car Standards)

AB 1493 (Pavley Bill) (Chapter 200, Statutes of 2002) requires ARB to develop and adopt regulations that achieve "the maximum feasible reduction of GHGs emitted by passenger vehicles and light duty truck and other vehicles determined by ARB to be vehicles whose primary use is non-commercial personal transportation in the state." In September 2004, pursuant to this directive, the ARB approved regulations to reduce GHG emissions from new motor vehicles beginning with the 2009 model year. These regulations created the Pavley standards. In September 2009, the ARB adopted amendments to the Pavley standards to reduce GHG emissions from new motor vehicles through the 2016 model year. These regulations created the Pavley II standards.

Advanced Clean Cars Program

In January 2012, the ARB approved a new emissions control program for model years 2017 through 2025. The program combines the control of smog, soot, and global warming gases and requirements for greater numbers of zero emission vehicles into a single packet of standards called Advanced Clean Cars. The Advanced Clean Cars Program includes the Zero Emission Vehicle Program, which is designed to achieve California's long-term emission reduction goals by requiring manufacturers to offer for sale specific numbers of zero-emission vehicles, which include battery electric, fuel cell, and plug-in hybrid electric vehicles.

C.8.3 Regional and Local

Butte County Air Quality Management District

BCAQMD is the air quality regulating authority in Butte County. The *CEQA Air Quality Handbook* (BCAQMD 2014) includes analysis requirements for construction and operational emissions. BCAQMD has not adopted thresholds of significance for GHG emissions. For construction and operational GHG emissions, BCAQMD's recommended threshold includes compliance with a qualified GHG reduction strategy, compliance with the Lead Agency's threshold, or consistency with the goals of AB 32.

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* does not contain any objectives or policies that specifically address GHG emissions. The Town has not adopted a climate action plan or any other plan to quantify existing GHG inventories or provide goals and measures to reduce GHG emissions in the town.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to GHG emissions:

- **Policy COS-P1.1:** Greenhouse gas emission impacts from proposed development projects shall be evaluated as required by the CEQA.
- **Policy COS-P1.2:** New development projects shall mitigate greenhouse gas emissions on-site or as close to the site as possible.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policies related to GHG emissions:

- **Policy SUS-6.1, Greenhouse Gas Reduction Efforts**: Support local, regional, and statewide efforts to reduce emissions of greenhouse gases linked to climate change.
- **Policy SUS-6.2, Greenhouse Gas Inventory and Climate Action Plan**: Maintain a Greenhouse Gas Emissions Inventory and implement the Climate Action Plan to make progress toward meeting the City's greenhouse gas emissions reduction goal.
- **Policy SUS-6.3, Greenhouse Gas Emissions and CEQA**: Analyze and mitigate potentially significant increases in greenhouse gas emissions during project review, pursuant to the California Environmental Quality Act.
- **Policy SUS-6.4, Community Trees**: Continue to support the planting and maintenance of trees in the community to increase carbon sequestration.

Butte County 2021 Climate Action Plan

The *Butte County 2021 Climate Action Plan* (Placeworks 2021), adopted on December 14, 2021, is Butte County's strategic plan to reduce GHG emissions in the unincorporated county. This climate

action plan updates the previously adopted climate action plan in Butte County, providing updated information, an expanded set of GHG reduction strategies, and a planning horizon out to 2050. Butte County is committed to reducing GHG emissions to 6.0 MT CO_2e per person by 2030 and 2.0 MT CO_2e per person by 2050, consistent with the 2017 Scoping Plan guidance. Butte County is also setting forth an interim target of 4.0 MT CO_2e per person by 2040. The following is a list of climate action plan strategies:

- **Strategy 1**: Continue efforts to promote energy conservation and efficiency opportunities for all residents, building/property owners, and renters in the unincorporated county, including support and promotion of programs for lower- income and disadvantaged populations.
- **Strategy 2**: Continue efforts to promote energy conservation and efficiency opportunities for all nonresidential uses in the unincorporated county, including County facilities, office space, commercial space, and industrial space.
- **Strategy 3**: Work with property owners and property management groups to increase overall building electrification and adoption of modern, efficient appliances in residential rental properties.
- **Strategy 4**: Support efforts to increase renewable and carbon-free energy generation, including wind, solar, and biomass, and to ensure customer access to such renewable energy
- **Strategy 5**: Continue efforts to promote water conservation for all residents, building/property owners, and businesses in the unincorporated county, including support and promotion of programs for lower-income and disadvantaged populations, and large water users.
- **Strategy 6**: Pursue Transportation Demand Management (TDM) strategies, implemented through local land use decisions and through partnerships with local employers, that reduce vehicle miles traveled (VMT) countywide.
- **Strategy 7**: Prioritize bicycling and walking as safe, practical, and attractive travel options countywide.
- **Strategy 8**: Reduce carbon emissions from transportation by facilitating a transition to efficient or clean-fuel vehicles.
- **Strategy 9**: Encourage hybrid and clean-fuel construction and landscaping equipment countywide.
- **Strategy 10**: Reduce the amount of solid waste sent to local landfills through innovative programs and partnerships.
- **Strategy 11**: Reduce emissions from disposal and decomposition of organic waste.
- **Strategy 12**: Work to reduce GHG emissions associated with agricultural equipment, in partnership with regional partners, agencies, and members of the agricultural community.

- **Strategy 13**: Track trends in agricultural operations and encourage existing and new farming techniques that reduce GHG emissions from crop cultivation.
- **Strategy 14**: Work with farmers and local and regional agencies to explore techniques to maximize carbon sequestration of the county's natural and working lands.
- **Strategy 15**: Implement projects and programs to reduce GHG emissions associated with Butte County operations.

City of Chico Climate Action Plan Update

The *City of Chico Climate Action Plan Update* (Rincon Consultants 2021) was adopted on October 19, 2021. The City of Chico is committed to a GHG emissions reduction target of 2.71 MT of CO_2e per person (or 292,437 MT of CO_2e in total emissions) by 2030. This corresponds to an 80 percent reduction in per capita emissions (or a 46 percent reduction in total emissions) below 1990 levels by 2030, exceeding the SB 32 target of 40 percent reduction in total emissions by 2030. To achieve the GHG emissions reduction target, the climate action plan includes 13 measures related to energy efficiency, renewable energy, sustainable transportation, development patterns, solid waste, water, urban trees and greenspace, and community engagement.

C.9 Hazards and Hazardous Materials

This section identifies the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of hazards and hazardous materials in the EIR, Section 3.9.

C.9.1 Federal

Hazardous Waste Management

The Federal Toxic Substances Control Act (1976) and the Resource Conservation and Recovery Act of 1976 (RCRA) established a program administered by the U.S. Environmental Protection Agency (EPA) for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the Hazardous and Solid Waste Act (HSWA), which affirmed and extended the "cradle to grave" system of regulating hazardous wastes. The use of certain techniques for the disposal of some hazardous wastes was specifically prohibited by HSWA. The statute also addresses program administration; implementation and delegation to the states; enforcement provisions and responsibilities; and research, training, and grant funding.

EPA Asbestos National Emission Standards for Hazardous Air Pollutants (NESHAP)

The asbestos NESHAP regulations specify work practices for asbestos to be followed during demolition and renovation of all structures, installations, and buildings (excluding residential buildings that have four or fewer dwelling units). 40 CFR Part 61 states that the owner or operator of a demolition or renovation activity and prior to the commencement of the demolition or renovation will thoroughly inspect the affected facility or part of the facility where the demolition or renovation operation will occur for the presence of asbestos. The regulations require the owner of the building or the operator to notify the appropriate state agency before any demolition, or before any renovations of buildings that could contain a certain threshold amount of asbestos or asbestos-containing material. In addition, particular manufacturing and fabricating operations either cannot

emit visible emissions into the outside air or must follow air cleaning procedures, as well as follow certain requirements when removing asbestos-containing waste. 40 CFR Part 61, Subpart M establishes the National Emission Standards for Hazardous Air Pollutants (NESHAP) and names asbestos-containing material as one of these materials. Asbestos-containing material use, removal, and disposal are regulated by U.S. EPA under this law. Work practice standards under the EPA for air toxics regulations would include removing all asbestos1containing materials, adequately wetting all regulated asbestos-containing materials, sealing the material in leak tight containers and disposing of the asbestos-containing waste material as expediently as practicable. In addition, notification of friable asbestos-containing material removal prior to a proposed demolition project is required by this law.

Universal Waste Management

40 CFR Part 273 governs the collection and management of widely generated waste, including batteries, pesticides, mercury-containing equipment, and bulbs. This regulation streamlines the hazardous waste management standards and ensures that such waste is diverted to the appropriate treatment or recycling facility.

U.S. Department of Labor, Occupational Safety and Health Administration

29 CFR Part 1910, Occupational Safety and Health Standards, requires facilities that use, store, manufacture, handle, process, or move hazardous materials to conduct employee safety training; inventory safety equipment relevant to potential hazards; have knowledge on safety equipment use; prepare an illness prevention program; provide hazardous substance exposure warnings; prepare an emergency response plan, and prepare a fire prevention plan.

29 CFR Part 1926 establishes safety and health regulations for construction. These standards require employee training; personal protective equipment; safety equipment; and written procedures, programs, and plans for ensuring worker safety when working with hazardous materials or in hazardous work environments during construction activities, including renovations and demolition projects and the handling, storage, and use of explosives. These standards also provide rules for the removal and disposal of asbestos, lead, lead based paint, and other lead materials.

U.S. Department of Transportation

Transportation of hazardous materials is regulated by the U.S. Department of Transportation’s Office of Hazardous Materials Safety. The office formulates, issues, and revises hazardous materials regulations under the Federal Hazardous Materials Transportation Law. The hazardous materials regulations cover hazardous materials definitions and classifications, hazard communications, shipper and carrier operations, training and security requirements, and packaging and container specifications. Vehicles transporting hazardous materials must be properly placarded. In addition, the carrier is responsible for the safe unloading of hazardous materials at the site, and operators must follow specific procedures during unloading to minimize the potential for an accidental release of hazardous materials. The hazardous materials transportation regulations are codified in 49 CFR Parts 100–185.

C.9.2 State

California Hazardous Waste Control Law

The California Hazardous Waste Control Law (HWCL) is administered by the California Environmental Protection Agency (CalEPA) to regulate hazardous wastes. While the HWCL is generally more stringent than RCRA, until the U.S. EPA approves the California program, both the state and federal laws apply in California. The HWCL lists 791 chemicals and about 300 common materials that may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal and transportation; and identifies some wastes that cannot be disposed of in landfills.

The California Code of Regulations (CCR), Title 22, Chapter 11, Article 2, Section 66261, defines hazardous waste as: a waste that exhibits the characteristics that may: (1) cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported or disposed or otherwise managed.

According to 22 CCR, substances having a characteristic of toxicity, ignitability, corrosivity, or reactivity are considered hazardous waste. Hazardous wastes are hazardous substances that no longer have a practical use, such as material that has been abandoned, discarded, spilled, or contaminated, or that is being stored prior to proper disposal.

California Occupational Safety and Health Administration

The California Occupational Safety and Health Administration (Cal/OSHA) is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR 337–340). The regulations specify requirements for employee training, availability of safety equipment, accident prevention programs, and hazardous substance exposure warnings.

Cal/OSHA is the agency responsible for enforcement of the construction safety orders of 8 CCR 1529 related to asbestos removal and cleanup. Section 1529 regulates construction-related asbestos exposure involving demolition of structures, removal of asbestos containing materials, asbestos clean-up, or excavation activities which may involve exposure to asbestos. Work practice standards for Cal/OSHA are similar to the EPA, but also include the presence of an asbestos competent person for monitoring during all demolition activities, HEPA filter dust collection systems, and ventilation of enclosed or isolated areas. Section 1532.1 addresses specific measures for construction workers to take if exposed to sources that contain lead, including lead-based paint.

Lead-Based Paint

The California Department of Public Health enforces lead laws and regulations related to the prevention of lead poisoning in children, prevention of lead poisoning in occupational workers, accreditation and training for construction-related activities, lead exposure screening and reporting, disclosures, and limitations on the amount of lead found in products. Accredited lead specialists are required to find and abate lead hazards in a construction project and to perform lead-related construction work in an effective and safe manner. Specific regulations include:

California Health & Safety Code Section

105250 Establishes a program to accredit lead-related construction training providers and certify individuals to conduct lead-related construction activities.

California Civil Code Sections 1102 to 1102.16

Requires the disclosure of known lead-based paint hazards upon sale of a property.

California Labor Code Sections 6716 to 6717

Provides for the establishment of standards that protect the health and safety of employees who engage in lead-related construction work, including construction, demolition, renovation, and repair.

California Health & Safety Code Sections 105185 to 105197

Establishes an occupational lead poisoning prevention program to register and monitor laboratory reports of adult lead toxicity cases, monitor reported cases of occupational lead poisoning to ascertain lead poisoning sources, conduct investigations of take-home exposure cases, train employees and health professionals regarding occupational lead poisoning prevention, and recommended means for lead poisoning prevention.

State Water Resources Control Board

The State Water Resources Control Board (SWRCB) protects water quality in California by setting statewide policy. The SWRCB supports the nine Regional Water Quality Control Boards, which, within their areas of jurisdiction, protect surface and groundwater from pollutants discharged or threatened to be discharged to the waters of the state. For the City of Chico, the Central Valley RWQCB (CVRWQCB) maintains jurisdiction within the subject basin. This protection is carried out through the issuance and enforcement of National Pollutant Discharge Elimination System (NPDES) permits, called Waste Discharge Requirements (WDRs), regulation of leaking underground storage tanks and contaminated properties through the Leaking Underground Storage Tank (LUST) and Spills, Leaks, Investigation, and Cleanup (SLIC) programs, respectively. USTs are regulated under Chapter 6.7 of the California Health and Safety Code and 23 CCR Chapter 16.

California Health and Safety Code – Handling and Storage of Hazardous Waste

In California, the handling and storage of hazardous materials is regulated by Chapter 6.95 of the California Health and Safety Code. Under Sections 25500–25543.3, facilities handling hazardous materials are required to prepare a Hazardous Materials Business Plan. The plan provides information to the local emergency response agency regarding the types and quantities of hazardous materials stored at a facility and provides detailed emergency planning and response procedures in the event of a hazardous materials release. In the event that a facility stores quantities of specific acutely hazardous materials above the thresholds set forth by the California code, facilities are also required to prepare a Risk Management Plan and California Accidental Release Plan, which provides information on the potential impact zone of a worst-case release, and requires plans and programs designed to minimize the probability of a release and mitigate potential impacts.

California Health and Safety Code – Transportation of Hazardous Waste

In California, transportation of hazardous waste is regulated under Chapter 6.5 of the California Health and Safety Code. Under Section 21560, hazardous waste generators must complete a

manifest for the waste before it is transported or offered for transportation. A manifest is a shipping document that is signed by the hazardous waste generator and contains the necessary information to be in compliance with all state and federal regulations. The purpose of the manifest is to allow for the waste to be tracked from point of origin through point of disposal and for the generator or regulatory agency to verify that the waste is properly delivered without incurring any loss along the way. The enforcement agencies for the transportation of hazardous materials regulations are the California Highway Patrol and Caltrans.

Emergency Response/Evacuation Plans

The state of California passed legislation authorizing the Office of Emergency Services (CalOES) to prepare a Standard Emergency Management System program, which sets forth measures by which a jurisdiction should handle emergency disasters. Non-compliance with the program could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster.

California Disaster and Civil Defense Master Mutual Aid Agreement

The California Disaster and Civil Defense Master Mutual Aid Agreement states that all resources and facilities of the state, including all political subdivisions, shall voluntarily aid and assist each other in the event of a disaster by the interchange of services, including rescue, relief, evacuation, rehabilitation, and reconstruction (CalOES 1950).

C.9.3 Regional and Local

Butte County Emergency Response

The Butte County Local Hazard Mitigation Plan (LHMP) was prepared to reduce risks for hazards by helping decision makers direct mitigation activities and resources. The LHMP documents the hazard mitigation planning process and identifies relevant hazards and vulnerabilities facing the county. The LHMP also includes the strategies the County will use to increase resiliency in the face of hazardous situations. This multi-jurisdictional plan includes Butte County, the cities of Biggs, Chico, Gridley, Oroville, and the Town of Paradise, as well as a number of public utilities and services agencies serving the area. According to the LHMP's Hazard Identification Assessment, the most significant hazards in the county are dam failure, 100, 200, and 500-year floods, levee failure, and wildfire (Butte County 2019). Butte County has adopted a multi-jurisdictional Emergency Operations Plan (EOP), which assigns functions and tasks consistent with California's Standardized Emergency Management System and the National Incident Management System. The intent of the EOP is to provide direction on how to mobilize and respond to an emergency from onset to recovery (Butte County 2011).

The Butte Emergency Command Center is the mutual aid coordination center for Butte County. They have the responsibility for coordinating all mutual aid requests in Butte County and have the authority to directly obtain resources from neighboring counties including Yuba, Sutter, Plumas, Glenn, Colusa, Tehama, and Lassen (Butte County 2018c). Butte County is also part of the California Disaster and Civil Defense Master Mutual Aid Agreement and is able to share or receive resources and/or services with other jurisdictions within California in the event of a disaster or emergency situation.

Hazardous Materials Joint Powers Agreement

The Hazardous Materials Joint Powers Agreement (JPA) was initiated in December 1990 by Butte County and its five cities: Biggs, Chico, Gridley, Oroville, and the Town of Paradise. The JPA is governed by the fire chiefs of the six signatory agencies (including Butte County). The Chico Fire Department (CFD) provides 11 of the 40 authorized state certified specialist positions on the team. The nearest specialists are dispatched to any hazardous materials emergency, regardless of jurisdiction (Butte LAFCO 2018).

City of Chico 2030 General Plan

The City's 2030 General Plan includes a number of goals, policies and actions that address the use, handling, storage, and transport of hazardous materials and emergency response in the event of a fire or other city-wide emergency. Relevant goals, policies and actions are as follows.

Safety Element

The General Plan provides several policies and actions related to emergency preparedness, fire hazards, public safety, and emergency response planning.

Goal S-1-: Minimize the loss of life and property resulting from natural and human-caused hazards.

Policy S-1.1 (Emergency Preparedness) – Promote public safety from hazards that may cause death, injury, or property damage through emergency preparedness and awareness.

Action S-1.1.1 (Emergency Plan Maintenance) – Maintain, and update as needed, the City's Emergency Plan to guide emergency management in the City.

Action S-1.1.2 (Emergency Response Awareness) – Promote community preparedness for hazards and awareness of emergency notification methods.

Action S-1.1.3 (Incident Training) – Continue to participate in the Federal Emergency Management Agency's National Incident Management System program, which provides a standardized approach to emergency incidents.

Goal S-4: Continue to provide effective and efficient fire protection and prevention services to Chico area residents.

Policy S-4.1 (Fire Safety Staffing) – Maintain adequate fire suppression and prevention staffing levels.

Policy S-4.2 (Interagency Coordination) – Continue to maintain interagency relationships to maximize fire protection services and support programs that reduce fire hazards.

Policy S-4.3 (Fire Safety Standards and Programs) – Support the development and implementation of standards and programs to reduce fire hazards and review development and building applications for opportunities to ensure compliance with relevant codes.

Goal S-8: Reduce the potential for public exposure to hazardous materials or the accidental releases of toxic or hazardous substances.

Policy S-8.1 (Hazardous Materials Safety Coordination) – Support efforts to reduce the potential for accidental releases of toxic and hazardous substances.

Action S-8.1.1 (Planning for Hazardous Materials Safety) – Consult with the State Office of Emergency Services, the State Department of Toxic Substances Control, the California Highway Patrol, Butte County, and other relevant agencies regarding hazardous materials routing and incident response programs.

Policy S-8.2 (Reduce Toxic Materials Use) – Reduce the use of hazardous and toxic materials in City operations.

City of Chico Emergency Response

As part of the Butte County LHMP, a Hazard Identification Assessment was conducted for the City of Chico, indicating that drought and water shortage, earthquake and liquefaction, 100-, 200-, and 500-year floods, heavy rain and storms, and wildfire are the hazards with the most widespread potential impact. The City has established a number of agreements and procedures regarding response to emergency situations. This includes standard emergency response procedures in line with the CalOES Standard Emergency Management System program, which sets forth measures by which a jurisdiction should handle emergency disasters and mutual aid agreements for emergency assistance. These emergency response measures are included in the Butte County EOP, such established roles for command/management, communication protocols, and establishment of priorities for resource allocation (Butte County 2011). The City maintains numerous mutual aid agreements, including those with Butte County, CSU, Chico's University Police Department, and all other jurisdictions of the state during emergency situations (in accordance with the California Disaster and Civil Defense Master Mutual Aid Agreement) for fire, police, evacuation, and rescue, among other shared services. The General Plan identifies Highway 99 and State Route 32 as emergency routes for evacuation within the city.

Town of Paradise 1994 General Plan

The Town's 1994 General Plan includes a number of goals, objectives, and policies that address the use, handling, storage, and transport of hazardous materials and emergency response in the event of a fire or other town-wide emergency. Relevant goals, policies and actions are as follows.

Safety Element

The General Plan provides several goals, objectives, and policies related to emergency preparedness, fire hazards, public safety, and emergency response planning.

Goal SG-1: Assure that law enforcement and fire protection services are enhanced sufficiently to meet the demands of new and existing land use development

Goal SG-2: Provide adequate access, including emergency vehicle access and evacuation, to all new parcels and existing parcels where feasible.

Goal SG-3: Strive to protect the Paradise community from injury, loss of life and property damage resulting from catastrophes and hazardous conditions.

Goal SG-6: Improve the communication systems used during townwide emergencies, such as wildland fires, earthquakes or volcanic occurrences.

Objective SO-2: Maintain an overall fire insurance (ISO) rating of three or better, and an emergency fire response within five minutes for 90% of all emergency incidents within town limits.

Objective SO-3: Maintain the *Paradise Multihazard Disaster Plan* and conduct practice exercises throughout the life of the *General Plan*.

Policy SP-1 - New and unmitigated land use development shall not cause the police and fire protection services emergency response times to full below the service levels established by this plan.

Policy SP-2 - Through the development review process, adequate roads shall be required to be constructed and/or improved for emergency vehicle access, particularly in high wildland fire hazard areas.

Policy SP-3 - Future development should be designed and constructed to take maximum advantage of known fire and crime prevention siting, orientation and building techniques.

Policy SP-5 - The town should promote fire prevention by continuing to require brush removal and fuel load clearing as ongoing conditions of development approval and property maintenance.

Policy SP-8 - The town shall encourage Butte County to enforce standards conforming to the fire safety standards established by the state Board of Forestry for state responsibility areas within the Paradise secondary and tertiary planting areas, including:

- Road standards for fire equipment access
- Standards for signs identifying streets, roads and buildings
- Minimum private water supply reserves for emergency fire use
- Fuel breaks and greenbelts
- Land use policies and safety standards that take into account the recurrent nature of wildland fires
- Design standards establishing minimum road widths and clearances around structures
- Emergency preparedness protocol and procedures
- Maximum length of cul-de-sac roadways

Policy SP-13 - The town shall attempt to require all new development to comply with the airport height restriction policy, airport safety area(s) policies and land use guidelines for safety compatibility of the Paradise Skypark Airpon Land Use Plan.

Policy SP-14 - Detrimental and toxic discharge into natural waterways shall not be permitted.

<u>Hazardous Waste Management Element</u>

The General Plan provides several goals, objectives, and policies related to the use, handling, storage, and transport of hazardous materials.

Goal SG-7: Provide for the safe disposal and handling of toxic and hazardous waste.

Goal SG-8: Direct and promote hazardous waste management practices and technologies that will, in order of priority:

- reduce the use of hazardous substances and the generation of hazardous wastes at their source;
- recover and recycle the remaining waste for reuse to the extent feasible;
- treat those wastes not amenable to source reduction or recycling so that the environment and community health are not harmed by their ultimate release or disposal;
- ensure the safe transportation and disposal of treated hazardous waste residuals in repositories made secure from liquids that might create a toxic leachate and contaminate groundwater.

Goal SG-9: Reduce the need for additional hazardous waste disposal sites.

Objective SO-7 - Minimize the generation of hazardous wastes by seeking waste reduction alternatives which are safe, economically viable, and which represent the best technology available to the generator.

Policy SP-24 - The county, and each city, shall require that all local land use decisions on siting specified hazardous waste management facilities are consistent with the goals and policies and the siting criteria contained in the Hazardous Waste Management Plan.

C.10 Hydrology and Water Quality

This section identifies the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of hydrology and water quality in the EIR, Section 3.10.

C.10.1 Federal

Clean Water Act

The Federal Water Pollution Control Act of 1948 was the first major United States law to address water pollution. Upon sweeping amendments made in 1972, the law became commonly known as the Clean Water Act (CWA) (33 USC § 1251). The CWA established the structure for regulating discharge of pollutants into waters of the United States and regulating quality standards for surface waters.

Clean Water Act Section 404

CWA Section 404 (33 USC § 1344) enables regulation of the discharge of dredged or fill material into waters of the United States, including wetlands. The basic premise of the program is that no discharge of dredged or fill material may be permitted if: (1) a practicable alternative exists that is

less damaging to the aquatic environment or (2) the nation's waters would be significantly degraded. To comply with these objectives, a permittee must document the measures taken to avoid and minimize impacts on waters of the United States and provide compensatory mitigation for any unavoidable impacts.

Clean Water Act Section 401

Under CWA Section 401 (33 USC § 1341), federal agencies are not authorized to issue a permit or license for any activity that may result in discharges to waters of the United States, unless a state or tribe where the discharge originates either grants, waives or denies CWA Section 401 certification. Granting certification, with or without conditions, allows the federal permit or license to be issued and remain consistent with any conditions set forth in the CWA Section 401 certification. Decisions made by states or tribes are based on the proposed project's compliance with USEPA water quality standards as well as applicable effluent limitations guidelines, new source performance standards, toxic pollutant restrictions, and any other appropriate requirements of state or tribal law. In California, the State Water Resources Control Board is the primary regulatory authority for CWA Section 401 requirements (additional details are provided in the following subsections).

National Pollutant Discharge Elimination System

The NPDES permit was established in the CWA to regulate municipal and industrial discharges to surface waters of the US. The ultimate objective of the CWA is zero pollutant discharge, but it recognizes the need for a system to regulate non-zero pollutant discharges until the zero-pollutant objective is feasible. CWA Section 402 established NPDES for this purpose. The NPDES regulates all pollutant discharges, particularly point source discharges, to the waters of the US.

Construction General Permit

The Construction General Permit (CGP; NPDES No. CAS000002, SWRCB Order No. 2009-0009-DWQ, adopted on November 16, 2010) became effective on February 14, 2011, and was amended by Order No. 2010-0014-DWQ and Order No. 2012-0006-DWQ. The CGP authorizes the discharge of stormwater (and certain unauthorized non-stormwater discharges) from construction sites that disturb 1 acre or more of land, and from smaller sites that are part of a larger, common plan of development. For all projects subject to the CGP, the applicant is required to hire a qualified developer to develop and implement an effective Stormwater Pollution Prevention Plan (SWPPP). All project registration documents, including the SWPPP, are required to be uploaded into the State Water Resources Control Board's online Stormwater Multiple Application and Report Tracking System at least 30 days prior to construction.

Section 14 of the Rivers and Harbors Appropriation Act of 1899 – Section 408

Under Section 408 (33 USC § 408), any use or alteration of a Civil Works project is subject to the approval of United States Army Corps of Engineers (USACE). This requirement was established in Section 14 of the Rivers and Harbors Act of 1899. Section 408 provides that USACE may grant permission for another party to alter a Civil Works project upon a determination that the alteration proposed will not be injurious to the public interest and will not impair the usefulness of the Civil Works project.

C.10.2 State

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne) of 1966 (California Water Code Section 13000 et seq.; CCR Title 23, Chapter 3, Subchapter 15) is the primary state regulation that addresses water quality. The requirements of the act are implemented by the State Water Resources Control Board at the state level and the Regional Water Quality Control Board (RWQCB) within the nine regions designated. The RWQCB carries out planning, permitting, and enforcement activities related to water quality in California. The RWQCB is responsible for controlling discharges to surface waters of the state by issuing waste discharge requirements or conditional waivers to waste discharge requirements. Waste discharge requirements are required by the RWQCB for activities that may affect water quality.

Clean Water Act Section 401 Water Quality Certification

A CWA Section 401 water quality certification is required for activities that require CWA Section 404 permits issued by USACE. As mentioned above, the State Water Resources Control Board has primary regulatory authority for CWA Section 401 requirements for protecting water resources. Enforcement of these requirements is also handled by the nine RWQCBs depending upon location of the potential impacts. The Central Valley RWQCB will be responsible for CWA Section 401 for this project.

Delegated Permit Authority

California has been delegated permit authority for the National Pollutant Discharge Elimination System (NPDES) permit program, including storm water permits for all areas except tribal lands. Issuance of CWA Section 404 permits remains the responsibility of USACE; however, the state actively uses its CWA Section 401 certification authority to safeguard that CWA Section 404 permits will comply with state water quality standards.

State Definition of Covered Waters

Under California state law, waters of the state refer to “any surface water or groundwater, including saline waters, within the boundaries of the state” (California Water Code Section 13050). Therefore, water quality laws apply to both surface water and groundwater. After the United States Supreme Court decision in *Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers*, 531 U.S. 159 (2001), the Office of Chief Counsel of the State Water Resources Control Board released a legal memorandum confirming the state’s jurisdiction over isolated wetlands. The memorandum stated that under the California Porter-Cologne Water Quality Control Act (Porter-Cologne), discharges to wetlands and other waters of the state are subject to state regulation, and this includes isolated wetlands. In general, the State Water Resources Control Board regulates discharges to isolated waters in much the same way as they do for waters of the United States, but the regulation is via Porter-Cologne rather than the CWA.

Central Valley Flood Protection Board (California Code Regs. Title 23, Division 1)

The CVFPB exercises regulatory authority within its jurisdiction to maintain the integrity of the existing flood control system and designated floodways by issuing permits for encroachments. The

CVFPB has mapped designated floodways along more than 60 streams and rivers in the Central Valley. In addition, in the California Code of Regulations (CCR), Title 23, Table 8.1 shows several hundred stream reaches and waterways that are regulated streams. Projects that encroach in a designated floodway or regulated stream, or within 10 feet of the toe of a state-federal flood control structure (levee), require an encroachment permit and the submission of an associated application, including an environmental assessment questionnaire. A project must demonstrate that it will not reduce the channel flow capacity and that it will comply with channel and levee safety requirements. In cooperation with USACE, the CVFPB enforces standards for the construction, maintenance, and protection of adopted flood control plans that will protect public lands from floods. The jurisdiction of the CVFPB includes the Central Valley, including all tributaries and distributaries of the Sacramento River, the San Joaquin River, and designated floodways (23 CCR § 2). The CVFPB has all the responsibilities and authorities necessary to oversee future modifications as approved by USACE pursuant to assurance agreements with USACE and the USACE Operation and Maintenance Manuals under 33 CFR 208.10 and 33 USC 408.

State Water Resources Control Board and Regional Water Quality Control Boards

The SWRCB adjudicates water rights, sets water pollution control policy, issues water board orders on matters of statewide application, and oversees water quality functions throughout the state by approving Basin Plans, TMDLs, and NPDES permits. RWCQBs are responsible for protecting beneficial uses of water resources within their regional jurisdiction using planning, permitting, and enforcement authorities to meet this responsibility.

C.10.3 Regional and Local

Regional Water Quality Control Board Basin Plan

The proposed Project is under the jurisdiction of the Central Valley RWQCB. The Central Valley RWQCB implements the *Water Quality Control Plan (Basin Plan) for the California Regional Water Quality Control Board Central Valley Region* (May 2018) to regulate surface and groundwater quality in the region. The Basin Plan covers the entire Sacramento and San Joaquin River Basins. The Basin Plan lists beneficial uses and water quality objectives to protect those uses. The proposed Project is in the Sacramento River Basin and will follow the requirements laid out in that portion of the Basin Plan.

Municipal Separate Storm Sewer Systems

CWA Section 402(p) requires the issuance of NPDES permits for five categories of stormwater dischargers, including MS4s. EPA defines an MS4 as “any conveyance or system of conveyances (roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels, and storm drains) owned or operated by a state, city, town, county, or other public body having jurisdiction over storm water, that are designed or used for collecting or conveying stormwater.” Pursuant to CWA Section 402, NPDES permits are required and issued for discharges from an MS4 serving a population of 100,000 or more for the Phase I MS4 Municipal Program and serving a population of 10,000 or more for the Phase II Small MS4 Program. As discussed, Butte County operates under Small MS4 stormwater permit.

Butte County Groundwater Conservation Ordinance (Chapter 33)

In November 1996, the voters in Butte County approved an ordinance to protect the groundwater resources in Butte County. One of the stated purposes of the ordinance was that the groundwater underlying Butte County is a significant water resource which must be reasonably and beneficially used and conserved for the benefit of the overlying land by avoiding extractions which harm the Butte Basin aquifer, causing exceedance of the safe yield or a condition of overdraft. The ordinance is now codified as Chapter 33 of the Butte County Code relating to groundwater conservation. The Proposed Project would not extract or use groundwater resources during construction and operations and would not conflict with the Butte County Groundwater Conservation Ordinance.

Butte County Integrated Water Resources Plan (IWRP)

The purpose of the IWRP is to document the stakeholder-centered process used by Butte County to develop water resources policy recommendations for consideration by the Butte County Board of Supervisors. The IWRP is part of the Butte County's proactive Integrated Water Resources Program.

Four-County Memorandum of Understanding

The counties of Butte, Colusa, Glenn, and Tehama share common surface water and groundwater resources. The purpose of the four county MOU is to establish the mutual understandings of the four counties with respect to their voluntary joint efforts toward regional coordination, collaboration and communication. Treated wastewater from the Proposed Project would be discharged into the Sacramento River in accordance with NPDES permitting requirements. The Proposed Project would also include a Frac-out Plan**,** which would outline all standard BMPs, monitoring, and contingency procedures in the event of frac-out during ground disturbing activities to protect groundwater resources. Therefore, the Proposed Project would not conflict with the Four-County MOU.

Butte County General Plan 2030 Water Resources Element

The Water Resources Element of the *Butte County General Plan 2030* describes the water resources within Butte County and contains goals and policies related to groundwater and surface water conservation and protection. It also provides additional guidance to Butte County related to decisions about water resources. The following goals and policies in the *Butte County General Plan 2030* are relevant to the hydrology and water quality analysis:

- **Goal W-1:** Maintain and enhance water quality.
- **Goal W-2:** Ensure an abundant and sustainable water supply to support all uses in Butte County.
- **Goal W-3:** Effectively manage groundwater resources to ensure a long-term water supply for Butte County.
- **Goal W-4:** Promote water conservation as an important part of a long-term and sustainable water supply.
- **Goal W-5:** Protect water quality through effective stormwater management.

- **Policy W-P1.4:** Where appropriate, new development shall be Low Impact Development (LID) that minimizes impervious area, minimizes runoff and pollution and incorporates best management practices.
- **Policy W-P1.8:** The County supports conversion from septic systems to public sewer service, where feasible.
- **Policy W-P2.1:** The County supports solutions to ensure the sustainability of community water supplies.
- **Policy W-P2.2:** The County may continue the Four-County Memorandum of Understanding (MOU) with Colusa, Glenn, Tehama and Sutter Counties, and may support the development of the Northern Sacramento Valley Integrated Regional Water Management Plan.
- **Policy W-P2.6:** The County supports water development projects that are needed to supply local demands.
- **Policy W-P2.7:** The Butte County Water Commission and the Department of Water Resource Conservation shall continue to be utilized as important partners in the water resource planning process.
- **Policy W-P3.3:** The County shall protect groundwater recharge and groundwater quality when considering new development projects.
- **Policy W-P4.4:** Opportunities to recover and utilize wastewater for beneficial purposes shall be promoted and encouraged.
- **Policy W-P4.6**: New development projects shall adopt best management practices for water use efficiency and demonstrate specific water conservation measures.
- **Policy W-P4.7**: County facilities shall adopt water conservation measures and when appropriate retrofit existing facilities to improve water conservation.
- **Policy W-P5.2**: New development projects shall identify and adequately mitigate their water quality impacts from stormwater runoff.
- **Policy W-P5.4:** Temporary facilities shall be installed as necessary during construction activities in order to adequately treat stormwater runoff from construction sites.

Town of Paradise 1994 General Plan

Chapter 6.6 of the *Town of Paradise 1994 General Plan*, Open Space/Conservation/Energy Element addresses the goals, objectives, policies, and implementation measures related to water resources in the Town. It addressed open space for preservation of natural resources, including rivers, streams and watersheds; and open space for public health and safety, including floodplains, watersheds, and the protection of water quality and reservoirs. The following policies in the *Town of Paradise 1994 General Plan* are relevant to the hydrology and water quality analysis:

- **Policy SP-17:** Development projects shall be designed to minimize soil erosion and shall be required to comply with all Town of Paradise adopted soil erosion standards maintained by the Town Engineering Office.
- **Policy OCEP-22**: Surface and groundwater quality shall be improved and preserved, and the Paradise area watershed shall be protected.
- **Policy OCEP-23:** Stream courses identified and designated as significantly important shall be carefully protected from the impacts of land use development, both within and outside the Town limits.
- **Policy OCEP-25:** Natural riparian vegetation along creeks shall be protected.

Town of Paradise Stormwater Ordinance

The Town of Paradise adopted an ordinance relating to Stormwater Quality Management for the purpose of protecting and promoting the health, safety and general welfare of the citizens of the Town. The purpose of the ordinance is also to protect and enhance the water quality, beneficial uses, habitats and ecosystems in receiving waters by reducing pollution and pollutant loads discharged in urban runoff from areas within the town's jurisdiction, and by prohibiting non-stormwater discharges to municipal storm drain systems.

Chico 2030 General Plan Open Space and Environment Element

The Chico 2030 General Plan Open Space and Environment Element provides context and sets goals and policies for the protection of water resources. The following goals and policies in the *Chico 2030 General Plan* are relevant to the hydrology and water quality analysis:

- **Goal OS-3:** Conserve water resources and improve water quality.
- **Policy OS-3.1, Surface Water Resources**: Protect and improve the quality of surface water.
- **Policy OS-3.2, Protect Groundwater**: Protect groundwater and aquifer recharge areas to maintain groundwater supply and quality.
- **Policy OS-3.3, Water Conservation and Reclamation**: Encourage water conservation and the reuse of water.

Chico Urban Area Nitrate Compliance Plan

The *Chico Urban Area Nitrate Compliance Plan* (Butte County 2000) was prepared in response to the contamination of groundwater in the Chico Urban Area by nitrate, a form of nitrogen, and the subsequent issuance of Prohibition Order No. 90-126 adopted by the Central Valley RWQCB on April 27, 1990. The discharge from individual septic systems was the primary source of groundwater nitrate contamination that exceeded drinking water standards set by the USEPA and the SWRCB. Nitrate levels that exceed the standards pose a threat to the public health and are subject to regulation. The *Chico Urban Area Nitrate Compliance Plan* supersedes the Nitrate Action Plan, which was adopted by the Butte County Board of Supervisors and Chico City Council in 1985.

C.11 Land Use and Planning

This section identifies the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of land use and planning in the EIR, Section 3.11.

C.11.1 Federal

No identified federal laws, regulations, orders, policies, or plans regarding land use and planning are relevant to the Proposed Project.

C.11.2 State

California State Planning and Zoning Law (California Government Code § 65000 to 66037)

The California State Planning and Zoning Law delegates most of the state's local land use and development decisions to the respective city or county, and describes the laws that pertain to the land use regulations set by the local government's general plan requirements, specific plans, and zoning.

C.11.3 Regional and Local

Town of Paradise "Dig Once" Policy

The Town of Paradise adopted the "Dig Once" Policy in 2019 to rebuild the Town's infrastructure after the 2018 Camp Fire. Per this policy, the Town strives to place all utility lines underground and direct utility agencies and companies to coordinate with each other when constructing and maintaining their infrastructure. This coordination would lessen the impact on the Town's roadways. Full relocation of utilities is estimated to take 5 years to complete, and work has already begun in Paradise. The Policy includes the following pertinent objectives related to land use and planning:

- Minimize disruption of the town's public infrastructure, such as paved roads and sidewalks.
- Ensure efficient, non-duplicative placement of infrastructure in the town's right-of-way (ROW).
- Protect and control access to public ROW and ensure that use of public ROW aligns with the vision for a resilient and modern Town of Paradise.

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan*, adopted in 1994 and amended through 2008, provides direction on land use decision-making for the next 15 years. The General Plan process offers the Town the opportunity to plan proactively rather than reactively for future development. The General Plan includes the following pertinent goals and policies related to land use and planning:

- **Implementation Measure LUI-7:** Continue to implement the Master Storm Drain Study and Facilities Plan
- **Policy ESP-6:** School sites should have on a timely basis access to all utilities and services, including sewer, water, gas, electricity, and drainage.

- **Objective LUO-10:** Consider the construction and installation of a formal sewer system to service the commercial and industrial areas in the town within the fifteen-year planning period.
- **Policy LUP-16:** The Town shall attempt to implement all feasible steps to assure that sewer service is made available to the commercial area of the Town as expeditiously as possible
- **Goal LUG-2:** Accommodate a rate of growth consistent with the physical and infrastructural limitations in Paradise.
- **Objective LUO-2:** Stimulate and accommodate commercial/industrial growth while maintaining the current quality of life.
- **Objective LUO-4:** Carefully manage and control population growth, while stimulating local economic growth.
- **Goal LUG-32:** Assure that all land uses in the town conform to the goals and policies of the *General Plan*.

Butte County General Plan 2030

The *Butte County General Plan 2030*, adopted in 2010 and updated in 2012, provides Butte County direction on how it will fulfill its community vision and manage its future growth. The General Plan addresses all aspects of Butte County's development, including land use, circulation, public facilities, and public safety. The General Plan includes the following pertinent goals and policies related to land use and planning:

- **Goal LU-1:** Continue to uphold and respect the planning principles on which the County's land use map is based.
- **Goal LU-3:** Create communities where there is a sense of well-being where families and neighbors can socialize, interact, and play.
- **Goal LU-5:** Provide adequate land for and promote the development of attractive commercial and industrial areas and uses that provide goods, services, and jobs.
- **Goal LU-9:** Coordinate land development with provision of new services and infrastructure.

Chico 2030 General Plan

The *Chico 2030 General Plan*, adopted in 2011 and amended in 2017, provides the City of Chico a comprehensive, long-range, and internally consistent policy framework for the growth and preservation of Chico. The General Plan consists of guiding principles, goals, policies, and actions to guide the physical development of Chico. The General Plan includes the following pertinent goals and policies related to land use and planning:

- **Goal LU-1:** Reinforce the City's compact urban form, establish urban growth limits, and manage where and how growth and conservation will occur.

- **Goal LU-2:** Maintain a land use plan that provides a mix and distribution of uses that meet the identified needs of the community.

C.12 Noise and Groundborne Vibration

This section summarizes the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of noise and groundborne vibration in the EIR, Section 3.12.

C.12.1 Federal

Noise Control Act of 1972

The Noise Control Act of 1972 (42 USC 4901 to 4918) was the first comprehensive statement of national noise policy. The Noise Control Act declared "it is the policy of the U.S. to promote an environment for all Americans free from noise that jeopardizes their health or welfare." Although the Noise Control Act, as a funded program, was ultimately abandoned at the federal level, it served as the catalyst for comprehensive noise studies and the generation of noise assessment and mitigation policies, regulations, ordinances, standards, and guidance for many states, counties, and municipal governments. For example, the noise elements of general plan documents and local noise ordinances considered in this analysis were largely created in response to the passage of the Noise Control Act.

Occupational Safety and Health Administration

The Occupational Safety and Health Administration established standards for occupational noise exposure under 29 CFR 1910.95. These regulations protect employees from excessive noise exposure and require a Hearing Conservation Program when routine exposure to high noise levels would occur. The regulations identify permissible daily noise exposures and stipulate that personal protection against the effects of noise exposure must be provided if those levels are exceeded.

Federal Transit Administration

The Federal Transit Administration (FTA) developed the *Transit Noise and Vibration Impact Assessment Manual* (Noise Manual) in September 2018. The Noise Manual provides technical guidance for conducting noise and vibration analyses for transit projects. While these standards and impact assessment methodologies are not directly applicable to the Proposed Project, they are routinely used as guidelines for projects in state and local jurisdictions. The Noise Manual provides vibration criteria for structural damage by building/structural category as shown in Table C.12-1.

Table C.12-1. Groundborne Vibration Structural Damage Criteria

Building Category	PPV (in/sec)	L_V (VdB)
I. Reinforced concrete, steel, or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

Source: FTA 2018

Notes: PPV = peak particle velocity, in/sec = inch per second, L_V = vibration velocity level, VdB = vibration decibel

The Noise Manual also includes criteria for acceptable levels of groundborne vibration by vibration-sensitive land uses as shown in Table C.12-2.

Table C.12-2. Groundborne Vibration Human Annoyance Criteria

Land Use Category	Maximum L_V (VdB)	Description
Workshop	90	Vibration is distinctly felt. Appropriate for workshops and similar areas not as sensitive to vibration.
Office	84	Vibration can be felt. Appropriate for offices and similar areas not as sensitive to vibration
Residential – daytime	78	Vibration is barely felt. Adequate for land uses that are sensitive to vibration.
Residential – nighttime	72	Vibration is not felt, but groundborne noise may be audible inside quiet rooms.

Source: FTA 2018

Notes: L_V = vibration velocity level, VdB = vibration decibel

C.12.2 State

California Noise Control Act

The California Noise Control Act, enacted in 1973 (Health and Safety Code 46010 et seq.), finds that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. The act declares that the State of California has a responsibility to protect the health and welfare of its citizens through the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians that is free from noise which jeopardizes their health or welfare. The act requires the Office of Noise Control in the Department of Health Services to aid local communities in developing local noise control programs. The Office of Noise Control also works with the Office of Planning and Research to provide guidance for preparing required noise elements in city and county general plans, pursuant to Government Code Section 65302(f).

Office of Planning and Research

The *State of California General Plan 2017 Guidelines* published by the Office of Planning and Research provides a basis for local programs to control and abate environmental noise and to protect residents from excessive exposure (Office of Planning and Research 2017). These guidelines include a noise level/land use compatibility chart that categorizes various outdoor L_{dn} ranges into up to four compatibility categories: normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable, depending on land use. These normally and conditionally acceptable L_{dn} ranges are intended to indicate that local conditions (existing noise levels and community attitudes toward dominant noise sources) should be considered in evaluating land use compatibility at specific locations. These guidelines are used by many agencies, environmental planners, and acoustical specialists as a starting point to evaluate the potential for noise impacts on and by a project. The guidelines are also used to evaluate methods for achieving noise compatibility with respect to nearby existing uses.

However, it is important to note that the guidance does not take local conditions into account, including a particular community's sensitivity to noise, noise reduction goals, or assessment of the relative importance of noise pollution. As a result, noise standards developed by local jurisdictions typically differ somewhat from the Office of Planning and Research's guidance.

C.12.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* includes the following noise-related policies:

- **Policy NP-1:** Where proposed nonresidential land uses are likely to produce noise levels exceeding the performance standards of Table 6.4-1 at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part NP-7 of the environmental review process so that noise mitigation may be included in the project design.
- **Policy NP-4:** Where noise mitigation measures are required to achieve the standards of Tables 6.4-1 and 6.4-2, the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers should be considered a supplemental means of achieving the noise standards after all practical design-related noise mitigation measures have been integrated into the project.
- **Policy NP-5:** Acoustical analyses should be prepared in accordance with the requirements of Table 6.4-3.
- **Policy NP-10:** The town shall assure that new development situated near existing residential care and retirement facilities is consistent with the goals, objectives and policies of the Noise Element.

Butte County General Plan 2030

The *Butte County General Plan 2030* includes the following policies related to noise:

- **Policy HS-P1.6:** Applicants proposing a new noise-producing development project near existing or planned noise-sensitive uses shall provide a noise analysis prepared by an acoustical specialist with recommendations for design mitigation.
- **Policy HS-P1.7:** Applicants for discretionary permits shall be required to limit noise-generating construction activities located within 1,000 feet of residential uses to daytime hours between 7:00 a.m. and 6:00 p.m. on weekdays and non-holidays.
- **Policy HS-P1.8:** Noise from generators shall be regulated near existing and future residential uses.
- **Policy HS-P1.9:** The following standard construction noise control measures shall be required at construction sites in order to minimize construction noise impacts:
    - Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

- Locate stationary noise-generating equipment as far as possible from sensitive receptors when sensitive receptors adjoin or are near a construction project area.
- Utilize quiet air compressors and other stationary noise-generating equipment where appropriate technology exists and is feasible.

Chico 2030 General Plan

The *Chico 2030 General Plan* includes the following policies related to noise:

- **Policy N-1.3, Acoustical Analysis:** Where proposed projects are likely to expose noise-sensitive land uses to noise levels exceeding the City's standards, require an acoustical analysis as part of environmental review so that noise mitigation measures may be identified and included in the project design. The requirements for the content of an acoustical analysis are outlined in Table N-3.

Noise Ordinances

The Town of Paradise, City of Chico, and Butte County have established policies and standards that aim to minimize the effects of noise on people through prescriptive construction standards, zoning restrictions, hours of operation, and suppression techniques. Table C.12-3 summarizes the applicable noise standards and policies.

Table C.12-3. Noise Ordinance Specifications

Jurisdiction	Noise Criteria
Town of Paradise	The operation of any tools or equipment used in construction, drilling, repair, alteration, or demolition work is prohibited between the hours of 7 p.m. and 6 a.m. on weekdays or at any time on Sundays or holidays.
City of Chico	Construction activities occurring between the hours of 10 a.m. and 6 p.m. on Sundays and holidays, and 7 a.m. and 9 p.m. on other days will be subject to one of the following limits: • No individual device or piece of equipment may produce a noise level exceeding 83 dBA at a distance of 25 feet from the source. • The noise level at any point outside of the property plane of the project may not exceed 86 dBA. The generation of noise in exceedance of 70 dBA at the property line of residential or commercial property is prohibited.
Butte County	Noise sources associated with construction activities occurring within 1,000 feet of residential uses is prohibited between the following hours: • Sunset to sunrise on weekdays and non-holidays; • Friday commencing at 6 p.m. through and including 8 a.m. on Saturday, as well as not before 8 a.m. on holidays; • Saturday commencing at 6 p.m. through and including 10 a.m. on Sunday; and • Sunday after the hour of 6 p.m.

Source: Town of Paradise 2021, City of Chico 2021, and Butte County 2021

C.13 Population and Housing

This section identifies the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of population and housing conditions in the EIR, Section 3.13.

C.13.1 Federal

No identified federal laws, regulations, orders, policies, or plans regarding population and housing are relevant to the Proposed Project.

C.13.2 State

California Relocation Act (California Government Code § 7260 et seq.)

The California Relocation Act requires state and local governments to provide relocation assistance and benefits to persons displaced as a result of projects undertaken by state or local governments that do not involve federal funds.

California Department of Housing and Community Development Home Investment Partnerships Program (HOME)

The California Department of Housing and Community Development Home Investment Partnerships Program (HOME) was created to assist cities, counties, developers, and nonprofit Community Housing Development Organizations (CHDOs) to create and retain affordable housing. It provides grants to cities and counties and low-interest loans to developers. Eligible activities to receive the grant must benefit low-income renters and owners.

C.13.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* provides direction on land use decision-making for the next 15 years. The General Plan process offers the Town the opportunity to plan proactively rather than reactively to future development. The General Plan includes the following pertinent goals and policies related to population and housing:

- **Goal LUG-20:** Develop a strong local economy, recognizing that this is a key element in solving service providers' financial difficulties.
- **Goal LUG-24:** Encourage a sense of community in Paradise.
- **Goal HG-1:** Encourage and facilitate the production of all housing types, from affordable workhorse housing to executive homes, to meet the Town's share of regional housing needs consistent with the overall goals, objectives, and policies of the Paradise General Plan.
- **Goal HG-2:** Improve and preserve safe, decent housing and neighborhoods for all Paradise residents.

Butte County General Plan 2030

The *Butte County General Plan 2030* provides Butte County direction on how it will fulfill its community vision and manage its future growth. The General Plan addresses all aspects of Butte County's development which includes land use, circulation, public facilities, and public safety. The General Plan includes the following pertinent goals and policies related to population and housing:

- **Policy H-P1.2:** Focus development in the unincorporated areas of the spheres of influence of the cities to accommodate the County's housing allocation.
- **Policy H-P5.1:** Continue to promote housing opportunities for all persons regardless of age, race, religion, gender, marital status, national origin, disability, or other barriers that prevent choice in housing.
- **Goal ED-1:** Improve the local economy by diversifying the economy, reducing the unemployment rate, increasing business revenues to the County, and increasing wages.
- **Policy ED-P1.1:** The County's priority for future growth is creating sustainable jobs and providing a living wage to families to reduce poverty.

Chico 2030 General Plan

The *Chico 2030 General Plan* provides the City of Chico a comprehensive, long-range, and internally consistent policy framework for the growth and preservation of Chico. The General Plan consists of guiding principles, goals, policies, and actions in order to guide the physical development of Chico. The General Plan includes the following pertinent goals and policies related to population and housing:

- **Goal ED-1:** Maintain and implement an Economic Development Strategy to enhance Chico's long-term prosperity.
- **Goal SUS-1:** Balance the environment, economy and social equity, as defined in the General Plan, to create a sustainable Chico.
- **Goal H1:** Increase equal housing opportunities.
- **Goal H2:** Provide housing that is affordable to low incomes.

C.14 Public Services

C.14.1 Federal

No identified federal laws, regulations, orders, policies, or plans regarding public services are relevant to the Proposed Project.

C.14.2 State

California Occupational Safety and Health Administration

In accordance with the California Code of Regulations, Title 8, Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Fighting Equipment," the California Occupational Safety and Health Administration has established minimum standards for fire suppression and emergency medical services. The standards include guidelines on the handling of highly combustible materials, fire hose sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

Uniform Fire Code

The Uniform Fire Code (California Code of Regulations, Title 24, Part 9) contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the code include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises. The Uniform Fire Code also contains specialized technical regulations related to fire and life safety.

California Health and Safety Code

State fire regulations are set forth in Sections 13000 et seq. of the California Health and Safety Code. Regulations address building standards, fire protection and notification systems, fire protection devices such as extinguishers, smoke alarms, high-rise buildings, childcare facility standards, and fire suppression training, among other topics.

C.14.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* provides direction on land use decision-making for the next 15 years. The General Plan process offers the Town the opportunity to plan proactively rather than reactively for future development. The General Plan includes the following pertinent goals and policies related to public services:

- **Goal LUG-4:** Provide adequate public services and infrastructure to meet future need.
- **Goal LUG-6**: Provide cost-effective public services in the community.
- **Goal LUG-8**: Assure that law enforcement and fire protection services are enhanced sufficiently to meet the demands of new and existing land use development.
- **Objective LUO-6**: Maintain a law enforcement response time for emergency police calls of no more than five minutes.
- **Objective LUO-7**: Maintain an overall fire insurance (ISO) rating of three or better, and an emergency fire response within five minutes for 90 percent of all emergency incidents within the Town limits.
- **Policy LUP-12**: The character of future development should be compatible with the town's service delivery abilities and shall not result in service level declines.
- **Policy LUP-13**: The town shall attempt to assure that the rate and character of growth is commensurate with, or does not exceed the current levels of public services, and shall attempt to assure that municipal services can be provided to areas planned for annexation and development.
- **Policy LUP-14**: Growth and land use development should be linked to the availability of public services and facilities, and to the degree of overall infrastructure and environmental constraints affecting property in the town.

- **Policy LUP-20**: New land use development shall not cause the levels of police and fire protection to fall below the service levels established by this plan.

Butte County General Plan 2030

The *Butte County General Plan 2030* provides Butte County direction on how it will fulfill its community vision and manage its future growth. The General Plan addresses all aspects of Butte County's development which includes land use, circulation, public facilities, and public safety. The General Plan includes the following pertinent goals and policies related to public services:

- **Goal PUB-2**: Provide adequate fire protection and emergency medical response services to serve existing and new development.
- **Goal PUB-3**: Maintain a safe environment in Butte County through the enforcement of law.
- **Goal PUB-4**: Support high quality schools and educational facilities for all Butte County residents.
- **Policy PUB-P4.1**: Review of development proposals shall be coordinated with school districts to determine and plan for capacity issues over time.
- **Policy PUB-P4.2**: Review of development proposals shall be coordinated with school districts regarding the location and design of new schools.
- **Policy PUB-P4.4**: Infrastructure development projects shall be coordinated to minimize the cost to the public of building needed schools.
- **Policy PUB-P4.5**: Information on projected population growth and development patterns shall be provided to school districts to facilitate adequate school facilities.
- **Policy PUB-P4.7**: New development projects shall be approved only if the County and the applicable School District finds that existing or planned schools will be adequate to serve it.
- **Goal PUB-5**: Provide library services to meet the informational and social needs of each community.

Chico 2030 General Plan

The *Chico 2030 General Plan* provides the City of Chico a comprehensive, long-range, and internally consistent policy framework for the growth and preservation of Chico. The General Plan consists of guiding principles, goals, policies, and actions in order to guide the City of Chico on the physical development of Chico. The General Plan includes the following pertinent goals and policies related to utilities and service systems:

- **Goal S-4**: Continue to provide effective and efficient fire protection and prevention services to Chico area residents.
- **Policy S-4.1, Fire Safety Staffing**: Maintain adequate fire suppression and prevention staffing levels.

- **Policy S-4.2, Interagency Coordination**: Continue to maintain interagency relationships to maximize fire protection services and support programs that reduce fire hazards.
- **Goal S-5**: Provide a safe, secure environment with responsive police services for the community.
- **Policy S-5.1, Police Services**: Continue to provide fundamental police services based upon rapid response to emergencies and response, control and intervention in conduct that threatens life and property.
- **Policy S-5.4, Collaboration and Coordination**: Maintain strong relationships with local and state law enforcement agencies and participate in joint disaster preparedness planning.
- **Goal PPFS-3**: Support efforts by Chico Unified School District, California State University Chico, Butte College and private educational institutions to maintain and improve educational facilities and services in the City.
- **Policy PPFS-3.1, CUSD Coordination**: Support Chico Unified School District's efforts to provide school sites and facilities that meet the educational needs of the community.

C.15 Recreation

This section identifies the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of recreation in the EIR, Section 3.15.

C.15.1 Federal

No identified federal laws, regulations, orders, policies, or plans regarding recreation are relevant to the Proposed Project.

C.15.2 State

California Department of Parks and Recreation Rules and Regulations (1999)

The CDPR has established rules and regulations to protect park areas for the enjoyment of future generations and to keep park visitors safe. Topics covered in the rules and regulations include protection of natural scenery, plants and animal life; loaded firearms and hunting; dead and down wood; fires; animals; noise (engine driven electric generators); all vehicle travel; campsite use; refuse; smoking; drones; and cleanup responsibilities.

C.15.3 Regional and Local

Bidwell Park Master Management Plan Update (2008)

Bidwell Park is approximately 3,670 acres and is one of the largest municipal parks in the United States. The Bidwell Park Master Management Plan Update was adopted by the City of Chico in 2008. The plan includes extensive information on the resources present in Bidwell Park and outlines updates and expansions of the existing management goals and objectives. The plan also contains implementing strategies and guidelines for translating the goals and objectives into actions guiding the everyday operation of the Park (City of Chico Park Division 2008).

Vegetative Fuels Management Plan (2020)

The City of Chico is proposing to implement a comprehensive program of work referred to as the Vegetative Fuels Management Plan. The plan is intended to protect lives and property and enhance the natural resources in Chico and covers all land owned and managed by the City of Chico, including parks, greenways, and open spaces. A key component of the Vegetative Fuels Management Plan is the identification of high fire hazard areas in greatest need of treatment, description of how fires can be managed, and development of policies and actions focused on reducing harmful impacts of wildfire in the community (City of Chico Parks Division 2020).

Butte County Bikeway Master Plan

The 2011 Butte County Bikeway Master Plan (Butte County 2011) provides updates to the Countywide Bikeway Master Plan originally adopted in 1998. The 2011 Bikeway Master Plan focuses on connectivity in all the unincorporated areas of Butte County, as well as the cities of Biggs, Chico, Gridley, and Oroville, and the Town of Paradise. The plan is intended to address safety and connectivity between the local communities and within rural areas of Butte County. The plan also serves as a tool to identify Butte County's proposed bicycle network within the *Butte County General Plan 2030* Circulation Element and proposed local development reviews that may involve existing or proposed portions of the network. The Bikeway Master Plan Update will also assist Butte County in its efforts to safely and equitably provide contiguous bicycle facilities in the future and implement roadway projects that are bicycle friendly throughout the unincorporated areas.

Town of Paradise 1994 General Plan

The Open Space, Conservation and Energy Elements of the *Town of Paradise 1994 General Plan* addresses the preservation of open space land for outdoor recreation, including areas of outstanding scenic, historic and cultural value; areas suited for recreation purposes; and areas which link major recreation and open space areas. No recreational goals or policies in the *Town of Paradise 1994 General Plan* are relevant to the Proposed Project.

Butte County General Plan 2030

The Conservation and Open Space Element of the *Butte County General Plan 2030* addresses the conservation, development, and utilization of natural resources in Butte County. The Public Facilities and Services Element addresses public services, infrastructure and facilities provided by Butte County, including parks and recreational facilities. The General Plan also presents information and policy guidance to ensure adequate provision and maintenance of Butte County recreational facilities, parks, and services. Policies applicable to the Proposed Project related to parks and recreation in Butte County are as follows:

- **Policy PUB-P6.1:** Review of development proposals shall be coordinated with public agencies in order to designate sites for new parks and recreation facilities.
- **Policy PUB-P8.7:** New development projects should incorporate multi-use trails and connections to existing trail networks.

Chico 2030 General Plan

The Parks, Public Facilities, and Services element of the *Chico 2030 General Plan* addresses the community's needs and interests for its parks of all sizes as well as its public facilities and services. There are no recreational goals or policies in the *Chico 2030 General Plan* that are relevant to the Proposed Project.

C.16 Transportation

This section identifies the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of transportation in the EIR, Section 3.16.

C.16.1 Federal

No identified federal laws, regulations, orders, policies, or plans regarding transportation are relevant to the Proposed Project.

C.16.2 State

SB 743 (Steinberg 2013), which added PRC § 21099 to CEQA, proposed a change in how transportation impacts are analyzed in transit priority areas to better align local environmental review with statewide objectives. These alignment considerations include reductions to GHG emissions, encouragement of infill mixed-use development in designated priority development areas (PDAs), reductions of regional sprawl land development, and reductions in mobile source VMT. In addition, SB 743 supports and complements the following State Bills and Executive Orders relevant to this project:

- AB 32 requires statewide GHG reductions to be below 1990 levels by 2035 according to SB 375 and ARB established GHG reduction targets for Metropolitan Planning Organizations (MPOs) to achieve in Regional Transportation Plans and Sustainable Community Strategies (RTP/SCS), including targets for the largest MPOs ranging from 13 percent to 16 percent reductions
- SB 391 requires that the California Transportation Plan (CTP) supports an 80 percent reduction in GHGs below 1990 levels by 2050
- Executive Order B-30-15 sets a GHG emissions reduction target of 40 percent below 1990 levels by 2030
- Executive Order S-3-05 sets a GHG emissions reduction target of 80 percent below 1990 levels by 2050
- Executive Order B-16-12 specifies a GHG emissions reduction target of 80 percent below 1990 levels by 2050, specifically for transportation.

In November 2017, OPR released the final proposed update to CEQA Guidelines consistent with SB 743, recommending VMT, both within and outside of transit priority areas, as the most appropriate metric of transportation impact. This metric will align with local environmental review under CEQA and with California's long-term GHG emissions reduction goals.

C.16.3 Regional and Local

Butte County 2020 Regional Transportation Plan/Sustainable Communities Strategy

The *Butte County 2020 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS) specifies the policies, projects, and programs necessary over a 20-year period between 2020 and 2040 to maintain, manage, and improve the region's transportation system. BCAG is the federally designated Metropolitan Planning Organization and the state-designated Regional Transportation Planning Agency for Butte County. The RTP/SCS provides a foundation for transportation decisions by local, regional, and state officials. This foundation is based on a vision of an efficient and environmentally sound multi-modal system.

The RTP/SCS is the region's long-range plan to meet the requirements of California's Sustainable Communities and Climate Change Act of 2008 (SB 375), which calls on regions throughout California to develop a Sustainable Communities Strategy that demonstrates the integration of land use, housing, and transportation for the purpose of reducing GHG emissions from passenger vehicles. The RTP/SCS is intended to be consistent with the California Transportation Plan developed by Caltrans.

2011 Butte County Bicycle Plan

The *2011 Butte County Bicycle Plan* (Butte County 2011) provides Butte County's vision for making bicycling an integral part of the transportation system with its unincorporated limits. The plan includes emphasis on regional connectivity between the local cities of Biggs, Chico, Gridley, Oroville and the Town of Paradise, in addition to the various rural communities and recreational opportunities that exist within Butte County. The plan serves as a tool to identify Butte County's proposed bicycle network within the Butte County General Plan Circulation Element and proposed local development reviews that may involve existing or proposed portions of the bicycle network. The plan will also assist Butte County in its efforts to safely and equitably provide contiguous bicycle facilities in the future, as well as implement roadway projects that are bicycle friendly throughout the unincorporated areas.

Town of Paradise 1994 General Plan

Based on the *Town of Paradise 1994 General Plan*, the following are the goals and policies:

- **Goal CG-2**: Provide safe, efficient and effective traffic flow, both within Paradise and between Paradise and its environs.
- **Goal CG-4**: Provide adequate access, including access for emergency vehicles and evacuation, to all new parcels and to existing parcels when feasible.
- **Policy CP-1**: The Town shall strive to maintain a level of service (LOS) "D" or better as the standard for new and existing roadways in the Paradise Planning Area. LOS "D" or better shall be maintained on all local streets within the town limits, and LOS "C" or better shall be maintained whenever feasible.
- **Policy CP-8**: The town should continue to designate and regulate truck routes in order to protect residential areas from unwanted noise and traffic.

- **Policy CP-13**: Automobile dependency within Paradise should be reduced for local residents and visitors by implementing congestion management and trip reduction plan programs that decrease the number of vehicle miles travelled which, in tum, reduces air pollution and congestion and saves energy.

- **Policy CP-15**: Expand public transportation services within Paradise and between Paradise and major employment centers as feasible, based on service demand and financial constraints.

Butte County General Plan 2030

The *Butte County General Plan 2030* has the following goals:

- **Policy CIR-P1.3**: Transportation planning within the municipalities' spheres of influence shall consider the municipalities' land use and circulation plans, as appropriate, and shall be consistent with Policy CIR-P6.1 pertaining to County Levels of Service.

- **Policy CIR-P2.1**: Carpooling shall be encouraged by providing additional carpool pickup and park-and-ride locations near transit centers and at freeway interchanges.

- **Policy CIR-P2.2**: Trip reduction among County employees shall be encouraged. Specific measures to encourage trip reduction could include providing subsidies, bicycle facilities, alternative work schedules, ridesharing, telecommuting and work-at-home programs, employee education and preferential parking for carpools/vanpools.

- **Policy CIR-P2.4**: Employers shall be encouraged to provide transit subsidies, bicycle facilities, alternative work schedules, ridesharing, telecommuting and work-at-home programs, employee education and preferential parking for carpools/vanpools.

- **Policy CIR-P3.10**: Trees located along urban streets shall be protected. If maintenance or upgrading requires tree removal, the trees shall be replaced.

- **Policy CIR-P6.1**: The level of service for County-maintained roads within the unincorporated areas of the county but outside municipalities' sphere of influences (SOIs) shall be level of service (LOS) C or better during the PM peak hour. Within a municipality's SOI, the level of service shall meet the municipality's level of service policy.

- **Policy CIR-P6.3**: Project approval shall be conditioned on the provision of roadway improvements to meet the level of service standards in policies CIR-P6.1 and CIR-P6.2. Exceptions to satisfying the level of service standards and/or constructing transportation facilities to the County's design standards may be allowed on a case-by-case basis where reducing level of service or not constructing a transportation facility to County standards would result in a clear public benefit. Such circumstances may include, but are not limited to the following:

    - Conserving agricultural or open space land.

    - Enhancing the agricultural economy.

  - Protecting scenic roadways or highways.
  - Preserving downtown community environments.

- **Policy CIR-P6.5**: Street improvements within the sphere of influence of an incorporated municipality shall conform to the street standards of that municipality.
- **Policy CIR-P7.2**: Existing road capacity available within the County road system shall be used to serve future development unless construction of a new road will enhance circulation opportunities.

Chico 2030 General Plan

Based on the *Chico 2030 General Plan*, the following are the policies:

- **Policy CIRC-1.4, Level of Service Standards**: Maintain LOS D or better for roadways and intersections at the peak PM period, except as specified below:
  - LOS E is acceptable for City streets and intersections under the following circumstances: Downtown streets, arterials served by scheduled transit, and arterials not served by scheduled transit, if bicycle and pedestrian facilities are provided within or adjacent to the roadway.
  - Utilize Caltrans LOS standards for Caltrans' facilities.
  - There are no LOS standards for private roads.
  - If improvements necessary to achieve the LOS standard results in impacts to a unique historical resource, a highly sensitive environmental area, requires infeasible right-of-way acquisition, or some other unusual physical constraint exists.
  - If the intersection is located within a corridor that utilizes coordinated signal timing, in which case, the operation of the corridor as a whole should be considered.
- **Policy CIRC-1.5, Vehicle Miles Travelled Analysis**: Consistent with State law, implement VMT assessments as part of the environmental review process under CEQA.
- **Policy CIRC-1.7, Goods Movement**: Provide clear routes for goods delivery
- **Policy CIRC-2.2, Circulation Connectivity and Efficiency**: Provide greater street connectivity and efficiency for all transportation modes.
- **Policy CIRC-9.1, Reduce Peak-Hour Trips**: Strive to reduce single occupant vehicle trips through the use of travel demand management strategies.
- **Policy CIRC-9.3, Emphasize Trip Reduction**: Emphasize automotive trip reduction in the design, review, and approval of public and private development.

C.17 Tribal Cultural Resources

This section identifies the federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of tribal cultural resources in the EIR, Section 3.17.

C.17.1 Federal

Indian Trust Assets

ITAs are legal interests in property held in trust by the United States for Native American tribes or individuals. Examples of potential ITAs are lands, minerals, fishing rights, and water rights. Management of ITAs is based on the following orders, agreements, and regulations:

- Executive Order 13175, Consultation and Coordination with Indian Tribal Governments 65 FR 67249
- Memorandum on Government-to-Government Relations With Native American Tribal Governments (FR Volume 59, Number 85, signed April 29, 1994)
- Secretarial Order No. 3175 – Departmental Responsibilities for Indian Trust Resources
- Secretarial Order No. 3206 – American Indian Tribal Rights, Federal -Tribal Trust Responsibilities, and the federal Endangered Species Act (ESA)
- Secretarial Order No. 3215 – Principles for the Discharge of the Secretary's Trust Responsibility
- Secretarial Order No. 3342 – Identifying Opportunities for Cooperative and Collaborative Partnerships with Federally Recognized Indian Tribes in the Management of Federal Lands and Resources
- Secretarial Order No. 3335 – Reaffirmation of the Federal Trust Responsibility to Federally Recognized Tribes and Individual Indian Beneficiaries

American Indian Religious Freedom Act of 1978

The American Indian Religious Freedom Act of 1978 (AIRFA; 42 U.S.C. § 1996) protects the rights of Native Americans to exercise their traditional religions by ensuring access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites.

Historic Sites Act of 1935

The Historic Sites Act of 1935 (54 U.S.C. 320101–320106, formerly 16 U.S.C. 461–467) declares "…that it is a national policy to preserve for public use historic sites, buildings, and objects of national significance…," asserting historic preservation as a government duty under jurisdiction of the United States Secretary of the Interior.

National Historic Preservation Act

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. For purposes of the discussion regarding tribal cultural resources, it is important to note that historic properties include properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization that meet the National Register criteria (36 C.F.R. § 800.16[l]).[1]

Traditional Cultural Properties (TCP) and Traditional Cultural Landscapes (TCL)

TCPs are properties associated with cultural practices or beliefs of a living community that are: (1) rooted in that community's history; and (2) important in maintaining the continuing cultural identity of a community. TCPs can refer to properties of importance to any community, including Indigenous communities. The appropriate terminology for sites of importance to Indian tribes is 'historic property of religious and cultural significance to an Indian tribe [and Native Hawaiian organization'" (ACHP 2008:19; ACHP 2011:14).

A TCL encompasses the same meaning and utility, as well as inclusivity of Indigenous communities. The Secretary of the Interior's Guidelines for the treatment of cultural landscapes define a cultural landscape as "a geographic area (including both cultural and natural resources and the wildlife or domestic animals therein), associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values" (Birnbaum and Peters 1996:4). Historic vernacular landscapes "evolved through use by the people whose activities or occupancy shaped them" and ethnographic landscapes "contain a variety of natural and cultural resources that associated people define as heritage resource" (Birnbaum and Peter 1996:4; Ball et al. 2015:7).

National Register Bulletin 38 provides examples of TCPs and TCLs that fit the definition in the guidelines (Parker and King 1998:1):

- A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world
- A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents
- An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices
- A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice
- A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity

[1] The terminology for NHPA is relative to federally recognized tribes. CEQA terminology, however, is inclusive of Native American tribes regardless of federal recognition.

TCPs and TCLs are eligible for inclusion on the NRHP if they meet the criteria set forth in 36 C.F.R. § 60.4, National Register Criteria for Evaluation. The steps in the identification and evaluation of TCPs are the following (abbreviated from Parker and King 1998:11-14):

1. Potential Traditional Cultural Properties must be identified through consultation with the affected community or Tribe.
2. The investigation must consider the beliefs and practices associated with a potential Traditional Cultural Properties from the perspective of the community or Tribe.
3. The potential Traditional Cultural Properties must be a property, that is, a tangible place on the landscape, rather than an intangible belief or practice.
4. The property must retain integrity of relationship with the beliefs and practices that give it meaning to the community or Tribe.
5. The property must retain integrity of condition, such that the elements of the property associated with the beliefs and practices that give it significance are present.
6. The property must meet one or more of the four criteria for eligibility on the National Register (see Section C.5.1).

Cultural resources routinely not considered for eligibility for inclusion in the NRHP are religious properties, moved properties, birthplaces and graves, cemeteries, reconstructed properties, commemorative properties, and properties achieving significance within the past 50 years. However, these resources, can be evaluated as eligible if they meet one or more of the NRHP eligibility criteria for evaluation, retain integrity, and meet special criteria requirements called criteria considerations. The most notable of the seven considerations (A through G) is Criteria Consideration G, which specifies that a property that has achieved significance within the last 50 years can qualify for the NRHP only if it is of exceptional importance. As noted by Parker and King (1998:17–18), “a significance ascribed to a property only in the past 50 years cannot be considered traditional.” However, they also note: “The fact that a property may have gone unused for a lengthy period of time, with use beginning again only recently, does not make the property ineligible for the [National] Register” (Parker and King 1998:14).

If a property is determined to be a TCP, it becomes the responsibility of the lead agency to assess whether the proposed project would have an effect on the property, and should the effect be adverse, would it alter or destroy the elements that make the property significant and eligible. If a proposed project is determined to have an adverse effect, the lead agency is responsible for seeking measures that would mitigate the adverse effects to TCPs.

C.17.2 State

Tribal Cultural Resources

As defined at PRC § 21074, a TCR is a site, feature, place, cultural landscape, sacred place or object that is of cultural value to a California Native American tribe, and is either: (1) on or eligible for the CRHR or a local historic register; or (2) the lead agency, at its discretion, chooses to treat the resource as a TCR. TCRs are similar to TCPs in terms of their characteristics, identification, and

treatment, and may include a cultural landscape to the extent that the landscape is geographically defined in terms of the size and scope of the landscape. Additionally, as defined at PRC § 21074, a historical resource, a unique archaeological resource, or a non-unique archaeological resource may also be a TCR if it conforms to the criteria of a TCR in PRC § 21074(a). CEQA mandates that lead agencies determine whether a project will have a significant impact on TCRs that are eligible for listing on the CRHR (i.e., a historical resource), or are determined to be significant by the lead agency in order to appropriately mitigate any such impacts.

Under the CEQA Guidelines, even if a resource is not included on any local, state, or federal register, or identified in a qualifying historical resources survey, a lead agency may still determine that any resource is a historical resource (i.e., TCR) for the purposes of CEQA, if there is substantial evidence supporting such a determination (CEQA Guidelines § 15064.5[a]). A lead agency must consider a resource to be historically significant if it finds that the resource meets the criteria for listing in the CRHR. A resource may be eligible for inclusion in the CRHR if it:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage (Criterion 1);
- Is associated with the lives of persons important in our past (Criterion 2);
- Embodies the distinctive characteristics of a type, period, region, or method of construction or represents the work of an important creative individual or possesses high artistic values (Criterion 3); and/or
- Has yielded, or may be likely to yield, information important in prehistory or history (Criterion 4).

In accordance with CEQA guidelines, cultural resources investigations are necessary to identify TCRs that may have significant impacts as a result of a project (14 CCR §15064.5). The following steps are routinely implemented in a cultural resources' investigation for CEQA compliance:

1. Identify cultural resources in the proposed project area
2. Evaluate against the CRHR criteria of significance (listed below)
3. Evaluate the impacts of the proposed project on all cultural/tribal resources
4. Develop and implement measures to mitigate proposed project impacts on historical resources or resources deemed significant by the lead agency

As TCRs hold cultural value to a California Native American tribe, consultation with local Native American tribes is an integral component of each of the cultural resources' investigation steps described above.

Assembly Bill 52 and Consultation

The lead agency for CEQA is responsible for consultation with Native American tribes regarding the potential for a project to impact TCRs, pursuant to AB 52 and PRC §§ 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, 21084.3, and 5097.94(m). AB 52 recognizes that "…tribes may have expertise with regard to their tribal history and practices, which concern the tribal cultural

resources with which they are traditionally and culturally affiliated…" and that consultation will occur between a lead agency and Native American tribes for covered projects.

PRC §21080.3.1 (a) and Government Code §65352.4 define consultation as "the meaningful and timely process of seeking, discussing, and considering carefully the views of others, in a manner that is cognizant of all parties' cultural values and, where feasible, seeking agreement. Consultation between government agencies and Native American tribes shall be conducted in a way that is mutually respectful of each party's sovereignty. Consultation shall also recognize the tribes' potential needs for confidentiality with respect to places that have traditional tribal cultural significance."

As described in Section 3.10, Cultural Resources, a proposed project may induce a significant impact to a historical resource, unique archaeological resource, or a TCR if it causes a substantial adverse change (i.e., physical demolition, destruction, relocation, or alteration) to the resource or immediate surroundings (14 CCR 15064.5[b]), thereby demolishing or significantly altering the physical characteristics that qualify it for listing on the CRHR or local registers (PRC §§ 5020.01[k] and 5024.1[g]). A project that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment (PRC § 21084.2). A lead agency shall establish measures to avoid impacts that would alter significant characteristics of a TCR, when feasible (PRC §21084.3).

As such, the Town is committed to working together with tribes and consultation efforts with California Native American tribes are described below.

Native American Historical, Cultural, and Sacred Sites

Pursuant to PRC 5097.94 the NAHC has authority and duty to "identify and catalog places of special religious or social significance to Native Americans, and known graves and cemeteries of Native Americans on private lands" and has the power and duty to make recommendations for acquisition by the state or other public agencies regarding Native American sacred places that are located on private lands, are inaccessible to Native Americans, and have cultural significance to Native Americans.

California Native American Graves Protection and Repatriation Act of 2001

The California Native American Graves Protection and Repatriation Act of 2001 (CalNAGPRA) requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items to provide a process for the identification and repatriation of these items to the appropriate tribes.

California Native American Traditional Tribal Cultural Places (SB 18)

SB 18 provides California Native American tribes an opportunity to participate in local land use decisions at an early planning stage for the purpose of protecting or mitigating impacts to cultural places. SB 18 requires local governments to consult with tribes prior to making certain planning decisions, including the adoption and amendment of general plans.

C.17.3 Regional and Local

Town of Paradise 1994 General Plan

Section 3.15 (Scenic and Cultural Resources) of the *Town of Paradise 1994 General Plan* details the Town's procedures for complying with the state and federal policies outlined above with regards to cultural resources. As discussed above, a TCR is a cultural resource of cultural value to a California Native American tribe and is therefore incorporated into the procedures codified in the various policy statements and implementation measures of the General Plan. The General Plan includes the following goals, policies, and implementation measures related to TCRs:

- **Goal OCEG-9**: Identify, record, preserve, and protect historical and archeological resources.
- **Policy OCEP-36**: The *Land Use Constraints Diagram* identifies areas of potential archaeological sensitivity. Proposed development or public works projects within this area shall be required to undertake an archaeological survey prior to project approval. Proposed projects outside this area, in locations that have not been significantly disturbed, shall be referred to the California Archaeological Inventory, Northeast Information Center, California State University, Chico to undertake an archaeological survey prior to project approval upon recommendation by the Center.
- **Implementation Measure OCEI-18**: Require compliance of all development projects with Appendix K (archeological impacts) of the *Guidelines for Implementation of the California Environmental Quality Act*.
- **Implementation Measure OCEI-19**: When an archaeological survey is required by the Town or recommended by the California Archaeological Inventory, Northeast Information Center, the survey shall be undertaken by a qualified professional archaeologist who is certified by the Society of Professional Archaeologists or has equivalent qualifications.
- **Implementation Measure OCEI-20**: Should any historic or pre-historic artifacts be discovered during construction, all work shall cease until a qualified professional archaeologist views the site, provides recommendations and gives clearance to continue.

Butte County General Plan 2030

Chapter 8 of the *Butte County General Plan 2030* details Butte County's protocols to identify, protect, and preserve cultural resources important to Native American groups in line with state and federal regulations, and specifies the mandated steps to identify, avoid, and mitigate (if necessary) effects to cultural resources. To this end, Butte County adopted three goals specific to cultural resources in the General Plan:

- **Goal COS-14:** Preserve important cultural resources
- **Goal COS-15:** Ensure that new development does not adversely impact cultural resources.
- **Goal COS-16:** Respect Native American culture and planning concerns

In support of these policies, the General Plan includes the following policies:

- **Policy COS-P14.1**: Historic and cultural resources management shall be coordinated with nearby jurisdictions, including the five incorporated municipalities, the Lassen and Plumas National Forests, other planning and regulatory agencies, and local tribes.
- **Policy COS-P14.2**: As part of CEQA and NEPA projects, evaluations of surface and subsurface cultural resources in the county shall be conducted. Such evaluations should involve consultation with the Northeast Information Center.
- **Policy COS-P14.3**: The Northeast Information Center and appropriate historic and preservation professionals shall be consulted when considering reuse of historic sites.
- **Policy COS-P15.1**: Areas found during construction to contain significant historic or prehistoric archaeological artifacts shall be examined by a qualified consulting archaeologist or historian for appropriate protection and preservation. Historic or prehistoric artifacts found during construction shall be examined by a qualified consulting archaeologist or historian to determine their significance and develop appropriate protection and preservation measures.
- **Policy COS-P15.2**: Any archaeological or paleontological resources on a development project site shall be either preserved in their sites or adequately documented as a condition of removal. When a development project has sufficient flexibility, avoidance and preservation of the resource shall be the primary mitigation measure.
- **Policy COS-P15.3**: Demolition permit application on potentially important historic sites shall be subject to discretionary review.
- **Policy COS-P16.2**: Impacts to the traditional Native American landscape shall be considered during California Environmental Quality Act or National Environmental Protection Act review of development proposals.
- **Policy COS-P16.3**: Human remains discovered during implementation of public and private development projects shall be treated with dignity and respect. Such treatment shall fully comply with the federal Native American Graves Protection and Repatriation Act and other appropriate laws.
- **Policy COS-P16.4**: If human remains are located during any ground disturbing activity, work shall stop until the County Coroner has been contacted, and, if the human remains are determined to be of Native American origin, the NAHC and most likely descendant have been consulted.
- **Policy COS-P16.5**: Consistent with State local and tribal intergovernmental consultation requirements such as SB18, the County shall consult with Native American tribes that may be interested in proposed new development projects and land use policy changes.

These policies are consistent with the state and federal processes outlined above.

Memorandum of Understanding between the City of Chico and Mechoopda Indian Tribe

An MOU has been established between the City of Chico and Mechoopda Indian Tribe of Chico Rancheria, describing the original relationship to the land. The MOU establishes framework for consultation between the City of Chico and Mechoopda Indian Tribe prior to development of new open space or land use plans, per SB 18, to best protect cultural resources in the City of Chico and all of its open spaces through government-to-government communication.

Chico 2030 General Plan

The Chapter 11 (Cultural Resources and Historic Preservation) element of the *Chico 2030 General Plan* identifies important local cultural, archaeological, and historic resources and establishes goals, policies, and actions for the protection and preservation of those resources. Importantly, the element supports a Memorandum of Understanding adopted in June 2008 between the City of Chico and the Mechoopda Indian Tribe of the Chico Rancheria. The element also establishes the policy guidance for the City of Chico's comprehensive Historic Preservation Program. To this end, the City of Chico adopted three goals specific to cultural resources in the General Plan:

- **Goal CRHP-1:** Protect and preserve archaeological, historical and other cultural resources to serve as significant reminders of the City's heritage and values.
- **Goal CRHP-2:** Reinvest in the archaeological, historical and other cultural resources that frame Chico's character and identity.
- **Goal CRHP-3:** Engage in and facilitate preservation efforts with local preservation and cultural entities.

The General Plan includes the following policies related to cultural resources:

- **Policy CRHP-1.1, Historic Preservation Program**: Maintain a comprehensive Historic Preservation Program that includes policies and regulations which protect and preserve the archeological, historical, and cultural resources of Chico.
- **Policy CRHP-2.1, Infill and Historic Preservation**: Integrate the values of historic preservation with infill development and adaptive reuse.
- **Policy CRHP-2.2, Adaptive Reuse**: Encourage the adaptive reuse of historic buildings when the original use of the structure is no longer feasible.
- **Policy CRHP-2.3, Demolition as Last Resort**: Limit the demolition of historic resources to an act of last resort, to be permitted only if: 1) rehabilitation of the resource is not feasible; 2) demolition is necessary to protect the health, safety, and welfare of its residents; or 3) the public benefits outweigh the loss of the historic resource.
- **Policy CRHP-2.4, Public Awareness of Heritage Resources**: Encourage public awareness of the heritage resources that helped shape the history of Chico.

- **Policy CRHP-2.5, Purchase of Historically Significant Buildings**: Explore grant funding, partnerships, and other opportunities to purchase historically significant buildings or sites that are eligible for State or National Registers as they become available.

- **Policy CRHP-3.1, Partnerships to Preserve Heritage Resources**: Foster partnerships with interested parties to preserve heritage resources.

These policies detail the City of Chico's protocols to, among others, identify, avoid, and mitigate impacts to archaeological, tribal, and built environment resources; integrate historic preservation into infill development; encourage public awareness of heritage resources; and establish partnerships with interested parties.

City of Chico Historic Preservation Ordinance

The historic preservation ordinance of the City of Chico's Municipal Code (Chapter 19.37) specifically affords protection for properties listed on the City of Chico's Historic Resources Inventory and provides a mechanism to add historic properties to the Inventory through Landmark Overlay zoning districts. The ordinance also provides development incentives to owners of designated historic property and establishes a number of exempt activities such as ordinary maintenance and repair. Proposals to significantly alter or demolish structures listed on the City of Chico's Historic Resources Inventory are reviewed by the City of Chico's five-member Architectural Review and Historic Preservation Board. The Board also reviews nominations to the City of Chico's Inventory and forwards recommendations to the City Council for a final determination of listing.

California State University, Chico Research Foundation Ecological Reserves Management Plan, Memorandums of Understanding and Agreement

California State University, Chico (CSU, Chico) has implemented a management plan for the Butte Creek Canyon Ecological Reserve (BCCER), which consists of a 287-acre property comprising two units, the Virgin Valley and Canyon Units, located along Butte Creek. The management plan includes a goal for natural and cultural resource preservation and enhancement, "to preserve and restore natural and cultural resources of the Reserve System in order to maintain ecological processes and enhance biological diversity; maintain the physical integrity and sociological sensitivity of historical and archeological sites, and protect the Reserves from undue encroachment or damage by human activities." In support of this goal, the management plan includes seven objectives related to cultural resources and a Cultural Resources Management Plan, which are consistent with the state and federal processes outlined above. According to the management plan, a number of cultural resources indicative of historical and pre-contact occupation are likely to occur on BCCER lands based on cultural resource inventories conducted on adjoining lands with similar landscape and habitat.

The Mechoopda Indian Tribe is partner with CSU, Chico to the Memorandum of Agreement Regarding Guiding Principles for CSU, Chico Consultation with the Mechoopda Indian Tribe of Chico Rancheria (2018) with commitments for consultation and development of a cultural resources plan regarding the recognized ancestral lands of the Mechoopda Indian Tribe that encompass the CSU, Chico campus. The Mechoopda Indian Tribe is also partner with Chico State Enterprises to the Memorandum of Understanding between the Mechoopda Indian Tribe of Chico Rancheria (Tribe) and Chico State Enterprises (CSE) (2020) for CSE-administered lands, which include the Big Chico

Creek Ecological Reserve and the Butte Creek Ecological Preserve; the Proposed Project intersects with the Butte Creek Ecological Preserve. The primary purpose of the Memorandum of Understanding is to facilitate communication, collaboration and consultation between the Parties as early as possible in the decision-making process to allow meaningful input into the development of programs, projects, plans, property decisions, use and/or activities that may impact cultural resources within CSE administered lands (e.g., the BCCER).

C.18 Utilities and Service Systems

This section identifies the applicable federal, state, and local laws, regulations, orders, policies, and plans that are relevant to the analysis of utilities and service systems in the EIR, Section 3.18.

C.18.1 Federal

Clean Water Act

The Clean Water Act establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters. The USEPA implemented pollution control programs under the Clean Water Act that sets wastewater standards for the industry.

C.18.2 State

California Integrated Waste Management Act (AB 939)

The California Integrated Waste Management Act (AB 939, Sher, Chapter 1095, Statutes of 1989 as amended) made all California cities, counties, and approved regional solid waste management agencies responsible for enacting plans and implementing programs to divert 25 percent of their solid waste by 1995 and 50 percent by the year 2000. Later legislation mandates the 50 percent diversion requirement be achieved every year.

C.18.3 Regional and Local

Town of Paradise 1994 General Plan

The *Town of Paradise 1994 General Plan* provides direction on land use decision-making for the next 15 years. The General Plan process offers the Town the opportunity to plan proactively rather than reactively for future development. The General Plan includes the following pertinent goals and policies related to utilities and service systems:

- **Goal LUG-4:** Provide adequate public services and infrastructure to meet future need.
- **Objective LUO-5:** Assure that an adequate water supply exists prior to approval of development in the Paradise planning area.
- **Objective LUO-10:** Consider the construction and installation of a formal sewer system to service the commercial and industrial areas in the town within the 15-year planning period.
- **Policy LUP-12**: The character of future development should be compatible with the town's service delivery abilities and shall not result in service level declines.

- **Policy LUP-13**: The town shall attempt to assure that the rate and character of growth is commensurate with, or does not exceed the current levels of public services, and shall attempt to assure that municipal services can be provided to areas planned for annexation and development.

Butte County General Plan 2030

The *Butte County General Plan 2030* provides Butte County direction on how it will fulfill its community vision and manage its future growth. The General Plan addresses all aspects of Butte County's development which includes land use, circulation, public facilities, and public safety. The General Plan includes the following pertinent goals and policies related to utilities and service systems:

- **Goal PUB-9:** Provide safe, sanitary and environmentally acceptable solid waste management.
- **Goal PUB-11**: Increase recycling among Butte County residents, businesses, and public agencies.
- **Goal PUB-12:** Manage wastewater treatment facilities at every scale to protect the public health and safety of Butte County residents and the natural environment.
- **Policy PUB-P11.2**: Construction sites shall provide for the salvage, reuse, or recycling of construction and demolition materials.
- **Policy W-P1.8**: The County supports conversion from septic systems to public sewer service, where feasible.
- **Policy PUB-P12.4**: New sewer collection and transmission systems shall be designed and constructed to minimize potential inflow and infiltration.
- **Policy PUB-P13.4**: Installation of sewer lines shall occur concurrently with construction of new roadways to maximize efficiency and minimize disturbance from construction activity.
- **Policy HS-P15.2**: Critical emergency response facilities such as fire, police, emergency service facilities and utilities shall be sited to minimize their exposure to flooding, seismic effects, fire, or explosion.

Butte County Power Butte Joint Powers Authority Agreement

The Butte County Board of Supervisors and the Chico City Council have entered into a Joint Powers Authority agreement intended to provide residents of the unincorporated areas of Butte County as well as residents of the City of Chico the ability to choose where they purchase their energy from, and the joint agreement has been titled the Butte Choice Energy Authority.

Chico 2030 General Plan

The *Chico 2030 General Plan* provides the City of Chico a comprehensive, long-range, and internally consistent policy framework for the growth and preservation of Chico. The General Plan consists of guiding principles, goals, policies, and actions in order to guide the City of Chico on the

physical development of Chico. The General Plan includes the following pertinent goals and policies related to utilities and service systems:

- **Goal PPFS-4:** Maintain a sanitary sewer system that meets the City's existing and future needs, complies with all applicable regulations, and protects the underlying aquifer.
- **Goal PPFS-5:** Maintain a sustainable supply of high-quality water, delivered through an efficient water system to support Chico's existing and future population, including fire suppression efforts.
- **Goal PPFS-8:** Ensure that solid waste and recyclable collection services are available to City residents.
- **Policy SUS-3.3, Municipal Waste Reduction**: Reduce consumption and increase recycling and reuse of materials in City operations.
- **Policy PPFS-4.1, Sanitary Sewer System**: Improve and expand the sanitary sewer system as necessary to accommodate the needs of existing and future development.
- **Policy PPFS-4.3, Capacity of Water Pollution Control Plant**: Increase system capacity by reducing wet weather infiltration into the sanitary sewer system.
- **Policy PPFS-4.4, Wastewater Flows**: Ensure that total flows are effectively managed within the overall capacity of the Water Pollution Control Plant.

City of Chico Sanitary System Management Plan

The City of Chico Sanitary System Management Plan was adopted on May 2, 2006, and was prepared to follow requirements of the State Water Resources Control Board Order No. 2006-0003. The plan is a combination of policies, procedures, and activities that would aid in the planning, management, operation, and maintenance of the City of Chico's sanitary sewer system.

C.19 Wildfire

C.19.1 Federal

The National Strategy

Pursuant to the 2009 Federal Land Assistance, Management, and Enhancement Act, the U.S. Department of Agriculture and U.S. Department of the Interior developed a national cohesive strategy to comprehensively address wildland fire management across all lands in the United States. The National Strategy recognizes and accepts fire as a natural process necessary for the maintenance of many ecosystems and strives to reduce conflicts between fire-prone landscapes and people (USDA and DOI, 2014). Specifically, the National Strategy identifies the following primary goals:

- **Restoration and maintenance of landscapes:** Landscapes across all jurisdictions are resilient to fire-related disturbances in accordance with management objectives.

- **Fire-adapted communities:** Human populations and infrastructure can withstand a wildfire without loss of life and property.
- **Wildfire response:** All jurisdictions participate in making and implementing safe, effective, efficient risk-based wildfire management decisions.

The National Strategy guides federal direction for the state and local agencies responsible for fire protection in the vicinity of the Proposed Project.

FEMA HMGP Grant – Town of Paradise Wildfire Mitigation Projects

The Town of Paradise, in Butte County, California, is proposing wildfire mitigation activities to enhance fire safety and mitigate the threat of wildfire. The purpose of the proposed HMGP grants is to protect people and property by reducing wildfire-related hazards within Paradise. Per Paradise, the Projects would implement wildfire mitigation measures throughout the town, through a combination of enhanced enforcement, education, and incentives to help property owners reduce hazards on their own lands and reduce hazardous fuels on town rights-of-way. The four projects include the following: (1) enhancing code enforcement activities to manage hazardous fuels and defensible space, (2) introducing a residential ignition-resistant improvement and defensible space program, (3) hazardous fuel reduction along town rights-of-way, and (4) removing hazardous dead or dying trees on private properties (FEMA 2022).

C.19.2 State

2018 Strategic Fire Plan for California

The *2018 Strategic Fire Plan for California*, developed by the State Board of Forestry and Fire Protection, provides direction and guidance to CAL FIRE and its 21 field units. This plan sets forth a number of goals focused on fire prevention, natural resource management, and fire suppression efforts, including the following (CAL FIRE, 2018):

- Improve the availability and use of consistent, shared information on hazard and risk assessment.
- Promote the role of local planning processes, including general plans, new development, and existing developments, and recognize individual landowner/homeowner responsibilities.
- Foster a shared vision among communities and the multiple fire protection jurisdictions, including county-based plans and community-based plans such as community wildfire protection plans.
- Increase awareness and actions to improve fire resistance of human-made assets at risk and fire resilience of wildland environments through natural resource management.
- Integrate implementation of fire and vegetative fuels management practices consistent with the priorities of landowners or managers.
- Determine and seek the needed level of resources for fire prevention, natural resource management, fire suppression, and related services.

- Implement needed assessments and actions for post-fire protection and recovery.

The 2018 Strategic Fire Plan for California guides CAL FIRE oversight of local agencies' responsibilities for fire protection and natural resource management in the vicinity of the Proposed Project.

Community Wildfire Prevention and Mitigation Report

CAL FIRE prepared the Community Wildfire Prevention & Mitigation Report in response to Executive Order N-05-19, which directed CAL FIRE, in consultation with other state agencies and departments, to recommend immediate, medium-term, and long-term actions to help prevent destructive wildfires, with a specific focus on vulnerable communities and populations in the state (CAL FIRE, 2019). Based on local fire plans developed by CAL FIRE units, CAL FIRE identified 35 priority projects for immediate implementation to help reduce public safety risks for more than 200 communities. Projects include removal of hazardous dead trees, vegetation clearing, creation of fuel breaks and community defensible spaces, and creation of ingress and egress corridors. The *Community Wildfire Prevention & Mitigation Report* also identifies near-term administrative, regulatory, and policy actions to address community vulnerability and wildfire fuel buildup through rapid deployment of resources.

CAL FIRE's identified medium-term and long-term actions encourage coordination and cooperation among the various levels of regional and local fire protection agencies.

California Fire Code

The California Fire Code (California Code of Regulations title 24, part 9) establishes minimum requirements to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings. Chapter 33 of the code contains requirements for fire preserving safety during construction, such as to develop a pre-fire plan in coordination with the fire chief, maintain vehicle access for firefighting at construction sites, and meet requirements for safe operation of construction equipment powered by internal combustion engines.

CAL FIRE Fire Hazard Severity Zone Mapping

CAL FIRE's Fire and Resource Assessment Program has modeled and mapped wildfire hazard zones using a science-based, field-tested computer model that assigns an FHSZ rating of moderate, high, or very high. CAL FIRE develops maps depicting FHSZs based on factors such as fuel, weather, terrain, and probability of future occurrence (Santa Clara County, 2017a).

The Board of Forestry and Fire Protection designates responsibility for wildland fire protection and prevention within FHSZs. State Responsibility Areas (SRAs) are defined as areas where the State of California has financial responsibility for wildland fire protection and prevention; incorporated cities and federal ownership are not included. Within SRAs, CAL FIRE is responsible for fire prevention and suppression (Public Resources Code section 4125; Office of the State Fire Marshal, 2021). Local Responsibility Areas (LRAs) are defined as incorporated cities, urban regions, agricultural lands, and portions of the desert where the local government is responsible for wildfire protection. This is typically provided by city fire departments, fire protection districts, counties, and in some instances by CAL FIRE under contract (Office of the State Fire Marshal, 2021).

FHSZ maps evaluate wildfire hazards, which are physical conditions that create a likelihood that an area will burn over a 30- to 50-year period. They do not take into account modifications such as fuel reduction efforts (Office of the State Fire Marshal, 2021). FHSZs are meant to help limit wildfire damage to structures through planning, prevention, and mitigation activities/requirements that reduce risk (Office of the State Fire Marshal, 2021).

C.19.3 Regional and Local

Butte County Local Hazard Mitigation Plan (LHMP) Update, 2019

In 2006, the state adopted Assembly Bill (AB) 2140 which added provisions specifying what is to be included in a LHMP and requiring a linkage between local jurisdictions' LHMP and the Safety Element of their General Plan. Butte County has a current LHMP which includes an assessment of the County's risk and vulnerability related to natural and other identified hazards and a comprehensive mitigation strategy which includes actions and projects designed to mitigate or reduce the impacts of those hazards and to increase community resiliency.

Butte County General Plan 2030 Health and Safety Element

The Health and Safety Element provides information about risks in Butte County due to natural and huma-made disasters. The LHMP, discussed above, is considered a part of the Health and Safety Element. The following goals and policies are relevant to wildland fires.

- Goal HS-11: Reduce risks from wildland fire and urban fire.
- Policy HS-P11.1: Fire hazards shall be considered in all land use and zoning decisions, environmental review, subdivisions review and the provision of public services.
- Policy HS-P11.2: Create communities that are resistant to wildfire by supporting the implementation of community wildfire protection plans and wildfire fuel load reduction measures in coordination with the appropriate government, community group, or non-profit organization and California Department of Forestry and Fire Protection (CAL FIRE).
- Policy HS-P11.3: The County supports the Wildfire Mitigation Action Plan, the Butte County Local Hazard Mitigation Plan (LHMP), and the Butte Unit Community Wildfire Protection Plan prepared by CAL FIRE and will cooperate with the Butte County Fire Department and the Butte County Fire Safe Council in implementing these plans.
- Policy HS-P11.4: New development projects shall meet current fire safe ordinance standards for adequate emergency water flow, emergency vehicle access, signage, evacuation routes, fuel management, defensible space, fire safe building construction and wildfire preparedness.
- Goal HS-12: Protect people and property from wildland or urban fires.
- Policy HS-P12.4: All development projects in wildland urban interface areas in High or Very High Fire Hazard Severity Zones shall provide, at a minimum, small-scale water systems for fire protection.

Butte County Pre-Disaster Mitigation Plan

The Butte County Pre-Disaster Mitigation Plan was developed by the Butte County Office of Emergency Management to meet the requirements of the Disaster Mitigation Act of 2000. The purpose of the plan is to provide strategies and enumerate potential projects for mitigating or reducing the loss of life and property in the event of an emergency or disaster with the confines of Butte County and its political subdivisions (Butte County Office of Emergency Management 2010).

Butte County Community Wildfire Protection Plan 2020-2025

The Butte County Community Wildfire Protection Plan was developed by Federal, State, and local agencies in order to identify and prioritize pre-fire and post-fire management strategies and tactics meant to reduce the loss of value at risk within Butte County. The plan establishes a framework for reducing the risks associated with wildfire by placing emphasis on what needs to be done before the fire starts. The plan strives to reduce firefighting costs and property losses, increase firefighter safety, and to enhance ecosystem health (Butte County 2020).

Town of Paradise General Plan Safety Element

The purpose of the Safety Element is to reduce the risk of death, injuries, property damage, and other economic and social consequences associated with natural and societal hazards, such as wildland fires. The following goals and policies are relevant to wildland fires:

- Goal SG-1: Assure that law enforcement and fire protection services are enhanced sufficiently to meet the demands of new and existing land use development.
- Policy SP-1: New and unmitigated land use development shall not cause the police and fire protection services emergency response times to full below the service levels established by this plan.
- Policy SP-2: Through the development review process, adequate roads shall be required to be constructed and/or improved for emergency vehicle access, particularly in high wildland fire hazard areas.
- Policy SP-3: Future development should be designed and constructed to take maximum advantage of known fire and crime prevention siting, orientation and building techniques.
- Policy SP-5: The town should promote fire prevention by continuing to require brush removal and fuel load clearing as ongoing conditions of development approval and property maintenance.
- Implementation Measure SI-6: Enforce and comply with the provisions of the Unform Building Code and Uniform Fire Code.

Town of Paradise Emergency Operations Plan (EOP)

The purpose of the EOP, its Functional Annexes and Hazard/Threat Specific Appendices is to provide the basis for a coordinated response before, during, and after a disaster incident affecting the Town of Paradise. The EOP is the principal guide for the town's response to, and management of real or potential emergencies and disasters occurring within its designated geographic boundaries. It also identifies how the town integrates into the Standardized Emergency

management System (SEMS) and the National Incident Management System (NIMS). Reducing risks from and response to wildland fire is also discussed in the EOP and focuses on fuel reduction and the reduction of wildland fire to infrastructure.

Paradise Fire Safe Council

Founded in 1999, the Paradise Fire Safe Council is comprised of volunteer community members under the umbrellas of the Butte County Fire Safe Council and the California Fire Safe Council. The council is designated under the Town of Paradise to provide community input on wildfire prevention and safety (Paradise Fire Safe Council 2008).

Chico General Plan Safety Element

The Safety Element of the Chico General Plan identifies known safety threats and hazards, along with the City's approach to managing these risks and hazards. The safety element covers fire risks and the provision of law enforcement and emergency services. The following goals and policies are relevant to wildland fires:

- Goal S-4: Continue to provide effective and efficient fire protection and prevention services to Chico area residents.
- Action S-4.1.1 (Fire Response Time): Strive to obtain an initial response time of five and a half minutes or less for at least 90 percent of fire emergency response calls in urbanized areas.
- Action S-4.3.3 (Project Design): As part of the project review process in wildland fire areas, require consideration of emergency evacuation routes and defensible buffer areas.
- Policy S-4.4 (Vegetation management): Support vegetation management and weed abatement programs that reduce fire hazards.

D

Emissions Modeling

Page Intentionally Blank

Memo

Date: Tuesday, April 26, 2022

Project: Paradise Sewer Project

To: Town of Paradise

From: Tanya Kalaskar, Environmental Planner, HDR

Subject: Emissions Modeling

Introduction

This memorandum describes the methodology and inputs used in the emissions modeling prepared for the proposed Paradise Sewer Project (Proposed Project) by HDR in April 2022. The modeling results are summarized in Tables 1 through 4 of this memorandum. Attachment 1 is the modeling output that shows the detailed results.

About the Model

The purpose of the California Emissions Estimator Model (CalEEMod) is to provide a uniform platform for government agencies, land use planners, and environmental professionals to estimate potential emissions associated with both construction and operational use of land use projects. CalEEMod utilizes widely accepted methodologies for estimating emissions combined with default data that can be used when site-specific information is not available. Sources of these methodologies and default data include but are not limited to the United States Environmental Protection Agency (USEPA) AP-42 emission factors, California Air Resources Board (CARB) vehicle emission models, studies commissioned by California agencies such as the California Energy Commission (CEC) and CalRecycle.

Methodology

CalEEMod version 2020.4.0 was used to estimate the Proposed Project's criteria air pollutant and GHG emissions during its construction. Construction emissions were estimated using a combination of Project-specific information and model defaults. Criteria air pollutant and GHG emissions were estimated for the construction of the Core Collection System and Export Pipeline System.

Inputs

The CalEEMod data inputs are based on or derived from information provided in Chapter 2, Project Description. The following data were utilized as inputs into the model:

- Area disturbance
- Construction schedule
- Type of construction equipment
- Quantity of construction equipment

- Number of construction crews
- Number of construction workers
- Quantity of soil exported
- Quantity of fill material imported

Results

Criteria Air Pollutants

Table 1 summarizes the unmitigated construction criteria air pollutant emissions by year for the Core Collection System. Table 2 summarizes the unmitigated construction criteria air pollutant emissions by year for the Export Pipeline System.

Table 1. Unmitigated Construction Criteria Air Pollutant Emissions – Core Collection System

Year	ROG	NO_X	PM_{10}	CO	SO_2	$PM_{2.5}$

Vegetation Community Descriptions and Special-Status Species Accounts

Technical Memorandum

Date:	Thursday, September 30, 2021
Project:	Paradise Sewer Project
To:	Town of Paradise
From:	Dan Williams, Biologist, HDR
Subject:	Vegetation Community Descriptions and Special-Status Species Accounts

Introduction

This memorandum describes the vegetation communities and special-status species identified during desktop review database queries and initial field surveys performed by HDR in support of the Paradise Sewer Project (proposed project) during spring 2021. The study area for these field studies is defined as the proposed project area/footprint and a 0.5-mile buffer. A biological resources and habitat assessment of the study area was conducted by HDR biologists Kelly Bartron and Dan Williams on February 23-25, 2021. During these assessments, vegetation communities in and within 500 feet of the proposed project area/footprint were characterized and mapped by hand, habitats were assessed for suitability to special-status species that had been identified through the database queries as having the potential to occur in the study area, and all plant and wildlife species were identified and recorded. **Attachment 1** is a mapbook that shows the study area and the vegetation communities mapped within it.

Project Background

The Town of Paradise in Butte County, California, is proposing to construct and operate a sewer collection system in Paradise and to build an 18-mile export pipeline to convey wastewater from Paradise to the City of Chico Water Pollution Control Plant (WPCP). The Paradise Sewer Project would replace private, individual septic systems that are managed by property owners.

The proposed project area/footprint includes the following components:

- **Collection System** – a wastewater collection system consisting of service connections to individual parcels with a designated sewer service area. The collection system would include construction of buried gravity and pressure lines, manholes, and pump stations, and would be located in Paradise.
- **Export Pipeline** – an 18-mile export pipeline to convey wastewater from Paradise to the Chico WPCP. The export pipeline would include construction of pipelines, three horizontal directional drilling (HDD) borings under waterways, two microtunnel borings (one under Highway 99 and one under a railroad crossing), a transition chamber (near the eastern city limits of Chico where the sewer line would change from gravity downslope to a force main to cross the flat topography of the valley), and a flow control and metering structure located at or near the Chico WPCP.
- **Connection to Chico WPCP** – connection of the export pipeline to the Chico WPCP via the flow control and metering structure.

Project Location and Environmental Setting

Paradise is in central Butte County, in the western foothills of the Sierra Nevada Mountains, and is situated approximately 12 miles east of Chico, which sits on the Sacramento Valley floor. Elevations in the study area range from approximately 2,320 feet above sea level at the highest point of the sewer service area to approximately 135 feet above sea level at the Chico WPCP.

The sewer service area is completely within the Paradise town limits, and is composed mostly of montane hardwood-conifer, ponderosa pine, and mixed chaparral habitats. The export pipeline would run from the southwest corner of Paradise, downslope under Skyway through blue oak-foothill pine and valley oak savanna habitats, to just east of the Chico city limits. At this point, the pipeline would leave the roadway for a little over 1 mile, crossing annual grassland habitat with vernal pools, then crossing under Butte Creek and its associated valley foothill riparian habitat via trenchless HDD boring. After crossing under Highway 99 using microtunnel technology, the pipeline would cross one more 0.2 mile stretch of annual grassland habitat between Southgate Avenue and McFadden Lane before rejoining roadway for the remainder of the route, to be installed under county roads through mostly agricultural land, the majority of which is almond or walnut orchard. West of Highway 99, the pipeline would cross under two more creeks (Comanche Creek and Little Chico Creek) via trenchless HDD boring before reaching its connection to the Chico WPCP.

Methodology

Prior to performing the initial field studies, the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) QuickView Tool in BIOS 5 (CDFW 2021a) and the US Fish and Wildlife Service (USFWS) Information Planning and Conservation (IPaC) System (USFWS 2021) were queried to determine which special-status wildlife species and sensitive communities have the potential to occur in the study area. A query of the CNDDB provided a list of processed and unprocessed occurrences for special-status species in the California US Geological Survey (USGS) 7.5-minute quadrangles (quads) that the proposed project intersects (i.e., Paradise East, Paradise West, Cherokee, Hamlin Canyon, Chico, and Ord Ferry) and all the quads surrounding these six quads. A shapefile of the proposed project area/footprint was entered into the USFWS IPaC System, and the system was queried to produce an official list of federally protected species that have the potential to occur in the study area as well as designated critical habitat. Results of these database queries are included as **Attachment 2**.

Vegetation communities in the study area were characterized by reviewing CDFW's *California Wildlife Habitat Relationships System* (CDFW 2021b) vegetation community maps and ground-truthing during surveys to refine vegetation mapping. Non-sensitive vegetation communities in the study area include annual grassland, blue oak woodland, blue oak-foothill pine woodland, cropland, deciduous orchard-vineyard, developed, disturbed/ruderal, irrigated row and field crops, mixed chaparral, montane hardwood-conifer, non-native woodland, pasture, ponderosa pine, and valley oak woodland.

Vegetation Community Descriptions

Each vegetation community and the common plant and wildlife species associated with them are described in the following sections.

Non-Sensitive Vegetation Communities

Non-sensitive vegetation communities in the study area include annual grassland, blue oak woodland, blue oak-foothill pine woodland, cropland, deciduous orchard-vineyard, developed, disturbed/ruderal, irrigated row and field crops, mixed chaparral, montane hardwood-conifer, non-native woodland, pasture, ponderosa pine, and valley oak woodland.

ANNUAL GRASSLAND

Much of the study area, especially the area adjacent to Skyway between Chico and Paradise, is characterized as annual grassland. The dominant species are non-native annual grasses, including Italian rye grass (*Festuca perennis*), oats (*Avena barbata* and *A. fatua*), a variety of bromes (*Bromus* ssp.), quaking grasses (*Briza maxima* and *B. minor*) and medusahead (*Elymus caput-medusae*). Associates include weedy forbs such as long-beaked filaree (*Erodium botrys*), field hedge parsley (*Torilis arvensis*), windmill pink (*Petrorhagia dubia*), and rose clover (*Trifolium hirtum*), with a sparse scattering of native species such as harvest brodiaea (*Brodiaea elegans* ssp. *elegans*). Much of the grassland in the study area appears to be grazed by cattle.

Annual grasslands provide foraging habitat for a wide variety of wildlife species including raptors, insectivorous and seed-eating birds, small mammals, amphibians, and reptiles. However, some wildlife species require special habitat features to be present for grasslands to be suitable to them such as cliffs, caves, ponds, or woody vegetation for breeding, resting, and escape cover. Reptiles commonly associated with this habitat type include western fence lizard (*Sceloporus occidentalis*), gopher snake (*Pituophis catenifer*), and valley garter snake (*Thamnophis sirtalis fitchi*). Birds commonly associated with this habitat include red-tailed hawk (*Buteo jamaicensis*), savannah sparrow (*Passerculus sandwichensis*), and western meadowlark (*Sturnella neglecta*). Mammals commonly found in this habitat type include black-tailed jackrabbit (*Lepus californicus*), California ground squirrel (*Otospermophilus beecheyi*), western harvest mouse (*Reithrodontomys megalotis*), Botta's pocket gopher (*Thomomys bottae*), California vole (*Microtus californicus*), and coyote (*Canis latrans*).

BLUE OAK WOODLAND

Much of the habitat in the middle elevations of the study area, along Skyway between Chico and Paradise, is characterized by blue oak (*Quercus douglasii*) woodland with an annual grassland understory composed of species similar to the annual grassland communities in the study area.

Blue oak woodlands produce acorns used as forage by a variety of wildlife species, including acorn woodpecker (*Melanerpes formicivorus*), California scrub-jay (*Aphelocoma californica)*, and mule deer (*Odocoileus hemionus*). Trees containing cavities provide nesting habitat for birds such as western bluebird (*Sialia mexicana*), tree swallow (*Tachycineta bicolor*), and northern flicker (*Colaptes auratus*) as well as potential roost sites for bats which prefer to roost in trees such as hoary bat (*Lasiurus cinereus*). Raptors, including white-tailed kite (*Elanus leucurus*), American kestrel (*Falco sparverius*), and great horned owl (*Bubo virginianus*) may nest in these woodlands. Coyotes and gray foxes (*Urocyon cinereoargenteus*) may forage in this habitat, and reptiles commonly associated with this habitat type include southern alligator lizard (*Elgaria multicarinata*), California kingsnake (*Lampropeltis californiae*), and western rattlesnake (*Crotalus oreganus*).

BLUE OAK-FOOTHILL PINE

Blue oak-foothill pine occurs mainly along Skyway between Chico and Paradise in the middle elevation portions of the study area. The blue oak-foothill pine habitat that occurs in the study area is

mainly characterized by blue oak woodland with an annual grassland understory composed of species similar to annual grassland communities in the study area, but with California buckeye (*Aesculus californica*) and California foothill pine (*Pinus sabiniana*) contributing to the sparse tree canopy.

Species associates are similar to those listed in the blue oak woodland habitat type. Wildlife species dominant in annual grassland habitat are present beneath the oak-pine canopy.

CROPLAND

Only a small portion of the westernmost part of the study area is characterized as cropland, as the majority of the farmlands in the study area are characterized as deciduous orchard. Croplands typically do not conform to normal habitat stages and are regulated by rotational crop cycles. Cropland habitats can either be annual or perennial, vary according to location in the state, and germinate at various times of the year. Additionally, they can occur in association with orchard-vineyard, irrigated pasture, residential-park, and wildlife habitats such as riparian, chaparral, wetlands, desert, and herbaceous types.

Many wildlife species have adapted to cropland habitat including Swainson's hawk, white-tailed kite, coyote, and gray fox. Introduced non-native species such as ring-necked pheasant (*Phasianus colchicus*) and European starling (*Sturna vulgaris*) forage extensively in cropland habitat. Ducks, geese, sandhill cranes (*Antigone canadensis*), and other species that use waste grains after harvest are also known to occur in cropland.

DECIDUOUS ORCHARD-VINEYARD

Deciduous orchard-vineyard is prevalent throughout the western portion of the study area from Highway 99 west to the Chico WPCP. The overwhelming majority of this habitat type in the study area is deciduous orchard, with only one small vineyard present along Hegan Lane. Deciduous orchards tend to be single species, tree dominated habitats that include almonds, apricots, nectarines, peaches, pecans, plums, walnuts, and figs. The orchards in the study area are primarily planted with almond and walnut trees. Trees are planted linearly and uniformly with an understory of low-growing grasses, legumes, and other herbaceous species; however, the understory composition is dependent on management methods. Common understory associates may include perennial grasses such as Bermuda grass (*Cynodon dactylon*) or johnsongrass (*Sorghum halepense*); or annual grasses such as soft chess brome (*Bromus hordeaceus*), annual ryegrass (*Lolium multiflorum*), red brome (*Bromus madritensis*), wild oat, and others; or forbs such as English plantain (*Plantago lanceolata*), charlock mustard (*Sinapis arvensis*), fiddleneck (*Amsinckia* spp.), and red-stemmed filaree (*Erodium cicutarium*). Orchard habitats may be associated with other agricultural types such as row and field crops or pasture, and some are near urban habitat types. They are frequently associated with valley-foothill riparian, mixed chaparral, and annual grasslands.

Wildlife associates include mule deer, black-tailed jackrabbit, western gray squirrel (*Sciurus griseus*) and bird species which feed on fruit or nuts such as yellow-billed magpie (*Pica nuttalli*) and American crow (*Corvus brachyrhynchos*). Other bird species more passively use orchards for cover and nesting such as mourning dove (*Zenaida macroura*) and wild turkey (*Meleagris gallopavo*).

DEVELOPED

Developed portions of the study area include the existing industrial and residential properties, existing roads, recreational areas, and various other areas with a history of disturbance supporting

ornamental or introduced vegetation, mainly in the Town of Paradise and the City of Chico proper. There are a few city parks that occur within the study area that include a mix of native, ornamental, and introduced tree species and mowed lawn. Because of the high degree of disturbance, these areas generally have a low habitat value for wildlife, although a number of species adapted for urban conditions can utilize these areas, such as western fence lizard, mourning dove, American robin (*Turdus migratorius*), house finch (*Haemorhous mexicanus*), and eastern fox squirrel (*Sciurus niger*).

DISTURBED/RUDERAL

Disturbed/ruderal portions of the study area include the road shoulders, dirt lots, lined irrigation ditches, and various other areas with a history of disturbance supporting ruderal vegetation. These areas are a mix of semi-barren ground with sparse vegetation consisting primarily of non-native annual grasses and invasive weeds. Because of the high degree of disturbance, these areas generally have a low habitat value for wildlife, although several species adapted for disturbed conditions can utilize these areas, such as western fence lizard, killdeer (*Charadrius vociferus*), California ground squirrel, and Botta's pocket gopher.

IRRIGATED ROW AND FIELD CROPS

A small patch of irrigated row and field crop occurs at the western end of the study area. Row and field crops do not conform to normal habitat stages. Irrigated row and field crops can include broccoli, cantaloupe and other melons, lettuce, onion, squash, asparagus, and strawberries. Crops are typically cyclical and follow a rotation schedule with off season plantings such as alfalfa used as a nitrogen fixer. Irrigated row and field crops tend to be associated with other planted and farmed landscapes such as orchards, vineyards, and pastures.

As most wildlife species are not welcome by growers, irrigated row and field crops typically have low wildlife habitat suitability, although some species have adapted to this vegetation community. Associated species are similar to those that may occur in cropland habitats. Waterfowl may utilize flooded or irrigated areas.

MIXED CHAPARRAL

Mixed chaparral occurs in the east central portion of the study area along and north of Skyway just west of Paradise. It is comprised of stiff, brushy vegetation and is often found on the periphery of, or forming the understory of, blue oak-foothill pine communities. Dominant species include ceanothus (*Ceanothus* spp.), scrub oak (*Quercus berberidifolia*), and various manzanitas (*Arctostaphylos* spp.). Common associates include chamise (*Adenostoma fasciculatum*), toyon (*Heteromeles arbutifolia*), yerba santa (*Eriodictyon californicum*), and birch leaf mountain-mahogany (*Cercocarpus betuloides*).

Wildlife associates include reptiles such as coast horned lizard (*Phrynosoma blainvillii*), California tiger whiptail (*Aspidoscelis tigris munda*), and California striped racer (*Coluber lateralis lateralis*), birds such as wrentit (*Chamaea fasciata*), California thrasher (*Toxostoma redivivum*), and blue-gray gnatcatcher (*Polioptila caerulea*), and mammals such as Audubon's cottontail (*Sylvilagus audubonii*) and mountain lion (*Puma concolor*).

MONTANE HARDWOOD-CONIFER

Montane hardwood-conifer can be found in the eastern portion of the study area, from along Skyway east of Tuscan Ridge and throughout the Town of Paradise. Associates can include ponderosa pine (*Pinus ponderosa*), Douglas-fir (*Pseudotsuga menziesii*), tanoak (*Notholithocarpus densiflorus*), Pacific madrone (*Arbutus menziesii*), California incense-cedar (*Calocedrus decurrens*), bay laurel (*Umbellularia californica*), California black oak (*Quercus kelloggii*), and interior live oak (*Q. wislizeni*).

Understory vegetation is mostly scattered woody shrubs including manzanita, mountain-mahogany, poison oak (*Toxicodendron diversilobum*), and a few forbs. Wildlife associates may include propagators of acorns such as Steller's jay (*Cyanocitta stelleri*), acorn woodpecker, and western gray squirrel, plus those that forage for acorns including wild turkey, mountain quail (*Oreortyx pictus*), band-tailed pigeon (*Patagioenas fasciata*), California ground squirrel, dusky-footed woodrat (*Neotoma fuscipes*), mule deer, and black bear (*Ursus americanus*).

NON-NATIVE WOODLAND

Non-native woodland describes a specific part of the study area north of the pipeline alignment between Skyway and Highway 99 which is designated as part of the Mendocino National Forest; a 209-acre parcel known as the Chico Seed Orchard where research, seed banking, and gene conservation is carried out for a wide variety of coniferous and deciduous tree species, many of which are not indigenous to the local area. Species associates include those listed in the deciduous orchard-vineyard habitat type.

PASTURE

Pasture lands tend to be composed of a mix of perennial grasses or legumes with 100 percent canopy cover. Non-native invasive plant species are common in pasture lands. Irrigated pasture lands are typically a permanent habitat associated with agriculture and established on soils unsuitable for other purposes. Pasture lands are also typically associated with a decent water supply. Pasture in the study area is restricted to one small area associated with the Chico State University farm along Hegan Lane.

Wildlife associates include ground-nesting birds such as waterfowl, ring-necked pheasant, northern harrier (*Circus hudsonius*), and sandhill crane. Irrigated pastures provide feeding and roosting sites for many wetland associates including shorebirds, wading birds, gulls, waterfowl, and raptors. Mule deer are also known to utilize pastures for grazing.

PONDEROSA PINE

Ponderosa pine can be found in small, scattered patches in the northern portion of the study area as elevations increase. The ponderosa pine vegetation community includes pure stands of ponderosa pine as well as stands of mixed species in which at least 50 percent of the canopy consists of ponderosa pine. These stands can vary from open and patchy to contiguous and dense. Typical tree associates include white fir (*Abies concolor*), incense-cedar, Jeffrey pine (*Pinus jeffreyi*), sugar pine (*Pinus lambertiana*), Douglas-fir, canyon live oak (*Quercus chrysolepis*), California black oak, Pacific madrone, and tanoak.

Shrub associates may include manzanita, ceanothus, mountain-misery (*Chamaebatia foliolosa*), Pacific dogwood (*Cornus nuttallii*), California buckthorn, and poison-oak. Grass and forb associates may include Orcutt brome (*Bromus orcuttianus*), carex (*Carex* spp.), bluegrass (*Poa* spp.), bottlebrush squirreltail (*Elymus elymoides*), lupine (*Lupinus* spp.), purple nightshade (*Solanum xanti*), and streptanthus (*Streptanthus* spp.).

Ponderosa pine may act as transitional or migratory habitat for deer and other wildlife species. Birds like hairy woodpecker (*Dryobates villosus*) and pygmy nuthatch (*Sitta pygmaea*) require conifers for food and shelter. Mammals such as North American porcupine (*Erethizon dorsatum*) and black bear are common in this community. Numerous bat species may also utilize crevices behind the bark of ponderosa pine trees for daily roosting sites.

VALLEY OAK WOODLAND

Small patches of valley oak woodland occur along Skyway between Paradise and Chico, as well as along the various county roads within the City of Chico. This vegetation community is dominated almost exclusively by valley oaks (*Quercus lobata*). Common associates include California sycamore (*Platanus racemosa*), northern California black walnut (*Juglans hindsii*), interior live oak, and blue oak. Understory associates may include poison oak, California wild grape (*Vitis californica*), toyon, and California blackberry (*Rubus ursinus*). Various oats (*Avena* spp.), brome, and barley (*Hordeum vulgare*) are expected as part of the ground cover. Other common associates may include those similarly found in annual grasslands. In areas where valley oak woodland extends to the foothills, it transitions to blue oak woodlands or blue oak-foothill pine habitats, or valley-foothill riparian if occurring near stream courses. Common wildlife associates include western fence lizard, California scrub-jay, oak titmouse (*Baeolophus inornatus*), white-breasted nuthatch (*Sitta carolinensis*), phainopepla (*Phainopepla nitens*), and western gray squirrel.

Sensitive Communities

Sensitive communities included are those that are of special concern to resource agencies or those that are protected under the California Environmental Quality Act (CEQA), Fish and Game Code (FGC), Sections 1600–1603, and/or Clean Water Act (CWA) Section 401 and Section 404. These include sensitive vegetation communities as well as sensitive aquatic resources. Of the vegetation communities identified in the study area, one is considered a sensitive habitat type: valley-foothill riparian. The valley-foothill riparian sensitive community and common plant and wildlife species associated with it, as well as sensitive aquatic resources identified in the study area, are described in the following sections.

VALLEY-FOOTHILL RIPARIAN

Riparian habitats are protected under FGC Section 1602. Valley-foothill riparian is documented along Butte Creek parallel to and west of Skyway, as well as along Comanche Creek and Little Chico Creek (**Attachment 1**, pages 19–21, and pages 26–28). Common canopy associates may include cottonwood (*Populus* spp.), California sycamore, and valley oak. Subcanopy associates may include alder (*Alnus* spp.), boxelder (*Acer negundo*), wild grape, wild rose (*Rosa acicularis*), elderberry, poison oak, and willows (*Salix* spp.). The herbaceous layer may consist of similar species to that of annual grassland with the addition of aquatic associates such as miner's lettuce (*Claytonia perfoliate*), poison-hemlock (*Conium maculatum*), and hoary nettle (*Urtica dioica*).

Valley-foothill riparian habitats may provide water, food, dispersal corridors, nesting habitat, and thermal refuge for an abundance of wildlife. Common wildlife associates include those found in valley oak woodlands and annual grasslands with the addition of some aquatic / marginal aquatic dependent amphibians, reptiles, and birds such as Pacific chorus frog (*Pseudacris sierra*), western pond turtle (*Actinemys marmorata*), and osprey (*Pandion haliaeetus*).

AQUATIC RESOURCES

Aquatic resources are considered a sensitive habitat type or land cover type because they provide important ecosystem functions to flora, fauna, and their habitat. Some functions include movement corridors, migratory and/or dispersal corridors, foraging habitat, and cover. Further, aquatic resources are capable of protecting surrounding land cover types from large precipitation events that may cause flooding and resulting adverse effects on biological resources. Five types of aquatic resources were identified in the study area: perennial channel, intermittent channel, ephemeral channel, wetland, and ditch.

Perennial Channel

Perennial channels typically flow continuously throughout an average rainfall year, often with the streambed located below the water table for most of the year. Five perennial channels were observed in the proposed project area/footprint and generally flow from north-northeast to south-southwest. These channels include Honey Run and an unnamed channel in the northeastern portion of the proposed project area/footprint, Butte Creek, Butte Creek Diversion Channel, and Comanche Creek at the western end of the proposed project area/footprint (**Attachment 1**, pages 4–11, 20, and 26).

Vegetation cover in Honey Run and the unnamed channel is approximately 5 to 20 percent herbaceous cover with 5 to 15 percent tree, shrub, and sapling cover. Vegetation cover in Butte Creek and Comanche Creek is approximately 15 to 50 percent herbaceous cover with approximately 10 to 50 percent trees, shrubs, and saplings cover. Honey Run and the unnamed channel are sinuous, medium gradient channels with sediment texture in the low-flow channel consisting of medium-coarse silt to small cobbles. Coarse silt to large cobbles and boulders are present in the low-flow channel of Butte Creek and Comanche Creek with sinuous, medium to high gradient stream profiles. Honey Run and the unnamed channel exhibited flow at or near the ordinary high water mark. The water level in Comanche Creek was above the ordinary high water mark. Butte Creek Diversion Channel could not be accessed to assess vegetation cover, stream profile characteristics, sediment texture, or water levels. Butte Creek, Butte Creek Diversion Channel, and Comanche Creek flow under several bridge crossings. Several culverts are present where the channels flow under roads or other structures. Vegetation observed in and near Honey Run was likely burned during the 2018 Camp Fire, and a swimming pool or some other form of impoundment is near the southwestern portion of Honey Run prior to flowing west, exiting the proposed project area/footprint.

Intermittent Channel

Intermittent channels typically flow for only a portion of the year, often during the wet season. The wet season is typically in the winter and spring during periods of sustained precipitation events when the streambed may be below the water table or when snow melt provides sustained water flow. Other intermittent sources of water may be human-made in which flow regimes are controlled by irrigation systems or other forms of human-made water conveyance flowing into and/or out of channels.

Four intermittent channels were observed in the proposed project area/footprint and generally flowing from north-northeast to south-southwest (**Attachment 1**, pages 5, 7, 10, 11, 27, and 28). Three unnamed, intermittent channels are in the northeastern portion of the proposed project area/footprint. Vegetation cover in these channels ranges from approximately 5 to 85 percent herbaceous cover and 0 to 85 percent tree, shrub, and sapling cover. Sediment texture in the low-flow portions of the channels ranges from fine silt to large cobbles. Stream profiles have a low to medium gradient and are sinuous. Water levels were at or near the ordinary high water mark at lower elevations or downstream reaches of the channel while higher elevations or upstream reaches were dry. Little Chico Creek is in the western portion of the proposed project area/footprint and flows under two bridge crossings. The eastern bridge crossing includes the Crouch Avenue Alternative while the western crossing includes the Preferred Alternative. Vegetation cover consists of approximately 10 to 15 percent tree, shrub, and sapling cover and 5 percent herbaceous cover. Little Chico Creek is dry and sinuous, has a low to medium gradient stream profile, and has medium silt to small cobbles in the low-flow portion of the channel.

Ephemeral Channel

Ephemeral channels typically flow only in direct response to, or immediately after, a precipitation event such as rain or snow. One ephemeral channel was observed in the northeastern portion of the proposed project area/footprint near Pearson Road and Black Olive Drive flowing from north-northeast to south-southwest (**Attachment 1**, page 11). Based on review of aerial imagery and online data as mentioned previously, the upstream portions of this channel may diverge from intermittent channels; however, potential hydrologic connectivity could not be confirmed due to access restrictions.

This channel is dry and sinuous and had medium gradient stream profile. The channel reach near Buschmann Road and Sierra Park Drive has been graded along the streambed, bank, and top of the channel's banks. The channel reach nearest Pearson Road and Black Olive Drive has been heavily burned, and much of the streambed, bank, and vegetation along the top of the banks appears to be dead. Vegetation cover consists of approximately 5 to 10 percent herbaceous cover with a few small, isolated shrub patches with up to 80 percent cover. Sediment texture consist primarily of fine silt.

Potential Wetland

The three types of potential wetlands observed in the study area are vernal pool, scrub-shrub wetland, and freshwater emergent wetland. While data collection is incomplete due to lack of access, based on observations of hydric or wetland vegetation, hydric soil where accessible, and wetland hydrology, there are several potential wetlands along Skyway and in the northeastern portion of the proposed project area/footprint (**Attachment 1**, pages 4, 5, 7, and 10).

Vernal pools are a type of seasonal wetland that typically consist of a mosaic of mounds and depressional areas with swales intermixed. These swales are often seasonal and have a hydrological connection to pools, allowing inundation during the wet season. Vernal pools often have a characteristic impermeable layer such as clay, which prevents the pool from drying prematurely. Hydric, or wetland, plants are often endemic annual grasses and forbs. The vernal pools along Skyway are dominated by *Crassula* spp. and *Lasthenia* spp. Soils consist of rocky basalt with a biotic crust present in the first few centimeters of the soil surface. Wetland hydrology indicators in the proposed project area/footprint include a mosaic of mounds and depressional areas connected by seasonal swales, as described previously, and biotic crust with surface soil cracks. Over 50 vernal pools are estimated along the northern and southern portions of Skyway based on a binocular scan from the roadside.

One potential scrub-shrub wetland and two potential freshwater emergent wetlands were observed in the northeastern portion of the proposed project area/footprint. The potential scrub-shrub wetland near Honey Run appears to be an isolated depressional area with *Salix* spp. as the dominant overstory vegetation and *Juncus* spp. as the dominant herbaceous vegetation. Two potential freshwater emergent wetlands are present in the northeastern portion of the study area with *Typha* spp. and *Juncus* spp. as the dominant herbaceous cover. No surface water was observed in the vernal pools, scrub-shrub wetland, or freshwater emergent wetlands.

Ditch

Five roadside ditches are present in areas of the proposed project area/footprint that could be accessed (**Attachment 1**, pages 1, 2, 11, 21, and 26). These ditches primarily convey stormwater from roads to subsurface storm drains or surface streams.

Special-Status Species Accounts

Candidate, sensitive, and special-status species are commonly characterized as species that are at potential risk or actual risk to their persistence in a given area or across their native habitat. These species have been identified and assigned a status ranking by governmental agencies such as CDFW and USFWS, and by private organizations such as California Native Plant Society (CNPS). The degree to which a species is at risk of extinction is the determining factor in the assignment of a status ranking. Some common threats to a species' or population's persistence include habitat loss, degradation, and fragmentation, as well as human conflict and intrusion. For the purposes of this biological review, special-status species are defined by the following codes:

- Listed, proposed, or candidates for listing under the federal Endangered Species Act (50 CFR § 17.11 – listed; 61 FR 7591 – candidates)
- Listed or proposed for listing under the California Endangered Species Act (FGC 1992 Section 2050 et seq.; 14 California Code of Regulations [CCR] § 670.1 et seq.)
- Designated as species of special concern by CDFW
- Designated as fully protected by CDFW (FGC §§ 3511, 4700, 5050, and 5515)
- Species that meet the definition of rare or endangered under CEQA (14 CCR § 15380) including CNPS List Rank 1B and 2.

The results of USFWS, National Marine Fisheries Service (NMFS), CDFW, and CNPS database queries identified several special-status species with the potential to be impacted by the proposed project. Results of these database queries are provided as **Attachment 2**. In cases where a determination was made that no suitable habitat for a given species is present in the study area, that species is not analyzed further in this document. A table listing all of the species returned by the database queries and rationale for whether or not there is potential for them to occur in the study area is provided as **Attachment 3**. Accounts describing each special-status species with potential to occur in the study area are provided in the following sections.

Plants

The database queries and preliminary analysis of habitat suitability in the study area revealed the potential for 39 special-status plant species to occur in the study area. Descriptions of each of these species are provided in the following sections and are based on information obtained from the CNPS Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2021).

JEPSON'S ONION

Jepson's onion (*Allium jepsonii*) is a perennial herb (bulb) that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the lily family (Liliaceae) and blooms from April to August. It typically occurs in in chaparral, cismontane woodland, and lower montane coniferous forest with an elevation range of 984 to 3,707 feet. Jepson's onion has potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of mixed chaparral, blue oak-foothill pine, and montane hardwood-coniferous forests.

FERRIS' MILK-VETCH

Ferris' milk-vetch (*Astragalus tener* var*. ferrisiae*) is an annual herb that is native and endemic to California with a California Rare Plant Rank of 1B.1. It is in the legume family (Fabaceae) and blooms between March and June. It typically can be found in wetlands, meadows, valley grasslands, and riparian areas at elevations ranging from 0 to 263 feet. Ferris' milk-vetch has the potential to occur in the lower elevations of the study area (from the City of Chico west to the Chico WPCP) because of the presence of vernal pools, riparian areas, and grassland habitats.

BIG-SCALE BALSAMROOT

Big-scaled balsamroot (*Balsamorhiza macrolepis*) is a native perennial herb found throughout western North America with a California Rare Plant Rank of 1B.2. It is in the sunflower family (Asteraceae) and blooms between March and June. It can typically be found on slopes in foothill woodlands, chaparral, and valley grasslands at elevations ranging from 115 to 4,806 feet. The species is tolerant of low water and has the potential to occur in the study area because of the presence of chaparral, grassland, and foothill woodland habitats.

WATERSHIELD

Watershield (*Brasenia schreberi*) is a native aquatic perennial herb found throughout North America and in other parts of the world with a California Rare Plant Rank of 2B.3. It is in the watershield family (Cabombaceae) and blooms between April and October. It can typically be found in freshwater marshes, ponds, and slow streams at elevations ranging from 3 to 7,218 feet. The species has the potential to occur in the study area because of the presence of slow streams, particularly Comanche Creek and Little Chico Creek.

FLAGELLA-LIKE ATRACTYLOCARPUS

Flagella-like atractylocarpus (*Campylopodiella stenocarpa*) is a native California moss with a California Rare Plant Rank of 2B.2. It is part of the moss family (Dicranaceae) and is low water tolerant. This species is non-vascular and is known to occur in cismontane woodland, often along roadsides, at elevations ranging from 935 to 1,410 feet. Flagella-like atractylocarpus has the potential to occur in the study area, especially in blue oak and blue oak-foothill pine habitats.

DISSECTED-LEAVED TOOTHWORT

Dissected-leaved toothwort (*Cardamine pachystigma*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the mustard family (Brassicaceae) and blooms between February and May. The species is known to occur in both wetlands and non-wetlands in chaparral and lower montane coniferous forest communities ranging from 984 to 4,594 feet in elevation. Dissected-leaved toothwort has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of chaparral, blue oak-foothill pine, and montane hardwood-conifer communities.

CHAPARRAL SEDGE

Chaparral sedge (*Carex xerophila*) is a perennial herb that is native to California with a California Rare Plant Rank of 1B.2. It is in the sedge family (Cyperaceae) and blooms between March and June. It is known to occur in open forest, scrub, thicket edges, and chaparral habitats ranging from 902 to 2,527 feet in elevation. Chaparral sedge has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of open forests, scrub, and chaparral habitats.

PINK CREAMSACS

Pink creamsacs (*Castilleja rubicundula*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the paintbrush family (Orobanchaceae) and blooms between April and June. It typically favors open chaparral, cismontane woodlands, meadows, seeps, and valley and foothill grassland habitats ranging from 65 to 3,002 feet. Pink creamsacs has the potential to occur in the study area because of the presence of chaparral, woodland, and valley and foothill grassland habitats.

WHITE-STEMMED CLARKIA

White-stemmed clarkia (*Clarkia gracilis* ssp*. Albicaulis*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the willowherb family (Onagraceae) and blooms between May and July. It typically occurs in chaparral and cismontane woodlands at elevations ranging from 688 to 3,609 feet. White-stemmed clarkia has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of chaparral habitat.

MILDRED'S CLARKIA

Mildred's clarkia (*Clarkia mildrediae* ssp*. Mildrediae*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the willowherb family (Onagraceae) and blooms in July and August. The species is shade and low water tolerant. It typically occurs in lower montane coniferous forests and cismontane woodland habitats at elevations ranging from 902 to 5,676 feet. Mildred's clarkia has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of blue oak-foothill pine woodland and montane hardwood-conifer forest.

MOSQUIN'S CLARKIA

Mosquin's clarkia (*Clarkia mosquinii*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the willowherb family (Onagraceae) and blooms between May and July. The species is shade and low water tolerant. It typically occurs in cismontane woodland and lower montane coniferous forests at elevations ranging from 590 to 4,856 feet. Mosquin's clarkia has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of blue oak-foothill pine woodland and montane hardwood-conifer forest.

SILKY CRYPTANTHA

Silky cryptantha (*Cryptantha crinita*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the borage family (Boraginaceae) and blooms between April and May. It typically occurs in riparian areas, occasionally in wetlands, in foothill pine forests, yellow pine forests, and valley grasslands at elevations ranging from 295 to 3,675 feet. Silky cryptantha has the potential to occur in the study area (from the Butte Creek crossing and east through Paradise) because of the presence of foothill pine forests and valley grasslands.

RECURVED LARKSPUR

Recurved larkspur (*Delphinium recurvatum*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the ranunculus family (Ranunculaceae) and blooms between March and June. It typically occurs in shadscale scrub, foothill woodlands, valley grasslands and occasionally in wetlands at elevations ranging from 9 to 2,592 feet. Recurved larkspur has the potential to occur in the study area because of the presence of foothill woodlands and valley grasslands.

CLIFTON'S EREMOGONE

Clifton's eremogone (*Eremogone cliftonii*) is a perennial herb that is native to California with a California Rare Plant Rank of 1B.3. It is in the carnation family (Caryophyllaceae) and blooms between April and September. It is known to occur in open granitic soils in chaparral and lower and upper montane coniferous forests at elevations ranging from 1,492 to 6,825 feet. Clifton's eremogone has the potential to occur in the study area (within the sewer service area) because of the presence of chaparral and montane coniferous habitats underlain with granitic soils.

AHART'S BUCKWHEAT

Ahart's buckwheat (*Eriogonum umbellatum* var*. ahartii*) is a perennial herb that is native to California with a California Rare Plant Rank of 1B.2. It is in the knotweed family (Polygonaceae) and blooms between June and September. It typically occurs on slopes and in openings of chaparral and cismontane woodland habitats at elevations ranging from 902 to 4,856 feet. Ahart's buckwheat has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of chaparral and cismontane woodland habitats.

FERN-LEAVED MONKEYFLOWER

Fern-leaved monkeyflower (*Erythranthe filicifolia*) is an annual herb that is native to California with a California Rare Plant Rank of 1B.2. It is in the lopseed family (Phrymaceae) and blooms between April and June. It typically occurs in ephemeral seeps among granitic slabs in meadows, chaparral, and lower montane coniferous forests at elevations ranging from 1,148 to 5,610 feet. Fern-leaved monkeyflower has the potential to occur in the study area (from Lookout Point and east through Paradise) because of the presence of chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats.

HOOVER'S SPURGE

Hoover's spurge (*Euphorbia hooveri*) is an annual herb that is both native and endemic to California. It is listed as federally threatened and has a California Rare Plant Rank of 1B.2. It an annual herb in the spurge family (Euphorbiaceae) and blooms between July and September. It typically occurs in wetlands, vernal pools, riparian, and valley grassland habitats forming mats of thin, hairless stems. Germination is known to occur after pools or wetlands dry with the arrival of summer. The species can occur at an elevation range of 80 to 820 feet. Hoover's spurge has the potential to occur in the study area (from Tuscan Ridge west to the Chico WPCP) because of the presence of valley grassland habitats with vernal pools.

ADOBE-LILY

Adobe-lily (*Fritillaria pluriflora*) is a perennial bulb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the lily family (Liliaceae) and blooms between February and April. It is known to occur in adobe clay soils of foothill woodlands, chaparral, and valley grassland habitat types at elevations ranging from 147 to 3,100 feet. Adobe-lily has the potential to occur in the study area because of the presence of foothill woodlands, chaparral, and valley grassland habitats.

WOOLLY ROSE-MALLOW

Woolly rose-mallow (*Hibiscus lasiocarpos var. occidentalis*) is a perennial herb that is native to California with a California Rare Plant Rank of 1B.2. It is in the mallow family (Malvaceae) and blooms between June and September. It typically occurs in freshwater marshes and wetland riparian habitat at elevations ranging from 0 to 509 feet. Woolly rose-mallow has the potential to occur in the lower elevations of the study area (from the City of Chico west to the Chico WPCP) because of the

presence of some small freshwater emergent wetland features and valley-foothill riparian habitat, especially along Butte Creek.

CALIFORNIA SATINTAIL

California satintail (*Imperata brevifolia*) is a perennial grass-like herb, that is native to California with a California Rare Plant Rank of 2B.1. It is in the blue grass family (Poaceae) and blooms between September and May. It typically occurs in chaparral, coastal scrub, Mojavean desert scrub, riparian, seep, and meadow habitat types at elevations ranging from 0 to 4,905 feet. California satintail has the potential to occur in the study area because of the presence of some small freshwater emergent wetland features as well as chaparral and riparian habitat.

RED BLUFF DWARF RUSH

Red Bluff dwarf rush (*Juncus leiospermus var. leiospermus*) is an annual grass-like herb that is native to California with a California Rare Plant Rank of CNPS 1B.1. It is in the rush family (Juncaceae) and blooms between March and May. It is known to occur in vernally mesic areas in chaparral, cismontane woodlands, meadows, seeps, valley and foothill grassland, and vernal pool habitats at elevations ranging from 98 to 4,118 feet. Red Bluff dwarf rush has the potential to occur in the study area because of the presence of chaparral, woodland, and valley and foothill grassland habitats with vernal pools.

COLUSA LAYIA

Colusa layia (*Layia septentrionalis*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the sunflower family (Asteraceae) and blooms between April and May. The species is known to inhabit foothill woodlands, chaparral, and valley grasslands at elevations ranging from 50 to 3,609 feet. Colusa layia has the potential to occur in the study area because of the presence of foothill woodlands, chaparral, and valley grasslands.

CANTELOW'S LEWISIA

Cantelow's lewisia (*Lewisia cantelovii*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the Miner's lettuce family (Montiaceae) and blooms between May and October. The species is known to occur in riparian and seep habitats in yellow pine forests, mixed evergreen forests, foothill woodlands, and chaparral vegetation communities at elevations ranging from 1,066 to 4,512 feet. Cantelow's lewisia has the potential to occur in the study area (from Lookout Point and east through Paradise) because of the presence of riparian, foothill woodland, and chaparral vegetation communities.

BUTTE COUNTY MEADOWFOAM

Butte County meadowfoam, (*Limnanthes floccosa* ssp*. californica*) is an annual herb that is both native and endemic to California. It is listed as federal and state endangered with a California Rare Plant Rank of 1B.1. It is in the meadowfoam family (Limnanthaceae) and blooms between March and May. The species is known to occur primarily on the margins of vernal swales located on alluvial terraces in annual grasslands with mima mound topography at elevations ranging from 115 to 1,215 feet. Butte County meadowfoam has the potential to occur in the study area (west of the sewer service area) because of the presence of annual grassland habitats with vernal pools.

VEINY MONARDELLA

Veiny monardella (*Monardella venosa*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.1. It is in the mint family (Lamiaceae) and blooms in June and July. The species is known to occur in heavy clay soils in cismontane woodland and

grassland communities at elevations ranging from 98 to 1,329 feet. Veiny monardella has the potential to occur in the study area (west of the sewer service area) because of the presence of cismontane woodland and grassland vegetation communities.

HAIRY ORCUTT GRASS

Hairy Orcutt grass (*Orcuttia pilosa*) is an annual grass-like herb that is both native and endemic to California. It is listed as federal and state endangered with a California Rare Plant Rank of 1B.1. It is in the grass family (Poaceae) and blooms between May and September. The species is known to occur in vernal pools within annual grasslands at elevations ranging from 85 to 660 feet. Hairy Orcutt grass has the potential to occur in the study area (from Tuscan Ridge west to the Chico WPCP) because of the presence of annual grassland habitats with vernal pools.

LEWIS ROSE'S RAGWORT

Lewis Rose's ragwort (*Packera eurycephala* var*. lewisrosei*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the sunflower family (Asteraceae) and blooms between March and July. The species is known to occur in chaparral, cismontane woodland, and lower montane coniferous forest at elevations ranging from 328 to 6,200 feet. Lewis Rose's ragwort has the potential to occur in the study area because of the presence of chaparral, blue oak-foothill pine, and montane hardwood-coniferous woodland communities.

AHART'S PARONYCHIA

Ahart's paronychia (*Paronychia ahartii*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.1. It is in the pink family (Caryophyllaceae) and blooms between March and June. The species is known to occur in cismontane woodland, grassland, and vernal pool habitats at elevations ranging from 1,066 to 4,512 feet. Ahart's paronychia has the potential to occur in the study area (from Lookout Point and east through Paradise) in blue oak-foothill pine, montane hardwood-conifer, and vernal pools within annual grassland vegetation communities.

SIERRA BLUE GRASS

Sierra blue grass (*Poa sierrae*) is a perennial grasslike herb that is both native and endemic to California with a California Rare Plant Rank of 1B.3. It is in the grass family (Poaceae) and blooms between April and June. The species is known to occur in openings in lower montane coniferous forest at elevations ranging from 1,148 to 6,282 feet. Sierra blue grass has the potential to occur in the study area (from Lookout Point and east through Paradise) because of the presence of blue oak-foothill pine and montane hardwood-conifer vegetation communities.

CALIFORNIA BEAKED-RUSH

California beaked-rush (*Rhynchospora californica*) is a perennial grasslike herb that is both native and endemic to California with a California Rare Plant Rank of 1B.1. It is in the sedge family (Cyperaceae) and blooms between May and July. The species is known to occur in bogs, fens, meadows, seeps, freshwater marshes and swamps, and lower montane coniferous forest vegetation communities at elevations ranging from 145 to 885 feet. California beaked-rush has the potential to occur in the study area (from Tuscan Ridge west to the Chico WPCP) because of the presence of small freshwater emergent wetland features within montane hardwood-conifer habitats.

BROWNISH BEAKED-RUSH

Brownish beaked-rush (*Rhynchospora capitellata*) is a perennial grasslike herb that is both native and endemic to California with a California Rare Plant Rank of 2B.2. It is in the sedge family

(Cyperaceae) and blooms in July and August. The species is known to occur in mesic soils in meadows, seeps, marshes, swamps, and montane coniferous forests at elevations ranging from 145 to 6,560 feet. Brownish beaked-rush has the potential to occur in the study area because of the presence of small freshwater emergent wetland features within montane hardwood-conifer habitats.

HALL'S RUPERTIA

Hall's rupertia (*Rupertia hallii*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the legume family (Fabaceae) and blooms between June and August. The species is known to occur along roadsides and in openings of cismontane woodland and lower montane coniferous forest at elevations ranging from 1,785 to 7,380 feet. Hall's rupertia has the potential to occur in the higher elevation portions of the study area (sewer service area) because of the presence of blue oak-foothill pine and montane hardwood-coniferous forests and the disturbed/ruderal areas adjacent to those habitat types.

SANFORD'S ARROWHEAD

Sanford's arrowhead (*Sagittaria sanfordii*) is a rhizomatous perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the water-plantain family (Alismataceae) and blooms between May and October. The species is known to occur in standing or slow-moving freshwater marshes, ponds, swamps, and ditches at elevations ranging from 0 to 1,985 feet. Sanford's arrowhead has the potential to occur in the study area because of the presence of slow-moving streams (especially Comanche Creek and Little Chico Creek).

FEATHER RIVER STONECROP

Feather River stonecrop (*Sedum albomarginatum*) is a perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the stonecrop family (Crassulaceae) and blooms in May and June. The species is known to occur in chaparral and lower montane coniferous forests at elevations ranging from 984 to 6,070 feet. Feather River stonecrop has the potential to occur in the study area (from Tuscan Ridge and east through Paradise) because of the presence of chaparral, blue oak-foothill pine, and montane hardwood-coniferous forest.

BUTTE COUNTY CHECKERBLOOM

Butte County checkerbloom (*Sidalcea robusta*) is a rhizomatous perennial herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the mallow family (Malvaceae) and blooms between April and June. The species is known to occur in chaparral and cismontane woodland communities at elevations ranging from 245 to 1,313 feet. Butte County checkerbloom is known to occur in the study area (between the Butte Creek crossing and the sewer service area) in chaparral and foothill woodland habitats.

SLENDER-LEAVED PONDWEED

Slender-leaved pondweed (*Stuckenia filiformis* ssp*. alpina*) is a perennial herb that is native to California with a California Rare Plant Rank of 2B.2. It is in the pondweed family (Potamogetonaceae) and blooms between May and July. The species is known to occur in shallow, clear water of lakes, drainage channels, freshwater marshes and swamps at elevations ranging from 15 to 7,628 feet. Slender-leaved pondweed has the potential to occur in slow-moving streams in the study area (especially Comanche Creek and Little Chico Creek).

BUTTE COUNTY GOLDEN CLOVER

Butte County golden clover (*Trifolium jokerstii*) is an annual herb that is both native and endemic to California with a California Rare Plant Rank of 1B.2. It is in the legume family (Fabaceae) and

blooms between March and May. The species is known to occur in mesic grasslands and vernal pools at elevations ranging from 145 to 1,313 feet. Butte County golden clover has the potential to occur in the study area (west of sewer service area) because of the presence of annual grassland habitats with vernal pools.

GREENE'S TUCTORIA

Greene's tuctoria (*Tuctoria greenei*) is an annual grass-like herb that is both native and endemic to California. It is listed as federally endangered and state rare with a California Rare Plant Rank of 1B.1. It is in the grass family (Poaceae) and blooms between May and September. The species is known to occur in shallow vernal pools (or at the shallow margins of deeper pools) at elevations ranging from 82 to 4,348 feet. Greene's tuctoria has the potential to occur in the study area because of the presence of annual grassland habitats with vernal pools.

BRAZILIAN WATERMEAL

Brazilian watermeal (*Wolffia brasiliensis*) is a perennial herb that is native to California, with a California Rare Plant Rank of 2B.3 which means it is rare in California but common elsewhere. It is in the arum family (Araceae) and blooms between April and December. The species is known to occur in shallow freshwater marshes and swamps at elevations ranging from 65 to 330 feet. Brazilian watermeal has the potential to occur in the study area because of the presence of small freshwater emergent wetlands.

Wildlife

The database queries and preliminary analysis of habitat suitability in the study area revealed the potential for 38 special-status wildlife species to occur in the study area. Descriptions of each of these species are provided in the following sections.

CROTCH BUMBLE BEE

Crotch bumble bee (*Bombus crotchii*) is an insect species which is a candidate for listing as state endangered in California. They nest underground, utilize open grassland and scrub habitats, and nectar from a variety of flowering plants including those in the following genera: *Asclepias*, *Chaenactis*, *Lupinus*, *Medicago*, *Phacelia*, and *Salvia* (CDFW 2019a). Crotch bumble bee has the potential to occur in the study area in annual grassland and mixed chaparral habitats.

WESTERN BUMBLE BEE

Western bumble bee (*Bombus occidentalis*) is an insect species which is a candidate for listing as state endangered in California. They utilize open grassland, chaparral, and scrub habitats as well as mountain meadows and urban parks and gardens. They typically nest underground in abandoned rodent burrows, and in open west-southwest facing slopes bordered by trees, although they do sometimes nest in above-ground locations such as in logs or among railroad ties (CDFW 2019a). Western bumble bee has the potential to occur in the study area in annual grassland and mixed chaparral habitats, as well as in parks and gardens in Chico and Paradise.

CONSERVANCY FAIRY SHRIMP

Conservancy fairy shrimp (*Branchinecta conservatio*) is a federally endangered species of crustacean which is endemic to vernal pools in California, almost entirely in the Central Valley. While the majority of sites inhabited by this species are large and turbid pools which remain inundated much longer than typical vernal pools, they can be found in smaller vernal pools as well (USFWS 2012). Conservancy fairy shrimp has the potential to occur in vernal pools in the study area.

VERNAL POOL FAIRY SHRIMP

Vernal pool fairy shrimp (*Branchinecta lynchi*) is a federally threatened species of crustacean which is endemic to vernal pools in California and southern Oregon, especially on the eastern side of California's Central Valley. They are found only in cool water vernal pools, requiring water temperatures of 50°F or lower to hatch, and they are typically associated with smaller, shallower vernal pools (about 6 inches deep) that have relatively short periods of inundation (USFWS 2007a). Vernal pool fairy shrimp has the potential to occur in vernal pools in the study area.

VALLEY ELDERBERRY LONGHORN BEETLE

Valley elderberry longhorn beetle is a federally threatened species of insect which is endemic to California. It occurs in the Central Valley from Shasta County south to Fresno County and from the valley floor up to approximately 500 feet in elevation. This species is completely dependent on elderberry shrubs (*Sambucus* spp.) in which they spend their entire life cycle; developing in the pith of the elderberry stems and only emerging as adults for a brief period in spring to reproduce. They are most often found occupying elderberry shrubs within riparian habitat but can also be found in elderberry shrubs in annual grassland or oak savanna habitats (USFWS 2017). Valley elderberry longhorn beetle is known to occur in valley-foothill riparian habitat in the study area with elderberry shrubs present, such as along Butte Creek and Little Chico Creek.

VERNAL POOL TADPOLE SHRIMP

Vernal pool tadpole shrimp (*Lepidurus packardi*) is a federally endangered species of crustacean which is endemic to vernal pools in California, especially in California's Central Valley from Shasta County south to Tulare County. They can occur in pools with water temperatures ranging from 50 to 84°F, though hatching rates become significantly lower at temperatures above 68°F. While this species is more prolific in pools with inundation periods of 6 months or greater, they can persist in smaller pools with shorter inundation periods (USFWS 2007b). There is final critical habitat for this species within 1.5 miles of the study area. Vernal pool tadpole shrimp has the potential to occur in vernal pools in the study area.

RIFFLE SCULPIN

Riffle sculpin (*Cottus gulosus*) is a California species of special concern which occurs in clear and shaded permanent, cool, headwater streams with moderate gradients where riffles and rocky substrates predominate. They are mostly present in mid-elevation reaches, although they are present below dams with coldwater releases (Moyle 2002). Riffle sculpin has the potential to occur in the study area in Butte Creek, Comanche Creek, and Little Chico Creek.

HARDHEAD

Hardhead (*Mylopharodon conocephalus*) is a California species of special concern which occurs in the Sacramento-San Joaquin and Russian River drainages, including their tributaries. They prefer small to large streams in low to mid-elevation environments, though they may also inhabit lakes or reservoirs. They are usually found in clear deep streams with a slow but present flow. Though spawning may occur in pools, runs, or riffles, the bedding area will typically be characterized by gravel and rocky substrate (CDFW 2015). Hardhead has the potential to occur in perennial streams in the study area, especially Butte Creek.

STEELHEAD (CENTRAL VALLEY DPS)

The Central Valley Distinct Population Segment (DPS) of steelhead is a federally threatened anadromous fish species which journeys from the marine and estuarine waters of San Francisco and San Pablo Bays to the Sacramento and San Joaquin Rivers and their tributaries to spawn. Spawning

habitat includes gravel-bottomed, fast-flowing, well-oxygenated rivers and streams (NMFS 2016a). Central Valley steelhead are known to occur within the study area in Butte Creek.

CHINOOK SALMON (CENTRAL VALLEY SPRING-RUN ESU)

The Central Valley spring-run Evolutionarily Significant Unit (ESU) of chinook salmon is a federally and state threatened anadromous fish species which journeys from the Sacramento-San Joaquin River Delta into the Sacramento River and its tributaries to spawn starting in late March (NMFS 2016b). Central Valley spring-run Chinook salmon are known to occur within the study area in Butte Creek, and in fact Butte Creek is known to have the largest self-sustaining, naturally spawning, wild population of spring-run Chinook salmon in the Central Valley. The species was observed in Butte Creek during field studies for the Project in spring 2021.

FOOTHILL YELLOW-LEGGED FROG

Foothill yellow-legged frog (*Rana boylii*) is an amphibian species which statewide is considered a California species of special concern, and as of March 2020 in certain portions of its range, has been elevated to state threatened or endangered. Foothill yellow-legged frogs that could occur in the study area could be part of the Feather River clade which are listed as state threatened. The species prefers shallow flowing streams and rivers with at least cobble sized substrate. Breeding generally occurs at the margins of wide shallow channels with reduced flow variation near tributary confluences. Specifically, egg masses are placed in low flow locations on or under rocks with preferred substrates being boulders, cobbles, or gravel (CDFW 2019b). Foothill yellow-legged frogs are known to occur in perennial streams and valley-foothill riparian habitats in the study area, especially Butte Creek and Honey Run.

CALIFORNIA RED-LEGGED FROG

California red-legged frog (*Rana draytonii*) is a federally threatened species and a California species of special concern. This species is dependent on suitable aquatic, estivation, and upland habitat. During periods of wet weather, starting with the first rainfall in late fall, California red-legged frogs disperse away from their estivation sites to seek suitable breeding habitat. Aquatic and breeding habitat is characterized by dense, shrubby, riparian vegetation and deep still or slow-moving water. Breeding occurs between late November and late April. California red-legged frogs estivate (period of inactivity) during the hot and dry months in upland habitats, typically within 300 feet of aquatic and riparian habitat. Upland habitats are composed of grasslands, woodlands, and/or vegetation that provide shelter, forage, and predator avoidance, including small mammal burrows, moist leaf litter, incised stream channels, and large cracks in the bottom of dried ponds (USFWS 2010). California red-legged frog has the potential to occur in perennial stream and valley-foothill riparian habitats in the study area, as well as annual grassland with small mammal burrows and connectivity to the above-mentioned aquatic habitats.

WESTERN SPADEFOOT

Western spadefoot (*Spea hammondii*) is an amphibian species which is considered a California species of special concern. They dwell underground for most of the year in burrows they dig themselves with the aid of a hard, black, wedge-shaped spade on each hindfoot. They emerge following winter rains to breed in vernal pools and other seasonal wetland features within grassland and sometimes valley-foothill hardwood habitats (Thomson et al. 2016). Western spadefoot has the potential to occur in vernal pools, annual grasslands, and valley oak, blue oak, and blue oak-foothill pine habitats in the study area.

WESTERN POND TURTLE

Western pond turtle is a reptile species which is considered a California species of special concern. They occupy various waterbodies, both natural and artificial, with exposed banks, logs, or other surfaces for basking, and connectivity to upland habitat with vegetative cover for nesting and overwintering (Thomson et al. 2016). Western pond turtles were observed basking on logs along Butte Creek during field studies for the Project in spring 2021, and are known to occur along Comanche Creek, Little Chico Creek and at the Chico WPCP ponds.

COAST HORNED LIZARD

Coast horned lizard is a reptile species which is considered a California species of special concern. They occupy sage scrub, dunes, alluvial scrub, annual grassland, chaparral, oak, riparian, coniferous forest, and saltbush scrub. They require loose, fine soil for burrowing, open areas for basking, and dense foliage for cover (Thomson et al. 2016). Coast horned lizard has the potential to occur in annual grassland, mixed chaparral, valley oak, blue oak, blue oak-foothill pine, and valley-foothill riparian habitats in the study area.

GIANT GARTER SNAKE

Giant garter snake (*Thamnophis gigas*) is a reptile species which is endemic to California's Central Valley and listed as federal and state threatened. They are a highly aquatic species, occupying marshes, sloughs, ponds, small lakes, low gradient streams, irrigation canals, rice fields, and associated uplands with at least some vegetation for escape, and burrows or soil crevices for refugia. They spend much of the year (usually October to March) in this underground refugia, then emerge in spring to breed. They are found from sea level to approximately 400 feet in elevation. Butte County is the northernmost extent of the range of this species (USFWS 2020). Giant garter snake has the potential to occur in perennial streams and valley-foothill riparian habitats in the lower elevation portions of the study area (from where Butte Creek crosses the study area, west to the Chico WPCP).

NORTHERN GOSHAWK

Northern goshawk (*Accipiter gentilis*) is an arboreal raptor which is considered a California species of special concern. They nest in mature, old-growth coniferous forests at high elevations in the Sierra Nevada and Cascade Mountains. They prefer stands with ponderosa pine and nest sites on north-facing slopes with nearby rivers, creeks, or streams. They prey mainly on small mammals such as rabbits and squirrels, and small to mid-sized birds such as robins and jays (Shuford and Gardali 2008). Northern goshawk has the potential to occur in montane hardwood-conifer and ponderosa pine habitats in the highest elevation portions of the study area (in the town of Paradise), though it is much more likely to occur as a migrant or winter visitor than to nest there.

TRICOLORED BLACKBIRD

Tricolored blackbird (*Agelaius tricolor*) is a state threatened species and a California species of special concern. It is a colonial species, nesting in populous colonies in fresh marshes with dense emergent vegetation or, increasingly with the loss of this preferred habitat, in dense patches of thorny shrubs such as Himalayan blackberry (*Rubus armeniacus*), or California wild rose (*Rosa californica*). The species is omnivorous, feeding mostly on insects, but also taking seeds and waste grains from croplands and grassy fields. For breeding habitat to be suitable, there must be foraging habitat and open water within 4 miles of the colony site (CDFW 2021b). Tricolored blackbird has the potential to occur in annual grassland, cropland, irrigated row and field crop, pasture, and valley-foothill riparian habitats in the study area. However, with a lack of suitable nesting habitat (dense

patches of thorny shrubs or fresh marshes with dense emergent vegetation), it is much more likely to forage in the study area than to nest there.

GREATER SANDHILL CRANE

Greater sandhill crane (*Antigone canadensis tabida*) is a tall wading bird that is a state threatened and state fully protected species in California. The species nests in the far northeastern corner of the state from Modoc Plateau south to Sierra Valley on the eastern side of the Sierra Nevada and Cascade Mountains. It overwinters in the Central Valley and low foothills in annual and perennial grassland habitats, moist croplands with rice or corn stubble, and open emergent wetlands (CDFW 2021b). Greater sandhill crane has the potential to occur from fall through spring in annual grassland, cropland, irrigated row and field crop, and pasture habitats in the study area. Migrating flocks of greater sandhill cranes were observed flying high over the study area during field studies in Spring 2021. However, the study area is not in the nesting range of the species.

GOLDEN EAGLE

Golden eagle (*Aquila chrysaetos*) is protected by the Bald and Golden Eagle Protection Act and is a state fully protected species in California. This large raptor prefers rolling foothills and mountain terrain, wide arid plateaus deeply cut by streams and canyons, and open mountain slopes, cliffs, and rock outcrops for nesting. They forage over open grasslands and oak savanna habitats for their mainly mammalian prey which consists largely of rabbits and ground squirrels, though they will often prey on lizards, snakes, and birds (CDFW 2021b). Golden eagle has the potential to occur in annual grassland, mixed chaparral, blue oak, and blue oak-foothill pine habitats in the study area, though it is much more likely to occur as a migrant or winter visitor than to nest there.

LONG-EARED OWL

Long-eared owl (*Asio otus*) is a bird species which is considered a California species of special concern. They nest and roost in dense stands of live oak (*Quercus* spp.) and in riparian thickets with dense canopies near meadow edges. At higher elevations, they also nest in dense stands of conifers. In winter they often form large roost groups in riparian thickets or dense stands of willows (CDFW 2021b). Long-eared owl has the potential to occur in montane hardwood-conifer, ponderosa pine, blue oak-foothill pine, and valley-foothill riparian habitats in the study area. At the lower elevations of the study area (from Tuscan Ridge west to the Chico WPCP), they are much more likely to occur as an uncommon migrant or winter visitor than to nest.

BURROWING OWL

Burrowing owl (*Athene cunicularia*) is a crepuscular bird species which is considered a California species of special concern. They nest underground, and in California, they mainly take over the burrows of California ground squirrels or occupy human-made ground cavities such as drainpipes or culverts. They can persist in many kinds of highly disturbed areas such as airports, golf courses, and vacant lots. The most important elements of suitable habitat for the species are small mammal burrows and open ground with sparse vegetative cover for foraging (CDFW 2021b). Burrowing owl has the potential to occur in annual grassland, cropland, irrigated row and field crop, pasture, and disturbed/ruderal habitats mainly in the lower elevations of the study area (from Tuscan Ridge west to the Chico WPCP).

SWAINSON'S HAWK

Swainson's hawk is a state threatened raptor species which nests in oak savanna and cottonwood riparian woodland adjacent to their foraging habitat of grassland or agricultural fields. They often

follow behind farm equipment to forage for killed or maimed rodents and are also often observed foraging over grassy roadsides or highway medians. Swainson's hawks are a neotropical migrant species, mostly departing California by October for wintering grounds as far south as Argentina and returning in March and April to nest (CDFW 2021b). Swainson's hawks are known to occur in valley oak woodland, valley-foothill riparian, pasture, and irrigated row and field crop habitat in the study area. An active Swainson's hawk nest was found during field studies for the Project in spring 2021.

NORTHERN HARRIER

Northern harrier is a raptor species which is considered a California species of special concern. They occupy a variety of open habitats such as marshes, wet meadows, weedy borders of lakes, rivers and streams, grasslands, pastures, and croplands where they patrol low for their prey of mainly small mammals and birds. They nest on the ground in patches of dense, tall vegetation in undisturbed areas (Shuford and Gardali 2008). Northern harrier is known to occur in annual grassland, pasture, and irrigated row and field crop habitats in the study area, and one was observed in the study area during field studies for the Project in spring 2021. However, with the lack of truly suitable nesting habitat in the study area (tall vegetation in undisturbed areas), it is much more likely to occur as a migrant or winter visitor than to nest there.

WHITE-TAILED KITE

White-tailed kite is a state fully protected raptor species in California which nests in oak savanna, oak and willow riparian, and other open areas with scattered trees near their foraging habitat of open grasslands, meadows, and farmland. They are often seen hover foraging over roadsides or grassy highway medians in pursuit of their prey; mainly small mammals such as voles, mice, and pocket gophers, though birds, reptiles, and insects are sometimes taken (CDFW 2021b). White-tailed kite has the potential to occur in annual grassland, blue oak and valley oak woodland, valley-foothill riparian, irrigated row and field crop, pasture, and disturbed/ruderal habitats in the study area.

AMERICAN PEREGRINE FALCON

American peregrine falcon (*Falco peregrinus anatum*) is a state fully protected raptor species in California which is often observed making high-speed pursuits of its mainly avian prey through canyons or over wetlands, lakes, rivers, or other aquatic habitats. They mainly nest on cliff ledges, though they will often use high human-made structures such as bridges, skyscrapers, or electrical towers (CDFW 2021b). American peregrine falcon has the potential to occur in blue oak-foothill pine, ponderosa pine, and montane hardwood-conifer habitats as well as developed portions of the study area.

BALD EAGLE

Bald eagle (*Haliaeetus leucocephalus*) is protected by the Bald and Golden Eagle Protection Act and is listed as state endangered in California. They are highly piscivorous, preferring to nest near large bodies of water such as rivers, lakes, and reservoirs with abundant fish. They build massive nests which they return to year after year in very large old-growth trees with open, supportive branches (CDFW 2021b). Bald eagle is known to occur in the study area, and a pair was observed perched along and soaring over Butte Creek in the study area several times during field studies for the Project in spring 2021.

YELLOW-BREASTED CHAT

Yellow-breasted chat (*Icteria virens*) is a neotropical migrant songbird which is considered a California species of special concern. It occupies early successional riparian habitats with a well-

developed shrub layer and an open canopy along narrow borders of streams, creeks, sloughs, and rivers (CDFW 2021b). They often nest in dense thickets of blackberries and willows where their raucous song can be heard emanating from deep in the brush. Yellow-breasted chat has the potential to occur in valley-foothill riparian habitat in the study area.

LOGGERHEAD SHRIKE

Loggerhead shrike (*Lanius ludovicianus*) is a predatory songbird which is considered a California species of special concern. Shrikes are unique for their practice of impaling their prey (mostly small mammals, birds, and lizards) on thorny vegetation or barbed wire fences. This species prefers shrublands and open woodlands with a fair amount of grass cover and areas of bare ground. They require tall shrubs or trees, fences, or power lines for hunting perches and territorial advertisement, and thorny vegetation or barbed wire fences for impaling their prey (CDFW 2021b). Loggerhead shrike has the potential to occur in annual grassland, mixed chaparral, blue oak woodland, valley oak woodland, valley-foothill riparian, irrigated row and field crop, pasture, and disturbed/ruderal habitats in the study area.

CALIFORNIA BLACK RAIL

California black rail (*Laterallus jamaicensis coturniculus*) is a state threatened and fully protected species in California. It is one of the least known bird species in North America as it is a very small and very secretive denizen of saline, brackish, and fresh emergent wetlands where its loud, piercing call (mostly delivered at night) is often the only indication of its presence. They are mainly known from tidal wetlands in the San Francisco Bay Area and southern California baylands, and fresh marshes in the Lower Colorado River Valley and Imperial Valley near the Salton Sea. However, they are known to occupy a few scattered ephemeral wetland features in the Sacramento Valley and lower Sierra Nevada foothills (CDFW 2021b). California black rail has the potential to occur in small freshwater emergent wetland and vernal pools within annual grassland habitats in the study area.

PURPLE MARTIN

Purple martin (*Progne subis*) is a neotropical migrant bird species and is considered a California species of special concern. They are the largest swallow species in North America, and are colonial, returning from their wintering grounds in late March and early April. With the exception of the Sacramento area, where they have taken to nesting under highway bridges, purple martins prefer to nest in the mountains and foothills in forest edges with plentiful cavities and ample airspace above the canopy to allow for foraging of aerial insects (CDFW 2021b). Purple martins have the potential to occur in montane hardwood-conifer and valley-foothill riparian habitats in the study area. They could occur as a migrant in the lower elevation portions of the study area but are only likely to nest at higher elevations in and near the town of Paradise.

YELLOW WARBLER

Yellow warbler (*Setophaga petechia*) is a neotropical migrant bird species and is considered a California species of special concern. They are usually found in cottonwood willow riparian habitat along creeks and rivers, though they also nest in montane shrubbery in open coniferous forests (CDFW 2021b). Yellow warblers have the potential to occur in montane hardwood-conifer and valley-foothill riparian habitats in the study area. They could occur as a migrant in the lower elevation portions of the study area but are most likely to nest at higher elevations in and near the town of Paradise.

CALIFORNIA SPOTTED OWL

California spotted owl (*Strix occidentalis occidentalis*) is considered a California species of special concern which ranges throughout the west slopes of the Sierra Nevada Mountains. They prefer older forests in areas of high canopy cover, with a multi-layered canopy, old decadent trees, a high number of large trees, and coarse downed woody debris (CDFW 2021b). California spotted owl has the potential to occur in montane hardwood-conifer and ponderosa pine habitats at the highest elevation portions of the study area. However, this species is much more likely to occur during migration or winter in the study area and is not likely to nest there due to the lack of old-growth, dense canopy forest.

PALLID BAT

Pallid bat (*Antrozous pallidus*) is a cave, cliff, and crevice-roosting bat which is considered a California species of special concern. While they mostly roost in rocky places, pallid bats sometimes choose to roost in hollow trees, buildings, or other human-made structures. They occupy a wide variety of habitats including grasslands, shrublands, and woodlands, from sea-level up to montane coniferous forests. They are most common in open, dry habitats with rocky areas for roosting (CDFW 2021b). Pallid bat has the potential to occur in all habitats in the study area and could potentially roost in hollow trees or buildings in the study area.

TOWNSEND'S BIG-EARED BAT

Townsend's big-eared bat (*Corynorhinus townsendii*) is a building, cave, mine, and tunnel-roosting bat which is considered a California species of special concern. They range nearly throughout California (with the exception of the highest elevations of the Sierra Nevada Mountains) and occupy a wide variety of habitat, though they prefer more mesic sites. They are able to hover-glean, and forage on habitat edges, taking moths, beetles, and other soft-bodied insects from brush and trees. They may use different sites for day roosts, night roosts, maternity roosts, and hibernacula. They are extremely sensitive to disturbance at roost sites and will abandon a roost easily (CDFW 2021b). Townsend's big-eared bat has the potential to occur in all habitats in the study area and could potentially roost in buildings or other human-made structures with dark, quiet recesses in the study area.

WESTERN MASTIFF BAT

Western mastiff bat (*Eumops perotis californicus*) is a building, cliff, and crevice-roosting bat which is considered a California species of special concern. While they mostly roost in rocky places, western mastiff bats sometimes choose to roost in hollow trees, buildings, or other human-made structures as long as there is a vertical face for them to drop off to take flight. They occupy a wide variety of arid to semi-arid habitats including grasslands, chaparral, coniferous and deciduous woodlands, and developed areas. They are most common in open, dry habitats with an abundance of crevices or buildings for roosting (CDFW 2021b). Western mastiff bat has the potential to occur in all habitats in the study area and could potentially roost in buildings or other human-made structures in the study area.

WESTERN RED BAT

Western red bat (*Lasiurus blossevillii*) is a tree-roosting bat which is considered a California species of special concern. While they mostly roost in rocky places, western red bats sometimes choose to roost in hollow trees, buildings, or other human-made structures. They occupy a wide variety of habitats including grasslands, shrublands, and woodlands, from sea-level up to montane coniferous forests. Roosts are most often in edge habitats adjacent to fields, streams, or urban areas (CDFW

2021b). Western red bat has the potential to occur in all habitats in the study area and could potentially roost in trees or buildings in the study area.

AMERICAN BADGER

American badger (*Taxidea taxus*) is a burrowing carnivorous mammal in the family Mustelidae which is considered a California species of special concern. They are most abundant in dry, open stages of grassland, shrubland, and woodland habitats, most crucially with friable soils for them to dig their burrows and pursue their fossorial mammal prey (CDFW 2021b). American badger has the potential to occur in annual grassland, mixed chaparral, and blue oak-foothill pine habitats in the study area, especially in the open habitats between Chico and Paradise.

Scientific Name	Common Name	Family	Lifeform	Blooming Period	CA Rare Plant Rank	State Rank	Global Rank
Agrostis hendersonii	Henderson's bent grass	Poaceae	annual herb	Apr-Jun	3.2	S2	G2Q
Allium jepsonii	Jepson's onion	Alliaceae	perennial bulbiferous herb	Apr-Aug	1B.2	S2	G2
Allium sanbornii var. sanbornii	Sanborn's onion	Alliaceae	perennial bulbiferous herb	May-Sep	4.2	S3S4	G4T3T4
Anomobryum julaceum	slender silver moss	Bryaceae	moss		4.2	S2	G5?
Arctostaphylos mewukka ssp. truei	True's manzanita	Ericaceae	perennial evergreen shrub	Feb-Jul	4.2	S3	G4?T3
Aspidotis carlotta-halliae	Carlotta Hall's lace fern	Pteridaceae	perennial rhizomatous herb	Jan-Dec	4.2	S3	G3
Astragalus pauperculus	depauperate milk-vetch	Fabaceae	annual herb	Mar-Jun	4.3	S4	G4
Astragalus tener var. ferrisiae	Ferris' milk-vetch	Fabaceae	annual herb	Apr-May	1B.1	S1	G2T1
Azolla microphylla	Mexican mosquito fern	Azollaceae	annual / perennial herb	Aug	4.2	S4	G5
Balsamorhiza macrolepis	big-scale balsamroot	Asteraceae	perennial herb	Mar-Jun	1B.2	S2	G2
Botrychium crenulatum	scalloped moonwort	Ophioglossaceae	perennial rhizomatous herb	Jun-Sep	2B.2	S3	G4
Botrychium minganense	Mingan moonwort	Ophioglossaceae	perennial rhizomatous herb	Jul-Sep	2B.2	S3	G4G5
Botrychium montanum	western goblin	Ophioglossaceae	perennial rhizomatous herb	Jul-Sep	2B.1	S2	G3
Brasenia schreberi	watershield	Cabombaceae	perennial rhizomatous herb (aquatic)	Jun-Sep	2B.3	S3	G5
	valley brodiaea	Themidaceae	perennial bulbiferous	Apr-	4.2	S3	G5T3

Brodiaea rosea ssp. vallicola			herb	May(Jun)			
Brodiaea sierrae	Sierra foothills brodiaea	Themidaceae	perennial bulbiferous herb	May-Aug	4.3	S3	G3
Bryum chryseum	brassy bryum	Bryaceae	moss		4.3	S3	G5
Bulbostylis capillaris	thread-leaved beakseed	Cyperaceae	annual herb	Jun-Aug	4.2	S3	G5
Calycadenia oppositifolia	Butte County calycadenia	Asteraceae	annual herb	Apr-Jul	4.2	S3	G3

Event Code: 08ESMF00-2021-E-06656
Project Name: Paradise Sewer Project

July 14, 2021

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to

utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office

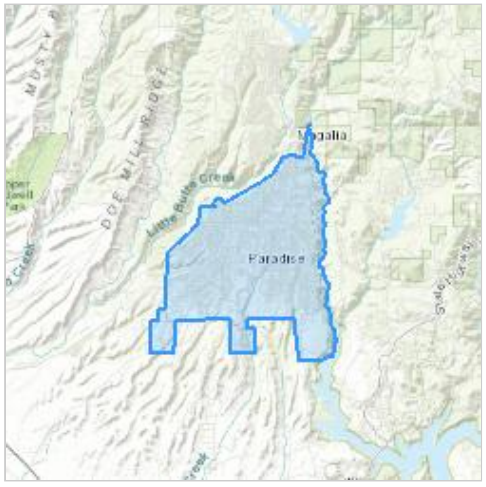
Project Summary

Consultation Code: 08ESMF00-2021-SLI-2318
Event Code: 08ESMF00-2021-E-06656
Project Name: Paradise Sewer Project
Project Type: WASTEWATER PIPELINE
Project Description: The Town of Paradise (Town) is proposing to construct a new sewer collection system within the Town, a connection pipeline, and connection to the City of Chico Water Pollution Control Plant. The Paradise Sewer Project would replace individualized septic systems within the Town's parcel boundaries which are managed by property owners. This project includes an extension of wastewater services from expansion of the City of Chico's service area to the Town, as approved by the Butte Local Agency Formation Commission.

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@39.76135065,-121.60481243550245,14z



Counties: Butte County, California

Endangered Species Act Species

There is a total of 10 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

Sensitive Biological Resources Table

Sensitive Biological Resources and their Potential to Occur in the Study Area

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
Plants							
Allium jepsonii	Jepson's onion	None	None	1B.2	Serpentine or volcanic soils in chaparral, cismontane woodland, and lower montane coniferous forest. Elevation: 984–3,707 feet. Blooming period: April–August (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Astragalus tener var. *ferrisiae*	Ferris' milk-vetch	None	None	1B.1	Meadows, seeps, and subalkaline grassland. Elevation: 0–263 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in annual grassland habitats in the western portion of the study area (from the City of Chico west to the Chico WPCP).
Balsamorhiza macrolepis	big-scale balsamroot	None	None	1B.2	Chaparral, cismontane woodland, and grassland. Elevation: 115–4,806 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.
Botrychium crenulatum	scalloped moonwort	None	None	2B.2	Bogs, fens, meadows, seeps, marshes, freshwater swamps, montane coniferous forests. Elevation: 4,159–10,758 feet. Sporing period: June–September (CNPS 2021).	N	Study area is below the known elevational range of the species.
Botrychium minganense	Mingan moonwort	None	None	2B.2	Mesic soils in bogs, fens, lower and upper montane coniferous forest. Elevation: 4,773–7,152 feet. Sporing period: July–September (CNPS 2021).	N	Study area is below the known elevational range of the species.
Botrychium montanum	western goblin	None	None	2B.1	Mesic soil in meadows, seeps, and montane coniferous forest. Elevation: 4,805–7,150 feet. Sporing period: July–September (CNPS 2021).	N	Study area is below the known elevational range of the species.
Brasenia schreberi	watershield	None	None	2B.3	Freshwater marshes, ponds, swamps, and streams with low velocity flows. Elevation: 3–7,218 feet. Blooming period: April–	Y	Potential to occur in the study area, in Comanche Creek or Little Chico Creek.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					October (CNPS 2021).		
Campylopodiella stenocarpa	flagella-like atractylocarpus	None	None	2B.2	Cismontane woodland, roadsides. Elevation: 935–1,410 feet. (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine, montane hardwood-conifer habitats, and disturbed/ruderal areas adjacent to those habitat types in the study area.
Cardamine pachystigma var. *dissectifolia*	dissected-leaved toothwort	None	None	1B.2	Chaparral, lower montane coniferous forest, serpentine outcrops, and gravelly serpentine talus. Elevation: 984-4,594 feet. (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Carex xerophila	chaparral sedge	None	None	1B.2	Serpentine and gabbro soils in chaparral, cismontane woodland, and lower montane coniferous forest. Elevation: 902–2,527 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Castilleja rubicundula var. *rubicundula*	pink creamsacs	None	None	1B.2	Serpentine soils in meadows, seeps, grassland, cismontane woodland, and openings of chaparral. Elevation: 65–3,002 feet. Blooming period: April–June (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.
Clarkia gracilis ssp. *albicaulis*	white-stemmed clarkia	None	None	1B.2	Chaparral and cismontane woodland. Elevation: 688–3,609 feet. Blooming period: May–July (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Clarkia mildrediae ssp. *mildrediae*	Mildred's clarkia	None	None	1B.3	Sandy, usually granitic, soils in cismontane woodland and lower montane coniferous forest. Elevation: 902–5,676 feet. Blooming period: May–August (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine and montane hardwood-conifer habitats in the study area.
Clarkia mosquinii	Mosquin's clarkia	None	None	1B.1	Rocky soils and roadsides in cismontane woodland and lower montane coniferous	Y	Potential to occur in blue oak-foothill pine, montane

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					forest. Elevation: 590–4,856 feet. Blooming period: May–July (CNPS 2021).		hardwood-conifer habitats, and disturbed/ruderal areas adjacent to these habitat types in the study area.
Cryptantha crinita	silky cryptantha	None	None	1B.2	Rocky volcanic soils, gravelly streambanks, gravel bars, foothill woodland. Elevation: 295—3,675 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in blue oak woodland, blue oak-foothill pine, valley oak woodland, and valley foothill riparian habitats in the study area.
Delphinium recurvatum	recurved larkspur	None	None	1B.2	Alkaline soils in chenopod scrub, cismontane woodland, and grassland. Elevation: 9–2,592 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.
Eremogone cliftonii	Clifton's eremogone	None	None	1B.3	Usually in granitic soils in openings of chaparral and montane coniferous forests. Elevation: 1,492–6,825 feet. Blooming period: April–September (CNPS 2021).	Y	Potential to occur in mixed chaparral, montane hardwood-conifer, and ponderosa pine habitats in the study area.
Eriogonum umbellatum var. *ahartii*	Ahart's buckwheat	None	None	1B.2	Serpentine soils on slopes in openings of chaparral and cismontane woodland. Elevation: 902–4,856 feet. Blooming period: June–September (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Erythranthe filicifolia	fern-leaved monkeyflower	None	None	1B.2	Usually in slow–draining ephemeral seeps that are among exfoliating granitic slabs in meadows, chaparral, and lower montane coniferous forest. Elevation: 1,148–5,610 feet. Blooming period: April–June (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Euphorbia hooveri	Hoover's spurge	FT	None	1B.2	Vernal pools. Generally, grows in relatively large, deep vernal pools among the rolling hills, remnant alluvial fans and depositional stream terraces at the base of the Sierra Nevada foothills. Elevation: 80–	Y	Potential to occur in vernal pools within annual grassland habitats in the western portion of the study area (from Tuscan Ridge Golf Club west

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					820 feet. Blooming period: July–October (CNPS 2021, USFWS 2009a).		to the Chico WPCP).
Frangula purshiana ssp. *ultramafica*	Caribou coffeeberry	None	None	1B.2	Serpentine soils in chaparral, montane coniferous forests, meadows, and seeps. Elevation: 2,705–6,330 feet. Blooming period: May–July (CNPS 2021).	N	Study area is below the known elevational range of the species.
Fritillaria pluriflora	adobe-lily	None	None	1B.2	Adobe soils in chaparral, cismontane woodland, and grassland. Elevation: 147–3,100 feet. Blooming period: February–April (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.
Hibiscus lasiocarpos var. *occidentalis*	woolly rose-mallow	None	None	1B.2	Freshwater marshes and swamps, as well as on soaked riverbanks and low peat islands in sloughs. Often occurs in riprap on sides of levees. Elevation: 0–509 feet. Blooming period: June–September (CNPS 2021).	Y	Potential to occur in small freshwater emergent wetland features and in valley foothill riparian habitats in the study area, especially along Butte Creek.
Imperata brevifolia	California satintail	None	None	2B.1	Mesic soils in chaparral, coastal scrub, Mojavean desert scrub, riparian scrub, meadows and seeps (often alkali). Elevation: 0–4,905 feet. Blooming period: September–May (CNPS 2021).	Y	Potential to occur in small freshwater emergent wetland features within mixed chaparral and valley foothill riparian habitats in the study area, especially along Butte Creek.
Juncus leiospermus var. *leiospermus*	Red Bluff dwarf rush	None	None	1B.1	Vernally mesic soils in chaparral, cismontane woodland, meadows, seeps, grassland, and vernal pools. Elevation: 98–4,118 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, montane hardwood-conifer, and vernal pools within annual grassland habitats in the study area.
Layia septentrionalis	Colusa layia	None	None	1B.2	Sandy serpentine soils in chaparral, cismontane woodland, and grassland. Elevation: 50–3,609 feet. Blooming period: April–May (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
Lewisia cantelovii	Cantelow's lewisia	None	None	1B.2	Mesic and granitic soils and occasionally serpentine seeps in broadleafed upland and lower montane coniferous forests, chaparral, and cismontane woodland. Elevation: 1,066–4,512 feet. Blooming period: May–October (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Limnanthes floccosa ssp. *californica*	Butte County meadowfoam	FE	SE	1B.1	Vernal swales and mesic grassland. Primarily on the margins of vernal swales and to a lesser extent on the margins of vernal pools located on alluvial terraces in annual grasslands with mima mound topography. Elevation: 115–1,215 feet. Blooming period: March–May (CNPS 2021, USFWS 2008).	Y	Potential to occur on margins of vernal pools within annual grassland habitats in the study area.
Monardella venosa	veiny monardella	None	None	1B.1	Heavy clay soils in cismontane woodland and grassland. Elevation: 98–1,329 feet. Blooming period: June and July (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine, montane hardwood-conifer, and annual grassland habitats in the study area.
Orcuttia pilosa	hairy Orcutt grass	FE	SE	1B.1	Vernal pools on high or low stream terraces and alluvial fans. Occurs in Northern Basalt Flow, Northern Claypan, and Northern Hardpan vernal pools within annual grasslands. Elevation: 85–660 feet. Blooming period: May–September (CNPS 2021, USFWS 2009b).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
Packera eurycephala var. *lewisrosei*	Lewis Rose's ragwort	None	None	1B.2	Serpentine soils in chaparral, cismontane woodland, and lower montane coniferous forest. Elevation: 328–6,200 feet. Blooming period: March–July (CNPS 2021).	Y	Potential to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Paronychia ahartii	Ahart's paronychia	None	None	1B.1	Cismontane woodland, grassland, and vernal pools. Elevation: 95–1,640 feet. Blooming period: March–June (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine, montane hardwood-conifer, and vernal pools within annual grassland

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
							habitats in the study area.
Penstemon personatus	closed-throated beardtongue	None	None	1B.2	Metavolcanic soils in chaparral and montane coniferous forests. Elevation: 3,490–6,955 feet. Blooming period: June–October (CNPS 2021).	N	Study area is below the known elevational range of the species.
Poa sierrae	Sierra blue grass	None	None	1B.3	Openings in lower montane coniferous forest. Elevation: 1,148–6,282 feet. Blooming period: April–June (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine and montane hardwood-conifer habitats in the study area.
Rhynchospora californica	California beaked-rush	None	None	1B.1	Bogs, fens, meadows, seeps, freshwater marshes and swamps, and lower montane coniferous forest. Elevation: 145–885 feet. Blooming period: May–July (CNPS 2021).	Y	Potential to occur in small freshwater emergent wetland features within montane hardwood-conifer and valley-foothill riparian habitats in the study area.
Rhynchospora capitellata	brownish beaked-rush	None	None	2B.2	Mesic soils in meadows, seeps, marshes, swamps, and montane coniferous forests. Elevation: 145–6,560 feet. Blooming period: July–August (CNPS 2021).	Y	Potential to occur in small freshwater emergent wetland features within montane hardwood-conifer and valley-foothill riparian habitats in the study area.
Rupertia hallii	Hall's rupertia	None	None	1B.2	Roadsides and openings of cismontane woodland and lower montane coniferous forest. Elevation: 1,785–7,380 feet. Blooming period: June–August (CNPS 2021).	Y	Potential to occur in blue oak-foothill pine, montane hardwood-conifer habitats, and disturbed/ruderal areas adjacent to those habitat types in the study area.
Sagittaria sanfordii	Sanford's arrowhead	None	None	1B.2	Standing or slow-moving freshwater marshes, ponds, swamps, and ditches that are typically shallow. Elevation: 0–1,985 feet. Blooming period: May–October (CNPS 2021).	Y	Potential to occur in the study area in Comanche Creek or Little Chico Creek.
Sedum albomarginatum	Feather River stonecrop	None	None	1B.2	Serpentine soils in chaparral and lower montane coniferous forest. Elevation:	Y	Potential to occur in mixed chaparral, blue oak-foothill

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					984–6,070 feet. Blooming period: May–June (CNPS 2021).		pine, and montane hardwood-conifer habitats in the study area.
Sidalcea robusta	Butte County checkerbloom	None	None	1B.2	Chaparral and cismontane woodland. Elevation: 245–1,313 feet. Blooming period: April–June (CNPS 2021).	Y	Known to occur in mixed chaparral, blue oak-foothill pine, and montane hardwood-conifer habitats in the study area.
Stuckenia filiformis ssp. *alpina*	slender-leaved pondweed	None	None	2B.2	Shallow, clear water of lakes, drainage channels, freshwater marshes and swamps. Elevation: 15–7,628 feet. Blooming period: May–July (CNPS 2021).	Y	Potential to occur in the study area in Comanche Creek or Little Chico Creek.
Trifolium jokerstii	Butte County golden clover	None	None	1B.2	Mesic grassland and vernal pools. Elevation: 145–1,313feet. Blooming period: March–May (CNPS 2021).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
Tuctoria greenei	Greene's tuctoria	FE	SR	1B.1	Vernal pools. Often grows in shallower pools or on the shallow margins of deeper pools. Does not tolerate long periods of inundation. Elevation: 82–4,348 feet. Blooming period: May–September (CNPS 2021).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
Wolffia brasiliensis	Brazilian watermeal	None	None	2B.3	Shallow freshwater marshes and swamps. Elevation: 65–330 feet. Blooming period: April and December (CNPS 2021).	Y	Potential to occur in small freshwater emergent wetland features in the study area.
Invertebrates							
Bombus crotchii	Crotch bumble bee	None	SCE	---	Open grassland and scrub habitats. Nesting occurs underground. This species is classified as a short-tongued species, whose food plants include those in the following genera: *Asclepias*, *Chaenactis*, *Lupinus*, *Medicago*, *Phacelia*, and *Salvia* (CDFW 2019a).	Y	Potential to occur in annual grassland and mixed chaparral habitats in the study area.
Bombus occidentalis	western bumble bee	None	SCE	---	Open grassy areas, urban parks and gardens, chaparral and shrub areas, and	Y	Potential to occur in annual grassland and mixed

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					mountain meadows. Typically nests underground in abandoned rodent burrows, such as old squirrel or other animal nests, and in open west-southwest slopes bordered by trees, although a few nests have been reported from above-ground locations such as in logs among railroad ties. Availability of nest sites may depend on rodent abundance (CDFW 2019a).		chaparral habitats, as well as some developed and disturbed/ruderal parts of the study area.
Branchinecta conservatio	Conservancy fairy shrimp	FE	None	---	Endemic to California vernal pools, almost entirely in the Central Valley, with the exception of one population along the central coast in Ventura County. Majority of sites inhabited by this species are large and turbid pools which remain inundated much longer than typical vernal pools (USFWS 2012).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
Branchinecta lynchi	vernal pool fairy shrimp	FT	None	---	Endemic to the grasslands of the Central Valley and the Central and South Coast Range mountains of California, and the Agate Desert of southern Oregon. Found only in cool water vernal pools, requiring water temperatures of 50˚F or lower to hatch. Typically associated with smaller and shallower vernal pools (about 6 inches deep) that have relatively short periods of inundation (USFWS 2007a).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
Desmocerus californicus dimorphus	valley elderberry longhorn beetle	FT	None	---	Dependent on host plant, elderberry (*Sambucus* spp.), which most commonly grows in riparian woodlands, but also in some upland habitats such as oak savannas and annual grasslands. Current presumed range in Central Valley extends from Shasta County south to Fresno	Y	Known to occur in valley foothill riparian habitats in the study area, especially along Butte Creek and Little Chico Creek where elderberry shrubs are known to be present.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					County, including the valley floor and lower foothills up to about 500 feet in elevation (USFWS 2017).		
Lepidurus packardi	vernal pool tadpole shrimp	FE	None	---	Found only in ephemeral freshwater habitats, including alkaline pools, clay flats, vernal lakes, vernal pools, vernal swales, and other seasonal wetlands. Patchily distributed across the Central Valley from Shasta County south to Tulare County with isolated occurrences in the East Bay Area (USFWS 2007b).	Y	Potential to occur in vernal pools within annual grassland habitats in the study area.
				Fish			
Acipenser medirostris	green sturgeon (southern DPS)	FT	SSC	---	Spawning occurs primarily in the Sacramento River, but those that spawn in the Feather and Yuba Rivers are also part of the southern DPS. Oceanic waters, bays, and estuaries during non-spawning season. Enters San Francisco Bay late winter through early spring, and spawning occurs from April through early July. Spawn in cool sections of river mainstems in deep pools containing small to medium-sized gravel, cobble, or boulder substrate (NMFS 2015).	N	Study area is outside the known range of the species, which occurs in the Sacramento River but not its tributary creeks.
Cottus gulosus	riffle sculpin	None	SSC	---	Permanent, cool, headwater streams where riffles and rocky substrates predominate. Such streams are clear and shaded, with moderate gradients. Found in many increasingly isolated watersheds in the Central Valley drainage and the central coast. They are mostly present in mid-elevation reaches, although they are present below dams with coldwater releases (Moyle 2002).	Y	Potential to occur in streams in the study area, including Butte Creek, Comanche Creek, and Little Chico Creek.
Hypomesus	delta smelt	FT	SE	---	Endemic to open waters of San Francisco	N	Study area is outside the

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
transpacificus					Bay and Sacramento-San Joaquin River Delta. Distribution includes San Pablo Bay up through Suisun Bay, upstream through the delta to the Sacramento River below Isleton, and the San Joaquin River below Mossdale. Spawning has not been observed in the wild but is thought to take place in sloughs and shallow edge-water channels in the upper delta and in Montezuma Slough near Suisun Bay. (USFWS 2010a).		known range of the species.
Mylopharodon conocephalus	hardhead	None	SSC	---	Small to large streams in low to mid-elevation environments. May also inhabit lakes or reservoirs. Preferred stream temperature might easily exceed 68ºF, though these fish do not favor low dissolved oxygen levels. Usually found in clear deep streams with a slow but present flow. Though spawning may occur in pools, runs, or riffles, the bedding area will typically be characterized by gravel and rocky substrate. Occurs from Sacramento-San Joaquin and Russian River drainages from the Pit River, Modoc County in the north, to the Kern River, Kern County in the south (CDFW 2015).	Y	Potential to occur in streams in the study area, especially Butte Creek.
Oncorhynchus mykiss irideus (pop. 11)	steelhead (Central Valley DPS)	FT	None	---	Includes naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from the Sacramento and San Joaquin Rivers and their tributaries; excludes such fish originating from San Francisco and San Pablo Bays and their tributaries. This DPS does include steelhead from two artificial propagation programs: Coleman National Fish Hatchery Program and Feather River	Y	Known to occur in perennial stream features in the study area, especially Butte Creek.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					Fish Hatchery Program. Spawning habitat includes gravel-bottomed, fast-flowing, well-oxygenated rivers and streams. Non-spawning habitat includes estuarine and marine waters (NMFS 2016a).		
Oncorhynchus tshawytscha (pop. 7)	chinook salmon (Sacramento River winter-run ESU)	FE	SE	---	Currently found in the Sacramento River below Keswick Dam. Spawns in the Sacramento River but not its tributaries. Requires clean, cold water over gravel beds with water temperatures between 42 and 57°F for spawning (NMFS 2016b).	N	Study area is outside the known range of the species, which occurs in the Sacramento River but not its tributaries.
Oncorhynchus tshawytscha (pop. 11)	chinook salmon (Central Valley spring-run ESU)	FT	ST	---	Currently found in the Sacramento-San Joaquin River Delta, the Sacramento River and its tributaries, including the American, Yuba and Feather Rivers, and Mill, Deer, and Butte Creeks. The numbers of adults are dependent on pool depth and volume, amount of cover, and proximity to gravel. Water temperatures greater than 80°F are lethal to adults (NMFS 2016c).	Y	Confirmed present in Butte Creek during field studies.
Oncorhynchus tshawytscha (pop. 13)	chinook salmon (Central Valley fall / late fall-run ESU)	None	SSC	---	Currently found primarily in the Sacramento River, where most spawning and rearing of juveniles takes place in the reach between Red Bluff Diversion Dam and Redding's Keswick Dam. The specific habitat requirements of late fall-run chinook salmon have not been determined but they are presumably similar to other Central Valley chinook salmon runs. It is believed that optimal conditions fall within the range of physical and chemical characteristics of the unimpaired Sacramento River above Shasta Dam (CDFW 2015).	N	Study area is outside the known range of the species, which occurs in the Sacramento River but not its tributaries.
Amphibians							

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
Rana boylii	foothill yellow-legged frog	None	ST	---	Shallow flowing streams and rivers with at least cobble sized substrate. Breeding generally occurs at the margins of wide shallow channels with reduced flow variation near tributary confluences. Specifically, egg masses are placed in low flow locations on or under rocks with preferred substrates being boulders, cobbles, or gravel (CDFW 2019b).	Y	Known to occur in perennial stream and valley foothill riparian habitats in the study area, especially Butte Creek and Honey Run.
Rana cascadae	Cascades frog	None	SCE, SSC	---	Found in a wide range of aquatic habitats and wet meadows that do not freeze. Not often seen on land. Breeding habitat generally consists of montane lentic areas with a preference for small shallow spring fed ponds (Thomson et al. 2016).	N	The proposed project area is outside the known range of the species (CDFW 2021b).
Rana draytonii	California red-legged frog	FT	SSC	---	Ponds and streams in humid forests, woodlands, grasslands, coastal scrub, and streamsides with plant cover in lowlands or foothills. Breeding habitat includes permanent or ephemeral water sources: lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps. Ephemeral wetland habitats require animal burrows or other moist refuges for estivation when the wetlands are dry. Essential breeding habitat must hold water for a minimum of 20 weeks. Occurs from sea level to 5,000 feet in elevation (USFWS 2010b).	Y	Potential to occur in perennial channel, valley foothill riparian, and annual grasslands with connectivity to those habitats in the study area.
Rana sierrae	Sierra Nevada yellow-legged frog	FE	ST	---	Lakes, ponds, marshes, meadows, and streams at high elevations ranging from about 4,500 to 12,000 feet but can occur as low as about 3,500 feet in the northern portions of their range. Highly aquatic. Adults can be found sitting on rocks along shorelines with little or no vegetation.	N	Study area is below the known elevational range of the species.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					Rarely found more than 3.3 feet from water (USFWS 2020c).		
Spea hammondii	western spadefoot	None	SSC	---	Grasslands, oak woodlands, coastal sage scrub, and chaparral in washes, floodplains, alluvial fans, playas, and alkali flats. Natural and artificial water bodies are used for breeding (Thomson et al. 2016).	Y	Potential to occur in vernal pools and small freshwater emergent wetland features within annual grassland, blue oak woodland, valley oak woodland, and mixed chaparral habitats in the study area.
Reptiles							
Actinemys marmorata	western pond turtle	None	SSC	---	Various water bodies including permanent and ephemeral systems either natural or artificial. Upland habitat that is at least moderately undisturbed is required for nesting and overwintering, in soils that are loose enough for excavation (Thomson et al. 2016).	Y	Known to occur in perennial streams, and valley foothill riparian habitats in the study area. Confirmed present in Butte Creek during field studies.
Phrynosoma blainvillii	coast horned lizard	None	SSC	---	Sage scrub, dunes, alluvial scrub, annual grassland, chaparral, oak, riparian, and Joshua tree woodland, coniferous forest, and saltbush scrub. Needs loose, fine soils for burrowing, open areas for basking, and dense foliage for cover. Negatively associated with Argentine ants (*Linepithema humi*) (Thomson et al. 2016).	Y	Potential to occur in annual grassland, mixed chaparral, blue oak woodland, blue oak-foothill pine, and valley oak woodland in the study area.
Thamnophis gigas	giant gartersnake	FT	ST	---	Marshes, sloughs, ponds, small lakes, low gradient streams, irrigation and drainage canals, rice fields and their associated uplands from sea level to 400 feet in elevation. Upland habitat should have burrows or soil crevices suitable for snakes to reside during their dormancy period from November through mid-March (USFWS 2020a).	Y	Potential to occur in perennial stream and valley foothill riparian habitats from Butte Creek to the western terminus of the study area.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
Birds							
Accipiter gentilis	northern goshawk	None	SSC	---	Nests in mature and old-growth coniferous forests at high elevations in the Sierra Nevada, Cascade, North Coast, and Transverse Ranges. Prefers stands with Pacific Ponderosa pine (*Pinus ponderosa* var. *pacifica*), Jeffrey pine (*Pinus jeffreyi*), Lodgepole pine (*Pinus contorta*), Douglas-fir (*Pseudotsuga menziesii*), and rarely pinyon-juniper (*Pinus monophylla* and *Juniperus* spp.) or quaking aspen (*Populus tremuloides*). Prefers stands with larger trees, denser canopies, and relatively open understories (Shuford and Gardali 2008).	Y	Potential to occur in montane hardwood-conifer and ponderosa pine habitats at the highest elevation portions of the study area. However, this species is much more likely to occur during migration or winter in the study area, and is not likely to nest there due to the lack of old-growth, dense canopy forest.
Agelaius tricolor	tricolored blackbird	None	ST, SSC	---	Preferred nesting habitat includes cattails (*Typha* spp.), bulrushes (*Schoenoplectus* spp.), Himalayan blackberry (*Rubus armeniacus*), and agricultural silage. Dense vegetation is preferred but heavily lodged cattails not burned in recent years may preclude settlement. Need access to open water (CDFW 2021b).	Y	Potential to occur in annual grassland, cropland, irrigated row and field crop, pasture, and valley foothill riparian habitats in the study area, though more likely to occur foraging than nesting.
Aquila chrysaetos	golden eagle	BGEPA	SFP	---	Prefers rolling foothills and mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, cliffs, and rock outcrops. (CDFW 2021b).	Y	Potential to occur in annual grassland, blue oak-foothill pine, and mixed chaparral habitats in the study area.
Antigone canadensis tabida	greater sandhill crane	None	ST, SFP	---	Breeds in and near wet meadow, shallow lacustrine, and fresh emergent wetland habitats. Winters in annual and perennial grassland habitats, moist croplands with rice or corn stubble, and open emergent wetlands. Prefers treeless plains. Nests in remote portions of extensive wetlands or	Y	Potential to occur in annual grassland, cropland, irrigated row and field crop, and pasture habitat in the study area. Does not nest in the study area region but does stop through the area on

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					sometimes shortgrass prairies. In California, breeds only in Siskiyou, Modoc, and Lassen Counties, and in Sierra Valley in Plumas and Sierra Counties. Winters primarily in the Sacramento and San Joaquin Valleys from Tehama County south to Kings County (CDFW 2021b).		migration and over winter. Migrant flocks were observed over the study area during field studies in Spring 2021.
Asio otus	long-eared owl	None	SSC	---	Widespread but uncommon and local across California year-round, except in the Central Valley where it is a rarely encountered migrant and winter resident. Nests and roosts in dense stands of live oak (*Quercus* spp.) in riparian thickets with dense canopies near meadow edges. Also nests in dense stands of conifers at higher elevations (CDFW 2021b).	Y	Potential to occur in montane hardwood-conifer, ponderosa pine, blue oak-foothill pine, and valley-foothill riparian habitats in the study area.
Athene cunicularia	burrowing owl	None	SSC	---	Resident in much of the state in open, dry grasslands and various desert habitats. Requires open areas with mammal burrows; especially those of California ground squirrel (*Otospermophilus beecheyi*). Inhabits rolling hills, grasslands, fallow fields, sparsely vegetated desert scrub, vacant lots and other open human disturbed lands such as airports and golf courses (CDFW 2021b).	Y	Potential to occur in annual grassland, cropland, irrigated row and field crop, pasture, and disturbed/ruderal habitats in the study area.
Buteo swainsoni	Swainson's hawk	None	ST	---	Nests in oak savanna and cottonwood riparian areas adjacent to foraging habitat of grasslands, agricultural fields, and pastures where they often follow farm equipment to gather killed and maimed rodents. Increasingly also nests in sparse stands of gum trees (*Eucalyptus* spp.) and Australian pines (*Casuarina equisetifolia*) and often forage along roadsides and	Y	Confirmed present in the study area during field studies from the City of Chico west to the Chico WPCP.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					grassy highway medians (CDFW 2021b).		
Circus hudsonius	northern harrier	None	SSC	---	Nests on the ground in patches of dense, tall vegetation in undisturbed areas. Breed and forage in a variety of open habitats such as marshes, wet meadows, weedy borders of lakes, rivers and streams, grasslands, pastures, croplands, sagebrush flats, and desert sinks (Shuford and Gardali 2008).	Y	Confirmed present in the study area during field studies, though more likely to forage than nest.
Coccyzus americanus occidentalis	yellow-billed cuckoo (western DPS)	FT	SE	---	Requires riparian woodland with dense cover; primarily old-growth cottonwood (*Populus* spp.) forests with willow (*Salix* spp.) understory but will also nest in overgrown orchards adjacent to streams and dense thickets alongside marshes. Persists in small numbers along the Sacramento River between Red Bluff and Colusa, the Feather River between Yuba City and the Bear River, Owens Valley, the Kern River Valley, the Colorado River Valley, the Santa Ana River near Prado Basin, and the San Luis Rey River in northern San Diego County (USFWS 2020b).	N	In Butte County, not known to nest away from the Sacramento River, which is outside the study area (CDFW 2021b).
Elanus leucurus	white-tailed kite	None	SFP	---	Fairly common resident of the Central Valley, coast, and Coast Range Mountains. Nests in oak savanna, oak and willow riparian, and other open areas with scattered trees near foraging habitat. Forages in open grasslands, meadows, farmlands, and emergent wetlands. Often seen hover foraging over roadsides or grassy highway medians (CDFW 2021b).	Y	Potential to occur in annual grassland, blue oak woodland, valley oak woodland, valley foothill riparian, irrigated row and field crop, pasture, and disturbed/ruderal habitats in the study area.
Falco peregrinus anatum	American peregrine falcon	None	SFP	---	Breeds near wetlands, lakes, rivers, or other waters on cliffs, banks, dunes or	Y	Potential to occur in blue oak-foothill pine, ponderosa pine,

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					mounds, mostly in woodland, forest, and coastal habitats. Nest is a scrape on a depression or ledge in an open site. May use man-made structures (such as bridges, skyscrapers, or electrical towers), large snags, or trees for nesting (CDFW 2021b).		and montane hardwood-conifer habitats as well as developed portions of the study area.
Gymnogyps californianus	California condor	FE	SE, SFP	---	From the southern Sierra Nevada Range, across the Tehachapi Range, and through the Transverse Ranges from Los Angeles County to Santa Barbara County, and north up the Coast Range Mountains to Big Sur and Pinnacles National Park. Nests in cavities located on steep rock formations or in the burned-out hollows of old-growth coast redwoods (*Sequoia semervirens*) or giant sequoias (*Sequoiadendron giganteum*). Less commonly uses cliff ledges or large old nests of other bird species. Forages in open terrain of foothill grassland and oak savanna habitats, and at coastal sites in central California (USFWS 2013).	N	The study area is outside the known range of the species (CDFW 2021b).
Haliaeetus leucocephalus	bald eagle	BGEPA	SE	---	Permanent resident in the highest Coast Range mountains, across the Cascade Range, and down the Sierra Nevada to the eastern Transverse Ranges of San Bernardino and Riverside Counties. Uncommon migrant and winter visitor to lowland rivers, lakes, and reservoirs. Nests in large, old-growth, or dominant live trees with open branchwork, especially ponderosa pine (*Pinus ponderosa*). Requires large bodies of water or rivers with abundant fish and adjacent snags	Y	Confirmed present in the study area during field studies.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					(CDFW 2021b).		
Icteria virens	yellow-breasted chat	None	SSC	---	Nests in early-successional riparian habitats with a well-developed shrub layer and an open canopy. Restricted to narrow borders of streams, creeks, sloughs, and rivers. Often nest in dense thickets of blackberry (*Rubus* spp.) and willow (*Salix* spp.) (Shuford and Gardali 2008).	Y	Potential to occur in valley foothill riparian habitats in the study area.
Lanius ludovicianus	loggerhead shrike	None	SSC	---	Shrublands and open woodlands with a fair amount of grass cover and areas of bare ground. Requires tall shrubs or trees, fences, or power lines for hunting perches and territorial advertisement. Also requires open areas of short grasses, forbs, or bare ground for hunting, large shrubs or trees for nest placement, and thorny vegetation or barbed wire fences for impaling prey (Shuford and Gardali 2008).	Y	Potential to occur in annual grassland, mixed chaparral, blue oak woodland, valley oak woodland, valley foothill riparian, irrigated row and field crop, pasture, and disturbed/ruderal habitats in the study area.
Laterallus jamaicensis coturniculus	California black rail	None	ST, SFP	---	Saline, brackish, and fresh emergent wetlands. Known to nest at scattered locations in the San Francisco Bay Area and Delta region, Point Reyes National Seashore, San Luis Obispo and Orange Counties, as well as the Imperial and Lower Colorado River Valleys. Spottily distributed in the Sacramento Valley (CDFW 2021b).	Y	Potential to occur in small freshwater emergent wetland and vernal pools within annual grassland habitats in the study area.
Progne subis	purple martin	None	SSC	---	Present in California from mid-March through late September. Requires concentrations of nesting cavities, relatively open airspace above accessible nest sites, and relatively abundant aerial insect prey. In the coastal mountains, Cascade Range, and Sierra Nevada foothills, inhabits open forests, woodlands,	Y	Potential to occur in montane hardwood-conifer and valley-foothill riparian habitats in the study area. Could occur as a migrant in the lower elevation portions of the study area, but only likely to nest at higher elevations in and near

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					and riparian areas. Extirpated as a breeder from most of the Central Valley except the Sacramento area where it has taken to nesting in hollow-box bridges (CDFW 2021b).		Paradise.
Riparia riparia	bank swallow	None	ST	---	A colonial nester in riparian and lacustrine bluffs or cliffs with fine-textured or sandy soils into which the nest cavities are dug. Also nests in earthen banks as well as sand and gravel pits. Currently most numerous in the Sacramento Valley along the Sacramento, Feather, and American Rivers, and Cache Creek in western Yolo County. (CDFW 2021b).	N	Could occur in the study area as a passage migrant, but unlikely to colonize anywhere in Butte County away from the Sacramento or Feather Rivers, which are outside the study area (CDFW 2021b).
Setophaga petechia	yellow warbler	None	SSC	---	Usually found in riparian deciduous habitats in summer: cottonwoods (*Populus* ssp.), willows (*Salix* ssp.), alders (*Alnus* ssp.), and other small trees and shrubs typical of low, open-canopy riparian woodland. Also breeds in montane shrubbery in open coniferous forests (CDFW 2021b).	Y	Potential to occur in montane hardwood-conifer and valley foothill riparian habitats in the study area.
Strix nebulosa	great gray owl	None	SE	---	Breeds in red fir (*Abies magnifica*), lodgepole pine (*Pinus contorta* ssp. *murrayana*), and mixed coniferous habitats, always near wet meadows. Nests in large, broken-topped snags usually 25 to 72 feet above the ground. A rarely seen resident at 4,500 to 7,500 feet in elevation in the Sierra Nevada Range, from the vicinity of Quincy south to the Yosemite region. (CDFW 2021b).	N	The study area is outside the known elevation range of the species.
Strix occidentalis occidentalis	California spotted owl	None	SSC	---	Older forests in areas of high canopy cover, with a multi-layered canopy, old decadent trees, a high number of large	Y	Potential to occur in montane hardwood-conifer and ponderosa pine habitats at the

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					trees, and coarse downed woody debris. In California, ranges throughout the west slopes of the Sierra Nevada Mountains, and down the Coast Range Mountains from Carmel south through the Transverse Ranges nearly to Baja California (Shuford and Gardali 2008).		highest elevation portions of the study area. However, this species is much more likely to occur during migration or winter in the study area, and is not likely to nest there due to the lack of old-growth, dense canopy forest.
Vireo bellii pusillus	least Bell's vireo	FE	SE	---	Once occupied much of the Central Valley, but has disappeared from most its former range, and is now restricted to southern California from southern Inyo and Monterey Counties south through the South Coast and Inland Empire regions. Obligate riparian breeder, favoring cottonwood (*Populus* spp.), willow (*Salix* spp.), and oak (*Quercus* spp.) woodlands, and mule fat (*Baccharis salicifolia*) scrub along watercourses (USFWS 2006).	N	The study area is outside the known current range of the species. The species has likely been extirpated from the Sacramento Valley since at least the mid-1980's.
Mammals							
Antrozous pallidus	pallid bat	None	SSC	---	Generally found in a wide variety of habitats but with some preference for drier areas. Day roosts are in caves, crevices, mines, and occasionally in hollow trees and buildings (CDFW 2021b).	Y	Potential to occur in all types of habitats including developed portions of the study area.
Aplodontia rufa californica	Sierra Nevada mountain beaver	None	SSC	---	Ranges across the Sierra Nevada Mountains from Shasta and Lassen Counties south to Tulare County. Generally found in dense riparian forests and open shrubscapes around most forest types. Specifically found in forests with open to moderate canopy cover and a dense understory near water. Requires deep friable soils and a cool moist microclimate (CDFW 2021b).	N	The study area is outside the known range of the species.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
Canis lupis	gray wolf	None	SE	---	Was considered extirpated from California by the early 20th Century, but as of 2012 has begun re-establishing an intermittent presence in the northeastern part of the state, from Siskiyou and Shasta Counties south through Lassen and Plumas Counties (CDFW 2020). Habitat preferences appear to be more prey dependent than cover dependent. Territories have a variety of topographic features. Forests, open meadows, rocky ridges, and lakes or rivers all comprise a pack's territory. In the West, have been known to follow the seasonal elevational movements of ungulate herds (Snyder 1991).	N	The study area is outside the known range of the species.
Corynorhinus townsendii	Townsend's big-eared bat	None	SSC	---	Ranges throughout California except for high elevation portions of the Sierra Nevada Mountains. Generally prefers mesic habitats but known to occur in all non-alpine habitats of California. Roosting occurs in caves, tunnels, mines, buildings, or other structures. This species may use different roosting sites during the day versus during the night (CDFW 2021b).	Y	Potential to occur in all types of habitats including developed portions of the study area.
Eumops perotis californicus	western mastiff bat	None	SSC	---	Ranges throughout southern California, the central coast, and the Sierra Nevada Mountains. Generally occurs in open, arid, or semi-arid habitats. Roosts in rock crevices and buildings (CDFW 2021b).	Y	Potential to occur in all types of habitats including developed portions of the study area.
Lasiurus blossevillii	western red bat	None	SSC	---	Ranges across the Central Valley, as well as the coast and Coast Range mountains from Mendocino County south, and east across the Los Angeles area into the Inland Empire region. Occurs in most	Y	Potential to occur in all types of habitats including developed portions of the study area.

Scientific Name	Common Name	Federal Status	State Status	State Rare Plant Rank	General Habitat Characteristics	Potential to Occur in Study Area	Rationale
					habitats except desert and alpine areas. Roosts in trees, sometimes shrubs, and typically at the margins of habitats (CDFW 2021b).		
Pekania pennanti	fisher (West Coast DPS)	None	SSC	---	Large areas of mature, dense forest stands with snags and greater than 50% canopy closure. Uncommon permanent resident of the Sierra Nevada, Cascades, and Klamath Mountains; also found in a few areas in the North Coast Ranges (USFWS 2014).	N	Not likely to occur in study area due to the lack of mature, dense canopy forest.
Taxidea taxus	American badger	None	SSC	---	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils in which they excavate burrows and forage for their fossorial mammal prey (CDFW 2021b).	Y	Potential to occur in annual grassland, mixed chaparral, and blue oak-foothill pine habitats in the study area.

Status: Federal Endangered (FE); Federal Threatened (FT); State Endangered (SE); State Threatened (ST); State Candidate Endangered (SCE); State Fully Protected (SFP); State Rare (SR); State Species of Special Concern (SSC); Bald and Golden Eagle Protection Act (BGEPA); California Native Plant Society (CNPS) State Rare Plant Rankings: 1B = Rare, Threatened, or Endangered in California and Elsewhere, 2B = Rare, Threatened, or Endangered in California, but More Common Elsewhere, Threat Ranks – 0.1 = Seriously threatened in California, 0.2 = Fairly threatened in California, 0.3 = Not very threatened in California

Swainson’s Hawk Survey and Elderberry Shrub Mapping Report

Town of Paradise
Paradise Sewer Project
Swainson's Hawk Survey and Elderberry Shrub Mapping Report
September 30, 2021

Technical Memorandum

Date:	Thursday, September 30, 2021
Project:	Paradise Sewer Project
To:	Town of Paradise
From:	Dan Williams, Biologist, HDR
Subject:	Swainson's Hawk Survey and Elderberry Shrub Mapping Report

Introduction

This memorandum provides the results of protocol-level Swainson's hawk (*Buteo swainsoni*) surveys and elderberry (*Sambucus* sp.) shrub mapping (field studies) performed by HDR in support of the Paradise Sewer Project (proposed project) during the spring of 2021. The Biological Study Area (BSA) for these field studies is defined as the proposed project area/footprint and a 0.5-mile buffer as shown in **Attachment 1** along with the locations of protocol Swainson's hawk survey points. Closer views of the Swainson's hawk survey points, as well as the locations of a Swainson's hawk nest and elderberry shrubs that were found during these field studies, are shown in **Attachment 2**. All plant and wildlife species observed during these field studies are included as **Attachment 3**.

Project Background

The Town of Paradise in Butte County, California is proposing to construct a new sewer collection system within Paradise and an 18-mile export pipeline to convey wastewater from Paradise to the City of Chico Water Pollution Control Plant (WPCP). The Paradise Sewer Project would replace individualized septic systems within the parcel boundaries of Paradise which are managed by property owners.

The proposed project area/footprint includes the following components:

- **Collection System** – a wastewater collection system consisting of service connections to individual parcels with a designated sewer service area. The collection system includes construction of buried gravity and pressure lines, manholes, and pump stations, and is located in Paradise.
- **Export Pipeline** - an 18-mile pipeline to convey wastewater from Paradise to the Chico WPCP. The export pipeline includes construction of pipelines, three horizontal directional drilling (HDD) borings under waterways, two microtunnel borings (one under Highway 99 and one under a railroad crossing), a Transition Chamber (near the eastern city limits of Chico where the sewer line would change from gravity downslope to a force main to cross the flat topography of the valley), and a Flow Control and Metering Structure located at or very near the Chico WPCP.
- **Connection to Chico WPCP** - the connection of the export pipeline to the Chico WPCP via the Flow Control and Metering Structure.

Project Location and Environmental Setting

Paradise is located in central Butte County, in the western foothills of the Sierra Nevada Mountains, and is situated approximately 12 miles east of the City of Chico which sits on the Sacramento Valley floor. Elevations in the BSA range from approximately 2,320 feet above sea level at the highest point of the sewer service area to approximately 135 feet above sea level at the Chico WPCP.

The sewer service area is completely within the Town of Paradise, and is composed mostly of montane hardwood-conifer, ponderosa pine, and mixed chaparral habitats. The export pipeline would run from the southwest corner of Paradise, downslope under Skyway (the main arterial road connecting Paradise and Chico) through blue oak-foothill pine and valley oak savanna habitats, to just east of the city limits of Chico. At this point, the pipeline would leave the roadway for a little over a mile, crossing annual grassland habitat with vernal pools, then crossing under Butte Creek and its associated valley foothill riparian habitat via trenchless HDD boring. After crossing under Highway 99, the pipeline would rejoin roadway for the remainder of the route, to be installed under county roads through mostly agricultural land, the majority of which is almond or walnut orchard. West of Highway 99 the pipeline would cross under two more creeks (Comanche Creek and Little Chico Creek) via trenchless HDD boring before reaching its connection to the Chico WPCP.

Methodology

Desktop Review

Prior to performing the field studies, the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) QuickView Tool in BIOS 5 (CDFW 2021), and the U.S. Fish and Wildlife Service (USFWS) Information Planning and Conservation (IPaC) System (USFWS 2021) were queried to determine which special-status wildlife species have the potential to occur in the BSA. A query of the CNDDB provided a list of processed and unprocessed occurrences for special-status species in the California USGS 7.5-minute quadrangles (quads) which the Proposed Project intersects (Paradise East, Paradise West, Cherokee, Hamlin Canyon, Chico, and Ord Ferry) and all the quads surrounding these six quads. A shapefile of the proposed project area/footprint was entered into the USFWS IPaC System, and the system was queried to produce an official list of federally protected species that have the potential to occur in the BSA as well as designated critical habitat. The CNDDB query results showed that there were occurrences of the state threatened Swainson's hawk and federal threatened valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) in the vicinity of the BSA. Valley elderberry longhorn beetle was also on the Official Species List returned by the IPaC system.

The CNDDB query showed that there are no Swainson's hawk occurrences from the BSA. However, there are several occurrences in central Butte County, most of them concentrated along the Sacramento River, with the exception of one nesting record from southeast of the Chico State University Farm. Within 5 miles of the BSA, there are no occurrences of Swainson's hawk east of Highway 99. There is one CNDDB occurrence of valley elderberry longhorn beetle from the BSA along Butte Creek, as well as other occurrences within 5 miles of the BSA along Big Chico Creek, and the Feather and Sacramento Rivers. No designated critical habitat for either species was found to exist in the BSA.

Swainson's Hawk Surveys

From February 23-25, 2021, HDR biologists Kelly Bartron and Dan Williams performed habitat assessment surveys of all portions of the BSA that were publicly accessible. Access away from the public roadways was not permitted for this field effort. Areas that were not accessible were scanned with binoculars and a high-powered spotting scope. In accordance with the Swainson's Hawk Technical Advisory Committee's *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (CDFW 2000), all trees within a 0.5-mile radius of the proposed project area/footprint were examined closely for large nest structures which had the potential to be Swainson's hawk nests.

Suitable foraging habitat for Swainson's hawk includes open grasslands, pastures, and agricultural fields planted in row crops (especially irrigated alfalfa or rice fields) with an ample small mammal prey base. It is important to note that orchards are not considered suitable foraging habitat for Swainson's hawk because the dense woody cover makes it difficult for them to stoop on prey. Suitable nesting habitat for Swainson's hawk includes valley foothill riparian woodland adjacent to suitable foraging habitat, or solitary trees surrounded by, or on the margins of, suitable foraging habitat. Fremont cottonwood (*Populus fremontii*), valley oak (*Quercus lobata*), walnut (*Juglans* sp.), and willow (*Salix* sp.) are the most frequently selected nest trees, though non-native trees in suitable habitat such as gum (*Eucalyptus* sp.) or Australian pine (*Casuarina equisetifolia*) are also often utilized (CDFW 2016).

Based on this information, as well as the distribution of mapped occurrences returned by the database queries, 10 survey points were identified from which to perform protocol Swainson's hawk surveys along the proposed project corridor. The locations of these survey points are shown in **Attachments 1 and 2**. Survey points were distributed between the Chico WPCP at the western end of the proposed project area/footprint, to as far east as Tuscan Ridge Golf Club at Skyway and Santa Rosa Road (at approximately 765 feet in elevation). From this point east, the topography steepens quite rapidly (reaching 1,000 feet in elevation just 1 mile east along Skyway) and the habitat transitions from predominately grassland, to blue oak-foothill pine, chaparral, and eventually montane hardwood-conifer dominated landscape. Based on the lack of suitable Swainson's hawk habitat in the BSA east of Tuscan Ridge Golf Club, including throughout the Town of Paradise sewer service area, and the lack of known occurrences of the species in the BSA east of Highway 99 (CDFW 2021), it was determined that protocol surveys would only be performed from Tuscan Ridge Golf Club west to the Chico WPCP. Survey points and the habitat within a 0.5-mile radius around them are described below in **Table 1**.

Table 1. Protocol Swainson's Hawk Survey Points

Survey Point	Location Description	Habitat Description
SWHA-01	Along Chico River Road approximately 0.3 mile west of the pipeline connection to the Chico WPCP	0.5-mile radius is bisected by an irrigation canal running along the west flank of Chico WPCP, then bending northwest toward Sacramento River. Confluence of Big Chico Creek and Sacramento River is approximately 1.5 miles to west. Some open agricultural fields within 0.5 mile, but majority of 0.5-mile radius is almond and walnut orchards.

Survey Point	Location Description	Habitat Description
SWHA-02	Along Chico Avenue between Crouch Avenue and Taffee Avenue	0.5-mile radius is bisected by Little Chico Creek and its associated riparian woodland corridor. Majority of surrounding land is almond and walnut orchards, but there are some open agricultural fields, including an approximately 8-acre area between the survey point and Little Chico Creek.
SWHA-03	Crouch Avenue at Little Chico Creek	0.5-mile radius is bisected by Little Chico Creek and its associated riparian woodland corridor. Majority of surrounding land is almond and walnut orchards, but there are some open agricultural fields, including an approximately 8-acre area near the corner of Crouch Avenue and Chico River Road.
SWHA-04	Crouch Avenue at Comanche Creek	0.5-mile radius is bisected by Comanche Creek and its associated riparian woodland corridor. There are also multiple irrigation canals and an artificial lake within 0.5 mile. Majority of surrounding land is almond and walnut orchards, but there are some open disturbed/ruderal areas.
SWHA-05	Intersection of Hegan Lane and Nicholas C. Shouten Lane	While a slight majority of the 0.5-mile radius around this point is almond and walnut orchard, the most notable feature in this area is the Chico State University Farm, featuring nearly 100 acres of open pasture dotted with a few dozen well-spaced mature fruit trees.
SWHA-06	Glen Oaks Memorial Park	Cemetery at the southern city limits of Chico with well-spaced mature valley oak and some non-native ornamental trees. There are some almond and walnut orchards within 0.5 mile, but majority of 0.5-mile radius is made up of developed and disturbed/ruderal areas.
SWHA-07	McFadden Lane	On the southeastern outskirts of Chico. Within 0.5-mile radius of this point is a mixture of developed areas, disturbed/ruderal areas, and almond and walnut orchards to the north and west, as well as valley oak woodland, annual grassland, and a baseball/softball complex to the south and east.
SWHA-08	Butte Creek Crossing	North end of the Virgin Valley Unit of Butte Creek Canyon Ecological Preserve where the export pipeline for the proposed project is to cross under Butte Creek via HDD boring. Within 0.5-mile radius of the point, there is extensive valley foothill riparian woodland habitat along Butte Creek, and annual grassland with vernal pools which are also used as grazing rangeland to the southeast.
SWHA-09	Skyway at The Bluffs / Spanish Gardens	0.5-mile radius is bisected by Skyway. To the north of Skyway are bluffs with a residential neighborhood, beyond which is the Canyon Unit of Butte Creek Canyon Ecological Reserve with extensive valley foothill riparian woodland. To the south of Skyway are annual grasslands with vernal pool complexes which are also used as grazing rangeland.

Survey Point	Location Description	Habitat Description
SWHA-10	Skyway at Tuscan Ridge Golf Club	0.5-mile radius is bisected by Skyway. To the north of Skyway are bluffs with annual grassland and valley oak transitioning to blue oak-foothill pine. Beyond the bluffs is a steep drop-off into Butte Creek Canyon through mixed chaparral habitat to extensive valley foothill riparian woodland at the canyon bottom. To the south of Skyway is Tuscan Ridge Golf Club with a mixture of valley oak and blue oak savanna interspersed with developed and ruderal/disturbed areas. Extensive annual grasslands with vernal pool complexes are interspersed with the oak savanna habitat beyond the golf community development.

In accordance with the CDFW 2000 methodology, HDR biologist Dan Williams performed protocol Swainson's hawk surveys between sunrise and 10 am on 3 dates between March 20 and April 5, 2021 (Protocol Survey Period II), and on 3 dates between April 5 and April 20, 2021 (Protocol Survey Period III). On successive rounds of surveys, the points were surveyed from east to west, and west to east in order to visit all points both earlier and later in the mornings. At each survey point, the biologist checked all known large nests with a high-powered spotting scope, scanned in all directions with binoculars for perched or flying raptors, recorded all raptors observed, and recorded all Swainson's hawks and their behaviors exhibited in or flying over the BSA. Results of these surveys are detailed below.

Elderberry Shrub Mapping and Assessment

In accordance with the *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* (USFWS 2017), all elderberry shrubs found within 165 feet of the proposed project area/footprint during the protocol Swainson's hawk surveys were mapped, and those that were close enough to the public roadway to allow close examination were thoroughly checked for exit holes; small oval-shaped holes in the stems of the shrubs which indicate the past or current presence of valley elderberry longhorn beetles. Since the overwhelming majority of known occurrences of valley elderberry longhorn beetle are from below 500 feet in elevation (USFWS 2017), and the highest elevation point for the protocol Swainson's hawk surveys was situated at 765 feet in elevation, elderberry shrub mapping in the BSA was also not conducted east of (higher than) this point.

Results

Swainson's Hawk Surveys

Results of the protocol-level Swainson's hawk surveys conducted between March 20 and April 5, 2021 are listed below in Table 2.

Table 2. Protocol Swainson's Hawk Survey Results

Survey Point	Swainson's Hawks Observed	Other Notable Observations
SWHA-01	None	The only raptor species observed from this point was a single American kestrel (*Falco sparverius*) on March 30.

Survey Point	Swainson's Hawks Observed	Other Notable Observations
SWHA-02	One Swainson's hawk observed on March 25: an immature bird that was observed flying high over Little Chico Creek from east to west and was then pursued and chased away by resident pairs of red-shouldered (*Buteo lineatus*) and red-tailed hawks (*Buteo jamaicensis*).	An active red-tailed hawk nest was observed during each round of surveys in a California sycamore (*Platanus racemosa*) along Little Chico Creek approximately 900 feet north by northwest of this point. A northern harrier (*Circus hudsonius*) was observed coursing low over the open agricultural field between the point and Little Chico Creek on April 5.
SWHA-03	None	No raptors observed from this point.
SWHA-04	None	A pair of red-tailed hawks was observed well to the south of this point perched along and soaring over Comanche Creek on April 5 and April 9. A red-shouldered hawk was observed soaring high over an orchard approximately 0.3 mile to the northwest on March 25. Multiple large nests in roadside trees in this vicinity were determined to be built by yellow-billed magpies (*Pica nuttalli*).
SWHA-05	A Swainson's hawk pair was observed building a nest in one of the large fruiting orchard trees in the Chico State University Farm on April 9. The nest tree was approximately 0.3 mile southeast of the proposed export pipeline route along Hegan Lane east of Hengst Drive.	On April 14, the Swainson's hawk pair was not observed in the area, and a great horned owl (*Bubo virginianus*) was present in the nest tree which would seem to indicate that the Swainson's hawk pair may have abandoned their nest attempt at this location.
SWHA-06	None	A pair of red-tailed hawks appeared to be residents in the cemetery trees as they were present during every round of surveys.
SWHA-07	None	A pair of red-tailed hawks was observed in a small grove of valley oaks approximately 500 feet southeast of the point on March 25.
SWHA-08	One adult Swainson's hawk was observed briefly soaring high above Butte Creek and continuing well to the north and out of sight on April 14.	A pair of bald eagles (*Haliaeetus leucocephalus*) was seen during multiple rounds of the surveys (March 25, March 30, April 9, and April 14) from this point and from SWHA-09. Sometimes they were observed soaring high overhead and other times they were observed perched in large trees overlooking Butte Creek or patrolling low over the creek, often with recently caught fish. Based on these observations it is possible this pair was nesting in a portion of the Butte Creek Canyon Ecological Reserve which could not be viewed from the public roadway. A ferruginous hawk (*Buteo regalis*) was observed from this point foraging over the annual grasslands to the southeast on March 30.

Survey Point	Swainson's Hawks Observed	Other Notable Observations
SWHA-09	None	A pair of bald eagles was observed from this point and from SWHA-08 during multiple rounds of the surveys. A juvenile red-tailed hawk was observed in a small grove of valley oaks immediately southwest of the point on March 25 and 30. A ferruginous hawk was observed soaring over the annual grasslands well to the south of the point on April 14.
SWHA-10	None	Many turkey vultures (*Cathartes aura*) were observed soaring over this point during every round of surveys. One prairie falcon (*Falco mexicanus*) was observed soaring well to the northeast over the high bluffs above Butte Creek Canyon on April 5.

Elderberry Shrub Mapping and Assessment

Elderberry shrubs were found at three locations in the BSA: along Butte Creek at the location of the proposed HDD crossing, and along Little Chico Creek at both the Crouch Avenue and Taffee Avenue proposed HDD crossings. Due to the lack of access away from the public roadways for these surveys, an accurate count of the total individual elderberry shrubs within 165 feet of the proposed project footprint was not possible, nor could the biologist examine many of the shrubs that could be identified from the public roadway close enough to determine if exit holes were present.

What could be determined from the public roadway was that at least one large elderberry shrub was present on the west bank of Butte Creek in the area of the proposed HDD crossing, while at least 12 elderberry shrubs were present on the north bank of Little Chico Creek near the proposed Crouch Avenue HDD crossing, and at least 15 elderberry shrubs were present on the north bank of Little Chico Creek near the proposed Taffee Avenue HDD crossing. No exit holes were observed in the few elderberry shrubs that were growing near enough to Taffee Avenue and Crouch Avenue to allow close examination, but several shrubs at each of these locations, and the one shrub identified across Butte Creek from SWHA-08 were too far from public access to allow proper examination for exit holes.

Summary and Recommendations

Swainson's Hawk

Multiple rounds of protocol Swainson's hawk surveys in the BSA during Spring 2021 identified one active Swainson's hawk nest, and two incidental sightings of individual Swainson's hawks in high flight which were likely migrating through the BSA. While the BSA east of Tuscan Ridge Golf Club, as well as the extensive almond and walnut orchards in the BSA between Highway 99 and the Chico WPCP are not considered suitable habitat for Swainson's hawk, the valley foothill riparian woodland along Butte Creek, Comanche Creek and Little Chico Creek, and the well-spaced mature fruit trees in the Chico State University Farm do provide suitable nesting habitat for Swainson's hawk.

Given that one pair of Swainson's hawks was confirmed nesting in the BSA, it is recommended that additional Phase II and Phase III protocol-level surveys for Swainson's hawks be conducted in the appropriate survey windows (March 20 through April 20) during the spring prior to the start of

construction activities related to the Proposed Project. A 2081 Incidental Take Permit from CDFW may be warranted for the Proposed Project to minimize the risk of unauthorized take of the species.

Valley Elderberry Longhorn Beetle

Elderberry shrubs were found to be present in the BSA along Butte Creek and Little Chico Creek, and while exit holes were not observed in shrubs that were growing close enough to the public roadway to allow thorough examination, there were several shrubs that could not be examined closely enough to confirm whether or not exit holes were present.

Given that elderberry shrubs were found to be present within riparian habitat in the BSA, valley elderberry longhorn beetle has the potential to occur in the BSA. Therefore, it is recommended that in the year prior to the start of construction, a more thorough mapping and examination of all elderberry shrubs within 165 feet of the proposed project footprint be conducted, including areas away from the public roadway which were not accessible during the Spring 2021 survey effort. If it is determined that all construction activities associated with the proposed project can avoid all mapped elderberry shrubs (i.e., by ensuring that entry and exit pits for HDD operation and all staging areas are sited at least 165 feet from all mapped shrubs), then informal consultation in the form of a Letter of Concurrence seeking a No Effect determination from USFWS shall be carried out. If it is determined that any mapped elderberry shrubs could be impacted by construction activities associated with the proposed project, then Section 7 consultation through USFWS should be initiated.

List of Species Observed During Surveys

Paradise Sewer Project – Species Observed during Spring 2021 Field Studies

PLANTS

INVASIVE = classified as an invasive species by the California Invasive Plant Council (Cal-IPC)

Abies concolor (white fir)
Acacia dealbata (silver wattle) INVASIVE: moderate
Acer macrophyllum (bigleaf maple)
Acer negundo (boxelder)
Achillea millefolium (common yarrow)
Acmispon americanus (American bird's foot trefoil)
Aesculus californica (California buckeye)
Agrostis exarata (spike bentgrass)
Alisma triviale (northern water plantain)
Alnus rhombifolia (white alder)
Ambrosia psilostachya (ragweed)
Ammannia coccinea (purple ammannia)
Amsinckia sp. (fiddleneck sp.)
Arceuthobium campylopodum (pine mistletoe)
Arctostaphylos manzanita (common manzanita)
Arctostaphylos viscida (whiteleaf manzanita)
Aristolochia californica (California pipevine)
Artemisia douglasiana (California mugwort)
Avena sp. (oat sp.) non-native
Blennosperma nanum (common stickyseed)
Brassica nigra (black mustard) INVASIVE: moderate
Briza maxima (big rattlesnake grass) INVASIVE: limited
Brodiaea elegans (harvest brodiaea)
Bromus diandrus (ripgut brome) INVASIVE: moderate
Bromus hordaceus (soft brome)
Calocedrus deccurens (incense cedar)
Cardamine hirsuta (hairy bittercress) non-native
Carduus pycnocephalus (Italian thistle) INVASIVE: moderate
Carex sp. (sedge sp.)
Ceanothus integerrimus (deerbrush)
Cedrus deodara (deodar cedar) non-native
Cerastium fontanum (common chickweed) non-native
Cercis occidentalis (western redbud)
Cercocarpus betuloides (birch leaf mountain mahogany)
Claytonia sp. (miner's lettuce sp.)
Convulvulus arvensis (field bindweed) non-native
Cortaderia selloana (Uruguayan pampas grass) INVASIVE: HIGH
Cotoneaster pannosus (silverleaf cotoneaster) INVASIVE: moderate
Crassula connata (sand pygmy weed)
Croton setiger (turkey-mullein)
Cynodon dactylon (Bermuda grass) INVASIVE: moderate

Cynoglossum grande (western houndstongue)
Cynosurus echinatus (dogtail grass) INVASIVE: moderate
Cyperus eragrostis (tall flatsedge)
Cytisus scoparius (Scotch broom) INVASIVE: HIGH
Erodium botrys (red-stemmed filaree) non-native
Erodium cicutarium (stork bill filaree) INVASIVE: limited
Erythranthe guttata (seep monkeyflower)
Eschscholzia californica (California poppy)
Eschscholzia lobbii (frying pan poppy)
Eucalyptus camaldulensis (red gum) INVASIVE: limited
Euphorbia maculata (spotted spurge) non-native
Festuca perennis (Italian rye grass) INVASIVE: moderate
Ficus carica (common fig) INVASIVE: moderate
Fraxinus latifolia (Oregon ash)
Genista monspessulana (French broom) INVASIVE: HIGH
Geranium dissectum (cutleaf geranium) INVASIVE: limited
Gilia tricolor (bird's eyes)
Heteromeles arbutifolia (toyon)
Juglans hindsii (northern California black walnut)
Juglans regia (English walnut) non-native
Juniperus californica (California juniper)
Lactuca seriola (prickly lettuce) non-native
Lamium amplexicaule (giraffe head) non-native
Lasthenia sp. (goldfields sp.)
Lepidium nitidum (shining peppergrass)
Lupinus sp. (lupine sp.)
Malva sp. (mallow sp.) non-native
Matricaria discoidea (pineapple weed)
Medicago polymorpha (California burclover) INVASIVE: limited
Medicago sativa (alfalfa) non-native
Mentha canadensis (wild mint)
Minuartia californica (California sandwort)
Narcissus pseudonarcissus (daffodil) non-native
Nerium oleander (oleander) non-native
Phoenix canariensis (Canary Island date palm) INVASIVE: limited
Phoradendron leucarpum (American mistletoe)
Phytolacca americana (pokeberry) INVASIVE: limited
Pinus ponderosa (ponderosa pine)
Pinus sabiniana (California foothill pine)
Plantago lanceolata (English plantain) INVASIVE: limited
Platanus racemosa (California sycamore)
Polypogon monspeliensis (rabbitsfoot grass) INVASIVE: limited
Populus fremontii (Fremont cottonwood)
Prunus dulcis (almond) non-native
Pseudognaphalium beneolens (cudweed)
Pseudotsuga menziesii (Douglas fir)
Quercus berberidifolia (inland scrub oak)
Quercus douglasii (blue oak)

Quercus kelloggii (California black oak)
Quercus lobata (valley oak)
Quercus wislizeni (interior live oak)
Rannunculus sp. (buttercup sp.)
Raphanus sativus (cultivated radish) INVASIVE: limited
Robinia pseudoacacia (black locust) INVASIVE: limited
Rubus armeniacus (Himalayan blackberry) INVASIVE: HIGH
Rumex crispus (curly dock) INVASIVE: limited
Salix sp. (willow sp.)
Sambucus nigra (black elderberry)
Sedella pumila (Sierra mock stonecrop)
Senecio vulgaris (common groundsel) non-native
Torilis arvensis (hedge parsley)
Toxicodendron diversilobum (poison oak)
Trifolium sp. (clover sp.)
Triphysaria eriantha (butter 'n' eggs)
Typha latifolia (broadleaf cattail)
Umbellularia californica (California bay laurel)
Verbascum thapsus (woolly mullein) INVASIVE: limited
Vitis californica (California wild grape)
Washingtonia robusta (Mexican fan palm) INVASIVE: moderate

INVERTEBRATES

Pipevine swallowtail (*Battus philenor*)
Western tiger swallowtail (*Papilio rutulus*)
West Coast lady (*Vanessa annabella*)
Mourning cloak (*Nymphalis antiopa*)

AMPHIBIANS

Pacific chorus frog (*Pseudacris sierrae*)
American bullfrog (*Lithobates catesbeianus*) non-native

REPTILES

Western pond turtle (*Emys marmorata*) California Species of Special Concern
"Northern Pacific" western rattlesnake (*Crotalus oreganus oreganus*)

FISH

Chinook salmon - Central Valley spring-run ESU (*Oncorhynchus tshawytcha* pop. 11) Federal Threatened / State Threatened

BIRDS

Greater white-fronted goose (*Anser albifrons*) flyover
Snow goose (*Chen caerulescens*) flyover

Ross's goose (*Chen rossii*) flyover
Canada goose (*Branta canadensis*)
Wood duck (*Aix sponsa*)
Mallard (*Anas platyrhynchos*)
American wigeon (*Mareca americana*)
Common merganser (*Mergus merganser*)
California quail (*Calipepla californica*)
Wild turkey (*Meleagris gallopavo*)
Double-crested cormorant (*Phalacrocorax auritus*) CDFW Watch List (for colonies only)
White-faced ibis (*Plegadis chihi*) CDFW Watch List (for colonies only) - flyover
Turkey vulture (*Cathertes aura*)
Osprey (*Pandion haliaetus*) CDFW Watch List
Northern harrier (*Circus hudsonius*) California Species of Special Concern
Cooper's hawk (*Accipiter cooperii*) CDFW Watch List
Sharp-shinned hawk (*Accipiter striatus*) CDFW Watch List (nesting only) project not in nesting range
Red-shouldered hawk (*Buteo lineatus*)
Red-tailed hawk (*Buteo jamaicensis*)
Swainson's hawk (*Buteo swainsoni*) State Threatened
Ferruginous hawk (*Buteo regalis*) USFWS Bird of Conservation Concern, CDFW Watch List
Bald eagle (*Haliaeetus leucocephalus*) USFWS Bird of Conservation Concern, State Endangered (pair was likely nesting at Butte Creek Canyon Ecological Preserve)
Greater sandhill crane (*Antigone canadensis tabida*) CA Threatened, CA Fully Protected (flyover)
Killdeer (*Charadrius vociferus*)
Spotted sandpiper (*Actitis macularius*)
Rock pigeon (*Columba livia*) non-native
Eurasian collared-dove (*Streptopelia decaocto*) non-native
Mourning dove (*Zenaida macroura*)
Great horned owl (*Bubo virginianus*)
Belted kingfisher (*Megaceryle alcyon*)
Anna's hummingbird (*Calypte anna*)
Acorn woodpecker (*Melanerpes formicivorus*)
Nuttall's woodpecker (*Dryobates nuttallii*)
Downy woodpecker (*Dryobates pubescens*)
Hairy woodpecker (*Dryobates villosus*)
Northern flicker (*Colaptes auratus*)
American kestrel (*Falco sparverius*)
Prairie falcon (*Falco mexicanus*) USFWS Bird of Conservation Concern, CDFW Watch List
Black phoebe (*Sayornis nigricans*)
Ash-throated flycatcher (*Myiarchus cinerascens*)
Western kingbird (*Tyrannus verticalis*)
California scrub-jay (*Aphelocoma californica*)
Yellow-billed magpie (*Pica nuttalli*) USFWS Bird of Conservation Concern
American crow (*Corvus brachyrhychos*)
Common raven (*Corvus corax*)
Tree swallow (*Tachycineta bicolor*)
Violet-green swallow (*Tachycineta thalassina*)
Northern rough-winged swallow (*Stelgidopteryx serripennis*)
Cliff swallow (*Petrochelidon pyrrhonata*)

Barn swallow (*Hirundo rustica*)
Oak titmouse (*Baeolophus inornatus*)
Bushtit (*Psaltriparus minimus*)
White-breasted nuthatch (*Sitta carolinensis*)
Brown creeper (*Certhia americana*)
Bewick's wren (*Thryomanes bewickii*)
House wren (*Troglodytes aedon*)
Ruby-crowned kinglet (*Regulus calendula*)
Western bluebird (*Sialia mexicana*)
Hermit thrush (*Catharus guttatus*)
American robin (*Turdus migratorius*)
Northern mockingbird (*Mimus polyglottos*)
European starling (*Sturnus vulgaris*) non-native
Cedar waxwing (*Bombycilla cedrorum*)
Phainopepla (*Phainopepla nitens*)
Yellow-rumped warbler (*Setophaga coronata*)
Black-throated gray warbler (*Setophaga nigrescens*)
Spotted towhee (*Pipilo maculatus*)
California towhee (*Melozone crissalis*)
Savannah sparrow (*Passerculus sandwichensis*)
Song sparrow (*Melospiza melodia*)
Lincoln's sparrow (*Melospiza lincolnii*)
"Oregon" junco (*Junco hyemalis*)
White-crowned sparrow (*Zonotrichia leucophrys*)
Golden-crowned sparrow (*Zonotrichia atricapilla*)
Lark sparrow (*Chondestes grammacus*)
Western tanager (*Piranga ludoviciana*)
Black-headed grosbeak (*Pheucticus melanocephalus*)
Brewer's blackbird (*Euphagus cyanocephalus*)
Brown-headed cowbird (*Molothrus ater*)
Western meadowlark (*Sturnella neglecta*)
Bullock's oriole (*Icterus bullockii*)
Cassin's finch (*Haemorhous cassinii*)
Purple finch (*Haemorhous purpureus*)
House finch (*Haemorhous mexicanus*)
Pine siskin (*Spinus pinus*)
Lesser goldfinch (*Spinus psaltria*)
American goldfinch (*Spinus tristis*)
House sparrow (*Passer domesticus*) non-native

MAMMALS

Western gray squirrel (*Sciurus griseus*)
California ground squirrel (*Otospermophilus beecheyi*)
Botta's pocket gopher (*Thomomys bottae*)
Coyote (*Canis latrans*)
Mule deer (*Odocoileus hemionus*)

Project Description:

The Town of Paradise (Town) is implementing the Paradise Sewer Project (Project), which involves identifying and implementing a long-term solution for collection, treatment, and reuse/disposal of its wastewater. The Project area currently includes the Town itself for wastewater treatment service and the length of Skyway Road extending westward, crossing Highway 99 into the southwest area of Chico onto Rancho de Farwell land for the effluent alignment corridor.

Re: Paradise Sewer Project, Butte County

Dear Ms. Ruth:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,

Nancy Gonzalez-Lopez

Cultural Resources Analyst

Subject: Notice of Opportunity to Consult Under Assembly Bill 52 for the Paradise Sewer Project in Butte County, California

Honorable Chairperson Lopez,

The Town of Paradise (Town), as the Lead Agency for the Paradise Sewer Project (Proposed Project), is providing this notice of opportunity to request notification from the Town for consultation regarding the Proposed Project pursuant to Public Resources Code (PRC) section 21080.3.1 and Chapter 532, Statutes of 2014 (i.e., AB 52).

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. A new wastewater management solution is needed to improve the local economy (e.g., encourage opening of new businesses) and reduce the potential for public health and environmental concerns caused by failed or failing septic systems.

The objectives of the Proposed Project are as follows:

- Provide a sewer system to serve Paradise in compliance with the Town of Paradise 1994 General Plan policies LUO-10, ESP-6, LUP-16, and LUI-7 (Quad Consultants 2008).
- Provide long-term, efficient, reliable, high quality treatment of wastewater in a cost-effective, environmentally beneficial manner to the people of Paradise.
- Improve the handling of wastewater in Paradise to address the economic and environmental concerns of the current system.
- Connect to the existing Chico Water Pollution Control Plant (WPCP) to provide efficient regional treatment of wastewater with no additional cost to City of Chico rate payers.

Existing Facilities

Wastewater treatment facilities in Paradise consist of individual, privately owned septic tanks and soil absorption disposal systems known as leach fields, together with several engineered subsurface disposal systems serving commercial and institutional facilities. Businesses and residences near the future sewer system continue to rely on septic tanks and leach field systems for wastewater treatment and disposal.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

Sewer Service Area

The sewer service area (SSA) would serve approximately 1,500 parcels (out of the 11,000 total parcels in Paradise) along the Skyway, Clark Road, and Pearson Road corridors. The SSA also would serve most businesses in Paradise and would enable future construction of affordable multi-family housing, which is limited because of multiple septic system constraints such as high groundwater, poor soils, and limited parcel sizes.

At the time of initial operation, an estimated 360 occupied parcels within the SSA would be generating an average wastewater flow of 109,000 gpd. It is estimated that it could take 30 years for the entire SSA to be occupied, at which time the average wastewater flow would be 448,000 gpd. The Town is considering this level of development and wastewater flow in planning its wastewater treatment solutions.

Collection System

The collection system would serve all parcels within the SSA, and would consist of a system of gravity sewers, small pump stations, and force mains. This collection system would enable properties within the SSA to have existing septic tanks and leach line systems abandoned altogether and would remove future onsite wastewater treatment and dispersal requirements. Because of the varied topography within the SSA, a number of pump stations and pressurized force mains would be required to pump flows out of valleys and swales, and back up to an adjacent gravity sewer. The collection system would consist of approximately 157,000 feet of 2- to 4-inch-diameter force mains, 29,000 feet of 8-inch-diameter gravity trunk lines, and 28 pump stations, all within public right-of-way. The gravity sewers would come together at the southwest edge of town, on Skyway, where they would transition to the export pipeline to the Chico WPCP.

Export Pipeline

The proposed export pipeline would start along Skyway at the south end of the Paradise collection system and would continue southwest along Skyway. Near Chico, at the bend where Skyway turns north, the pipeline would continue west, heading cross-country with crossings of Butte Creek and Highway 99 until reaching Midway, and would proceed into Chico and end at the Chico WPCP. The connection to the Chico WPCP is not associated with other ongoing facility upgrades. Figure 1 of Attachment A shows the proposed export pipeline route and connection to the Chico WPCP.

Consultation

At this time, the Town is seeking to consult with California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area, in compliance with CEQA, California Public Resources Code (PRC) section 21080.3.1. The Town has requested the assistance of the Native American Heritage Commission (NAHC), in compliance with PRC 21080.3.1(c) to provide a list of California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area. The NAHC has provided a list of California Native American tribes in support of these efforts, and the Town is reaching out to each of the contacts provided.

The Town would like to take this opportunity to notify the KonKow Valley Band of Maidu of an opportunity to consult with SSWD regarding the potential for this Proposed Project to impact tribal cultural resources, as defined in PRC section 21074. The purposes of tribal consultation under Section 21080.3.1 is to determine, as part of the CEQA review process, whether tribal cultural resources are present within the Proposed Project area, and if so, whether the Proposed Project will significantly impact those resources. If tribal cultural resources may be significantly impacted, then consultation will also help to determine the most appropriate way to avoid or mitigate those impacts.

In accordance with Section 21080.3.1(d) of the PRC, please respond within 30 days from the receipt of this letter to either request or decline consultation in writing for this Project. Please send your written response to:

John “Jay” Lloyd, Senior Cultural Resources Specialist
HDR Engineering, Inc.
2379 Gateway Oaks Drive, Suite 200
Sacramento, CA 95833
John.Lloyd@hdrinc.com
916.679.8715

If you have any concerns regarding cultural resources and/or tribal cultural resources within the Project area shown on the enclosed map, or if you have any concerns regarding issues related to the overall Proposed Project, please contact me using the contact information provided below.

Thank you and we look forward to your response.

Sincerely,

Marc Mattox

Subject: Notice of Opportunity to Consult Under Assembly Bill 52 for the Paradise Sewer Project in Butte County, California

Honorable Chairperson Ramirez,

The Town of Paradise (Town), as the Lead Agency for the Paradise Sewer Project (Proposed Project), is providing this notice of opportunity to request notification from the Town for consultation regarding the Proposed Project pursuant to Public Resources Code (PRC) section 21080.3.1 and Chapter 532, Statutes of 2014 (i.e., AB 52).

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. A new wastewater management solution is needed to improve the local economy (e.g., encourage opening of new businesses) and reduce the potential for public health and environmental concerns caused by failed or failing septic systems.

The objectives of the Proposed Project are as follows:

- Provide a sewer system to serve Paradise in compliance with the Town of Paradise 1994 General Plan policies LUO-10, ESP-6, LUP-16, and LUI-7 (Quad Consultants 2008).
- Provide long-term, efficient, reliable, high quality treatment of wastewater in a cost-effective, environmentally beneficial manner to the people of Paradise.
- Improve the handling of wastewater in Paradise to address the economic and environmental concerns of the current system.
- Connect to the existing Chico Water Pollution Control Plant (WPCP) to provide efficient regional treatment of wastewater with no additional cost to City of Chico rate payers.

Existing Facilities

Wastewater treatment facilities in Paradise consist of individual, privately owned septic tanks and soil absorption disposal systems known as leach fields, together with several engineered subsurface disposal systems serving commercial and institutional facilities. Businesses and residences near the future sewer system continue to rely on septic tanks and leach field systems for wastewater treatment and disposal.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

Sewer Service Area

The sewer service area (SSA) would serve approximately 1,500 parcels (out of the 11,000 total parcels in Paradise) along the Skyway, Clark Road, and Pearson Road corridors. The SSA also would serve most businesses in Paradise and would enable future construction of affordable multi-family housing, which is limited because of multiple septic system constraints such as high groundwater, poor soils, and limited parcel sizes.

At the time of initial operation, an estimated 360 occupied parcels within the SSA would be generating an average wastewater flow of 109,000 gpd. It is estimated that it could take 30 years for the entire SSA to be occupied, at which time the average wastewater flow would be 448,000 gpd. The Town is considering this level of development and wastewater flow in planning its wastewater treatment solutions.

Collection System

The collection system would serve all parcels within the SSA, and would consist of a system of gravity sewers, small pump stations, and force mains. This collection system would enable properties within the SSA to have existing septic tanks and leach line systems abandoned altogether and would remove future onsite wastewater treatment and dispersal requirements. Because of the varied topography within the SSA, a number of pump stations and pressurized force mains would be required to pump flows out of valleys and swales, and back up to an adjacent gravity sewer. The collection system would consist of approximately 157,000 feet of 2- to 4-inch-diameter force mains, 29,000 feet of 8-inch-diameter gravity trunk lines, and 28 pump stations, all within public right-of-way. The gravity sewers would come together at the southwest edge of town, on Skyway, where they would transition to the export pipeline to the Chico WPCP.

Export Pipeline

The proposed export pipeline would start along Skyway at the south end of the Paradise collection system and would continue southwest along Skyway. Near Chico, at the bend where Skyway turns north, the pipeline would continue west, heading cross-country with crossings of Butte Creek and Highway 99 until reaching Midway, and would proceed into Chico and end at the Chico WPCP. The connection to the Chico WPCP is not associated with other ongoing facility upgrades. Figure 1 of Attachment A shows the proposed export pipeline route and connection to the Chico WPCP.

Consultation

At this time, the Town is seeking to consult with California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area, in compliance with CEQA, California Public Resources Code (PRC) section 21080.3.1. The Town has requested the assistance of the Native American Heritage Commission (NAHC), in compliance with PRC 21080.3.1(c) to provide a list of California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area. The NAHC has provided a list of California Native American tribes in support of these efforts, and the Town is reaching out to each of the contacts provided.

The Town would like to take this opportunity to notify the Mechoopda Indian Tribe of an opportunity to consult with SSWD regarding the potential for this Proposed Project to impact tribal cultural resources, as defined in PRC section 21074. The purposes of tribal consultation under Section 21080.3.1 is to determine, as part of the CEQA review process, whether tribal cultural resources are present within the Proposed Project area, and if so, whether the Proposed Project will significantly impact those resources. If tribal cultural resources may be significantly impacted, then consultation will also help to determine the most appropriate way to avoid or mitigate those impacts.

In accordance with Section 21080.3.1(d) of the PRC, please respond within 30 days from the receipt of this letter to either request or decline consultation in writing for this Project. Please send your written response to:

Subject: Notice of Opportunity to Consult Under Assembly Bill 52 for the Paradise Sewer Project in Butte County, California

Honorable Chairperson Clark,

The Town of Paradise (Town), as the Lead Agency for the Paradise Sewer Project (Proposed Project), is providing this notice of opportunity to request notification from the Town for consultation regarding the Proposed Project pursuant to Public Resources Code (PRC) section 21080.3.1 and Chapter 532, Statutes of 2014 (i.e., AB 52).

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. A new wastewater management solution is needed to improve the local economy (e.g., encourage opening of new businesses) and reduce the potential for public health and environmental concerns caused by failed or failing septic systems.

The objectives of the Proposed Project are as follows:

- Provide a sewer system to serve Paradise in compliance with the Town of Paradise 1994 General Plan policies LUO-10, ESP-6, LUP-16, and LUI-7 (Quad Consultants 2008).
- Provide long-term, efficient, reliable, high quality treatment of wastewater in a cost-effective, environmentally beneficial manner to the people of Paradise.
- Improve the handling of wastewater in Paradise to address the economic and environmental concerns of the current system.
- Connect to the existing Chico Water Pollution Control Plant (WPCP) to provide efficient regional treatment of wastewater with no additional cost to City of Chico rate payers.

Existing Facilities

Wastewater treatment facilities in Paradise consist of individual, privately owned septic tanks and soil absorption disposal systems known as leach fields, together with several engineered subsurface disposal systems serving commercial and institutional facilities. Businesses and residences near the future sewer system continue to rely on septic tanks and leach field systems for wastewater treatment and disposal.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

Sewer Service Area

The sewer service area (SSA) would serve approximately 1,500 parcels (out of the 11,000 total parcels in Paradise) along the Skyway, Clark Road, and Pearson Road corridors. The SSA also would serve most businesses in Paradise and would enable future construction of affordable multi-family housing, which is limited because of multiple septic system constraints such as high groundwater, poor soils, and limited parcel sizes.

At the time of initial operation, an estimated 360 occupied parcels within the SSA would be generating an average wastewater flow of 109,000 gpd. It is estimated that it could take 30 years for the entire SSA to be occupied, at which time the average wastewater flow would be 448,000 gpd. The Town is considering this level of development and wastewater flow in planning its wastewater treatment solutions.

Collection System

The collection system would serve all parcels within the SSA, and would consist of a system of gravity sewers, small pump stations, and force mains. This collection system would enable properties within the SSA to have existing septic tanks and leach line systems abandoned altogether and would remove future onsite wastewater treatment and dispersal requirements. Because of the varied topography within the SSA, a number of pump stations and pressurized force mains would be required to pump flows out of valleys and swales, and back up to an adjacent gravity sewer. The collection system would consist of approximately 157,000 feet of 2- to 4-inch-diameter force mains, 29,000 feet of 8-inch-diameter gravity trunk lines, and 28 pump stations, all within public right-of-way. The gravity sewers would come together at the southwest edge of town, on Skyway, where they would transition to the export pipeline to the Chico WPCP.

Export Pipeline

The proposed export pipeline would start along Skyway at the south end of the Paradise collection system and would continue southwest along Skyway. Near Chico, at the bend where Skyway turns north, the pipeline would continue west, heading cross-country with crossings of Butte Creek and Highway 99 until reaching Midway, and would proceed into Chico and end at the Chico WPCP. The connection to the Chico WPCP is not associated with other ongoing facility upgrades. Figure 1 of Attachment A shows the proposed export pipeline route and connection to the Chico WPCP.

Consultation

At this time, the Town is seeking to consult with California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area, in compliance with CEQA, California Public Resources Code (PRC) section 21080.3.1. The Town has requested the assistance of the Native American Heritage Commission (NAHC), in compliance with PRC 21080.3.1(c) to provide a list of California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area. The NAHC has provided a list of California Native American tribes in support of these efforts, and the Town is reaching out to each of the contacts provided.

The Town would like to take this opportunity to notify the Mooretown Rancheria of Maidu Indians of an opportunity to consult with SSWD regarding the potential for this Proposed Project to impact tribal cultural resources, as defined in PRC section 21074. The purposes of tribal consultation under Section 21080.3.1 is to determine, as part of the CEQA review process, whether tribal cultural resources are present within the Proposed Project area, and if so, whether the Proposed Project will significantly impact those resources. If tribal cultural resources may be significantly impacted, then consultation will also help to determine the most appropriate way to avoid or mitigate those impacts.

In accordance with Section 21080.3.1(d) of the PRC, please respond within 30 days from the receipt of this letter to either request or decline consultation in writing for this Project. Please send your written response to:

Subject: Notice of Opportunity to Consult Under Assembly Bill 52 for the Paradise Sewer Project in Butte County, California

Dear Director Taylor,

The Town of Paradise (Town), as the Lead Agency for the Paradise Sewer Project (Proposed Project), is providing this notice of opportunity to request notification from the Town for consultation regarding the Proposed Project pursuant to Public Resources Code (PRC) section 21080.3.1 and Chapter 532, Statutes of 2014 (i.e., AB 52).

Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create the potential for public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. A new wastewater management solution is needed to improve the local economy (e.g., encourage opening of new businesses) and reduce the potential for public health and environmental concerns caused by failed or failing septic systems.

The objectives of the Proposed Project are as follows:

- Provide a sewer system to serve Paradise in compliance with the Town of Paradise 1994 General Plan policies LUO-10, ESP-6, LUP-16, and LUI-7 (Quad Consultants 2008).
- Provide long-term, efficient, reliable, high quality treatment of wastewater in a cost-effective, environmentally beneficial manner to the people of Paradise.
- Improve the handling of wastewater in Paradise to address the economic and environmental concerns of the current system.
- Connect to the existing Chico Water Pollution Control Plant (WPCP) to provide efficient regional treatment of wastewater with no additional cost to City of Chico rate payers.

Existing Facilities

Wastewater treatment facilities in Paradise consist of individual, privately owned septic tanks and soil absorption disposal systems known as leach fields, together with several engineered subsurface disposal systems serving commercial and institutional facilities. Businesses and residences near the future sewer system continue to rely on septic tanks and leach field systems for wastewater treatment and disposal.

The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico WPCP, and connection to the WPCP—and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and rate payers as a result of the Proposed Project.

Sewer Service Area

The sewer service area (SSA) would serve approximately 1,500 parcels (out of the 11,000 total parcels in Paradise) along the Skyway, Clark Road, and Pearson Road corridors. The SSA also would serve most businesses in Paradise and would enable future construction of affordable multi-family housing, which is limited because of multiple septic system constraints such as high groundwater, poor soils, and limited parcel sizes.

At the time of initial operation, an estimated 360 occupied parcels within the SSA would be generating an average wastewater flow of 109,000 gpd. It is estimated that it could take 30 years for the entire SSA to be occupied, at which time the average wastewater flow would be 448,000 gpd. The Town is considering this level of development and wastewater flow in planning its wastewater treatment solutions.

Collection System

The collection system would serve all parcels within the SSA, and would consist of a system of gravity sewers, small pump stations, and force mains. This collection system would enable properties within the SSA to have existing septic tanks and leach line systems abandoned altogether and would remove future onsite wastewater treatment and dispersal requirements. Because of the varied topography within the SSA, a number of pump stations and pressurized force mains would be required to pump flows out of valleys and swales, and back up to an adjacent gravity sewer. The collection system would consist of approximately 157,000 feet of 2- to 4-inch-diameter force mains, 29,000 feet of 8-inch-diameter gravity trunk lines, and 28 pump stations, all within public right-of-way. The gravity sewers would come together at the southwest edge of town, on Skyway, where they would transition to the export pipeline to the Chico WPCP.

Export Pipeline

The proposed export pipeline would start along Skyway at the south end of the Paradise collection system and would continue southwest along Skyway. Near Chico, at the bend where Skyway turns north, the pipeline would continue west, heading cross-country with crossings of Butte Creek and Highway 99 until reaching Midway, and would proceed into Chico and end at the Chico WPCP. The connection to the Chico WPCP is not associated with other ongoing facility upgrades. Figure 1 of Attachment A shows the proposed export pipeline route and connection to the Chico WPCP.

Consultation

At this time, the Town is seeking to consult with California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area, in compliance with CEQA, California Public Resources Code (PRC) section 21080.3.1. The Town has requested the assistance of the Native American Heritage Commission (NAHC), in compliance with PRC 21080.3.1(c) to provide a list of California Native American tribes that are traditionally and culturally affiliated with the Proposed Project area. The NAHC has provided a list of California Native American tribes in support of these efforts, and the Town is reaching out to each of the contacts provided.

The Town would like to take this opportunity to notify the Mooretown Rancheria of Maidu Indians of an opportunity to consult with SSWD regarding the potential for this Proposed Project to impact tribal cultural resources, as defined in PRC section 21074. The purposes of tribal consultation under Section 21080.3.1 is to determine, as part of the CEQA review process, whether tribal cultural resources are present within the Proposed Project area, and if so, whether the Proposed Project will significantly impact those resources. If tribal cultural resources may be significantly impacted, then consultation will also help to determine the most appropriate way to avoid or mitigate those impacts.

In accordance with Section 21080.3.1(d) of the PRC, please respond within 30 days from the receipt of this letter to either request or decline consultation in writing for this Project. Please send your written response to:

Agenda

Project:	Paradise Sewer Project in Butte County, California
Subject:	AB 52 Consultation Meeting
Date:	Tuesday, August 10, 2021; 1:30 pm
Location:	Meeting held via WebEx
Invitees:	Jessica Lopez, Konkow Valley Band of Maidu, Tribal Chair Kyle McHenry, Mechoopda Indian Tribe, Tribal Historic Preservation Officer Marc Mattox, Town of Paradise, Public Works Director/Town Engineer John Buttz, HDR, Project Manager Leslie Tice, HDR, CEQA Project Lead Jay Lloyd, HDR, Senior Cultural Resources Specialist Monica Ruth, HDR, Cultural Resources Specialist

I. Welcome/Introductions

II. Project Overview
   - A. Sewer Service Area
   - B. Collection System
   - C. Export Pipeline

III. CEQA/AB 52 Consultation Discussion
   - A. The purposes of tribal consultation under Section 21080.3.1 (aka AB 52) is to determine, as part of the CEQA review process, whether tribal cultural resources are present within the Proposed Project area, and if so, whether the Proposed Project will significantly impact those resources. If tribal cultural resources may be significantly impacted, then consultation will also help to determine the most appropriate way to avoid or mitigate those impacts.

IV. Review Action Items

V. Conclusion

Agenda

Project:	Paradise Sewer Project in Butte County, California
Subject:	AB 52 Consultation Meeting
Date:	Thursday, September 09, 2021; 11:00 am
Location:	Meeting held via WebEx
Invitees:	Jessica Lopez, Konkow Valley Band of Maidu, Tribal Chair Matthew Gramps-Williford, Konkow Valley Band of Maidu, Tribal Historic Preservation Officer Kyle McHenry, Mechoopda Indian Tribe, Tribal Historic Preservation Officer Marc Mattox, Town of Paradise, Public Works Director/Town Engineer John Buttz, HDR, Project Manager Leslie Tice, HDR, CEQA Project Lead Jay Lloyd, HDR, Senior Cultural Resources Specialist Monica Ruth, HDR, Cultural Resources Specialist

I. Welcome

II. Review of Action Items from 8/10/21 Meeting

- **HDR** to provide GIS data (shapefiles) of the project area (inclusive of service area and export pipeline) to both the Konkow Valley Band of Maidu and Mechoopda Indian Tribe
    - **Minutes and shapefiles were provided via One Drive/email on 8/16/2021**
- The **Town of Paradise/HDR** will reach out again to both the Konkow Valley Band of Maidu and Mechoopda Indian Tribe in three weeks (early September) to set up a time to discuss items of concern following the Tribes' review of their respective internal databases/information against the GIS data; meeting to possibly take place the week following Labor Day.

III. CEQA/AB 52 Consultation Discussion

A. Known Tribal Cultural Resources

B. Areas/resources of concern

C. Proposed Mitigation Measures

IV. Review Action Items, as applicable

V. Conclusion

From: Ruth, Monica
To: "Jessica Lopez"; Om Yepi; K McHenry
Cc: Stanley, Ashley; Mattox, Marc; Buttz, John; Edwards, Dawn
Subject: Paradise Sewer Project update, request for review
Date: Thursday, April 7, 2022 2:34:41 PM
Attachments: [redacted]Alternatives.pdf

Greetings Chairwoman Lopez, Cultural Resource Director Williford, and THPO McHenry –

The Town of Paradise has asked HDR to relay a Sewer Project update to you. We have adjusted the pipeline alignment of the Proposed Project in the south part of Chico, on the west side of Highway 99 (see attached figure). We would like your input regarding potential impacts to Tribal Cultural Resources caused by this change. The attached figure is marked up so you can compare the new proposed pipeline alignment to the previously-proposed alignment.

The proposed export pipeline crossing of Hwy 99 has been updated to eliminate two alternatives west of the trenchless crossing of Hwy 99: the Southgate Ave-McFadden Lane-Midway alternative and the Norfield Ave-Midway alternative. The proposed export pipeline will now follow Entler Avenue to Midway with two options for trenchless crossing at Hwy 99: either at the northeast end of Norfield Avenue (the teal dashed line shown in the attached figure) or at the northeast end of Southgate Ave (the orange dotted line in the attached). The change was based in part on feedback we received from you through the AB52 consultation process and the Town anticipates that the potential for impacts from the new Entler Ave-Midway route will be less than the previous Southgate Ave-McFadden Lane-Midway and the Norfield Ave-Midway alternatives.

The Town would like to know if you have any concerns or questions about these changes, and if these changes would result in a change to potential impacts to Tribal Cultural Resources. I'm available to discuss on the phone and can set up calls/meetings with the Town if that is preferred.

Please let me know how you would like to proceed.

Thank you,
Monica

Responses to Comment Letters Received during Public Review of Draft PEIR

I Responses to Comment Letters Received during Public Review of Draft PEIR

I.1 Introduction

This Final Environmental Impact Report (FEIR) was prepared in accordance with the California Environmental Quality Act (CEQA) (Cal. Pub. Res. Code Section 21000, et seq.) and State CEQA Guidelines (Cal. Code Regs. Section 15000, et seq.). The Town of Paradise is the lead agency for the environmental review of the proposed Paradise Sewer Project and has the principal responsibility for approving the project. This Final PEIR assesses the expected environmental impacts resulting from the adoption and implementation of the proposed project and responds to public comments received on the Draft EIR.

The following sections contain

1) a review of CEQA Guidelines pertinent to public comments and responses,
2) a matrix of all letters and corresponding Town responses, and
3) copies of the original comment letters.

In two cases, comments received on the Draft PEIR prompted the addition of text to the final version of the document i.e., the Final PEIR. These changes are shown in **bold** format in the Final EIR. No deletions were made as a result of public comments. Small grammatical or punctuation changes that were made are not specifically called out (e.g., adding a period at end of sentence, fixing misspellings). No changes were made to the Draft PEIR appendices (App. A – H); however this appendix (Appendix I) is a new attachment to the Final PEIR.

The Final EIR also includes informational updates and clarifications. Beyond the requirements set by CEQA and relevant court cases discussed below, every attempt has been made to respond to comments that address the project in general, in an effort to provide the most complete information possible.

I.2 Responsibilities of the Town

CEQA Guidelines Section 15088(b) requires that responses be made to only those comments that are specific to the Draft EIR. In addition, in the court case *Browning-Ferris Industries of California, Inc. v. San Jose 181 Cal. App. 3d 852* (1986), the court stated that the Lead Agency must respond to all significant environmental comments in a level of detail commensurate with that of the comment, citing *Gallegos v. California Board of Forestry 76 Cal. App. 3d 945* (1978), *Twain Harte Homeowners Association v. County of Tuolumne 128 Cal. App. 3d 664* (1982), and *Cleary v. County of Stanislaus 118 Cal. App. 3d 348* (1981). Following are additional Lead Agency responsibilities as described in CEQA Guidelines (Section 15088):

- (a) “The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The Lead Agency

shall respond to comments raising significant environmental issues received during the noticed comment period and any extensions and may respond to late comments" (15088(a))

- (b) "The lead agency shall provide a written proposed response, either in a printed copy or in an electronic format, to a public agency on comments made by that public agency at least 10 days prior to certifying an environmental impact report" (15088 (b)).
- (c) "The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the Lead Agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice. The level of detail contained in the response, however, may correspond to the level of detail provided in the comment (i.e., responses to general comments may be general). A general response may be appropriate when a comment does not contain or specifically refer to readily available information, or does not explain the relevance of evidence submitted with the comment" (15088(c)).
- (d) "The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the Lead Agency should either:
    1) Revise the text in the body of the EIR, or
    2) Include marginal notes showing that the information is revised in the response to comments (15088(d)).

Finally, "if any public agency or person who is consulted with regard to an EIR or Negative Declaration fails to comment within a reasonable time as specified by the Lead Agency, it shall be assumed, without a request for a specific extension of time, that such agency or person has no comment to make. Although the Lead Agency need not respond to late comments, the Lead Agency may choose to respond to them" (CEQA Guidelines Section 15207).

The Town's responses to each comment on the Draft PEIR represent a good-faith, reasoned effort to address the environmental issues identified by the comments. Accordingly, Town staff's and its consultants' final analysis provided in the responses to comments are backed by substantial evidence. Likewise, the Town's legal counsel prepared and/or independently reviewed responses to the Draft PEIR comments.

I.3 Responsibilities of the Commenter

CEQA Guidelines Section 15132(d) requires that the Final EIR consist of the responses of the Lead Agency to significant environmental points raised in the review and consultation process. In addition, CEQA Guidelines Sections 15201 and 15204 discuss public participation regarding the review and evaluation of EIRs. Specifically, Section 15204 states the following:

- "(a) In reviewing draft EIRs, persons and public agencies should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that

would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project. CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR" (15204 (a)).

- "(c) Reviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to [CEQA Guidelines] Section 15064, an effect shall not be considered significant in the absence of substantial evidence" (15204 (c)).
- "(d) Reviewing agencies or organizations should include with their comments the name of a contact person who would be available for later consultation if necessary. Each responsible agency and trustee agency shall focus its comments on environmental information germane to that agency's statutory responsibility (15204 (d)).
- (e) This section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section (15204 (e)).
- "(f) Prior to the close of the public review period for an EIR or mitigated negative declaration, a responsible or trustee agency which has identified significant effects on the environment may submit to the lead agency proposed mitigation measures which would address those significant effects. Any such measures shall be limited to impacts affecting those resources that are subject to the statutory authority of that agency. If mitigation measures are submitted, the responsible or trustee agency shall either submit to the lead agency complete and detailed performance objectives for the mitigation measures, or shall refer the lead agency to appropriate, readily available guidelines or reference documents which meet the same purpose" (15204 (f)).

Table I-1 lists those persons, organizations, and public agencies that provided written comments on the Draft PEIR. The assigned comment letter number, letter date, letter author and affiliation with a particular organization, if presented in the comment letter or if representing a public agency, is also listed. Letter numbers beginning with "W" were received on the Paradise website, while letter numbers beginning with "L" were received by email or mail post. Format for reference to specific comments in the matrix is: Letter number-Comment number (e.g., W1-1 is referencing the first letter and the first comment in that letter).

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
Alice Patterson	July 17, 2022	W1	1	I am inquiring for my partner, who lost his home in the fire… How do I find out if his property would be affected by an Easement should this sewer project be approved? This could impact how/when he rebuilds. Property address is 5975 N. Libby. Is there a list of locations where the easements would be going?	Thank you for your message. You can go to https://paradisesewer.com/ and scroll down to “Find My Property”. If you input your friend’s address, it will show you whether it is within the proposed sewer area.
Linda Barton	July 25, 2022	W2	1	I am about to choose a builder to finally rebuild in Paradise. At this moment, it appears the sewer project for Paradise will help those businesses on Skyway. Which means 99%+ of the residents won't benefit from this undertaking. Who is going to pay for this very expensive but necessary project? I am not interested in seeing it listed when I get my property tax bill.	The Town has secured grant funding for the development of the preliminary engineering and preparation of the environmental documentation. We are also working to secure grant funding for the design, right-of-way, and construction stages of the project. The connection fees have not yet been determined for property owners connecting to the system.
State Water Resources Control Board	July 27, 2022	L1	1	See attached letter. All information advisory in nature.	Thank you for the information that you provided on federal regulatory requirements that must be met as part of the Town’s proposed Clean Water State Revolving Fund (CWSRF) funding application process. We understand that the list of necessary actions referenced in your comment letter pertain to the Town’s pursuit of CWSRF funding, along with the corresponding CEQA+ process. We understand that this is not a list of actions and materials that are being recommended for inclusion in the Draft PEIR; therefore, no change has been made to the PEIR.
Kat Carlisle	July 28, 2022	W3	1	Can you tell me when the final design and right of way acquisition phases will begin for the Paradise Sewer Project please? I saw on the project schedule that these phases are anticipated to begin in Summer 2022, but I wasn't sure if that meant they have already started or not. Thank you!	Thank you for your comment and question. We have not yet started design or right of way, as we are still seeking funding for this phase of the design. We will update paradisesewer.com as soon as an updated timeline is established. This website will continue to be updated as the project phases are identified. www.Paradisesewer.com
Earl Eckert	Aug 1, 2022	W4	1	Will the agreement with Chico permit all pumped septic loads to be disposed of in paradise rather than continuing to be disposed of at the County land fill lagoon. Own property at 2199 De Mille Rd.	The publlic Sewer Regionalization Project Advisory Committee (SRPAC) drafted the Principals of Agreement, which were the outline of the draft Intermunicipal Agreement (IMA) between the Town of Paradise and the City of Chico. Currently, only residential and commercial sewer connections are identified and accounted for in the Sewer Service Area (SSA) and sewer discharge that will be discharged at the City of Chico Water Pollution Control Plant. Pumped septic systems discharges from residents or businesses are not accommodated in the discharge to the Chico WPCP. Disposal of pumped septic loads will not change as it is outside of the scope of this Project.
Pam Galloway	Aug 2, 2022	W5	1	I think it is a stupid waste of money that could be used for a different project. The cost of the project, the amount of time necessary to complete the sewer project and the number of people who would benefit from it should make it a non starter.	Thank you for your input. The Town appreciates all viewpoints and opinions expressed by our community.
Brian Anderson	Aug 3, 2022	W6	1	Who will handle the collection system and pump stations daily operations?	Thank you for your question. The Town of Paradise staff is in charge of maintainance and operation of the collection system and pump stations.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
Brian Anderson			2	What type(s) of odor control systems will be used?	The Proposed Project includes the use of odor control canisters, as stated in Section 2.8 of the Draft PEIR. Section 3.3.4.4 explains "Routine operations and maintenance activities will include periodic inspection of the odor control cannisters, which will be provided at the Export Pipeline System's flow control and metering structure." Section 2.8 further elaborates: "Physical on-site inspection and maintenance of the air release valves and odor control canisters would be done according to the maintenance protocols that accompany the devices, and would occur every 6 months to ensure optimal performance of these devices. Air release valves would be inspected to ensure they are operating properly. The odor control canisters would be replaced as needed when the carbon media becomes saturated and loses the ability to absorb odors."
Brian Anderson			3	And projected annual cost?	The current level of design has not yet supported this level of detailed planning; annual costs have not yet been projected.
Brian Anderson			4	Where will biosolids and sewage debris be removed to?	Town of Paradise flows will join with City of Chico flows at the Chico Water Pollution Control Plant (WPCP), from which point they are treated per the Chico WPCP's current processing standards. Section 2.4.2 in the Draft PEIR outlines this process: "The sludge (biosolids) portion of the wastewater is treated by anaerobic digestion, followed by mechanical dewatering. The resulting biosolids are then hauled directly from the Chico WPCP for land application in unincorporated Sacramento County, California."
Brian Anderson			5	How many full time employees will be hired to operate and maintain Paradise Wastewater Collection and Transportation?	As stated in Section 3.3.4.1 of the Draft PEIR : "About 5-10 permanent employees would be required to serve the Proposed Project during operations and maintenance." Section 2.8 provides a further breakdown of that number: "The wastewater operations team would include…: administrative and reception staff, accounting staff, three field crew/utility staff, and one on-site service technician."
Brian Anderson			6	Under what jurisdiction/license will Paradise Wastewater be in compliance with State Water Resources Control Board?	The treatment and discharge of the flow from the Town of Paradise will be handled under the City of Chico's current permits, as outlined in Section 2.4.2 of the Draft PEIR: "The Proposed Project… would not increase nor substantially decrease the availability of sewer service within the City or County (see more details in Section 2.5.1 Core Collection System and assessment of effects in Section 3.18.4, Impact Analysis [Utilities and Service Systems]). Therefore, the Town's connection falls within the requirements of this NPDES permit." Currently, the City's treated wastewater "is regulated in accordance with National Pollutant Discharge Elimination System (NPDES) Permit No. CA0079081", as also stated in Section 2.4.2.
Brian Anderson			7	What city department will oversee Paradise wastewater operations?	The Town's Public Works department would oversee the operations of the Proposed Project. See Section 2.8 of the Draft PEIR: "The existing Public Works director would serve in a management role over sewer functions."
Ivan Garcia	Aug 5, 2022	W7	1	Good luck on the project. Would like to encourage and support the paving of a multi-use path on top of your sewer line with the ability to connect this new path to the intersection of Honey run/Skyway near Skyway golf park on the west and to the Paradise Memorial Trail in Paradise. I would suggest paving so that you can send emergency equipment up the hill to fully utilize the Skyway for emergency evacuations.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the Town's jurisdiction. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
Joe Rees	Aug 5, 2022	W8	1	As natural disasters increase in frequency and severity, climate change is becoming harder and harder to ignore. The rise in these disasters along with an overall growing sense of crisis when it comes to the environment is causing an increase in climate anxiety. In fact, a recent Yale survey found that 70 percent of Americans are now “very or somewhat worried about global warming.” I thought this would be an interesting topic to cover in a guest article for your website. I would address the increase in climate anxiety and what your site visitors can do to relieve their stress while also helping the environment. What do you think?	Thank you for your email. I appreciate your offer. Right now we are focused on the Paradise Sewer EIR, but if we see a fit in the future, we will let you know.
Rick Hoddinott	Aug 8, 2022	W9	1	Along the proposed alignment for the export pipeline on Entler Avenue, what is the pipe constructed of and where will it be located along the roadway?	Thank you for your questions. Section 2.5.2 of the Draft PEIR explains that the Export Pipeline System would be located within the Butte County right-of-way on Entler Avenue. As stated in Section 2.5.2.3, "the following materials are anticipated to be used on the Export Pipeline System construction: • PVC pipe and miscellaneous fittings • Concrete maintenance holes • Precast concrete cylinders for the Transition Chamber, the Flow Control and Metering Structure, and associated mechanical and electrical equipment for installation at each of the two structures • Metal carrier pipe at each of the five trenchless crossings • Temporary and permanent paving (asphalt) • Backfill material"
Rick Hoddinott			2	How will the project address nearby wells which may be located near the proposed alignment?	As stated in Section 3.10.1.4: "Historical use of high-density septic systems and leach fields in Paradise have resulted in surface and groundwater contamination". Because it has been shown that septic systems can lead to "effluent in water supply resulting in degradation of water quality" (Section 3.19.1.4), implementing a sewer system would lessen the risk of contaminating nearby well water quality. All pipelines will be subject to inspection and maintenance as outlined in Section 2.8 of the Draft PEIR. Specifically, per Section 2.8 "The Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Sanitary Sewer Systems General Order, or SSSGO) was adopted by the SWRCB in May 2006. The purpose of the SSSGO was to provide a consistent statewide approach for reducing sanitary sewer overflows (including leakages). Per the SSSGO, and subject to its terms, the Town will need to develop a sewer system management plan. The sewer system management plan will include policies, procedures and activities covering the planning, management, operation and maintenance of the collection system. As part of this sewer system management plan, the Town must also develop and implement an overflow emergency response plan to identify measures to protect public health and the environment." Additionally, the Proposed Project would not impact the availability of water in nearby wells. Section 3.10.4.2 of the Draft PEIR states that construction of the Proposed Project "would not cause a new deficit in aquifer volume or a lowering of the groundwater table" and that "no impact would occur on groundwater supply and recharge during operations and maintenance." Also see responses to Ripley's comment #L10-7.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
Rick Hoddinott			3	Was the old railroad (Old Sacramento Northern) right of way considered for the pipe alignment in lieu of Entler Avenue?	The specific route you propose would not reduce any environmental impacts of the chosen Entler Avenue Alternative, and therefore, was not analyzed in the Draft PEIR. As stated in Section 5.1.1 of the Draft PEIR, "CEQA Guidelines Section 15126.6(a) states that 'an EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project.'"
Rick Hoddinott			4	During construction, how will the project address temporary traffic control along Entler Avenue, considering CHP uses the roadway as direct access.	The Proposed Project includes implementation of mitigation measure MM-HAZ-6: Traffic Management Plan to reduce potential traffic impacts during construction. The traffic management plan will be enforced by the Town and/or contracted construction manager hired by the Town for the project and will include requirements such as: Schedule truck trips outside of the peak traffic hours, Store all equipment and materials in designated staging areas, Install traffic control devices where traffic conditions warrant, Coordinate all construction activities with the emergency service providers in the area, and Post notices and/or appropriate signage to notify the public of upcoming construction activities. Refer to Section 3.9.4.6 of the Draft PEIR for a detailed description of MM-HAZ-6: Traffic Management Plan. As discussed in 3.9.4.6, "per the SSSGO, and subject to its terms, the Town will need to develop a sewer system management plan. The sewer system management plan will include policies, procedures and activities covering the planning, management, operation and maintenance of the collection system. As part of this sewer system management plan, the Town must also develop and implement an overflow emergency response plan to identify measures to protect public health and the environment". Please also see response to Comment L7-1 from the Butte County Public Works Department.
Vicki Taylor	Aug 8, 2022	L2	1	I am so happy to see this project going forward. As a 36 year resident of Paradise I am well aware of all the projects that have fallen thru due to lack of sewers or septic capacity. I look forward to seeing new businesses in Paradise that were made possible because of the sewer project. The entire town population will certainly benefit, even if they are not directly connected.	Thank you for your input. The Town is considering all comments in preparation of the Final PEIR.
Anonymous	Aug 8, 2022	L3	1	Sounds good. Build it.	Thank you for your input. The Town is considering all comments in preparation of the Final PEIR.
Tod Kimmelshue	Aug 8, 2022	L4	1	Could the pipeline go west on the unimproved portion of Edgar Ave instead of Chico Ave. Then north to Taffee. This would save us from having to destroy a paved road (Chico Ave). I understand those are public right of ways.	Thank you for your question. City ownership of the unimproved portion of Edgar Avenue could not be confirmed. Additionally, the specific route you propose would not reduce any environmental impacts of the chosen Entler Avenue Alternative, and therefore, was not analyzed in the Draft PEIR. As stated in Section 5.1.1 of the Draft PEIR, "CEQA Guidelines Section 15126.6(a) states that 'an EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project.'" We will keep your suggestion in mind as the project enters the next phase of design.

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
Ronald Lassonde	Aug 10, 2022	W10	1	I am very impressed with the due diligence that the Paradise Town Staff has put into the Sewer EIR. The Sewer is absolutely necessary for businesses to rebuild in our Down Town. A rebuilt Down Town is critical to the overall recovery of our town. We need the PEIR approved as soon as possible so we can move forward and rebuild our Town.	Thank you for your input. The Town is considering all comments in preparation of the Final PEIR.
Mandi McKay	Aug 10, 2022	W11	1	Chico Velo supports the Town of Paradise and the Sewer Project and encourages the project or project sponsor to include the paving of a multi-use path for bicycles and pedestrians on top of the proposed project. Currently, Skyway is not a safe route for bicyclists or pedestrians traveling to or from Paradise. This project provides a unique opportunity to solve dual challenges of meeting the need for wastewater infrastructure and also providing a safer, more direct route between Chico and Paradise for bicyclists and pedestrians. If the new multi-use path followed the sewer line all the way to Southgate Lane on the East side of Hwy 99, it would connect users to the existing Midway bike path on the West side of 99. Additionally, a multi-use path could enable emergency equipment to drive up the path and allow Skyway to be fully utilized as an emergency evacuation route. Thank you for the consideration- please let us know if you have questions or if Chico Velo can provide additional support.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Richard Smith	Aug 10, 2022	L5	1	I own a 20 acre walnut orchard at 3662 Hegan Ln. Chico cross from Fimple/Hegan intersection. PG&E installed a new gas line on the north side of Hegan (2-3 ft.) north of edge of pavement. Where is the sewer line going to be placed in my area, under Hegan Lane? north side of Hegan Lane or south side of Hgean Lane? If on the same area as PG&E gas line, what is the minimum distance from gas line? What is the diameter of sewer line? My concern is if this trenching will kill the walnut trees/root system? or if trees will have to be removed for the trenching?	Thank you for your questions. We appreciate your concerns. The Proposed Project would not remove any trees during trenching. As stated in Section 2.5.2.1 of the Draft PEIR, the ridge gravity section (from connection with Core Collection Service to transition chamber located just before pipeline reaches Chico) will consist of two separate gravity sewer pipes: one 8 inches in diameter to handle low flows, and one 10 inches in diameter that would accommodate the build out flows. The pipeline would be placed under Hegan Lane, within the public right-of-way. The Town will be following all requirements of the PG&E Greenbook (https://www.pge.com/en_US/large-business/services/building-and-renovation/greenbook-manual-online/greenbook-manual-online.page)

Andrew D'Lugos	Aug 11, 2022	W12	1	Currently, Skyway is not a safe route for bicyclists or pedestrians traveling to or from Paradise. This project provides a unique opportunity to solve dual challenges of meeting the need for wastewater infrastructure and also providing a safer, more direct route between Chico and Paradise for bicyclists and pedestrians. I fully support the plan of paving a multi-use path for bicyclists and pedestrians.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Kirk Monfort	Aug 11, 2022	W13	1	This would be a great opportunity to build a bike path to Paradise that would tie into the current Paradise Bike Path that goes from the Paradise Park up through Magalia. We never had a link from Chico to that Bike path although the right of way has been preserved from the Midway by Hagen Lane. It would also provide for service and inspection of the eventual sewer line. A Dual Use facility. There might also be transportation dollars available to do this.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Richard Stone	Aug 15, 2022	W14	1	JUST PAVED ALL OF SKYWAY, IT'S REALLY A NICE ROAD. I HOPE THAT THE NEW ROAD WILL NOT BE DUG UP FOR THE SEWER PIPE AND JUST PATCHED UP TO LOOK LIKE CRAP AS THE UNDERGROUND PGE SUB COMPANYS HAVE DONE IN TOWN. SHOULD HAVE WAITED ON THE PAVING UNTILL THE SEWER WAS PUT IN. THEN PAVE THE SKYWAY.	Thank you for your comment. Consistent with Town policy, paved areas that are impacted by the sewer project will be repaved in full lane widths, to avoid trench patchwork.
Joseph Mount	Aug 16, 2022	W15	1	I was informed that the treatment plant had treated water they wanted move . Would you please send me any test result on the treated water	Thanks for your inquiry. I understand your question is about the discharge/effluent from the Chico Water Pollution control plant. Although the Town of Paradise proposed to connect to the WPCP in the future, we do not yet have a connection (which is being analyzed in the current Draft PEIR). I would suggest you contact the City of Chico Water Pollution Control Plant directly to inquire about the effluent.
Brian Anderson	Aug 22, 2022	W16	1	What agency will have jurisdiction to provide collection services within the Town of Paradise?	Thank you for your comments on the Paradise Sewer Project. The Town of Paradise will own and operate the sewer system. We are currently scheduled to start Design and Right of Way in the near future, as funding becomes available, and the details of implementing the system will be identified at that time. Some specific details, such as the operator name license information, are not yet identified. Information on the current permit structure for the Town can be found in Section 3.10.1.6 of the Draft PEIR: "As required by Phase II of the NPDES, Butte County operates under a Small Municipal Separate Storm Sewer System (MS4) stormwater permit, which authorizes the discharge of stormwater to surface water in the state from small municipal separate storm sewer systems. The Town's MS4 Permit is currently operating under an approved waiver secured in 2021 due to the reduced population associated with the 2018 Camp Fire and other factors. See Section 2.4.2 for information on the Chico WPCP and associated NPDES permit."
Brian Anderson			2	Who holds the license to operate wastewater services within Paradise jurisdiction?	See above response to Comment #W16-1.
Brian Anderson			3	Who will maintain and operate the pump stations ?	The Town of Paradise is in charge of maintenance and operation of the collection system and pump stations.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
Brian Anderson			4	What methods of odor control will be employed at each pump station, wet well and other areas where wastewater may come in contact with atmosphere? Odor mitigation is of critical importance to our community.	The Proposed Project includes the use of odor control canisters, as stated in Section 2.8 of the Draft PEIR. Section 3.3.4.4 explains "Routine operations and maintenance activities will include periodic inspection of the odor control cannisters, which will be provided at the Export Pipeline System's flow control and metering structure." Section 2.8 further elaborates: "Physical on-site inspection and maintenance of the air release valves and odor control canisters would be done according to the maintenance protocols that accompany the devices, and would occur every 6 months to ensure optimal performance of these devices. Air release valves would be inspected to ensure they are operating properly. The odor control canisters would be replaced as needed when the carbon media becomes saturated and loses the ability to absorb odors." Additionally, see Section 3.3.4.4: "Once complete, the Proposed Project would provide an overall odor benefit, because it will replace existing septic tanks within the sewer service area that emit unpleasant odors."
Brian Anderson			5	24 hour response to spills and overflows is critical.	As stated in Section 2.8 of the Draft PEIR, the Town will "develop and implement an overflow emergency response plan… Pursuant to [the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems], the Town will be required to report sanitary system overflows... using an electronic reporting system. Review and approval by the City and County of the Town's proposed sewer system management plan would be required prior to start of operations." See Section 2.8 of the Draft PEIR for a list of minimum requirements of the Town's sewer overflow response plan.
Brian Anderson			6	An 18 mile pipeline with about a 1500 ft elevation loss, gravity flow management is critical and demands highly skilled personnel.	The proposed Export Pipeline System includes segments of both gravity flow and pressurized flow. See Section ES1.5.2 of the Draft PEIR to see the sub-components of the Export Pipeline System. The wastewater operations team will include 5-10 permanent employees, including three field crew/utility staff and one on-site service technician, as outlined in Section 2.8.
Steven Cismowski	Aug 22, 2022	W17	1	I am writing in opposition to the proposed Paradise Sewer Project. Given the increase of ground water concerns in the north state, coupled with the impacts the current and projected drought cycle is having on our groundwater resources, this project is perilously flawed.	Thank you for your input. The Town is considering all comments in the preparation of the Final PEIR. We appreciate all viewpoints and opinions expressed by our community. We discuss groundwater impacts in Section 3.10.4 of the Draft PEIR. (p.268 Butte Co Policy W-P1.8: The County supports conversion from septic systems to public sewer service, where feasible). See also responses to Ripley's comment letter #10.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			2	Information is needed regarding the projected increase in size of the current Chico Wastewater Treatment Plant in order to accommodate this increase in treatment. Keeping in mind Chico's current growth-rate and several other LARGE development projects that will also increase demand on this facility - Valley's Edge and Barber Yard, this facility will need to expand, but to what extent?	As stated in Section 3.18.4.1 of the Draft PEIR: "The Regionalization Planning Report for the Paradise Sewer Project determined that the Chico WPCP has adequate capacity to serve the Proposed Project's projected demand and commitments, in addition to serving the City's service area within its jurisdictional boundaries (Carollo Engineers 2022)… Based on these factors, the Proposed Project would not stress the capacity of the current system. The Proposed Project would not require the construction or relocation of wastewater facilities, nor would it require expansion of the existing Chico WPCP facility." This section goes on to outline in further detail: "The Chico WPCP… has an existing capacity of 12 mgd with future expandability of up to 15 mgd. The annual average flow coming into the Chico WPCP currently is 6.3 mgd. The Proposed Project would add an additional 0.109 mgd of wastewater to the Chico WPCP influent at the time of initial connection (estimated for 2026) and a maximum of 0.464 mgd at full build-out (estimated for 2057) and would not increase or decrease the availability of sewer service within the City or County. " Further, as discussed in Section 2.4, "due to estimated future wastewater flow increases to the Chico WPCP based on the City's current and future population, including the estimated Town sewer discharge in 2026, the City would need to implement a project at the WPCP, consisting of the addition of a fourth secondary clarifier. This clarifier would be installed within the footprint of the existing plant, adjacent to three existing secondary clarifiers. The fourth clarifier is required whether Paradise connects to the Chico WPCP or not. Considering the Town's maximum of 0.464 mgd flow anticipated to connect to the City's WPCP in 2026, the fourth clarifier would be needed in 2028. Without the Town's additional flow, the fourth clarifier is needed in 2029. Finally, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement.
			3	Information and analysis are needed to fully understand the impacts of removing the equivalent of 1/8th of Big Chico Creek's average annual flow out of the current hydrological cycle based on projected peak flow at sewer build out. The long-term impacts of effectively pumping that much water out of the hydrological cycle helping feed local aquifers and creeks (chiefly, Butte Creek, the last viable salmon run off the Delta river system) is unconscionable. Paradise, pre-Camp Fire, was renowned for its forest, largely of Ponderosa pine, growing at lower altitudes than commonly encountered. The additional ground water these trees received from leach lines, not to mention additional nutrients, helped support this rich forest. Taking that life support away will certainly forever change the forest of Paradise's future canopy. Property owners wishing to replicate that forest will need to pump even more ground water to use in their landscapes further exacerbating the drying of downstream aquifers.	The Proposed Project does not include any pumping of groundwater. We understand you are referring to the removal of leach fields and the presumed loss of water to the local system. The Paradise Irrigation District (PID) supplies water to the Town of Paradise, as demonstrated in Section 3.5.1 of the Draft PEIR. From 2022 PID UWMP: "PID overlies an area with fractured rock aquifers as the only potential groundwater supply. These types of aquifers are not expected to provide a significant source of water". At the time of plan preparation, PID is not within a designated basin and not subject to compliance with the Sustainable Groundwater Management Act (SGMA). Big Chico Creek average annual flow is 300 cfs (https://sacriver.org/explore-watersheds/eastside-subregion/big-chico-creek-watershed/#:~:text=Records%20show%20that%20the%20average,during%20winter%20storm%20runoff%20events.), or 139.9 mgd (https://www.convertunits.com/from/cfs/to/million+gallon/day+[US]). At the Project's proposed full buildout, which may not occur until 2057, the projected flow would be 0.464 mgd, which is 0.3% of the Big Chico Creek average annual flow, not 1/8th.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			4	The proposed path crosses three surface flow creeks (Butte, Comanche and Little Chico) that countless wildlife (and residents) relies on for sustenance and recreation. While the current engineered solution for these crossings may provide sufficient cover, over time, erosion will continue to drop current creek elevations eventually exposing these lines making them vulnerable to damage and leakage.	The proposed pipeline path does not cross surface creeks; it goes underneath them at a minimum depth of 20 feet below the creek bed surface (as stated in Section 2.5.2.2 of the Draft PEIR, and shown in Figure 2-14). Further, it was determined that "Operation and maintenance activities… would not include ground disturbing activities that could expose or disturb soil. Therefore, operation and maintenance of the Proposed Project would not result in substantial soil erosion or the loss of topsoil" (Section 3.7.4.2). The Town's sewer system management plan, outlined in Section 2.8, will contain a sewer overflow response plan to respond to damage or leakage of the pipeline system, including the following minimum requirements: "Proper notification procedures so that the primary responders and the regulatory agencies are informed of all overflows in a timely manner;... Procedures to ensure that appropriate staff and contractor personnel are aware of and follow the Town's sewer overflow response plan and are appropriately trained to do so;... A program to ensure that all reasonable steps are taken to contain untreated wastewater and prevent discharge of untreated wastewater to waters of the US and minimize or correct any adverse impact on the environment; The Town Public Works Department would have on-hand the equipment and spare parts necessary to rapidly implement a repair."
			5	The system will require frequent clean out and regular servicing in order to remain functional. To fail to do so could result in calamitous disaster and contamination of numerous entities (rivers, creeks, farmland, etc.). Encumbering future municipal operations with this laborious task over such a long pipeline will certainly result in failure and/or increased costs to the consumer. There is simply no way to guarantee that funding for this team of pipeline workers and equipment will be sustainable.	Section 2.8 of the Draft PEIR includes inspection, monitoring, and maintenance procedures that will be included in the Town's sewer system management plan, which is required to comply with the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems. Procedures that relate to clean out and regular servicing include, but are not limited to, the following: "Inspections of the Core Collection System and the Export Pipeline System would occur one to two times per year, depending on deposition observed within the system… As needed, based upon the results of the camera inspections, the pipelines would be flushed to push deposited material farther down the pipelines to the Chico WPCP… Physical inspection and maintenance of instrumentation would occur monthly according to the maintenance protocols that accompany the instruments." Funding for operations is outside the scope of this PEIR. As commenter provides an opinion on future funding availability with no reference, the Town can not respond to the final sentence.
			6	Paradise's septic waste system served to provide a governor to check unbridled growth. Removing that check, will certainly further increase Paradise's growth potential resulting in an escalating list of long-term impacts for future Butte County residents. The increase growth potential will make future fire suppression impossible, trigger roadway expansion, increase sprawl and further tax our limited natural resources, most acutely, our water resources.	We appreciate all viewpoints and opinions expressed by our community; however, since this comment consists of strictly opinion on future growth potential with no supporting evidence, the Town has no response to the commenter's thoughts. However, growth inducing impacts in the Town have been analyzed and are outlined in Section 4.4, and it is concluded that "Any inducement of the population growth that might occur as a result of the Proposed Project in the shorter term would be a return and/or regrowth and repopulation toward pre-fire levels. Any growth beyond pre-fire levels that could occur in the longer term would be consistent with the *Town of Paradise 2022-2030 Housing Element Update* (Town of Paradise 2022a). This growth would be limited by (1) the current boundaries of the Town, (2) the capacity of the Proposed Project infrastructure, and (3) the Chico WPCP operational (disposal permit allowance) and existing plant infrastructure (facilities limitations) capacity." Further, as noted in multiple locations in the Draft PEIR, this CEQA effort is limited to within the Paradise town boundaries and does not allow for sewer connections outside of the Town.
			7	This country has a rich history of failed environmental engineered solutions to current challenges. Measures like this start out seemingly a "good idea at the time" only to create unforeseen impacts for future generations to solve.	We appreciate all viewpoints and opinions expressed by our community.

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			8	I encourage you to reconsider grandfathering in previous property-owner's septic systems to allow our neighbors who have suffered so much to return to their homes and preserve the future of Paradise by ensuring large developers a toehold to urbanize our beloved mountain communities.	The scope of the Proposed Project is intended to cover the Core Collection System, and at a programmatic level, cover the potential for future connections at the request of property owners outside of the Core Collection, yet within the Town limits, which is considered in the Extended Collection System assessment. This includes an opportunity for other Town property owners to apply to connect to the sewer system in the future, following buildout of the export system. Further, Section 1.1.2 of the Draft PEIR states: "The overall purpose of the Proposed Project is not to serve the entire Town; areas will continue to exist that are served by the existing Onsite Wastewater Management Zone. Instead, the Extended Collection System would provide an opportunity for other property owners within Town limits to connect."
Ryan Duncanwood	Aug 22, 2022	W18	1	ITS GOOD	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community.
Bud Linggi	Aug 22, 2022	W19	1	I lived behind the Optimo Lodge from o/a 1948 until I went into the Service, 1960. Of course, along the way of those years, my dad went to Chico, down Neal Road, for the Crocker Bank and I might have accompanied him and used a restroom after he made the deposit. By this time, local dogs wiped out our chickens and after the Crocker Bank, we went to a Chico outfit that gave us the number of cleaned chickens we needed. The following week our destination was some place in Oroville for the steaks we needed for the next week, a long trip down Clark Road was used. So when talk of sewers for Paradise comes up, I remember the leech fields where I got my fishing worms...	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community.
Diane Pajouh	Aug 22, 2022	W20	1	I would like to request that we do not damage our new Skyway Roads that have just been installed/updated. Thank You.	Repaving of roadways would occur consistent with Town policy, such that Town paved areas that are impacted by the Proposed Project will be repaved in full lane widths, to avoid trench patchwork. For those roadways not within the Town, Butte County or the City of Chico would have jurisdiction over any repaving requirements for those sections of road.
Mike Petersen	Aug 22, 2022	W21	1	Has the town looked into putting turbines inside the 18 mile pipeline to generate electricity? I believe this has been done in other cities and might give Paradise a chance to control our own energy independence.	Thank you for your input. This is not currently part of the proposed project, as directed by Town Council.
Michael Schwartz	Aug 22, 2022	W22	1	Not the best idea they have. For too many reasons. I vote no.	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community.
Gary Wolt	Aug 22, 2022	W23	1	What policy is in place to control cost increases in the future?	Thank you for your comments and questions. The City of Chico will be the wastewater operator for the Chico Water Pollution Control Plant, and the treatment portion of the fees will be administred by the City. The Intermunicipal Agreement (IMA) between the Town of Paradise and the City of Chico addresses noticing for costs, which are compliant with all public noticing requirements for future rate increases. The Principles of Agreement, which will inform the IMA are available on the project website at paradisesewerproject.com.
			2	Will the town of Paradise be subsidizing Chico's wastewater system, with no control on whatever increase they want or need. The ability to justify any price increase seems to be a normal phenomena.	The Town of Paradise and the City of Chico performed an assessment of the value of the existing City of Chico Water Pollution Control Plant, which are included in the Technical Memorandum and reports located on Paradisesewer.com. The connection fee identified pays for the value of the plant at the time of connection, and accommodates the Sewer Service. See response to Comment #W23-1 for more information.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			3	Are they incorporating any valving in the design for emergency use in the event that the pipeline or Chico's waste water facility experiences a catastrophic failure?	Yes, appropriate valving is being provided. As part of the discussion under *Flow Control and Metering Structure* in Section 2.5.2, in description of transition chamber, it is stated: "The first below-ground chamber would be dry (the wastewater would remain within the pipe that is exposed within the chamber) and would contain a magnetic flow meter and a pressure gauge on the pipeline, with the chamber being the access point to this flow meter. The second chamber would be wet, with the wastewater discharging into the chamber via a modulating plug valve. A modulating plug valve would keep the Transition Chamber and Gravity Force Main Sections full, to maintain the hydraulic function of the Gravity Force Main Section.
			4	Would valving be in place to allow Paradise to construct there own wastewater facility, or have a load out facility at a future point in time?	No, there is no valving being provided for a future Paradise wastewater facility, nor is any accommodation being provided for a load out facility, as these fall outside the scope of the proposed Project..
Matthew Carlson	Aug 23, 2022	W24	1	I support the sewer project and along with it believe a multi use path would be an invaluable asset to the community. It would encourage community health and growth. Paradise lacks safe routes currently so this is needed.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Tony Catalano	Aug 23, 2022	W25	1	Please include a bike lane!	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Rob Williams	Aug 23, 2022	W26	1	Caltrans funded a bike riding tourism study and our Final Report identified several Signature Bikeway Routes i.e. East Bay Mud Pipeline. The report has an economic analysis of adding bike/walking paths to a local economy. See, BikeValleytoSierra.com	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Kevin Baxter	Aug 24, 2022	W27	1	I would like to mention my support for the addition of a multi use path along the Skyway during construction of the sewer line. This path would be of historic interest as it would continue the "line" used by trains in the past as well as provide a safer route for non motorized travel to and from Paradise via the Skyway. The path would also be a viable option as an alternative route for emergency vehicles or as an additional route of evacuation, should the need arise. Thank you in advance.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Steve DePue	Aug 24, 2022	W28	1	It would be an ideal time to put in a wide paved bike trail up to Paradise on the skyway corridor. You could also put in fiber optical cable for internet use along the same right of way with the sewer project. Take advantage of multiple uses for the construction project on the sewer system. Also, the paved bike path provides superior access to the fiber optical cable and sewer lines when repairs or access is needed. Perhaps power could also be delivered from the Chico area to Paradise in an underground line rather than on poles! Planning makes for a better future!	Thank you for your comment.The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.

Andrew Keller	Aug 24, 2022	W29	1	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. Such a path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
William Llamas	Aug 24, 2022	W30	1	Seems the Draft PEIR a done deal? So confusing. We need a more comprehensive review other than a commission and/or Board. A citywide meet up for face to face speaking is necessary. And are there any ideas on building UP in downtown. Apartment buildings may be most suitable for many residents. What about beautification projects with help of citizens? So many ideas and no leadership. Time is a wasting and we should have already planted thousands of trees.	Thank you for your input. The PEIR provides the environmental review for the proposed Paradise Sewer Project. Density (multi-family housing or vertical construction) becomes more feasible with a sewer system, and is one of the benefits of the sewer project. Section 1.3.1 of the Draft PEIR describes the public notices, scoping meetings, and public review meetings that have taken place so far: *"Due to restrictions under State of California Executive Order N-33-20, scoping for the Proposed Project occurred under Coronavirus Disease 2019 (COVID-19) restrictions; therefore, electronic postings, virtual meetings and physical mailings were the appropriate venues for information distribution… The Town hosted two virtual public scoping meetings to seek public and stakeholder input on the environmental scope of the Proposed Project. The first virtual public meeting took place on May 13, 2021, and included 29 public attendees. The second virtual public meeting took place on May 25, 2021, and included 14 public attendees. Public meeting attendees were encouraged to ask questions and provide input on the Proposed Project and process."* Beautification projects and other potential Town projects are not included in the scope of this sewer system assessment, but all comments are being reviewed by the Town for future opportunities.
Bruce McLean	Aug 24, 2022	W31	1	I live along the Little Chico Creek bike path and have cycled to Paradise up the Skyway at least once a month over the last 7 yrs. It was very disappointing not to see a dedicated two-way bike path installed when PG&E put their electrical infrastructure underground. Then it was extremely disappointing when a dedicated bike path was not installed when the Skyway was recently paved. Let's not strike out by not creating a dedicated bike path when the sever line is extended from Paradise to Chico.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Jeri Valdez	Aug 24, 2022	W32	1	I decline the project in it's entirety! If it does not service ALL main roads as well as the WHOLE community. What is the point? Makes no sense at all.	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community and the Town is considering all comments in preparation of the Final PEIR. The Proposed Project includes the opportunity for property owners outside of the initial Core Collection System to connect to the sewer system. See Section 2.5.3 of the Draft PEIR: "The Extended Collection System would be an extension of the Core Collection System that would allow collection of sewage from parcels outside the Core Collection System, within the Town limits."

Kevin Cook	Aug 25, 2022	W33	1	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. This path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path. I am an avid local cycler and this would only encourage more cyclists to come visit and recreate in our community.	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
Kim Hunter	Aug 25, 2022	W34	1	I am preparing comments on behalf of the Butte County Public Works Department. Is there an email address that can be used to send comments on Monday? Thank you, Kim Hunter, Project Manager Land Development Division Butte County Public Works Department	Kim, I received your email about how to submit comments for Monday. You can send them to this group via email [email addresses included: Stanley, Ashley <astanley@townofparadise.com> , Curtis, Colette <ccurtis@townofparadise.com>, Mattox, Marc <mmattox@townofparadise.com>] or submit a hard copy in the mail. Thank you, Ashley
Monica Zukrow	Aug 25, 2022	W35	1	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. Such a path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path. Thanks for your consideration!	Thank you for your comment. The Proposed Project includes a sewer pipeline and wastewater collection system. The design and construction of pedestrian or bicycle facilities are outside of the scope of the Proposed Project. Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town. Your recommendations have been noted and will be referred to the County as a potential feature for coordination with future project opportunities.
David Copp	Aug 26, 2022	W36	1	It seems as though the Draft PEIR has been reasonably well considered. We will never know all of the impacts in advance, but the benefits of the project seem to outweigh the impacts, and it needs to progress.	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community.
			2	We think the sewer coverage area should be expanded. We have a multifamily property at 5830 Greenthumb Lane, which is just outside of the coverage area, even though it covers the area essentially across the street (Elliott Rd). We would like to have our property included, please. Thank you	The Sewer Service Area for the Core Collection System includes the commercial core and most densely populated area of the Town. Properties outside of the Core Collection System coverage area and within Town boundaries are intended to have the option to consider connecting to the sewer system as part of the Extended Service Area.

Ward Habriel	Aug 26, 2022	L6	1	First, the responsibility of Government is the safety and protection of its citizens; our basic rights of life, liberty and property. When you meet those basic rights; then, and only then, do you look for other benefits to the community that you govern. So, the question is about the Town Govt. meeting the basic needs of the folks in Town. The basic services for public safety are police, fire, and emergency medical services. Then ask yourself if you feel safe with the current facilities and staffing. (Remember, the third fire station was never built, the hospital is gone, and our cops are stretched thin). And there is no plan for change in these vital areas. Having a sewer does not correct or improve the absence of the above. We are no safer by having a sewer!	Thank you for your input. This comment has been considered, and is outside the scope of the PEIR.
			2	Second, there is no good justification to change from a septic system to a sewer system. Septic systems have worked extremely well for many rural communities for many many years. In Paradise, we have had very few failed or questionable septic systems; but let me just highlight a few examples of addressing a 'questionable' system. Cozy Diner: The Town, (based on limited space concerns) wanted to close the restaurant; there was no room to extend the leach field and the volume produced at the diner was exceeding the capacity of the existing septic system. Cozy management found a solution, agreed to spend a lot of money, and made the necessary improvements. Next, the Holiday Market leach field (it is under the asphalt parking lot) (which is not the best location for a leach field); Holiday was willing to spend a lot of money to dig up the old system and replace it with deeper drainage. It works just fine. Next, the MacDonalds Restaurant on Clark Rd. Here was another "questionable" leach field, and there was not enough property to expand it. MacDonalds Corp. increased the parking lot size to accommodate additional leach field space (at a substantial cost). And lastly, the new Safeway Store on Skyway, they wanted to add a gas station and restaurant on the property, but there wasn't enough space for an extended leach field. So, Safeway Corp. bought additional acreage to be able to accommodate a larger leach field. Each of these examples show that whatever the concern is from the Town about a septic system, there was a remedy, if the property owner was willing to spend the dollars and improve the system. Have you ever heard of someone having an 'ailment' of any kind, because the septic system failed? Septic systems are not unsafe or unhealthy. There are other CA communities with similar concerns that have never been forced by the local Govt. to re-do their septic systems.	We appreciate all viewpoints and opinions expressed by our community. Section 2.3.1 *Project Need* includes information from the Centers for Disease Control and Prevention (CDC), including: "Research on septic system failure is limited, but some research indicates that septic systems should be studied more carefully. “In 2013, the Centers for Disease Control and Prevention (CDC) looked at nearly four decades of data on disease outbreaks linked to drinking untreated groundwater. The data was drawn from 248 outbreaks that were reported to the CDC between 1971 and 2008. Of the 172 cases in which a source of contamination was determined, 67 percent were linked to a septic tank or an improperly designed well” (Circle of Blue 2015)." Further, Section 2.3.2 *Project Objectives and Goals* provides references and information from the State Water Resources Control Board and engineering findings that demonstrate the value of changing to a contained sewer system. In addition, examples noted in your comment focus on very large corporate entities that have surplus resources; however, small businesses that would also support diverse economic growth in the Town may not have the capital to fund such property expansions that, as you note, can be quite substantial in cost. Therefore, small businesses may not be able to open new retail stores or restaurants, which can then limit opportunities for regrowth of the downtown retail area.

			3	Looking at the benefits to having a sewer system, is not based on what problems you get rid of (see above); but consider the possible benefits to collection sewerage, treating it, and using the effluent. Many folks thought that if the Town got some benefit from having a sewer system, then maybe it was a good idea. There are samples all over CA where treated wastewater is used for irrigation (especially on large grass areas - schools, playgrounds, golf courses, cemetery districts, etc.) Anywhere that reclaimed water can be used reduces the amount of potable water used. Some communities have plumbed all the fire hydrants with treated wastewater. But that is not the plan for Paradise (there was an original plan to have local treatment), but the current proposal is to run a pipe (nearly 20 miles) from Paradise to Chico. The wastewater from Paradise would end up at the Chico treatment plant. The discharge of treated wastewater goes into the Sacramento River; ergo, neither Paradise nor Chico get a benefit from our wastewater.	We appreciate all viewpoints and opinions expressed by our community. This is a statement of opinion and the subject matter is responded to in depth in the commenter's remaining responses and in responses to Mr. Ripley below.
			4	And, there are costs that go along with having a sewer system: a cost to get hooked up (including, the digging up the street), a cost to discharge, a permit fee (annually or monthly), and, is that cost then passed on to consumers?	The Town is seeking grant funding for the design, right of way and construction phases of the project. The sewer pipe and lateral to the property line will be covered by the project costs. When the septic system switches over to sewer, the cost to connect the commercial facility to the sewer system will be borne by the parcel owner. The parcel owner will also be responsible for monthly sewer service fees once connected to the sewer. However, costs are not detailed in the PEIR, as they will be determined by the Town once the PEIR is approved and funding is identified.
			5	Would all the commercial facilities with new sewers raise thier prices to cover the costs of using a sewer?	The Town is seeking grant funding for the design, right of way and construction phases of the project. The sewer pipe and lateral to the property line will be covered by the project costs. When the septic system switches over to sewer, the cost to connect the commercial facility to the sewer system will be borne by the parcel owner. Commercial facilities would determine pricing for their merchandise/services.
			6	Would Paradise folks go to Magalia (with no sewer) and shop to avoid the price increases in Paradise?	We appreciate your thoughts and opinions, but can not forecast customer behavior, nor what commercial owners will charge for services.
			7	Wouldn't it be nice if there was a plan to use treated wastewater here in Paradise to irrigate our new golf course?	This comment has been considered, and is outside the scope of the PEIR.
			8	Other comments: there are septic systems in CA, where there is no requirement for an inspection every ten years.	This comment has been considered, and is outside the scope of the PEIR.
			9	There is a summary of numerous comments/complaints I received since the question of a sewer for Paradise came up seven plus years ago. But, remember, this happened before and the Town Council was 'recalled'!	This comment has been considered, and is outside the scope of the PEIR.

Maurine Hansen	Aug 26, 2022	W37	1	I just finished paying off a $22,000.00 hookup bill in another address. We were not in the zone to be on the first to hook up from septic, to sewer, so were required to wait. We were not able to hook up, but years later we were required to and the price hugely increased. We were told the cost would be even more if we didnt do it "now". I now live in a zone that is not part of the first hook ups. Does that mean another huge financial cost to me, in the future?	The Town is seeking grant funding for the design, right of way and construction phases of the project. The sewer pipe and lateral to the property line will be covered by the project costs. When the septic system switches over to sewer, the cost to connect the commercial facility to the sewer system will be borne by the parcel owner. The parcel owner will also be responsible for monthly sewer service fees once connected to the sewer. Costs for connections within the Core Collection System area or at the Expanded Collection System area are not evaluated in the PEIR, as they will be determined by the Town once the PEIR is approved and funding is identified.
Roger Cole	Aug 28, 2022	W38	1	The proposal to hook Paradises new sewer system to an expanded Chico sewer water treatment system at the Sacramento River sounds good at first. It saves money and utilizes efficiently excess capacity of said water treatment facility. It also simplifies Paradise's process into a pipeline construction project. However, as we all have noted from the years of the long ongoing drought, the foothills need every drop of water they can get and /or save or reuse. This plan will export millions of gallons of water from Paradise, and therefore is not good. Instead the wastewater should be treated and returned as close as possible and feasible to the water area it comes from. The single best feature of the existing septic tank/reach line system has been retention of treated wastewater in the ecosystem. A similar goal can be accomplished by constructing a primary sewage treatment plant in Paradise followed by a final treatment in a constructed wetland polishing system. This will produce many local benefits. After the wetland the water can flow to another reservoir location or allowed to be absorbed into the ground or flow through a stream, other kind of recharge. The benefits of retaining water cannot be overestimated. Streams with added wastewater-effluent can improve water quality and support water re-use, while creating habitat and providing urban amenities The Cost–benefit analyses of stream-flow augmentation projects many times fail to account for the full value of ecosystem services provided, including renewed habitats and enhanced urban amenities. *(References provided in original attached letter)*	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community. As required by CEQA (CEQA Guidelines Section 15126.6), the City has reviewed alternatives and examined thoe which meet the goals of the project and reduce the potential for environmental impacts. One of the goals of the Proposed Project (Section 2.3.2) is to address the public health threat by removing individual septic systems. Other goals discussed in the same section noted above, was to allow return of population, and to provide for affordable housing. The local treatment option has been reviewed a number of times (Section 2.2) and each time it has been determined that the regional connection ws recommended as the best long-term solution for the Town (Section 2.2.1). Therefore, in 2020, the Regional Board stated that "it is the Board's strong recommendation for the Town to conserve limited resources and focus its feasibility analysis on the regionalization option" (RWQCB 2020, as referenced in Section 2.2.2). Further, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
Butte County Department of Public Works	Aug 29, 2022	L7	1	1. Permitting Authority: The PEIR acknowledges that the details of the required permitting and agreements that will be needed for the construction and ongoing operations of the Export Pipeline System within the County right-of-way have yet to be determined. Table ES-1 summarizes the anticipated required project permits and approvals for agencies and jurisdictions (p. xxiv). However, the table does not specify permitting authority for Butte County. The need for obtaining encroachment permits for work within the County rights-of-way is discussed several times in the PEIR, including Section 1.5 *Issues to be Resolved* (p.10). Butte County is a Responsible Agency based on its discretionary approval power over certain aspects of the project including permitting authority which should be specifically recognized in Table ES-1.	As discussed in the Draft PEIR in Sections ES1 and 1.1, which indicate "Butte County… [is] considered [a] Responsible Agenc[y] under CEQA based on their discretionary approval over aspects of the Proposed Project and their utilization of this PEIR for their CEQA compliance. Specifically... The County will rely on this CEQA analysis to make its decision on project elements impacting County-owned and maintained rights of way". More specific language (see new bolded text below) clarifying Butte County's permitting authority has been added to the "Permit, Approval, or Clearance" column in Table ES-1 and Table 1-1 in the Final PEIR, to read: Approval for installation and operations and maintenance of the export pipeline and any appurtenant facilities located within County rights of way; specifically for encroachment permits within County rights of way.
			2	2. Impact HAZ-6 Impact and Analysis: Section 3.9 Hazards and Hazardous Materials does not appear to provide adequate discussion and analysis on how the proposed mitigation measures will reduce Impacts HAZ-6 and HAZ-7 to a less than significant level. Impact HAZ-6: Impair implementation of or physically intefere with an adopted emergency response plan or emergency evacuation plan Impact HAZ-7: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires The Department requests that additional discussion and analysis should be provided in the PEIR to demonstrate how the proposed Mitigation Measures, specifically MM-HAZ-3, MM-HAZ-4, and MM-HAZ-5, will reduce the identified significant impacts to a less than significant level. For example, further discussion providing information on the importance of a Rapid Demobilization Plan and how rapid demobilization will be critical during an emergency would support the proposed mitigation measures.	In response to the comment, the following text has been added or updated to Section 3.9.4.6, Mitigation. **Per Section 3.9.2.3, any contractor on the project, whether in the Town, City or County, will be required to implement procedures defined in the Butte County Local Hazard Mitigation Plan Update, as adopted and annexed by the Town of Paradise. As stated in Section 3.9.2.3, The Butte County Local Hazard Mitigation Plan Update (Butte County 2019b) includes an assessment of the county's risk and vulnerability related to natural and other identified hazards and a comprehensive mitigation strategy which includes actions and projects designed to mitigate or reduce the impacts of those hazards and to increase community resiliency. The Proposed Project will be held to the strategies in the Butte County Local Hazard Mitigation Plan Update. In addition, the same section also refers to the Butte County General Plan 2030 (Butte County 2012), noting that the Town would be held accountable to multiple goals and associated policies related to hazards and hazardous material, such as: "Policy HS-P15.3: Emergency access routes shall be kept free of traffic impediments." Finally, Section 3.9.2.3 also states that the Town will be held to their own policies presented in drafts of the "Town of Paradise General Plan, Safety Element (2022) and Hazardous Waste Management Element (2022)". Policies within these elements include: Policy SP-1: New and unmitigated land use development shall not cause the police and fire protection services emergency response times to fall below the service levels established by this plan, and Policy SP-2: Through the development review process, adequate roads shall be required to be constructed and/or improved for emergency vehicle access, particularly in high wildland fire hazard areas. Proposed Project mitigation measures, discussed below support implementation of the County and Town policies by ensuring evacuation routes would not be blocked during an emergency, that emergency response services have access to major routes, which is critical during an emergency, and that there is a plan for rapid demobilization in a situation requiring evacuation.** Further, for each of the three noted mitigation measures, the following has been added to restate existing requirements prior to describing mitigation measure: **The Proposed Project will be held accountable to the Butte County Local Hazard Mitigation Plan Update and policies included in the Butte County General Plan and the Town's draft Safety Element (2022) and Hazardous Waste Management Element (2022).**

			3	Both the Rapid Demobilization Plan and Evacuation Warning Procedures should be provided to Butte County Public Works for review as part of the encroachment permit application process.	In addition to the Town's commitment to the Butte County Local Hazard Mitigation Plan Update, per commenter's request, materials developed during implementation of MM-HAZ-4 (Rapid Demobilization Plan) and MM-HAZ-5 (Evacuation Warning Procedures) will be provided to Butte County Public Works during the encroachment permit application process.
City of Chico Public Works Department	Aug 29, 2022	L8	1	The City understands that the Paradise Sewer Project (Project) is a critical component to the Town of Paradise's (Paradise) overall Camp Fire recovery effort and that the design of the project is in an early phase. Given the scope of the Project, the alignment of certain segments of the proposed pipeline, the location of associated equipment located within or adjacent to the City limits and Sphere of Influence, and the pipeline's ultimate connection to the City's Water Pollution Control Plant (WPCP), we look forward to coordinating closely with Paradise during the design, construction, and implementation phases of the Project. Close coordination will be particularly important for numerous reasons, including, but not limited to: 1) Avoiding potential conflicts between the Paradise Sewer Project and the City's proposed infrastructure projects that are located along or adjacent to the Project's proposed alignment (e.g., the P-18 sewer trunkline segments located within the railroad grade in South Chico and within the Entler Avenue and Midway rights-of-way, the intersection improvements at Hegan Lane and Midway, etc.). 2) Ensuring collaboration regarding the design of those project components (e.g., the Transition Chamber located off lower Skyway, the Flow Control and Metering Structure proposed near the WPCP, and all connections to the City's existing and proposed facilities) that are located within or adjacent to the City to avoid and minimize the potential environmental impacts (soil contamination, water pollution, odors, etc.) that could result from system failures.	Thank you for your comments. The Town also looks forward to closely coordinating with the City during the design, construction, and implementation phases of the Project. The Town agrees that close coordination will avoid and minimize the potential environmental impacts that could result from conflicts during construction or system failures at new infrastructure. Further, as discussed in Section 2.8 Proposed Operations and Maintenance, "The... Sanitary Sewer Systems General Order... (SSSGO) applies to all publicly owned sanitary sewer collection systems in California with more than one mile of sewer pipe... and would be overseen by the RWQCB during permitting the proposed project under the (SSSGO). Since the Town's collection system will have more than one mile of sewer pipe, and the Town will own and operate the collection system, the Town will comply with the SSSGO. Per the SSSGO, and subject to its terms, the Town will need to develop a sewer system management plan. The sewer system management plan will include policies, procedures and activities covering the planning, management, operation and maintenance of the collection system." It is anticipated that the Town, County and City will be coordinating as this plan is being developed. Further, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement.
			2	The City appreciates Paradise's inclusion of the permitting requirements in the PEI R, including the Sanitary Sewer Systems General Order and associated conditions requiring the preparation of a Sewer System Management Plan and an Overflow Emergency Response Plan that will be both reviewed and approved by the City of Chico. These documents will provide the policies, procedures and activities covering the planning, management, operation, and maintenance of the collection system. In addition, these efforts will result in emergency response planning to identify measures to protect public health and the environment, particularly as they relate to an inadvertent release of sewage.	The Town agrees with the City's statements, and again, will be coordinating with the City during development of the Sewer System Management Plan. Further, the Town will abide by Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , which requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement.

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			3	According to the PEIR, wastewater studies prepared for the Town determined the Project export pipeline system design should be based on an estimated average wastewater conveyance and treatment need for the Paradise sewer service area to be 0.464 million gallons per day (mgd). Due to the conceptual nature of the inclusion of the entire Extended Collection System outside of the Core Collection System, as identified in Figure ES-1, it is unclear at this time if serving the greater area would have the potential to exceed the maximum design of 0.464 mgd. Any future expansions should be analyzed and agreed to by the City to prevent any unforeseen wastewater exceedances that could negatively affect pipeline and plant capacities.	The 0.464 million gallon per day estimated discharge from the Town of Paradise to the City of Chico Water Pollution Control Plant is the agreed upon discharge, and an effective capacity limit. The Principles of Agreement developed between the Town of Paradise and City of Chico, which are currently being drafted into an Inter-Municipal Agreement to be adopted by the Town Council and City Council, include the maximum discharge amount and methods in which this amount would be monitored and controlled by both the Town and City. In addition, the Principles of Agreement state "The Town and the City agree to prohibit future connections to the export pipeline in the portion of the pipeline that sits outside of the Town limits or City limit." (www.paradisesewer.com, 1st Draft Principles of Agreement version 7, 21-March-2022). Finally, the extent of area and associated flow that could be served by the sewer system within the Town (ie., the core collection system area alone, or expanded to include the extended collection system area) would be forecasted in advance to determine when and if the 0.464 million gallon per day allotment could be reached. At such a time, the Town of Paradise would approach the City of Chico in a similar fashion to determine if a mutual desire existed to accept additional flows from the Town based upon the City's treatment plant capacity, needed connection payments and other factors – similarly as the original 0.464 million gallon per day agreement is currently being negotiated.
			4	The City looks forward to collaborating with the Town of Paradise and its professional sewer design team in the development of the project and looking for partnership opportunities that will benefit both communities.	Thank you for your comments.
Laurie and Jim Noble	Aug 29, 2022	L9	1	*(handwritten letter - transcribed)* Public Information - There needs to be a very accessible public forum of information regarding the Town of Paradise Sewer Project. Very few people have participated and know of plans to date regarding this immense project. Blue Flamingo could be a group to widely disseminate information. There are numerous and very complex issues to deal with as this project moves forward. Residents should have opportunity for input.	Thank you for your comments and reference to Blue Flamingo. The Town has made information available on multiple platforms, to provide information to the community and as required by CEQA statute: 1) the Town has put up a website to include all information related to the Proposed Project (https://paradisesewer.com); virtual public scoping meetings were held in May 2021. 3) In support of the scoping meetings and corresponding comment period, social media and email blasts went out before and after the virtual meetings, postings were made in newspapers (Paradise Post and Enterprise-Record) and project information regarding the meetings and solicitation of public comments were posted at multiple public locations. Similarly, public meetings were held in August 2022 during public review of Draft PEIR. Many of the same outlets were used in this draft release outreach, but "live" public meetings, rather than virtual, were held in Paradise and Chico.
			2	*(handwritten letter - transcribed)* Water Retention: We are hearing from individuals a very strong concern regarding grey water and stormwater retention. Both have been a significant part of Paradise's groundwater for many decades. The installation of signal lights and reconfiguring the intersection at the top of Clarke Road directed stormwater runoff to be diverted from the triangle of land between Skyway Rd and Clark. Trees on that property died over the course of a couple of years. They were cut off from their supply of water. As streets throughout town are repaired and upgraded, will the storm drains immediately run off the ridge or be directed to catchment basins? What are the details of all the plans?	Thank you for your input. The Town is considering all comments in the development of detailed design.

			3	*(handwritten letter - transcribed)* Future Economic Development/Commercial Development: is on hold until a sewer system is in place. What is the time line for installation of the system includiing connection to west of Chico Sewage treatment Plant? How does it fit in with rebuilds and repaving of roadways?	As included in Section 2.6 Proposed Schedule of the Draft PEIR, construction of the Core Collection System is proposed to be constructed between August 2024 and May 2026. The Export Pipeline System is proposed for construction between August 2024 and July 2026. The Extended Collection System would be constructed case-by-case and could occur 2026 through 2056. In terms of roadways, repaving would occur consistent with Town policy, such that Town paved areas that are impacted by the Proposed Project will be repaved in full lane widths, to avoid trench patchwork. For those roadways not within the Town, the County or Chico would have jurisdiction over any repaving requirements for those sections of road.
			4	*(handwritten letter - transcribed)* Cal Poly: water/design ideas presented by students in Spring of 2019 should be revisited. The(y) had some good ideas - how to deal with terrain elevations, as an example.	Thank you for your input. The Town is considering all comments in the development of detailed design.
			5	*(handwritten letter - transcribed)* Santa Cruz: converting from septic tanks to sewer system - abandoned tank --> sink holes - legal disclosures for property sales - Town of Paradise policy - need to deal with.	The Town is considering all comments in the preparation of the Final PEIR and development of detailed design.
			6	*(handwritten letter - transcribed)* Davis: Sewer Issues having to clean to keep system moving.	We appreciate all viewpoints and opinions expressed by our community.
			7	*(handwritten letter - transcribed)* Drought: Issues need to be considered. This is not just in Paradise, in Butte County, in the wester states, in North America, it is a global worldwide issue and needs to be dealt with now.	We appreciate all viewpoints and opinions expressed by our community.
			8	*(handwritten letter - transcribed)* Water Added: to make the sewer system flow clear to the Sacramento River area treatment plant is possilby inappropriate be it fresh potable water added or grey water.	We appreciate all viewpoints and opinions expressed by our community.
			9	*(handwritten letter - transcribed)* Pump up Sewage: from low lying areas of the community to the main lines may be restrictive and financially prohibitive.	Section 2.5.1 of the Draft PEIR provides the preliminary design for the Core Collection System: "The Core Collection System would consist of approximately 157,000 feet of 6- to 8-inch-diameter gravity sewers, 29,000 feet of 2- to 4-inch-diameter force mains, and up to 28 pump stations. The pipelines would be buried approximately 3 to 15 feet below the ground surface, depending on local topography and sewer system design features and constraints." These 28 pump stations would provide the necessary pressure to transition the sewage to the Export Pipeline System. There are no pumps included in design of Export Pipeline System, which depends on gravity flow.
			10	*(handwritten letter - transcribed)* Land installations: Another drought issue the Town of Paradise could and should deal with immediately is lawn development/ installation. Curtail or limit it immediately there is no water, Mount Shasta is bare of snow except for a few glacial remains.	This comment has been considered, and is outside the scope of the PEIR.

Paradise Sewer Project PEIR Comment Matrix

			11	*(handwritten letter - transcribed)* Draft Program Environmental Impact Report, pg 429 Hydrology and Water Quality HYD-2: is in need of more evaluation. The removal of all waters from households and businesses could have a very long lasting impact. Details of well level is swayle when opened to install solar water pump was about 6" from ground level during drought year when wells were failing in the Valley.	The Town believes it conducted sufficient analysis in Section 3.10 to meet the requirements of CEQA. All findings were disclosed and discussed in Section 3.10.4. To clarify one point, the project is limited to sewer effluent, not any potable water, which is managed by Paradise Irrigation District; therefore, there would be no removal of "all waters from households and businesses". At the time of plan preparation, Paradise Irrigation District (which services much of the Town) is not within a designated basin and not subject to compliance with the Sustainable Groundwater Management Act (SGMA). The nearest adjacent basin is the Vina Groundwater Subbasin, of which the Paradise contribution is negligible. Groundwater existing conditions are described in Section 3.10.1.3 Groundwater.
Dana Ripley	August 29, 2022	L10	1	The opportunity to provide this public comment on the Paradise Sewer Project Draft ProgramEnvironmental Impact Report (PEIR) is appreciated. As you are aware, I have been advocating for nearly two years a local water reuse project in Paradise as an alternative to the 18-mile wastewater export identified as the superior project in the draft PEIR. On November 30, 2021 I submitted to your office a white paper entitled Town of Paradise, Butte County CA, Sewer, Water Reuse and Wildfire Defense Integrated Plan (SWRWD Plan). That white paper is included in this public comment as Exhibit A. *(Exhibit A attached with comment letter following spreadsheet)*	Thank you for your input. We appreciate all viewpoints and opinions expressed by our community. The document you label a "white paper" has been referred to here as "Mr. Ripley's Sewer, Water Reuse and Wildfire Defense Integrated Plan (SWRWD Plan)" and was submitted along with proposal to the project team for review. In the document, engineering and other services are offered by you for the project that is advocated for in the SWRWD Plan, which implies a vested business interest in selection of the SWRWD option, which should be recognized. Throughout our responses to comments below, we will address the points brought up in comments that related to the SWRWD Plan. As explained, the DEIR discusses those alternatives which are reasonable and can adequately achieve the basic objectives and goals of the project, while reducing the proposed project's potential for impacts to the physical environment. Comments and information collected in Mr. Ripley's SWRWD option do not show that the chosen alternatives manifestly are unreasonable. Further, the Town's determination to eliminate the local options was discussed and reasons identified are tabled in Section 5.2 of the PEIR; it is not required by CEQA for the Town to re-defend its findings as discussed in the PEIR. Per *Laurel Heights, supra, 47 Cal.3d at p.393* as referenced in S*ave Our Access-San Gabriel Mountains vs Watershed Conservation Authority, supra, 68 Cal.App.5th 8* , CEQA Guidelines define "substantial evidence as enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." Further, the Laurel Heights court "cautions that a court may not set aside an agency's approval of an EIR on the ground that an opposite conclusion would have been equally or more reasonable. CEQA's purpose is to compel government to make decisions with environmental consequences in mind" (*Laurel Heights, supra, 47 Cal.3d at p.393* as referenced in *Save Our Access-San Gabriel Mountains vs Watershed Conservation Authority, supra, 68 Cal.App.5th 8*). The Town's proposed project was not found to cause any environmental consequences after applying appropriate mitigation measures (Section 3.20 of the PEIR). Having said that, the Town has decided to respond to Mr. Ripley's comments, to the extent the comments are supported by fact and documented calculations.
			2	In light of the broad implications of the export versus local reuse options for Paradise, it may be instructive to consider the California Environmental Quality Act (CEQA) Guidelines which includes as an advantage of the “Program” EIR the following: Allow the lead agency to consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Agreed, the Town has and will continue to adhere to CEQA Guidelines Section 15168 (b)(4). In addition, Section 15126.6 (a) states: "An EIR need not consider every conceivable alternative to a project..." and "an EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project..." (15126.6(a)). In findings of *Save our Access-San Gabriel Mountains vs Water Conservation Authority 68 Cal.App.5th 8* , in discussion of the number of alternatives evaluated, the court found: "The rule of reason (in deciding which alternatives to include) 'requires the EIR to set forth only those alternatives necessary to permit a reasoned choice' and to 'examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project.'" (Bay-Delta, supra43 Cal.4that p 1163 was used as reference in court findings).

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			3	Area of Known Controversy #1: Growth Inducing Impacts: **The draft PEIR, Section 1.4, recognizes that there may exist growth inducing impacts specifically in the City of Chico and rural Butte County outside of Town and City limits.** In a November 4, 2020 letter from the Central Valley Regional Water Quality Control Board, Region #5 (R5) addressing the local facility versus regional alternatives for Paradise, the statement is made that the "Pipeline to Chico can be cost-effectively sized to accommodate a large range of flows." In a tabulation of pipe carrying capacities of the 10.5 mile 12" diameter export pipe force main along the valley floor (from Skyway at Butte Creek to the Chico WPCP) utilizing reasonable flow velocities ranging from 3 feet per second (fps) to 7 fps, the available capacity could potentially be as high as 1.758 million gallons per day (mgd) average daily flow (ADF). This capacity is approximately 3.8 times the 0.464 mgd ADF capacity allocated to Paradise in the inter-municipality agreement between Chico and Paradise considered as part of the draft PEIR. The tabulation indicates that up to approximately 1.3 mgd ADF of wastewater export pipe force main capacity could be available to undeveloped properties in southeast Chico as well as rural Butte County along the pipeline alignment. *(All references used in text can be found as part of original letter and exhibits [attached]).*	In reference to the first sentence (bolded in comment), the reference to Section 1.4 and extracted text is misrepresented. The Draft PEIR and the Town do NOT "recognize(s) that there may exist growth inducing impacts specifically in the City of Chico and rural Butte County outside of Town and City limits". Section 1.4 Areas of Known Controversy in the Draft PEIR (which is the section referenced in the comment) does state that these potential impacts "have been raised by other agencies, the public, or other stakeholders" and that the issue has been previously communicated to the Town or identified in the PEIR scoping process - there is no statement in which it could be inferred that the Town recognizes this issue may, in fact, be valid and Section 4.4 Growth Inducing Impacts speaks specifically to the Town's rebuttal of the potential for inducement in the City or Butte County, stating: "There would be no precedent-setting action that might trigger expansion of the Town as the proposed sewer system would not change Town boundaries and does not allow for service beyond those boundaries. As such, there would be no resulting development or encroachment to isolated or adjacent areas of open space. Further, the Proposed Project would not trigger unplanned expansion of the existing Chico WPCP. The proposed sewer service is within the current capacity, facility function, and purpose of the Chico WPCP." In addition, the engineering work completed by HDR did not include provision for any such additional connections to the Gravity Force Main. Finally, the Principles of Agreement developed between the Town of Paradise and City of Chico, which are currently being drafted into an Inter-Municipal Agreement to be adopted by the Town Council and City Council, states "The Town and the City agree to prohibit future connections to the export pipeline in the portion of the pipeline that sits outside of the Town limits or City limit." (www.paradisesewer.com, 1st Draft Principles of Agreement version 7, 21-March-2022). In conclusion, as noted multiple times in the Draft PEIR and demonstrated above, the scope of the Draft PEIR and any CEQA clearance that it would provide would be limited to infrastructure to support sewer connections within the Town of Paradise boundaries. In regard to the export pipeline, the section of the export pipeline referred to in the comment is the Gravity Force Main. Again, the comment appears to relate to a concern about additional connections happening along the export pipeline, between the Town of Paradise and the Chico Water Pollution Control Plant. As stated in Section 2.5.2: , "A single 12-inch diameter pipe is needed for the Gravity Force Main for pipe to flow full, creating a beneficial force main based on the hydraulic behavior of the sewer (eliminating the need for a pump station, which is not a part of this system), so the effluent can reach the Chico WPCP. No pump stations would be required" and "A modulating plug valve would keep the Transition Chamber and Gravity Force Main sections full, to maintain the hydraulic function of the Gravity Force Main Section. The Gravity Force Main was sized based on a differential head criteria, not based on a velocity criteria, such as the 3 to 7 feet per second figures stated in the comment.

Paradise Sewer Project PEIR Comment Matrix

			4	Area of Known Controversy #2: Reconsideration of Local Treatment Option: **The draft PEIR, Section 1.4, recognizes potential reconsideration of local treatment plant construction instead of the proposed connection to the Chico WPCP, which was evaluated in 2017 and 2020.** In both Bennett 2017 and HDR 2020, the local treatment alternatives described did not consider distributing recycled water to all parcels served by the sewer system. Conversely, the SWRWD Plan considers extensive urban reuse serving all collected parcels thereby adding a water supply component to PID's portfolio enhancing its drought preparedness and supply resiliency. As described in the white paper, the dual distribution included in the SWRWD Plan has multiple benefits including 1) delivery of non-potable recycled water for residential, park, sports, commercial, and buffer area irrigation, 2) seasonal shallow aquifer recharge in winter months, 3) automated community-scale wildfire defense for essential facilities, public/private buildings and evacuation routes, 4) high pressure supplemental water supply for fire suppression, 5) protection of Paradise Irrigation District's (PID) potable distribution from depressurization in the event of another extreme wildfire event, and 6) beneficial use of nutrients inherent in municipal wastewater. The draft PEIR, Section 5.2.1, Table 5.2-1 Local Alternatives and Reasons for Elimination from Consideration, lists as Local Alternative #3: Local WWTP with Water Recycling with the Town for Local Reuse and Wildfire Defense. In response to the 12 bullet points asserting infeasibility, included in this public comment is Exhibit 2 providing a rebuttal to each point individually in table format. *(Exhibit 2 rebuttals are considered separately beginning with Comment #9 below; all references used in text can be found as part of original letter and exhibits [attached]).*	Similar to the response in Mr. Ripley's Comment #3, the bolded text in this comment has been misrepresented and it is not true that the Draft PEIR or the Town recognizes this statement as accurate; in fact, the Town rebukes reconsideration of the local option and provides reasoning for the elimination in Section 5.2.1, Table 5.2-1. Thank you for sharing your document (referred to in the responses as "SWRWD Plan" - see response to L10-1) that provides your personal viewpoint regarding one of multiple local project options that have, in different forms, been considered by the Town. As noted in the comment, the "Local Treatment Option", which in various forms has been assessed multiple times over the past 10-15 years, was eliminated from consideration and was not carried through the Draft PEIR as an alternative, for those reasons identified in Section 5.2.1, Table 5.2-1. CEQA Guidelines state that an EIR: "must describe a range of reasonable alternatives to the project... which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project..." (CEQA Guidelines Section 15126.6 (d)(a); italics added). *Save Our Access-San Gabriel Mountains vs. Watershed conservation Authority (2021) 68 Cal.App5th 8 at p.18* (Save Our Access) found that "... plaintiff (hadn't) explained how any of the alternatives would 'avoid or lessen one or more of (the project's) significant impacts...". "As the WCA (Watershed Conservation Authority) board found, no significant impacts were identified that could not be avoided or reduced to a less than significant level." (*Save Our Access, proceedings at p.18*). This same condition applies to the Paradise Proposed Project, which realized no significant impacts during analysis that could not be mitigated to a less-than-significant level. Mr. Ripley's letter and all other public comment letters received and responded to in this spreadsheet do not, in fact, present any opposition to specific Draft PEIR significance findings with or without mitigation incorporated, as appropriate. Further, with reference to *South of Market Community Action Network vs. City and County of San Francisco (2019) 33 Cal.App.5th pp. 321, 345* (South of Market) findings, *Save Our Access* ' elaborates; courts found that "CEQA 'does not require that an agency consider specific alternatives that are proposed by members of the public or other outside agencies' " (Save Our Access, supra, 68 Cal.App5th 8 at p.17 with reference to South of Market proceedings pp. 321, 345). Additional discussion on the feasibility and reasoning for elimination of this specific option is included in response to Mr. Ripley's comment #1 above and #9 below.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			5	Lost Opportunity for Recycled Water: Assuming the export pipe force main has an ADF capacity of about 1.8 mgd, the potential lost opportunity for urban water reuse in Paradise and southeast Chico could be as much as 2,000 acre-feet per year (afy). On August 11, 2022, Governor Newsom announced California's Water Supply Strategy, Adapting to a Hotter, Drier Future. Part of the Strategy is to increase urban water recycling in coastal and inland communities to about 0.8 million acre-feet per year (MAF) by 2030 and to about 1.8 MAF by 2040. Urban water reuse in Paradise and southeast Chico would clearly be consistent with the Strategy and likely would be eligible for significant grant funding included in the 2021-2022 $5.2 billion state appropriations for California water systems including water recycling. In its 2020 Urban Water Management Plan (UWMP), PID indicated that the community will continue to work to examine the viability of a centralized sewer system and any associated opportunities to develop a recycled water supply as it continues to recover from the Camp Fire and look to the future of rebuilding and redevelopment of Butte County. The 18-mile export plan would foreclose on any opportunity in the foreseeable future to develop a recycled water supply in Paradise. In similar fashion, Cal Water-Chico District indicated in its 2020 UWMP that Cal Water continues to actively investigate recycled water opportunities, such as satellite, or decentralized, recycled water generation at select areas within the Chico area, for use in that area. The 10.5-mile export force main pipeline would likely also foreclose on Cal Water's ability to a develop recycled water supply in southeast Chico in the foreseeable future. In both Paradise and southeast Chico, the export pipeline would represent a lost opportunity to develop local recycled water resources that might otherwise be available. This would be inconsistent with the Governor's Water Supply Strategy to maximize alternative urban water supplies, including recycled water for non-potable urban demands, for a more secure and resilient water supply future. *(All references used in text can be found as part of original letter and exhibits [attached]).*	In order to best understand calculations and comparisons presented in this comment and others, it may be easier to use consistent measures. Therefore, if you convert 0.464 million gallons per day (0.464 MGD) of Paradise effluent (that is, the maximum proposed to be conveyed to the Chico WPCP in the Draft PEIR) to acre-feet per year, you have 520.09138 acre-feet per year of wastewater (www.convertunits.com/from/million+gallon/day+[US]/to/(acre+feet)+per+year). Once you then convert acre-feet per year to MILLION acre-feet per year, which is referenced in the Governor's strategy and other municipal and agency goals, the maximum wastewater to be conveyed for treatment to the Chico WPCP from Paradise is **0.00052 million acre-feet (MAF) per year.** (https://citizenmaths.com/flow/520.0913772803632-acre-feet-per-year-to-million-acre--feet-per-year). This amount equates to **0.065%** of the 0.8 MAF annual increase goals mentioned in comment that the Governor's strategic plan introduces, which would likely not be considered a significant input in isolation. It is agreed that this .00052 MAF would be conveyed to Chico and, as commenter states, would not be available for Paradise as recycled water. However, Paradise has no authority over how the Chico WPCP treats wastewater, and in the future, recycling of Chico WPCP effluent for secondary use in and around the Chico area could be considered by the WPCP. As stated in the Regional Water Board's letter of November 4, 2020 which is referenced in the Draft PEIR, "The City of Chico already provides recycled water for waterfowl habitat uses, and City staff have stated that expanded recycled water use would be desirable and may be pursued in the future. Revenue generated through regionalization with Paradise could make recycled water projects more feasible for Chico."Therefore, since the Governor's California Water Supply Strategy includes increasing urban water recycling generally "in coastal and inland communities", as you have noted, and given the Regional Water Board's findings noted above, implementation of this project does not represent a "lost opportunity", as the opportunity remains to develop recycled water treatment at the Chico WPCP where there are more available resources, if doing so becomes a viable option for them in the future.

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			6	Issue to be Resolved: Butte LAFCo service extension approval: The draft PEIR, Section 1.5 indicates that Butte LAFCo's approval of the 18-mile extension of sewer service by Chico to Paradise is an issue to be resolved. However, the required LAFCo approval may be in conflict with state Government Code as indicated by the Executive Officer's letter of May 20, 2021 which states: Provisions for extension of service requests are found in Government Code §56133 and in Section 4.5 of the Commission Policies and Procedures. Service extensions outside of an agency's Sphere of Influence may only be approved by LAFCo if there is "an existing or impending threat to the health or safety of the public or the residents of the affected territory. (§56133(c)) . . . . . The City/Town will need to provide documentation/justification of the existing or impending public health and safety threat the extension of services would address. This is a critical prerequisite to the project as it is the *only legally permissible justification available* [emphasis added] to the LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence. Since an existing or impending threat to the health or safety of the public or the residents does not exist, it appears that Butte LAFCo cannot approve the sewer extension request even if it wanted to. The only path forward on this may in fact be a waiver by the state legislature and Governor similar procedurally to Assembly Bill 36 (Gallagher, 2021). Recognizing that the 18-mile extension request is contrary to the Governor's Water Supply Strategy because it could potentially foreclose on up to 2,000 afy of urban water recycling, the Governor would likely not support the waiver legislation even if approved by the State assembly and senate. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Govt. Code Section 56133 applies to the request to Butte County LAFCO for Chico to provide sewer services to the Town through the pipeline; the Town is outside the City's boundary and its sphere of influence: (a) A city or district may provide new or extended services by contract or agreement outside its jurisdictional boundary only if it first requests and receives written approval from the commission of the county in which the affected territory is located. (b) The commission may authorize a city or district to provide new or extended services outside its jurisdictional boundary but within its sphere of influence in anticipation of a later change of organization. (NOTE: Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement. (c) The commission may authorize a city or district to provide new or extended services outside its jurisdictional boundary and outside its sphere of influence to respond to an existing or impending threat to the health or safety of the public or the residents of the affected territory, if both of the following requirements are met: (1) The entity applying for approval has provided the commission with documentation of a threat to the health and safety of the public or the affected residents. (2) The commission has notified any alternate service provider, including any water corporation as defined in Section 241 of the Public Utilities Code, that has filed a map and a statement of its service capabilities with the commission. In Section 2.2, the EIR discusses the existing threat to the health and safety of the public and Town residents from the existing septic systems as follows: "Failed septic systems can release untreated wastewater into groundwater at the ground surface or cause pipe failures in buildings, resulting in environmental degradation and public health risk due to water contamination or exposure to untreated wastewater." Section 2.2 cites multiple studies which assess the public health concerns related to failing septic systems, concluding: "Concurrent to and since the Town's numerous wastewater management studies, public health […] impacts associated with septic system usage continue to persist." In regards to comment on the Governor's Water Supply Strategy, it is important to note that it is a strategy and policy document, rather than a law. Further, the Water Board currently has water reuse policy and regulations in place (https://www.waterboards.ca.gov/water_issues/programs/recycled_water/), and still issued its 2020 Evaluation of Wastewater Treatment Plant Options letter to Paradise with those requirements in place and full awareness of the reuse issue, as can be seen from the letter's reference to recycled water and Chico (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf).

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			7	Scalable to Sewer Entire Town: The export project as proposed in the draft PEIR limits the Paradise wastewater contribution to the Chico WPCP to 0.464 mgd. This limits sewer service to about 1,500 residential and commercial parcels within the sewer service area (SSA). The SWRWD Plan, conversely, is scalable to whatever service area Paradise chooses long term, including service to all 10,600 parcels served by PID pre-fire. This would be consistent with a local Paradise Post press report stating: ***(Congressman Doug) LaMalfa pointed to the sewer as an essential infrastructure need for Paradise. "You know, a portion of this is going to help with that longtime need for a sewer system to this town, which unlocks a lot of possibilities for (Paradise)," he said. He also pointed out that as Paradise rebuilds, it can be part of an important part of California's need to build more housing, pointing out that California is 2.5 million units short of what it needs.*** For context on the limitations with sewer service only to within the SSA, the draft PEIR states: Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. This metric would likely remain unchanged with the 18-mile export plan serving only the SSA – Paradise would still be the largest unsewered community in California since the SSA includes only about 14% of the permitted parcels within the Town. *(All references used in text can be found as part of original letter and exhibits [attached]).*	- As described in Section 5.2.1, Table 5.2-1 regarding the specific reasons for not carrying the local option forward as an alternative in the Draft PEIR, the Town did not find proposed infrastructure corresponding to the local option to be "scalable". As discussed in the draft PEIR and further elaborated on in the Regional Water Board's analysis included in a letter dated November 4, 2022 and referenced in the Draft PEIR, (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf), the options would be to either (1) build small at a lower current cost to accommodate estimated levels of effluent over next 5-10 years and require an upgrade and/or demolish/rebuild of infrastructure at some future cost as the treatment needs increase with population growth in the future, or (2) build facilities to some estimated maximum capacity now at much higher short term costs and only use a small portion of the facilities for the next 10-40 years, depending on realized future population growth. Per the Regional Water Board's findings in their November 4, 2022 letter, the local option would be: "Not easily scalable. (A Paradise) WWTP would be sized for currently-proposed collection system. Adding additional service area in the future would necessitate expansion of the WWTP and conveyance infrastructure. Depending on available Rights of Way and treatment/disposal areas, suitable additional areas may not be available. Further, treatment processes may not be easily scalable without substantial redesign and reconstruction of WWTP elements. Expansion of the WWTP to accommodate larger, future flows would be costly." (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf) - Depending on the final buildout within the Core Collection System area plus the number of future sewer expansions that may be requested during the Extended Collection System implementation, as well as changes that would be expected to occur in other California communities, the Town would not remain "the largest unsewered community in California" with implementation of the Proposed Project, but could become "the largest community in California with unsewered areas". As a note, this sentence was used to introduce the Town's post-fire history and was referenced from Butte County Association of Governments documentation (BCAG 2019a); it was not intended to provide "context on the limitations with sewer service only to within the SSA" as stated in the comment. - The information presented in Mr. Ripley's SWRWD Plan and in his comment letter do not manifestly show the alternatives that were assessed in the draft PEIR are unreasonable or that they do not contribute to a range of alternatives which are capable of attaining most of the basic objectives of the project.
			8	State-of-the-Art Infrastructure: The same local Paradise Post press report indicated that: [Paradise Mayor Steve] Crowder pointed out that the undergrounding project by Pacific Gas and Electric is also a critical project that will make Paradise "a state-of-the-art community with a brand new infrastructure." Beyond underground electrical power distribution, "state-of-the-art" infrastructure should also include sewer collection, potable water distribution, non-potable water distribution, independent high pressure supplemental fire supply, fiber optic distribution, and community-scale wildfire defense integrated with the recently authorized wildfire early warning system. Clearly, all underground utility construction should be coordinated and should precede construction of any new public roads where the utilities are installed. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Thank you for your input. The Town also considers financing options when pursuing a project. The Town is seeking grant funding for Design, Right of Way and Construction of the sewer project, which is available for septic to sewer conversions, but is not currently available for the alternative utility systems described. Analysis of timing and funding for utility construction and new roadways is not included in the Draft PEIR for Town sewer service; CEQA documentation requirements for utilities construction and/or new public roads would be determined and carried out when corresponding projects are defined.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			9	(Appendix B) 1.0 State and Regional Water Board Policies supporting regionalization: Any State Water Resources Control Board (SWRCB) or Regional Water Quality Control Board (RWQCB) policy supporting "regionalization" is an out-of-date policy predicated on "disposal" of wastewater and not beneficial reuse. RWQCB Central Valley Region #5 (R5) Resolution R5-2009-0028 indicating support for "Regionalization" in the same resolution supports "Reclamation, Recycling, and Conservation." In the context of the Town of Paradise proposed 18-mile export pipe, the increased discharge of secondary effluent to the Sacramento River runs against California's long-standing strategy to minimize potable water demand and increase water recycling. The SWRCB encourages water recycling with more recent statewide policies and orders including the 2018 Water Quality Control Plan for Recycled Water and the 2016 General Order for Water Reclamation Requirements for Recycled Water Use. Further, Governor Newsom this month released California's Water Supply Strategy which establishes a plan for significant increases in urban water recycling by both coastal and inland communities. The plan targets an increase of 0.8 million acre-feet (MAF) by 2030 and 1.8 MAF by 2040 (see Figure 1 [in App B]). Based on the state's overwhelming need to reduce potable water demand and beneficially recycle water wherever feasible, it is the 18-mile export plan that would likely not be supported Governor's office and would likely not be supported by state and federal funding agencies. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see response to Mr. Ripley's comment #5 to statements regarding the Governor's California's Water Supply Strategy and comment response #6 for discussion of the Regional Water Board's understanding of water recycling and reuse value. In regards to regionalization policies, in a letter dated November 4, 2020 from the Regional Water Board to the Paradise Town Manager cited above and in the Draft PEIR multiple times (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf), preliminary findings of the Regional Water Board are as follows: "... it is the opinion of the (Regional Water) Board's technical staff that the regionalization option presents an objectively more sustainable long-term solution to the Town's wastewater infrastructure needs. Due to the apparent overwhelming advantages of the regionalization option, it is the (Regional Water) Board's strong recommendation for the Town to conserve limited financial resources and focus its feasibility analysis on the regionalization option." Further, the Regional Water Board states: "Informing this evaluation is the (Regional Water) Board's decades of experience that local wastewater treatment plants of the type being considered by the Town consistently struggle to comply with applicable regulatory requirements to protect groundwater and surface water." In the Regional Water Board's qualitative analysis attached to their Nov 2020 letter, the Board finds that: "... it is not clear if a sufficient number of users are available, or that a recycled water delivery system (within the Town) would be feasible" and "The City of Chico already provides recycled water for waterfowl habitat uses, and City staff have stated that expanded recycled water use would be desirable and may be pursued in the future. Revenue generated through regionalization with Paradise could make recycled water projects more feasible for Chico." Finally, the Regional Water Board's analysis regarding viability of financial assistance finds that a local alternative is: "Likely to receive less favorable consideration, or outright denial, especially if regionalization has similar or better overall feasibility. May not comply with State and Regional Water Board policies supporting regionalization of wastewater services." (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf). Given the Regional Water Board's negative findings regarding local project feasibility, funding access, and potential for further groundwater and surface water impacts, as well as other reasons captured in Section 5.2.1, Table 5.2-1, the Town eliminated local alternatives from consideration in the Draft PEIR.
			10	(Appendix B) In the Town's case, "regionalization" assumes connection to Chico's water pollution control plant (WPCP) which discharges secondary effluent to the Sacramento River. In light of R5's intent to require Chico to remove nitrogen from its discharge, the draft PEIR should not overlook the cost and energy intensity required to nitrify and denitrify prior to discharge. As a related example, R5 required Sacramento Regional Sanitation District's WPCP in Elk Grove to remove nitrogen prior to discharge to the Sacramento River at a capital cost exceeding $2 billion. Local reuse, conversely, would beneficially utilize nitrogen and other nutrients for agricultural, landscape, and turf fertilization. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Regarding the "R5 intent to require" the City to nitrify and denitrify (treated water) prior to discharge, the comment has been considered, and is outside the scope of the PEIR, which is about construction, operation and maintenance of the pipeline; rules for use of it are separate. For response to comments regarding local reuse being considered in the future at the Chico WPCP, please refer to the response to Mr. Ripley's comments #5 and #9. Finally, the intent of an agency cannot be confirmed or disputed by the Town as there is no backup information supporting the statement.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			11	(Appendix B) 2. Regional Board November 2020 letter supporting regionalization: The November 2020 R5 letter fails to compare local urban water reuse with river discharge and "recycled water for waterfowl habitat uses". Nor does the letter consider the multi-benefits of a dual distribution system within the Town that would include 1) non-potable recycled water for landscape, park, turf and agricultural irrigation, 2) seasonal aquifer recharge dispersed throughout the service area, 3) state-of-the-art community-scale wildfire defense, 4) high pressure supplemental water supply for fire suppression, 5) protection against any future depressurization of PID's potable distribution system and 6) beneficial use of nutrients inherent in wastewater. Upgrades to the Chico water WPCP for river discharge and/or agricultural reuse could easily exceed $300 million for nutrient removal and other treatment process improvements over the next decade. The Town would be responsible for it's proportionate share of costs and its contribution would offer zero benefit to Paradise Irrigation District's (PID)water supply portfolio and zero benefit for the Town's fire suppression capability. *(All references used in text can be found as part of original letter and exhibits [attached]).*	This comment has been considered, and is outside the scope of the PEIR. It is not within the Town's jurisdiction to question or explain the Regional Water Board's findings as stated in the November 2020 letter, nor has data resulting from any level of planning/design been publicly released by the Chico WPCP that could be accurately used to estimate costs for upgrades at the Chico WPCP for recycled water or to estimate the financial contribution that the Town could be required to make. The scope of the PEIR is limited to construction of a sewer system and does not include an assessment of the potential for future water recycling at the Chico WPCP. Although the comment is not relevant to the project, some explanation may be of assistance. Regarding reference to the dual distribution system acting as protection against any future depressurization of PID's potable distribution system, PID's 2020 Urban Water Management Plan (2020 UWMP; pidwater.com) described what occurred during the Camp Fire: "Several hours into the duration of the Camp Fire, PID's pipe network experienced a significant depressurization in a majority of its water mains. A significant number of the 10,480 individual service laterals and/or meters melted and the system partially drained. Though the WTP continued to produce water during the fire, demands from fire sprinklers, firefighting activities, and free-flowing service connections where structures once stood drained significant portions of the system. This depressurization event resulted in negative pressure in many areas throughout the main network..". Since the same or less costly pipe materials, meters and valves are generally used in constructing purple pipe lines (recycled water) as is used in potable water lines, what occurred in the Camp Fire wouldn't be stopped by increasing the number of lines, but by upgrades to pipeline materials or other safeguards, as would be determined by Paradise engineering team (pidwater.com) pp. 3-3 and Annex F-27). Further, the Mitigation Plan attached as part of PID's 2020 UWMP presents *Action 9. Backup Portable Generators* as a mitigation action based on their risk assessment study. Benefits that would result from funding this action include "The District would not experience a depressurization of distribution system (and would not) lose the ability to treat water for the Town of Paradise…". As such, PID presents backup portable generators as the solution to mitigate the potential for a long power outage or depressurization during wildfire (pidwater.com, 2020 urban water management plan, Annex F-47).

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			12	(Appendix B) The R5 letter indicates that [the] "Pipeline to Chico can be cost-effectively sized to accommodate a large range of flows." This indicates that the pipeline can likely accommodate significant wastewater flows over and above the needs of the Town for planned developments within Chico's southeast sphere of influence and rural Butte County along the pipeline route. Table 1 presents pipeline capacities for the proposed 10.5 mile 12" export pipe force main based on a range of flow velocities. Table 3 presents the carrying capacity of plastic pipe from an engineering manual which indicates velocities for 12" pipe within the range of 1.3 to 10.12 feet per second (fps). The 7 fps maximum figure presented in Table 1 is well within the range presented in the engineering manual. At that flow velocity, the export pipe capacity is about 2,400 gallons per minute (gpm), or about 1.7 million gallons per day (MGD) on an average day flow (ADF) basis and 3.4 mgd on a peak hour flow (PHF) basis. *(All references used in text can be found as part of original letter and exhibits [attached]).*	The section of the export pipeline referred to in the comment is the Gravity Force Main. As stated in the Draft PEIR (pp. 43-51), "Flow leaving the Transition Chamber would be under pressure based on the gravity flow from the steep Ridge Gravity Section, and the pipe would flow full, creating a beneficial force main based on the hydraulic behavior of the sewer (eliminating the need for a pump station, which is not a part of this system), so the effluent can reach the Chico WPCP. A modulating plug valve would keep the Transition Chamber and Gravity Force Main Sections full, to maintain the hydraulic function of the Gravity Force Main Section." Therefore, the Gravity Force Main was sized based on a differential head criteria, not based on a velocity criteria, such as the 3 to 7 feet per second figures stated in the comment. The comment appears to relate to a concern about additional connections happening along the export pipeline, between the Town of Paradise and the Chico Water Pollution Control Plant. The engineering work completed by HDR did not include provision for any such additional connections to the Gravity Force Main. In addition, the Principles of Agreement developed between the Town of Paradise and City of Chico, which are currently being drafted into an Inter-Municipal Agreement to be adopted by the Town Council and City Council, states "The Town and the City agree to prohibit future connections to the export pipeline in the portion of the pipeline that sits outside of the Town limits or City limit." (www.paradisesewer.com, 1st Draft Principles of Agreement version 7, 21-March-2022). Please also refer to response to L10-6 and other discussions of the Regional Water Board's 2020 study and letter to the Town.
			13	(Appendix B) At 1.7 mgd ADF, the lost opportunity for local water recycling in the Town, southeast Chico and rural Butte County could be about 2,000 acre-feet per year (afy) as indicated in Table 2. "Regionalization" as a primary justification for the 18-mile export project is clearly in conflict with the Governor's California's Water Supply Strategy since it forecloses on a potential 2,000 afy of urban water recycling in the Town and southeast Chico. Based on current drought and wildfire threat conditions, the Governor's office would likely strongly support the local reuse alternative over the export alternative. In that same light, the grant funding opportunities for local water reuse would likely be significantly greater than for the 18-mile export based on the Governor's strong emphasis on urban reuse projects anywhere in the state. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see responses to Mr. Ripley's comments #5 and #9. Anticipating what level of support would be imparted by the Governor's office would be speculative and does not speak to the Draft PEIR's adequacy or accuracy; therefore, this comment has been considered, but does not require specific response. However, it is anticipated that the Governor may give some deference to the findings of the Regional Water Board.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			14	(Appendix B) The R5 letter fails to acknowledge that Butte LAFCo cannot approve an 18-mile extension of sewer service absent an existing or impending public health and safety threat. The 0.1 mgd post-fire subsurface dispersal in the sewer service area (SSA) that had a pre-fire permitted subsurface dispersal capacity of about 0.5 mgd cannot be considered an existing or impending health threat. Absent such a threat, Butte LAFCo cannot approve the extension as it is the only legally permissible justification available to LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence. The only path forward with the extension request therefore would likely be a waiver approved by the state legislature and the Governor, similar procedurally to Assembly Bill 36 (Gallagher, 2021). *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see response to Mr. Ripley's comment #6 above. Further, it is not within the Town or commenters' jurisdiction to interpret regulatory guidance or make a determination regarding what Butte LAFCo can or will approve, and, more immediately, is outside the scope of this Draft PEIR. LAFCo staff are uniquely qualified and appointed to make such determinations based on regulatory guidance and experience and the agency has its own process for public review and appeals.
			15	(Appendix B) The R5 November 2020 letter did not confirm the presence of an existing or impending public health and safety threat in Paradise of which it has the technical and regulatory authority to determine. Even if R5 made such a determination, the proposed export project serving only 14% of the Town would not alleviate most of the threat since there is ample high density residential, commercial, health careand institutional development outside of the proposed SSA which could also have subsurface dispersal issues. Absent an existing or impending health and safety threat, the 18-mile export project as indicated above is legally impermissible. In its alternative analysis of the regionalization versus local reuse options available to the Town, R5 erred in not considering Government Code restrictions on any extension of utility service from one jurisdiction to another in California. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see responses to Mr. Ripley's coments #11 (Town's lack of jurisdiction/expertise to explain findings of Regional Water Board), and #'s 6 and 14 (LAFCo Government Code restrictions). Further, the 2020 Regional Water Board letter was not required to discuss a public health and safety threat, as they had already declared it as such in their In a letter dated May 4, 1992; at that time the RWQCB approved the Town's plans to establish an "Onsite Wastewater Management Zone" to address public health and environmental concerns noted in previous studies (RWQCB 1992). The 2020 letter was intended, as titled, to present an Evaluation of Wastewater Treatment Plant Options (https://paradisesewer.com/wp-content/uploads/2021/04/2020-Central-Valley-Regional-Water-Quality-Control-Board-Alternatives-Analysis.pdf). Please also refer to comment response L10-14. Further, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement; therefore, the Town is following existing regulatory guidance.

			16	(Appendix B) 3. Siting local wastewater facility within residential and business areas: Figure 2 presents an image of a California Title 22 water reclamation facility sited in a residential setting in southern California. This facility was permitted by R8 (Santa Ana Region) under Title 22 criteria and had operated continuously between 1981 and 2006 when the facility was decommissioned with the arrival of an Inland Empire Utilities Agency (IEUA) purple pipe extension to two adjoining golf courses. During its 25-year operation, this author was not aware of a single odor or noise complaint from residents adjacent to the facility. This image was included in the Water Reuse textbook as an example of a satellite treatment plant located in a housing development. Figure 3 presents a 2021 satellite image of the decommissioned facility indicating its close proximity to numerous residences and a swimming pool. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Although the comment is not relevant to the project, some explanation may be of assistance. In review of the text accompanying the figure in this case study (Tchobanoglous, G., et al, *Water Reuse, Technologies, and Applications* , McGraw Hill, 2007, Figure 12-17), as introduced by the commenter, some points require clarification. The author of the textbook does state "The plant... is provided with odor control facilities. The design features have proved that a wastewater facility can be constructed and operated in a residential-type setting without nuisance" (p.760). However, there is no information on noise or odor complaints received and no description provided to understand the criteria used to determine "without nuisance" or to understand what the author's thresholds were. The project "was initially conceived and built by a developer who needed a golf course to improve marketability and value of the residential property", was used solely for the Upland Hills Country Club (p.760) golf course irrigation, and payment was made by the golf course for the recycled water. The author found that "Because the influent wastewater is of domestic origin and the influent has a TDS of about 485 mg/L, the effluent is well-suited for golf course irrigation (p.761). Treatment of the wastewater, as described in the case study, was limited as compared to another case study in the same textbook for the Solaire Building in New York constructed around 2005 (751). Reclaimed water at the NY facility was limited in use to only toilet flushing and cooling tower makeup, and later added irrigation at an adjacent park. However, the NY system also required ozone oxidation, ultraviolet disinfection, and ultrafiltration membrane units, injection of potable water, and later, for irrigation, the addition of a reverse osmosis system - all absent from the process flow description for the golf course facility as described in the textbook, possibly due to changing water quality requirements for reclaimed water over time or variances in state/regional regulatory requirements. Therefore, noise and odor effects could be very different if the golf course facility were required to add those additional treatment systems. Further, the facility was decommissioned because "... the facilities are in need of upgrading to preserve their integrity. Lack of adequate local financing for improvements is an obstacle in implementing necessary upgrades. ... unfunded replacement reserves would have facilitated needed rehabilitation and upgrades to ensure continued operations without full system replacement" (p.761). Therefore, the decision was to decommission the failing local facility and connect to the Inland Empire Utilities Agency facilities (as described in commenter's discussion).
			17	(Appendix B) 4. Lack of sufficient recycled water users in area Table 3 indicates PID's pre-fire estimate of total water demand in 2040 of 7,817 afy. This compares with 3,576 afy of PID's pre-fire estimate of 2040 wastewater dispersal as indicated in Table 4. These two values indicate that, on an annual basis, the total service area pre-fire potable and raw water demand is roughly 2.2 times the wastewater generation. On a seasonal basis, the non-potable exterior irrigation demand could be as high as 4 times the interior potable demand on peak summer days. Clearly, with dual distribution to all served parcels, the annual average non-potable demand exceeds the potential recycled water supply. *(All references used in text can be found as part of original letter and exhibits [attached]).*	PID updated their Urban Water Management Plan (UWMP) in 2021, which reports much lower estimates of demand over a 20 year horizon (2025 - 2045; published in June 2021 and available at: https://pidwater.com/docs/about-your-water/water-supply/2001-pid-2020-urban-water-management-plan/file). Given there is no water reuse in the Town at this time, the calculations include all water needs for the community. In this document, PID reports: "There is no known deficit of supply in the planning horizon of this UWMP, even considering the likely impacts of climate change in that time period with increasing temperature, reduction in rainfall, and declining snowpack." (PID UWMP 2021, Section 6.13, p.6-12) In the same document, DWR Tables 7-2, 7-3, and 7-4 (pp. 7-6 to 7-7) compare PID supply with Town estimated demand 2025-2045. These calculations look at a normal year (7-2), a single dry year (7-3), and up to five years of consecutive drought conditions (7-4). Even with up to five years of consecutive drought conditions, 2025-2045, PID shows a minimum estimated 1,312 acre-foot **overage**. PID states: "It is important to note that in all scenarios shown in these tables, Normal Year demands are shown, without the expected conservation percentages ranging from 10-50% that would be expected in drought conditions. By comparing reduced supply volumes in dry years to Normal Year demand levels, it is shown conservatively that PID is able to successfully meet demand in all year types." (p. 7-6). The 2015 UWMP appears to no longer be available at the PID website noted above; further, there are no estimates for "wastewater dispersal" in PIDs 2022 document; therefore, the quoted wastewater numbers in this comment can not be verified or discussed.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			18	(Appendix B) 5. Large effluent storage facility needed for winter flows: Based on information provided by Town engineers, the heat of the Camp Fire at the ground surface did damage some septic tanks, particularly those constructed of plastic or fiberglass. However, of the 11,000+ leachfields there has been no reported damage. With that context, the Sewer, Water Reuse, and Wildfire Defense (SWRWD) Plan proposes to utilize the existing 11,000+ leachfields for shallow aquifer recharge in the winter months eliminating the need for a seasonal effluent storage facility. The dual distribution will be in place, and individual irrigation controllers will be used to control and meter delivery of tertiary effluent to existing leachfields in the winter months as/when needed. Ultimately, the pre-fire 2040 estimate 3,576 afy dispersal of septic tank effluent would be reduced to about 980 afy dispersal of tertiary effluent meeting strict Title 22 unrestricted irrigation standards. These values assume the long-term objective of the SWRWD Plan to serve most if not all of PID's 10,600 service connections and not just the 1,500 connections in the proposed SSA. *(All references used in text can be found as part of original letter and exhibits [attached]).*	As stated in Comment Response 17, based on PID's Urban Water Management Plan (UWMP) (2025 - 2045; published in June 2021 and available at: https://pidwater.com/docs/about-your-water/water-supply/2001-pid-2020-urban-water-management-plan/file) the 2022 UWMP (PID 2021 - reference in Comment Response 17), there is no projected shortage of water.
			19	(Appendix B) 6. Land for storage environmentally sensitive: Land for seasonal storage unnecessary. See response #5 above. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see response to comment #L10-4 above regarding the elimination of the local option as an alternative in the Draft PEIR.

Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			20	(Appendix B) 7. Local WWTP construction would be a lengthy process: The 2016 General Order for Water Reclamation Requirements for Recycled Water Use provides an expedited path for recycle permits, since most non-potable recycled water projects rely on the same regulatory framework provided in Title 22. With low-pressure effluent collection and temporary treatment facilities at say, the abandoned Lava Creek golf course, time to first-flush would likely be less than 18 months, perhaps as little as 12 months from authorization to proceed. This compares with estimates of the gravity collection and 18-mile export project taking as much as a decade to first-flush. There is ample precedent in R5 for satellite water reuse facilities permitted under Title 22 criteria for disinfected tertiary recycled water. In combination with the 2016 General Order, the R5 approval process could be concurrent with the facility design thereby expediting the project delivery schedule. *(All references used in text can be found as part of original letter and exhibits [attached]).*	The project as proposed will be operational by Summer 2026, as shown in the schedule on paradisesewer.com.
			21	(Appendix B) 8. Auxiliary water system would for fire suppression would be a separate pipeline system: Yes, a separate pipeline system would be required modeled after El Dorado Irrigation District's dual distribution system (in operation for over four decades) and San Francisco's auxiliary water supply system (in operation for over a century). In addition, the dual distribution provides access to individual leachfields for winter subsurface dispersal and would provide assurance that, in the event of a repeat of an extreme wildfire event, that PID's potable system would be protected from depressurization caused by the abrupt increased demand from residential sprinklers and fire-fighting activity. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Thank you for your comments. They are outside the scope of the project and fire suppression is not one of the identified objectives of this project.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			22	(Appendix B) 9. Inefficient oversizing of treatment facility in early years: Inefficient oversizing of infrastructure is not unique to wastewater treatment facilities – it is a given on any infrastructure project – water import and treatment facilities, power generation and transmission, highways, airports, rail facilities, ports, etc. etc. Utilization is never near optimum in the early years, and full utilization may come decades after construction is complete. For context, how efficient is a $184 million export project when the initial flow estimate is only about 0.1 mgd serving a 2026 connected population of 1,391? Since the $184 million figure is only a Class 5 estimate (- 30% to +50%) coupled with the recent inflation spike, the actual construction bid cost could easily exceed $300 million – with no possible opportunity for interim temporary facilities or phasing. Where's the early year efficiency in that? *(All references used in text can be found as part of original letter and exhibits [attached]).*	The pipeline has been sized to accomodate the flow from the Core Collection and Extended Collection system, as well as the Treatment Plant capacity, within the 30-year planning horizon as laid out in the Town of Paradise 2022 General Plan Housing Element Update (Section 2.5.1.1 of the Draft PEIR). Further, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement. Estimates regarding "actual construction bid costs" would be speculative at this level of design.
			23	(Appendix B) 10. O&M for a full-scale treatment facility would be supported by a small initial ratepayer base: Figure 4 presents a satellite water reclamation facility owned and operated by Fresno County Special Districts, County Service Area #34. This facility was permitted by R5 under Title 22 criteria in 2005. Table 6 presents the 2022-2023 projected operating budget for operation and maintenance (O&M) of this facility. Compare that Fresno County CSA #34 O&M value with estimates for the export project O&M: $254,000/yr for the regional pipeline, $1,022,000 for the gravity collection system, and the $491,000 contribution to Chico WPCP O&M. These annual costs total $1,767,000/year starting at first-flush. How can the Town afford this when most of the SSA parcels are currently vacant? Add to this annual O&M cost the annual cost of the local share of loan debt repayment since it is unlikely that the project will achieve 100% grant funding for capital costs. If interior residential water use is reduced to 42 gallons per person per day (gpcd) by 2040 in accordance with recommendations by the California Department of Water Resources, the Town connected population served by a similar Title 22 facility (CSA #34 plant) could potentially be about 4,700, equal to the estimated population in the SSA at Year 2050. *(All references used in text can be found as part of original letter and exhibits [attached]).*	The local treatment alternative does not meet the goals of the project as set out in Section 2.3.2, Project Goals and Objectives. Further, as explained above, the Town has secured grant funding for the development of the preliminary engineering and preparation of the environmental documentation. We are also working to secure grant funding for the design, right-of-way, and construction stages of the project. The Town is aware of the cost estimates associated with design, construction, and operation of the sewer project, as is estimated at this early point in design. As noted in previous and subsequent comment responses, this comment does not speak to the physical environmental assessment of potential impacts that could result from proposed project implementation and speaks to potential costs, which is outside of the scope of the PEIR.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			24	(Appendix B) 11. Treatment processes not easily scalable: The export plan has zero potential for phasing and cannot be scaled up ever once capacity is reached in the collected area of the SSA. The local treatment collection system and local water reuse plant, however, can be scaled up to ultimately serve all 10,600 connections and be designed to operate efficiently even at low initial flows. *(All references used in text can be found as part of original letter and exhibits [attached]).*	Please see Comment Response #L10-7 regarding scalability.
			25	(Appendix B) 12. Extensive ongoing monitoring required for local recycling: Table #6 does not call out monitoring costs since Fresno County operators conduct in-house lab tests as part of their normal daily and weekly routines. Monitoring costs are included in the "Professional and Specialized Services" line item. Monitoring reports are submitted by the operators to R5 on a quarterly and annual basis. All operators are state-certified and are employees of Fresno County.	Thank you for the information. The PEIR is to analyze the proposed Town sewer pipeline construction, operation and maintenance and does not include a discussion of costs.
Richard L. Harriman	August 30, 2022	L11	1	Thank you for granting my request for a one-day extension of time within which to submit the following Comments regarding the Draft Program EIR (DPEIR) for the above-referenced Project. I am submitting the following comments regarding the above-referenced proposed project on behalf of myself, as a resident of the City of Chico and the County of Butte, a taxpayer and rate payer of the City of Chico and the County of Bulle, and as a member of the Butte Environmental Council and in the public interest of other residents of the City of Chico and the County of Butte.	Thank you for your input.
			2	1. I join in the Comments submitted, by the Butte County Local Agency Formation Commission and the County of Butte, regarding the DPEIR.	Thank you for your input. We appreciate all viewpoints expressed by our community members.
			3	2. I also join in the Comments submitted by Dana Ripley, regarding the DPEIR.	Thank you for your input.

Paradise Sewer Project PEIR Comment Matrix

Commenter/Agency	Comment Date	Letter No.	Comment No.	Comment Text	Comment Response
			4	3. I am requesting that the Final PETR include a copy of my letter comments, dated June 3, 2021, regarding the Notice of Preparation which were submitted on that date and that they be included in the Response to Comments on the DPEIR for the proposed sewer line project, including the article that I prepared which analyzes the public policy, legal, and environmental benefits to be gained by reconsidering the "Preferred Project." The issues raised in my letter of June 3, 2021 have not been addressed, analyzed, or considered in the DPEIR and that they be analyzed and considered in the "Project Alternatives" section of the EIR prepared for the proposed project.	As requested, the June 3, 2021 letter with attachments has been appended to the (this) current comment letter from Mr. Harriman (#L11) and issues raised are addressed here. Since Mr. Ripley's SWRWD Plan and comments appear to be consistent with Mr. Harriman's June 3, 2021 letter and current comments, some issues have already been responded to and therefore, references to Mr. Ripley's L10 comment letter (comments 1 – 25) are provided, as appropriate. Issue 1. Response: Your agreement with LAFCo NOP comment letter dated May 20, 2021 is noted and the referenced LAFCo letter is attached to June 3 letter as part of this response to comments appendix; Issue 2. Response: Thank you for providing your "Urban Water Conservation: Another Alternative" opinion paper. Similar to the SWRWD Plan, calculations and opinions are included that the Town is not required to provide responses to as there is no substantiation or factual documentation to consider. Further, comments on costs and financing options are outside the scope of the PEIR. Any remaining points described in the your paper are similar to, and in some cases identical to, the SWRWD plan and are responded to in responses to Mr. Ripley's letter (#L10, 1 to 25). Issue 3. Assessment of environmental, planning, and economic impacts corresponding to updates to the General Plan would be speculative and are outside the scope of this sewer project PEIR – as noted by Mr. Harriman, both the Town and City have separate CEQA documentation to analyze effects that may result from future updates to both communities' General Plans. Issue 4. Given that the Proposed Project Description has evolved and been updated between the commenters letter date of June 3, 2021 and the posting of the Draft PEIR for public review on July 14, 2022, this issue has been resolved. There were no comments received on the Draft PEIR from Mr. Harriman or any other commenters on the Draft PEIR that contested the completeness or accuracy of the description of the Proposed Project. Further, this comment again focuses on opinion regarding the rationale for project, but does not reference facts to support the opinion; therefore, the Town is not required to respond. Issue 5. As you request in comment, the PEIR does "disclose, analyze, discuss and address the potential significant impacts to the environment which may occur". However, the EIR cannot address possible future changes to the final project, as they are unknown and would be speculative; however, as required by CEQA (Section 15162 (a) and (a)(1)), "When an EIR has been certified… for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines… (that) substantial changes are proposed in the project which will require major revisions of the previous EIR… due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects", the Town would be required to complete additional CEQA analysis if either of the conditions referenced above were to result from changes to the final project. Section 5.2 of the PEIR describes why the Town has eliminated the "local option" from consideration as a feasible alternative; therefore, there is no discussion of the issues presented in the letter within the "Project Alternatives" section of the PEIR, rather all are addressed here. Please also see responses to Ripley's letter – L10, Responses #4 and #11 regarding alternatives.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			5	4. The benefits for prevention of significant adverse environmental effects from recurrent wildfires on the Ridge that could be provided by the alternative recommended by Dana Ripley in his comments regarding the true "Preferred Alternative" were not considered in the previous Study relied upon in the DPEIR. The previous Study and Analysis needs to be updated in light of advantages of the locally owned and controlled specially engineered Treatment Facility on the Ridge. The reason for this request is that the previous analysis relied upon in the DPEIR was prepared before lhe Paradise Camp Fire and needs to be updated, due to the elevated risk of recurrent wildfire, which can be mitigated by the re-use of treated effluent to irrigate and enhance the defensive open space needed to protect new urban development in the Town of Paradise and in the County of Butte.	Regarding existing wildfire risk, the PEIR evaluated the proposed project in light of this resource and, with mitigation incorporated (Section 3.18.4, Table 3.19-1), the Town's analysis found that implementation of the proposed project did not result in "significant adverse environmental effects" on Wildfire, a finding that was not disputed by Mr. Harriman in this comment letter. Development of solutions to current wildfire conditions would be a separate project and is not within the scope of this PEIR. As relates to the reference to Mr. Ripley's comment, Mr. Ripley's "preferred alternative" (as defined by Mr. Ripley and not related to the Town's CEQA analysis) was considered but eliminated from consideration as an alternative as described in the Town's response to Mr. Ripley's comment #L10-4. In addition, this is the first mention of the "Treatment Facility on the Ridge", which has not been described or otherwise mentioned in comments received on Draft PEIR; the only reference to "the Ridge" was found in a letter Mr. Harriman distributed at a meeting with the Town and Town attorney, that he had written to the Chico Enterprise-Record on June 4, 2021 (Letter is provided as an attachment to Mr. Harriman's comment letter following the June 3, 2021 letter discussed in L11-4 above). In this letter to the press, "the Ridge" is described as being part of unincorporated (Butte) County, not within the Town boundaries. The Town would not have jurisdiction to propose facilities outside of the Town boundaries; therefore this is outside of the scope of this Paradise sewer project PEIR. Finally, regarding the request for additional studies and analysis, *ParadiseSewer.com* provides links to all of the studies considered in developing the Proposed Project (under the "Project Materials" tab); the list does include pre-wildfire studies, but they are matched in number by those completed since 2020, post-fire. Further, please refer to Comment Response #L10-4 regarding the requirements to analyze an alternative under CEQA.
			6	5. Although I have made this comment at public meetings regarding the proposed project, it should be noted that the DPEIR does not address, analyze, or consider the environmental, planning, and economic impacts of not requiring lhe preparation of the updated General Plans and Environmental Impact Reports for Town of Paradise and the City of Chico as part of the "Preferred Project" analysis, although the Butte County LAFCo has been requesting the Town of Paradise to do so, since 1985. The DEIR should require a Condition to require such updates to be prepared and approved, prior to the commencement of construction of the proposed project or as a condition of approval by LAFCo.	As stated in multiple Sections of the Draft PEIR, including Sections 2.2.1, 2.2.2, and 2.3.1, the Proposed Project is consistent with the goals of the 1994 Town of Paradise General Plan and accounts for growth consistent with the recently updated Town of Paradise 2022 Housing Element. Further, a resolution (#13-04, included in Appendix B of the PEIR) was adopted by the Paradise Planning Commission in 2013 finding the "1994 Paradise General Plan substantially complies with the statutory mandates under Government Code Section 65302" (Appendix B). Please also review response to L11-4 above, which discusses environmental review of updates to general plans.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			7	6. The Project Description is not stable, finite, and accurate. Draft Program EIR should be revised, amended, corrected, and re-circulated and the public comment period be re-opened and new public Scoping Meetings held by the lead agencies, including both the City of Chico and the Town of Paradise. The reason for require the requested action is that because the purported rationale for the proposed project [expedited redevelopment of the Town of Paradise] will not be achieved by the development and construction of the proposed project, as defined. In fact, the construction of the Project Alternative advocated by Civil Engineer Dana Ripley could be expedited and achieved much more rapidly than the construction of the "Preferred Alternative" recommended for adoption in the DPEIR.	The project as proposed fulfills the Project Goals and objectives stated in Section 2.3.2 of the Draft PEIR. Please also review response to L11-4 above, which discusses sufficiency of the project description.
			8	7. The DPEIR fails to disclose, analyze, discuss and address the potential significant impacts to the environment which may occur, depending on what changes arc made to the "Final Project" pursuant to the "Design Build" legislation adopted in AB 36 (Gallagher). The adoption of AB 36 by the State Legislature has rendered the DPEIR's analyses legally inadequate, because the proposed Preferred Alternative may bear little or no resemblance to tbe proposed Preferred Project Alternative, due to currently unknown changes made to the final design prior to and/or during construction of the project. Further, due to the preparation of a Draft "Program" EIR, the actual project may be significantly changed during construction by circumventing the project description in the Final PEIR tluough the use of multiple Project Addendums that do not require notice to the public or public review during the course ol' construction of the Final Project design, whatever it may be.	Please see response to L11-4 above, which discusses future project plan updates. Further, *County of Inyo, supra, 71 Cal.App.3d* at p.199 as referenced in *South of Market v City and Co of San Francisco, supra, 33 Cal.App5th 321* at p.8, concludes that "the CEQA reporting process is not designed to freeze the ultimate proposal in the precise mode of the initial project; indeed, new and unforeseen insights may emerge during investigation, evoking revision of the original proposal". The Town recognizes that "Project Addendums" are not required to be noticed to the public; however, CEQA Addendums are also only allowed "if some changes or additions are necessary but none of the conditions (described in CEQA Section 15162 (a), which is quoted in L11-4, Comment 5 above)..." that would call for preparation of a subsequent EIR (new significant effects or substantially increased effects and others listed in Section 15162), would occur. Therefore, if updates to the Proposed Project did occur in the future, the Town would consider what level of additional CEQA analysis, if any, was appropriate based on the potential for new or increased physical effects on the environment or other conditions occur described in Section 15162. Further, Chico City Code Section 15.40.285, *Regulation of Waste Received from Other Jurisdictions* , requires that any project with another municipality which would utilize the Chico sanitary sewer system requires an intermunicipal agreement (IMA) and sets out the requirements for such agreement; therefore, regulatory requirements already in place are being adhered to.

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			9	8. However, the most egregious legal inadequacy of the DPEIR is that it is barely readable and understandable, due to the lack of a Table of Contents and inadequate organization and disclosure of the Comments made during the Notice of Preparation process. The DPEIR glosses over the numerous comments and objections that were made in the Notice of Preparation process. Specifically, without having the Town General Plan updated since 1980, the changes in density requirements and other legislation that has been adopted by the State Legislature to provide for more dense residential dwelling units and reduction of Green House Gasses are barely even mentioned in the DPEIR, which results in accelerated "urban sprawl" within the Town's Sphere of Influence. Instead of focusing on dense multi-story and affordable multi--family housing in the Town's previously developed urban footprint, the "Preferred Alterative" supports and incentivizes accelerated inefficient sprawl in the Town and into the County's Jurisdiction.	The Draft PEIR document begins with a Table of Contents. All comments received during the NOP public comment window are included with the DPEIR in Appendix A: NOP Scoping Report, organized into a Comment Matrix, as well as Town responses. All comments received in response to release of the Draft PEIR have been reviewed and considered in the process of creating the Final PEIR, in addition to comments received from Mr. Harriman outside of both public comment periods (see response to Comment L11-4). The version of the The Town of Paradise General Plan used in the development of the Draft PEIR, drafted in 1994, rather than 1980, includes amendments through 2008, and the Town of Paradise Housing Element referenced in the Draft PEIR was updated in 2022 (see response to L11-6 and PEIR, Appendix B). Density (multi-family housing or vertical construction) becomes more feasible with a sewer system, and is one of the benefits of the sewer project. Please see Comment Response #W17-6 regarding growth outside of the Town of Paradise. Regarding the Draft PEIR focus on affordable housing, as stated in 2.3.2 Project Objectives and Goals, providing economic recovery and construction of affordable housing are integral to the Proposed Project, being identified as the primary objectives and goals of the project to meet the needs of the community (Section 2.3.1).
			10	9. Finally, the DPEIR's failure to adequately disclose, analyze, discuss, consider, and compare and contrast the expense of the Preferred Alternative to the more efficient and expandable specially engineered waste treatment facilities discussed in great length in the Comments submitted by Dana Ripley in his Comments and "White Paper" demonstrates the legal inadequacy of the DPEIR and the failure to proceed in the manner required by law, pursuant to Public Resources Code sections 21 168 and 21 168.5.	Please see Comment Response #L10-4 and #L11-5 regarding the requirements to analyze an alternative under CEQA. CEQA Guidelines Section 15064 describes how to determine significance of effects. Section 15064 (d) states that a Lead Agency should "consider direct physical changes in the environment which may be caused by the project" and defines a "direct physical change" as "a physical change in the environment which is caused by..." the project (Section 15064 (d)(1)). CEQA Guidelines Section 15124, defining what must be include in a project description, does not state that cost of a project is required. Often estimated costs at the early levels of design, such as here, carry huge contingencies as there isn't sufficient detail to make a refined cost estimate. What is required in the CEQA Project Description is "A general description of the project's technical, economic, and environmental characteristics" (Section 15124 (c)). As noted in previous response, economic recovery of the community is integral to the Proposed Project and a primary objective (Section 2.3.1).

Paradise Sewer Project PEIR Comment Matrix					
Commenter/Agency	**Comment Date**	**Letter No.**	**Comment No.**	**Comment Text**	**Comment Response**
			11	Please include this letter and Comments in the Record of Proceedings and include all of the Comments made regarding the Notice of Preparation previously relied upon by the public to review this very expensive and unnecessary public project in a Revised and Amended Draft EIR for the Preferred Project, instead of Program EIR for this vague, inadequately described, and expensive "Preferred Project". In addition, please remand the review of this proposed project back to the Public Works Department Staff for the preparation of an updated Project Review and Analysis, based on current water resource conditions and Wildland Urban Interface (WUI) environmental setting and background on the Town of Paradise, in the light of the Governor's Water Resiliency Portfolio and recently adopted Water Policy focusing on more efficient use of our water and energy resources. Finally, the Town of Paradise should be required to conduct the updated Study while contemporaneously updating the Town's General Plan.	Given that most of this is strictly opinion and how the Town will proceed is under jurisdiction of the Town administration, there is no response required for most of statements included in this comment. All comment letters received during the NOP public review period (July 14 through August 29, 2021) are contained and responded to in the Scoping Report that was/is attached to the PEIR (Appendix A). Comments received separately from Mr. Harriman outside of a formal public review period (June 3, 2021), have been included as attachments to this letter addressing comments on the Draft PEIR (#L11) and are responded to above in response to comment #L11-4.
			12	Thank you for the opportunity lo comment on the DPEIR. Please put me on your circulation list for the this Draft EIR and/or any changes in the process, including recirculation of a revised or amended NOP, Project Description, and/or revised or amended Draft EIR for this amorphous project.	We will continue to include you in the circulation list for any further documentation on the project, as was done on previous phases of this process (see attached email dated July 14, 2022 titled *Paradise Sewer Project Draft PEIR is Available!*).
Dannette Barefield	August 30, 2022	W39	1	I support the pier project	Thank you for your input. We appreciate all viewpoints expressed by our community members.
Patty Wilson	August 30, 2022	W40	1	I only wanted to know how the sewer was going down the hill. After repaving the skyway, I would hope you would not have to dig it back up. I can not see where the town plans on digging.	Thank you for your comment. Section 2.5.2.1 outlines how the sewer flows travel the Export Pipeline System, including the Ridge Gravity Section for downhill flows and the Gravity Force Main Section for uphill flows. Any digging will take place in the public right-of-way. Much of Skyway falls under County jurisdiction, and is outside of the jurisdiction of the Town.

L1

Marc Mattox
Town of Paradise
5555 Skyway
Paradise, CA 95969

Dear Mr. Mattox:

ENVIRONMENTAL IMPACT REPORT (EIR) FOR TOWN OF PARADISE (TOWN); PARADISE SEWER PROJECT (PROJECT); BUTTE COUNTY; STATE CLEARINGHOUSE NO. 2021050008

We understand that the Town is pursuing Clean Water State Revolving Fund (CWSRF) financing for this Project (CWSRF No. C-06-8568-210). As a funding agency and a state agency with jurisdiction by law to preserve, enhance, and restore the quality of California's water resources, the State Water Resources Control Board (State Water Board) is providing the following information on the EIR to be prepared for the Project.

The State Water Board, Division of Financial Assistance, is responsible for administering the CWSRF Program (Program). The primary purpose for the Program is to implement the Clean Water Act and various state laws by providing financial assistance for wastewater treatment facilities necessary to prevent water pollution, recycle water, correct nonpoint source and storm drainage pollution problems, provide for estuary enhancement, and thereby protect and promote health, safety and welfare of the inhabitants of the state.

The Program is partially funded by the United States Environmental Protection Agency (USEPA) and requires additional "California Environmental Quality Act (CEQA)-Plus" environmental documentation and review. Two enclosures are included that illustrate the Program's environmental review process including the additional CEQA-Plus federal requirements. For the complete environmental application package and instructions please visit: http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml . The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by the federal agencies or their representatives will need to be resolved prior to the State Water Board's approval of a CWSRF financing commitment for the proposed Project. For further information on the Program, please contact Mr. Brian Cary, at (916) 449-5624.

It is important to note that prior to a CWSRF financing commitment, projects subject to provisions of the Federal Endangered Species Act (ESA), must obtain ESA, Section 7 clearance from the United States Department of the Interior, Fish and Wildlife Service (USFWS), and/or the United States Department of Commerce National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) specific to any potential effects to special-status species.

Please be advised that the State Water Board will coordinate with the USEPA to consult with the USFWS, and/or the NMFS regarding all federal special-status species that the Project has the potential to affect if the Project is to be financed by the Program. The Town will need to identify whether the Project will involve any direct effects from construction activities, or indirect effects such as growth inducement, that may affect federally listed threatened, endangered, or candidate species that are known, or have a potential to occur in the Project site, in the surrounding areas, or in the service area, and to identify applicable conservation measures to reduce such effects.

In addition, CWSRF projects must comply with federal laws pertaining to cultural resources, specifically Section 106 of the National Historic Preservation Act (Section 106). The State Water Board is responsible for ensuring compliance with Section 106 and is required to consult directly with the California State Historic Preservation Officer (SHPO). The SHPO consultation is initiated once sufficient information is provided by the CWSRF applicant (https://www.waterboards.ca.gov/water_issues/programs/grants_loans/docs/cultural_resources_report_prep.pdf). If the Town decides to pursue CWSRF financing, please retain a consultant that meets the Secretary of the Interior's Professional Qualifications Standards (http://www.nps.gov/history/local-law/arch_stnds_9.htm) to prepare a Section 106 compliance report.

Note that the Town will need to identify the Area of Potential Effects (APE), including construction and staging areas, and the depth of any excavation. The APE is three-dimensional and includes all areas that may be affected by the Project. The APE includes the surface area and extends below ground to the depth of any Project excavations. The records search request should extend to a ½-mile beyond project APE. The appropriate area varies for different projects but should be drawn large enough to provide information on what types of sites may exist in the vicinity.

Other federal environmental requirements pertinent to the Project under the Program include the following (for a complete list of all federal requirements and instructions please visit http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml :

A. An alternative analysis discussing environmental impacts of the Project. The alternative analysis must include:

- A “no project/no action” alternative.
- Comparative analysis among the alternatives that includes discussions of beneficial and adverse impacts on the existing environmental, future environmental, and individual sensitive environmental issues associated with the project.
- Analysis of direct, indirect, and cumulative impacts on sensitive environmental resources, if applicable.
- Appropriate mitigation measures to mitigate adverse impacts, if appropriate.
- Thorough discussion of the rationale for selection of the chosen alternative for the project.

B. A public hearing or meeting for certification of the EIR.

C. Compliance with the Federal Clean Air Act: (a) Provide air quality studies that may have been done for the Project; and (b) if the Project is in a nonattainment area or attainment area subject to a maintenance plan; (i) provide a summary of the estimated emissions (in tons per year) that are expected from both the construction and operation of the Project for each federal criteria pollutant in a nonattainment or maintenance area, and indicate if the nonattainment designation is moderate, serious, or severe (if applicable); (ii) if emissions are above the federal de minimis levels, but the Project is sized to meet only the needs of current population projections that are used in the approved State Implementation Plan for air quality, quantitatively indicate how the proposed capacity increase was calculated using population projections.

D. Compliance with the Coastal Zone Management Act: Identify whether or not the Project is within a coastal zone and the status of any coordination with the California Coastal Commission.

E. Protection of Wetlands: Identify any portion of the proposed Project area that should be evaluated for wetlands or United States waters delineation by the United States Army Corps of Engineers (USACE), or requires a permit from the USACE, and identify the status of coordination with the USACE.

F. Compliance with the Farmland Protection Policy Act: Identify whether or not the Project will result in the conversion of farmland. Identify the status of farmland (prime, unique, local or statewide Importance) in the Project area and determine if this area is under a Williamson Act Contract.

G. Compliance with the Migratory Bird Treaty Act: List any birds protected under this act that may be impacted by the Project and identify conservation measures to minimize impacts.

H. Compliance with the Flood Plain Management Act: Identify whether or not the Project is in a Flood Management Zone and include a copy of the Federal Emergency Management Agency flood zone maps for the area.

I. Compliance with the Wild and Scenic Rivers Act: Identify whether or not any Wild and Scenic Rivers would be potentially impacted by the Project and include conservation measures to minimize such impacts.

Following are specific comments on the Town's draft EIR:

1. On page 70, there might be an error in the section references as most of the references say Section 0.

Please upload to the Financial Assistance Application Submittal Tool (FAAST) (https://faast.waterboards.ca.gov/) the following documents applicable to the proposed Project following the Town's completion of the CEQA process: (1) one copy of the draft and final EIR, (2) the resolution certifying the EIR and making CEQA findings, (3) all comments received during the review period and the Town's response to those comments, (4) the adopted Mitigation Monitoring and Reporting Program and (5) the Notice of Determination filed with the Butte County Clerk and the Governor's Office of Planning and Research, State Clearinghouse. In addition, we would appreciate notices of any hearings or meetings held regarding environmental review of any projects to be funded by the State Water Board.

Thank you for the opportunity to review the Town's draft EIR. If you have any questions or concerns, please feel free to contact me at (916) 341-5879, or by email at Kristen.Way@waterboards.ca.gov or contact Brian Cary at (916) 449-5624, or by email at Brian.Cary@waterboards.ca.gov.

Sincerely,

Kristen Way
Environmental Scientist

I am so happy to see this project going forward. As a 36 year resident of Paradise I am well aware of all the projects that have fallen thru due to lack of sewers or septic capacity. I look forward to seeing new businesses in Paradise that were made possible because of the sewer project. The entire town population will certainly benefit, even if they are not directly connected.

Could the pipeline go west on the unimproved portion of Edgar Ave instead of Chico Ave. Then North to Taffee. This would safe having to distroy a paved road (Chico Ave). I understand those are public right of ways.

I OWN A 20 ACRE WALNUT ORCHARD AT 3662 HEGAN LN. CHICO. CROSS FROM FINLEY/HEGAN INTERSECTION. PGTE INSTALLED A NEW GAS LINE ON THE NORTH SIDE OF HEGAN @2-3 ft. NORTH OF EDGE OF PAVEMENT. WHERE IS THE SEWER LINE GOING TO BE PLACED IN MY AREA. UNDER HEGAN LANE? NORTH SIDE OF HEGAN LN. OR SOUTH SIDE OF HEGAN LANE? IF ON THE SAME AREA AS PGTE GAS LINE, WHAT IS THE MINIMUM DISTANCE FROM GAS LINE? WHAT IS THE DIAMETER OF ~~GAS~~ SEWER LINE? MY CONCERN IS IF THE TRENCHING WILL KILL THE WALNUT ~~TREES~~ TREES / ROOT SYSTEM. OR IF TREES WILL HAVE TO BE REMOVED FOR THE TRENCHING?

Your comments will be taken into consideration during the preparation of the Final PEIR

RECEIVED
AUG 26 2022
TOWN CLERK'S DEPT

The Town has asked for public input regarding the proposed sewer project, and I would like to submit these comments:

First, the responsibility of Government is the safety and protection of its citizens; our basic rights are life, liberty and property. When you meet those basic rights; then, and only then, do you look for other benefits to the community that you govern.

So, the question is about the Town Govt. meeting the basic needs of the folks in Town.

1 The basic services for public safety are police, fire, and emergency medical services. Then ask yourself if you feel safe with the current facilities and staffing. (Remember, the third fire station was never built, the hospital is gone, and our cops are stretched thin). And there is no plan for change in these vital areas. Having a sewer does not correct or improve the absence of the above. We are no safer by having a sewer!

Second, there is no good justification to change from a septic system to a sewer system. Septic systems have worked extremely well for many rural communities for many many years. In Paradise, we have had very few failed or questionable septic systems; but let me just highlight a few examples of addressing a 'questionable' system. Cozy Diner: The Town, (based on limited space concerns) wanted to close the restaurant; there was no room to extend the leach field and the volume produced at the diner was exceeding the capacity of the existing septic system. Cozy management found a solution, agreed to spend a lot of money, and made the necessary improvements. Next, the Holiday Market leach field (it is under the asphalt parking lot) (which is not the best location for a leach field); Holiday was willing to spend a lot of money to dig up the old system and replace it with deeper drainage. It works just fine. Next, the MacDonalds Restaurant on Clark

2 Rd. Here was another "questionable" leach field, and there was not enough property to expand it. MacDonalds Corp. increased the parking lot size to accommodate additional leach field space (at a substantial cost). And lastly, the new Safeway Store on Skyway, they wanted to add a gas station and restaurant on the property, but there wasn't enough space for an extended leach field. So, Safeway Corp. bought additional acreage to be able to accommodate a larger leach field. Each of these examples show that whatever the concern is from the Town about a septic system, there was a remedy, if the property owner was willing to spend the dollars and improve the system. Have you ever heard of someone having an 'ailment' of any kind, because the septic system failed? Septic systems are not unsafe, or unhealthy.

There are other CA communities with similar concerns that have never been forced by the local Govt. to re-do their septic systems.

Looking at the benefits to having a sewer system, is not based on what problems you get rid of (see above); but consider the possible benefits to collecting sewerage, treating it, and using the effluent. Many folks thought that if the Town got some benefit from having a sewer system, then maybe it was a good idea. There are samples all over CA where treated wastewater is used for irrigation (especially on large grass areas - schools,

3 playgrounds, golf courses, cemetery districts, etc.) Anywhere that reclaimed water can be used reduces the amount of potable water used. Some communities have plumbed all the fire hydrants with treated wastewater. But that is not the plan for Paradise (there was an original plan to have local treatment), but the current proposal is to run a pipe (nearly 20 miles) from paradise to Chico. The wastewater from Paradise would end up at the Chico treatment plant. The discharge of treated wastewater goes into the Sacramento River; ergo, neither Paradise nor Chico get a benefit from our wastewater.

And, there are costs that go along with having a sewer system: a cost to get hooked up

4 (including, the digging up the street), a cost to discharge, a permit fee (annually or monthly), and, is that cost then passed on to consumers? Would all the commercial

5 facilities with new sewers raise their prices to cover the costs of using a sewer? Would

6 Paradise folks go to Magalia (with no sewer) and shop to avoid the price increases in Paradise?

7 Wouldn't it be nice if there was a plan to use treated wastewater here in Paradise to irrigate our new golf course?

8 Other comments: there are septic systems in CA, where there is no requirement for an inspection every ten years.

9 This is a summary of numerous comments/complaints I received since the question of a sewer for Paradise came up seven + years ago. But, remember, this happened before and the Town Council was 'recalled'!

Subject: Draft Program Environmental Impact Report for the Paradise Sewer Project

Dear Ms. Curtis,

The Department of Public Works has reviewed the Draft Program Environmental Impact Report (PEIR) that was issued for the public review and comment period on July 14, 2022. Based on our review, the following comments have been prepared under Butte County's authority as a Responsible Agency:

1. Permitting Authority: The PEIR acknowledges that the details of the required permitting and agreements that will be needed for the construction and ongoing operations of the Export Pipeline System within the County right-of-way have yet to be determined. Table ES-1 summarizes the anticipated required project permits and approvals for agencies and jurisdictions (p. xxiv). However, the table does not specify permitting authority for Butte County.

   The need for obtaining encroachment permits for work within the County rights-of-way is discussed several times in the PEIR, including Section 1.5 *Issues to be Resolved* (p. 10). Butte County is a Responsible Agency based on its discretionary approval power over certain aspects of the project including permitting authority which should be specifically recognized in Table ES-1.

2. Impact HAZ-6 Background and Analysis: Section 3.9 Hazards and Hazardous Materials does not appear to provide adequate discussion and analysis on how the proposed mitigation measures will reduce Impacts HAZ-6 and HAZ-7 to a less than significant level.

   - Impact HAZ-6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan

   - Impact HAZ-7: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires

   The Department requests that additional discussion and analysis should be provided in the PEIR to demonstrate how the proposed Mitigation Measures, specifically MM-HAZ-3, MM-HAZ-4, and MM-HAZ-5, will reduce the identified significant impacts to a less than significant level. For example, further discussion providing information on the importance of a Rapid Demobilization Plan and how rapid demobilization will be critical during an emergency would support the proposed mitigation measures.

3 Both the Rapid Demobilization Plan and Evacuation Warning Procedures should be provided to Butte County Public Works for review as part of the encroachment permit application process.

Please feel free to contact me at (530) 538-7681 or at khunter@buttecounty.net if you have any questions.

Sincerely,

Kim Hunter

RE: DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT (PEIR) FOR PARADISE SEWER PROJECT (SCH# 2021050008)

Dear Ms. Curtis –

Thank you for the opportunity to comment on the above referenced project. The City has reviewed the Draft PEIR and offers the following comments:

The City understands that the Paradise Sewer Project (Project) is a critical component to the Town of Paradise's (Paradise) overall Camp Fire recovery effort and that the design of the project is in an early phase. Given the scope of the Project, the alignment of certain segments of the proposed pipeline, the location of associated equipment located within or adjacent to the City limits and Sphere of Influence, and the pipeline's ultimate connection to the City's Water Pollution Control Plant (WPCP), we look forward to coordinating closely with Paradise during the design, construction, and implementation phases of the Project.

Close coordination will be particularly important for numerous reasons, including, but not limited to:

1

1) Avoiding potential conflicts between the Paradise Sewer Project and the City's proposed infrastructure projects that are located along or adjacent to the Project's proposed alignment (e.g., the P-18 sewer trunkline segments located within the railroad grade in South Chico and within the Entler Avenue and Midway rights-of-way, the intersection improvements at Hegan Lane and Midway, etc.).

2) Ensuring collaboration regarding the design of those project components (e.g., the Transition Chamber located off lower Skyway, the Flow Control and Metering Structure proposed near the WPCP, and all connections to the City's existing and proposed facilities) that are located within or adjacent to the City to avoid and minimize the potential environmental impacts (soil contamination, water pollution, odors, etc.) that could result from system failures.

2

The City appreciates Paradise's inclusion of the permitting requirements in the PEIR, including the Sanitary Sewer Systems General Order and associated conditions requiring the preparation of a Sewer System Management Plan and an Overflow

2 Emergency Response Plan that will be both reviewed and approved by the City of Chico. These documents will provide the policies, procedures and activities covering the planning, management, operation, and maintenance of the collection system. In addition, these efforts will result in emergency response planning to identify measures to protect public health and the environment, particularly as they relate to an inadvertent release of sewage.

3 According to the PEIR, wastewater studies prepared for the Town determined the Project export pipeline system design should be based on an estimated average wastewater conveyance and treatment need for the Paradise sewer service area to be 0.464 million gallons per day (mgd). Due to the conceptual nature of the inclusion of the entire Extended Collection System outside of the Core Collection System, as identified in Figure ES-1, it is unclear at this time if serving the greater area would have the potential to exceed the maximum design of 0.464 mgd. Any future expansions should be analyzed and agreed to by the City to prevent any unforeseen wastewater exceedances that could negatively affect pipeline and plant capacities.

4 The City looks forward to collaborating with the Town of Paradise and its professional sewer design team in the development of the project and looking for partnership opportunities that will benefit both communities.

If you have any questions, please feel free to contact me at (530) 879-6901 or LeighAnn.Sutton@chicoca.gov.

Sincerely,

Tracy R Bettencourt for

Leigh Ann Sutton, P.E.

To: Town of Paradise
From: Laurie Noble and Jim Noble
Regarding: Town of Paradise Sewer Project Draft Environmental Impact Report

RECEIVED
AUG 29 2022
TOWN CLERK'S DEPT

Public Information

There needs to be a very accessible public forum of information regarding the Town of Paradise Sewer Project. Very few people have participated and know of plans to date regarding this immense project. 1

Blue Flamingo could be a group to widely dissemenate information. There are numerous and very complex issues to deal with as this project moves forward. Residents should have opportunity for imput.

Water retention

We are hearing from individuals a very strong concern regarding grey water and storm water retention

Both have been a significant part of Paradises ground water for many decades. The installation of signal lights and reconfiguring the intersection at the top of Clarke Road directed storm water runoff to be diverted from the triangle parcel between Skyway Rd and Clark. Trees on that property died over the course of a couple of years. They were cut off from their supply of water. 2

As streets throughout town are repaired and upgraded will the strom drains ~~turned off~~ immediately run off the ridge or be directed to catchment basins? What are the details of all the plans?

Future Economic Development / Commercial Development

is on hold until a sewer system is in place. What is the time line for installation of the system including connection to west of Chico Sewage treatment Plant? 3

How does it fit in with rebuilds and repaving of roadways?

4 Cal Poly water/design ideas presented by students in Spring of 2019 should be revisited. They had some good ideas — how to deal with terrain elevations as an example.

5 Santa Cruz converting from septic tanks to sewer system — abandoned tank → sink holes — legal disclosures for property sales — Town of Paradise policy - need to dealt with.

6 Davis - Sewer Issues having to clean to keep system moving.

intentionally Blank

7 Drought issues need to be considered. This is not just in Paradise, in Butte County, in ~~the~~ the western states in north America it is a global world wide issue & needs to be dealt with now.

8 Water added to make the sewer system flow clear to the Sacramento River area ~~of~~ a treatment plant is possibly inappropriate be it fresh potable water added or grey water.

9 Pump up sewage from low lying areas of the community to the main lines ~~may~~ may be restrictive and financially prohibitive.

10 Lawn installations
Another drought issue the Town of Paradise could and should deal with immediately is lawn development / installation. Curtail or limit it immediately there is NO water, Mount Shasta is bare of snow except for a few glacial remains.

3:34pm

11 Draft Program Environmental Impact Report page 4/29 Hydrology and Water Quality HYD-2: is in need of more evaluation. The removal of all waters from households and businesses could have a very long lasting impact. Details of well level in Swayle when opened to install solar water pump was about 6" from ground level during drought year when wells were failing in the Valley. Laurie Noble 8/29/2022

Re: Paradise Sewer Project, Draft Program EIR
Public Comment

Marc,

The opportunity to provide this public comment on the Paradise Sewer Project Draft Program Environmental Impact Report (PEIR) is appreciated. As you are aware, I have been advocating for nearly two years a local water reuse project in Paradise as an alternative to the 18-mile wastewater export identified as the superior project in the draft PEIR. On November 30, 2021 I submitted to your office a white paper entitled *Town of Paradise, Butte County CA, Sewer, Water Reuse and Wildfire Defense Integrated Plan* (SWRWD Plan). That white paper is included in this public comment as Exhibit A.

In light of the broad implications of the export versus local reuse options for Paradise, it may be instructive to consider the California Environmental Quality Act (CEQA) Guidelines which includes as an advantage of the "Program" EIR[1] the following:

> *Allow the lead agency to consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts.*

This public comment will attempt to respond to the draft PEIR's assertions that the SWRWD Plan is infeasible and further highlight the benefits to Rebuild Paradise goals and aspirations for restoring a vibrant community with state-of-the-art infrastructure to serve many generations to come. This PEIR is now *at an early time* when Paradise has the opportunity to reconsider *broad policy alternatives* that may have been overlooked or misunderstood in the draft report.

This draft PEIR public comment is presented as follows.

Area of Known Controversy #1: Growth Inducing Impacts

The draft PEIR, Section 1.4, recognizes that there may exist growth inducing impacts *specifically in the City of Chico and rural Butte County outside of Town and City limits.*

In a November 4, 2020 letter from the Central Valley Regional Water Quality Control Board, Region #5 (R5) addressing the local facility versus regional alternatives for Paradise, the statement is made that the "*Pipeline to Chico can be cost-effectively sized to accommodate a large range of flows.*" In a tabulation of pipe carrying capacities of the 10.5 mile 12" diameter export pipe force main along the valley floor (from Skyway at Butte Creek to the Chico WPCP) utilizing reasonable flow velocities ranging from 3 feet per second (fps) to 7 fps[2], the available capacity could potentially be as high as 1.758 million gallons per

day (mgd) average daily flow (ADF)[3]. This capacity is approximately 3.8 times the 0.464 mgd ADF capacity allocated to Paradise in the inter-municipality agreement between Chico and Paradise considered as part of the draft PEIR.

The tabulation indicates that up to approximately 1.3 mgd ADF of wastewater export pipe force main capacity could be available to undeveloped properties in southeast Chico as well as rural Butte County along the pipeline alignment.

Area of Known Controversy #2: Reconsideration of Local Treatment Option

The draft PEIR, Section 1.4, recognizes potential *reconsideration of local treatment plant construction instead of the proposed connection to the Chico WPCP, which was evaluated in 2017 and 2020.*

In both Bennett 2017[4] and HDR 2020[5], the local treatment alternatives described did not consider distributing recycled water to all parcels served by the sewer system. Conversely, the SWRWD Plan considers extensive urban reuse serving all collected parcels thereby adding a water supply component to PID's portfolio enhancing its drought preparedness and supply resiliency. As described in the white paper, the dual distribution included in the SWRWD Plan has multiple benefits including 1) delivery of non-potable recycled water for residential, park, sports, commercial, and buffer area irrigation, 2) seasonal shallow aquifer recharge in winter months, 3) automated community-scale wildfire defense for essential facilities, public/private buildings and evacuation routes, 4) high pressure supplemental water supply for fire suppression, 5) protection of Paradise Irrigation District's (PID) potable distribution from depressurization in the event of another extreme wildfire event, and 6) beneficial use of nutrients inherent in municipal wastewater.

The draft PEIR, Section 5.2.1, Table 5.2-1 *Local Alternatives and Reasons for Elimination from Consideration*, lists as Local Alternative #3: *Local WWTP with Water Recycling with the Town for Local Reuse and Wildfire Defense.* In response to the 12 bullet points asserting infeasibility, included in this public comment is Exhibit 2 providing a rebuttal to each point individually in table format.

Lost Opportunity for Recycled Water

Assuming the export pipe force main has an ADF capacity of about 1.8 mgd, the potential lost opportunity for urban water reuse in Paradise and southeast Chico could be as much as 2,000 acre-feet per year (afy)[6].

On August 11, 2022, Governor Newsom announced *California's Water Supply Strategy, Adapting to a Hotter, Drier Future*[7]. Part of the *Strategy* is to increase urban water recycling in coastal and inland communities to about 0.8 million acre-feet per year (MAF) by 2030 and to about 1.8 MAF by 2040[8]. Urban water reuse in Paradise and southeast Chico would clearly be consistent with the *Strategy* and likely would be eligible for significant grant funding included in the 2021-2022 $5.2 billion state appropriations for California water systems including water recycling.

In its 2020 Urban Water Management Plan (UWMP), PID indicated that *the community will continue to work to examine the viability of a centralized sewer system and any associated opportunities to develop a recycled water supply as it continues to recover from the Camp Fire and look to the future of rebuilding and redevelopment of Butte County*[9]. The 18-mile export plan would foreclose on any opportunity in the foreseeable future to develop a recycled water supply in Paradise.

In similar fashion, Cal Water-Chico District indicated in its 2020 UWMP that *Cal Water continues to actively investigate recycled water opportunities, such as satellite, or decentralized, recycled water generation at select areas within the Chico area, for use in that area*[10]. The 10.5-mile export force main pipeline would likely also foreclose on Cal Water's ability to a develop recycled water supply in southeast Chico in the foreseeable future.

In both Paradise and southeast Chico, the export pipeline would represent a lost opportunity to develop local recycled water resources that might otherwise be available. This would be inconsistent with the Governor's *Water Supply Strategy* to maximize alternative urban water supplies, including recycled water for non-potable urban demands, for a more secure and resilient water supply future.

Issue to be Resolved: Butte LAFCo service extension approval

The draft PEIR, Section 1.5 indicates that Butte LAFCo's approval of the 18-mile extension of sewer service by Chico to Paradise is an issue to be resolved. However, the required LAFCo approval may be in conflict with state Government Code as indicated by the Executive Officer's letter of May 20, 2021 which states:

> *Provisions for extension of service requests are found in Government Code §56133 and in Section 4.5 of the Commission Policies and Procedures. Service extensions outside of an agency's Sphere of Influence may only be approved by LAFCo if there is "an existing or impending threat to the health or safety of the public or the residents of the affected territory. (§56133(c)) . . . . . The City/Town will need to provide documentation/justification of the existing or impending public health and safety threat the extension of services would address. This is a critical prerequisite to the project as* ***it is the only legally permissible justification available*** *[emphasis added] to the LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence*[11].

Since *an existing or impending threat to the health or safety of the public or the residents* does not exist, it appears that Butte LAFCo cannot approve the sewer extension request even if it wanted to. The only path forward on this may in fact be a waiver by the state legislature and Governor similar procedurally to Assembly Bill 36 (Gallagher, 2021). Recognizing that the 18-mile extension request is contrary to the Governor's *Water Supply Strategy* because it could potentially foreclose on up to 2,000 afy of urban water recycling, the Governor would likely not support the waiver legislation even if approved by the State assembly and senate.

Scalable to Sewer Entire Town

The export project as proposed in the draft PEIR limits the Paradise wastewater contribution to the Chico WPCP to 0.464 mgd. This limits sewer service to about 1,500 residential and commercial parcels within the sewer service area (SSA).

The SWRWD Plan, conversely, is scalable to whatever service area Paradise chooses long term, including service to all 10,600 parcels served by PID pre-fire. This would be consistent with a local Paradise Post press report stating:

(Congressman Doug) LaMalfa pointed to the sewer as an essential infrastructure need for Paradise. "You know, a portion of this is going to help with that longtime need for a sewer system to this town, which unlocks a lot of possibilities for (Paradise)," he said. He also pointed out that as Paradise rebuilds, it can be part of an important part of California's need to build more housing, pointing out that California is 2.5 million units short of what it needs[12].

For context on the limitations with sewer service only to within the SSA, the draft PEIR states:

Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California[13].

This metric would likely remain unchanged with the 18-mile export plan serving only the SSA – Paradise would ***still*** be the *largest unsewered community in California* since the SSA includes only about 14% of the permitted parcels within the Town.

State-of-the-Art Infrastructure

The same local Paradise Post press report indicated that:

[Paradise Mayor Steve] Crowder pointed out that the undergrounding project by Pacific Gas and Electric is also a critical project that will make Paradise "a state-of-the-art community with a brand new infrastructure."[14]

Beyond underground electrical power distribution, "*state-of-the-art*" infrastructure should also include sewer collection, potable water distribution, non-potable water distribution, independent high pressure supplemental fire supply, fiber optic distribution, and community-scale wildfire defense integrated with the recently authorized wildfire early warning system[15]. Clearly, all underground utility construction should be coordinated and should precede construction of any new public roads where the utilities are installed.

Summary

Section 15168(b)(4) of the CEQA Guidelines allows the lead agency to *consider broad policy alternatives and program-wide mitigation measures* ***at an early time*** with a "Program" EIR. This public comment suggests that now is the early time for the Town to reconsider the fundamental broad policy alternatives of 18-mile wastewater export/river discharge versus 1) water conservation, 2) water reuse, 3) aquifer recharge, 4) enhanced fire suppression, 5) community-scale wildfire defense, 6) protection of potable water distribution from depressurization and 7) beneficial use of nutrients. Further, the local reuse alternative offers the upside potential of ultimately providing sewer service to 100% of the Town.

The recommendation, therefore, is to elevate the SWRWD Plan as presented in Exhibit A to "feasible" CEQA status and then reconsider what is in fact the environmentally superior alternative. In reconsideration of the 18-mile export plan, its feasibility might rest with a legislative waiver of GC §56133(c) since absent such a waiver, it may not be *legally permissible*.

If the Town accepts the recommendation above, the draft PEIR should be recirculated consistent with CEQA guidelines[16].

1 EXECUTIVE SUMMARY

1.1 INTRODUCTION

This white paper[1] is presented to the Town of Paradise (TOP) and Butte County as an alternative vision and approach to solving the Town's longstanding sewer infrastructure needs. It is an attempt by the author to provide an independent view of the recognized sewer problem facing TOP, and offer an alternative opinion and recommendation as to a comparable cost, environmentally superior solution relative to the sewer project currently under California Environmental Quality Act (CEQA) review.

1.2 18-MILE WASTEWATER EXPORT PLAN

The project currently under CEQA review is described in the Notice of Preparation dated May 3, 2021, as follows:

> *The Proposed Project consists of three constructed components—a wastewater collection system in Paradise, an 18-mile export pipeline to convey wastewater to the Chico Water Pollution Control Plant (WPCP), and connection to the WPCP — and operation of the new sewer system. The export pipeline would begin at the southwest edge of Paradise and run for approximately 8 miles along Skyway until reaching south Chico, at which point the pipeline would leave Skyway and continue west, crossing Butte Creek, Highway 99, and the Union Pacific Railroad, and terminating at the Chico WPCP in Chico. The Proposed Project would not change the service area of the Chico WPCP other than the addition of the Paradise connection and treatment. Moreover, there would be no additional fees for Chico residents and existing Chico WPCP rate payers as a result of the Proposed Project. This long-term wastewater solution will allow for sustainable housing and business activity in Town, supporting the community's economic recovery and vitality*[2].

For purposes of this white paper, the current proposed project is referred to as the "Export Plan." The total capital cost of the Export Plan as presented by TOP's consultant in December 2020 is $184 million[3]. This estimate provides sewer service to approximately 1,470 parcels within the existing Sewer Service Area (SSA).

1.3 SEWER, WATER REUSE AND WILDFIRE DEFENSE INTEGRATED PLAN

The alternative project as presented in this white paper includes the following major components:

1. Effluent-only pressure sewer collection within the SSA
2. Local water recycling facility sited within or adjacent to TOP
3. High pressure non-potable auxiliary water supply system (AWSS)
4. Non-potable AWSS distribution to all parcels within SSA
5. Non-potable water irrigation supply for all parcels within SSA including parks, irrigated buffers, evacuation routes, high-risk slopes
6. California Title 22 disinfected tertiary recycled water for seasonal aquifer recharge

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

7. Non-potable water tank storage within TOP serving multiple pressure zones
8. Supplemental raw water supply for AWSS bypassing PID treatment plant in emergencies, if necessary
9. Supplemental groundwater supply for AWSS in emergencies, if necessary
10. Strategic wildfire defense capabilities including rooftop sprinklers, water cannons, water misters protecting essential and high value assets from wind-driven ember cast
11. Separation of potable and non-potable water distribution to prevent depressurization of potable system and chemical contamination caused by abrupt increase in water demand during a wildfire event
12. Robust community-scale wildfire mitigation and defense strategy to reduce insurance underwriters' risk profile and lower property insurance premiums
13. Septage receiving facility to accommodate biosolids from all TOP septic tanks
14. Expedited system delivery of 18-24 months from award of design-build contract to first flush relative to 5-10 years for the Export Plan
15. Significant opportunity for state and federal grant funding sources otherwise not available to the Export Plan
16. Ability to ultimately expand system to include all residential and commercial parcels within TOP

For purposes of this white paper the sewer, water reuse, and wildfire defense integrated plan is referred to as the "SWRWD Plan." A preliminary budget for this alternative plan is presented that relies in large part of prior estimates prepared by TOP's own consultant teams. For specific components not estimated previously, planning level budgets are presented. Based on these preliminary budgets, the capital cost of the SWRWD Plan serving the existing SSA is estimated at $187 million.

1.4 Purpose of White Paper

The intent of this white paper is to present an alternative vision and approach to solving TOP's sewer needs with a multi-dimensional set of objectives – an approach that recognizes value in local water reuse coupled TOP's overwhelming need to develop a robust community-scale wildfire defense strategy.

The Export Plan offers the one-dimensional benefit of regional wastewater disposal. The SWRWD Plan, on the other hand, offers 16 multi-dimensional co-benefits as listed in Section 1.3 above. This white paper also discusses beneficial non-technical aspects of the SWRWD Plan including permitting, capital costs, grant funding, property/wildfire insurance, system procurement, and time to implement.

By preparation of this white paper, a request is made to TOP to review the information herein and include the SWRWD Plan in the "Alternatives" section of the Draft Environmental Impact Report (DEIR) in accordance with CEQA guidelines. Upon approval of a Final EIR with both options included, TOP would be able to competitively bid the Export Plan and the SWRWD Plan on a design-build (DB) basis.

2 SEWER COLLECTION

Two alternative collection systems serving the SSA have been evaluated by TOP consultant teams previously resulting in distinctly different recommended technical approaches and cost estimates. In November 2020, HDR, Inc. in its Technical Memo #3 recommended a gravity collection system with an estimated capital cost of $119.6 million[4]. In June 2017, Bennett Engineering Services in its Alternatives Analysis and Feasibility report recommended an effluent-only pressure sewer system with an estimated capital cost of $47.4 million[5]. For each alternative evaluated, the specific number of parcels included within the same SSA were both approximately 1,470.

This section will briefly compare the two collection approaches evaluated previously.

2.1 GRAVITY COLLECTION

The gravity collection system proposed in 2020 consists of 154,000 lineal feet (lf) of gravity sewers, 27,000 lf of pressure force mains, 27 pump stations, 791 manholes, and 1,469 service lateral connections. Of the gravity sewers, most will require excavation in the range of 4 to 16 feet below ground, however approximately 2,000 lf will require excavation to depths ranging from 16 to 20 feet.

Excavation to these depths may prove difficult given that the Tuscan formation, in its "unweathered" state, is marked by predominantly hard and course rock fragments that make excavation difficult without blasting or the use of rock trenchers[6]. The constructability of deep gravity sewers in hardrock soils within the SSA is likely the predominate factor in the relatively high estimated construction cost.

Figure 1 presents images of gravity sewer construction in sandy soils showing how impactful deep trench installation of manholes and pipelines can be in residential neighborhoods. For TOP, the impact may be substantially greater if blasting or rock trenchers are required for deep trenches in hardrock areas.

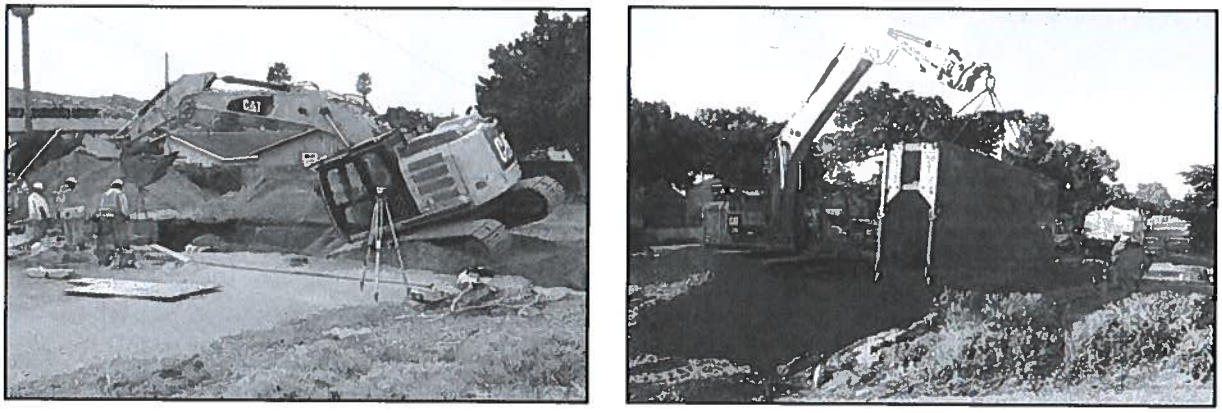

Figure 1 Gravity Collection Construction, San Luis Obispo County, CA

2.2 LIQUID-ONLY PRESSURE COLLECTION

The effluent-only pressure collection system proposed in 2017 consists of approximately 120,000 lf of sewer collectors, 60,000 lf of pressure trunks, 8,000 lf of gravity trunk, one local pump station, and 1,471 private connections each with its own interceptor tank. Since the collection system is pressurized, shallow pipelines with variable grades do not require deep trench excavations. Bennett indicated that

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

after conducting extensive research, a low-pressure system was selected in lieu of a more expensive gravity system. Cost savings were realized by reduced pipe size and shallower depth (three feet below the surface) for low pressure systems as compared to gravity systems[7].

Figure 2 presents images of low-pressure collection utilizing horizontal directional drilling (HDD) construction in a residential neighborhood. HDD installation is significantly less impactful during construction relative to open deep trenches required for gravity collection.

Figure 2 Horizontal Directional Drilling Low-Pressure Sewer, South Kent Island, MD

HDD construction is commonly used for other underground utilities including potable and recycled water distribution, underground electrical power distribution, cable TV, and fiber optic cable.

2.3 Recommended SWRWD Collection System

In 2020, TOP rejected the effluent only-pressure effluent collection in favor of gravity collection, as follows.

> *To reduce collection system capital costs, the 2017 Report recommended the use of a septic tank effluent pumping (STEP) system, which discharges into shallow gravity sewers. This STEP system would require that individual septic tanks remain in use. After completion of the 2017 Report, Paradise citizens indicated a strong preference to eliminate septic tanks and/or pumps on individual parcels. As a result, for this Project, the Town directed the development of a traditional gravity sewer system, which eliminates septic tanks[8].*

The collection system recommended for the SWRWD Plan is summarized as follows.

> *A low-pressure sewer effluent system is preferred to serve the Town. While the system requires a portion of infrastructure and maintenance on each parcel, it limits the number of pipelines and manholes needed in the collection system and reduces the cost of the collection system[9].*

Based on the cost estimates prepared by HDR and Bennett, a collection cost reduction of $72.2 million is realized by selection of effluent-only pressure system. In addition to the significant cost reduction, deep trenches (up to 20 feet) required for gravity collection in hardrock areas, may in fact be infeasible from a construction standpoint absent blasting. For these reasons, the effluent only pressure collection system as recommended by Bennett is recognized as the only technically and economically feasible collection option for TOP in the SWRWD Plan.

3 WASTEWATER TREATMENT

The regional plan includes an 18-mile export pipeline for treatment at the Chico Water Pollution Control Plant (WPCP) while the SWRWD Plan includes treatment at a new local facility located within or near the TOP. This section summarizes the two options and their prior cost estimates.

3.1 EXPORT TO CHICO WPCP

Based on the HDR 2020 investigation, the cost of this option is $52.2 million for the export pipeline and $13.0 million for connection to the Chico WPCP, for a total of $65.2 million[10]. This option would require a fee and operations agreement with the City of Chico, as well as a service extension approval from Butte LAFCo, land use approvals from Butte County, and right-of-way acquisition from various private landowners.

The alignment of the proposed 18-mile export pipeline is presented in Figure 3.

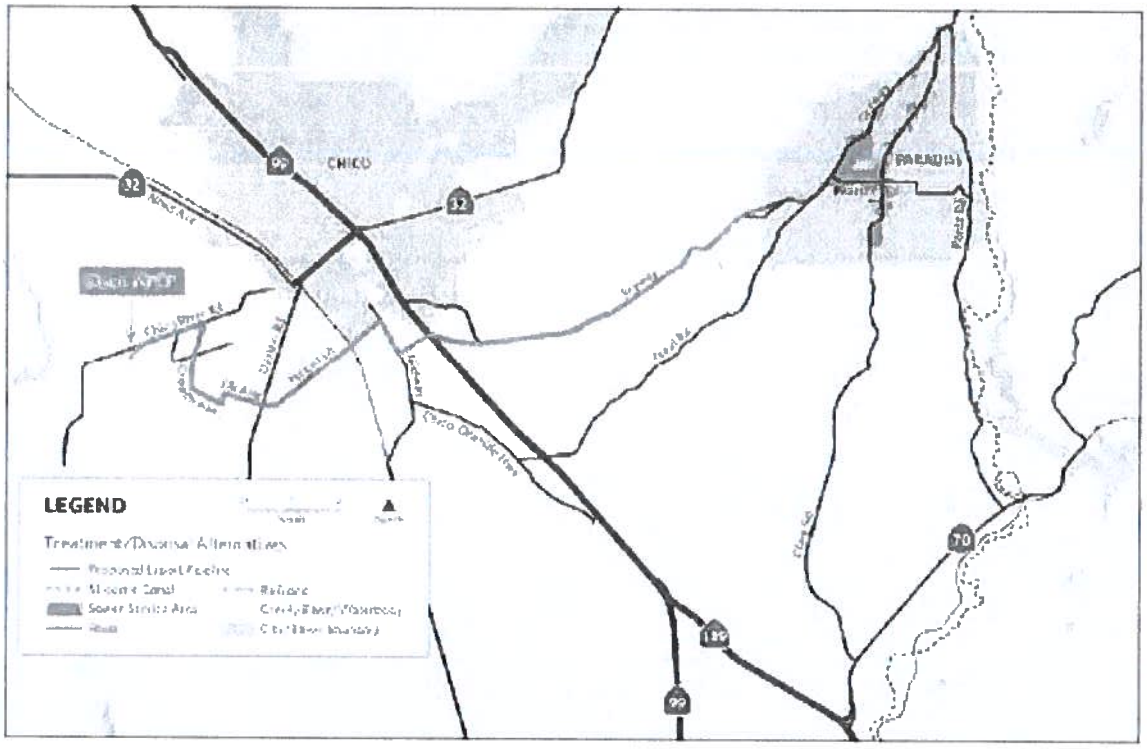

Figure 3 Export Pipeline Alignment[11]

The Chico WPCP discharges all of its treated secondary to the Sacramento River. Based on the 2021 Cal Water Urban Water Management Plan, there are no plans for upgrading the WPCP effluent to tertiary treatment and distribution of recycled water back to the City of Chico within the foreseeable future as indicated below.

> *Implementation of a recycled water program at either treatment plant would require upgrades allowing for tertiary treatment and new distribution infrastructure between the treatment plant and potential District customers. Based on these conditions, a recycled water system in the Chico District is not planned at this time and will likely only be considered if conditions related to District*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

supply change significantly in the future. As shown in Table 6-4, there is no recycled water supply for the Chico District[12].

It would be infeasible at any point in the future to return recycled water 18-miles from the Chico WPCP back to TOP.

3.2 Local Treatment Facility

Both HDR and Bennett estimated costs for a local treatment facility. For a local recycling plant producing California Title 22 (T22) disinfected tertiary recycled water with ultraviolet disinfection, HDR estimated a capital cost of $37.4 million in 2020[13]. For a similar facility, Bennett estimated a capital cost of $25.1 million in 2017[14].

In order to minimize pumping energy and costs for recycled water use within TOP, the SWRWD Plan proposes to site the local treatment facility at a location where elevation can be preserved to the greatest extent feasible. With effluent-only pressure sewer collection, the treatment site could be located anywhere in the lower half of the SSA without any intermediate pump stations. Three potential undeveloped parcels are listed in Table 1 that are located near the lower southern limit of the TOP jurisdictional boundary (and contiguous to the SSA) that provide ample area for the treatment facility as well as for any buffer or setback requirements.

Table 1 Potential Local Treatment Sites

APN	Zoning	Acres	Street	Elevation
055-180-001	TOP	40	Old Clark Road	1,510'
054-380-002	TOP	47	Dudley Lane	1,600'
017-090-097	AG-160	59	Skyway Xing	1,370'

The area requirements for the actual treatment facility itself is less than 3 acres for a 0.45 million gallon per day (mgd) capacity serving the existing SSA[15]. The facility would be fully enclosed with integral noise and odor control. All critical unit processes would have component parallel redundancy consistent with T22 regulations including an on-site reserve emergency storage pond if ever needed.

Because all three parcels are located in a "very high fire hazard severity zone" the treatment facility will be constructed of fire-resistant materials including concrete, masonry, and metal siding. There would be no unit process exposed to the exterior elements including wildfire ember cast. In defense against embers, an additional layer of protection would include rooftop sprinklers and strategically placed water cannons (as presented in Section 5 below) in the facility design.

An example of a water filtration plant constructed with fire-resistant materials is presented in Figure 4. A 0.45 mgd T22 water recycling facility serving the existing 1,470 parcel SSA would be similar in size to the 12,000 square foot building shown.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

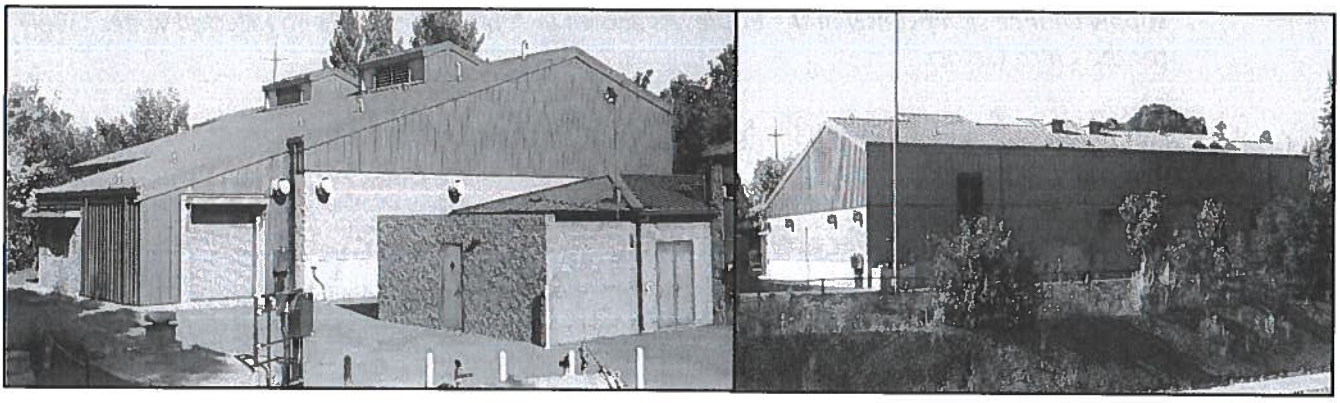

Figure 4 Fire-Resistant Water Filter Plant Building, Pleasanton, CA

3.3 Septage Receiving Facility

The proposed Export Plan does not include a septage receiving station even though that plan serves only about 14% of the existing parcels within TOP. HDR states that Providing a septage receiving station is only feasible if a local WWTP is constructed[16]. The SWRWD Plan includes a septage facility to serve the 1,470 parcels within the SSA as well as the approximate 9,000 TOP parcels not included in the SSA. The septage plant would be co-located with the water recycling facility discussed in Section 3.2 above and would be included in the 3-acre treatment facility footprint. The estimated capital cost of the septage receiving facility is $10.1 million[17].

3.4 Energy Intensity

The regional Export Plan requires significant energy to pump raw wastewater 10 miles from Pump Station #2 (Skyway at Butte Creek) to the Chico WPCP. The estimated energy intensity of pumping from PS #2 to the WPCP in dual 6" PVC pipelines is about 5 megawatt-hours per million gallons (MWh/mg)[18]. Adding an additional 1.5 MWh/mg for secondary treatment at the WPCP, the total energy intensity for the Export Plan is estimated to be about 6.5 MWh/mg.

The energy intensity of various treatment alternatives published by authoritative sources is summarized in Table 2. These are examples of local treatment process options that potentially could be used in the SWRWD Plan. By comparison, the Export Plan relative energy requirement could be multiples of the energy requirement for the local project.

The energy intensity of the collection system is assumed to be equal for the Export Plan and the SWRWD Plan, however effluent-only sewer pump efficiency is substantially higher that the pump efficiency of the 27 raw wastewater pumps used in gravity collection systems.

Due to the risk of electrical transmission equipment igniting more wildfires after the devastation of the Camp and Dixie wildfires, PG&E has recently announced plans to underground 10,000 miles of power transmission lines at a cost that could exceed $20 billion[19]. This is in addition to the planned 300 miles of undergrounding power distribution in Butte County including Paradise[20]. Based on the future costs to harden both transmission and distribution power lines, the PG&E customer costs for utility power will likely increase substantially in the foreseeable future. For this reason, the energy intensity for any project should be a critical consideration not only for environmental impact including greenhouse gas emission, but for ongoing operating costs over the life of the project.

Table 2 Energy Intensity SWRWD Treatment Alternatives

Secondary Treatment Alternatives	WEF MOP[21] (MWh/mg)	M&E[22] (MWh/mg)	WEF/EPRI[23] (MWh/mg)	PA Survey[24] (MWh/mg)	PA Survey[25] (kWh/lb BOD)
1. Extended Aeration (EA)	--	--	--	<3.8	<2.9
2. Membrane Bioreactor (MBR)	1.8	1.9-3.8	2.7	--	--
3. Seq. Batch Reactor (SBR)	1.3	--	1.1	<1.8	<1.6
4. Oxidation Ditch (OD)	--	--	--	<2.0	<1.6
5. Trickling Filter (TF)	0.12	0.23-0.35	0.6	<0.5	<0.4

4 Effluent Reuse

Reuse of municipal wastewater has many decades of history in California. Currently, over 700,000 acre-feet per year (230 billion gallons/yr) are recycled in the state for golf course, landscape, turf, agricultural, commercial, industrial, and fire suppression uses as well as groundwater recharge[26]. The reuse of wastewater generated within TOP is the dominant distinguishing feature of the SWRWD Plan relative to the Export Plan.

4.1 Dual Distribution

In order to beneficially use recycled water within TOP for non-potable uses such as irrigation and fire suppression, a dual distribution pipeline network is required. For the SWRWD Plan, a "purple pipe" distribution system is proposed to serve each parcel in the SSA.

4.1.1 Residential Landscape Irrigation

The predominate non-potable water demand within TOP is residential landscape irrigation. The use of recycled water for residential landscaping has been in practice at El Dorado Irrigation District for over three decades. EID has developed outreach and technical materials available to homeowners, engineers, landscape designers, and contractors related to recycled water use on residential properties[27]. Images of EID purple pipe recycled water irrigation systems on residential and commercial properties under construction are presented in Figure 5.

For potable water service at EID, each service connection has a water meter, backflow prevention device, and pressure reducing valve. For recycled water service, each connection has a water meter and pressure reducing valve[28]. For the SWRWD Plan, backflow prevention devices are recommended for both potable and recycled connections.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

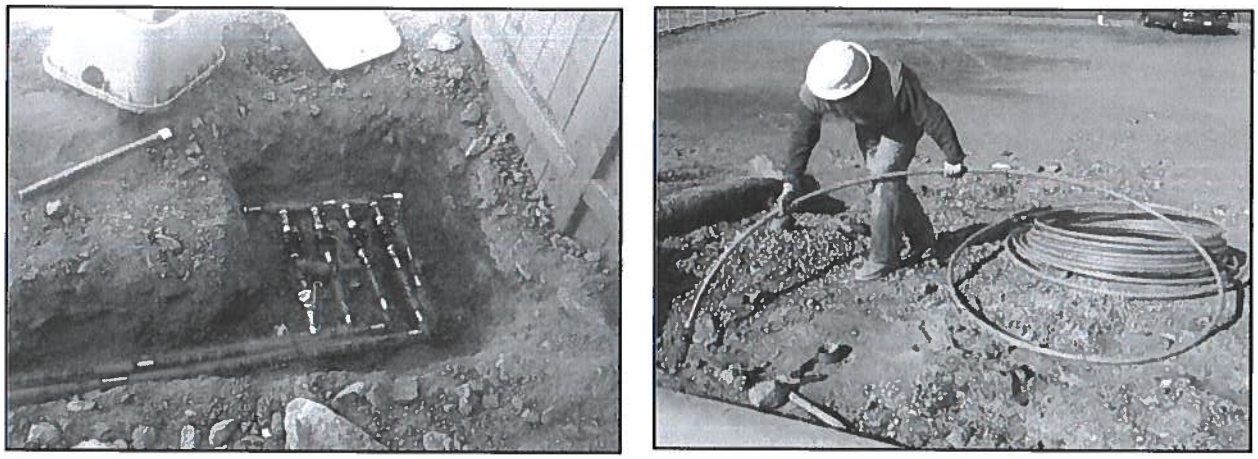

Figure 5 Recycled Water Residential Irrigation Installation, El Dorado Hills, CA

4.1.2 Public Area Landscape Irrigation

The SWRWD Plan includes non-potable water distribution for irrigation of parks, school campuses, sports fields, irrigated road medians, etc. An example of recycled water utilized for sports field irrigation is presented in Figure 6. It should be noted that the local wholesale water district[29] has requested a 10% curtailment in water use by its retail customers due to spring 2021 drought conditions, however that curtailment request does not apply to recycled water irrigators. This sports park has had an active summer 2021 soccer tournament season with outstanding turf conditions despite the drought.

Figure 6 Recycled Water Irrigation of Sports Park, Pleasanton, CA

4.2 Wildfire Risk Reduction Buffers

In the June 2020 report by the Conservation Biology Institute, wildfire risk reduction buffers (WRRB's) are recognized as a scientific justification for a "defensible space" zone around a community. In CBI's findings, it concluded that:

> *The model results, as well as the conversations with the Paradise TAC, support the hypothesis that reducing flammability of land cover in the region between the wildland area and urban area in Wildfire Risk Reduction Buffers reduces risk of ignition in the urban area. According to this model, which emphasizes the effects of strong winds, focusing on reducing fire risk in the upwind areas adjacent to the town would provide maximum ignition risk-reduction benefits. We used the north-easterly "Jarbo Gap" wind direction in our analysis, but this process could be modified to explore priority locations for other wind directions or scenarios, as suggested by the Paradise TAC[30].*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

Since June 2020 when CBI issued its report on WRRB's, the 2021 Dixie Fire has demonstrated that southwesterly winds can be just as intense and destructive as the northeasterly winds of the Camp Fire. It is therefore assumed that for wildfire defense planning, that winds from any direction be included in all planning scenarios. For the SWRWD Plan, strategic perimeter WRRB's could be irrigated with non-potable water for open space recreation and areas of refuge in time of emergency. These areas could be irrigated throughout the summer season to ensure maximum protection during the fall and early winter wildfire season.

Beyond WRRB's at the perimeter of the community, interior irrigated buffers have demonstrated protection during the 2018 Camp Fire within TOP. The satellite image presented in Figure 7 clearly demonstrates how the irrigated Paradise Community Park shielded downwind buildings across Black Olive Drive from the prevailing northeasterly winds at the time. This demonstrates not only the usefulness of the linear park as defensible space, but the added benefit as an irrigated buffer to reduce flammable dry vegetation upwind of high asset value buildings and public facilities.

Figure 7 Irrigated Paradise Community Park (center), December 11, 2018[31]

This irrigated buffer concept could be replicated at essential facilities such as evacuation centers, schools, government buildings, hospital campus, churches, retirement homes, fire stations and high value commercial properties. Since wildfire wind direction is variable and unpredictable, these irrigated buffers could potentially surround essential and high valued real estate assets on all sides.

4.3 PID 2020 Urban Water Management Plan

Paradise Irrigation District (PID) recently submitted its Urban Water Management Plan (UWMP) to the California Department of Water Resources as required by the Urban Water Management Planning Act of 1983. The Plan summarizes PID's plans for use of recycled water, as follows.

> *At the time of plan preparation, structures are served by septic tanks throughout the Town, with no centralized sewer system owned or operated by any entity. With no centralized sewer system, there is no opportunity for treatment or use of recycled water within PID's boundary. The viability of a local sewer system is being examined at this time at a conceptual level, creating the possibility of recycled supply in the long-term planning horizon. DWR Table 6-4 and DWR Table 6-5 reflect the inapplicability of this resource through the planning horizon of this document.*
>
> *The community will continue work to examine the viability of a centralized sewer system and any associated opportunities to develop a recycled water supply as it continues to recover from the Camp Fire and look to the future of rebuilding and redevelopment of Butte County*[32].

4.4 Seasonal Irrigation Demand

PID's previous 2015 UWMP provided a 2020 pre-fire water demand estimate of 6,623 acre-feet (af) for potable and raw water customers. Of that amount, 3,030 af was assumed to ultimately be discharged to septic tanks then subsurface leachfields. These values indicate that about 55% of PID's pre-fire demand was for exterior irrigation on an annual basis. Based on historical precipitation and evapotranspiration data, most of the irrigation demand would be between April and September. For the SWRWD Plan, it can be assumed that most of the recycled water produced will be used for irrigation during these months.

4.5 Winter Aquifer Recharge

During the months of October through March, there will be more recycled water produced than required for irrigation. During these months, the SWRWD Plan proposes to utilize existing leachfields for shallow aquifer recharge of the same T22 disinfected tertiary recycled water effluent quality required for unrestricted irrigation. The dual distribution system, which provides non-potable supply to each parcel within the SSA, would also discharge to the existing subsurface dispersal fields utilizing the irrigation manifolds and controllers already located at each parcel[33]. This concept avoids the need for seasonal effluent storage reservoirs and/or large centralized wintertime subsurface dispersal facilities.

This concept maintains widespread distribution recharge of the fractured rock aquifer underlying TOP, which supplied domestic and agricultural demands prior to the PID surface water treatment plant and distribution system. PID has also historically used one well for seasonal supplemental supply and emergency backup, though since 2020 it is not currently in operation due to mechanical issues[34]. Additional wells located at recycled water tank sites could supplement the AWSS system described in Section 5.2 below.

5 WILDFIRE DEFENSE

5.1 FIRE HAZARD SEVERITY ZONE MAPPING

As indicated in Figure 8, Cal Fire has designated most of the TOP land area within its jurisdictional boundary as within a "very high fire hazard severity zone" (VHFHSZ).

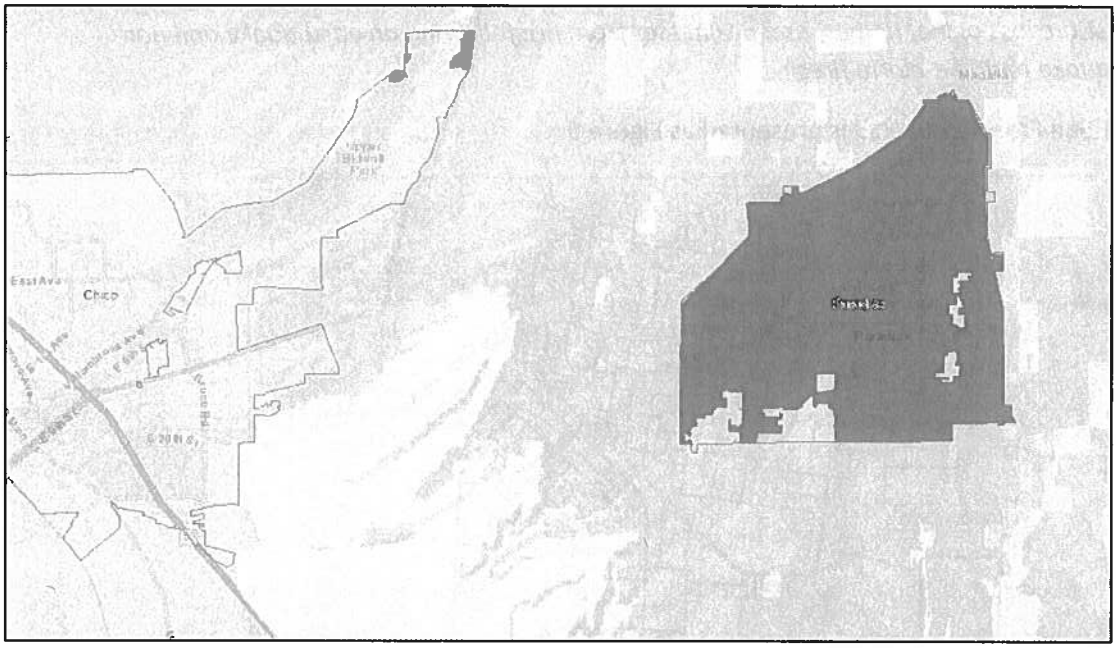

Figure 8 Fire Hazard Severity Zone Map[35]

Beyond providing sewer and recycled water service to parcels within the SSA, the SWRWD Plan proposes a robust community-scale wildfire defense strategy in light of the VHFHSZ designation for nearly all parcels within TOP. The wildfire defense strategy is proposed to ensure that the 2018 Camp Fire devastation within the SSA never occurs again.

The January 2021 California Wildfire and Forest Resilience Action Plan states:

> *Protect Wildfire-Prone Homes and Neighborhoods: To address the long-term trend of more people living in the [Wildland Urban Interface] WUI, it is critical to increase vulnerable communities' resilience to uncontrolled wildfires. As described in OPR's Fire Hazard Planning Technical Advisory, developments in the WUI increase the number of ignitions, the likelihood that wildfires become urban conflagrations, putting many homes and structures at risk of being damaged or destroyed by a wildfire, and constrain fuel-management activities*[36].

5.2 AUXILIARY WATER SUPPLY SYSTEM

The SWRWD Plan proposes a non-potable dual distribution system conceptually described in Section 4 above as a high-pressure Auxiliary Water Supply System (AWSS) for fire suppression and wildfire defense in anticipation of a potential wildfire recurrence equal in severity to the 2018 Camp Fire.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

5.2.1 San Francisco AWSS

In operation for over a century, the San Francisco AWSS is an integral part of its emergency fire suppression system. The San Francisco AWSS is conceptually described as follows.

> *The Auxiliary Water Supply System (AWSS) is a non-potable fire-suppression water system that was built the decade following the catastrophic 1906 San Francisco earthquake. The purpose of the AWSS is to provide the San Francisco Fire Department (SFFD) with a high-pressure fire suppression water system that can be utilized during large fires. The system is vital for protection against the loss of life, homes, and businesses from fire following an earthquake and non-earthquake multiple-alarm fires[37].*

A map of the San Francisco AWSS is presented as Figure 9.

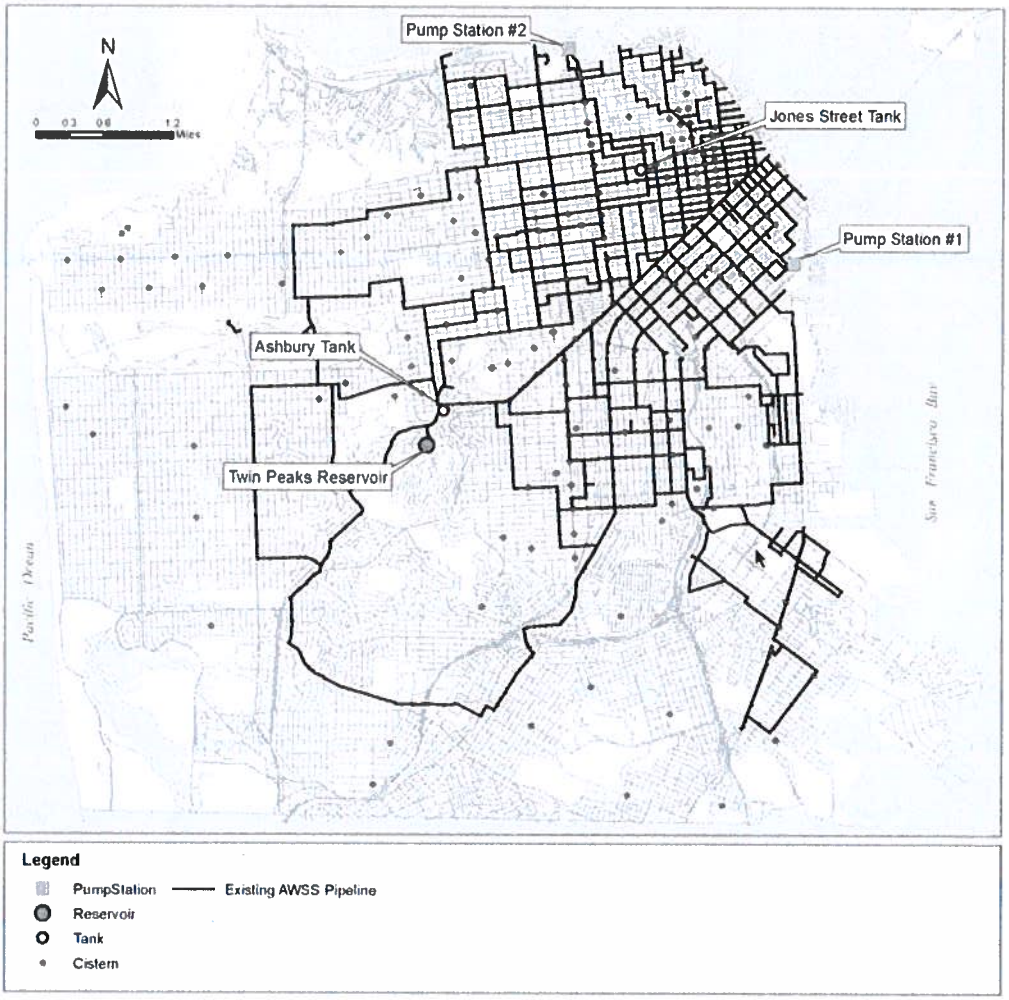

Figure 9 Map of San Francisco AWSS

The overriding objectives of the San Francisco AWSS after the 1906 earthquake were **volume and pressure**. The City had previously burned 5 times over six decades, and insurance rates soared, and, in some areas, coverage was unobtainable. *Strongly influenced by insurance companies of the period, the AWSS is dedicated to the principle that the City will never again be destroyed by fire, at least not for the lack of water for fire-fighting purposes[38].*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

The San Francisco AWSS is supplied by three non-potable water storage facilities at elevations of 758 feet, 495 feet, and 369 feet above sea level. The system is designed to utilize elevation (without pumps required) to provide high pressure to three separate zones in the AWSS distribution system. Specially designed high-capacity high-pressure dry barrel hydrants are equipped with three threaded outlets that can be independently valved. The hydrant bonnets are color-coded for firefighters' quick recognition of the pressure zone at any particular point in the system. Black hydrants are supplied by the Twin Peaks reservoir, red hydrants by the Ashbury Tank, and blue hydrants by the Jones Steet Tank (see Figure 9 for reservoir and tank locations). Figure 10 presents examples of color-coded hydrants at various locations with the AWSS distribution system. Note the cast label on the blue bonnet *"SF AWS 1909."*

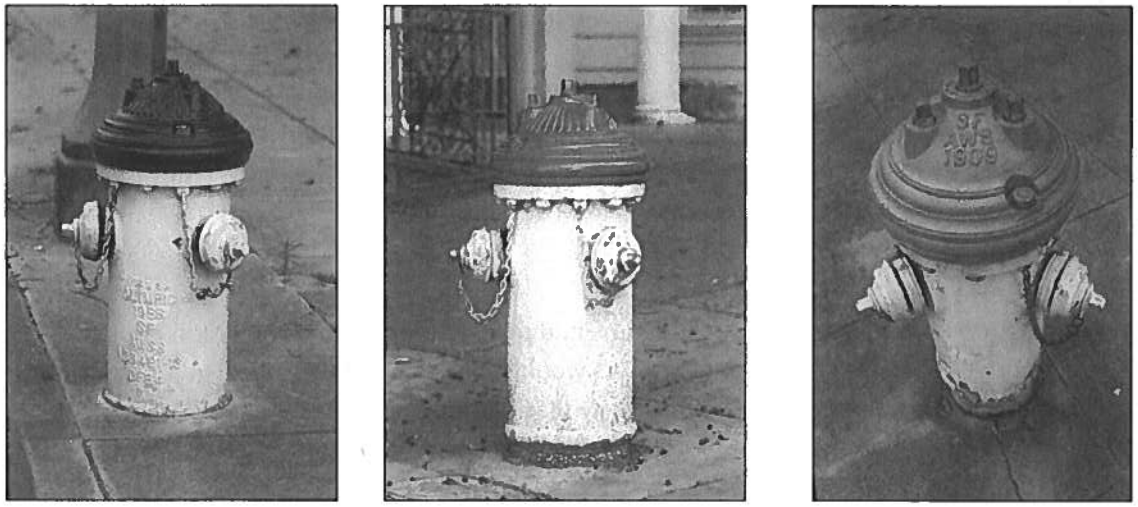

Figure 10 Color-coded SF AWSS hydrants

As a non-potable water system, the AWSS can be supplemented with supplies that do not meet drinking water standards. Figure 11 presents a fireboat manifold currently under construction at Embarcadero Fire Station No. 35 in San Francisco. In the event a large fire, fireboats can connect to the manifold and supply bay saltwater under pressure to the AWSS in the event water supply in tank storage is insufficient for whatever reason including pipe rupture caused by earthquake. The fireboat Phoenix has a pumping capacity of 9,600 gallons per minutes (gpm) and the fireboat Guardian has a pumping capacity of 24,000 gpm which provide backup supply if ever needed. A total of 5 of fireboat manifolds are located along the waterfront that were originally installed in about 1912[39].

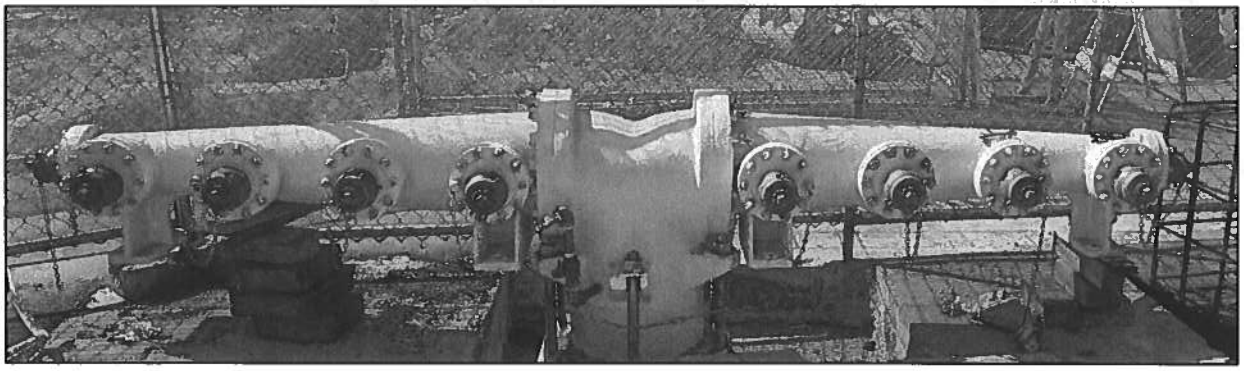

Figure 11 Fireboat manifold under construction at SF Fire Station No. 35, October 7, 2021

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

5.2.2 Paradise AWSS

The SWRWD Plan includes a high pressure non-potable distribution system similar in concept to the San Francisco AWSS. The source of supply would include recycled water supplemented as needed with well water and/or raw untreated reservoir water. The design criteria for tank storage, pressure zones, static and operating pressures, delivery capacities, pipeline alignments, pipeline diameters, would be developed in close coordination with local water supply and fire professionals including PID and Cal Fire-Butte County. Fire and water distribution professionals at San Francisco Public Utilities Commission (SFPUC) would also be consulted for best practices on how to best implement and operate a similar AWSS in TOP. While the San Francisco AWSS is designed for urban high-density and high-rise fires, there are likely many lessons learned on design, construction, and operation that would apply equally to a AWSS given TOP's low-density development pattern.

The overriding objective of the Paradise AWSS would be **volume and pressure** just as the case in San Francisco today 115 years after it was originally conceived. With a well-designed AWSS, Paradise would be much more resilient by being much better prepared to defend against an uncontrolled wildfire preventing a repeat of the devastation that occurred in November 2018.

5.3 Public and Private Fire Hydrants

AWSS hydrants in San Francisco supply enough volume and pressure for direct connection of attack hoses without the pressure assist of a fire engine. This would allow, for instance, local volunteer fire fighters to have sufficient flow and pressure available without assist from Cal Fire engines. Image in Figure 12 shows an AWSS hydrant supplying sufficient pressure and volume for six attack hoses simultaneously.

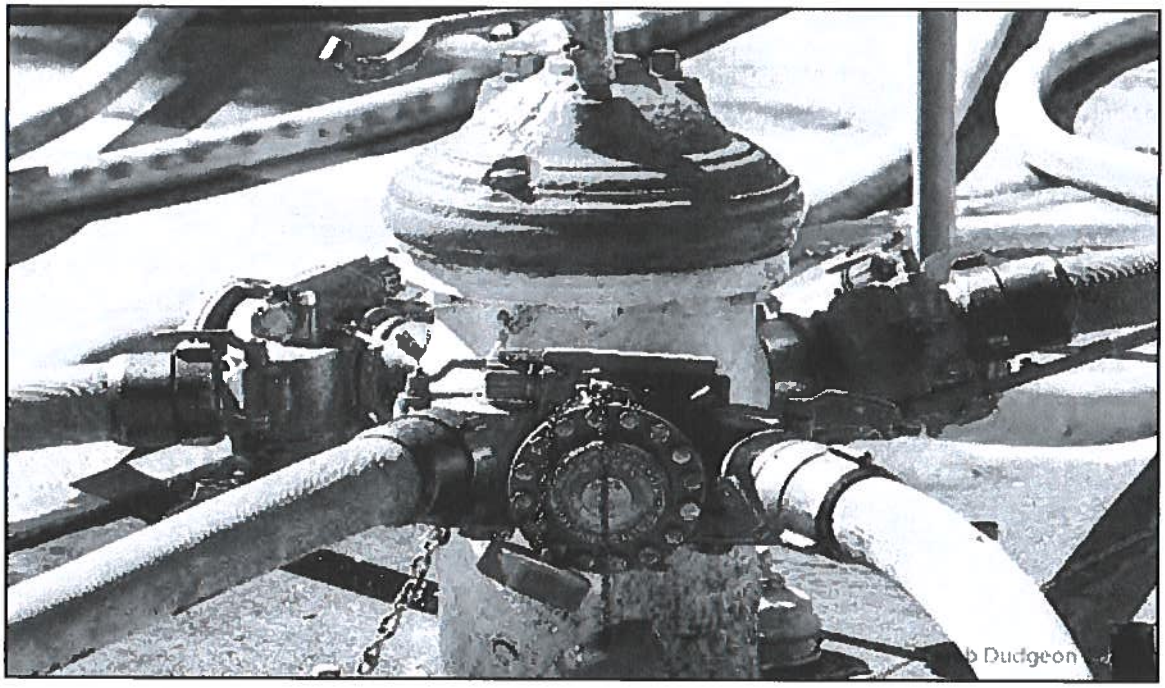

Figure 12 San Francisco AWSS hydrant direct connection of six attack hoses

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

The AWSS could potentially supply private hydrants and fire hoses on residential or commercial properties within the service area that may be distant from the larger public hydrants in the public right-of-way. If appropriate, a plan for private hydrants and/or private firehoses would need to be a coordinated effort by Cal Fire, PID, and TOP. Images of a private hydrant and a private fire hose reel at a California rural residential property is presented in Figure 13.

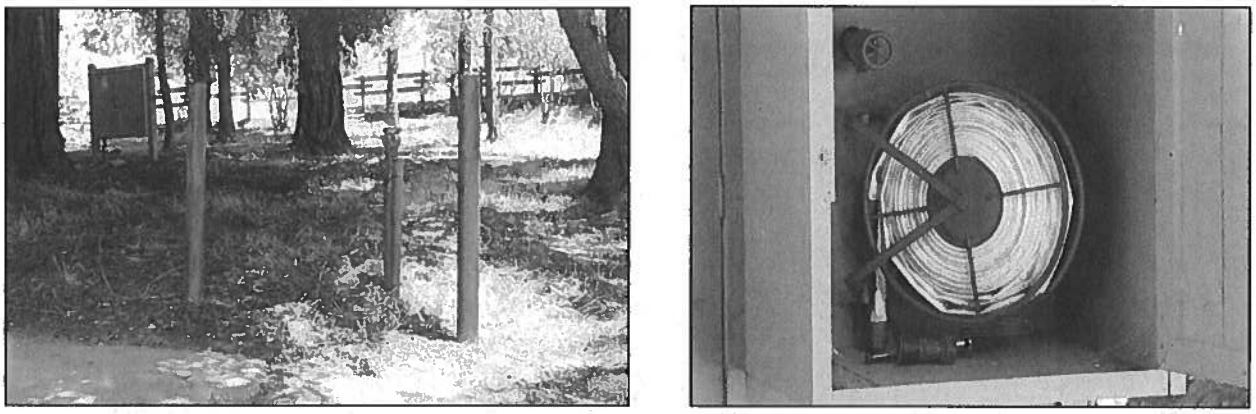

Figure 13 Private Hydrant and Fire Hose, Alameda County, CA

5.4 Strategic Placement of Water Cannons

High-capacity water cannons are widely used for agricultural irrigation, dust suppression, and wildfire defense[40]. These water cannons have a throw radius of up to 310 feet and can be used to preemptively add moisture content to a large area in response to high-risk red alert weather forecasts. An example of a water cannon irrigating a corn field is presented as Figure 14.

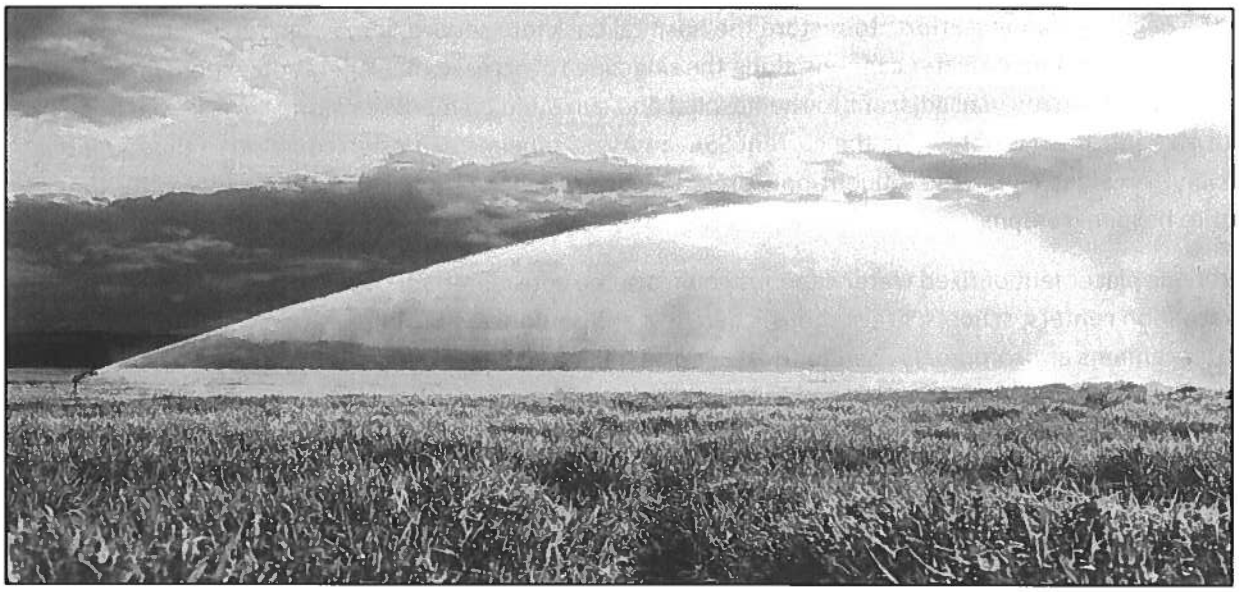

Figure 14 High-Capacity Irrigation Sprinkler (Water Cannon)

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

The Feather River Hospital on Pentz Road is located adjacent to the steep Feather River canyon on its east side as indicated in Figure 15. The Camp Fire northeast winds against the steep canyon wall in combination with dry vegetation created a chimney effect resulting in an intense inferno at the ridgeline. Hospital and medical support buildings near or adjacent to the ridgeline were severely damaged.

Figure 15 Feather River Hospital Campus (left), Feather River Canyon (right), December 11, 2018[41]

In the ongoing planning efforts to restore the hospital back into service, it may be prudent to consider strategic placement of water cannons along the ridgeline to increase the vegetation water content on the high-risk canyon wall adjacent to the hospital and surrounding medical campus. While the hospital site on Pentz Road is not within the current SSA, an AWSS pipeline extension could serve this essential facility. An extension of the effluent-only pressure sewer pipeline should also be considered for the entire hospital campus.

Strategic placement of fixed water cannons could also be considered for other essential facilities such as evacuation centers, schools, fire stations, churches, and senior care facilities. Strategically placed fixed water cannons are commonly used for dust suppression at mining facilities[42] and this same concept could be employed for protection of essential facilities both preemptively and during a wildfire incident.

For planning of a new rebuilt downtown core on Skyway, it may also be prudent planning to consider water cannons to preemptively increase water content of landscapes, hardscapes, and rooftops for the four city blocks included in the downtown planning zone.

5.5 Rooftop Sprinklers

The Paradise AWSS could also supply rooftop sprinklers for wildfire defense on government, commercial, institutional and residential buildings. An example of a rooftop sprinkler system on a rural residential building is presented in Figure 16.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

Figure 16 Rooftop Sprinklers on Residential Building

5.6 Use of Satellites and Artificial Intelligence to Prioritize Water Allocation

Preemptive use of water cannons, rooftop sprinklers, and turf/landscape sprinklers in the event of wildfire threat could increase ground and hardscape water content at a community scale. Satellite imagery and artificial intelligence technology is now being adopted by Cal Fire and local fire agencies to predict wildfire spread and risk to communities, described as follows.

> *What's the information used for? The images help commanders make decisions on how to best deploy their resources, keep firefighters safe, predict a fire's spread and identify structures in its path. It can aid municipalities and others who are calling for evacuations of people in harm's way[43].*

The AWSS would be controlled by a Supervisory Control and Data Acquisition (SCADA) system where Cal Fire, PID, and incident command would have real-time information on status of water supply in tank storage and distribution system operating pressures during a wildfire emergency. *With SCADA control of the AWSS, incident command could prioritize immediate water allocations to the highest risk areas of the community to conserve available water supply if necessary. This prioritization would be guided by real-time wildfire intelligence software platforms that are now being deployed by Cal Fire, power utilities and local emergency response agencies.*

5.7 Depressurization of Potable System

PID's potable water pipe network experienced rapid depressurization during the Camp Fire, described as follows.

> *Several hours into the duration of the Camp Fire, PID's pipe network experienced a significant depressurization in a majority of its water mains. Though the WTP continued to produce water during the fire, demands from fire sprinklers, firefighting activities, and free-flowing service connections where structures once stood drained significant portions of the system. This depressurization event resulted in negative pressure in many areas throughout the main network, which caused an indeterminate amount of damage in the system. Volatile organic compounds (VOCs) were also introduced into the system as smoke, debris, and other contaminants were*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

drawn in through damaged system appurtenances and exposed service connections of destroyed structures[44].

This depressurization phenomenon is not unique to PID resulting from the 2018 Camp Fire - it has happened recently to numerous other communities devastated by wildfires[45]. By separating the potable water system from the fire suppression water supply, the risk of depressurization of the potable system is substantially reduced since the underlying cause is the abrupt increase in water demand from residential yard sprinklers and fire-fighting activities. That demand could otherwise be on the AWSS. If depressurization were to occur on the AWSS, it is a non-potable system so any chemical contamination, if ever to occur, would not impact the community drinking water supply. The integrity and water quality of the potable system would remain intact.

In order to further ensure that the potable system does not experience negative pressures that would contaminate the distribution pipelines, backflow prevention devices are recommended for all potable service connections going forward. As an added safety precaution for the AWSS, backflow prevention devices are also recommended for all recycled water service connections.

A recycled water backflow prevention device serving a large commercial property is presented as Figure 17. Recycled water for this retail property is used for landscape irrigation, exterior hydrants, and interior fire sprinklers. A gas station is also equipped with overhead canopy recycled water sprinklers.

Figure 17 Backflow Protection on Recycled Water System, Livermore, CA

5.8 PID Inability to Deliver Sufficient Water Supply in Wildfire Incident

Key design criteria in the planning and design of any water supply system include peak demand in normal operations and duration of peak demand during a firefighting incident. When the 2018 wildfire threatened, PID's ability to deliver water was constrained, described as follows.

Wildfires in or near the PID service area in the Town of Paradise provide a significant impact to the District's ability to deliver water. The 2008 fires showed that further education in the community is needed to stop the use of yard sprinklers during evacuations. The water is not beneficial and takes water away from firefighting efforts[46].

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

With the AWSS, PID would be able to supplement the non-potable water storage tanks with untreated Magalia surface water and/or groundwater from wells located near each storage tank. This could greatly improve the ability to supply sufficient water to the AWSS when recycled water in tank storage may be insufficient to meet the immediate incident demand. With sufficient tank storage plus immediately available supplemental supply, the water cannons, rooftop sprinklers, yard sprinklers, private hydrants, private fire hoses, etc. could be utilized to increase ground, landscape, and rooftop water content, preemptively, when wildfire warnings are issued. If evacuation orders are issued rooftop and yard sprinklers could be left on, while the large water cannons could be operated remotely to conserve supply.

Increasing water content of ground, hardscape, and building roof/siding could be an effective defense against wind-driven ember storms generated by wildfires miles upwind. This would be an added protection over and above creating defensible space around structures. Wind-driven embers were the major source of ignitions in Paradise during the 2018 Camp Fire[47]. Incident command, with the SCADA system, would have the ability to prioritize available AWSS supply to zoned areas of the community at highest immediate risk. Reducing or eliminating AWSS supply in specific zones of the community would not impact the health and safety of non-evacuated residents since the potable supply would not be affected by any localized zone area shutdown.

Incident command, through the SCADA system, could also selectively activate biodegradable surfactant foam injection systems strategically located throughout the AWSS. Surfactant foams increase the effectiveness of the water that is available for fire suppression, and thereby reduce the volume of water required for any specific incident. Since the AWSS is separate from the potable water system, injection of biodegradable surfactant foam would not impact water quality of the drinking water supply. Figure 18 presents a water cannon creating a fine mist with a foam and wetting agent mixture.

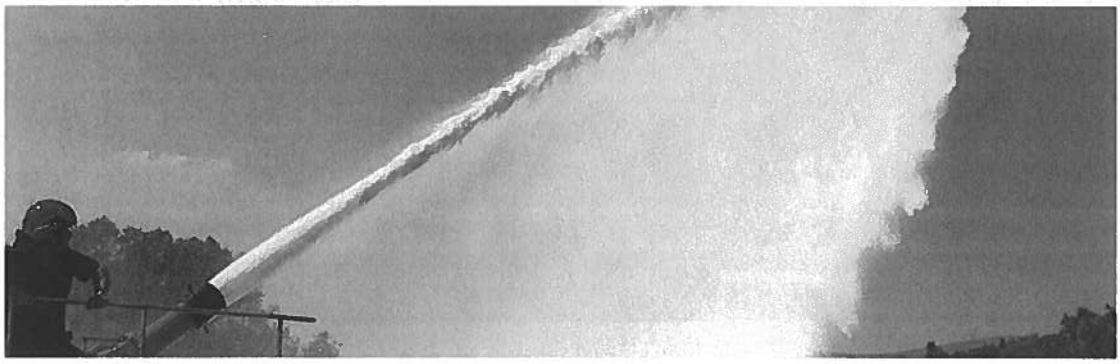

Figure 18 Firefighting Water Cannon Using Surfactant Foam

[Note: Class A foams are a mixture of foaming and wetting agents in a non-flammable solvent and are non-hazardous, non-corrosive, non-flammable, and readily biodegradeable. The foam extinguishes fire by isolating the fuel, reducing the fuel temperature, and separating the supply of oxygen. Class A foam solution, containing 0.1 to 1.0% foam, reduces the tendency of water to "bead up" by lowering surface tension. This in turn allows the water to penetrate the burning surface, absorb the heat and cool the fire much more rapidly, with less water. Class A foams provide quicker control and increased penetrating power for deep seated fires [48]]

5.9 Use of Snow Machines at 2021 Caldor Fire

The Caldor Fire has burned approximately 222,000 acres in El Dorado and Alpine Counties CA and Douglas County NV since ignition on August 14th. Full containment was achieved on October 25th. A total of approximately 900 structures were damaged or destroyed by this fire. Of interest to the proposed SWRWD Plan, snow cannons typically used in the winter and spring months to supplement snowpack on ski slopes, were used on an emergency basis during the Caldor Fire to increase water content of groundcover, vegetation, trees, hardscapes, and buildings at ski resorts described as follows.

> *Heavenly, whose slopes most years are filled with fluffy white snow and downhill skiers as the Labor Day holiday approaches, is now eerily dry and abandoned, and forced to use its snow cannons to blast streams of water to hydrate surrounding mountainside vegetation. Susan Whitman, a spokesperson for Heavenly, Northstar and Kirkwood resorts, told the paper that their hydrants pumped "significant water" onto the resort and that everyone is "laser focused on safety and mitigation at this point but we do want to be a helpful resource." Similarly, Sierra at Tahoe employed their water cannons to mitigate wildfire impact, misting nearby buildings and trees[49].*

A nighttime image of a portable snow machine used as a wildfire mitigation is presented as Figure 19.

Figure 19 Portable snow cannon at Sierra-at-Tahoe, Twin Bridges, CA on August 30, 2021

Part of the detailed design development of the SWRWD Plan would be an investigation as the relative benefit of utilizing the air-assisted snow cannon versus the typical water cannon used in agriculture and dust suppression. The air-assisted snow cannons have the benefit of using less water and are efficient at increasing humidity particularly in the nighttime hours. Portable snow cannons also can be deployed when and where needed in anticipation of wildfire risks. A plan for strategic fixed and portable placement of water cannons and/or snow cannons will be based on an engineering study by fire suppression and wildfire mitigation experts in consultation with Cal Fire – Butte County.

6 EXPANSION OF SEWER SERVICE AREA

This section will address the Sewer Service Area (SSA) as presently proposed in the Export Plan.

6.1 CURRENT PROPOSED SSA

The proposed SSA is presented graphically in Figure 20 and is described as follows.

> The SSA contains 1,469 parcels. As of April 2020, there were 300 parcels with habitable structures within the SSA. The Project is estimated to come on-line by 2027, at which time there will be an estimated 357 occupied parcels within the SSA generating an average wastewater flow of 109,000 gallons per day (gpd; see Figure 2). It is estimated that it could take 30 years for all 1,469 parcels to be occupied, at which time the average wastewater flow would be 448,000 gpd[50].

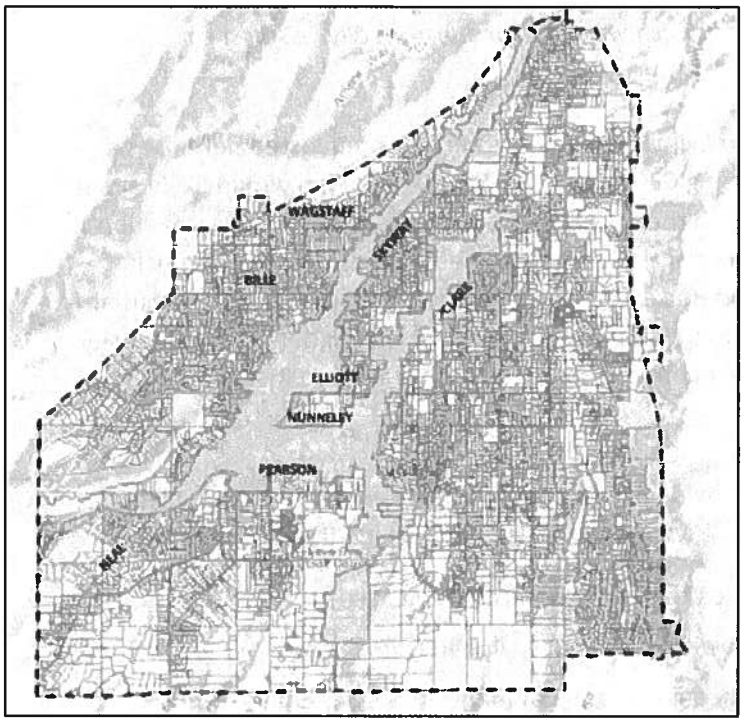

Figure 20 Proposed Sewer Service Area

The total number is existing TOP parcels is approximately 11,800[51]. Therefore, the current proposed SSA includes about 12.5% of the total number of existing TOP parcels. For the Export Plan as presented, the local gravity collection pipelines, local pump stations, local forcemains, regional pump stations, and regional forcemains would likely limit the system to 448,000 gallons per day (gpd) average dry weather flow. The land uses for the 1,469 parcels included in the SSA would forever collectively be limited to that design capacity. There would also be no potential connection of existing TOP parcels outside of the SSA. This would be particularly problematic for many commercial, high density multi-family or small lot single-family properties located adjacent or proximate to the SSA boundary.

6.2 SWRWD PHASED EXPANSION BEYOND SSA

Contrary to the Export Plan, the SWRWD Plan could be expanded in logical phases to include any number of TOP parcels. The increase in wastewater flows collected would generally balance seasonally with the recycled water irrigation demand and subsurface dispersal capacity on a lot-by-lot basis since wastewater collection and non-potable distribution would be installed concurrently. The treatment facility could be expanded ultimately to serve all 11,800 parcels at any one of the three alternative treatment sites presented in Section 3.2 above. If a large discharger, such as a brewery, were proposed in the SSA the Export Plan as proposed would likely preclude that use from being permitted by TOP. The SWRWD Plan, conversely, could easily accommodate that discharger in the SSA, or anywhere within TOP, with an appropriate phased expansion plan.

ALL RIGHTS RESERVED

7 PERMITTING

This section briefly addresses state and Butte County permitting considerations for the either the Export Plan or the SWRWD Plan.

7.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

The California Environmental Quality Act (CEQA) states:

> *The Legislature finds and declares that it is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects, and that the procedures required by this division are intended to assist public agencies in systematically identifying both the significant effects of proposed projects and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects.*[52]

It would require an affirmative decision by TOP to include the SWRWD Plan, as requested herein, as a feasible alternative to the Export Plan in the ongoing CEQA review. The SWRWD Plan would likely avoid a number of environmental impacts associated with the Export Plan such as deep hardrock excavation for the local collection system, increased risk of damage to existing buried utilities with deep trench excavation, 18-miles of pipeline in unincorporated Butte County (largely undeveloped lands), potential growth inducement of connected future development along pipeline alignment, higher energy intensity relative to local reuse, and increased secondary effluent discharge to the Sacramento River.

7.2 BUTTE COUNTY LOCAL AGENCY FORMATION COMMISSION

The Butte Local Agency Formation Commission provided TOP with comments on the Paradise Sewer Project EIR Notice of Preparation. Key points of the May 20, 2021 letter[53] include the following.

- An extension of service application requires review and approval by LAFco
- Plan needed for sewer service for parcels within TOP but excluded from SSA
- Growth inducing impact of potential connection of development properties along 18-mile export pipe route seeking sewer service
- Loss of potential beneficial use of recycled water
- Increased wildfire hazard caused by reconstruction in a severe fire zone

Since the SWRWD Plan does not extend any service outside of the existing TOP boundary, LAFCo jurisdiction would not apply therefore a LAFCo application/review would not be necessary.

7.3 STATE WATER RESOURCES CONTROL BOARD

The California State Water Resources Control Board (SWRCB) regulates effluent discharge and water reuse projects in Butte County through the Region 5 Central Valley Regional Water Quality Control Board (R5). A brief discussion of SWRCB and R5 policies follows.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

7.3.1 Water Quality Control Policy for Recycled Water

The Water Quality Control Policy for Recycled Water was adopted by the SWRCB on December 11, 2018. Selected excerpts from that policy[54] are presented as follows.

- *The purpose of the Policy for Water Quality Control for Recycled Water (Recycled Water Policy, hereafter Policy) is to encourage the safe use of recycled water from wastewater sources that meets the definition in California Water Code (Water Code) section 13050(n), in a manner that implements state and federal water quality laws and protects public health and the environment.*
- *When used in compliance with this Policy, California Code of Regulations, title 22 and all applicable state and federal water quality laws, the State Water Board finds that recycled water is safe for approved uses, and strongly supports recycled water as a safe alternative to fresh water or potable water for such approved uses.*
- *The State Water Board supports the use of recycled water to diversify community water supplies and mitigate the impacts of climate change.*
- *Increase the use of recycled water from 714,000 acre-feet per year (afy) in 2015 to 1.5 million afy by 2020 and to 2.5 million afy by 2030.*

7.3.2 Water Reclamation Requirements for Recycled Water Use

The SWRCB adopted statewide Water Reclamation Requirements for Recycled Water Use on June 7, 2016. Selected excerpts from that Order[55] are presented as follows.

- *Recycled water use can help to reduce local water scarcity. It is not the only option for bringing supply and demand into a better balance, but it is a viable cost-effective solution that is appropriate in many cases. The feasibility of recycled water use depends on local circumstances, which affect the balance of costs and benefits. In drought conditions, recycled water can be particularly valuable, given the scarcity of alternative supplies. In normal precipitation years recycled water use may reduce groundwater extraction.*
- *The California Legislature has declared that a substantial portion of the future water requirements of the state may be economically met by beneficial use of recycled water. (Wat. Code, § 13511.) The Legislature also expressed its intent that the state undertakes all possible steps to encourage development of water recycling facilities so that recycled water may be made available to help meet the growing water requirements of the state. (Wat. Code, § 13512.*
- *Recycled Water Policy promotes the use of recycled water to achieve sustainable local water supplies and reduce greenhouse gas emissions.*
- *Water recycling is an essential part of an overall program to manage local and regional water resources. Many local governing bodies have adopted resolutions establishing their intent to proceed with planning, permitting, and implementation of recycled water projects. These projects will provide water supply and municipal wastewater disposal benefits for communities, and will provide water supply benefits to agriculture.*

7.3.3 Policy in Support of Regionalization, Reclamation, Recycling, and Conservation for Wastewater Treatment Plants

R5 adopted a Resolution No. R5-2009-0028 in Support of Regionalization, Reclamation, Recycling and Conservation for Wastewater Treatment Plants on April 23, 2009. Selected excerpts from that Resolution[56] are presented as follows.

- *Evaluating regionalization, reclamation, recycling and/or conservation opportunities requires a balancing of these and many other considerations, including impacts to water quality, costs, authority to implement and other factors necessary to determine if regionalization, reclamation, recycling and/or conservation are feasible and practicable for the specific facility(ies).*
- *In evaluating the feasibility of regionalization, reclamation, recycling and conservation projects, the interrelationship of regionalization, reclamation, recycling, and conservation should be considered.*

R5 realized in 2009 that the interests of "regionalization" and "recycling" might require an evaluation of interrelationships – recognizing that the stated objectives might in cases be in conflict or mutually exclusive. In the case of the TOP Export Plan versus SWRWD Plan, the two alternatives are in fact mutually exclusive – TOP cannot proceed with both.

The perceived benefits in 2009 of "regionalization" (such as economy of scale and operational efficiency) may be overridden in current times by the benefits of water reuse given recurring California droughts and statewide wildfire hazards. Water reuse is the primary component of the SWRWD Plan and the dual distribution system required for wildfire defense could not be justified on its own independent of water reuse.

The SWRCB encouragement of water reuse in the 2018 Recycled Water Policy and the 2016 Water Reclamation Order, and likely encouragement of the wildfire defense plan, would probably supersede the R5 "Regionalization" Policy if ever brought to the Board's attention for a determination. Encouragement from the SWRCB for the Paradise SWRWD Plan could also be anticipated since it has a comparable capital cost and greater grant funding opportunities (see Section 8 below) in addition to beneficial local water reuse and offers a robust wildfire defense strategy.

8 Capital Cost and Funding Considerations

This section will discuss capital cost estimates of the two plans as well a grant funding opportunities.

8.1 Export Plan Cost Estimate

Prior capital estimates of the Export Plan are summarized in Table 3.

The total estimated capital cost presented in HDR 2020 is $184.7 million, however this figure did not include a local septage plant. Since the Export Plan only includes about 12.5% of the TOP parcels, there will remain about 9,000 septic tanks that will require periodic pump-out service. Therefore, it is assumed that a septage plant will be required with either the Export Plan or SWRWD Plan.

Table 3 Export Plan Cost Estimate

Plan Components	Estimate Source	Capital Cost
Local Gravity Collection	HDR 2020[57]	119,511,000
18-mile Export Pipeline	HDR 2020[58]	52,174,000
Chico WPCP Connection	HDR 2020[59]	12,990,000
Local Septage Plant	HDR 2020[60]	10,095,000
Total Export Plan		**$194,770,000**

8.2 SWRWD Plan Cost Estimate

Capital cost estimates for the SWRWD Plan are summarized in Table 4.

Table 4 SWRWD Plan Cost Estimate

Plan Components	Estimate Source	Capital Cost
Local Pressure Collection	Bennett 2017[61]	47,428,000
Local T22 Tertiary Treatment	Bennett 2017[62]	25,099,000
Non-Potable AWSS Distribution	Ripley 2021[63]	80,000,000
Non-Potable AWSS Tank Storage	Ripley 2021[64]	10,000,000
Appurtenances, Wildfire Defense	Ripley 2021[65]	15,000,000
Local Septage Plant	HDR 2020[66]	10,095,000
Total SWRWD Plan		**$187,622,000**

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

8.3 Grant Funding Opportunities

This section will briefly present a list of six potential grant funding sources available to the SWRWD Plan that likely would not be available to the Export Plan.

8.3.1 Governor Newsom's $15 Billion Climate Crisis and Vulnerable Communities Package

Governor Newsom signed a package of 24 bills on September 22, 2021 described as follows.

> *Governor signs 24 bills focused on climate and clean energy efforts, drought and wildfire preparedness The largest climate package in state history, Governor Newsom highlights over $15 billion in funding to tackle wildfire and drought challenges, build climate resilience in communities, promote sustainable agriculture and advance nation-leading climate agenda.*[67]

At the signing ceremony, the Governor stated:

> *"California is doubling down on our nation-leading policies to confront the climate crisis head-on while protecting the hardest-hit communities," said Governor Newsom. "We're deploying a comprehensive approach to meet the sobering challenges of the extreme weather patterns that imperil our way of life and the Golden State as we know it, including the largest investment in state history to bolster wildfire resilience, funding to tackle the drought emergency while building long-term water resilience, and strategic investments across the spectrum to protect communities from extreme heat, sea level rise and other climate risks that endanger the most vulnerable among us."*[68]

The SWRWD Plan as presented herein could be considered a strategic investment to protect Paradise from future wildfire as well as long-term water resilience.

8.3.2 Governor Newsom's $5.1 Billion Plan for Water Infrastructure

This plan includes *$1.3 Billion for Drinking Water/Wastewater Infrastructure especially for small and disadvantaged communities and $150 Million for Groundwater Cleanup and water recycling to improve climate resilience*[69]. This could be a potential funding source for the sewer and water reuse components of the SWRWD Plan.

8.3.3 California Senate Bill 63

This legislation proposes to fund Projects to reduce the flammability of structures and communities to prevent their ignition from wind-driven embers. The department may consider the fire risk of an area, the geographic balance of projects, and whether the project is complementary to other fire prevention or forest health activities when awarding local assistance grants[70].

This could be a potential funding source for the wildfire defense component of the SWRWD Plan.

8.3.4 California Assembly Bill 52

This bill would require the Air Resources Board to include recommendations for achieving the maximum technologically feasible and cost-effective reductions of emissions of greenhouse gases and black carbon from wildfires. The bill would also express the intent of the Legislature to appropriate an amount from the Greenhouse Gas Reduction Fund for wildfire mitigation and prevention[71].

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

8.3.5 Water Reuse and Resiliency Act of 2021

This proposed federal legislation is described generally as follows.

> *But instead of new dams or desalination plants, Senators Dianne Feinstein and Alex Padilla want the state to take a more innovative approach in prepping for future megadroughts experts predict will only worsen due to global warming. In new legislation introduced Friday, the lawmakers are seeking $1 billion to boost stormwater capture, groundwater recharge and water recycling efforts in the Golden State and throughout the U.S.*[72]

This could be a funding source for the water reuse/aquifer recharge components of the SWRWD Plan.

8.3.6 US Bureau of Reclamation Water SMART Funding

This USBR program includes funding for drought resiliency projects that decrease vulnerabilities and costs of drought, as follows.

> *Reclamation will provide funding for projects that build long-term resilience to drought and reduce the need for emergency response actions through this Drought Resiliency Projects Grants funding opportunity. Drought resiliency can be defined as the capacity of a community to cope with and respond to drought. Under this funding opportunity, Reclamation will fund projects that will build resiliency to drought by increasing the reliability of water supplies and improving water management*[73]

This could be a potential funding source for the water reuse and aquifer recharge components of the SWRWD Plan.

8.3.7 US House Bill 1352

This legislation proposes to increase technical assistance to rural and small municipalities and tribal governments from $25 million/year to $175 million/year through to 2026. The bill includes the following text.

> *SEC. 222. RESIDENTIAL ONSITE SEWAGE DISPOSAL SYSTEMS. "Not later than the date that is 1 year after the date of the enactment of this section, the Administrator shall establish a grant program to make grants to users of a septic tank and drainage field for costs associated with repairing, replacing, or upgrading such tank and such field.".*[74]

This could be a potential federal funding source for the effluent-only pressure sewer component of the SWRWD Plan since each parcel would require an upgraded on-site interceptor tank to replace each existing septic tank. Drain fields may also require upgrading since they are integral to the aquifer recharge component of the SWRWD Plan.

8.3.8 US House Bill 3684

The $1.2 trillion Infrastructure Investment & Jobs Act recently passed the U.S. Senate and will likely reach President Biden's desk in mid-August. In that proposed legislation, there is almost $55 billion in water infrastructure funding[75]. In this funding package there are significant funding opportunities for Clean Water Infrastructure Resiliency and Sustainability, connection of homes and communities to Publicly Owned Treatment Works, and Wastewater Energy Efficiency Grants – where the SWRWD Plan may have higher eligibility rankings relative to the Export Plan.

9 PROPERTY/WILDFIRE INSURANCE

This section will address how the SWRWD Plan might assist TOP residents and businesses obtain property/ fire insurance coverage at affordable rates.

9.1 AVAILABILITY AND COST OF FIRE COVERAGE

Property owners in the VHFDSZ are facing the prospect of losing property insurance coverage due to property insurers' multi-billion dollar losses caused by widespread destruction of properties over the last four years in the western U.S. For Butte County victims of the Camp Fire, the insurance coverage crisis is summarized by State Assemblyman Gallagher, as follows.

> *Assemblymember James Gallagher, a Republican whose district includes Paradise, said his constituents' biggest concern is access to coverage. They want to avoid the California FAIR Plan, which is the state's insurer of last resort that comes with a hefty premium and only covers fire damage. Critics add that the plan was never created to be a permanent solution for California homeowners seeking fire insurance. "I think that most of my constituents acknowledge that they live in high-risk areas and we are willing to pay," Gallagher said. "But it has to be a reasonable premium, and I don't think the government is going to be able to provide that on its own. You need the private insurance market to be part of that solution."*[76]

From the private insurance perspective, *ember generation is the primary driver of structure ignition from wildfires, and there are ways to minimize the risk with proper planning through the creation of defensible space. Ensuring that wildfire risk is considered when planning new developments and enforcing appropriate building codes in those areas will be important moving forward*[77].

9.2 COMMUNITY HARDENING ESSENTIAL

In June 2019, the California Commission on Catastrophic Wildfire Cost and Recovery concluded the following.

> *Widespread home hardening upgrades are an important strategy to reducing wildfire risks to homeowners. A McClatchy analysis of impact of the post-2008 wildfire building codes in the Camp Fire footprint shows that homes meeting these more stringent defensibility codes had much higher survivability rates than those without. This was true even where ember cast was a major driver of fire and setbacks were sometimes relatively tight. Meeting the higher standard appeared to matter a great deal in Paradise. The Insurance Institute for Business and Home Safety (IBHS)'s empirical tests of home meeting the post-2008 wildfire building code standard also indicates higher survivability. On the other hand, many homes meeting post-2008 code burned in the Tubbs Fire, indicating that more than home hardening is essential to defensibility during a fire with high ember cast.*[78]

For defense against ember casts generated from wildfires that may be miles upwind, the Commission recognized that **more than home hardening is essential to defensibility**. Since ember casts respect no parcel or jurisdictional boundaries only community-scale hardening can protect against ember cast that can ignite spot fires miles downwind of a wildfire. Community-scale hardening would create a layer of defense otherwise could not exist with home or parcel-level hardening.

9.3 AWSS AS A COMMUNITY-SCALE WILDFIRE MITIGATION

The impetus for design and installation of the AWSS following the 1906 earthquake in San Francisco was from the insurance industry of the period. The insurance underwriters promoted the AWSS as a means to prevent a repeat occurrence of the devastation from fire due to a failed water supply system, as described below.

> *The AWSS remains the only high-pressure network of its type in the United States, and was the only public project funded by the citizenry following the Great Earthquake of 1906. The system was developed with a $5.2 million bond issue approved by the people of San Francisco in 1908. Strongly influenced by the insurance companies of the period, the AWSS is dedicated to the principle that the City will never again be destroyed by fire, at least not for lack of water for firefighting purposes. It is capable of covering a city block (100,000 square feet) with water to a depth of 25 feet in one day*[79].

There may be parallels between the San Francisco devastation from fire in 1906 and the Camp Fire in 2018. The parallels may not be just in the extent of devastation, but in how the insurance industry played/will play in ensuring that a robust firefighting AWSS is in place as a means to provide better fire defense and suppression capability – with the end result being affordable property insurance coverage on a long-term basis.

The insurance industry needs to quantify risk in order to provide equitable premiums – and that quantification is the product today of state-of-the-art proprietary computer modeling. The models consider a myriad of factors that include community risk mitigation as well as property mitigation as described below.

> *By recognizing mitigation features in the modeling process, insurers can calculate discounts for homeowners who mitigate risk. For wildfire, this includes features such as fire-resistive siding, specific roofing materials, and landscaping mitigation. For example, CoreLogic and AIR explicitly reflect community and homeowner mitigation characteristics in their models*
>
> *As data availability improves mitigation discounts could be a catalysis to a beneficial feedback loop, not only for data collection but also for wildfire resilience. As more companies offer discounts for risk mitigation, customers will have a greater incentive to install features to reduce their homes. As mitigation features become more prevalent, more insurers may be forced to offer these discounts in order to remain competitive*[80].

9.4 INSURANCE IMPACT ON REBUILD EFFORTS

The high cost of property insurance could potentially have negative impact on TOP resident and business's ability to rebuild and remain in Paradise. Recent comments from state Senator Dodd regarding his constituency in Napa County shed light on the issue of property insurance in high wildfire risk areas.

> *In hard-hit Napa Valley, which has burned multiple times this last decade, successful winemakers and longtime residents are weighing their options to rebuild or move out entirely simply by looking at their property insurance policies. "They just can't get insurance," said Democratic state Sen. Bill Dodd, whose district spans the region's celebrated vineyards. "Or the insurance is so expensive that there is no way they could ever afford that kind of coverage."*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

Dodd said he supports allowing private insurers to factor in future disasters if it means residents in his districts can avoid exorbitant pricing offered by the FAIR plan. "So many people right now are going naked with no insurance or paying seven or eight times the annual premium they did before," the senator said. "If they raised the rates 50%, that would be a blessing.[81]"

Paradise Mayor Steve Crowder affirmed in September 2021 a similar insurance coverage and affordability crisis in Paradise. Hardening individual homes and buildings is a means to becoming a fire safe community, with the desired impact of lower insurance rates, indicated as follows.

Crowder also referenced his hopes for insurance affordability in Paradise. He said the town is always looking for grants to do a variety of things, including replacing its emergency sirens and grants to help standing homes get hardened. Crowder said this includes roofing, windows or whatever else is needed. . . . . "We want to be a fire safe community and we want to let the insurance industry know, 'Don't sit in an ivory tower and set our rates. Come look through our town, see what we're doing and then set our rates accordingly,'" Crowder said[82].

9.5 Path Forward: Robust Parcel-Scale and Community-Scale Wildfire Mitigations

The wildfire defense component of the SWRWD Plan would bolster the overall objective of a fire safe community by including a robust community-scale mitigation plan over and above individual home/parcel mitigations. As a path forward, the California Office of Planning and Research Commission on Catastrophic Wildfire Cost and Recovery included the following 5 recommendations for both property-scale and community-scale mitigations in its June 2019 final report.

- ***Recommendation 11.****Set home fire risk reduction and community risk reduction standards with input from insurers and require insurers to write insurance where home owner and community both meet standards.*
- ***Recommendation 12.****Require insurers to implement a tiered mitigation credit based on the level of home hardening. This is presented as an alternative to Recommendation 11, but the Commission believes it would be far less effective than Recommendation 11 because it does not address the unavailability of insurance.*
- ***Recommendation 19.****Provide significant state investments in prevention and mitigation efforts, whether funded by a state tax and a specific fund in the state budget for direct mitigation or small grants for home hardening.*
- ***Recommendation 21.****The commission recommends that the state require that any municipality or government body that approves new development, including new construction on vacant land, is able to provide firefighting service to that property within a certain maximum time*[83].

The Insurance Institute for Business & Home Safety in its April 2021 report makes similar recommendations as follows.

- *Homeowners need to both reduce the presence of fuel surrounding their home and leverage advice from the likes of IBHS to harden their structure against flames and embers. While the analysis presented in this study shows a material reduction in risk by reducing fuels, ~40% of properties that had low fuel density were still destroyed in a wildfire demonstrating the importance of other factors beyond the fuel immediately surrounding the property.*

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

- *Community leaders need to spearhead and organize with local and national organizations that promote wildfire preparedness, because wildfire protection does not stop at the boundaries of a single property. Creating firebreaks by removing debris including dead leaves in alleyways is an example of impactful community effort.*
- *Governments and regulators need to promote good homeowner behavior and disseminate information to their communities on the risks of uncontrolled wildfires. Wildfires will not go away, and it is also possible for wildfires to re-occur at the same location, since many underlying risk factors (including topography and wind direction) do not tend to change over time.*
- *Insurance carriers need to focus on pathways to understand the specific risk and mitigation activities of individual properties. The scientific and modeling communities will continue to expand the analytical tools related to neighborhood-scale risk and other wildfire mitigation appropriately price the risk* [84].

9.6 Role of Global Reinsurance Underwriters

John Norwood, an insurance industry lobbyist representing insurance agents, wholesalers, and carriers in Sacramento, stated in a July 2021 Insurance Journal viewpoint that:

> *The availability and affordability of property insurance in California are not likely to change until the worldwide reinsurance market believes California is serious about addressing its wildfire risks and there are demonstrable results in reducing the number and severity of wildfires in the state. Without the reinsurance market backing California property/casualty insurance companies, there will continue to be an availability crisis in the state for property insurance and prices for such coverage will continue to increase to the detriment of California's homeowners and businesses.* [85]

Implementation of the wildfire defense component of the SWRWD Plan would likely provide definitive evidence to the global reinsurance underwriters that Paradise is indeed serious about addressing its wildfire risks.

10 Design-Build Procurement and Operations

This section will discuss use of the design-build (DB) procurement process for the SWRWD Plan.

10.1 Assembly Bill 36 (Gallagher)

The proposed AB 36 legislation includes the following language.

> *The bill would authorize the Town of Paradise to use the design-build contracting process to provide for the provision of sewer treatment to the Town of Paradise, including for infrastructure connecting the Town of Paradise to an existing treatment facility*[87].

The SRWRWD plan would include a new local treatment facility, it is therefore uncertain whether AB 36 could apply to this alternative. However, there is nothing in existing state public bidding procurement law precluding TOP from including the SWRWD Plan in the DB public bidding procurement process as an "or equal" or "alternatively designed system." In fact, procurement statutes encourage competition in all forms in the selection process and that would include alternative design concepts using the DB format.

In order for an "or equal" bid opportunity for the SWRWD Plan, the SWRWD must be included in the alternatives section of the CEQA environmental review currently in process. In this manner, the Export Plan and the SWRWD Plan could compete in a fair and equitable manner based on proposed design features, team qualifications, financial capability, and contractor ability to deliver on an established schedule.

10.2 Coordination with Other Right-of-Way Underground Construction

The successful SWRWD DB contractor could offer cost-saving coordination with other underground utility contractors with HDD installation of the effluent-only pressure sewer pipelines. Underground conduit installation that might be coordinated and constructed concurrently include:

- DB contractor effluent-only pressure sewer
- DB contractor non-potable water distribution
- PID potable water distribution reconstruction
- PG&E underground electrical distribution
- Fiber optic internet cable installation

Recognizing that PG&E undergrounding of electrical distribution and PID replacement of potable water lines are both in progress, time is of the essence in developing a sewer collection design and construction schedule so the coordination can begin as soon as possible.

With the Export Plan, the gravity collection planning and design could take 2 years or more once the DB contract has been awarded. The deep trenches required for the gravity sewer pipelines would likely cause significant conflicts and risks of damage to existing utilities including underground electrical conduits and potable water pipelines. In addition, road restoration costs for gravity collection pipelines, manholes and lift stations would be significantly greater than for the HDD installation of effluent-only pressure sewer lines that require no manholes or lift stations in the right-of-way.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

Assuming that PID pipeline repair/reconstruction, PG&E underground electrical distribution, fiber optic broadband, SWRWD effluent collection, SWRWD non-potable distribution, AWSS hydrants and water cannons and turnouts can all be coordinated – then road restoration would be required only once instead of multiple times in a relative short period. The end product for TOP would be far superior – new state-of-the-art infrastructure for all underground utilities combined with newly reconstructed road surfaces, sidewalks, and storm drainage.

10.3 Ownership/Operations

The ownership and operation of the SWRWD system could be by either TOP or PID, or a contracted private owner/operator. A recommendation for owner/operator will be made as part of the DB bid proposal. A likely scenario would be for the DB contractor to assume operational responsibility for a startup period followed by a multi-year operation contract. Once that contract has expired, it could be renewed, rebid, or assumed by PID or TOP.

Infrastructure components located on private parcels will be maintained by whatever operating entity operates the complete system. Property owners will not be responsible for responding to alerts, routine inspections or septage pumpouts. Three "permissions" will be necessary for on-lot infrastructure design, construction and operation, summarized as follows.

1. A right of entry to allow the utility engineering contractors to visit property in order to effectively design interceptor tank system to serve the property in an acceptable manner.
2. A temporary construction easement on the property to allow a contractor to construct the new interceptor tank and abandon the existing septic tank.
3. A permanent easement will be required for the area around the tank and control panel to allow utility personnel to maintain the system in perpetuity.

Voluntary right-of-entry agreements allowing property access by utility personnel for the three permissions listed above have been successfully used elsewhere where property owner participation rates have exceeded 99%[88].

Operation of the entire SWRWD system, including the collection system, water recycling facility and non-potable dual distribution system would require nearly the same operator and managerial skillsets already available with PID's existing staff. There could be significant ongoing operational cost savings with PID operating water supply, water reuse and wildfire defense systems.

A case study in a historic California agricultural water district with pre-1914 water rights assuming operation of a state-of-the-art municipal water recycling system, is El Dorado Irrigation District (EID) in El Dorado County, CA. The district is responsible for water supply, wastewater management, water recycling, recreation, and hydropower. *Since the late 1970's, EID has maintained a recycled water system in El Dorado Hills. In 1989, EID reached an agreement with the Serrano Partners to develop a system to provide recycled water to irrigate the master planned community's front yards, backyards, parks, common areas, and golf course. In 2004, the EID Board of Directors mandated the use of recycled water for all new subdivisions and developments in the recycled water service area*[89].

EID was the first district in California to deliver T22 recycled water to individual residential lots for both front and back yard landscaping.

11 COMMUNITY RECOVERY PLAN

In April 2019, TOP developed a Community Recovery Plan[90] with extensive community outreach and resident input. The Plan includes the following recovery objectives.

STRONGER: Rebuild Paradise's Economy

- *Improve utilities — underground gas and electric lines and improve fiber optic internet, cell service, etc.*
- *Install a sewer system*
- *Improve access to medical services and facilities; rebuild Feather River Hospital*

GREENER: Make Paradise Greener

- *Invest in sustainable design and infrastructure strategies, such as solar and innovative buildings*
- *Rebuilding in a more resilient way — become an example to the world and other rural communities*

Figure 22 presents an illustrative plan of the proposed new Paradise civic center, with the irrigated Paradise Community Park on the southeastern side.

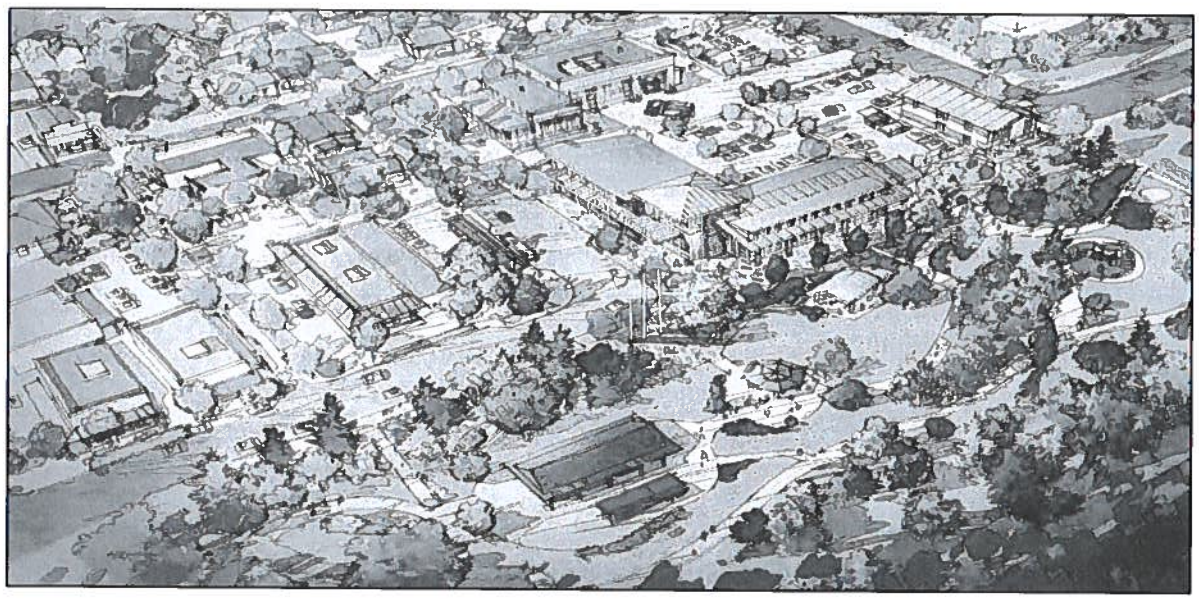

Figure 22 Paradise Recovery Plan, New Civic Center, Illustrative Plan

Wildfire defense planning should consider irrigated linear buffer strips, like the community park, on all sides surrounding the civic center. The AWSS would supply irrigation in the summer season, and strategically located water cannons would stand guard over the high-density civic center commercial and office buildings ready to provide protection from wind-driven embers cast from any direction. Rooftop sprinklers supplied by the AWSS could be installed on all civic center buildings for an added layer of protection.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

This robust wildfire defense strategy could also be developed for emergency evacuation centers. As experienced in the Camp Fire, it is impossible to evacuate an entire town in a very short time frame despite evacuation planning that may already be in place. Road capacity is limited and therefore all residents may not have the time or wherewithal to escape the wildfire. Evacuation centers, such as big box retail stores, school gymnasiums, recreation centers, etc. could be strategically located around the community that could be outfitted with strategic water cannons and rooftop sprinklers supplied by the AWSS.

One foam surfactant injection system serving the entire civic center AWSS could be remotely activated so that rooftop sprinklers and water cannons would have the added fire suppression capability available with fire-retarding biodegradeable foam. This foam injection concept could easily be applied to each evacuation center for an added layer of protection.

Beyond the typical turf and landscape irrigation that would be supplied by the AWSS, additional sprinklers could be installed to irrigate the hardscapes along the evacuation routes – roadway, bike lane, and sidewalks. This would ensure that evacuations would remain safe and the AWSS would suppress landed embers from blowing further and igniting downwind. Sprinklers could be activated preemptively, for instance, with the issue of a wildfire red alert or on declaration of an evacuation order.

Figure 23 presents an illustrative plan of an evacuation route included in the Community Recovery Plan.

Figure 23 Paradise Recovery Plan Vision for the Future, Evacuation Route

12 TIME IS OF THE ESSENCE

TOP is anxious to provide sewer service to the SSA in as short a timeframe as indicated below.

> *Timing is everything. AB 36 allows the use of design-build for these projects pursuant to existing law's authority for local agencies to use this contract methodology. This authority sunsets on January 1, 2025. According to the Town of Paradise, it plans to contract for the design of the sewer project in 2022*[91]

The December 2020 project delivery schedule for the Export Plan is presented in Figure 24. *Recognizing the* potential jurisdictional, environmental, regulatory and funding issues associated with the 18-mile export pipeline, TOP has more recently indicated that the sewer project could take 5 to 10 years to complete[92].

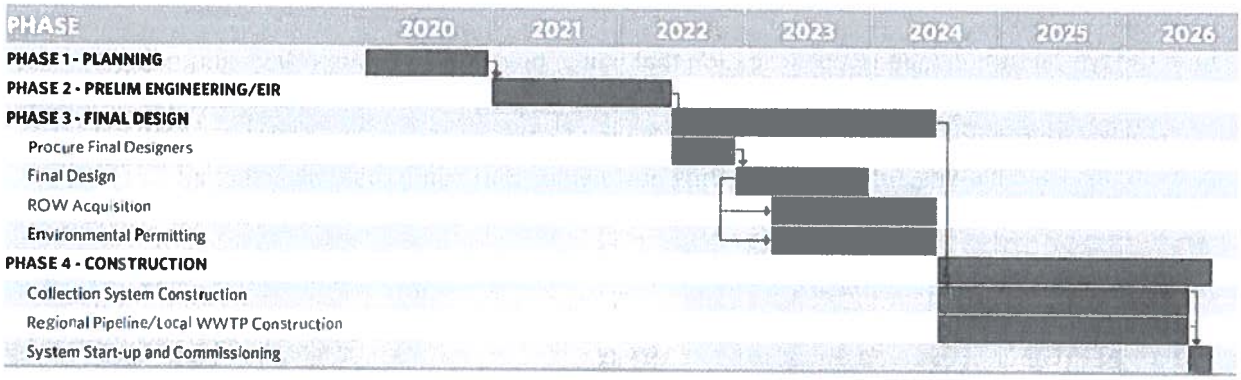

Figure 24 Export Plan Delivery Schedule[93]

As indicated in Section 10.2 above, coordination of all underground utility construction could represent a significant time and cost savings, but only if done concurrently. In this regard, time is of the essence since PID and PG&E underground construction is in progress and ongoing.

12.1 IMPORTANCE TO REBUILD EFFORTS

The SWRWD Plan could potentially provide first flush sewer service within the SSA within 18 to 24 months of DB award. This is a fraction of the amount of design and construction time needed for the Export Plan.

Even though the Feather River Hospital on Pence Road is not in the current SSA, pressure effluent collection and an AWSS extension could be expedited in an early phase to serve this essential facility in the near term. This could be critically important to the rebuild efforts to have the hospital reopen without fear of a repeated evacuation and destruction caused by wildfire.

Recent images of the Feather River Hospital are presented in Figure 25.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

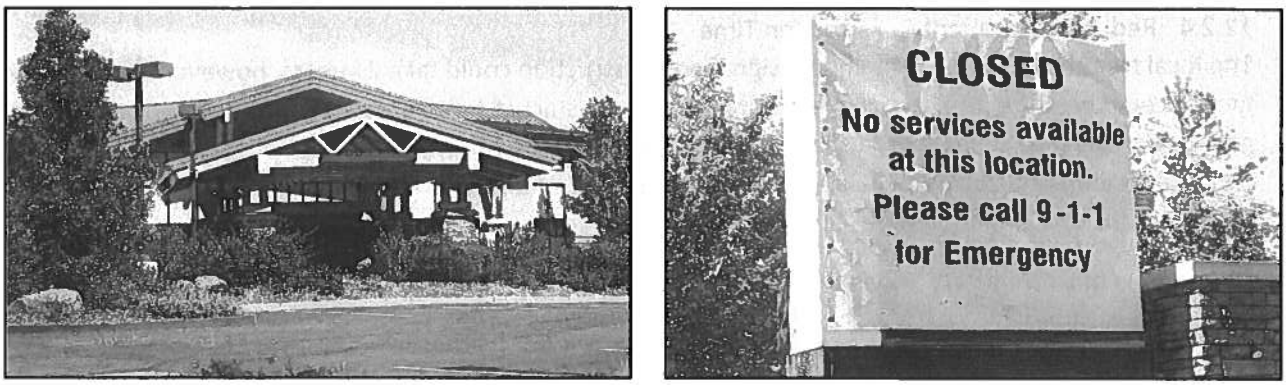

Figure 25 Feather River Hospital, May 28, 2021

Award of the SWRWD Plan could also initiate the process of insurance underwriters' work on mitigation modeling to determine premium discounts for a robust AWSS coupled with a robust wildfire defense system. Without reasonably priced insurance premiums, rebuild efforts may become constrained as construction loans and mortgages could be unavailable without reasonably priced property insurance premiums on a long-term basis.

12.2 Expedited Project Delivery

The estimated time required from award of DB contract to first flush within the SSA is 18 to 24 months, based on the following expediting factors.

12.2.1 Reduced Permitting Time

The CEQA review requirements for the SWRWD Plan are significantly less that for the Export Plan, since all construction activities are within TOP existing right-of-way and on existing parcels. There are no environmental issues associated with pipeline alignments on undeveloped lands, sensitive wetlands, creek crossings, highway crossing, increased surface discharge to the Sacramento River, etc.

As for a SWRCB/R5 water recycling permit, SWRCB Order WQ 2016-0068-DDW[94] coupled with Title 22 regulations would establish the water quality standards required for the proposed uses of recycled water and aquifer recharge. The required Engineer's Report submitted to R5 would be prepared concurrent with design of the collection and treatment systems.

12.2.2 Reduced Engineering Time

Compared with deep excavation required for gravity pipelines, manholes, and pump stations, the shallow HDD installation is as low in impact as the installation of underground electrical power distribution or fiber optic cable. The amount of engineering required for HDD is minimal, with the main design issue being avoidance of conflicts with existing buried utilities.

12.2.3 Reduced Collection Construction Time

Construction of the effluent-only pressure sewer can be constructed in phases allowing certain zones within the SAA to connect sequentially in a relatively rapid fashion. The commercial cores along Skyway and Clark Roads would be the priority, and installation of on-site interceptor tanks and controls could proceed at owners' discretion. Extensions of effluent-only sewer pipelines and AWSS pipelines could be extended to areas outside of the SSA, such as to the Feather River Hospital campus, based on priorities established by TOP.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

12.2.4 Reduced Treatment Construction Time

The local treatment facility planning, design, and construction could take 2+ years, however a temporary facility could be place into service on a rental basis since startup flows are estimated to be only 100,000 gallons per day (gpd). Small capacities could be added incrementally if needed. Delivery of a temporary package treatment facility would likely take less than three months from date of order plus an estimated three months of installation time.

An example of a temporary 3-increment 150,000 gpd facility permitted on a temporary basis by R5 is presented in Figure 26.

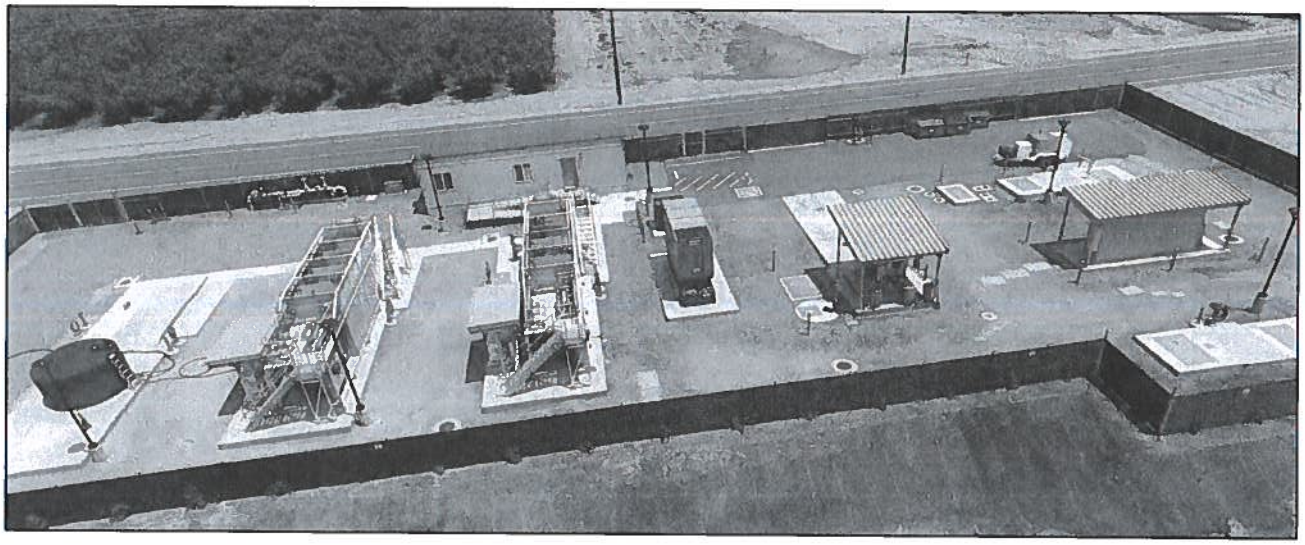

Figure 26 Temporary Package Wastewater Treatment Facility, Madera County, CA

12.2.5 Reduced Effluent Reuse Construction Time

The dual distribution piping would generally occur concurrent with the HDD collection piping installation. There may be a temporary imbalance in effluent demand relative to effluent generated on an annual or seasonal basis. In the event of an imbalance, temporary irrigation sites and/or temporary dispersal sites could be needed on an interim basis.

One site that might be considered for a temporary and/or permanent recycled water irrigation system is the Lava Creek Golf Course located on Old Clark Road. This facility was extensively damaged in the Camp Fire and has not reopened. TOP may want to consider options for Lava Creek in its rebuild campaign perhaps as municipal facility. The vineyard immediately to the north could also be a beneficial reuse site for tertiary effluent on a temporary and/or permanent basis.

This site is within TOP jurisdictional boundary and is immediately adjacent to the proposed SSA boundary. A local golf facility using recycled water could be an attractive community amenity as TOP plans it's rebuild future. Recent images of Lava Creek Golf Course are presented as Figure 27.

13 SUMMARY

The SWRWD Plan described in this report is much more than just a sewer system. It is an integrated plan addressing not only the long-standing and pressing sewer needs of TOP but also beneficial water reuse and a robust wildfire defense strategy. Highlights are summarized below.

1. Effluent-only pressure sewer collection within the Sewer Service Area (SSA)
2. Local water recycling facility sited within or adjacent to TOP
3. High pressure non-potable auxiliary water supply system (AWSS)
4. Non-potable AWSS distribution to all parcels within SSA
5. Non-potable water irrigation supply for all parcels within SSA including parks, irrigated buffers, evacuation routes, high-risk slopes
6. California Title 22 disinfected tertiary recycled water for seasonal aquifer recharge
7. Non-potable water tank storage within TOP serving multiple pressure zones
8. Supplemental raw water supply for AWSS bypassing PID treatment plant in emergencies, if necessary
9. Supplemental groundwater supply for AWSS in emergencies, if necessary
10. Strategic wildfire defense capabilities including rooftop sprinklers, water cannons, water misters protecting essential and high value assets from wind-driven ember cast
11. Separation of potable and non-potable distribution to prevent depressurization of potable system and chemical contamination that can ensue during a wildfire event

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

12. Robust community-scale wildfire mitigation strategy to reduce underwriters' risk profile and lower property insurance premiums

13. Septage receiving facility to accommodate biosolids from all TOP septic tanks

14. Expedited system delivery of 18-24 months from award of design-build contract to first flush relative to 5-10 years for the Export Plan

15. Significant opportunity for state and federal grant funding sources otherwise not available to the Export Plan

16. Ability to ultimately expand system to include all residential and commercial parcels within TOP

The major advantages of the SWRWD Plan relative to the Export Plan, are summarized below.

13.1 Water Reuse

Reuse of wastewater otherwise discharged to the Sacramento River and ultimately to the Pacific Ocean is the primary benefit of the SWRWD Plan. The value of keeping a water resource available locally is summarized by Assemblyman Gallagher in August 2021, as follows.

> *"Two years ago this lake [Lake Oroville] was full," Gallagher said. "Yes, we've had a drought. Yes, we have less run-off this year due to climate change. But you shouldn't see a lake this low after two years into a drought. "It's because of bad management. Water that continues to flow out this reservoir, down the river, into the Delta, into the ocean; water that is not usable for farms, for your families, for our cities — and we're the ones that are asked to cut back."*[95]

The total potential benefit of recycling 0.45 mgd of collected wastewater from the SSA would equal approximately 160 million gallons per year (mgy). If all of the 11,500 parcels within TOP are ultimately collected and effluent reused for irrigation and aquifer recharge, the total potential benefit would be approximately 900 mgy.

13.2 Protection of Potable Water Distribution

Depressurization of water distribution systems is a largely unrecognized risk of wildfire devastation on communities in the Wildland Urban Interface. Separation of the potable distribution from the fire suppression water supply would prevent the underlying cause – the rapid increase in demand caused by residential yard sprinklers and fire hydrants occurring simultaneously. A robust AWSS coupled with SCADA controls and real time weather and incident data could intelligently manage water resources in the distribution system so that limited supply is directed to where it is needed most while at the same time preventing depressurization of the potable system. The potable system would forever be protected from rapid depressurization and the potential for chemical contamination that can ensue.

13.3 Wildfire Risk Mitigation

Wildfire risk mitigation, whether recognized or not, will likely be an overarching reality of any rebuild plan going forward. Without mitigation, private property insurance may be either be unobtainable or unaffordable. Home hardening required with recently updated building codes coupled with property owner diligence in landscape and building maintenance can provide protection, but that is limited to

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

parcel-scale mitigation. This provides limited protection in dry weather high-wind conditions where ember casts can travel miles downwind of active wildfires.

What is missing, is community-scale hardening. Design of a robust AWSS including its potential as an automated state-of-the-art wildfire defense system ready to activate upon any threat of high-risk weather conditions. With community-scale hardening coupled with parcel-scale hardening, the insurance industry will likely recognize those robust mitigations in their rate models which would quantify risk reduction and ultimately credits in their premium rate structures. Without robust mitigations, insurance underwriters may refuse to renew policies with property owners facing the prospect of going without insurance coverage.

Unfortunately, Butte County has experienced another devastating wildfire whose ignition occurred in very close proximity to the original ignition of the 2018 Camp Fire. Both ignitions appear to have been caused by electrical transmission equipment in the Feather River Canyon. An image of the Dixie Fire smoke plume, as seen from Skyway Road in Paradise, is presented in Figure 28.

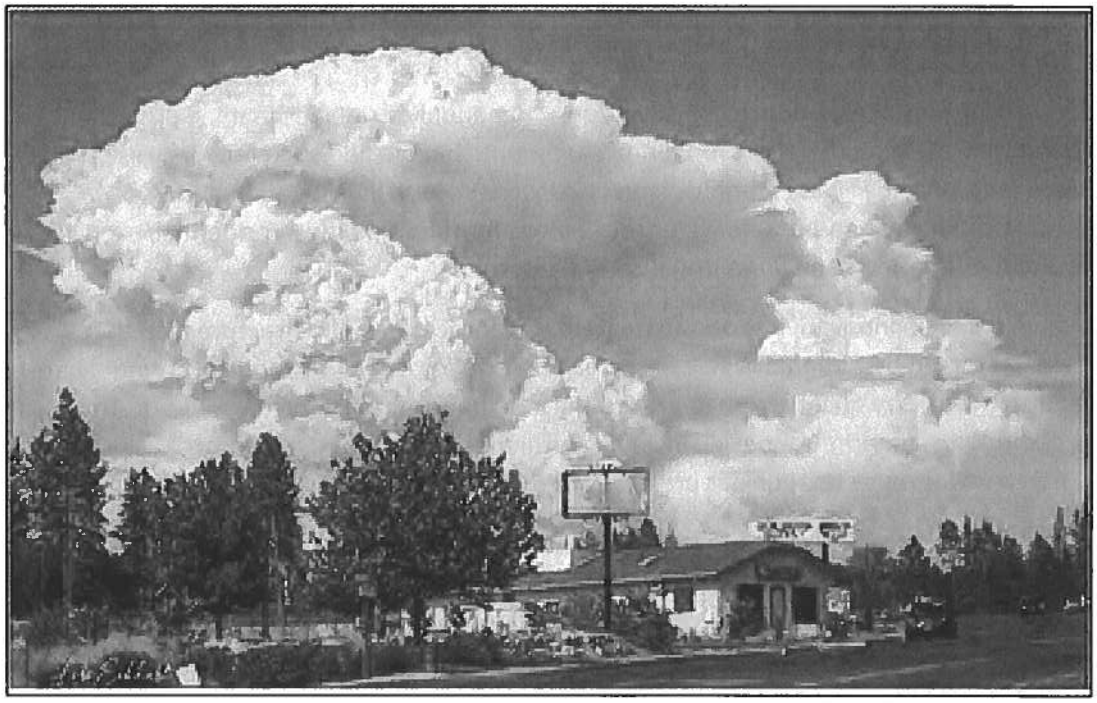

Figure 28 Dixie Fire plume of Smoke as seen July 19, 2021 from Skyway Road, Paradise[96]

As demonstrated by the Camp Fire and now Dixie Fire, TOP is in a high-risk wildfire setting. Robust mitigations will be required not only for obtaining affordable property insurance, but for the most basic need to protect life and property. Without those basic protections and assurances, TOP rebuild efforts may be constrained going forward.

13.4 Time to First Flush

The SWRWD Plan could be expedited at numerous levels – environmental review, design, construction, startup, etc. to provide first flush service to properties within the SSA in as little as 18 months from DB award. This compares with 5 to 10 years for the Export Plan.

© 2021 Dana K. Ripley
ALL RIGHTS RESERVED

13.5 Grant Opportunities

There are likely to be numerous state and federal grant funding opportunities available to the SWRWD Plan beyond the normal EPA/SRF and USBR wastewater programs. Due to the heightened awareness of the western U.S. drought and extended wildfire seasons, many legislative proposals have been introduced in 2020 and 2021 that could potentially support the SWRWD Plan in the near term. Seven of those grant funding programs are listed in Section 8.3 above.

13.6 Concurrent CEQA Review Requested

Similar to the Export Plan, the SWRWD Plan requires CEQA environmental review prior to any DB award. TOP would have to take an affirmative action to reissue an amended NOP to include the SWRWD Plan and then incorporate it in its draft Environmental Impact Report for certification. With a certified EIR including both the Export Plan and the SWRWD Plan, TOP could then competitively bid the two options in a fair, open and transparent DB procurement process.

14 About the Author

Dana Ripley has four decades of experience consulting on water supply strategic planning projects engaging collaboration with team members, upper management, and outside stakeholders. His project development experience includes water supply planning associated with investigation and implementation of potable and non-potable water reuse plans for municipalities, residential/ commercial development projects and large irrigators in California.

He is noted for developing an innovative septic abatement water recycling infrastructure plan that was peer-reviewed and endorsed by National Water Research Institute for its ability to protect groundwater, surface water and saltwater bay quality from degradation from domestic wastewater sources. This comprehensive community water reuse design including effluent-only pressure collection was published in a widely acclaimed water reuse textbook as presented in Figure 29[97].

Dana's water master planning portfolio includes preparation of a California SB 610 water supply assessment for a large master-planned community in the San Joaquin Valley which was approved as part of the project's CEQA entitlement. Dana also won a grant award from Metropolitan Water District of Southern California Innovative Water Supply Program to develop a template for decentralized non-potable water reuse in urban settings.

Dana has a strong interest in energy-efficient decentralized wastewater reuse treatment facilities that can be located in sensitive urban settings which produce an effluent quality consistent with California standards for unrestricted irrigation, fire suppression and other municipal/industrial non-potable water uses. Recent designs include hourly shutdown features that are compatible with renewable power sources, microgrids, and real-time utility pricing structures.

Dana holds a Bachelor of Science degree from the University of California at Davis, a MBA from the University of Santa Clara, and is a Registered Consulting Civil Engineer in California.

Town of Paradise
Sewer Project Draft Program EIR

Rebuttal Responses to
Table 5.2-1
Local Alternative #3 Infeasibility

Draft PEIR Table 5.2-1 Reason for Infeasibility	Policy and Technical Responses to Infeasibility Assertions
1. State and Regional Water Board Policies supporting regionalization	Any State Water Resources Control Board (SWRCB) or Regional Water Quality Control Board (RWQCB) policy supporting "regionalization" is an out-of-date policy predicated on "disposal" of wastewater and not beneficial reuse. RWQCB Central Valley Region #5 (R5) Resolution R5-2009-0028 indicating support for "Regionalization" in the same resolution supports "Reclamation, Recycling, and Conservation." In the context of the Town of Paradise proposed 18-mile export pipe, the increased discharge of secondary effluent to the Sacramento River runs against California's long-standing strategy to minimize potable water demand and increase water recycling. The SWRCB encourages water recycling with more recent statewide policies and orders including the 2018 Water Quality Control Plan for Recycled Water and the 2016 General Order for Water Reclamation Requirements for Recycled Water Use. Further, Governor Newsom this month released California's Water Supply Strategy which establishes a plan for significant increases in urban water recycling by both coastal and inland communities. The plan targets an increase of 0.8 million acre-feet (MAF) by 2030 and 1.8 MAF by 2040 (see Figure 1). Based on the state's overwhelming need to reduce potable water demand and beneficially recycle water wherever feasible, it is the 18-mile export plan that would likely not be supported Governor's office and would likely not be supported by state and federal funding agencies. In the Town's case, "regionalization" assumes connection to Chico's water pollution control plant (WPCP) which discharges secondary effluent to the Sacramento River. In light of R5's intent to require Chico to remove nitrogen from its discharge[1], the draft PEIR should not overlook the cost and energy intensity required to nitrify and denitrify prior to discharge. As a related example, R5 required Sacramento Regional Sanitation District's WPCP in Elk Grove to remove nitrogen prior to discharge to the Sacramento River at a capital cost exceeding $2 billion[2]. Local reuse, conversely, would beneficially utilize nitrogen and other nutrients for agricultural, landscape, and turf fertilization.
2. Regional Board November 2020 letter supporting regionalization	The November 2020 R5 letter fails to compare local urban water reuse with river discharge and "*recycled water for waterfowl habitat uses*". Nor does the letter consider the multi-benefits of a dual distribution system within the Town that would include 1) non-potable recycled water for landscape, park, turf and agricultural irrigation, 2) seasonal aquifer recharge dispersed throughout the service area, 3) state-of-the-art community-scale wildfire defense, 4) high pressure supplemental water supply for fire suppression, 5) protection against any future depressurization of PID's potable distribution system and 6) beneficial use of nutrients inherent in wastewater. Upgrades to the Chico water WPCP for river discharge and/or agricultural reuse could easily exceed $300 million[3] for nutrient removal and other treatment process improvements over the next decade. The Town would be responsible for it's proportionate share of costs and its

Draft PEIR Table 5.2-1 Reason for Infeasibility	Policy and Technical Responses to Infeasibility Assertions
	contribution would offer zero benefit to Paradise Irrigation District's (PID) water supply portfolio and zero benefit for the Town's fire suppression capability. The R5 letter indicates that [the] "*Pipeline to Chico can be cost-effectively sized to accommodate a large range of flows.*" This indicates that the pipeline can likely accommodate significant wastewater flows over and above the needs of the Town for planned developments within Chico's southeast sphere of influence and rural Butte County along the pipeline route. Table 1 presents pipeline capacities for the proposed 10.5 mile 12" export pipe force main[4] based on a range of flow velocities. Table 3 presents the carrying capacity of plastic pipe from an engineering manual which indicates velocities for 12" pipe within the range of 1.3 to 10.12 feet per second (fps). The 7 fps maximum figure presented in Table 1 is well within the range presented in the engineering manual. At that flow velocity, the export pipe capacity is about 2,400 gallons per minute (gpm), or about 1.7 million gallons per day (MGD) on an average day flow (ADF) basis and 3.4 mgd on a peak hour flow (PHF) basis[5]. At 1.7 mgd ADF, the lost opportunity for local water recycling in the Town, southeast Chico and rural Butte County could be about 2,000 acre-feet per year (afy) as indicated in Table 2. "Regionalization" as a primary justification for the 18-mile export project is clearly in conflict with the Governor's *California's Water Supply Strategy* since it forecloses on a potential 2,000 afy of urban water recycling in the Town and southeast Chico. Based on current drought and wildfire threat conditions, the Governor's office would likely strongly support the local reuse alternative over the export alternative. In that same light, the grant funding opportunities for local water reuse would likely be significantly greater than for the 18-mile export based on the Governor's strong emphasis on urban reuse projects anywhere in the state. The R5 letter fails to acknowledge that Butte LAFCo cannot approve an 18-mile extension of sewer service absent an *existing or impending public health and safety threat*[6]. The 0.1 mgd post-fire subsurface dispersal in the sewer service area (SSA) that had a pre-fire permitted subsurface dispersal capacity of about 0.5 mgd cannot be considered an *existing or impending health threat*. Absent such a threat, Butte LAFCo cannot approve the extension *as it is the only legally permissible justification available to LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence*[7]. The only path forward with the extension request therefore would likely be a waiver approved by the state legislature and the Governor, similar procedurally to Assembly Bill 36 (Gallagher, 2021). The R5 November 2020 letter did not confirm the presence of *an existing or impending public health and safety threat* in Paradise of which it has the technical and regulatory authority to determine. Even if R5 made such a determination, the proposed export project serving only 14% of the Town would not alleviate

Draft PEIR Table 5.2-1 Reason for Infeasibility	Policy and Technical Responses to Infeasibility Assertions
	most of the threat since there is ample high density residential, commercial, health care and institutional development outside of the proposed SSA which could also have subsurface dispersal issues. Absent an existing or impending health and safety threat, the 18-mile export project as indicated above is *legally impermissible*[8]. In its alternative analysis of the regionalization versus local reuse options available to the Town, R5 erred in not considering Government Code restrictions on any extension of utility service from one jurisdiction to another in California.
3. Siting local wastewater facility within residential and business areas	Figure 2 presents an image of a California Title 22 water reclamation facility sited in a residential setting in southern California. This facility was permitted by R8 (Santa Ana Region) under Title 22 criteria and had operated continuously between 1981 and 2006 when the facility was decommissioned with the arrival of an Inland Empire Utilities Agency (IEUA) purple pipe extension to two adjoining golf courses. During its 25-year operation, this author was not aware of a single odor or noise complaint from residents adjacent to the facility. This image was included in the *Water Reuse* textbook[9] as an example of a satellite treatment plant located in a housing development. Figure 3 presents a 2021 satellite image of the decommissioned facility indicating its close proximity to numerous residences and a swimming pool.
4. Lack of sufficient recycled water users in area	Table 3 indicates PID's pre-fire estimate of total water demand in 2040 of 7,817 afy[10]. This compares with 3,576 afy of PID's pre-fire estimate of 2040 wastewater dispersal as indicated in Table 4[11]. These two values indicate that, on an annual basis, the total service area pre-fire potable and raw water demand is roughly 2.2 times the wastewater generation. On a seasonal basis, the non-potable exterior irrigation demand could be as high as 4 times the interior potable demand on peak summer days. Clearly, with dual distribution to all served parcels, the annual average non-potable demand exceeds the potential recycled water supply.
5. Large effluent storage facility needed for winter flows	Based on information provided by Town engineers[12], the heat of the Camp Fire at the ground surface did damage some septic tanks, particularly those constructed of plastic or fiberglass. However, of the 11,000+ leachfields – there has been no reported damage. With that context, the Sewer, Water Reuse, and Wildfire Defense (SWRWD) Plan proposes to utilize the existing 11,000+ leachfields for shallow aquifer recharge in the winter months eliminating the need for a seasonal effluent storage facility. The dual distribution will be in place, and individual irrigation controllers will be used to control and meter delivery of tertiary effluent to existing leachfields in the winter months as/when needed. Ultimately, the pre-fire 2040 estimate 3,576 afy dispersal of septic tank effluent would be reduced to about 980 afy[13] dispersal of tertiary effluent meeting strict Title 22 unrestricted irrigation standards. These values assume the long-term objective of the SWRWD

Draft PEIR Table 5.2-1 Reason for Infeasibility	Policy and Technical Responses to Infeasibility Assertions
	Plan to serve most if not all of PID's 10,600 service connections and not just the 1,500 connections in the proposed SSA.
6. Land for storage environmentally sensitive	Land for seasonal storage unnecessary. See response #5 above.
7. Local WWTP construction would be a lengthy process	The 2016 General Order for Water Reclamation Requirements for Recycled Water Use provides an expedited path for recycle permits, since most non-potable recycled water projects rely on the same regulatory framework provided in Title 22. With low-pressure effluent collection and temporary treatment facilities at say, the abandoned Lava Creek golf course, time to first-flush would likely be less than 18 months, perhaps as little as 12 months from authorization to proceed. This compares with estimates of the gravity collection and 18-mile export project taking as much as a decade to first-flush. There is ample precedent in R5 for satellite water reuse facilities permitted under Title 22 criteria for disinfected tertiary recycled water. In combination with the 2016 General Order, the R5 approval process could be concurrent with the facility design thereby expediting the project delivery schedule.
8. Auxiliary water system would for fire suppression would be a separate pipeline system	Yes, a separate pipeline system would be required modeled after El Dorado Irrigation District's dual distribution system (in operation for over four decades) and San Francisco's auxiliary water supply system (in operation for over a century). In addition, the dual distribution provides access to individual leachfields for winter subsurface dispersal and would provide assurance that, in the event of a repeat of an extreme wildfire event, that PID's potable system would be protected from depressurization caused by the abrupt increased demand from residential sprinklers and fire-fighting activity[14].
9. Inefficient oversizing of treatment facility in early years	Inefficient oversizing of infrastructure is not unique to wastewater treatment facilities – it is a given on any infrastructure project – water import and treatment facilities, power generation and transmission, highways, airports, rail facilities, ports, etc. etc. Utilization is never near optimum in the early years, and full utilization may come decades after construction is complete. For context, how efficient is a $184 million export project when the initial flow estimate is only about 0.1 mgd serving a 2026 connected population of 1,391[15]? Since the $184 million figure is only a Class 5 estimate (- 30% to +50%) coupled with the recent inflation spike, the actual construction bid cost could easily exceed $300 million – with no possible opportunity for interim temporary facilities or phasing. Where's the early year efficiency in that?

10. O&M for a full-scale treatment facility would be supported by a small initial ratepayer base	Figure 4 presents a satellite water reclamation facility owned and operated by Fresno County Special Districts, County Service Area #34. This facility was permitted by R5 under Title 22 criteria in 2005. Table 6 presents the 2022-2023 projected operating budget for operation and maintenance (O&M) of this facility. Compare that Fresno County CSA #34 O&M value with estimates for the export project O&M: $254,000/yr for the regional pipeline[16], $1,022,000 for the gravity collection system[17], and the $491,000 contribution to Chico WPCP O&M[18]. These annual costs total $1,767,000/year starting at first-flush. How can the Town afford this when most of the SSA parcels are currently vacant? Add to this annual O&M cost the annual cost of the local share of loan debt repayment since it is unlikely that the project will achieve 100% grant funding for capital costs. If interior residential water use is reduced to 42 gallons per person per day (gpcd) by 2040 in accordance with recommendations by the California Department of Water Resources[19], the Town connected population served by a similar Title 22 facility (CSA #34 plant) could potentially be about 4,700, equal to the estimated population in the SSA at Year 2050[20].
11. Treatment processes not easily scalable	The export plan has zero potential for phasing and cannot be scaled up ever once capacity is reached in the collected area of the SSA. The local treatment collection system and local water reuse plant, however, can be scaled up to ultimately serve all 10,600 connections and be designed to operate efficiently even at low initial flows.
12. Extensive ongoing monitoring required for local recycling	Table #6 does not call out monitoring costs since Fresno County operators conduct in-house lab tests as part of their normal daily and weekly routines. Monitoring costs are included in the "Professional and Specialized Services" line item. Monitoring reports are submitted by the operators to R5 on a quarterly and annual basis. All operators are state-certified and are employees of Fresno County.

Re: Town of Paradise Sewer Pipeline Project
Comments re Draft Program EIR (DPEIR)

Dear Mr.Mattox:

Thank you for granting my request for a one-day extension of time within which to submit the following Comments regarding the Draft Program EIR (DPEIR) for the above-referenced Project.

I am submitting the following comments regarding the above-referenced proposed project on behalf of myself, as a resident of the City of Chico and the County of Butte, a taxpayer and rate payer of the City of Chico and the County of Butte, and as a member of the Butte Environmental Council and in the public interest of other residents of the City of Chico and the County of Butte.

1. I join in the Comments submitted, by the Butte County Local Agency Formation Commission and the County of Butte, regarding the DPEIR.

2. I also join in the Comments submitted by Dana Ripley, regarding the DPEIR.

3. I am requesting that the Final PEIR include a copy of my letter comments, dated June 3, 2021, regarding the Notice of Preparation which were submitted on that date and that they be included in the Response to Comments on the DPEIR for the proposed sewer line project, including the article that I prepared which analyzes the public policy, legal, and environmental benefits to be gained by reconsidering the "Preferred Project."

4. The issues raised in my letter of June 3, 2021 have not been addressed, analyzed, or considered in the DPEIR and that they be analyzed and considered in the "Project Alternatives" section of the EIR prepared for the proposed project. The benefits for prevention of significant adverse environmental effects from recurrent wildfires on the Ridge that could be provided by the alternative recommended by Dana Ripley in his comments regarding the true "Preferred Alternative" were not considered in the previous Study relied upon in the DPEIR. The previous Study and Analysis needs to be updated in light of advantages of the locally owned and controlled specially engineered Treatment Facility on the Ridge. The reason for this request is that the previous analysis relied upon in the DPEIR was prepared before the Paradise Camp Fire and needs to be updated, due to the elevated risk of recurrent wildfire, which can be mitigated by the re-use of treated effluent to irrigate and enhance the defensive open space needed to protect new urban development in the Town of Paradise and in the County of Butte.

5. Although I have made this comment at public meetings regarding the proposed project, it should be noted that the DPEIR does not address, analyze, or consider the environmental, planning, and economic impacts of not requiring the preparation of the updated General Plans and Environmental Impact Reports for Town of Paradise and the City of Chico as part of the "Preferred Project" analysis, although the Butte County LAFCo has been requesting the Town of Paradise to do so, since 1985. The DEIR should require a Condition to require such updates to be prepared and approved, prior to the commencement of construction of the proposed project or as a condition of approval by LAFCo..

6. The Project Description is not stable, finite, and accurate. Draft Program EIR should be revised, amended, corrected, and re-circulated and the public comment period be re-opened and new public Scoping Meetings held by the lead agencies, including both the City of Chico and the Town of Paradise. The reason for require the requested action is that because the purported rationale for the proposed project [expedited redevelopment of the Town of Paradise] will not be achieved by the development and construction of the proposed project, as defined. In fact, the construction of the Project Alternative advocated by Civil Engineer Dana Ripley could be expedited and achieved much more rapidly than the construction of the "Preferred Alternative" recommended for adoption in the DPEIR.

7. The DPEIR fails to disclose, analyze, discuss and address the potential significant impacts to the environment which may occur, depending on what changes are made to the "Final Project" pursuant to the "Design Build" legislation adopted in AB 36 (Gallagher). The adoption of AB 36 by the State Legislature has rendered the DPEIR's analyses legally inadequate, because the proposed Preferred Alternative may bear little or no resemblance to the proposed Preferred Project Alternative, due to currently unknown changes made to the final design prior to and/or during construction of the project. Further, due to the preparation of a Draft "Program" EIR, the actual project may be significantly changed during construction by circumventing the project description in the Final PEIR through the use of multiple Project Addendums that do not require notice to the public or public review during the course of construction of the Final Project design, whatever it may be.

8. However, the most egregious legal inadequacy of the DPEIR is that it is barely readable and understandable, due to the lack of a Table of Contents and inadequate organization and disclosure of the Comments made during the Notice of Preparation process. The DPEIR glosses over the numerous comments and objections that were made in the Notice of Preparation process. Specifically, without having the Town General Plan updated since 1980, the changes in density requirements and other legislation that has been adopted by the State Legislature to provide for more dense residential dwelling units and reduction of Green House Gasses are barely even mentioned in the DPEIR, which results in accelerated "urban sprawl" within the Town's Sphere of Influence. Instead of focusing on dense multi-story and affordable multi-family housing in the Town's previously developed urban footprint, the "Preferred Alterative" supports and incentivizes accelerated inefficient sprawl in the Town and into the County's Jurisdiction.

9. Finally, the DPEIR's failure to adequately disclose, analyze, discuss, consider, and compare and contrast the expense of the Preferred Alternative to the more efficient and expandable specially engineered waste treatment facilities discussed in great length in the Comments submitted by Dana Ripley in his Comments and "White Paper" demonstrates the legal inadequacy of the DPEIR and the failure to proceed in the manner required by law, pursuant to Public Resources Code sections 21168 and 21168.5.

10 Please include this letter and Comments in the Record of Proceedings and include all of the Comments made regarding the Notice of Preparation previously relied upon by the public to review this very expensive and unnecessary public project in a Revised and Amended Draft EIR for the Preferred Project, instead of Program EIR for this vague, inadequately described, and expensive "Preferred Project". In addition, please remand the review of this proposed project back to the Public Works Department Staff for the preparation of an updated Project Review and Analysis, based on **current** water resource conditions and Wildland Urban Interface (WUI) environmental setting and background on the Town of Paradise, in the light of the Governor's Water Resiliency Portfolio and recently adopted Water Policy focusing on more efficient use of our water and energy resources. Finally, the Town of Paradise should be required to conduct the updated Study while contemporaneously updating the Town's General Plan,

11 Thank you for the opportunity to comment on the DPEIR. Please put me on your circulation list for the this Draft EIR and/or any changes in the process, including recirculation of a revised or amended NOP, Project Description, and/or revised or amended Draft EIR for this amorphous project. .

Very truly yours,

Richard L. Harriman

Re: Town of Paradise Sewer Pipeline Project
Comments re Notice of Preparation of Project EIR

Dear Ms. Curtis:

I am submitting the following comments regarding the above-referenced proposed project on behalf of myself, as a resident of the City of Chico, a taxpayer and rate payer of the City of Chico, and on behalf of the Northern California Environmental Defense Center in the public interest of other residents of the City of Chico and the County of Butte.

1. I join in the comments, dated May 20, 2021, submitted by Stephen Lucas, the Executive Officer of the Butte County Local Agency Formation Commission. [A true copy is attached hereto and is incorporated by reference herein.

2. Attached please find a copy of an article that I prepared which analyzes the public policy, legal, and environmental benefits to be gained by re-considering the "Preferred Project," and request that the issues set forth therein be analyzed and considered in the "Project Alternatives" section of the EIR prepared for the proposed project, especially the benefits for prevention of significant adverse environmental effects from recurrent wildfires on the Ridge.

3. Although I have already made this comment at public meetings regarding the proposed project, I want to reiterate my request that the EIR analyze the environmental, planning, and economic impacts of not including the preparation of the updated General Plans and Environmental Impact Reports for Town of Paradise and the City of Chico as part of the "Preferred Project" analysis, because the proposed project will require such updates to be prepared and approved, prior to consideration of the proposed project or as a condition of approval by LAFCo.

4. The proposed Project Description is not stable, finite, and accurate, so that it is my request that the Notice of Preparation of the EIR be revised, amended, corrected, and re-circulated and the public comment period be re-opened and new public Scoping Meetings held by the lead agencies, including both the City of Chico and the Town of Paradise, because the purported rationale for the proposed project [expedited redevelopment of the Town of Paradise] will not be achieved by the development and construction of the proposed project, as defined.

5. The EIR should also disclose, analyze, discuss and address the potential significant impacts to the environment which may occur, depending on what changes are made to the final project under the "Design Build" legislation pursuant to AB 36 (Gallagher), if enacted by the State Legislature.

Thank you for the opportunity to comment on the Notice of Preparation of the EIR. Please put me on your circulation list for the Draft EIR and/or any changes in the process, including recirculation of a revised or amended NOP or Project Description.

Very truly yours,

RICHARD L. HARRIMAN

Re: Town of Paradise Sewer Project – Notice of Preparation of Environmental Impact Report

Dear Ms. Curtis:

The Butte Local Agency Formation Commission (LAFCo) appreciates the opportunity to provide input for the Town of Paradise Sewer Project – Notice of Preparation of Environmental Impact Report that will support the proposed sewer line extension from the City of Chico Water Pollution Control Plant (WPCP) to the Town of Paradise. This will also require the approval of an extension of services application by LAFCo as the service extension is proposed to be outside of the City's jurisdictional and Sphere of Influence boundaries.

The primary concern of LAFCo as a responsible agency with permitting authority is to ensure that the Commission is regularly consulted by affected agencies to avoid the matter *being presented to the Commission for action after important decisions and milestones have been locked in.* It is our understanding that coordination with LAFCo is identified as a Phase 2 implementation issue under the Preparation of an Environmental Impact Report (EIR) covering the selected alternative.

LAFCO's Role

Government Code Section 56133(a)(b)(c) mandates that A city or district may provide new or extended services by contract or agreement outside its jurisdictional boundary **only if it first requests and receives written approval from the commission.** The commission may authorize a city or district to provide new or extended services outside its jurisdictional boundary outside its jurisdictional boundary and outside its sphere of influence to respond to an existing or impending threat to the health or safety of the public or the residents of the affected territory, if the entity applying for approval has provided the commission with documentation of a threat to the health and safety of the public or the affected residents.

The proposal for the City to extend its sewage collection and/or wastewater treatment facilities to the Town falls under the purview of Section 56133 and therefore, LAFCo. Should the sewer service extension be approved by LAFCo for the proposed sewer service area boundary identified by the Town, any future adjustments to that boundary or additional sewer connections will require the consent the City as the contracted provider and LAFCo as the approving authority for the service extension request.

Provisions for extension of service requests are found in Government Code §56133 and in Section 4.5 of the Commission Policies and Procedures. Service extensions outside of an agency's Sphere of Influence may only be approved by LAFCo if there is "an existing or impending threat to the health or safety of the public or the residents of the affected territory. (§56133(c))

Support Documents

The City/Town will need to provide documentation/justification of the existing or impending public health and safety threat the extension of services would address. This is a critical prerequisite to the project as it is the only legally permissible justification available to the LAFCo to approve a service extension request outside of an agency's (Chico) Sphere of Influence.

Additionally, the City will have to demonstrate how such an arrangement will not impact its current residents or its responsibility to serve the existing parcels within its jurisdictional boundaries/service area who are not currently sewered and utilize on-site septic systems. This would include the remaining approximately 3,000 parcels that are not currently connected to the City's sewer infrastructure but fall under are under the Chico Urban Area Nitrate Compliance Plan which calls for the termination of on-site septic systems as a contributor to ground water nitrate contamination. It is fundamentally critical that the City ensure that it retains adequate WCPP capacity for future service demands from it residents.

Along with a determination of capacity, LAFCo will also have to review the fiscal viability of the proposed extension, particularly the projected cost to Paradise residents of such service and the assurances that City residents do not in any way subsidize the proposed service.

EIR-NOP Observations/Comments:

1. **Project Description** - The proposed project for the purposes of the EIR, should be adequately described to include not only the sewer infrastructure analysis, but the necessary Extension of Services Application that is expected to be initiated by the City of Chico and considered for approval by LAFCo. It is vitally important to recognize that limiting the "project description" to only the sewer infrastructure project will make associated regulatory agency approvals such as LAFCo's more complicated. This raises the important question of just what type of governance is anticipated now by the Town and what type of governance oversight may be useful in the future such a special district or subsidiary district? For the EIR to be of the greatest value, it should consider all alternatives that may be desired now or in the future.

2 **Proposed Sewer Service Area** – The proposal describes the intended Sewer Service Area, which is limited primarily to the commercial and industrial land uses along Skyway, Pearson and Clark Roads. How would future sewer connection requests *within* the Town Sewer Service Area (not along the pipe to Chico) be addressed?

   There are small lot residential neighborhoods immediately adjacent to the proposed Town Sewer Service area. It seems reasonable based on early public comments to anticipate that landowners *contiguous* to the Town's Sewer Service Area/collection system with a developed use and failing septic system would desire to connect rather than repair an existing system. This is a different scenario from new development. Butte County Environmental Health Division regulations require a landowner with a failed septic system to connect to a public sewer if the access is within 250 feet of the affected parcel. How will additional requests for access to sewer services be addressed?

3. **Post Treatment (Recycled) Water** – The Town will be sending significant quantities of effluent to the City's WPCP, which will be treated, and under current conditions, discharged to the Sacramento River. Given the extreme focus on drought planning, the reuse of treated effluent is an ever more important source of scarce water supplies. At some point, the City of Chico may determine that moving to tertiary treatment and reusing this valuable resource is a priority. The question is: Who will retain the rights to treated water discharged from the Chico WPCP? Will the Town receive credit/compensation for its share of the treated effluent?

4. **WPCP Concerns** – How will the City and Town address future WPCP issues such as plant expansions, conversion to tertiary treatment and violations at the WPCP be addressed.

5. **Administration** - Who will provide overall administration of the proposed sewer extension to the Town? How will customer relations such as billing, maintenance, and new connections be accomplished?

6. **Governance Alternatives** – Should the sewer service extension be found unworkable, or if LAFCo cannot determine a legally supportable exemption from the requirements found in GC56133, what other alternatives would be considered (such as the creation of a separate subsidiary district to provide sewer service to both cities)? Such a reorganization would make 56133 no longer applicable, as the new district will have its own sphere.

7. **Growth Inducement** - Depending on the design capacity of the pipeline, its location, and its potential users, it is likely that additional development within the Town could become possible. Current on-site wastewater treatment systems greatly limit development potential. Once sewer becomes available, those growth limitations no longer apply. This analysis may be difficult to accurately assess given the age of the Town General Plan adopted in 1994. Ideally, the 1994 General Plan would be updated based on current conditions prior to estimating future sewerage flows. Additionally, other landowners outside the City boundaries in proximity to such a sewer line may request or expect that the development of those lands be permitted to utilize the new sewer line. The potential environmental impacts of such development needs to be analyzed in the EIR unless a firm prohibition on such connections is included in the project, if not, LAFCo may consider conditions of approval that would restrict access to the sewer line to parcels only within the Town's defined sewer service area.

8. **Chico Urban Area Nitrate Compliance Plan** – The Nitrate Compliance Plan was adopted in 2000 as a result of the Central Valley Regional Water Quality Control Board Prohibition Orders No. 90-126 and 905-024 which addressed the nitrate contamination in the groundwater linked to on-site septic systems in the Chico Urban Area. The orders called for existing septic systems be discontinued and connections to the City sewer system be required. Much effort and resources were spent on this program and the City has installed significant new sewage collection infrastructure over the past decade to allow all affected parcels to connect. How will the City ensure that the WPCP maintains/reserves the capacity to accommodate these remaining approximately 3,000 uses on septic systems?

9. **Increased Exposure to Severe Fire Hazard.** Development of the project is intended to encourage the growth and redevelopment of the Town of Paradise. While this has many desirable benefits, the EIR cannot ignore the serious adverse fire risk impact of the project. As the fire demonstrated, Paradise is clearly located in a severe fire zone with limited access for evacuation. Encouraging redevelopment and growth in that area will inevitably result in increased exposure of the new structures and residents to the severe fire risk. This impact is

likely to be significant over the long run. It must be analyzed and mitigation measures explored to mitigate the risk. For example, is an additional evacuation route feasible?

LAFCo is eager to be cooperative partner in the effort to bring sewer service to the Town as the project is likely to greatly assist the Town to address a serious long-term problem and augment the Town's ability to rebuild a sustainable and viable commercial district. However, we are all bound to comply with the law, even where it may hinder achievement of a desirable objective. We look forward to working with the City and Town and its partners in development of this proposal in order to determine if a legally permissible path forward can be found for LAFCo to approve the extension of services. Please do not hesitate to contact me should you have any questions

Sincerely,

Steve Lucas

Stephen Lucas
Executive Officer

URBAN WATER CONSERVATION: ANOTHER ALTERNATIVE

By Richard L. Harriman*

The recent coordinated "roll out" of the proposed Paradise Sewage Pipeline to the City of Chico's waste water treatment facility on River Road calls for a renewed focus on "improved urban water conservation" referred to by Lester Snow, a well-respected former member of Governor Jerry Brown's administration in 2015.

California statutes mandate re-use of tertiary *treated* wastewater by urban communities within their jurisdictions. Re-use of tertiary treated wastewater from de-centralized treatment facilities for purposes that do not require potable water is defined as a "beneficial use" of water.

Civil engineering consultants have the knowledge, technology, and experience necessary to design and construct specially engineered tertiary wastewater treatment systems to serve new development or retro-fit infill development. If implemented, this technology can reduce the demand for potable urban water *by almost 90%*. Currently, facilities have been permitted by the Central Valley Regional Water Quality Control Board and are successfully operating in the cities of Fresno, Clovis, and in Madera County (and, also, in Monterey County).

Similarly, financing for de-centralized tertiary wastewater systems is available. Community Facility District (CFD) financing for public police, fire safety services, and infrastructure for public utilities is commonly utilized throughout the state. Public finance consultants are familiar with this financing; and, following the repeal of redevelopment agency statutes, other new financing options were created and are available for new systems.

The financial and environmental benefits of specially engineered de-centralized community wastewater treatment facilities are numerous. First, using small-scale wastewater treatment systems allows a local government to avoid excess treatment capacity and debt service for treatment facilities that are *over-sized* to anticipate future growth. Second, the use of small-scale community wastewater treatment facilities avoids having to *speculate* about the rate of future growth and allows the local governments to respond more accurately to *real growth*, rather than to speculate on the rate of *future* growth during *uncertain* future market conditions.

The failure to use small-scale wastewater facilities imposes an unnecessary burden on the existing local taxpayers and water users. Currently, they pay for excess unused capacity that does not benefit these rate payers---who do *not need it, and may never use it.* Using tertiary treated

1766

wastewater from small-scale de-centralized facilities avoids the cost of having to construct and operate additional unnecessary water conveyance facilities to *return the tertiary treated waste water* to the users for re-use on site, sell it to agricultural users, or discharge for in-stream uses.

Finally, the environmental benefits of small-scale wastewater treatment facilities include re-use of urban tertiary treated wastewater closer to the original user, as required by Water Code section 53353, which will reduce the total amount of groundwater used. Second, the use of this technology allows local governments to "fine tune" the rate and amount of new growth planned for the local community. Third, these systems may be used for both new development and retro-fitting in-fill growth, without expanding or surcharging the existing centralized wastewater treatment facilities. Fourth, charging the residents of the new growth and/or infill development for the cost of their own wastewater treatment facilities and operating expenses will make these residents more aware of their own water use, so they may reduce their use of potable water supplies as much as possible. Fifth, the re-use of recycled water from such facilities will reduce demand *per capita* on groundwater supplies for potable water and the cost of water for non-potable uses.

Therefore, the current paradigm of hugely expensive "design-build" large-scale centralized wastewater treatment facilities and conveyance systems should be re-examined in the light of currently available wastewater treatment technology, solar energy systems, and financing. Governor Newsom's administration should aggressively pursue "improved urban conservation" by permitting local agencies and developers to use state-of-the-art small-scale de-centralized tertiary wastewater systems for new development. This alternative can be implemented quickly and expedited by updating local general plans, general plan implementation action plans, and Subdivision Map conditions of approval. If adopted, this strategy will: 1) reduce costs for both developers and local rate payers; 2) reduce energy costs, 3) protect and enhance environmental resources; and 4) implement the mandatory "beneficial use" of recycled tertiary treated wastewater. In light of the fact that the stated Project Description is focused on the expedited re-development of the Town of Paradise and other unincorporated communities on the Ridge, the enormous cost of the proposed project, the 5-10 year time frame identified by the project consultants for the completion of the "Preferred" project, and the potential ability of recycled waste water to be used for fire control and irrigated defensible space require a re-

examination of the de-centralized specially engineered waste water treatment facilities for this project.

*Mr. Harriman is an environmental and land use attorney in Chico, who has practiced in the Central Valley for over 45 years and is a member of the Butte County Water Commission.

Dear Rick:

Since I know that you are the direct contact for the Paradise Post and the Town of Paradise community,
I am reaching out to you toward the end that you and I might have a telephone conversation
regarding this project.

The purpose of my request is to communicate that my clients and others in Chico and the County want you,
the Town of Paradise (TOP) City Council, the Ridge community in the County, and the development community
to know and understand that my clients and other members of the Chico and Butte County community support the
expedited redevelopment of Paradise and the unincorporated community on the Ridge.

I would like to share with you the basis for our position that the quickest, most efficient,and most cost-effective
way to jump start and fast-track the redevelopment of Paradise and the Ridge and to protect the reconstructed
community on the Ridge from future wildfire events and damage to life and property is by the use of de-centralized
specially engineered and designed wastewater treatment facilities on the Ridge and to retain the treated/recyled
water and re-use it on the Ridge for non-potable uses, such as the creation and maintenance of green/defensible
open space to protect hardened structures buffered by defensible open space. Also, I would like to have an
opportunity to discuss why the TOP should initiate the update of its General Plan, including the Transportation/

1769

Circulation/Infrastructure Element which will be required before the sewer pipeline can be approved and
constructed.

We are asking you to reconsider the option originally considered and, then, rejected by the Town Council,
because of the amount of time and the huge expense of constucting and maintaining the proposed sewer
pipeline project---and the fact that the proposed pipeline will NOT come on line for at least 5-10 years,
as estimated by the project consultants in an open meeting.

Please let me know when it would be a good time for you to discuss with you on the phone after
Mike returns to the office.

Thank you for your time and consideration of this request. If you have any questions, please
contact me at my office phone or cell phone or text me (24/7) Hope you have a great warm summer
weekend.

Respectfully yours,

Richard Harriman

Subject: Paradise Sewer Project Draft PEIR is Available!
Date: Thursday, July 14, 2022 2:45:00 PM
Attachments: Paradise Sewer Project_Notice of Availability.pdf

---

Hi,

Please find attached the notice for the release of the Paradise Sewer Project Draft Program Environmental Impact Report (PEIR). The Draft PEIR is available at the following websites: Town of Paradise or Town of Paradise Sewer Project. Refer to the attached notice for information about document availability, public review period, submitting comments, and public meetings. Please reach out to me at tanya.kalaskar@hdrinc.com if you have trouble accessing the attached notice.

Thank you,
Tanya

Jul 17, 2022	W1/1	Alice	Patterson	Good morning-- I am inquiring for my partner, who lost his home in the fire... How do I find out if his property would be affected by an Easement should this sewer project be approved? This could impact how/when he rebuilds. Property address is 5975 N. Libby. Is there a list of locations where the easements would be going? Thank you. Alice
Jul 25, 2022	W2/1	Linda	Barton	I am about to choose a builder to finally rebuild in Paradise. At this moment, it appears the sewer project for Paradise will help those businesses on Skyway. Which means 99%+ of the residents won't benefit from this undertaking. Who is going to pay for this very expensive but necessary project? I am not interested in seeing it listed when I get my property tax bill.
Jul 28, 2022	W3/1	Kat	Carlisle	Hello, Can you tell me when the final design and right of way acquisition phases will begin for the Paradise Sewer Project please? I saw on the project schedule that these phases are anticipated to begin in Summer 2022, but I wasn't sure if that meant they have already started or not. Thank you!
Aug 1, 2022	W4/1	Earl	Eckert	Will the agreement with Chico permit all pumped septic loads to be disposed of in paradise rather than continuing to be disposed of at the County land fill lagoon. Own property at 2199 De Mille Rd.
Aug 2, 2022	W5/1	Pam	Galloway	I think it is a stupid waste of money that could be used for a different project. The cost of the project, the amount of time necessary to complete the sewer project and the number of people who would benefit from it should make it a non starter.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 3, 2022	W6/7	brian		Questions of concern from a 29 year licensed wastewater career in California: 1) Who will handle the collection system and pump stations daily operations? 2) What type(s) of odor control systems will be used? And projected annual cost? 3) Where will biosolids and sewage debris be removed to? 4) How many full time employees will be hired to operate and maintain Paradise Wastewater Collection and Transportation? 5) Under what jurisdiction/license will Paradise Wastewater be in compliance with State Water Resources Control Board? 6) What city department will oversee Paradise wastewater operations? Yours, Brian Anderson
Aug 5, 2022	W7/1	Ivan	Garcia	Good luck on the project. Would like to encourage and support the paving of a multi-use path on top of your sewer line with the ability to connect this new path to the intersection of Honey run/Skyway near Skyway golf park on the west and to the Paradise Memorial Trail in Paradise. I would suggest paving so that you can send emergency equipment up the hill to fully utilize the Skyway for emergency evacuations. Thank you.
Aug 5, 2022	W8/1	Joe	Rees	Hi, As natural disasters increase in frequency and severity, climate change is becoming harder and harder to ignore. The rise in these disasters along with an overall growing sense of crisis when it comes to the environment is causing an increase in climate anxiety. In fact, a recent Yale survey ound that 70 percent of Americans are now “very or somewhat worried about global warming.” I thought this would be an interesting topic to cover in a guest article for your website. I would address the increase in climate anxiety and what your site visitors can do to relieve their stress while also helping the environment. What do you think? Thanks so much for your time, Joe Rees joe@catastrophes.info

Aug 8, 2022	W9/4	Rick	Hoddinott	1. Along the proposed alignment for the export pipeline on Entler Avenue, what is the pipe constructed of and where will it be located along the roadway? 2. How will the project address nearby wells which may be located near the proposed alignment? 3. Was the old railroad (Old Sacramento Northern) right of way considered for the pipe alignment in lieu of Entler Avenue? 4. During construction, how will the project address temporary traffic control along Entler Avenue, considering CHP uses the roadway as direct access.
Aug 10, 2022	W10/1	Ronald	Lassonde	I am very impressed with the due diligence that the Paradise Town Staff has put into the Sewer EIR. The Sewer is absolutely necessary for businesses to rebuild in our Down Town. A rebuilt Down Town is critical to the overall recovery of our town. We need the PEIR approved as soon as possible so we can move forward and rebuild our Town
Aug 10, 2022	W11/1	Mandi	McKa7	Hello- Chico Velo supports the Town of Paradise and the Sewer Project and encourages the project or project sponsor to include the paving of a multi-use path for bicycles and pedestrians on top of the proposed project. Currently, Skyway is not a safe route for bicyclists or pedestrians traveling to or from Paradise. This project provides a unique opportunity to solve dual challenges of meeting the need for wastewater infrastructure and also providing a safer, more direct route between Chico and Paradise for bicyclists and pedestrians. If the new multi-use path followed the sewer line all the way to Southgate Lane on the East side of Hwy 99, it would connect users to the existing Midway bike path on the West side of 99. Additionally, a multi-use path could enable emergency equipment to drive up the path and allow Skyway to be fully utilized as an emergency evacuation route. Thank you for the consideration- please let us know if you have questions or if Chico Velo can provide additional support. Thank you.
Aug 11, 2022	W12/1	Andrew	D'Lugos	Currently, Skyway is not a safe route for bicyclists or pedestrians traveling to or from Paradise. This project provides a unique opportunity to solve dual challenges of meeting the need for wastewater infrastructure and also providing a safer, more direct route between Chico and Paradise for bicyclists and pedestrians. I fully support the plan of paving a multi-use path for bicyclists and pedestrians.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 11, 2022	W13/1	Kirk	Monfort	This would be a great opportunity to build a bike path to Paradise that would tie into the current Paradise Bike Path that goes from the Paradise Park up through Magalia. We be never had a link from Chico to that Bike path although the right of way has been preserved from the Midway by Hagen Lane. It would also provide for service and inspection of the eventual sewer line. A Dual Use facility. There might also be transportation dollars available to do this.
Aug 15, 2022	W14/1	Richard	Stone	JUST PAVED ALL OF SKYWAY, IT'S REALLY A NICE ROAD. I HOPE THAT THE NEW ROAD WILL NOT BE DUG UP FOR THE SEWER PIPE AND JUST PATCHED UP TO LOOK LIKE CRAP AS THE UNDERGROUND PGE SUB COMPANYS HAVE DONE IN TOWN. SHOULD HAVE WAITED ON THE PAVING UNTILL THE SEWER WAS PUT IN. THEN PAVE THE SKYWAY.
Aug 16, 2022	W15/1	Joseph	Mount	I was informed that the treatment plant had treated water they wanted move . Would you please send me any test result on the treated water . Thank You Web site OkaVate.com
Aug 22, 2022	W16/6	brian	anderson	I have not read in the reporting the following: 1)What agency will have jurisdiction to provide collection services within the Town of Paradise? 2) Who holds the license to operate wastewater services within Paradise jurisdiction? 3)Who will maintain and operate the pump stations ? 4)What methods of odor control will be employed at each pump station, wet well and other areas where wastewater may come in contact with atmosphere? As a retired SWRCB licensed WWTP operator of 29 years in the Bay Area the question above are very relevant. Odor mitigation is of critical importance to our community. 24 hour response to spills and overflows is critical. An 18 mile pipeline with about a 1500 ft elevation loss, gravity flow management is critical and demands highly skilled personnel.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 22, 2022	W17/8	Steven	Cismowski	I am writing in opposition to the proposed Paradise Sewer Project. Given the increase of ground water concerns in the north state, coupled with the impacts the current and projected drought cycle is having on our groundwater resources, this project is perilously flawed. In my review of the PEIR, I could not find any information addressing the following items: 1) Information is needed regarding the projected increase in size of the current Chico Wastewater Treatment Plant in order to accommodate this increase in treatment. Keeping in mind Chico's current growth-rate and several other LARGE development projects that will also increase demand on this facility - Valley's Edge and Barber Yard, this facility will need to expand, but to what extent? 2) Information and analysis are needed to fully understand the impacts of removing the equivalent of 1/8th of Big Chico Creek's average annual flow out of the current hydrological cycle based on projected peak flow at sewer build out. The long-term impacts of effectively pumping that much water out of the hydrological cycle helping feed local aquifers and creeks (chiefly, Butte Creek, the last viable salmon run off the Delta river system) is unconscionable. Paradise, pre-Camp Fire, was renowned for its forest, largely of Ponderosa pine, growing at lower altitudes than commonly encountered. The additional ground water these trees received from leach lines, not to mention additional nutrients, helped support this rich forest. Taking that life support away will certainly forever change the forest of Paradise's future canopy. Property owners wishing to replicate that forest will need to pump even more ground water to use in their landscapes further exacerbating the drying of downstream aquifers. 3) The proposed path crosses three surface flow creeks (Butte, Comanche and Little Chico) that countless wildlife (and residents) relies on for sustenance and recreation. While the current engineered solution for these crossings may provide sufficient cover, over time, erosion will continue to drop current creek elevations eventually exposing these lines making them vulnerable to damage and leakage.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
				4) The system will require frequent clean out and regular servicing in order to remain functional. To fail to do so could result in calamitous disaster and contamination of numerous entities (rivers, creeks, farmland, etc.). Encumbering future municipal operations with this laborious task over such a long pipeline will certainly result in failure and/or increased costs to the consumer. There is simply no way to guarantee that funding for this team of pipeline workers and equipment will be sustainable. 5) Paradise's septic waste system served to provide a governor to check unbridled growth. Removing that check, will certainly further increase Paradise's growth potential resulting in an escalating list of long-term impacts for future Butte County residents. The increase growth potential will make future fire suppression impossible, trigger roadway expansion, increase sprawl and further tax our limited natural resources, most acutely, our water resources. This country has a rich history of failed environmental engineered solutions to current challenges. Measures like this start out seemingly a "good idea at the time" only to create unforeseen impacts for future generations to solve. I encourage you to reconsider grandfathering in previous property-owner's septic systems to allow our neighbors who have suffered so much to return to their homes and preserve the future of Paradise by ensuring large developers a toehold to urbanize our beloved mountain communities.
Aug 22, 2022	W18/1	Ryan	Duncanwood	ITS GOOD
Aug 22, 2022	W19/1	Bud	Linggi	I lived behind the Optimo Lodge from o/a 1948 until I went into the Service, 1960. Of course, along the way of those years, my dad went to Chico, down Neal Road, for the Crocker Bank and I might have accompanied him and used a restroom after he made the deposit. By this time, local dogs wiped out our chickens and after the Crocker Bank, we went to a Chico outfit that gave us the number of cleaned chickens we needed. The following week our destination was some place in Oroville for the steaks we needed for the next week, a long trip down Clark Road was used. So when talk of sewers for Paradise comes up, I remember the leech fields where I got my fishing worms... Bud
Aug 22, 2022	W20/1	Diane	Pajouh	I would like to request that we do not damage our new Skyway Roads that have just been installed/updated. Thank You.
Aug 22, 2022	W21/1	Mike	Petersen	Has the town looked into putting turbines inside the 18 mile pipeline to generate electricity? I believe this has been done in other cities and might give Paradise a chance to control our own energy independence.
Aug 22, 2022	W22/1	Michael	Schwartz	Not the best idea they have. For too many reasons. I vote no.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 22, 2022	W23/4	Gary	Wolt	What policy is in place to control cost increases in the future? Will the town of Paradise be subsidizing Chico's wastewater system , with no control on whatever increase they want or need. The ability to justify any price increase seems to be a normal phenomena. Are they incorporating Any valving in the design for emergency use in the event that the pipeline or Chico's waste water facility experiences a catastrophic failure? Would valving be in place to allow Paradise to construct there own wastewater facility, or have a load out facility at a future point in time?
Aug 23, 2022	W24/1	Matthew	Carlson	I support the sewer project and along with it believe a multi use path would be an invaluable asset to the community. It would encourage community health and growth. Paradise lacks safe routes currently so this is needed.
Aug 23, 2022	W25/1	Tony	Catalano	Please include a bike lane!
Aug 23, 2022	W26/1	Rob	Williams	Caltrans funded a bike riding tourism study and our Final Report identified several Signature Bikeway Routes ie East Bay Mud Pipeline. The report has an economic analysis of adding bike/walking paths to a local economy. See, BikeValleytoSierra.com
Aug 24, 2022	W27/1	Kevin	Baxter	I would like to mention my support for the addition of a multi use path along the Skyway during construction of the sewer line. This path would be of historic interest as it would continue the "line" used by trains in the past as well as provide a safer route for non motorized travel to and from Paradise via the Skyway. The path would also be a viable option as an alternative route for emergency vehicles or as an additional route of evacuation, should the need arise. Thank you in advance. Kevin Baxter
Aug 24, 2022	W28/1	Steve	DePue	It would be an ideal time to put in a wide paved bike trail up to Paradise on the skyway corridor. You could also put in fiber optical cable for internet use along the same right of way with the sewer project. Take advantage of multiple uses for the construction project on the sewer system. Also, the paved bike path provides superior access to the fiber optical cable and sewer lines when repairs or access is needed. Perhaps power could also be delivered from the Chico area to Paradise in an underground line rather than on poles! Planning makes for a better future!
Aug 24, 2022	W29/1	Andrew	Keller	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. Such a path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path
Aug 24, 2022	W30/1	William	Llamas	Seems the Draft PEIR a done deal? So confusing. We need a more comprehensive review other than a commission and/or Board. A citywide meet up for face to face speaking is necessary. And are there any ideas on building UP in downtown. Apartment buildings may be most suitable for many residents. What about beautification projects with help of citizens? So many ideas and no leadership. Time is a wasting and we should have already planted thousands of trees.

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 24, 2022	W31/1	Bruce	McLean	I live along the Little Chico Creek bike path and have cycled to Paradise up the Skyway at least once a month over the last 7 yrs. It was very disappointing not to see a dedicated two-way bike path installed when PG&E put their electrical infrastructure underground. Then it was extremely disappointing when a dedicated bike path was not installed when the Skyway was recently paved. Let's not strike out by not creating a dedicated bike path when the sever line is extended from Paradise to Chico.
Aug 24, 2022	W32/1	Jeri	Valdez	I decline the project in it's entirety! If it does not service ALL main roads as well as the WHOLE community. What is the point? Makes no sense at all.
Aug 25, 2022	W33/1	Kevin	Cook	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. This path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path. I am an avid local cycler and this would only encourage more cyclists to come visit and recreate in our community.
Aug 25, 2022	W34/1	Kim	Hunter	I am preparing comments on behalf of the Butte County Public Works Department. Is there an email address that can be used to send comments on Monday? Thank you, Kim Hunter, Project Manager Land Development Division Butte County Public Works Department
Aug 25, 2022	W35/1	Monica	Zukrow	I support the project and encourage the project to include a multi use paved path for bikes and pedestrians on top of the sewer project. Such a path could be used by emergency equipment to drive up the hill even while Skyway itself is functioning as a one-way downhill evacuation route. This is a great opportunity to also include new regional multi-use non-motorized path to connect Chico and Paradise from the intersection at Honey Run and Skyway to the Paradise Memorial Path. Thanks for your consideration!
Aug 26, 2022	W36/2	David	Copp	It seems as though the Draft PEIR has been reasonably well considered. We will never know all of the impacts in advance, but the benefits of the project seem to outweigh the impacts, and it needs to progress.
Aug 26, 2022	W36/2	David	Copp	We think the sewer coverage area should be expanded. We have a multifamily property at 5830 Greenthumb Lane, which is just outside of the coverage area, even though it covers the area essentially across the street (Elliott Rd). We would like to have our property included, please. Thank you
Aug 26, 2022	W37/1	Maurine	Hansen	I just finished paying off a $22,000.00 hookup bill in another address. We were not in the zone to be on the first to hook up from septic, to sewer, so were required to wait. We were not able to hook up, but years later we were required to and the price hugely increased. We were told the cost would be even more if we didnt do it "now". I now live in a zone that is not part of the first hook ups. Does that mean another huge financial cost to me, in the future?

Submission Date	Letter Number/ # Comments	First Name	Last Name	Comment
Aug 28, 2022	W38/1	Roger	Cole	The proposal to hook Paradises new sewer system to an expanded Chico sewer water treatment system at the Sacramento River sounds good at first. It saves money and utilizes efficiently excess capacity of said water treatment facility. It also simplifies Paradise's process into a pipeline construction project. However, as we all have noted from the years of the long ongoing drought, the foothills need every drop of water they can get and /or save or reuse. This plan will export millions of gallons of water from Paradise, and therefore is not good. Instead the wastewater should be treated and returned as close as possible and feasible to the water area it comes from. The single best feature of the existing septic tank/reach line system has been retention of treated wastewater in the ecosystem. A similar goal can be accomplished by constructing a primary sewage treatment plant in Paradise followed by a final treatment in a constructed wetland polishing system. This will produce many local benefits. After the wetland the water can flow to another reservoir location or allowed to be absorbed into the ground or flow through a stream, other kind of recharge. The benefits of retaining water cannot be overestimated. Streams with added wastewater-effluent can improve water quality and support water re-use, while creating habitat and providing urban amenities The Cost–benefit analyses of stream-flow augmentation projects many times fail to account for the full value of ecosystem services provided, including renewed habitats and enhanced urban amenities. Sincerely, Roger Cole, Forest Ranch, CA

				References: Constructed Treatment Wetlands (PDF) Phoenix Arizona Constructed wetland Project (EPA) In 1990, city managers in Phoenix, Arizona, needed to improve the performance of the 91st Avenue Wastewater Treatment Plant to meet new water quality standards issued by the Arizona Department of Environmental Quality. After learning that upgrading their treatment plant might cost as much as $635 million, the managers started to look for a more cost-effective way to polish the treatment plant's wastewater discharge into the Salt River. A preliminary study suggested that the city consider a constructed wetland system that would polish effluent, while supporting high-quality wetland habitat for migratory waterfowl and shorebirds, including endangered species, and protecting downstream residents from flooding at a lower cost than retrofitting their existing treatment plant. As a result, the 12-acre Tres Rios Demonstration Project began in 1993 with assistance from the U.S. Army Corps of Engineers, the Bureau of Reclamation and EPA's Environmental Technology Initiative and now receives about two million gallons of effluent per day. The demonstration project was so successful that the city and the Bureau of Reclamation asked EPA for help in expanding the project to a full-scale, 800-acre project. Project Title: Paradise Sewer Project

Project Applicant: Town of Paradise

Project Location (include county): Paradise, Chico, and Butte County

Project Description:

The Town of Paradise is proposing to construct, operate, and maintain a new sewer collection system within the Town limits that includes an 18-mile export pipeline from the Town to the Chico Wastewater Pollution Control Plant. The Proposed Project would consist of three primary components: Core Collection System, Export Pipeline System, and Extended Collection System.

This is to advise that the Town of Paradise (☒ Lead Agency or ☐ Responsible Agency) has approved the above

described project on November 7,2022 (date) and has made the following determinations regarding the above described project.

1. The project [☐ will ☒ will not] have a significant effect on the environment.
2. ☒ An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
   ☐ A Negative Declaration was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures [☒ were ☐ were not] made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan [☒ was ☐ was not] adopted for this project.
5. A statement of Overriding Considerations [☐ was ☒ was not] adopted for this project.
6. Findings [☒ were ☐ were not] made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:

Town of Paradise, 5555 Skyway, Paradise, CA 95969

Town of Paradise

Council Agenda Summary **Agenda Item: 6(a)**

Date: November 7, 2022

ORIGINATED BY:	Ashley Stanley, Engineering Division Manager
REVIEWED BY:	Kevin Phillips, Town Manager
SUBJECT:	Paradise Sewer Project Division of Financial Assistance Authorizing Resolution for Funding Applications
LONG TERM RECOVERY PLAN:	Yes, Tier 1 "Sewer"

COUNCIL ACTION REQUESTED:

1. Consider adopting Resolution No. 2022-__, A Resolution of the Town Council of the Town of Paradise Authorizing A Financial Assistance Application To The State Water Resources Control Board For The Paradise Sewer Project And Designating The Town Manager Or Designee To Sign And Submit The Application

Background:
Since its incorporation in 1979, the Town has sought a formal wastewater treatment solution for the community, with service for commercial and densely populated residential areas being a priority. Failed and failing septic systems create public health and environmental concerns and have limited economic growth. Prior to the Camp Fire, which almost completely destroyed the town in 2018, Paradise was the largest unsewered community in California. The Town has prepared numerous studies to address its need for a centralized wastewater treatment solution, and in its most recent study, the Town identified a proposed sewer service area. The proposed sewer service area includes the Town's commercial corridors, and as described in the 2017 feasibility study, it represented the area that had the most septic systems that had failed or were projected to fail by 2022.

The Proposed Project would consist of three primary components: Core Collection System, Export Pipeline System, and Extended Collection System. The Core Collection System would support the centralized businesses and housing in Town, including approximately 1,500 parcels along the Skyway, Clark Road, and Pearson Road corridors. The proposed Export Pipeline System would start at the southern end of the Core Collection System as a gravity sewer line and would continue southwest approximately 18 miles to the City of Chico for connection to the Chico Water Pollution Control Plant. Other than the Town of Paradise flow, no other connections will be allowed to the export pipeline. The Extended Collection System would be an extension of the Core Collection System that would allow collection of sewage from parcels outside the Core Collection System, but within the Town limits.

The Town of Paradise is seeking construction funding concurrently to related environmental review procedures to maintain readiness

Analysis:

The Budget Act of 2021 (Senate Bill 129 and Senate Bill 170) appropriated $1.55 billion to the State Water Resources Control Board (SWRCB) in item 3940-106-0001 (the Infrastructure Appropriation). The budget bill specifies that $650 million (M) is for wastewater projects, with priority given to septic-to-sewer conversions.

The Town of Paradise is working with the State Water Resources Control Board to maximize potential funding which could contribute to the construction of the Paradise Sewer Project.

As a component of the application process for this funding opportunity, the Town is required to adopt a resolution designating authority to sign and submit the application.

Financial Impact:

There are no financial impacts associated with this specific action requested. Project funding is addressed separately through various Council Actions and various funding sources.

TOWN OF PARADISE
RESOLUTION NO. 2022-

A RESOLUTION AUTHORIZING A FINANCIAL ASSISTANCE APPLICATION TO THE STATE WATER RESOURCES CONTROL BOARD FOR THE PARADISE SEWER PROJECT AND DESIGNATING THE TOWN MANAGER OR DESIGNEE TO SIGN AND SUBMIT THE APPLICATION

WHEREAS, the Town desires to finance the costs of constructing and/or reconstructing certain public facilities and improvements relating to its wastewater system, including the **Paradise Sewer Project** ("Project"); and

WHEREAS, the Town intends to finance the construction and/or reconstruction of the Project or portions of the Project with moneys ("Project Funds") provided by the State of California, acting by and through the State Water Resources Control Board ("State Water Board"); and

WHEREAS, the State Water Board may fund the Project Funds with proceeds from the sale of obligations, the interest upon which is excluded from gross income for federal income tax purposes (the "Obligations"); and

WHEREAS, prior to either the issuance of the Obligations or the approval by the State Water Board of the Project Funds, the Town desires to incur certain capital expenditures (the "Expenditures") with respect to the Project from available moneys of the Town.

NOW, THEREFORE, BE IT resolved by the Town Council of the Town of Paradise, as follows that:

1. The above recitals are true and correct.
2. The TOWN MANAGER ("Authorized Representative") or designee is hereby authorized and directed to sign and file, for and on behalf of the Town, a Financial Assistance Application for a financing agreement from the State Water Resources Control Board for the planning, design, and construction of the **Paradise Sewer Project**.
3. This Authorized Representative, or designee, is designated to provide the assurances, certifications, and commitments required for the financial assistance application, including executing a financial assistance agreement from the State Water Board and any amendments or changes thereto.
4. The Authorized Representative, or designee, is designated to represent the Town in carrying out the Town's responsibilities under the financing agreement, including certifying disbursement requests on behalf of the Town and compliance with applicable state and federal laws.

Council Agenda Summary **Agenda Item: 6(b)**

Date: November 7, 2022

ORIGINATED BY: Marc Mattox, Public Works Director/Town Engineer

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: CDBG-DR Infrastructure Authorizing Resolution

LONG TERM RECOVERY PLAN: Yes.

COUNCIL ACTION REQUESTED:

1. Consider adopting Resolution No. 2022-__ , "A Resolution of the Town Council of the Town of Paradise Authorizing and Approving Execution of a Grant Agreement to Receive an Allocation of Funding from the 2018 CDBG-DR Infrastructure Program and any Forthcoming Amendments, Thereto."

Background:

On January 27, 2020, United States Department of Housing and Urban Development (HUD) published Federal Register Notice 85 FR 4681 allocating $1,017,399,000 in CDBG-DR funding, related to the Federal Emergency Management Agency (FEMA) Major Disaster Declarations DR-4382 from July to September 2018 and DR-4407 in November 2018. The California Department of Housing and Community Development (HCD) is the grantee responsible for administering the CDBG-DR funds allocated to the State of California. CDBG-DR supports the State of California's unmet recovery needs related to the Federal Emergency Management Agency (FEMA) Major Disaster Declarations DR- 4382 from July to September 2018 and DR-4407 in November 2018.

Recognizing unmet infrastructure recovery needs, related to DR-4382 from July to September 2018 and DR-4407 in November 2018, HCD allocated $317,428,488 of the CDBG-DR funding to the Disaster Recovery Infrastructure Program (DR-Infrastructure). DR-Infrastructure projects are funded to assist with meeting the unmet infrastructure needs of local communities. This program provides funding for FEMA Public Assistance (PA) match projects, FEMA Hazard Mitigation Grant Program (HMGP) match projects, other non-FEMA match projects, and stand-alone projects identified by local communities impacted by DR-4382 or DR-4407.

On February 8, 2022, Paradise Town Council adopted Resolution No. 2022-12, a resolution of the Town Council of the Town of Paradise declaring certain projects critical to Camp Fire recovery with unfunded needs for consideration in the CDBG-DR Infrastructure Program (DR-4407).

On August 19, 2022, the Town of Paradise was formally notified by California Housing and Community Development that of the $317M made available for allocations, the Town would be recipients of $199,592,735.75 for implementation of identified projects in the program.

In addition, the Town of Paradise was formally notified by California Housing and Community Development than an additional $30,000,000 would be allocated to the Town of Paradise for the purposes of the design and engineering phase of the Paradise Sewer Project.

On September 15, 2022, The Town of Paradise Town Council approved a proposed Action Plan for the allocation of funding received through the CDBG-DR Infrastructure Program.

On October 11, 2022, the Town of Paradise adopted a specific resolution relating to the $199,592,735.75 allocation for various infrastructure projects.

Analysis:

As a component of the administration of CDBG-DR Infrastructure funding, the Town of Paradise is required to adopt a second resolution for specific items including designation of authorized staff to enter into, execute, and deliver agreements and any and all subsequent amendments, thereto, with the State of California – relating to the Paradise Sewer Project specific $30,000,000 allocation.

Financial Impact:

There are no new financial impacts associated with this action item.

TOWN OF PARADISE
RESOLUTION NO. 2022-_____

A RESOLUTION OF THE TOWN COUNCIL OF THE TOWN OF PARADISE AUTHORIZING AND APPROVING EXECUTION OF A GRANT AGREEMENT TO RECEIVE AN ALLOCATION OF FUNDING FROM THE 2018 CDBG-DR INFRASTRUCTURE PROGRAM AND ANY FORTHCOMING AMENDMENTS, THERETO

BE IT RESOLVED by the Town Council of the Town of Paradise as follows:

SECTION 1:

The Town Council of the Town of Paradise has reviewed the State of California's CDBG-DR Action Plan for 2018 disasters and, hereby, approves the execution of a Standard Agreement between Town of Paradise ("Subrecipient") and the California Department of Housing and Community Development ("HCD"), allocating to the Subrecipient the aggregate amount, not to exceed, $30,000,000 ("Grant") for design and engineering work relative to the Paradise Sewer Project, a new in-ground wastewater collection and export system to serve the Sewer Service Area of the Town of Paradise.

The Town Council agrees to perform infrastructure-development-related activities, as further detailed in the Standard Agreement and consistent with the applicable Disaster Recovery Infrastructure Program (DR-Infrastructure) Policies and Procedures, as the same may be amended from time to time.

SECTION 2:

The Town Council hereby authorizes and directs the Town Manager or designee, Public Works Director/Town Engineer, to enter into, execute, and deliver the Standard Agreement and any and all subsequent amendments, thereto, with the State of California for the purposes of the Grant.

SECTION 3:

The Town Manager or designee, Public Works Director/Town Engineer, is authorized to execute and deliver all project applications and any and all related documentation required to effectuate the terms of the Standard Agreement, and to act on the Town's behalf in all matters pertaining to all such applications and documentation, thereof.

SECTION 4:

If an application is approved, the Town Manager or designee, Public Works Director/Town Engineer, is authorized to enter into, execute, and deliver all Notice(s) to Proceed, and

any and all subsequent amendments, thereto, with the State of California for the purposes of the Grant.

SECTION 5:

If an application is approved, the Town Manager or designee, Public Works Director/Town Engineer, is authorized to sign and submit Funds Requests and all required reporting forms and other documentation as may be required by the State of California, from time to time, in connection with the Standard Agreement for purposes of the Grant.

PASSED AND ADOPTED at a regular meeting of the Town Council of the Town of Paradise held on November 7, 2022 by the following vote:

Council Agenda Summary **Agenda Item: 6(c)**

Date: November 7, 2022

ORIGINATED BY: Ross Gilb, Finance Director / Town Treasurer

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: FY 2022-23 Operating and Capital Budget Update

COUNCIL ACTION REQUESTED:

1. After presentation, review and file the financial information provided by staff concerning the FY 2022-23 operating and capital budgets; and
2. Approve staff recommended budget adjustments. (ROLL CALL VOTE)

Background:

The fiscal year (FY) 2022-23 operating and capital budgets were adopted July 12, 2022. The General Fund was adopted with a balanced budget, which was achieved through a transfer from the PG&E Settlement funds to compensate for revenue shortfalls resulting from the 2018 Camp Fire. During the September 13, September 15, and October 11, 2022 Town Council Meetings, Council approved additional expenditures relating to the restoration of dispatch services project (CIP #7324), the Category 4 Tree Removal program (CIP #7312), various capital projects relating to CDBG-DR Infrastructure funding, and additional public works department positions.

Currently, about four months of transactions have been recorded for the current fiscal year. Revenues and expenditures from the beginning of FY 2022-23 through the end of October 2022 have been recorded and reviewed in preparation of the analysis below. Staff will continue to closely monitor costs and prepare recommended budget updates regularly to keep the Town Council and community apprised of any significant changes.

Analysis:

A complete budget performance report is attached for detail review, which contains unaudited actual figures for FY 2021-22, the adopted budget for FY 2022-23, the currently amended budget for FY 2022-23 including amendments approved by Council during meetings from the beginning of the fiscal year through October 11, 2022, actual revenues and expenditures to date, proposed budget amendments by general ledger account, and the proposed amended budget for FY 2022-23. The most significant developments are described in detail for each major fund below. Additionally, all recommended budget adjustments have been summarized in the attached Adjustment Summary document as well as listed in detail for each fund affected in the attached Budget Worksheet Report.

General Fund (1010):

Revenues:

Property Tax and Sales Tax

Property tax and sales tax revenues make up the majority of the Town's General Fund revenue budget. The Town has yet to receive any significant property tax or sales tax revenue allocations for the current fiscal year as of the end of the October 2022. Initial allocations are expected to be received for analysis during the mid-year budget review.

Transient Occupancy Tax

The total budgeted amount of Transient Occupancy Taxes expected to be received during FY 2022-23 is $200,000. This budget is based on actual receipts of $225,000 during the prior fiscal year. Currently, there are two facilities remitting transient occupancy taxes within the Town limits.

USDA Revenues

During the first quarter of FY 2022/23, the Town was notified of the availability of grant funding through the United States Department of Agriculture (USDA) that would provide up to 60% of the total purchase price of much needed vehicles and equipment for the Town of Paradise. Town staff worked with the USDA to apply for funding to be applied toward the purchase of a new Street Sweeper (estimated purchase price of $300,000), a Community Services Officer truck and related upfit (estimated purchase price of $75,000), and three Ford Rangers (estimated purchase price of $37,000 each) for the Fire Inspector, Code Enforcement Officer, and Construction Inspector positions. The Town was subsequently awarded a grant of $260,000 based on 60% of the originally estimated purchase price of these vehicles and equipment.

The local share of $144,000 for the Street Sweeper is recommended to be funded through the use of Measure V reserves, as described in the applicable expenditure section of the agenda summary below. The cost of the local share of the other vehicles included under this grant were included in the originally adopted budget for FY 2022-23. However, since the time of budget development, the total cost of the vehicle purchases has increased a total of $22,700 for the combined equipment purchases. The additional expenditures have been included as a proposed budget adjustment within the Police and Public Works General Fund departmental budgets. As the Town was able to secure a greater amount of grant funding through the USDA than originally expected at the time of budget development, the proposed additional expenditures are offset by increases to budgeted USDA revenues based on the total amount of the grant award. As such, there is no General Fund impact as a result of the proposed amendments.

Expenditures:

Overall, General Fund expenditures are within revised budgeted expectations for the first four months of the fiscal year.

As mentioned above, during the September 13, September 15, and October 11, 2022 Town Council Meetings, Council approved additional expenditures relating to the restoration of dispatch services project (CIP #7324), the Category 4 Tree Removal program (CIP #7312), various capital projects relating to CDBG-DR Infrastructure funding, and additional public works department positions. The total projected General Fund impact of these approved expenditures for FY 2022-23 is $145,870. These additional General Fund financial impacts related to the General Fund

portion of costs for the Public Works positions approved during the September 15, 2022 Council meeting ($90,870), the purchase of workstations and equipment for the newly approved Public Works positions ($20,000), and the purchase of a new Ford Ranger for the newly approved Construction Inspector position ($35,000). These additional costs are included in the amended budget column of the summaries below.

In addition to these previously approved expenditures, staff has identified a net $100,500 of recommended additional General Fund expenditures for FY 2022-23 (excluding Measure V), the majority of which are offset by the additional unbudgeted revenues recognized above. Additionally, staff has identified $144,000 of recommended expenditures to be funded through Measure V reserves.

The recommended changes by department are summarized in the chart below. A detailed description of each change by department is also provided.

General Fund Expenditure Summary by Division
Fiscal Year 2022/23 Budget

Description	2021/22 Unaudited Acutal	2022/23 Adopted Budget	2022/23 Amended Budget	2022/23 Actual to Date	2022/23 Proposed Adjustments	2022/23 Proposed Budget
Non Departmental	$ 1,323,274	$ 1,734,773	$ 1,734,773	$ 6,879	$ -	$ 1,734,773
Town Council	36,066	37,600	37,600	11,757	-	37,600
Town Clerk	257,213	334,531	334,531	105,121	-	334,531
Town Manager	294,433	370,179	370,179	123,689	-	370,179
Central Services	593,519	665,138	665,138	442,820	12,700	677,838
Information Technology	95,838	-	-	-	-	-
HR & Risk Management	210,709	226,733	226,733	72,845	-	226,733
Legal Services	156,559	203,110	203,110	5,133	-	203,110
Finance	293,384	309,762	309,762	83,181	2,150	311,912
Police	5,405,275	6,118,298	6,118,298	2,477,628	12,500	6,130,798
Fire	4,511,280	5,857,303	5,857,303	1,039,325	-	5,857,303
Community Development	586,049	1,469,713	1,469,713	182,375	-	1,469,713
Public Works	1,212,520	1,226,280	1,567,150	404,957	73,150	1,640,300
Subtotal	14,976,118	18,553,420	18,894,290	4,955,709	100,500	18,994,790
Measure V	1,183,046	1,510,994	1,510,994	313,643	144,000	1,654,994
Grand Total	$ 16,159,164	$ 20,064,414	$ 20,405,284	$ 5,269,352	$ 244,500	$ 20,649,784

Measure V:

- **$144,000 Increase**: As mentioned above, during the first quarter of FY 2022-23, the Town was awarded grant funding through the USDA that would provide up to 60% of the total purchase price of much needed equipment for the Town of Paradise. A portion of the grant for which the Town was awarded was to be applied toward the purchase of a new Street Sweeper to assist with street clean up during ongoing road construction efforts. The total amount of the grant relating to the street sweeper purchase was $156,000 based on 60% of the originally estimated purchase price of $260,000. Due to inflationary pressures since the time of grant award, the quoted purchase price of the street sweeper has increased to $300,000. As such, the proposed budget adjustment for FY 2022-23 includes the total local match requirement of $144,000 in order to leverage the grant funding available through USDA and secure current pricing for this much-needed equipment. The proposed budget adjustment would increase the total budgeted expenditures for FY 2022-23 from $1,510,994 to $1,654,994. This would reduce the projected Measure V reserves as of the end of FY 2022/23 from approximately $917,000 to $773,000.
- The proposed amendment and revised budget for the purchase of the Street Sweeper, as described above, was presented to, and approved by the Measure V Citizen Oversight Committee on October 25, 2022.

Town Manager:

- **$0 Net Impact**: Based on review of financial activity within the departmental budget, $4,000 of the total funds originally budgeted towards the replacement of departmental equipment are proposed to be reclassified toward employee development and costs related to Town-wide meetings based on anticipated need for the remainder of the fiscal year.

Central Services

- **$10,000 Increase**: The actual cost of insurance premiums in the amount of approximately $298,000 relating primarily to general liability, mobile equipment and property coverage was approximately $10,000 greater than the budgeted premium of $289,000.

- **$2,700 Increase**: The Town's apportioned share of LAFCO operating expenses for the fiscal year was approximately $2,700 greater than originally anticipated at the time of budget development.

Finance

- **$2,150 Increase:** During the first quarter of the fiscal year, staff identified the urgent need for replacement of the fireproof filing cabinet used by the Finance and other administrative departments for storage of deposits and confidential information. The replacement was not originally included in the adopted departmental budget; however, the old cabinet was no longer functional, and the new cabinet is expected to serve the Town for years to come.

Police Department

- **$0 Net Impact:** Based on direction provided by Council during the prior fiscal year, Town staff has been actively involved in restoring dispatch services to the Town. The originally adopted budget included salaries and benefits for two public safety dispatcher positions for the full fiscal year. Staff continues to work towards recruitment efforts, however as of the time of budget review, neither of the two public safety dispatcher positions have been filled. The lack of expenditures relating to salaries and benefits for these two positions has created budget savings for the first quarter of the fiscal year. A budget adjustment of $10,500 is recommended to provide funds for advertising and ongoing recruitment efforts for these positions. The proposed additional expenditures are offset by savings related to salaries and benefits described above.

Public Works Engineering

- **$0 Net Impact:** The repairs of traffic loops at two locations throughout Town were needed due to damages incurred. The cost of the repairs totaled $22,950 and will be reimbursed by the parties responsible for the damages. A budget amendment for the expenditures and related reimbursement revenues has been included for proper tracking of financial activity.

Facilities

- **$40,000 Increase**: The cost of services for the removal of green waste from Town-owned properties has been identified as ongoing need based on continued annual clean up requirements. The recommended amendment of $40,000 is based on the anticipated annual cost for all Town-owned properties.

General Fund Fiscal Impact and Fund Summary:

The total recommended General Fund budget amendments includes $244,500 of net additional expenditures, which is offset by $56,450 of additional revenues. This leaves a total of $188,050 of additional funding requirements. In order to balance the General Fund budget, an additional transfer from the PG&E Settlement Fund in the amount of $44,050 is recommended as well as a draw-down of Measure V reserves in the amount of $144,000. This additional recommended transfer amount brings the total proposed budgeted transfer from the settlement funds to $11,175,297 for the full fiscal year. The Fiscal Sustainability Model has been updated based on this amended transfer amount to ensure ongoing fiscal sustainability based on a medium growth scenario. The details of the updates to the Fiscal Sustainability Model have been included below. A General Fund and PG&E Settlement Fund budget summary is also included below which presents the beginning fund balances, original and amended budget figures, and summarized actual results to date. A full detail of all figures presented below is included in the attached Budget Worksheet Reports.

General Fund Long Term Fiscal Sustainability Model Impact:

The originally adopted budget for FY 2022-23 included a transfer from the PG&E Fund to the General Fund totaling $10,985,377. The originally budgeted transfer amount maintained an ending reserve balance of the PGE Settlement Fund of $205,002,236 as of the end of FY 2022-23. Based on the fiscal sustainability model projections from the FY 2022-23 adopted budget, the amount of the original settlement amount reserved for use toward operational costs (~$200 million) remaining as of the end of the 25-year projection period is projected to be $64 million, as shown in the charts below.

The amendments to the originally adopted budget that were approved by Council during the September 13, 2022, September 15, 2022, and October 11, 2022 Council meetings increased the total projected General Fund expenditures for FY 2022-23 by $145,870. These additional General Fund financial impacts related to the General Fund portion of costs for the Public Works positions approved during the September 15, 2022 Council meeting ($90,870), the purchase of workstations and equipment for the newly approved Public Works positions ($20,000), and the purchase of a new Ford Ranger for the newly approved Construction Inspector position ($35,000), as described above. These General Fund impacts increased the revised estimated total projected transfer needed from the PG&E Fund to balance the General Fund to $11,131,247. This increase to the budgeted transfer from the PG&E Fund reduced the estimated balance of the PG&E Fund at the end of FY 2022-23 to $204,856,366.

The costs related to the additional public works positions are the only costs that would be expected to be recurring, while the remainder of the costs would be expected to be one-time, nonrecurring expenditures for the current fiscal year. Based on the updated fiscal sustainability model projections from the recurring costs incorporated into the FY 2022-23 amended budget, the amount of the original settlement amount reserved for use toward operational costs (~$200 million) remaining as of the end of the 25-year projection period after is projected to be approximately $2.7 million less than the original estimate based on the adopted budget, or $61.3 million.

Based on review of the actual fiscal activity compared to the amended budget through October 2022, staff has proposed net additional General Fund expenditures totaling $44,050, which would bring the revised estimated total projected transfer from the PG&E Fund required to balance the General Fund to $11,175,297.

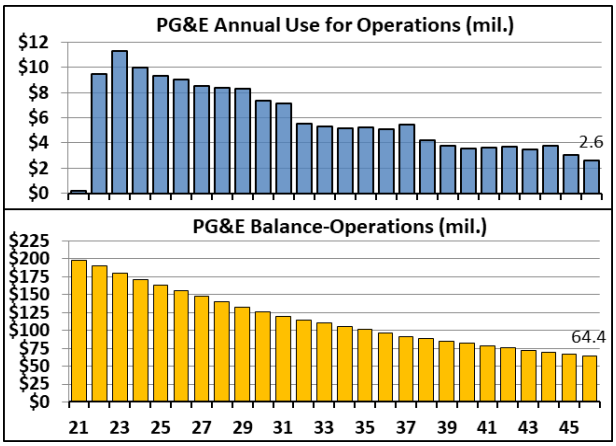
During the first quarter of the fiscal year, the Town received reimbursement of the 1% total settlement amount that was originally held back during the settlement to pay for trailing legal costs. The amount of the reimbursement received by the Town was equal to 1% of the total settlement amount ($2,700,000) less final attorney fees ($472,157), for a net reimbursement of $2,227,843. The net effect of the additional increase to the budgeted transfer from the PG&E Fund and the trailing cost reimbursement is projected to increase the estimated balance of the PG&E Fund at the end of FY 2022-23 to $207,040,159.

Based on the further updated fiscal sustainability model projections from the recurring costs of $44,050 incorporated into the FY 2022-23 amended budget, the amount of the original settlement amount reserved for use toward operational costs (~$200 million) remaining as of the end of the 25-year projection period after is projected to be approximately $1.4 million less than the amended estimate based on the adopted budget, or $59.9 million.

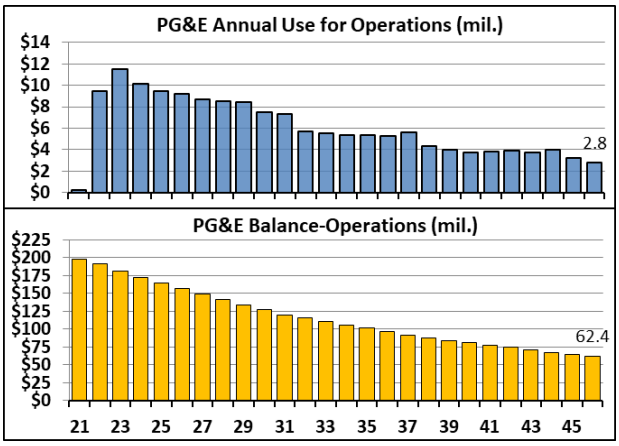
However, with the receipt of the trailing costs reimbursement during the current fiscal year, the total amount of the original settlement expected to be remaining at the end of the 25-year projection period is projected to be approximately $62.4 million as shown in the charts below.

The projected balance of $62.4 million is a positive indicator of continued long-term fiscal sustainability through the period projected and provides an additional contingency reserve that can be utilized if revenue backfill is needed beyond the 25-year projection period, or in the event that rebuild activity, or other factors, varies significantly from current projections at any point in the future.

Originally Adopted FY 2022-23 Budget



Proposed Amended FY 2022-23 Budget



Building Safety and Wastewater Services (Fund 2030)

All revenues and expenditures relating to the Building Safety and Wastewater Services fund are within budgeted expectations for the first four months of the fiscal year. A detailed budget performance report is attached for review.

Animal Control Services (Fund 2070)

All revenues and expenditures relating to the Animal Control fund are within budgeted expectations for the first four months of the fiscal year. A detailed budget performance report is attached for review.

Camp Fire Recovery (Fund 2090)

All revenues and expenditures relating to the Camp Fire Recovery Fund are within budgeted expectations for the first four months of the fiscal year. Town staff continues to work closely with FEMA, CalOES, and insurance to recover reimbursement for infrastructure project costs related to the 2018 Camp Fire on a timely basis. A detailed budget performance report is attached for review.

COVID-19 (Fund 2095)

The original budget included $1,359,500 of approved expenditures for FY 2022-23 and projected an ending fund balance of $1,224,280 as of June 30, 2023.

During Town Council meetings held through October 11, 2022, Council approved $777,561 of total additional expenditures funded through the use of the American Rescue Plan Act (ARPA) funds. The additional expenditures included $392,561 toward the restoration of dispatch services project (CIP #7324), $90,000 toward the Category 4 Tree Removal program (CIP #7312), $195,000 toward facility repairs to Town Hall, and $100,000 toward facility repairs to Fire Station 81.

The amended budget includes $2,137,061 of approved expenditures for FY 2022-23 and currently projects an ending fund balance of $446,719 as of June 30, 2023.

All revenues and expenditures relating to the COVID-19 fund are within revised budgeted expectations for the first four months of the fiscal year. Revenues relating to the second disbursement for the second half of the Town's allocation of ARPA funds are likely to be realized during the second half of the fiscal year. A detailed budget performance report is attached for review.

Capital Improvement Fund (2100)

- **$250,000 Increase**: On June 14, 2022 Paradise Town Council declared an emergency to repair or replace the culvert on Stearns Road in the vicinity of the Dry Creek drainage and to make related repairs to the roadway (CIP/DR Project #9418). Since the declaration, Town staff has bid the project, contracted the work, and completed the project of replacing the culvert. Town Council accepted the completed project on October 11, 2022. The $250,000 proposed maximum project cost is based on the maximum estimated project cost for project engineering and construction. All project costs are expected to be funded through local drainage funds, which would result in no additional General Fund impacts.

- **$100,000 Increase**: Additional funds in the amount of $100,000 have been identified as needed towards the completion of the Pentz Pathway Phase 2 (CIP/DR Project #9389). The original budget estimate included in the CIP/DR plan for FY 2022-23 was $187,450, which was budgeted to be funded through the use of Federal Congestion Mitigation Air Quality funds. The additional $100,000 budget amendment is proposed to be funded through the use of the Town's transportation funds annual allocations.

- **$0 Net Impact**: Interim Safety Striping for various critical locations throughout Town (CIP/DR Project #9420) has been identified as a critical project proposed to be completed during the current fiscal year. This project is proposed to be funded through the use of transportation funds originally allocated towards the Town's CDBG Sidewalk Improvements 2022 project (CIP/DR Project #9417). As presented during the October 11, 2022 Council meeting, cost savings are expected to be realized on the CDBG Sidewalk project that would allow for the reallocation of up to $300,000 in additional funds towards other transportation related projects.

- **$60,000 Correction**: A project to update the Town's pavement management program software was included under the adopted FY 2022-23 Capital Improvement Plan (CIP/DR Project #9416), which was planned to be funded through use of Gas Tax Funds. The budgeted line item for these costs was inadvertently excluded from the Gas Tax budget and is recommended to be included under the Gas Tax Fund (GL 2120.45.4750.5910.100) to ensure the Town-wide budget document matches the CIP/DR budget. As the entirety of this project was planned to be funded through the use of Gas Tax fund, there is no General Fund financial impact as a result of this adjustment.

- All other revenues and expenditures relating to the Capital Improvement fund are within budgeted expectations for the first four months of the fiscal year. Revenues are likely to be realized later in the fiscal year as reimbursement requests are completed for costs incurred during the fiscal year. A detailed budget performance report is attached for review.

Significant expenditures for the first four months of the fiscal year include:

- 9394 Downtown Sewer Environmental Survey: $ 348,969
- 9377 Almond Multi-Modal Improvements: $ 238,093
- 9385 Paradise Gap Closure Project: $ 191,695
- 9418 Stearns Road Culvert Replacement $ 159,819
- 9390 Skyway-Neal Bike-Ped Project $ 41,952

Disaster Recovery Fund (2105)

All revenues and expenditures relating to the Disaster Recovery fund are within budgeted expectations for the first four months of the fiscal year. Revenues are likely to be realized later in the fiscal year as reimbursement requests are completed for costs incurred during the fiscal year. A detailed budget performance report is attached for review.

Significant expenditures for the first four months of the fiscal year include:

- 7303 On System Road Rehabilitation: $2,683,586
- 7324 Restoration of Dispatch Services: $ 180,044
- 7312 Category 4 Tree Removal: $ 119,137
- 7320 SWRCB Septic Grant $ 98,937
- 7309 Transportation Master Plan $ 60,365

Gas Tax / Street Maintenance (Fund 2120)

All revenues and expenditures relating to the Gas Tax fund are within budgeted expectations for the first four months of the fiscal year. A detailed budget performance report is attached for review.

Business and Housing (Fund 2160)

All revenues and expenditures relating to the Business and Housing fund are within budgeted expectations for the first four months of the fiscal year. A detailed budget performance report is attached for review.

PGE Settlement Fund (7700)

- **Revenues**:
    - The Town has received $381,490 in interest revenues for the first three months of the fiscal year, which is trending in line with total budgeted expectations of $1,100,000 for the full fiscal year. Staff continues to closely monitor revenues as securities mature and funds are reinvested into new investments under this quickly changing interest rate environment.
    - As mentioned above, during the first quarter of the fiscal year, the Town received reimbursement of the 1% total settlement amount that was originally held back during the settlement to pay for trailing costs. The amount of the reimbursement received by the Town was equal to 1% of the total settlement amount ($2,700,000) less final attorney fees ($472,157), for a net reimbursement of $2,227,843.
- **Expenditures / Transfers Out:**
    - **$44,050 Increase**: As mentioned above, the total recommended General Fund budget amendments includes $244,500 of net additional expenditures, which is offset by $56,450 of additional revenues, and a recommended draw-down of Measure V reserves in the amount of $144,000. This leaves a total of $44,050 of additional funding requirements. In order to balance the General Fund budget, an additional transfer from the PG&E Settlement Fund in the amount of $44,050 is recommended.

Conclusion:

Overall, the Town-wide financial activity for the first four months of the fiscal year is within budgeted expectations. The total impact to the General Fund of the recommended adjustments above is an additional $44,050 in expenditures, which is recommended to be offset by an additional transfer from the PG&E Settlement Funds. The amended FY 2022-23 PG&E fund total transfer amount of $11,175,297 and projected PG&E Settlement Fund balance at the end of the projection period included in the Fiscal Sustainability model ($62.4 million) is still a positive indicator of ongoing fiscal sustainability based on a medium growth scenario. Staff will continue to closely monitor financial activity against budgeted benchmarks and will bring any additional recommendations for budget amendment during the mid-year budget review process.

Adjustment Summary: November 7, 2022

Budget Fund (Department)	Adjustment Item	GL Budget Code	Adjustment Description	Amount	
General (Town Manager)	Budget Reclassification - Employee Development	1010.20.4200.5223.105	Reclassification of original furniture and equipment budget for Town-wide employee development	$ 1,000	Estimated Costs

Town of Paradise

Council Agenda Summary **Agenda Item: 6(d)**

Date: November 7, 2022

ORIGINATED BY: Jessica Erdahl, Sr. Capital Projects Manager

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: Emergency Relief Project: 2023 On-System Road Rehabilitation – PSE Approval and Authorize Advertisement for Bids.

LONG TERM RECOVERY PLAN: Yes, Tier 1

COUNCIL ACTION REQUESTED:

1. Consider adopting Resolution No.2022- __, A Resolution of the Town Council of the Town of Paradise approving the plans and specifications for the 2023 On-System Road Rehabilitation Project and authorizing advertisement for bids on the project. (ROLL CALL VOTE)

Background:

Due to the ongoing recovery effort and debris removal operations within the Town and Butte County, the Town's on-system roadway infrastructure sustained heavy damage in the wake of the Camp Fire. The pavement structural sections were damaged in two ways:

1. Pavement Scarring due to Car Fires – On the day of the Camp Fire, several motorists were required to abandon their vehicles and continue evacuating on foot. The subsequent car fires damaged the pavement, justifying the need for repair.

2. Pavement Structural Section Damage due to Heavy Truck Traffic – Following the Camp Fire, the Town has experienced a staggering level of truck traffic. During the CALOES Debris Removal effort, over 3.7 million tons of material was removed, equivalent to approximately 300,000 truckloads. During that same period, PG&E, Comcast, and AT&T have restored the distribution infrastructure. PG&E has already removed over 92,000 trees, and an additional 100,000 trees are estimated for removal in 2020. The volume of trucks using the Town's on-system roads has resulted in damage to the pavement structural section, justifying the need for rehabilitation.

The Town coordinated with Caltrans and Federal Highways Administration (FHWA) to secure Emergency Relief permanent restoration funding to repair damaged on-system roads town wide. Through the Emergency Relief Program, the Town of Paradise has been approved for $55,439,200 for the on-system road rehabilitation project. The approved project is located on Federal-Aid "On-System" roads – meaning the Town's primary collectors and arterials such as Skyway, Clark, Pearson, Elliott, Bille, Wagstaff, Pentz, etc.

On November 10, 2020, Paradise Town Council awarded master on-call contracts to Mark Thomas, Dokken Engineering, GHD, Inc., Wood Rodgers, Inc. and Dewberry Drake Haglan to perform on-call professional civil engineering services for a variety of local, state, and federally-funded projects. Subsequently, in January 2021, task orders were issued to Mark Thomas,

Dokken Engineering, and Wood Rodgers, Inc. to perform civil design services on the on-system road rehabilitation project.

The overall scope of work for the Project can be summarized as follows:

- Repair Camp Fire damaged on-system roads to achieve a pre-fire condition.

On June 14, 2022 Paradise Town Council awarded Contract No. 7303.1.CON, 2022 On-System Roadway Rehabilitation –Skyway (Project 1) to Baldwin Contracting Company, Inc. dba Knife River Construction in the amount of their base bid plus additive bid #1,$5,069,864.78.

A vicinity map of the town wide on-system road project limits, as well as the proposed 2023 project limits are provided in this Agenda Summary.

Analysis:
The on-system road rehabilitation project is consistent with priorities identified in the Paradise Long-Term Recovery Plan prepared in response to the 2018 Camp Fire and necessary to restore roadway infrastructure to a pre-fire condition.

Road rehabilitation projects will be identified based on utility undergrounding completion. As segments of utilities are nearing completion, the Town of Paradise will identify and bid specific segments of roadways as individual projects. The goal of this approach is to maximize efficiency, partnership and remain good stewards of precious public funds and community impacts by reducing excavations into recently rehabilitated roadways.

With Council approval of the plans and specifications and authorization to advertise for bids, staff proposes the following schedule:

Project No. 2 (2023) – Dean Road, Merrill Road, Wagstaff Road, Bille Road, Elliott Rd, Sawmill Road, Pearson Road, S Libby Road, Stearns Road, and Country Club Drive (8.5 miles).

Advertise for bid:	November 2022
Award Contract:	January 2023
Construction:	Spring 2023

Future Projects – 2024-2025

Financial Impact:
FHWA Emergency Relief funds have been authorized as Advance Construction (AC) for the construction and construction engineering phases. Advance Construction is a project authorization technique that allows FHWA to authorize a project phase without obligating Federal funds. Projects authorized under Advance Construction procedures will not receive federal reimbursement until Federal funds become available and are obligated on a subsequent sequence. The Town will use local funds to perform the construction and construction engineering phases for future federal reimbursement. Emergency Relief AC funding is typically obligated as federal funds within 6 months following federal authorization to proceed.

The total estimated construction and construction engineering cost for on-system roads town wide is $51,935,200 and $8,8550,50.80 for the 2023 project. The estimated funding breakdown is shown below. A detailed project accounting description for each project bid will be made available at the time of contract award.

2023 On-System Road Rehabilitation Project

Contract Items	Total Estimated Cost	Total Participating Cost	Emergency Relief (AC) 75.25 %	Local Match 24.75%	Non-Participating (Utility Adjustments)
Construction Project 2 - 2023	$ 7,379,209.00	$ 6,962,209.00	$ 5,239,062.27	$ 1,723,146.73	$ 417,000.00
Contingency (10%)	$ 737,920.90	$ 737,920.90	$ 555,285.48	$ 182,635.42	
Construction Management (10%)	$ 737,920.90	$ 737,920.90	$ 555,285.48	$ 182,635.42	$ -
Total	**$ 8,855,050.80**	**$ 8,438,050.80**	**$ 6,349,633.23**	**$ 2,088,417.57**	**$ 417,000.00**
Total Available Funding	$ 46,907,348.74	$ 46,066,861.66	$ 34,665,313.40	$ 11,401,548.26	$ 840,487.08
Balance	**$ 38,052,297.94**	**$ 37,628,810.86**	**$ 28,315,680.17**	**$ 9,313,130.69**	**$ 423,487.08**

Required matching funds, $2,088,417.57 (24.75%), are anticipated to be awarded through the Community Development Block Grant-Disaster Recovery fund allocation process.

Environmental Review:

The project is exempt under State CEQA Guidelines [Section 15269(a)], which states:

The following emergency projects are exempt from the requirements of CEQA.

(a) Projects to maintain, repair, restore, demolish, or replace property or facilities damaged or destroyed as a result of a disaster in a disaster-stricken area in which a state of emergency has been proclaimed by the Governor pursuant to the California Emergency Services Act, commencing with Section 8550 of the Government Code. This includes projects that will remove, destroy, or significantly alter an historical resource when that resource represents an imminent threat to the public of bodily harm or of damage to adjacent property or when the project has received a determination by the State Office of Historic Preservation pursuant to Section 5028(b) of Public Resources Code.

The project location is a disaster-stricken area, proclaimed as a major disaster by the President on November 12, 2018 (FEMA-4407-DR) and as a State of Emergency by the State of California on November 8, 2018. The purpose of the project is to repair existing infrastructure damaged by the Camp Fire. No further environmental review is necessary for this project.

RESOLUTION NO. 2022-____

A RESOLUTION OF THE TOWN COUNCIL OF THE TOWN OF PARADISE APPROVING THE PLANS, SPECIFICATIONS AND ESTIMATES FOR THE 2023 ON-SYSTEM ROAD REHABILITATION PROJECT AND AUTHORIZING ADVERTISEMENT FOR BIDS ON THE PROJECT.

WHEREAS, on-system roads sustained damage as a result of the Camp Fire; and,

WHEREAS, the Town of Paradise has received a $55,439,200 allocation of Federal Highway Administration Emergency Relief Program funds; and,

WHEREAS, the purpose of the Emergency Relief Program is Repair or reconstruction of Federal-aid highways and roads ("On-System") which have suffered serious damage as a result of natural disasters.

WHEREAS, eligible repairs may include, but are not limited to, damage occurring to pavement or other surface courses, shoulders, embankments, cut slopes, roadside development, and stream channels, whether man-made or natural. Pavement repairs or reconstruction may also include rock slope protection, cribbing, or other stream bank control features, bridges, retaining walls, culverts and debris removal, including other deposits from roadway drainage channels and the traveled way.

WHEREAS, the 2023 On-System Road Rehabilitation Project is consistent in scope with the approved emergency relief funds: and,

WHEREAS, the 2023 On-System Road Rehabilitation Project is consistent with priorities identified in the Paradise Long-Term Recovery Plan prepared in response to the 2018 Camp Fire.

NOW, THEREFORE, BE IT RESOLVED BY THE TOWN COUNCIL OF THE TOWN OF PARADISE AS FOLLOWS:

Section 1. The design, plans, specifications and estimates for the 2023 On-System Road Rehabilitation Project described in the Town Council Agenda Summary for this Resolution are hereby approved.

Section 2. The Public Works Department is authorized to advertise the 2023 On-System Road Rehabilitation Project.

Section 3. The 2023 On-System Road Rehabilitation Project is exempt from the provisions of the California Environmental Quality Act pursuant to State CEQA Guidelines [Section 15269(a)] Emergency Projects.

PASSED AND ADOPTED by the Town Council of the Town of Paradise on this 7th day of November 2022, by the following vote:

Town of Paradise

Council Agenda Summary **Agenda Item: 6(e)**

Date: November 7, 2022

ORIGINATED BY: Marc Mattox, Public Works Director/Town Engineer

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: Off-System Road Rehabilitation Project– PSE Approval and Authorize Advertisement for Bids.

LONG TERM RECOVERY PLAN: Yes, Tier 1

COUNCIL ACTION REQUESTED:

1. Consider directing staff to submit a formal request to FEMA designating FEMA-4407-DR-CA PA ID: 007-55520-00 PW 363 as an Improved Project. (ROLL CALLVOTE)

Background:

Due to the ongoing recovery effort and debris removal operations within the Town and Butte County, the Town's off-system roadway infrastructure sustained heavy damage in the wake of the Camp Fire. The pavement structural sections were damaged in two ways:

1. Pavement Scarring due to Car Fires – On the day of the Camp Fire, several motorists were required to abandon their vehicles and continue evacuating on foot. The subsequent car fires damaged the pavement, justifying the need for repair.

2. Pavement Structural Section Damage due to Heavy Truck Traffic – Following the Camp Fire, the Town has experienced a staggering level of truck traffic. During the CALOES Debris Removal effort, over 3.7 million tons of material was removed, equivalent to approximately 300,000 truckloads. During that same period, PG&E, Comcast, and AT&T have restored the distribution infrastructure. PG&E has already removed over 92,000 trees, and an additional 100,000 trees are estimated for removal in 2020. The volume of trucks using the Town's on-system roads has resulted in damage to the pavement structural section, justifying the need for rehabilitation.

The Town coordinated with the Federal Emergency Management Agency (FEMA) to secure Public Assistance permanent restoration funding to repair damaged off-system roads town wide. Through the Public Assistance Program, the Town of Paradise has been approved for $38,290,000 for the off-system road rehabilitation project. The approved project is located on "Off-System" roads. Off-system roadway rehabilitation include roadways that are not on the on-system roadways and will be funded by FEMA.

On November 10, 2020, Paradise Town Council awarded master on-call contracts to Mark Thomas, Dokken Engineering, GHD, Inc., Wood Rodgers, Inc. and Dewberry Drake Haglan to perform on-call professional civil engineering services for a variety of local, state, and federally-funded projects. Subsequently, in January 2021, task orders were issued to GHD, Dokken Engineering, and Dewberry to perform civil design services on the off-system road rehabilitation project.

Analysis:

During the design process, engineering design and code requirements required several modifications of the approved scope of work listed in the FEMA Public Assistance Project Worksheet. This cost-neutral scope change was submitted to CalOES and FEMA in March of 2022. The primary transmittal is attached to this Agenda Summary which explains the scope changes required, including approval of new road rehabilitation techniques, upgrades to pedestrian access ramps and monument preservation.

In recent weeks in coordination with CalOES and FEMA, a recommendation has been made for the Town to make a request for a conversion to an Improved Project in accordance with 44 CFR 206.203(d)(1), copied below:

> ***Improved projects.*** *If a subrecipient desires to make improvements, but still restore the predisaster function of a damaged facility, the recipient's approval must be obtained. Federal funding for such improved projects shall be limited to the Federal share of the approved estimate of eligible costs.*

This designation would allow the Town and FEMA to avoid arduous reviews and clarifications on the requested scope change and move forward towards completion. The major caveat with an Improved Project is that in the event project work exceeds the original allocation amount, no additional funds may be awarded – meaning potential cost increases would be borne by the Town of Paradise. Unchanged, however, only incurred actual costs up to the approved amount could be reimbursed.

Staff has reviewed the impacts of this potential action and is requesting Council approval to formally request the Improved Project designation for this work effort. In forecasting future project implementation based on current construction costs and potential global economic changes, staff believes the risk associated with the action is outweighed by the benefits of streamlining the project process and scope revisions needed.

If approved, staff will submit the Improved Project request immediately aiming for a quick approval to ensure no delays are incurred in delivering the 2023 Off-System Paving Project.

Financial Impact:

The total estimated construction and construction engineering cost for off-system roads town wide is $38,290,000. The estimated funding breakdown is shown below.

Off-System Road Rehabilitation Project

Phase	Total Estimated Cost	Total Participating Cost	FEMA/CalOES 93.75 %	Local/CDBG-DR Match 6.25%
Preliminary Engineering	$3,064,000.00	$ 3,064,000.00	$ 2,872,500.00	$ 191,500.00
Construction	$30,631,000.00	$ 30,631,000.00	$ 28,716,562.50	$ 1,914,437.50
Construction Management	$4,595,000.00	$ 4,595,000.00	$ 4,307,812.50	$ 287,187.50
Total	**$ 38,290,000.00**	**$ 38,290,000.00**	**$ 35,896,875.00**	**$ 2,393,125.00**

Required matching funds, $2,393,125 (6.25%), are planned for approved Paradise Community Development Block Grant-Disaster Recovery Infrastructure fund allocations.

Finally, staff recommends the addition of a contingency fund using Paradise Community Development Block Grant-Disaster Recovery Infrastructure fund allocations. Based on recent grant award announcements, staff is planning a CDBG-DR Action Plan Amendment in December 2022 which will allow for additional projects to be funded – including increasing the fund's commitment from just the minimum match requirement to include a $5M contingency reserve. This reserve will offset the risk of an Improved Project designation in the event construction costs exceed original approved funding amounts.

Environmental Review:

The project is exempt under State CEQA Guidelines [Section 15269(a)], which states:

The following emergency projects are exempt from the requirements of CEQA.

(a) Projects to maintain, repair, restore, demolish, or replace property or facilities damaged or destroyed as a result of a disaster in a disaster-stricken area in which a state of emergency has been proclaimed by the Governor pursuant to the California Emergency Services Act, commencing with Section 8550 of the Government Code. This includes projects that will remove, destroy, or significantly alter an historical resource when that resource represents an imminent threat to the public of bodily harm or of damage to adjacent property or when the project has received a determination by the State Office of Historic Preservation pursuant to Section 5028(b) of Public Resources Code.

The project location is a disaster-stricken area, proclaimed as a major disaster by the President on November 12, 2018 (FEMA-4407-DR) and as a State of Emergency by the State of California on November 8, 2018. The purpose of the project is to repair existing infrastructure damaged by the Camp Fire. No further environmental review is necessary for this project.

- FEMA Scope Change Request Memo

Town of Paradise
Public Works Department
5555 Skyway
Paradise, CA 95969
(530) 872-6291

March 10, 2022

Mr. David Gillings
Public Assistance Officer
California Office of Emergency Services
3650 Schriever Avenue
Mather, CA 95655

Subject: Scope Change Request, FEMA-4407-DR-CA PA ID: 007-55520-00

Dear Mr. Gillings:

The Town of Paradise requests a scope of work change for the uncompleted permanent work under PW#363 as a result of the Camp Fire. PW#363 aims to repair surface and structural damage to "Off-System" (non-Federal Highways Administration/National Highway System) roadways in the Town of Paradise. This scope of work change does not increase the overall cost of the project. The following scope of work is currently included in the approved Project Report:

- Replace asphalt concrete pavement
- Replace of hot mix asphalt (.25' Depth)
- Replace of hot mix asphalt (Digouts w/.25' Depth)
- Replace of aggregate base
- Remove roadway
- Replace thermoplastic traffic stripe
- Replace Inductive loop detector

The proposed scope of work change includes the above list as well as the following items of work:

- Pavement Structural Section Repairs
  - Full-Depth Reclamation – Cement
  - Pulverized Roadbed
- ADA Curb Ramp Reconstruction
- Utility and Monument Adjustments
  - Adjust Utilities/Monuments to Grade
  - Re-establish Monument

Introduction

Since the Project Worksheet was approved, the Town has retained a team of highly qualified civil engineering team to prepare plans, specifications, and estimates for the off-system road rehabilitation project. Final plans, specifications and estimates were recently completed in January 2022. These plans were prepared with the benefit of proper design using supplemental topographic surveys and detailed geotechnical field investigations, which were not available when the original project was created. These critical items assisted the design process to ensure damage repair techniques are both efficient and effective.

This letter aims to document the repair techniques to be utilized in the revised project, summarized below:

1. **Pavement Structural Section Design** – Additional geotechnical data has been gathered, including R-Values and pavement cores for the various segments of roadways. Generally, R-Values were lower and pavement sections were thinner than what was assumed in original scope request. The road rehabilitation strategies changed as a result.
2. **ADA Curb Ramp Reconstruction** – Department of Justice requires all curb ramps to be upgraded to meet ADA standards in conjunction with pavement rehabilitation projects. This work was not included in the original scope.
3. **Utility and Monument Adjustments** – Paradise Irrigation District, a California Special Public Utility District has approximately 791 utility covers in the pavement structural section requiring adjustment during paving operations. The Town of Paradise also has town owned storm drain infrastructure requiring adjustment to accommodate paving operations. Additionally, monument protection and re-establishment, governed by Section 8771 and Section 8725 of the Business and Professions Code and Section 605 of the California Penal Code, need to be included as items of work.

Background

Due to the ongoing recovery effort and debris removal operations within the Town and Butte County, the Town's roadway infrastructure sustained heavy damage in the wake of the Camp Fire. A vicinity map showing off-system road routes within the Town is included within **Attachment 1**.

As result of the Camp Fire, the pavement structural sections on Off-System roads were damaged in two major ways:

1. **Pavement scarring due to vehicle fires** – On the day of the Camp Fire, several motorists were required to abandon their vehicles and continue evacuating on foot. The subsequent vehicle fires damaged the pavement, justifying the need for repair.
2. **Pavement structural section damage due to heavy truck traffic** – Following the Camp Fire, the Town has experienced a staggering level of truck traffic. During the CALOES Debris Removal effort, over 3.7 million tons of material was removed, equivalent to approximately 300,000 truckloads. During that same period, PG&E, Comcast, and AT&T have restored the distribution infrastructure. PG&E has already removed over 92,000 trees, and an additional 100,000 trees were estimated for removal in 2020. The volume of trucks using the Town's off-system roads has resulted in damage to the pavement structural section, justifying the need for rehabilitation.

Immediately following the Camp Fire, Town staff worked with FHWA and FEMA to develop a strategy for rehabilitation of all on-system and off-system roads within the Town limits. The direction was to demonstrate "visible evidence" of pavement damage related to the incident, specifically to capture damage due to debris hauling. In response, the Town has performed two road condition surveys. The first survey was performed in January 2019, and the second was performed in September 2019. The timing of the surveys was to document the pavement condition immediately following the fire and then provide evidence of damage after 8 months of intense hauling. The visual evidence suggests that all off-system roads need rehabilitation because of the Camp Fire and are eligible for Public Assistance and Emergency Relief Program funds through FEMA and FHWA, respectively.

The Town prepared a funding request to justify the pavement rehabilitation required for all off-system roads within the Town limits. The request included technical information requested by FEMA, including explicit criteria justifying full-depth pavement reconstruction (Digouts), traffic counts, and Traffic Index (TI) calculations.

Based on the condition surveys, the most apparent evidence of pending pavement failure is due to increased cracking and rutting. An increase in the longitudinal and transverse cracking, with isolated areas of alligator cracking was observed when the two roadway surveys were compared. An increase in rutting, especially in the areas where trucks start and stop was also observed throughout the roadway network.

Based on the evidence provided by the road condition surveys and limited information regarding the existing soil conditions, the Town of Paradise proposed a rehabilitated pavement section including two primary components:

- Full Depth Pavement Reconstruction (Digouts) (3" Hot Mix Asphalt over 4" Aggregate Base) – Digouts will be constructed where changes in cracking and rutting are severe.
- Cold Plane and Overlay (2" Cold Plane and 3" Hot Mix Asphalt Overlay) – The grind and overlay will be applied to the entire roadway surface (including digout locations).

When these treatment techniques were selected limited geotechnical data was available and the existing pavement structural sections were unknown. Given the timeframe required to submit the request within the PA program, detailed analysis was deferred to the preliminary engineering and design phase.

Item 1 - Pavement Repair Techniques including FDR and Pulverization

Following the completion of required studies and design, critical factors were discovered which require a modified approach to pavement repairs, explained further below.

Traffic Volumes

The original funding application used traffic counts from BCAG's Post Camp Fire Population Study conducted in November 2019. This scope change request proposes using average daily traffic estimates from BCAG's regional traffic model developed 2017/2018 (pre-Camp Fire). While traffic volumes are slightly higher in the pre-Camp Fire estimates, the truck ratios are much lower than what was observed in the Post Camp Fire Population Study.

Traffic Index Calculations

Originally calculated TIs using traffic data from the Post Camp Fire Population Study ranged from 8.5 to 10.7. For funding estimate purposes, a TI of 8 was used for all off-system roads in the original funding application. A TI of 8 was intended to provide a resilient pavement section that would serve the town beyond the immediate recovery period.

During preparation of the geotechnical reports, it was observed that using a TI of 8 was too conservative for many of the low-volume off-system roads. The calculated TI's, using the revised traffic volumes (pre-camp Fire) ranged from 5 to 7, lower than originally estimated. The reduced TI's included in the final geotechnical reports helped off-set a portion of the construction cost increases discussed later in this memorandum.

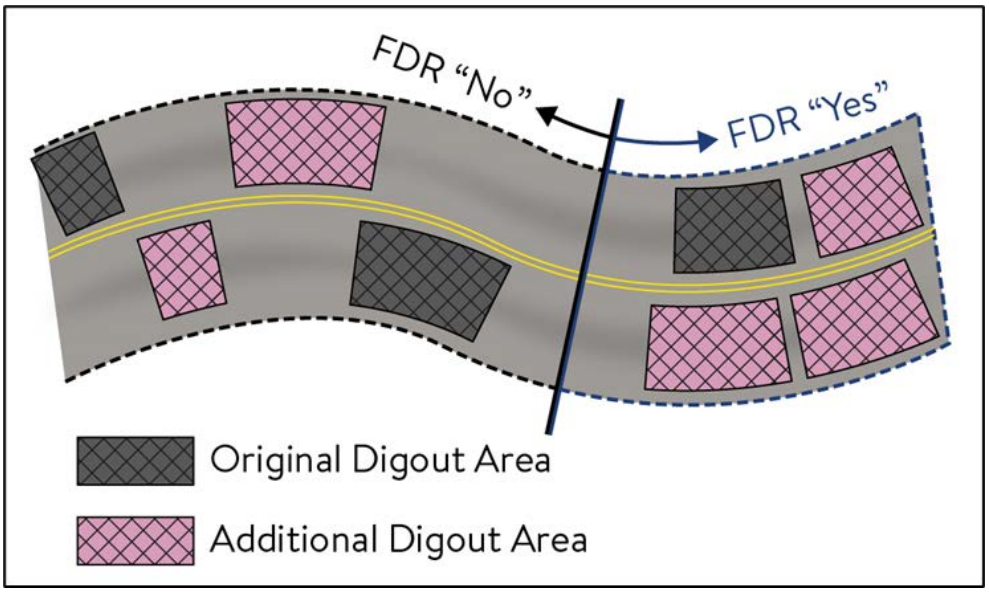
Resistance Values (R Values)

When the original funding application as prepared, an R-Value of 23 was assumed based on available geotechnical testing provided by Butte County. As part of the 100% plans, detailed subsurface geotechnical investigations were performed, and the true R-values were determined. The calculated R-values ranged from 8 to 47. However, in order to reduce the number of pavement structural sections required for the project, the R-Values used for final design ranged from 15 to 30. Setting the minimum R-value to 15 resulted in a cost saving measure as well.

After the geotechnical field investigations and lab analysis was complete, the pavement rehabilitation strategies proposed in the original project worksheet need to be expanded. In areas where the estimated digout surface area exceeds 20% of the total surface area of a logical roadway segment, the design team considered the use of Full Depth Reclamation (FDR) or pulverization in lieu of the pavement digout / overlay strategy. Roads with HMA or chip seal surfaces that were less than 0.15 feet thick and are supported on either subgrade soils or relatively thin sections of AB are not suitable for FDR, therefore pulverization was the selected roadway rehabilitation treatment.

Within these roadway segments, the cost of constructing the digouts would be equivalent to or more expensive than placing FDR or pulverizing for the following reasons:

- Labor costs for saw cutting, excavating, placing material, and compaction are eliminated.
- Construction process for FDR or pulverization reduces contract working days
- Reduced working days results in lower traffic control costs and minimizes disturbance to the travelling public.



The Town understands the need to avoid betterments under the FEMA Public Assistance program. The use of FDR or pulverization will provide a superior product when compared to the digouts for a reduced cost. The proposal for FDR and pulverization was considered very carefully by Town staff and the civil engineering team, and it was determined these strategies represented the most efficient and effective use of critical funding.

Item 2 - ADA Curb Ramp Reconstruction

Title II of the Americans with Disabilities Act (ADA) requires that state and local governments ensure that persons with disabilities have access to the pedestrian routes in the public right of way. An important part of this requirement is the obligation whenever streets, roadways, or highways are altered to provide compliant curb ramps where street level pedestrian walkways cross curbs. This requirement is intended to ensure the accessibility and usability of the pedestrian walkway for persons with disabilities.

Based on guidance from the Department of Justice and Department of Transportation dated July 8, 2013 (**See Attachment 5**), curb ramps shall be included or upgraded to current standards in conjunction with pavement rehabilitation projects. It is the responsibility of the Town to meet these requirements and remain compliant with Title II of the Americans with Disabilities Act . This work was not included in the original funding

documentation. The Town's civil engineering team prepared ADA Assessment memorandums (**See Attachment 4**) to document existing conditions, non-compliant curb ramps, and identify construction costs. This scope change request to upgrade ramps to meet current standards does not increase the overall funding request, due to cost saving measure discussed previously in this memorandum.

Item 3 - Utility and Monument Adjustments

Paradise Irrigation District, a California Special Public Utility District has approximately 791 utility covers in the pavement structural section. The off-system road rehabilitation project work necessitates the adjustment of PIDs utility lids below grade (for milling operations) and back to new finished grade following the installation of the roadway treatment. PID is a special public utility district eligible to receive FEMA funding and was also impacted by the Camp Fire. Correspondence with Cal OES on February 16, 2022 indicated that PID utility adjustments are a FEMA reimbursable eligible expense. Further, the Town of paradise owns and maintains storm drain infrastructure. These covers will also require adjustment to accommodate paving operations and have been included in this scope change request.

Section 8771 and section 8725 of the Business and Professions Code and Section 605 of the California Penal Code governs perpetuating, preserving and re-establishing all survey monumentation. Any monuments to be disturbed as a result of construction activities, will require re-establishment under the direction of a Licensed Surveyor. Monuments located in existing well, will require adjustments to grade, similar to the above utilities.

This scope change request to adjust utilities and monuments does not increase the overall funding request, due to cost saving measure discussed previously in this memorandum.

Summary

Leadership from the Town of Paradise, Caltrans, FHWA, FEMA and CalOES have been working together closely to ensure the Camp Fire recovery is a success. Repairing the Town's roadway network is critical to this objective. These repairs must be completed as soon as possible and sequenced in the recovery to prevent further damage and costs to the recovery.

We hope this letter provides a clear justification for the scope of work change request. For the sake of consistency amongst other federal recovery partners, a comparable modification request was made to FWHA and subsequently approved on October 7, 2021. This approved request did expand the repair techniques available for the project.

If you would like to meet or require additional information, please let us know. Thank you for effort in helping rebuild Paradise.

This scope of work change request applies to the project listed below according to the FEMA Grants Portal project number:

#132422 - P/W0363	DR4407 - Town of Paradise – Road Damages Occurring During the performance of Emergency Work (PPDR and Hazardous Tree Removal)

Sincerely,

Marc Mattox
Public Works Director/Town Engineer

Town of Paradise

Council Agenda Summary **Agenda Item: 6(f)**

Date: November 7, 2022

ORIGINATED BY: Jessica Erdahl, Sr. Capital Projects Manager

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: Off-System Road Rehabilitation Project– PSE Approval and Authorize Advertisement for Bids.

LONG TERM RECOVERY PLAN: Yes, Tier 1

COUNCIL ACTION REQUESTED:

1. Consider adopting Resolution No.2022- __, A Resolution of the Town Council of the Town of Paradise approving the plans and specifications for the Off-System Road Rehabilitation Project and authorizing advertisement for bids on the project. (ROLL CALL VOTE)

Background:

Due to the ongoing recovery effort and debris removal operations within the Town and Butte County, the Town's off-system roadway infrastructure sustained heavy damage in the wake of the Camp Fire. The pavement structural sections were damaged in two ways:

1. Pavement Scarring due to Car Fires – On the day of the Camp Fire, several motorists were required to abandon their vehicles and continue evacuating on foot. The subsequent car fires damaged the pavement, justifying the need for repair.

2. Pavement Structural Section Damage due to Heavy Truck Traffic – Following the Camp Fire, the Town has experienced a staggering level of truck traffic. During the CALOES Debris Removal effort, over 3.7 million tons of material was removed, equivalent to approximately 300,000 truckloads. During that same period, PG&E, Comcast, and AT&T have restored the distribution infrastructure. PG&E has already removed over 92,000 trees, and an additional 100,000 trees are estimated for removal in 2020. The volume of trucks using the Town's on-system roads has resulted in damage to the pavement structural section, justifying the need for rehabilitation.

The Town coordinated with the Federal Emergency Management Agency (FEMA) to secure Public Assistance permanent restoration funding to repair damaged off-system roads town wide. Through the Public Assistance Program, the Town of Paradise has been approved for $38,290,000 for the off-system road rehabilitation project. The approved project is located on "Off-System" roads. Off-system roadway rehabilitation include roadways that are not on the on-system roadways and will be funded by FEMA.

On November 10, 2020, Paradise Town Council awarded master on-call contracts to Mark Thomas, Dokken Engineering, GHD, Inc., Wood Rodgers, Inc. and Dewberry Drake Haglan to perform on-call professional civil engineering services for a variety of local, state, and federally-funded projects. Subsequently, in January 2021, task orders were issued to GHD, Dokken Engineering, and Dewberry to perform civil design services on the off-system road rehabilitation project.

The overall scope of work for the Project can be summarized as follows:

- Repair Camp Fire damaged off-system roads to achieve a pre-fire condition.

A vicinity map of the town wide off-system road project limits, as well as the proposed 2023 project limits are provided in this Agenda Summary.

Analysis:
The off-system road rehabilitation project is consistent with priorities identified in the Paradise Long-Term Recovery Plan prepared in response to the 2018 Camp Fire and necessary to restore roadway infrastructure to a pre-fire condition.

Road rehabilitation projects will be identified based on utility undergrounding completion. As segments of utilities are nearing completion, the Town of Paradise will identify and bid specific segments of roadways as individual projects. The goal of this approach is to maximize efficiency, partnership and remain good stewards of precious public funds and community impacts by reducing excavations into recently rehabilitated roadways.

With Council approval of the plans and specifications and authorization to advertise for bids, staff proposes the following schedule:

Project No. 1 (2023) – 12.5 miles

Advertise for bid:	December 2022
Award Contract:	February 2023
Construction:	Spring 2023

Future Projects – 2023-2025

Financial Impact:
FEMA Public Assistance funds have been authorized for construction and construction engineering phases at actual documented cost incurred. However, a concurrent agenda item will be presented requesting authorization to request an Improved Project though FEMA.

The total estimated construction and construction engineering cost for off-system roads town wide is $35,226,000 and $8,305,947 for the 2023 project. The estimated funding breakdown is shown below. A detailed project accounting description for each project bid will be made available at the time of contract award.

Off-System Road Rehabilitation Project

Staff Report- Phase

Phase	Total Estimated Cost	Total Participating Cost	FEMA/CalOES 93.75 %	Local Match 6.25%
Preliminary Engineering	$3,064,000.00	$ 3,064,000.00	$ 2,872,500.00	$ 191,500.00
Construction	$30,631,000.00	$ 30,631,000.00	$ 28,716,562.50	$ 1,914,437.50
Construction Management	$4,595,000.00	$ 4,595,000.00	$ 4,307,812.50	$ 287,187.50
Total	**$ 38,290,000.00**	**$ 38,290,000.00**	**$ 35,896,875.00**	**$ 2,393,125.00**

Required matching funds, $2,393,125 (6.25%), are anticipated to be awarded through the Community Development Block Grant-Disaster Recovery fund allocation process.

Environmental Review:

The project is exempt under State CEQA Guidelines [Section 15269(a)], which states:

The following emergency projects are exempt from the requirements of CEQA.

(a) Projects to maintain, repair, restore, demolish, or replace property or facilities damaged or destroyed as a result of a disaster in a disaster-stricken area in which a state of emergency has been proclaimed by the Governor pursuant to the California Emergency Services Act, commencing with Section 8550 of the Government Code. This includes projects that will remove, destroy, or significantly alter an historical resource when that resource represents an imminent threat to the public of bodily harm or of damage to adjacent property or when the project has received a determination by the State Office of Historic Preservation pursuant to Section 5028(b) of Public Resources Code.

The project location is a disaster-stricken area, proclaimed as a major disaster by the President on November 12, 2018 (FEMA-4407-DR) and as a State of Emergency by the State of California on November 8, 2018. The purpose of the project is to repair existing infrastructure damaged by the Camp Fire. No further environmental review is necessary for this project.

TOWN OF PARADISE
RESOLUTION NO. 2022-____

A RESOLUTION OF THE TOWN COUNCIL OF THE TOWN OF PARADISE APPROVING THE PLANS, SPECIFICATIONS AND ESTIMATES FOR THE OFF-SYSTEM ROAD REHABILITATION PROJECT AND AUTHORIZING ADVERTISEMENT FOR BIDS ON THE PROJECT.

WHEREAS, off-system roads sustained damage as a result of the Camp Fire; and,

WHEREAS, the Town of Paradise has received a $38,290,000 allocation of Federal Emergency Management Agency Public Assistance funds; and,

WHEREAS, the purpose of the Public Assistance Program is to Repair or reconstruct Non-Federal aid highways and roads ("Off-System") which have suffered serious damage as a result of natural disasters.

WHEREAS, eligible repairs may include, but are not limited to, damage occurring to pavement or other surface courses, shoulders, embankments, cut slopes, roadside development, and stream channels, whether man-made or natural. Pavement repairs or reconstruction may also include rock slope protection, cribbing, or other stream bank control features, bridges, retaining walls, culverts and debris removal, including other deposits from roadway drainage channels and the traveled way.

WHEREAS, the Off-System Road Rehabilitation Project is consistent in scope with the approved Public Assistance funds: and,

WHEREAS, the Off-System Road Rehabilitation Project is consistent with priorities identified in the Paradise Long-Term Recovery Plan prepared in response to the 2018 Camp Fire.

NOW, THEREFORE, BE IT RESOLVED BY THE TOWN COUNCIL OF THE TOWN OF PARADISE AS FOLLOWS:

Section 1. The design, plans, specifications and estimates for the Off-System Road Rehabilitation Project described in the Town Council Agenda Summary for this Resolution are hereby approved.

Section 2. The Public Works Department is authorized to advertise the Off-System Road Rehabilitation Project.

Section 3. The Off-System Road Rehabilitation Project is exempt from the provisions of the California Environmental Quality Act pursuant to State CEQA Guidelines [Section 15269(a)] Emergency Projects.

Council Agenda Summary **Agenda Item: 6(g)**

Date: November 7, 2022

ORIGINATED BY:	Marc Mattox, Public Works Director/Town Engineer Ashley Stanley, Engineering Division Manager
REVIEWED BY:	Kevin Phillips, Town Manager
SUBJECT:	2022 Transportation Master Plan-Honey Run Road
LONG TERM RECOVERY PLAN:	Yes, Tier 1 – Multiple

COUNCIL ACTION REQUESTED:

Upon conclusion of public discussion of the findings of the Transportation Master Plan supplemental Honey Run Road analysis, relating to the Honey Run Road reopening, consider a resolution, or an alternative action:

1. Consider adopting Town of Paradise Resolution No. 2022-____, "A Resolution of the Town Council of the Town of Paradise expressing a desire to reopen Honey Run Road between Town Limits and Honey View Terrace as a Historical Community Route with vehicular speed, weight, and length restrictions;" or
2. Provide alternative action (ROLL CALL VOTE)

Background:

Funded by a United States Economic Development Administration (EDA) grant, the Town of Paradise (Town) has developed the Town of Paradise Transportation Management Plan (TMP). Approved by the Town Council in 2022, the TMP is a comprehensive effort to evaluate transportation and economic needs and develop recommendations to support recovery following the 2018 Camp Fire. The TMP included extensive public engagement and ranges in topics including daily and emergency evacuation traffic needs, transportation safety, active transportation, economic analysis, community design standards, engineering details and re-establishment of survey monuments and benchmarks.

The compiled TMP includes reports and plans developed through the EDA grant, that will guide the Town's Camp Fire recovery by recommending transportation initiatives and strategies consistent with the Town of Paradise Long Term Community Recovery Plan (LTCRP) and updates. The supplemental tasks to the TMP included an analysis of the alternatives to Honey Run Road for consideration in evaluating the re-opening of the roadway.

Due to safety impacts on the roadway following the 2018 Camp Fire, Honey Run Road has remained closed post-fire. Although the historic road was already in poor condition due to lack of funding for maintenance, it's historic nature, and limited access pre-fire, the roadway was further impacted by post-fire hazardous tree removal and associated heavy equipment loading on the road. As the Town performed studies and sought funding to repair roadways, Honey Run

Road remained open within Butte Creek Canyon in Butte County limits only, where the roadway was not impacted.

In alignment with the Long-Term Community Recovery Plan (LTCRP), the Transportation Master Plan (TMP) surveyed the community to determine the desired use of Honey Run Road. Re-opening Honey Run Road was identified as the priority (with safety improvements of approximately $80,000, which garnered 63% of the responses), over the other presented alternatives (restrictions on lanes (13%), limit direction of travel (13%), full road closure (6%), "other" (6%)).

Staff engaged the Transportation Master Plan consultants to prepare a memorandum presenting the improvements that could be made to increase safety on Honey Run Road. Initially, the team evaluated the minimal safety improvements in the estimated range of $80,000. This option included evaluation of guardrail at the five narrowest sections of Honey Run Road within the Town limits. The repaving costs already funded in the Off System Roads project were not included in the cost estimate; the Off System Road repaving separately rehabilitates Honey Run Road to pre-fire widths of approximately nine feet of travelled way, through the FHWA funded project (2023 Town Paving Plan). Although establishing guardrail at these five narrow sections would increase safety in those roadway cross sections only and is in alignment with the survey response and estimated costs, these minimal improvements are not feasible due to current standards for guardrail termination/safety. Sufficient length and width on the roadway are required to terminate the guardrail before and after the narrow sections. This is required to ensure the guardrail is not a safety hazard. Thus, the desired, minimal improvement of $80,000 was determined by Staff to be infeasible due to the additional improvements and costs that are necessary for increased guardrail lengths and roadway width improvements it would trigger to maintain two-way traffic (guardrail would narrow the road without additional wall/embankment improvements and costs).

Staff directed the TMP consultants to evaluate additional alternatives to compare to re-opening Honey Run in its existing condition. These alternatives are presented in the Honey Run TMP memorandum.

To meet current roadway design and safety requirements, the following options were presented:

	Alternative Roadway Option	Estimated Cost	Stakeholder Support
1.	Two-Way Roadway	$6.1M	Yes
2.	One-Way Southbound Only Roadway	$4.4M	No
3.	Emergency Roadway Only	$4.4M	No
4.	Motor Vehicle Traffic Prohibited	$1.9M	No

The alternatives presented are significantly more expensive than the community identified desire to re-open Honey Run road with an investment of $80,000 (estimated at the time of the survey, which included guardrail at only the narrow sections). It was determined by Staff that the costs in the alternatives are not in alignment with the survey responses received and level of investment desired by the community, and the alternatives are not supported by other

stakeholders (County residents, Butte County Public Works, Cal Fire, Paradise Police Department). Additionally, it should be noted that the Town staff heard from the biking community via Chico Velo, who utilizes Honey Run Road as a cycling route, that their preference was to limit local traffic by establishing two-way bicycle traffic only, or two-way bicycle traffic with emergency vehicle access. These suggested options did not have stakeholder support at the Town, County or other stakeholder level, and were not carried forward, but are feasible to pursue if additional support for these options were presented by project stakeholders.

Please see the September 16, 2022 Honey Run Roadway Alternatives Evaluation by Mark Thomas.

On October 11, 2022, Paradise Town Council heard staff updates and public comments on the issue and directed staff to continue forward and request Butte County partner with the Town for the proposed resolution adoption for the Honey Run corridor between Merlin Lane and Town Limits as well as a collaborative approach to properly install signage regulating size, weight and speed restrictions of the roadway.

Analysis:

Following direction given by the Paradise Town Council on October 11, 2022, staff immediately contacted Butte County Public Works to explore feasibility of a concurrent action by the County Board of Supervisors. Butte County Public Works indicated a strong commitment to work with Town staff and install specialty advanced signage, including turnaround warnings for large trucks, to protect the safety of all roadway users. Butte County also indicated their section of Honey Run Road does not require a special designation due to the potential of setting unnecessary precedence in comparison to other active County roads.

With this information in mind, staff proposes the following course of action:

1. Paradise Town Council adopts a resolution expressing a desire to reopen Honey Run Road between Town Limits and Honey View Terrace as a Historical Community Route with vehicular speed, weight, and length restrictions
2. Town of Paradise finalizes bid packages to advertise planned road rehabilitation, including Honey Run Road between Town Limits and Honey View Terrace
3. Paradise and Butte County Public Works collaboratively design and install a series of signs leading to entrances of the Honey Run corridor between Merlin Lane and Honey View Terrace which provide opportunities for turnarounds, advanced warning and regulations of speed, weight and length restrictions
4. Town of Paradise performs road rehabilitation activities
5. Paradise and Butte County jointly reopen Honey Run Road, estimated mid-2023.

Environmental Analysis:

The Town of Paradise Transportation Master Plan is considered exempt from CEQA pursuant to Public Resources Code 21080(b)(3) Projects undertaken, carried out, or approved by a public agency to maintain, repair, restore, demolish, or replace property or facilities damaged or destroyed as a result of a disaster in a disaster-stricken area in which a state of emergency has been proclaimed by the Governor pursuant to Chapter 7 (commencing with Section 8550) of Division 1 of Title 2 of the Government Code.

Financial Impact:

There is no financial impact by passing this Resolution. Existing Town Staff will implement the Resolution within the FHWA funded and locally matched Off System Roadway repaving project.

MARK THOMAS

MEMORANDUM

To:	Marc Mattox, PE	Project No.:	SA-21111
Cc:	Ashley Stanley, PE		
From:	Paul Martin, PE, TE		
Date:	September 16, 2022		
RE:	**Honey Run Roadway Alternatives Evaluation**		

As requested by the Town of Paradise, we have prepared this memorandum discussing the current conditions of Honey Run Road and engineering considerations to re-open the roadway to public use following the 2018 Camp Fire.

Study Area

Honey Run Road parallels Skyway, traveling within Butte Creek Canyon and adjacent to Butte Creek, before ascending in grade to the elevated ridge area where the Town of Paradise is located. Honey Run Road traverses a length of approximately 9.75 miles between Skyway in unincorporated Butte County near State Route 99 (SR-99), at its west end, and Skyway in the Town of Paradise north of Pearson Road, at its east end. The westerly 6.5 miles of the roadway parallels the creek with gentle curves and minor grades. Around mile 6.5, the roadway narrows, and the centerline striping is omitted to convey slower travel speeds and heightened caution for opposing traffic.

The roadway begins to rise in grade higher than Little Butte Creek as it ascends towards the Town of Paradise with curves becoming sharper and more frequent. Around 8.0 miles, the roadway enters the Town of Paradise, and around mile 9.75, Honey Run terminates at Skyway north of Pearson Road. This memorandum focuses on the 1.75-mile length of Honey Run within the Town of Paradise. Refer to Attachment A showing the project study location.

Current Roadway Layout

Honey Run Road before the Camp Fire typically has provided for two-way vehicular travel linking unincorporated Butte County with the Town of Paradise. The roadway is historically popular with cyclists given the length, natural beauty, and low motor vehicle traffic volumes.

Honey Run Road is an older roadway and has not been constructed to modern engineering standards; as a result, it is typically lacking the following elements:

1. Structural base under the asphalt paving.
2. Guardrails to minimize severity of potential errant vehicles leaving the roadway. Note that prior to the Camp Fire, trees provided a de-facto guardrail treatment. These trees were impacted by the fire or post fire hazard removal and are no longer providing slope stabilization or protection from leaving the roadway.
3. Graded or paved shoulders.
4. Motorist turnaround areas to change direction.
5. Wider roadway areas for passing of stopped, parked, or immobilized vehicles.

There is currently a soft closure in effect via signage at the intersection of Honey Run Road and Honey View Terrace within the Town of Paradise, for traffic leaving town and traveling westerly towards Butte County. The road closure is in place due to the Camp Fire impacts to the road and trees. Since the roadway has been signed as closed, typical daily traffic volumes cannot be measured.

While the roadway has a "soft closure" through signage, members of the public have continued to utilize the roadway infrequently. It should be noted that the Butte County portion of the road remains open and is scheduled for repaving. In addition, increased graffiti along the roadway has been observed, with graffiti painted directly upon the asphalt.

Within the Town limits, paving rehabilitation on Honey Run Road has been designed, funded, and is scheduled for implementation in 2025. However, stormwater flows have been modified due to changes to the area natural landscape following the Camp Fire devastation and the dead tree removal program. This modified stormwater flow activity has caused rapid erosion of the hillside and drainage areas along and across the roadway. The modified stormwater drainage patterns are believed to cause rapid failure of pavement in vulnerable areas and the road will need additional mitigating improvements to position for any potential paving project.

Current Roadway Dimensions

Recent measurements at five Honey Run road locations indicate the roadway varies in width between 10.5 feet and 18.8 feet, and clear zone width ranges between 0 and 3.4 feet. Where the clear zone is narrow or near zero feet, there is inadequate room to install standard guardrails. Refer to Attachment B showing recent photographs of Honey Run Road.

Typical Two-Lane Roadway Dimensions

Town of Paradise, Butte County, and American Association of State Highway and Transportation Officials (AASHTO) standards were reviewed to evaluate the design of the two-lane roadway. Roadway dimensions account for the following criteria:

1. Roadway classification and designation (includes public and private roadways)
2. Provision of two-way motor vehicle travel, or one-way travel
3. Existing or anticipated traffic volumes

Table 1 provides a summary of engineering standards with guidance for typical dimensions of a two-lane roadway.

Table 1 – Typical Dimensions for Two-Lane Roadway

Source	Roadway Type	Minimum Paved Road Width (feet)	Minimum Clear Zone (feet)
Town of Paradise (2022)	Local Road	24	4
Town of Paradise (1971)	Interior Street, Residential-Public Maintained (Standard B-1)	24	0-2.5
AASHTO[1]	Low-Volume Road in Rural Area (400 Vehicles per day or less)	18	0-6
Butte County[2]	Rural Subdivision Private Road (Standard RS-7)	20	6
Butte County[2]	Paradise Sphere of Influence Private Drive-Double Dwelling (Standard PS-2)	16	2

1. AASHTO Guidelines for Geometric Design of Low-Volume Roads, Second Edition, 2019
2. Butte County Public Works Improvement Standards, v20200219

The minimum paved area is intended for vehicle travel, while the clear zone is an area that is free of obstruction and sufficiently flat to enable an errant vehicle to encroach without overturning. The clear zone width is measured from the edge of traveled way to the nearest obstruction or the beginning of a non-traversable slope. Shoulders are part of the clear zone. The clear zone can also often allow for temporary parking or disabled vehicles to park to reduce roadway blockage. Where clear zone cannot be provided, a guardrail may be installed to prevent errant off-road travel when adjacent to steep hillsides.

Alternatives for Consideration

Given the Honey Run Road is currently closed, an opportunity exists to consider other layouts serving a variety of multimodal needs such as:

- Public motor vehicle traffic
- Emergency only traffic
- Active transportation travel (cycling and walking)

Based on the review of existing conditions, roadway standards, and needed improvements, the following Honey Run Road alternatives are presented for consideration:

1. **Alternative 1: Two-Way Roadway:** Improve Honey Run Road to include a minimum paved road width of 20 feet, and a minimum unpaved clear zone of 2 to 6 feet in both directions, with guardrails and turnaround areas as needed.
2. **Alternative 2: One-Way Southbound Only Roadway:** Improve Honey Run Road to include a minimum paved road width of 16 feet. The roadway could include a 6-feet wide striped left shoulder and a 10-feet wide travel lane, with guardrails and pullout areas as needed. The roadway would facilitate motor vehicle traffic in the southbound direction only, and cyclists can ride downhill in the travel lane and uphill in the shoulder.
3. **Alternative 3: Emergency Only Roadway:** Improve Honey Run Road to include a minimum paved road width of 16 feet. The roadway could include a 6-feet wide striped left shoulder and a 10-feet wide travel lane, with guardrails and pullout areas as needed. The roadway would facilitate emergency vehicle traffic only, and cyclists can ride downhill in the travel lane and uphill in the shoulder.

4. Alternative 4: Motor Vehicle Traffic Prohibited: Close Honey Run Road to all motor vehicle traffic and provide minor improvements with fencing and asphalt improvements to accommodate walking and cycling activity only.

Refer to Attachment C showing cross-sections for the Honey Run Road alternatives presented above.

Construction Cost Estimate Parameters

We have prepared a conceptual construction cost estimate for the alternatives based on the following parameters:

1. Alternative 1: Two-Way Roadway:
    a. Paved roadway width of 20 feet
    b. Shoulders/Clear Zone of 2 feet on both sides
    c. Guardrail installation for 3,000 feet
    d. 10 feet of widening into the hillside (opposite creek side)
    e. Lump sum of $1,000,000 for retaining walls
    f. Contingency of 25%
    g. Cost for minor or miscellaneous items of 10%
2. Alternative 2: One-Way Southbound Only Roadway:
    a. Paved roadway width of 16 feet
    b. Shoulders of 2 feet on both sides
    c. Guardrail installation for 3,000 feet, including 1000 feet of cast-in-place/precast concrete beams
    d. 6 feet of widening into the hillside (opposite creek side)
    e. Lump sum of $500,000 for retaining walls
    f. Contingency of 25%
    g. Cost for minor or miscellaneous items of 10%
3. Alternative 3: Emergency Only Roadway:
    a. Same parameters as Alternative 2
4. Alternative 4: Motor Vehicle Traffic Prohibited:
    a. Paved roadway width of 12 feet
    b. Shoulders of 2 feet on both sides
    c. Guardrail installation for 5,280 feet
    d. Contingency of 25%
    e. Cost for minor or miscellaneous items of 10%

The conceptual cost estimate for improving Honey Run Road is only provided within the Town of Paradise, and a similar funding amount would need to be provided by Butte County to provide consistency in the improvements within the unincorporated County area.

Alternatives Evaluation

Any selected Honey Run Road alternative would need to be coordinated with Butte County for consistency including paving and other engineering improvements. Potential roadway widening within Butte County likely would need to be implemented for approximately 1.5 miles in length.

Table 2 provides an evaluation of various alternatives for the traffic operations and layout of Honey Run Road and the anticipated costs for construction and ongoing maintenance.

Table 2 – Alternatives Evaluation

Alternative	Motor Vehicle Traffic Served?	Emergency Traffic Served?	Comfort for Bicycle and Pedestrian Traffic?	Estimated Construction Cost	Anticipated Annual Maintenance Cost
1 - Two-Way Roadway	Two-Way Daily	Yes	Low	$6.1 million	Highest
2 - One-Way Southbound Only Roadway	Southbound Only	Yes	Low	$4.4 million	Moderate
3 - Emergency Only Roadway	Emergency Only	Yes	High	$4.4 million	Moderate
4 - Motor Vehicle Traffic Prohibited	None	No	High	$1.9 million	Lowest

As shown above, the alternatives provide a range of multi-modal and emergency accommodations; funding for implementation and ongoing maintenance would need to be identified and balanced with other community priorities.

Recommendations

Based on review of current conditions and applicable standards, this memorandum has evaluated various improvement alternatives for Honey Run Road. Given the roadway has been effectively closed to regular motor vehicle traffic, and the high cost for improvements to restore daily operations, we recommend the Town consider on-way southbound travel only or permanent closure; Alternatives 2-4. Limited available capital funding can be applied to other roadways within the community to serve both daily traffic needs as well as emergency evacuation needs.

TOWN OF PARADISE
RESOLUTION NO. 2022-___

A RESOLUTION OF THE TOWN COUNCIL OF THE TOWN OF PARADISE EXPRESSING A DESIRE TO REOPEN HONEY RUN ROAD BETWEEN TOWN LIMITS AND HONEY VIEW TERRACE AS A HISTORIC RURAL COMMUNITY ROUTE WITH VEHICULAR SPEED, WEIGHT AND LENGTH RESTRICTIONS

WHEREAS, the United States and Butte County possess a rich collection of historic roads that range from scenic overlooks to utilitarian routes that embody local craftsmanship and environmental accommodation; and

WHEREAS, many of these historic roads offer a unique contribution to the historic fabric of communities and regions, including the Town of Paradise and Butte County; and

WHEREAS, Honey Run Road is a historic road with a legacy that has permitted its travelers to access and experience unique and remote portions of the Town of Paradise and Butte County that cannot be experienced in any other location; and

WHEREAS, the Town and adjacent Butte County residents and Butte County desire the road to be open for vehicular and bike travel; and

WHEREAS, Honey Run Road is not a Town of Paradise evacuation route due to its discharge into Butte Creek Canyon; and

WHEREAS, the road parallels Skyway in a circuitous route because it winds to the canyon floor and hugs the hillside; and

WHEREAS, as a result, the road is narrow and does not comply with current Federal, State or Local transportation safety standards, resulting in dangerous circumstances for vehicular traffic if appropriate caution is not undertaken while traveling this route; and

WHEREAS, the road was significantly damaged during the Camp Fire; and

WHEREAS, Town staff has analyzed the feasibility of rehabilitating and reconstructing Honey Run Road and determined that it would require substantial road widening to establish current roadway and safety standards, and other significant improvement measures that would only benefit a low volume of daily traffic, are a significant cost, and would only improve the portion of the road in the Town of Paradise; and

WHEREAS, the Town desires to honor the historical quality to which Honey Run Road contributes and to enable Town and County residents to utilize the road for infrequent scenic trips or to access specific remote areas in as safe a manner as possible.

NOW THEREFORE, BE IT RESOLVED by the Town Council of the Town of Paradise as follows:

SECTION 1. The above facts are true and correct and are incorporated by reference as if fully set forth herein.

SECTION 2. Honey Run Road between Town Limits and Honey View Terrace should be reopened as an historical "Historic Rural Community Route" in the future, following pavement restoration by the Town to establish a minimum width of nine feet of travelled way in conjunction with new vehicular speed, weight and length restrictions, which is estimated to occur in 2023.

PASSED AND ADOPTED by the Town Council of the Town of Paradise this 7th day of November, 2022 by the following vote:

AYES:

NOES:

ABSENT:

NOT VOTING:

_____
Steve Crowder, Mayor

ATTEST:

Town of Paradise

Council Agenda Summary **Agenda Item: 6(h)**

Date: November 7, 2022

ORIGINATED BY: Marc Mattox, Public Works Director / Town Engineer

REVIEWED BY: Kevin Phillips, Town Manager

SUBJECT: Town of Paradise Facilities Update & Budget Adjustment

LONG TERM RECOVERY PLAN: No

COUNCIL ACTION REQUESTED:

1. Consider awarding Contracts 9419.TH, 9419.FD, and 9419.PD for various improvements to Town Hall, Station 81 and Police Department buildings to the lowest, responsible, responsive bidder (actual bid results to be presented at Council meeting).(ROLL CALL VOTE)

Background:

At the October 11, 2022 Paradise Town Council meeting, Council approved budget modifications and authorized staff to advertise for bids for the performance of various facilities improvements at Town Hall, Fire Station 81 and Police Department buildings. Improvements for these facilities include modifications for increased staffing, restroom improvements and adjustments to support restoration of dispatch services. Since the Council meeting, staff has issued Notices to Contractors, held mandatory pre-bid meetings and hosted requested tours of the facilities to assist potential bidders.

Analysis:

Staff anticipates publicly opening bids for the Fire Station 81 and Town Hall projects on November 3, 2022 and Police Department project on November 7, 2022. Full bid results and award recommendations will be presented to the Town Council during the Agenda Summary presentation for consideration.

Financial Impact:

The proposed projects have approved Engineer's Estimates and funding sources, described below:

Contract	Estimates	Funding Source
9419.TH	$200,000	Previously unassigned American Rescue Plan Act funds
9419.FD	$300,000	Previously unassigned American Rescue Plan Act funds ($250,000), Measure V Reserves ($50,000)
9419.PD	$50,000	Previously unassigned American Rescue Plan Act funds

Final bid results and project costs will be presented at the Council meeting for consideration of approval and award.

Town of Paradise

Council Agenda Summary

Date: November 7, 2022

Agenda Item: 6(i)

ORIGINATED BY:	Colette Curtis, Recovery and Economic Development Director
REVIEWED BY:	Kevin Phillips, Town Manager
SUBJECT:	Review and Adopt Long Term Recovery Plan Update
LONG TERM RECOVERY PLAN:	Yes

COUNCIL ACTION REQUESTED:

1. Consider reviewing and adopting the Long-Term Recovery Plan Update, prepared by Urban Design Associates. (ROLL CALL VOTE)

Background:

Following the 2018 Camp Fire, the Town of Paradise was gifted a contract with Urban Design Associates (UDA) through the North Valley Community Foundation and Butte Strong Fund to prepare a Community Long Term Recovery Plan (LTRP). The development of the LTRP represented one of the most comprehensive planning and response efforts to have occurred as an immediate response to a community disaster – capturing the intensity and need of public participation and visioning for a path forward.

Since the adoption of the 2019 Long Term Community Recovery Plan, the Town of Paradise in partnership with countless organizations and individuals have been working towards the goals established in the Plan. In October 2021, Town Council directed staff to contract with UDA once again to draft an update to the 2019 Long Term Community Recovery Plan to document the progress made to date, and to reach back out to our community for guidance on any changes needed to the plan three years into recovery.

Analysis:

Over the last year, UDA met with stakeholders, held community meetings, and took surveys in order to draft the update to the Long Term Community Recovery Plan. Feedback from residents, stakeholders, and town leadership provided a status update for original recovery projects and helped pinpoint gaps that informed next steps for both old and new projects. Acting as building blocks for rebuilding, the recovery projects in the document respect the huge impacts that have already been made since the original 2019 LTCR Plan. In the update, all of the original projects are listed but re-organized to better reflect the evolving needs of the community. Some projects have been completed; others have been retired if no longer applicable to residents. Over a dozen new projects are proposed to achieve the community's vision.

On October 22, 2022, UDA presented the draft Long Term Community Recovery Plan Update to Town Council during the regular Town Council meeting. Council comments made during the meeting and directly to UDA were incorporated into the draft, and tonight the Final Long Term Community Recovery Plan Update is complete.

Financial Impact:

The Town of Paradise's contract with UDA for $110,000 is funded by the North Valley Community Foundation ($25,000), Feather River Foundation ($25,000) and the Town's general fund ($60,000). It is anticipated the updated plan will enable the Town to continue to compete at a high level for future grant opportunities as the time from the initial wave of support received following the fire increases.

Community Development Block Grant-Disaster Recovery (CDBG-DR) Priority Projects 154

1913

EXECUTIVE SUMMARY

Forever changed by the Camp Fire, the Paradise community has worked tirelessly to rebuild and resume life on the Ridge. Priorities have shifted from immediate needs to long-term visions to maintain a resilient community.

Rebuilding update 3 years from the first building permit issued on February 20, 2019

	SINGLE FAMILY HOMES IN DEVELOPMENT	MULTI-FAMILY HOMES IN DEVELOPMENT
Building Permit Applications Received	2,179	427
Building Permits Issued	1,984	313
Homes Rebuilt and Certificate of Occupancies Issued	1,243	257

On November 8, 2018, California's deadliest and the world's most expensive wildfire to date destroyed Paradise. The town was the epicenter of the fire, with every property and every resident affected in some capacity. The massive impact of this scale of destruction is still visible today, four years later.

But the residents of Paradise responded to this tragedy with strength and unity. Alongside first-responders and with the aid of the State of Emergency and Major Disaster declarations for Butte County and the Butte Strong Fund, the Town of Paradise was able to lead a team of federal, state, and local partners to kick off the original long-term recovery process in 2019. Slowly but

1914

Community Development Block Grant Award

On August 22, 2022, the Town of Paradise received a $199,000,000 Community Development Block Grant Disaster Recovery (CDBG-DR) award from the California Department of Housing and Community Development. This funding was listed as a potential source to cover the unmet need in many of the original recovery projects. It will go a long way in supporting the rebuilding of Paradise.

surely, Paradise began to grow back. Residents returned, businesses reopened, and life resumed.

Paradise's beauty is its unity and resilience.

Now, just four years since the original long-term recovery plan, Paradise has made huge strides in rebuilding: many residents have come back, rebuilding and repairing their community anchors. This was no small feat: the remarkable alignment and actions of community leaders, town leadership, for-profit and non-profit organizations, state and federal partners, and individual residents cannot be understated.

This evolution represents a changed landscape from which new recovery priorities have emerged. Town leadership identified the need to revisit the Long-Term Recovery Plan (LTRP) completed in 2019 to continue momentum into the future.

This document is the product of a second round of targeted community engagement. This Long-Term Recovery Plan Update (LTRPU) features the status of all the original recovery projects as reported by designated local partners, provides updates and new projects to reflect the changed environment, and celebrates other related initiatives.

Document Overview

The plan is divided into the following three sections: Engagement Process, Recovery Projects, Parallel Initiatives, and Appendix.

Engagement Process

A second, robust community engagement process advanced the consensus vision. Feedback from residents, stakeholders, and town leadership provided a status update for original recovery projects and helped pinpoint gaps that informed next steps for both old and new projects.

Recovery Projects

Acting as building blocks for rebuilding, the recovery projects in this document respect the huge impacts that have already been made since the original 2019 LTRP. All of the original projects are listed and supplemented to better reflect the evolving needs of the community. Some projects have been completed; others have been updated or superseded; some have been retired if no longer applicable to residents. And, approximately a dozen new projects are proposed to achieve the community's vision.

In support of this vision are five goals, which establish the framework for each of the subsequent recovery projects.

- Make Paradise Safer
- Rebuild Paradise's Range of Housing and Welcome Residents Home
- Rebuild Paradise's Economy
- Make Paradise Better
- Make Paradise Greener

This section also includes a description of what defines a recovery project: recovery priority, project description, lead, partners, action steps, etc.

Parallel Initiatives

There are many local organizations aligned with this planning effort that have worked tirelessly to return life to the Ridge. These remarkably robust efforts are recorded and celebrated in this document as proof of the immense scale of work done by the Paradise community.

Extraordinary tenacity and resourcefulness define the Paradise community.

Appendix

The appendix includes a summary of the entire community engagement process: strengths, weaknesses, and opportunities analysis; dot exercise; survey results; and recovery project preference feedback. Additionally, the Community Development Block Grant-Disaster Recovery (CDBG-DR) Priority Projects are listed for reference.

WILDFIRE ADAPTATION PRINCIPLES

Successful disaster relief efforts rely on organization and planning. Considering basic principles at each stage of the recovery process can help structure the complex, difficult task of adapting while rebuilding.

Communities that experience any type of disaster know the arduous and complex nature of recovery well. No matter the type and scale of disaster, the impact of the ensuing chaos and tragedy cannot be overstated. Additionally, all communities are entirely unique in layout, governance, demographics, and more. This means every recovery is unique.

There is no easy one-size-fits all methodology for wildfire resiliency.

This list of Wildfire Adaptation Principles is intended to work as a overarching priority list to help organize the massive task of recovery, focusing on a broad stroke of topics spanning from immediate post-disaster pressure relief to long-term resiliency projects. Considering these aspects of recovery have helped Paradise in its short- and long-term recovery and will continue to be applicable in the future for other communities that face similar wildfire threats.

Wildfire Adaptation Principles

Categorized by scale, each of the following principles should be considered to help mitigate wildfire risk.

Community Scale

1. **Manage public lands**
   Reduce wildfire risk by actively managing the fuel load in the wildlands.

2. **Create firebreaks**
   Interrupt the potential spread of wildfire by creating separations around urbanized areas.

3. **Harden infrastructure (electrical, water, sewer, storm)**
   Strengthen critical infrastructure systems so that they can be quickly returned to service after a fire with only minimal repairs/cost.

4. **Create redundant emergency notification systems**
   Implement both voluntary and audible notification systems to supplement first responders and neighbors going door to door.

5. **Provide multiple ingress and egress routes and a regional emergency evacuation plan**
   Ensure the safety of residents by providing multiple ways to evacuate supported by cross jurisdiction coordination.

Neighborhood Scale

6. **Minimize dead-end streets**
   Promote a connected street grid as two ways out increase public safety.

7. **Foster places of refuge and neighborhood fuel reduction**
   Identify sites to shelter in place, such as local parks, and actively reduce the fuel load across neighborhoods.

Lot Scale

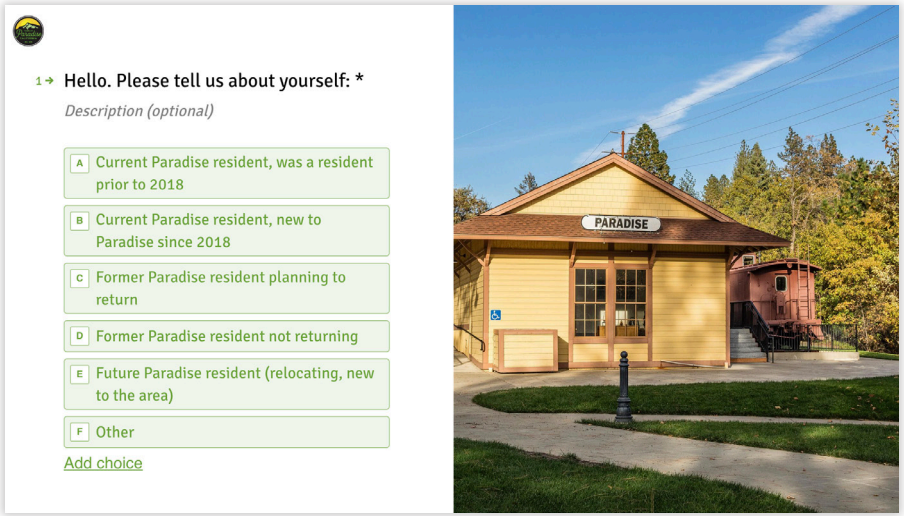
8. **Require defensible space**
   Minimize combustible material within 100 feet of homes and other primary structures.

9. **Codify fire resistant construction (thermal shell)**
   Mandate fire hardening for residences, businesses, and institutions.

10. **Encourage aggressive code enforcement**
    Support the detection of unnecessary wildfire risk (fuel buildup) and enforcement of violations per local codes.

1918

Engagement Process



Screenshot from the Online Survey

ENGAGEMENT RECAP

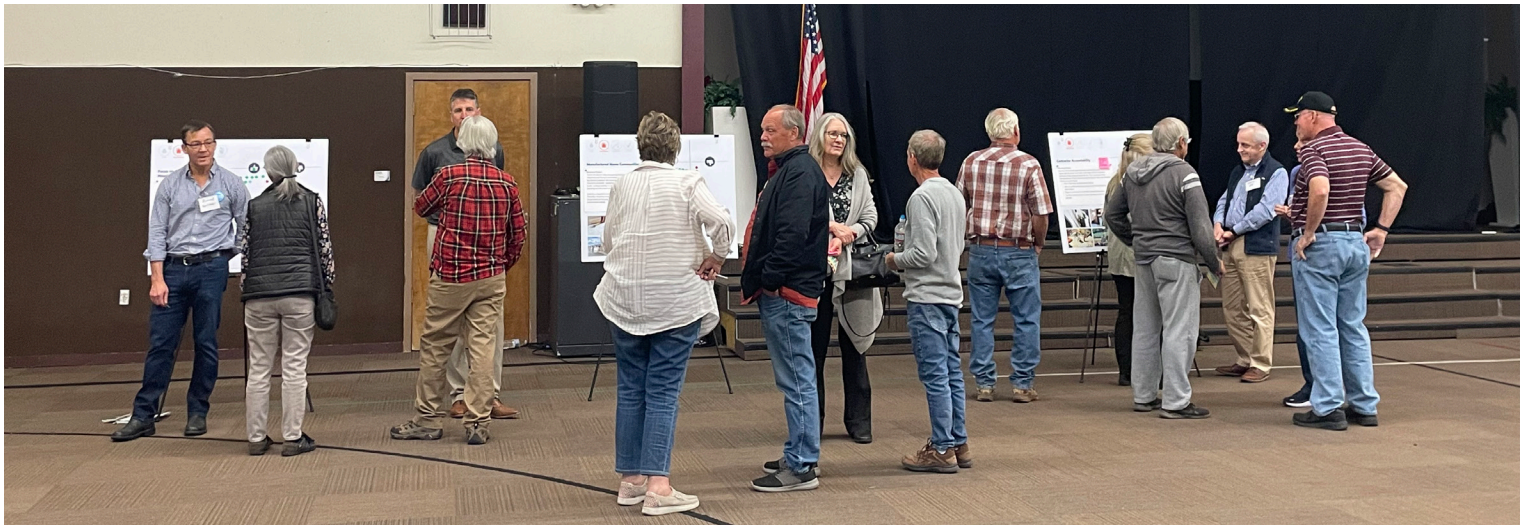
Community is at the heart of the recovery process with residents paving the way to rebuilding.

In the four years since the 2018 Camp Fire, residents, community leaders, and Town of Paradise staff have worked diligently to rebuild their beloved community with the Long-Term Recovery Plan (LTRP) as the guiding document. To honor the huge impacts of individual and community rebuilding work, this update to the LTRP is intended to parallel the original process with an extensive, resident-driven engagement and planning effort.

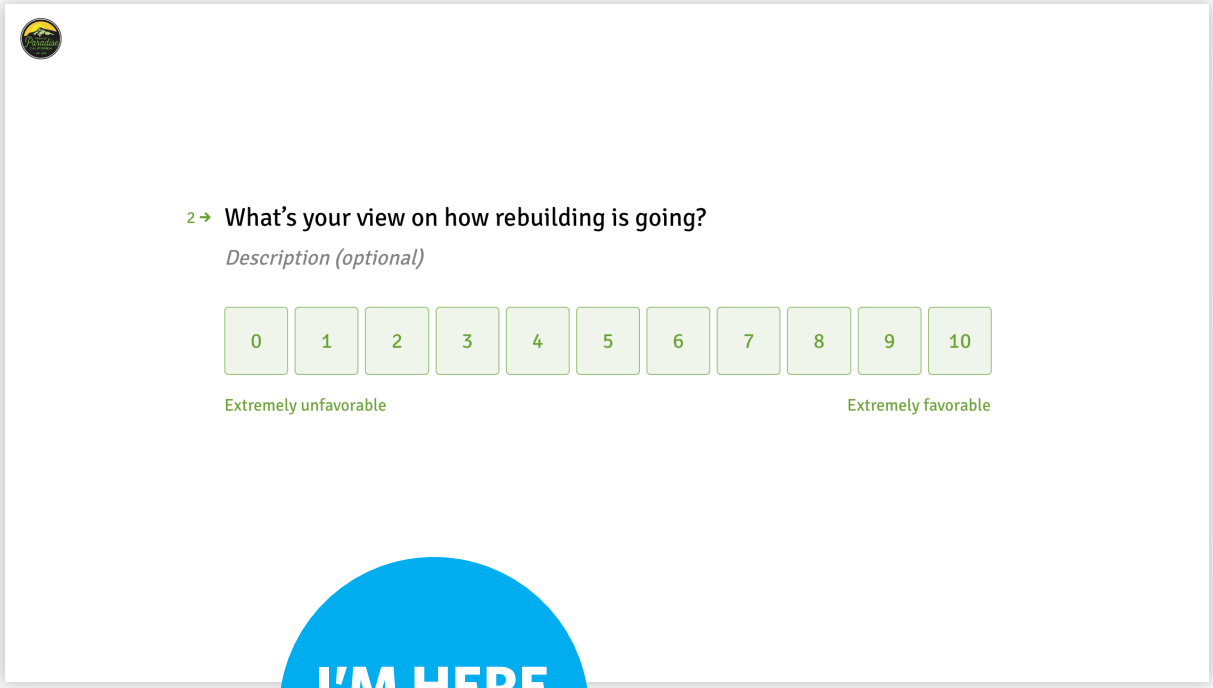
The plan updates and proposed new recovery projects included in this document are a product of community and stakeholder input received during an extensive engagement process that included an online survey, stakeholder and town staff interviews, a virtual listening session, and a drop-in open house.

Documentation of this engagement process and the specific survey responses received from residents can be found in the appendix.

1920



In-Person Open House
April 28, 2022



Screenshot from the Online Survey

The Planning Process

The planning process utilized in developing the LTRPU included three steps:

1. Listening
2. Testing
3. Deciding

Step 1 – Listening utilized several strategies for reaching and engaging the public in a conversation regarding the recovery efforts of the last three years and any additional new priorities moving forward. The purpose of this step was to establish a robust repository of work completed to date, identify gaps still existing today, and pinpoint what must be done to continue the momentum in the future. Community engagement during this step included several town staff, stakeholder interviews, and an online survey for residents.

Step 2 – Testing continued the engagement process by solidifying the resident, stakeholder, and local leadership vision into a series of proposed additional recovery projects that build on the work of the original LTRP. Each proposed new recovery project is related to one of the five categories from the 2019 vision — Safer, Welcoming, Stronger, Better, and Greener. During this step, the new projects were made public to residents and stakeholders through a virtual public meeting and an in-person open house to gather feedback and propose additional ideas.

Step 3 – Deciding is the final step, where proposed recovery projects were refined based on resident feedback and follow-up stakeholder interviews. As a result, this document captures residents' ideas, visions, and goals for the future of Paradise and is accompanied by a series of actionable recovery projects that will continue to push the Town of Paradise forward and build on the incredible work of the last three years.

The town would like to acknowledge and thank the many volunteers, residents, and local leaders that made the community engagement process a success and made it possible to continue growing and moving forward.

1922

Approaches to Engagement

The planning process utilized several engagement methods to involve residents, stakeholders, and local leadership in the LTRP process in 2022.

Stakeholder Interviews

Stakeholder interviews were conducted with town staff, local leadership, and community stakeholders during the Listening and Deciding phases of the process. In the Listening Phase, stakeholders helped to provide insight on the work completed to date, offered updates to the original 39 recovery projects, and proposed new projects for the update. Over 25 stakeholder interviews were conducted with individuals identified as Leads or Supporting Partners for one or more of the initial 39 recovery projects. In the Deciding Phase, stakeholders reviewed the refined recovery projects, offered recommendations for intended partnerships and funding sources, and established timelines for projected completion.

Online Survey

While the last four years have brought many residents back to the Town of Paradise and a few new residents who did not live in town before the Camp Fire, many residents are still displaced as they work to rebuild their homes. Additionally, the COVID-19 Pandemic reshaped community engagement processes globally. Therefore, an online survey was distributed to connect with existing and potential future residents to maximize virtual engagement. This survey was distributed during the Listening Phase of the process. It included over 30 questions on various topics, including status as a resident of Paradise, reflections on the rebuilding to date, top priorities for rebuilding into the future, and unmet needs. Just under 1,200 responses were received; 75% of those responses were from current Paradise residents or former residents planning on returning.

Virtual Listening Session and In-Person Drop-In Open House

During the Testing Phase of the engagement process, two public meeting options were offered — one as a virtual meeting via Zoom and the other as an in-person drop-in open house. Over 250 residents were engaged across both meetings, with the assistance of over a dozen facilitators. Conversations during the Virtual Public Meeting focused on presenting the survey results from the Listening Phase. In contrast, the In-Person Drop-In Open House focused on gathering input on the proposed new recovery projects. Feedback from both of these public meetings helped shape and refine the proposed recovery projects while adding to the list of necessary action items to see the town continue to recover and flourish.

MAKE IT PARADISE

OVERVIEW OF RECOVERY PROJECTS

The Long-Term Recovery Plan Update (LTRPU) is a guide for the Town of Paradise to use throughout the continuation of the recovery effort. The following pages contain the recovery projects, which make up the LTRPU. These projects have been identified by the town and its residents as vital and necessary for the rebuilding and recovery of the community.

Each of the projects has a project lead and additional project partners where applicable. The project lead acts as a champion for the initiative, charged with the task of seeing the project through implementation and coordinating the necessary partners, funding sources, and action steps required to reach completion. In this document, recovery projects are organized based on where the town will continue to focus their attention:

- **Town-led Recovery Projects** are those which town staff are responsible for taking action on. These projects are largely Tier 1 priority, meaning that they are most critical to the town's long-term recovery.
- **Partner-led Recovery Projects** are those which are being championed by various individuals, agencies, and organizations whose knowledge is directly applicable to each respective project. These projects range from Tier 1 to Tier 3 level of priority. Where the town is involved, these projects are a secondary focus.

In addition to being organized based on project leads, recovery projects are keyed to the five categories of the Community Vision. A colored circle in the upper right-hand corner of each recovery project page identifies which of the five categories the project falls under. Those categories are as follows:

- Welcoming (Red)
- Safer (Yellow)
- Stronger (Purple)
- Better (Blue)
- Greener (Green)

The LTRPU should be viewed as an overall conceptual community vision and blueprint for rebuilding the town. While the recovery projects have all been identified as potential avenues for recovery and rebuilding, the specifics and designs of each have and will evolve over time.

1926

WELCOMING

After the Camp Fire, Paradise's residents faced tough decisions to return and rebuild their community or, in some cases, relocate elsewhere. Those that have returned have made enormous strides in rebuilding damaged and lost homes, advocating for affordability, and implementing better safety measures. As Paradise looks to the future and begins to grow with new residents, the types of support needed must evolve. Focusing on the future of homeownership, rentership, and housing affordability is paramount in creating a welcoming Paradise.

1927

PARADISE, CALIFORNIA

SAFER

Reducing Paradise's vulnerability by making the environment safer will always be a top priority following the Camp Fire. The original recovery plan focused primarily on the immediate safety needs of residents; today, many efforts to make Paradise safer continue or have evolved to meet residents' changing needs.

This category of Recovery Projects continues to prioritize the safety of Paradise residents and acts as a model of a progressive, resilient, fire safe California town.

1928

STRONGER

As residents return to Paradise, the need for a stronger business community has grown. Supporting local small businesses and providing job training are new priorities in addition to strengthening and diversifying the local economy.

1929

PARADISE, CALIFORNIA

BETTER

Many new opportunities to improve Paradise have emerged due to the rebuilding process that has been underway since the Camp Fire. Addressing old and new cultural and infrastructural challenges is a critical aspect in recovery, creating a healthier, more resilient Paradise for residents.

1930

GREENER

The beauty, strength, and endurance of Paradise are unparalleled. As rebuilding efforts progress, sustainability has emerged as a top priority, with Paradise at the forefront of innovative resiliency projects nationwide. Small changes can have big impacts, so the focus of this section has evolved from more technological solutions to behavioral and beautification efforts.

1931

PARADISE, CALIFORNIA

TOWN-LED PROJECTS

Town-led projects are those which the town leadership has identified as a responsibility of the local government to champion and support through completion. The majority of these projects have a Tier 1 recovery priority.

Recommended Recovery Projects

- Building Resiliency Center (BRC)
- Supporting Homeowners
- Residential Codes and Standards
- **New Insurance Alternatives**
- **Support for First-Time Homebuyers**
- **Focus on Attainable Housing**
- Standing Burned Trees on Private Property
- Emergency Notification System
- Evacuation Routes
- Interconnected Path System
- Missing Road Segments
- Long Dead-End Streets
- Underground Utilities
- Fuels Management Plan
- Facilities Maintenance and Upgrades (New Fire Station 82)
- **Prioritizing Road Reconstruction**
- **Firesafe Building Standards**
- Sustainable Fiscal Model
- Sewer System
- Walkable Downtown
- Planning and Zoning
- **Walkability & Bikability**
- **Beautification And Ecology**
- **Contractor Accountability**
- Resident Fire Safe Education
- Economic Development Strategy
- High-Speed Data Network
- **Support for Mom-and-Pop Businesses**
- 2019 Building Energy Efficiency Standards
- Sustainable Stormwater and Drainage
- Sustainable Development
- Sustainable Building Programs
- New Civic Center
- Opportunity Zone

Bold indicates added recovery project

1932

COMPLETED

RP01

BUILDING RESILIENCY CENTER (BRC)

The building which houses the Building Resiliency Center (BRC), was donated to the town by Bank of America. The structure sustained only minor roof damage during the Camp Fire but has since been repaired and undergone modest improvements.

The BRC, or "Brick" as it's been nicknamed, is a one-stop shop for all building resources. It allows residents and contractors to talk face-to-face with experts to get questions answered on the spot. Since opening, representatives from the Town of Paradise, Butte County, Cal OES, the State Licensing Board, PG&E, and several other agencies have been available on various days to answer questions and process permits and forms. In addition, resources are available to assist with financing and grant applications, as well as representatives of the Housing Advocacy Center. Rebuild Advocates have also offered free-of-charge services to assist with rebuilding, insurance, and finances.

Cost Estimate

- Butte Strong $346,953
- USDA Grant $148,300
- ATT $20,000
- **Total** **$515,253**

Resources

- USDA
- EDA
- North Valley Community Foundation

RESILIENCY PERMIT & HOUSING RESOURCE CENTER

RP 01

Recovery Priority

Tier 1
This project focuses on providing help to homeowners during the rebuilding process and has a Tier 1 recovery priority. Housing reconstruction can be optimized if residents have access to comprehensive housing services at a single location, including information on permitting, counseling, financing, inspection, and rebuilding options.

Project Description
Paradise should create a "one-stop shop" for permits and housing resources.

The town is increasing the capacity of the building permit department. Plans will be evaluated for ordinance, building code, and Wildland-Urban Interface compliance. The goal is to respond to building permits within an average of five days.

In support of the expanded permit counter, housing counseling and finance specialists, such as HUD and other funding/granting stakeholders, should be co-located.

Lead
- Town of Paradise

Action Steps
- Retrofit the former Bank of America building to accommodate the Resiliency Permit & Housing Resource Center
- Hire a coordinator to run the facility and help shepherd residents through the rebuilding process
- Relocate appropriate town and 4Leaf staff (initial 4Leaf contract term is for 3 years) from Town Hall to the new facility
- Invite the appropriate governmental agencies and private stakeholders to share the office space

Cost Estimate

Increased permit center capacity	To be determined
Coordinator position	To be determined
Retrofit former Bank of America building	To be determined
Furniture, fixtures, and equipment	To be determined

Potential Resources
- Banking Partners
- Butte Strong Fund
- California Governor's Office of Emergency Services (Cal OES)
- CalHome Program
- Community Development Block Grants (CDBG) Home
- Federal Emergency Management Agency (FEMA)
- Small Business Administration (SBA)
- State Insurance Commissioner
- Town of Paradise
- U.S. Department of Agriculture (USDA)
- U.S. Department of Housing and Urban Development (HUD)

Return on Investment
Residents will benefit from the simplified access to resources, added transparency and improved convenience. Also, the town should see accelerated home starts and enhanced coordination among the housing partners.

Timeline
0 to 2 years

SUPERSEDED

RP02

SUPPORTING HOMEOWNERS

Update

This recovery project has been superseded by Firesafe Building Standards.

SUPPORTING HOMEOWNERS

RP 02

Recovery Project Priority

Tier 1

This project focuses on aiding homeowners to make homes more ignition-resistant. The project has a Tier 1 recovery priority. Community-wide resilience can be increased if more buildings in Paradise exceed the fire regulations.

Project Description

The Town of Paradise should apply for funding to make grants available to homeowners and property owners to rebuild homes and buildings with ignition resistant building materials that exceed the minimum standards and requirements. Eligible projects (such as roofs, windows, siding, or foundations) would need to exceed current applicable federal, state, and local regulations. Funding would be dependent on the state (Cal OES) being awarded a federal FEMA Hazard Mitigation Grant. If successful, grants of up to $25,000 per household could be available, depending on the federal and state award.

Lead

- Town of Paradise

Action Steps

- Submit a notice of interest to Cal OES (complete)
- Submit a sub-application to Cal OES, so that Cal OES can apply for the grant from FEMA (in process)
- If the grant is awarded:
  - Work with Cal OES and FEMA to determine what types of projects and improvements will be eligible for funding
  - Establish an intake, vetting, and approval process for applications
  - Advertise the available funding and application process to residents

Cost Estimate

Available grant funding (max)	$25,000/homeowner
Cost of application	Minimal to the town

Return on Investment

Assists homeowners in exceeding the building standards, resulting in a stronger, more fire-resilient community.

Potential Resources

- Federal Emergency Management Agency (FEMA)
- Hazard Mitigation Grant Program (HMGP)

Timeline

1 year

1934

UPDATED

RP03

RESIDENTIAL CODES AND STANDARDS

Recovery Priority

Tier 1

The level of priority remains Tier 1. Hardening building envelopes combined with aggressive fuel reduction both increases safety and reduces insurance premiums.

Project Description

Residential codes and standards have been updated and additional measures are planned. This includes:

- Addition to the Paradise code of the Wildfire Prepared Home Standard
- Planned consideration for addition to the code of IBHS Wildfire Prepared Multifamily and Wildfire Prepared Community Standards when completed
- Pending completion of updated design standards for downtown and other commercially zoned properties

Funding for inspection and enforcement has been elusive. The town applied for a Hazard Mitigation Grant from FEMA but did not receive an award. Current funding to hire off-duty firefighters as inspectors is set to expire. However, a new opportunity is available through the USDA: the Community Wildfire Defense Grant is for inspection and enforcement of fuel reduction for residential and commercial defensible space. The Town of Paradise plans to apply.

Lead

Town of Paradise

Additional Action Steps

- Council to consider adoption of Wildfire Prepared Multifamily and Wildfire Prepared Community Standards
- Continue to seek long-term funding for increased code inspection and enforcement
- Use town staff or a grant to develop/update landscape design guidelines

Cost Estimate (Spent and Projected)

- Updated design guidelines $150,000
- Inspection & enforcement $10M

Potential Resources

- Transportation Master Plan Grant (design standards)
- USDA Community Wildfire Defense Grant

Return on Investment

Certainty about future standards, resiliency through maintenance, and increased safety through education.

Timeline (2022 and forward)

0 to 3 years

ADDED

RP04

NEW INSURANCE ALTERNATIVES

Recovery Priority

Tier 1
The lack of insurance alternatives and rising insurance costs make New Insurance Alternatives a Tier 1 recovery priority.

Project Description
Identify new insurance alternatives beyond the California Fair Plan. The town was awarded a grant from the Bay Area Foundation's California Resiliency Challenge (CRC) program to do a Resiliency/Mitigation Plan for the town. Proceeds were used to procure RCAC and a supporting team of experts to work on this initiative. Goals include reduction of wildfire risk, developing insurance alternatives, and pushing for supporting legislation. Key components of this study include risk analysis and modeling to establish a direct correlation between Paradise's fire safe measures and reduced wildfire risk. Recommendations are due in February 2023. One new insurance option being considered is community-based insurance (self-insurance pool).

California's Insurance Commissioner is advancing legislation related to the IBHS Prepared Home Standards that would further broaden insurance choices for homeowners.

Long-term inspection and enforcement must also be addressed as fire risk can increase over time without proper maintenance.

Lead
Town of Paradise

Partner
RCAC

Action Steps
- Complete RCAC study
- Continue risk modeling to measure metrics that support reduced fire risk
- Implement risk reduction projects at the building and community scale
- Track and support state legislation related to expanding insurance options
- Identify sources of subsidy for long-term inspection and enforcement

Cost Estimate

Long-term inspection and enforcement	To be determined

Potential Resources
- California Resiliency Challenge Grant, managed by RCAC
- FEMA HMGP
- USDA Community Wildfire Defense Grants
- USDA AIM Grants
- CalFire Grants
- Fire Wise Grants
- Initiating a Special Fire Protection District

Return on Investment
Removing a major hurdle to rebuilding.

Timeline
0 to 5 years

CALIFORNIA FAIR PLAN PROPERTY INSURANCE

ADDED

RP05

SUPPORT FOR FIRST-TIME HOMEBUYERS

Recovery Priority

Tier 1
Restoring options for first time homebuyers is a Tier 1 recovery priority.

Project Description
Find new tools to allow first-time homebuyers to purchase a home. Traditional first-time homebuyer programs are limited to acquisition of an existing unit that meets health and safety code standards and to households earning 120% or less of local Area Median Income (AMI). Most available units in Paradise are newly built and priced above 120% of Butte County AMI. This mismatch is stifling aspiring first-time home buyers in Paradise.

The town oversees a variety of programs for first-time homebuyers, including down payment assistance. Additionally, HUD and the state provided the town with a down payment assistance waiver to increase assistance limits in recognition of higher post-fire home prices. CalHome disaster loan assistance is also available for qualifying fire affected renters and owners, with priority up to 120% AMI.

Under the DCTA HUD/LISC Grant (capacity building project), RCAC & LISC proposed a program to help first time home buyers, who may already own or have inherited property in the Town of Paradise, but were not in possession before the fire. It involves having a foundation (or an entity established for the purpose of land banking) act as a holding entity for the property during construction, until the foundation is built. A philanthropic entity would have funds available at a nominal interest rate to reduce the risk for local mortgage lenders.

The tools exist to help would-be buyers if regulations and home inventory can be brought into aligned.

Note that the Community Housing Improvement Program (CHIP) and Habitat for Humanity both have programs for households earning less than 60% AMI.

Lead
Town of Paradise

Action Steps
- Town to continue working with HCD to find a solution to the acquisition of an existing home requirement
- Town to encourage contractors to offer smaller, more affordable homes that fall at or below 120% of AMI

Cost Estimate

Retrofits	To be determined

Potential Resources
- HUD
- CalHome
- Foundations

Return on Investment
Expanding housing opportunities and choices.

Timeline
0 to 3 years

ADDED

RP06

FOCUS ON ATTAINABLE HOUSING

Recovery Priority

Tier 1
This is a Tier 1 recovery priority due to the lagging recovery of relatively affordable housing.

Project Description
Support the restoration of attainable housing. Before the fire, Paradise was filled with relatively affordable housing for working families and residents on fixed incomes. The re-creation of these options has been impeded by relatively high stick-built home prices, hurdles to redeveloping manufactured home parks, increased material/labor costs, skyrocketing insurance and mortgage rates, delayed PG&E settlements, the lack of a sewer system, as well as other factors.

Affordability in Paradise are generally falls into the following segments:

- Affordable Housing: up to 80% AMI
- Attainable Housing: 80% to 120% AMI
- Workforce Housing: 120% to 180% AMI

Per the online survey, Paradise residents identified the attainable housing segment as their top priority. There are both Owner Occupied Rehab/Reconstruction (OOR) and ReCoverCA funds to tackle this problem as well as other potential resources. The challenge is available home inventory in the $250,000 to $350,000 range. The town should work with housing developers on creative ways to bring the price point into this range. Reducing the square footage to approximately 1,000 square feet and splitting attached units, such as duplexes, into condominiums are two initial options.

There is also a CDBG-DR Small MF Projects Funding Program for up to seven units. These can be scattered site, individual units or duplexes, fourplexes, etc. and there are several applications being submitted.

It should be noted that existing newly built homes are being offered in the workforce housing segment and non-profit developers are using their tools to target the affordable housing up to 60% of AMI. The town has established a Housing Advisory Committee to work make recommendations to Town Council on all housing types, issues associated with each type, and potential locations.

Lead
Town of Paradise

Partners
- CHIP
- Mercy Housing
- Developers
- Contractors

Action Steps
Housing Advisory Committee to meet and make recommendations

Cost Estimate
To be determined

Potential Resources
- Owner Occupied Rehab/Reconstruction (OOR) loans
- ReCoverCA (CDBG DR grant funds)
- Septic Replacement Grant (Town of Paradise)
- Rebuild Paradise Foundation
  - Septic Grant (reimbursement)
  - Missing Middle (reimbursement)
- USDA
  - Direct 502 Loan Program (for lower income households)
  - Guaranteed Loan Program (for higher income households)
- Conventional financing

Return on Investment
Expanding housing opportunities and choices.

Timeline
0 to 5 years

UPDATED

RP07

HAZARD TREES

Recovery Priority

Tier 1
Hazard trees are still Tier 1 priority.

Project Description
Since the 2019 LTRP Report, the hazard tree and debris removal programs oversaw the removal of millions of tons of debris and thousands of hazardous trees that were a threat to fall into public and eligible private roads. Of the thousands of standing burned trees have been felled, some still await removal. Others remain standing, posing a threat to the safety of residents. It is imperative to the safety and beauty of Paradise that hazard trees be removed.

There are four categories of hazard trees that must be considered separately.

Category 1: Hazard trees on public property that are a threat to the public/public improved property. Category 1 trees were mostly removed in the immediate emergency response to the Camp Fire to allow safe repopulation.

Category 2: Hazard trees on private property that are a threat to the CalRecycle debris removal effort and/or the CalRecycle crews and the public right-of-way. Category 2 trees were mostly removed in the secondary response to the Camp Fire to allow for the safe removal of fire debris.

Category 3: Hazard trees on private property that are a threat to the public right-of-way/improved property and private roads that are served by Northern Recycling and Waste Services (NRWS). These trees were removed through the FEMA Public Assistance "Government Hazard Tree Removal Program" or the Private Hazard Tree Removal Program.

Category 4: Hazard trees on private property that constitute a threat to abutting or private property. The Category 4 tree removal program phase 1 (assessment) was recently approved through FEMA/CalOES. Category 4 trees are a very broad range of trees. The category is defined as hazard trees on private property that constitute a fire hazard and includes trees that are a threat to rights-of-way on private roads not served by NRWS, trees that are a threat to living or work areas, and trees that are on the "back forty" of private property, which greatly increase the risk of fire in the community as well as the risk of bark beetle infestation.

Lead
Town of Paradise

Additional Action Steps
Continue efforts to remove standing burned trees with the Public Assistance Program, the Hazard Mitigation Grant Program, and the Right of Entry program

Cost Estimate (Spent and Projected)
- Category 1: $509,932
- Category 2: $17,573
- Category 3: $1,200,655 (Town's cost, not overall program cost)
- Category 4: Total requested: $11,747,128
  - Phase 1 (Assessment) approved $801,082
  - Phase 2 (removal) pending approval

Potential Resources
- Public Assistance (PA): Categories 1-3
- Hazard Mitigation Grant Program (HMGP): Category 4

Return on Investment
- Removing an obstacle to reconstruction
- Reduction of an extreme fire hazard
- Health and safety of the region

Timeline
0 to 2 years

EMERGENCY NOTIFICATION SYSTEM

Recovery Priority

Tier 1
The Emergency Notification System recovery project remains a Tier 1 priority.

Project Description
Establish a multi-layered/redundant emergency notification system in addition to the existing voluntary Code Red notification system. The phase I feasibility study, environmental clearance, and CEQA are all completed. Also, the town has received federal approval from FEMA that has launched the project toward construction. 21 towers will be constructed across the town as the basis of an audible system. Residents will be able to hear it from anywhere in Paradise – could be a horn blast or an audible signal. The operational target date is summer 2023.

Lead
Town of Paradise

Additional Action Steps
Construction

Cost Estimate
- Not to exceed $2.9 million

Potential Resources
- Federal Hazard Mitigation Grant Program (HMGP) administered in partnership with CalOES (75%)
- CDBG-DR Infrastructure funding 25% match

Return on Investment
Regaining public trust and the built-in safety that comes with a redundant system

Timeline (2022 and forward)
0 to 1 year

RP09

EVACUATION ROUTES

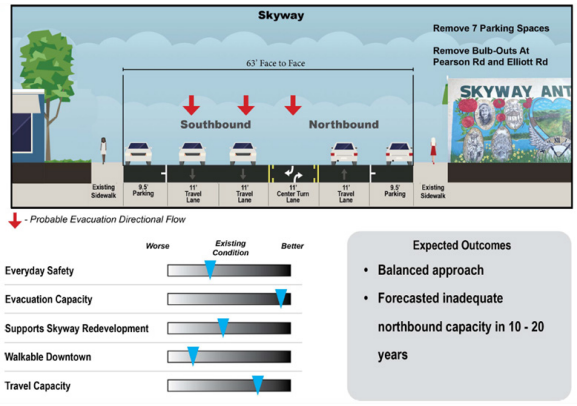
Recovery Priority

Tier 1

Evacuation routes in Paradise are the main roads into and out of town. They were tested in the Camp Fire. Residents ranked improvements as a Tier 1 priority.

Project Description

All roads in Paradise serve as either primary or secondary ingress/egress routes. The Town of Paradise, through a $1.8M grant funded by the Economic Development Administration, commissioned a comprehensive Transportation Master Plan (TMP) between 2020 and 2022. The TMP combined community feedback, regional coordination and independent technical analysis to formulate appropriate recommendations which could benefit the town in future evacuation scenarios.



Specifically, the TMP recommended over 50 infrastructure projects which could benefit emergency evacuation in some manner. These projects are estimated to exceed $600M in total cost. Further the TMP also identified crucial policies and programs the town could implement. Two such decisions include the removal of roadway medians/islands where appropriate and the reconfiguration of Skyway between Pearson Road and Elliott Road.

The Transportation Master Plan also positioned the Town of Paradise to submit projects for consideration in the 2018 CDBG-DR Infrastructure Program administered by California Housing & Community Development (HCD). This program made $317M available to 2018 Wildfire affected communities for the purposes of supporting recovery through the implementation of critically needed projects. In late August 2022, the Town of Paradise was notified its allocation of these funds would be $199M. In September, the Town Council approved a plan to fund the development of specific evacuation route projects, highlighted below:

- Pentz Road Widening, $73M: Widens Pentz Road between Pearson Road and Skyway complete with center two-way left turn lane and Class I multi-use bike path, which can double as an evacuation asset.
- Skyway Widening, $15M: Widens Skyway between Bille Road and Wagstaff Road to increase overall capacity of the critical arterial.

These projects each require extensive work to advance to construction, however, if maintained as a community priority could reach completion milestones between 2025–2028.

Lead

Town of Paradise

Action Steps

- Implement CDBG-DR Infrastructure projects
- Secure additional funding for future efforts

Cost Estimate

$500M+ for remaining projects and recommendations

Potential Resources

- California Department of Transportation (Caltrans)
- Federal Highways Administration (FHWA)
- Economic Development Administration (EDA)

Return on Investment

Increased life safety and housing activity

UPDATED

RP10

INTERCONNECTED PATH SYSTEM

Recovery Priority

Tier 1
The proposed path system focuses on increasing capacity along main ingress and egress routes in the event of an emergency evacuation. The level of priority is Tier 1.

Project Description
Immediately following the 2018 Camp Fire, it was recognized that Class I multi-use bike paths should be incorporated into future infrastructure plans for the town. These paths support daily activities in community living for pedestrians and bicyclists alike while also serving as potential evacuation assets in future emergencies.

Through a $1.8M grant funded by the Economic Development Administration, the Town of Paradise commissioned a comprehensive Transportation Master Plan (TMP) between 2020 and 2022. The TMP combined community feedback, regional coordination, and independent technical analysis to formulate appropriate recommendations which could benefit the town in future evacuation scenarios and create an interconnected path system. The TMP recommends Class I bike-ped pathways along the following critical corridors: Skyway, Clark, Sawmill Pentz, Wagstaff, Bille, Elliott, Valley View, Pearson, Roe, Oliver, and Neal.

The TMP's overall interconnected path recommendation map can be found to the right:

The Transportation Master Plan also positioned the Town of Paradise to submit projects for consideration in the 2018 CDBG-DR Infrastructure Program administered by California Housing & Community Development (HCD).

This program made $317M available to 2018 Wildfire affected communities to support recovery by implementing critically needed projects. In late August 2022, the Town of Paradise was notified that its allocation of these funds would be $199M. In September, the Town Council approved a plan to fund the development of specific evacuation route projects, highlighted below:

- Pentz Road Widening, $73M: Widens Pentz Road between Pearson Road and Skyway, complete with center two-way left turn lane and Class I multi-use bike path.
- The Town of Paradise also has four pending applications through the Active Transportation Program administered by Caltrans — proposing Class I Bike Paths along Oliver, Neal, Pentz, and Skyway.

Lead
Town of Paradise

Action Steps
- Implement CDBG-DR Infrastructure projects

MISSING ROAD SEGMENTS

Recovery Priority

Tier 1
Completing the primary road network is a Tier 1 priority as it is central to improving evacuation alternatives.

Project Description
All roads in Paradise serve as either primary or secondary ingress/egress routes. The Town of Paradise, through a $1.8M grant funded by the Economic Development Administration, commissioned a comprehensive Transportation Master Plan (TMP) between 2020 and 2022. The TMP combined community feedback, regional coordination and independent technical analysis to formulate appropriate recommendations which could benefit the town in future evacuation scenarios.

Specifically, the TMP recommended over 50 infrastructure projects which could benefit emergency evacuation in some manner. These projects are estimated to exceed $600M in total cost.

UNDERGROUND UTILITIES

Recovery Priority

Tier 1
Overhead electric and communication lines were severely damaged in the fire. Undergrounding utilities to harden against future disasters is a Tier 1 community priority.

Project Description
In May 2019, Pacific Gas & Electric (PG&E) announced their intention to underground all distribution facilities in Paradise. In 2021, telecommunications companies further agreed to jointly trench with PG&E. This activity has a three-fold benefit to Paradise:

- Overall risk reduction of wildfire ignition as a result of wind, vehicle collisions or other events, and
- Improved evacuation certainty with no combustible poles near road edges in the event of a wildfire
- Reduces the likelihood and/or impact of future Public Safety Power Shutoff events

Undergrounding of utilities in Paradise has mad significant progress in the last two years. Over 80 miles of work in Paradise has been complete and is nearing 50% completion overall. 2025 remains the overall completion objective for the program.

The Town of Paradise remains in constant communication for the organization and sequencing of undergrounding efforts while working to ensure future road projects are not adversely affected.

Lead
Town of Paradise

Partners
PG&E, Comcast, AT&T

Action Steps
Facilitate completion of the overall program while ensuring temporary construction impacts are minimized

Cost Estimate
$200M+

Return on Investment
Increased life safety and utility resiliency

Completion in 2025

UPDATED

RP14

FUELS MANAGEMENT PLAN

Recovery Priority

Tier 1
Fuels management is a primary tool in reducing fire risk. The direct link to fire safety means that this will always be a Tier 1 priority.

Project Description
This project called for updating the forest management plan and implementing a town-wide fuels management plan to lower the fire risk by reducing the fuel load. It also highlighted the need for sustainable ongoing funding.

The Paradise Ridge and Butte County Fire Safe Council, along with the Paradise Fire Department, have taken the local lead in aggressively tackling fuels management. One example is the Paradise Grazing Management Plan. The primary goal of this plan is to establish a sustainable, fire safe landscape that balances vegetation growth and removal to manage undesirable, invasive, flammable plant species. Historically, this was done with grazing or frequent, low-intensity fires. It notes that managing vegetation with grazing is a lower risk practice for wildland urban interface areas that prescribed fire.

The balance of this recovery project remains as originally written.

Lead
- Cal FIRE
- Paradise Fire Department
- Town of Paradise
- ISO (Insurance Service Office)
- Paradise Ridge Fire Safe Council
- Butte County Fire Safe Council
- Paradise Zone Captains
- Civic Groups
- Butte County Office of Emergency Management

Action Steps
- Establish program parameters
  - goals of the program
  - structure of the program
  - organizational responsibilities
  - Establish funding source or incentive programs to offset costs to property owners
- Increase staffing in code enforcement
- Create a GIS database of active, in progress fuels reduction projects
- Partnership/contract with private vegetation management business
- Collaborate with Fire Safe Councils, USFS, Cal FIRE and other governmental agencies
- Education program reinforcing community involvement and responsibility
- Review current abatement process for efficiency and effectiveness

Cost Estimate

Code enforcement positions 2 or 3 x $50,000/each	$100,000–$150,000
Staff support cost	$30,000
Fuels reduction implementation costs	TBD
Voucher program for free green waste drop-off days once a week when facility is working again 40 people x 2/mo x $10 average x 12 mo	$9,600
Elderly low income and disabled defense space assistance program (can be volunteer driven or paid contractor) 200 homes/year x 5 hrs/home x $150/hr	$150,000
Fuels reduction and forest thinning program 200 acres x $1,400/acre	$280,000
Grazing 300 acres x $800/acre	$240,000

Potential Resources
- Town of Paradise
- Fire Safe Council
- Vegetation Management Industry Professional
- USDA
- Cal FIRE
- Butte County Community Wildfire Protection Plan
- Butte County Hazard Mitigation Plan
- Hazard Mitigation Grant Program (HMGP)

Return on Investment
Reduction in fire risk through the management and lessening of combustible materials (fuel).

Timeline

FACILITIES MAINTENANCE AND UPGRADES (New Fire Station 82)

Recovery Priority

Tier 1
This project remains a Tier 1 priority project as the need is the same.

Project Description
The town has purchased a property at the corner of Pearson and Sawmill Roads. The goal is to locate New Station 82 on this site and potentially co-locate the public works corp yard. The town needs to first go through a process to strategically spend insurance proceeds before committing to a plan as funds are limited.

It should be noted that Town Hall, the Police Department, and Fire Station No. 1, all of which survived the Camp Fire, will require maintenance and upgrades over time. Fire hardening is a primary concern as all three buildings predate current firesafe best practices/codes. Ideally, at some point in the future, these facilities could be collocated for operational and emergency management efficiencies if/when they become obsolete.

Lead
Town of Paradise

Additional Action Steps
- Town process to confirm allocation of insurance proceeds
- Design and construction

Cost Estimate (Spent and Projected)

Fire Station 82 design and construction	$4,000,000
Other projects	T.B.D.

Potential Resources
- Insurance
- Hazard Mitigation Grant Program (HMPG)
- Public Assistance (PA)
- U.S. Department of Agriculture (USDA)

Return on Investment
Operational efficiencies, reduced response time, and overall fire protection.

Timeline (2022 and forward)

Fire Station 82	0-2 years
Other projects	Ongoing

OLD STATION 82

ADDED

RP16

PRIORITIZING ROAD RECONSTRUCTION

Recovery Priority

Tier 1
The Town of Paradise has secured funding to rehabilitate all publicly owned roadways damaged by the Camp Fire. Sequencing the road projects properly is a Tier 1 community priority.

Project Description
As Paradise rebuilds, the necessary reconstruction of damaged roads has been a top priority. While the repairs have vastly improved quality of life, the phasing schedule of construction can be disruptive and has not been made available to the public.

This project acknowledges residents' frustration with lack of communication by improving community awareness on the reconstruction schedule. In response, the town has made a Paving Map available on their website and coordinate with PG&E, Comcast, AT&T, and PID to create an online interactive tool for residents to see the schedule for undergrounding on a street-by-street basis.

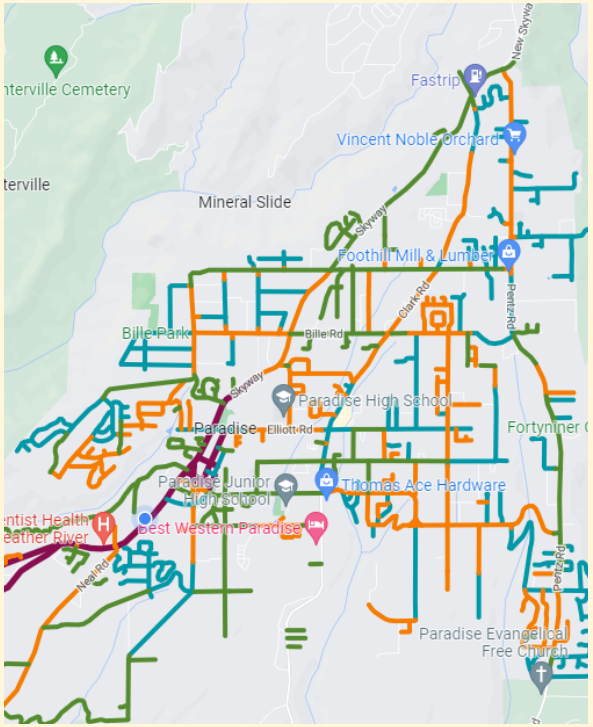
Lead
Town of Paradise

Partners
PG&E, Comcast, AT&T, PID

Action Steps
- Coordinate with PG&E, Comcast, AT&T, and PID to determine an accurate schedule
- Build a website and/or online interactive mapping tool to publicize the road reconstruction schedule

Cost Estimate
Minor

Timeline
Completion in 2022



1948

ADDED

RP17

FIRESAFE BUILDING STANDARDS

Recovery Priority

Tier 1
Rising insurance premiums are an existential threat to recovery. The relationship of this project to insurance costs makes it a Tier 1 recovery priority.

Project Description
Implement firesafe building standards beyond the Wildland Urban Interface (WUI) Code to reduce fire risk and insurance rates. The Insurance Institute for Business and Home Safety (IBHS) has developed a new set of guidelines called the Wildfire Prepared Home Standard and are creating similar standards for multifamily buildings and communities. These standards are targeted at lowering insurance premiums and increasing the pool of companies offering insurance in areas affected by wildfire. The IBHS Home Standards were adopted by the town in 2022. They require measures such as a 5-foot non-combustible perimeter around the home and no combustible fences within 5 feet of the home.

Owners of existing non-conforming homes and businesses will need financial assistance to meet the new standards and take advantage of long-term premium reductions.

Lead
Town of Paradise

Partner
IBHS

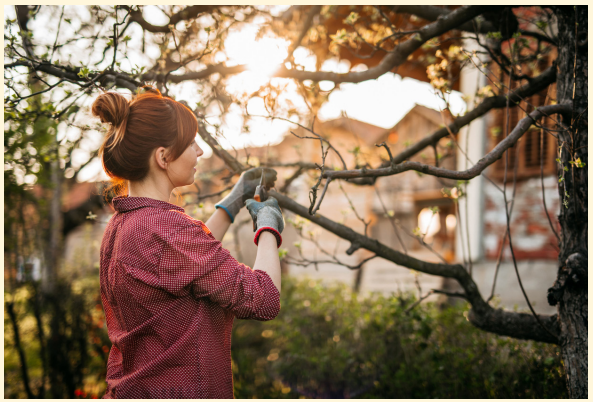
Action Steps
- Town to publisize adoption of IBHS Wildfire Prepared Home Standards
- Town to consider adoption of Multi-family and Community Standards once completed by IBHS

Cost Estimate
- Retrofit — To be determined
- Long-term inspection and enforcement — To be determined

Potential Resources
- FEMA Mitigation Grant
- Owner Occupied Rehab/Reconstruction (OOR) Loan
- Infrastructure Investment and Jobs Act (IIJA)

Return on Investment
Retrofitting existing buildings to adopted standards will make them more firesafe and could help reduce insurance premiums.

Timeline
0 to 3 years



1949

COMPLETED

RP18

SUSTAINABLE FISCAL MODEL

Update

Securing gap funding and financing sources needed to support the municipality's operations until the tax base is restored has been completed. Revenue was back-filled from the State of California for the first two years ($10,000,000 total) along with insurance proceeds ($5,000,000). About 80% or $180,000,000 of the town's $270,000,000 settlement with PG&E will fund the balance. MGT Partners did a long-term (25-year) fiscal sustainable model that included projected revenues and expenditures. The projections assumed a modest rebuild rate. Part of the remaining 20% of the PG&E settlement is a safety net if revenue recovery doesn't meet projections.

SUSTAINABLE FISCAL MODEL

RP 13

Recovery Project Priority

Tier 1
It is essential that the town continue to be a viable and strong local jurisdiction in the years following the disaster and into the future. Therefore, this project has a Tier 1 recovery priority.

Project Description
The Town of Paradise will experience an estimated loss of tax revenue of $155 million over the next 20 years due to loss of tax base. At the same time, the necessary response to the disaster has increased the required resources and staff for the town to provide essential government services to facilitate recovery. Gap funding and financing sources will be needed to support the operations of the municipality, until the tax base is restored.

The town is continuing to evaluate the lost revenue and seeking support for gap funding.

Lead
- Town of Paradise

Action Steps
- Continue to analyze and collect data on estimated lost revenue to support funding requirements and determine what investments in town infrastructure can accelerate recovery
- Seek legislative support for gap funding (ongoing)
- Seek appropriate grant funding through public and private entities to facilitate and accelerate recovery.

Cost Estimate

Loss of tax revenue to be replaced	$155 million
Cost to create plan	$0

Potential Resources
- Town of Paradise

Return on Investment
Ensures the continuity of government for the town as a viable and strong local jurisdiction.

Timeline
0 to 15 years

UPDATED

RP19

SEWER SYSTEM

Recovery Priority

Tier 1
The sewer system is a primary community priority and is therefore classified as a Tier 1 project.

Project Description
For a number of years, the town has pursued a municipal solution for wastewater treatment to address failed septic systems that have degraded local groundwater quality and constrained affordable housing, essential community services, and related economic growth. Reliance on septic systems has resulted in two areas of concern: environmental impacts and economic impediments. Failed septic systems release untreated wastewater into groundwater or ground surface, resulting in environmental degradation and public health risk due to water contamination or exposure to untreated wastewater. Economically, the lack of a sewer system has suppressed the development of a sustainable business community by limiting the size and types of businesses that can affordably operate in the community. Development of affordable and workforce housing has also been hindered as larger housing facilities require more sewer treatment capacity than a traditional septic system can provide within the available parcel sizes. As a result of these concerns, the town worked diligently for more than 50 years, even prior to its incorporation in 1979, to identify a feasible wastewater treatment solution for the community, with a priority to provide service to those commercial and densely populated residential areas with failed and failing septic systems.

Three primary objectives and associated goals drove the development of the Paradise Sewer Project as it exists in 2022:

- Provide long-term, efficient, reliable treatment of wastewater in a cost-effective, environmentally beneficial manner to current and returning town residents, in a manner acceptable to the RWQCB and other permitting agencies:
  - Accommodate regrowth while reducing further environmental degradation of groundwater and surface water from failing septic systems
  - Reduce the public health risk associated with failing septic systems
- Generate economic recovery by eliminating septic-related capacity limitations, as well as the general burden of on-site wastewater management for businesses:
  - Promote the return or arrival of essential community services and businesses by removing restrictions caused by on-site septic systems
- Provide for the ability to construct and maintain affordable housing, specifically multi-family housing:
  - Support centralizing affordable housing to Paradise's urban core, along major evacuation routes

The Town of Paradise released its Program Environmental Impact Report in July 2022 and anticipates a Final version being considered in late 2022. The project aims to contract with the City of Chico for overall wastewater treatment services at their existing Water Pollution Control Plant. If approved, the town's Sewer Service Area could generate 0.464 million gallons per day and be exported to the City's plant for treatment and disposal.

UPDATED

RP20

SEWER SYSTEM, CONT.

The Town of Paradise has secured $30M for the design phase through California Housing & Community Development using CDBG-DR funds.

Lead
Town of Paradise

RP21

WALKABLE DOWNTOWN

Recovery Priority

Tier 1
Given that this project is a primary community priority and is currently being implemented, it is classified as a Tier 1 priority project.

Project Description
Design a walkable central business district (Skyway to the Community Park and Pearson to Elliot Road). The town was awarded a grant before the fire to add sidewalks, lighting, landscaping, and drainage facilities in this area.

Construction of the revitalized downtown is currently underway, with completion expected by the end of 2023. The project benefits will be many, including a new enticing environment for land and business owners alike — especially with the prospects of a future sewer system in 2027.

Lead
Town of Paradise

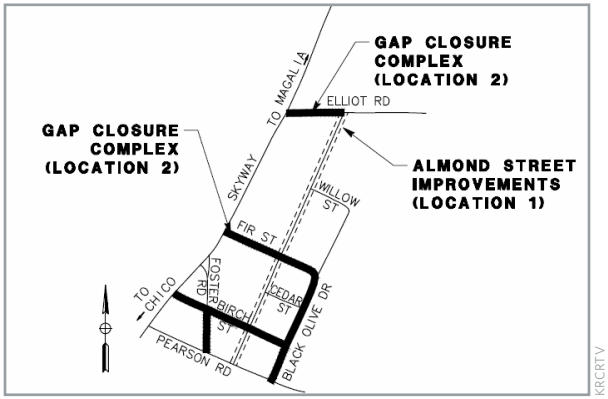
Action Steps
- Implement CDBG-DR Infrastructure projects
- Secure additional funding for future efforts

Cost Estimate
$7M

Potential Resources
California Department of Transportation (Caltrans)

Return on Investment
A safer and more convenient downtown for pedestrians. Plus, expenditure of grant dollars that have already been secured.

Timeline
2022



1953

COMPLETED

RP22

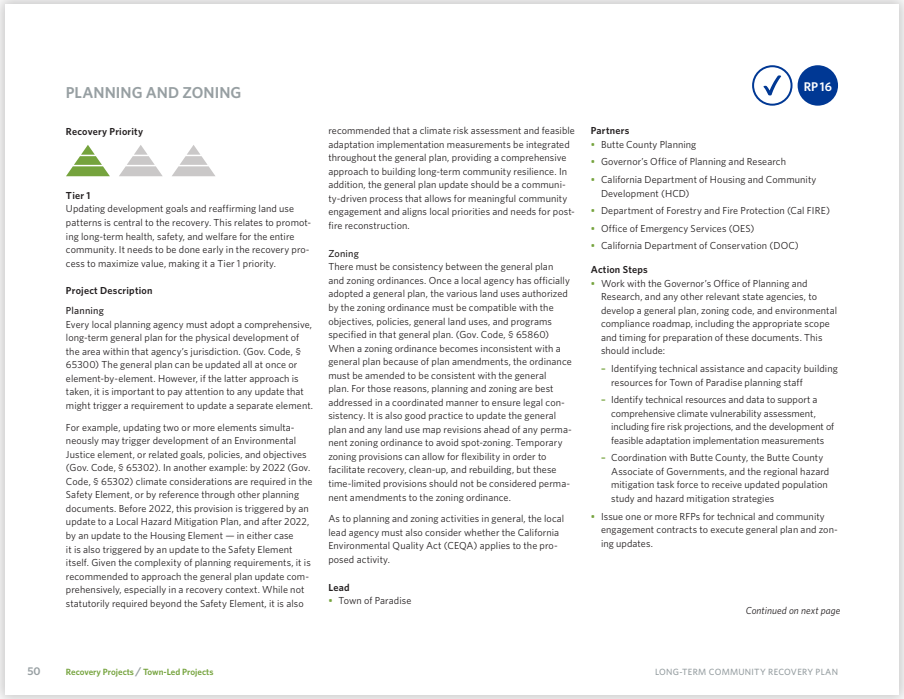
PLANNING AND ZONING

There are seven mandated General Plan elements: Land Use, Open Space, Conservation, Housing, Circulation, Noise, and Safety. The Paradise General Plan Update is proceeding on schedule. This includes the Housing Element, which was sent to the state in June for certification. A portion of the housing Element was paid for by Prop 84 funds, as it lays out policies for fire resiliency.

The Safety Element is waiting for comments from CalFire and then certification from the Board of Forestry. The Health and Safety Code now incorporates the requirements of the Wildfire Prepared Home Standard, discussed in detail under the Firesafe Building Standards recovery project.

Work on the Land Use, Open Space, Conservation, Circulation, and Noise Elements will start in 2023 and take approximately two years. Robust public outreach and a technical advisory committee are planned as part of this process. Also, a zoning overlay is being drafted to allow for increased density along the planned sewer line. It will be processed with the General Plan Update and other zoning amendments. Funding will be provided by a General Plan Update surcharge on permits that has been in place since the 1990s.

This recovery projects is considered complete as the intent has been met.



PLANNING AND ZONING

RP16

Recovery Priority

Tier 1
Updating development goals and reaffirming land use patterns is central to the recovery. This relates to promoting long-term health, safety, and welfare for the entire community. It needs to be done early in the recovery process to maximize value, making it a Tier 1 priority.

Project Description

Planning
Every local planning agency must adopt a comprehensive, long-term general plan for the physical development of the area within that agency's jurisdiction. (Gov. Code, § 65300) The general plan can be updated all at once or element-by-element. However, if the latter approach is taken, it is important to pay attention to any update that might trigger a requirement to update a separate element.

For example, updating two or more elements simultaneously may trigger development of an Environmental Justice element, or related goals, policies, and objectives (Gov. Code, § 65302). In another example: by 2022 (Gov. Code, § 65302) climate considerations are required in the Safety Element, or by reference through other planning documents. Before 2022, this provision is triggered by an update to a Local Hazard Mitigation Plan, and after 2022, by an update to the Housing Element — in either case it is also triggered by an update to the Safety Element itself. Given the complexity of planning requirements, it is recommended to approach the general plan update comprehensively, especially in a recovery context. While not statutorily required beyond the Safety Element, it is also recommended that a climate risk assessment and feasible adaptation implementation measurements be integrated throughout the general plan, providing a comprehensive approach to building long-term community resilience. In addition, the general plan update should be a community-driven process that allows for meaningful community engagement and aligns local priorities and needs for post-fire reconstruction.

Zoning
There must be consistency between the general plan and zoning ordinances. Once a local agency has officially adopted a general plan, the various land uses authorized by the zoning ordinance must be compatible with the objectives, policies, general land uses, and programs specified in that general plan. (Gov. Code, § 65860) When a zoning ordinance becomes inconsistent with a general plan because of plan amendments, the ordinance must be amended to be consistent with the general plan. For those reasons, planning and zoning are best addressed in a coordinated manner to ensure legal consistency. It is also good practice to update the general plan and any land use map revisions ahead of any permanent zoning ordinance to avoid spot-zoning. Temporary zoning provisions can allow for flexibility in order to facilitate recovery, clean-up, and rebuilding, but these time-limited provisions should not be considered permanent amendments to the zoning ordinance.

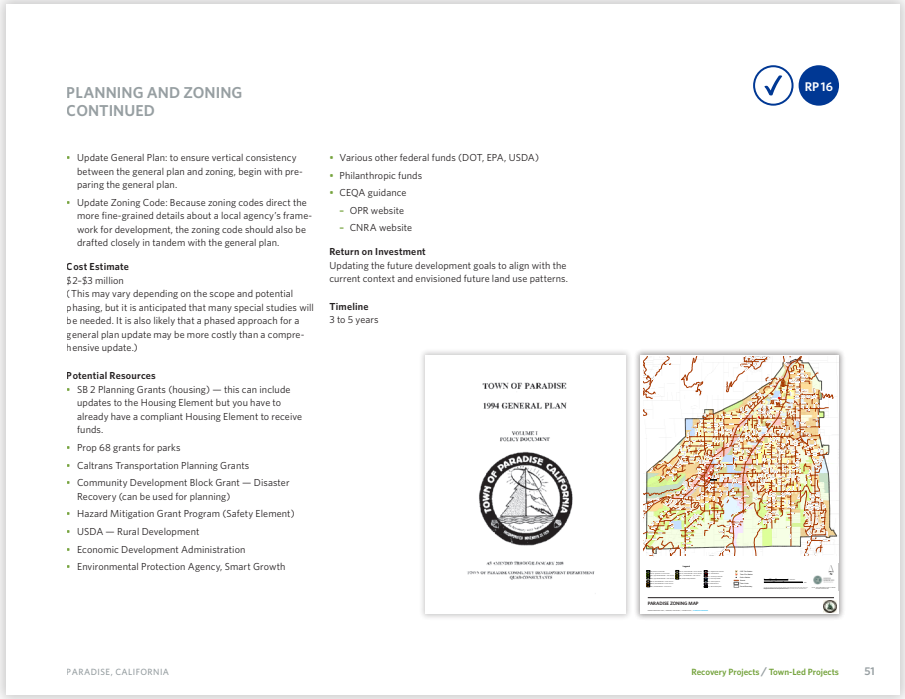
As to planning and zoning activities in general, the local lead agency must also consider whether the California Environmental Quality Act (CEQA) applies to the proposed activity.

Lead
- Town of Paradise

Partners
- Butte County Planning
- Governor's Office of Planning and Research
- California Department of Housing and Community Development (HCD)
- Department of Forestry and Fire Protection (Cal FIRE)
- Office of Emergency Services (OES)
- California Department of Conservation (DOC)

Action Steps
- Work with the Governor's Office of Planning and Research, and any other relevant state agencies, to develop a general plan, zoning code, and environmental compliance roadmap, including the appropriate scope and timing for preparation of these documents. This should include:
  - Identifying technical assistance and capacity building resources for Town of Paradise planning staff
  - Identify technical resources and data to support a comprehensive climate vulnerability assessment, including fire risk projections, and the development of feasible adaptation implementation measurements
  - Coordination with Butte County, the Butte County Associate of Governments, and the regional hazard mitigation task force to receive updated population study and hazard mitigation strategies
- Issue one or more RFPs for technical and community engagement contracts to execute general plan and zoning updates.

Continued on next page



PLANNING AND ZONING CONTINUED

RP16

- Update General Plan: to ensure vertical consistency between the general plan and zoning, begin with preparing the general plan.
- Update Zoning Code: Because zoning codes direct the more fine-grained details about a local agency's framework for development, the zoning code should also be drafted closely in tandem with the general plan.

Cost Estimate
$2-$3 million
(This may vary depending on the scope and potential phasing, but it is anticipated that many special studies will be needed. It is also likely that a phased approach for a general plan update may be more costly than a comprehensive update.)

Potential Resources
- SB 2 Planning Grants (housing) — this can include updates to the Housing Element but you have to already have a compliant Housing Element to receive funds.
- Prop 68 grants for parks
- Caltrans Transportation Planning Grants
- Community Development Block Grant — Disaster Recovery (can be used for planning)
- Hazard Mitigation Grant Program (Safety Element)
- USDA — Rural Development
- Economic Development Administration
- Environmental Protection Agency, Smart Growth
- Various other federal funds (DOT, EPA, USDA)
- Philanthropic funds
- CEQA guidance
  - OPR website
  - CNRA website

Return on Investment
Updating the future development goals to align with the current context and envisioned future land use patterns.

Timeline
3 to 5 years

1954

ADDED

RP23

WALKABILITY & BIKABILITY

Recovery Priority

Tier 1
This is a Tier 1 priority as it should parallel ongoing road reconstruction.

Project Description
The community survey revealed that many residents would like to see the pedestrian and bike network expanded beyond the Interconnected Path System recovery project. This could include some combination of sidewalks, trails, and bike lanes branching off the primary path network. Paradise is a rural community and to maintain its unique character these elements should be used selectively. Still, opportunities exist to enhance the quality of life within neighborhoods through targeted implementation of this initiative.

Lead
Town of Paradise

Action Steps
- Look for opportunities to extend the pedestrian and bike network
- Identify potential funding sources
- Confirm proposed locations with Town Council and Paradise residents

Cost Estimate
To be determined

Potential Resources
- Active Transportation Program (ATP)

Return on Investment
- Increased walkability and pedestrian/bike safety

Timeline
0 to 5 years

1955

ADDED

RP24

BEAUTIFICATION AND ECOLOGY

Recovery Priority

Tier 1
This is a Tier 1 priority as it should be implemented with ongoing community adaptation measures.

Project Description
The town should work on new approaches to beautification and ecology given the postfire terrain and updated fire safety requirements. The fire decimated most of the local cultural landscape and pollinator population. A community character which was dominated by large trees has been replaced by vast open vistas. Safety requirements now preclude foundation planting and trees within falling distance of public streets. Ground level fuels are also prohibited. These facts require rethinking how lots and the community should be planted. At the same time, plant pallets need to be established to bring back the pollinators that support a balanced ecosystem and agriculture.

It should be noted that the Paradise Recreation and Parks District is looking to reintroduce oak trees throughout the area to replace the lost conifers. They also want to encourage more agricultural uses, e.g. orchards, vineyards, etc. as fire breaks within the community.

Lead
Town of Paradise

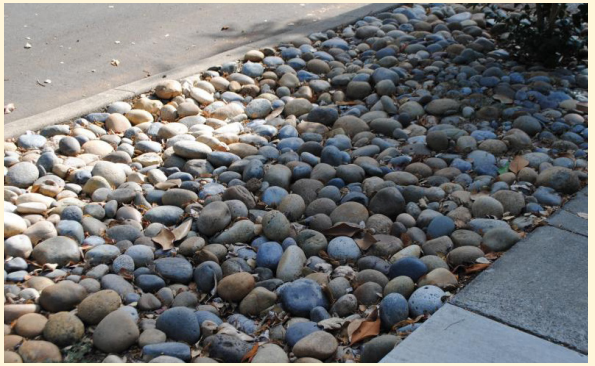
Action Steps
Form an advisory committee to explore balancing the requirements of fire safety with restoration of local ecology and beautification

Cost Estimate
To be determined

Potential Resources
- Nature Conservancy
- American Society of Landscape Architects
- Paradise Garden Club

Return on Investment
Community pride and inviting the pollinators back along with former residents.

Timeline
0 to 5 years



1956

ADDED

RP25

CONTRACTOR ACCOUNTABILITY

Recovery Priority

Tier 2
Given that there is an existing system that needs to be improved, Contractor Accountability is a Tier 2 recovery priority.

Project Description
Approximately one-third of survey respondents in Paradise report that they have been taken advantage of by a contractor working on their property since the fire. The town should develop additional strategies for holding contractors accountable for the quality of their work, property damage, and failure to perform work. Quality construction is a cornerstone of fire safety and resident happiness.

Lead
Town of Paradise

Partners
Contractor State Licensing Board (CSLB)

Action Steps
- Have the CSLB step up enforcement efforts with more frequent visits to Paradise.
- Provide owner/builder pulling their own permits with education materials from CSLB about contracting laws
- Create an online forum for complaints

Cost Estimate
To be determined

Potential Resources
To be determined

Return on Investment
Restoration of resident confidence that contractors are being held to recognized industry standards.

Timeline
0 to 1 year

1957

COMPLETED

RP26

RESIDENT FIRE SAFE EDUCATION

Update

Blue Flamingo, in partnership with the Paradise Fire and Police Departments, spearheaded to initiatives to provide resident fire safe education to the Town of Paradise. Now utilized by CalFire on the state's wildfire preparedness website — ReadyForWildfire.org — a video series called Ready, Set, Go was produced to instruct residents in the necessary wildfire preparedness measures to stay alert and protected in Wildland Urban Interface communities. In addition, the $30k grant supported printing collateral material with defensible space requirements, fridge magnets to help residents know their zone for evacuation purposes, and social media promotion of events and activities around wildfire safety and preparedness.

Defensible space checklist produced by Blue Flamingo

Recovery Priority

Tier 2
Fire safe education is a Tier 2 priority. With an unceasing need to stay in touch with current best practices, this program is important to the recovery.

Project Description
A perpetual education program could be established to train residents on Cal FIRE's guidelines and regulations on fire safe construction, landscaping, and defensible space. Paradise should aspire to rebuild as a model fire safe town.

Lead
- Cal FIRE
- Paradise Fire Department
- Town of Paradise
- ISO (Insurance Service Office)
- Paradise Ridge Fire Safe Council
- Butte County Fire Safe Council
- Paradise Zone Captains
- Civic Groups
- Butte County Office of Emergency Management

Action Steps
- Identify best fire safe practices by consulting with subject matter experts/professionals
- Coordinate with surrounding stakeholders (Cal FIRE, Fire Safe Councils, Butte County) when developing educational curriculum to ensure a consistent message throughout the Paradise area
- Determine who would be lead/coordinating agency, department or group
- Identify distribution methods (videos, pamphlets, fliers, social media, community group, etc.)

Cost Estimate

Public cost, program information, defensible space brochures, etc.	$5,000
Printing and mailing town evacuation plan	$10,000
Wildfire Ready Raccoon youth materials; children's book, trading card, promotion	$5,000
Evacuation safety video, go bag materials, and other social media outreach	$10,000
Scotch broom weed wrench lending program 20 wrenches x $150/each	$3,000
Community presentation materials — projector, in-case of emergency booklets, etc.	$1,500
Community training days on how to safely reduce fuels with machinery and equipment as well as safe pile burning practices — 10 x $100	$1,000
Continuing education/professional development for coordinator	$5,000
Community outreach/program coordinator	$50,000

Potential Resources
- NFPA
- Firewise USA
- California State Fire Marshal Office
- National Wildland Coordination Group — Wildland-Urban Interface Mitigation Committee
- National Institute of Technology
- Insurance Institute for Business and Home Safety
- Fire Safe Councils
- Public relations firms (on how to roll out an effective program)
- Butte County Community Wildfire Protection Plan
- Butte County Hazard Mitigation Plan
- Hazard Mitigation Grant Program (HMGP)

Return on Investment
Increased resident awareness of the steps required to live safely in the Wildland-Urban Interface.

Timeline
0 to 3 years

UPDATED

RP27

ECONOMIC DEVELOPMENT STRATEGY

Recovery Priority

Tier 2

An economic development strategy is related to recovery from the economic damage and restoring financial stability. It is important to the recovery, still qualifying it as a Tier 2 priority.

Project Description

A non-residential market study was implemented as part of the Transportation Master Plan and accepted by Council in March 2022. This information is being shared with developers and businesses investing in Paradise. The next step will be a strategy for an Economic Development Plan to be prepared by the town in the Summer of 2023.

Lead

Town of Paradise (setting policy, direction, strategy, and leading programs and projects)

Additional Action Steps

- Creation of an Economic Development Plan to include adoption of policy, direction, and strategy to go forward
- Town identifies projects

Cost Estimate

Non-residential market study and development site map

$60,000

Economic Development Plan	To be determined
Project Costs	To be determined

Potential Resources

- Transportation Master Plan
- Study Cost: U.S. Department of Agriculture (USDA) Rural Business Development Grants (RBDG) Program Funding
- Economic Development Plan: U.S. Economic Development Administration (EDA) Disaster Recovery Funding
- Projects: Varies by nature of project

Return on Investment

Rebuilding the business and employment base.

Updated Timeline

- Study and Economic Development Plan: 0 to 1 year
- Projects: Varies

1959

UPDATED

RP28

HIGH-SPEED DATA NETWORK

Recovery Priority

Tier 2

The high speed data network remains a Tier 2 priority because it can provide residents and businesses with an improved internet connection, allowing them to communicate more effectively, and it provides safer infrastructure for internet service distribution.

Project Description

This recovery project called for the town to work with providers to make the fiber optic network accessible to all residents and businesses as part of the infrastructure rebuilding effort. In 2020, the town issued a Request for Proposals for agencies to produce a feasibility study examining the demand and viability of installing high-speed broadband infrastructure in Paradise. The Geographical Information Center (GIC) at Chico State Enterprises submitted a proposal that was approved by Town Council in the summer of 2020. The goal of this study was to determine the demand for and cost of installing broadband infrastructure. The resulting Paradise Broadband Feasibility Study, completed in 2021, focuses on the demand within the town for high-speed broadband services.

Provides are currently undergrounding lines as housing and infrastructure are rebuilt. Future funding opportunities for broadband infrastructure are anticipated to be available through the California Advanced Services Fund (CPUC).

Lead

- Town of Paradise
- Internet Service Providers (i.e. Comcast, AT&T, Level 3, MCI, and U.S. TelePacific Corp.)
- Northeastern California Connect Consortium
- CSU Chico

Action Steps

- Per 2021 Paradise Broadband Feasibility Study

Cost Estimate: Per Original LTRP

Underground Fiber Deployment (Shared Underground Cost)	$3.7 million
Underground Fiber Deployment (Standalone Deployment)	$11.4 million

The first scenario ($3.7M) assumes this deployment partners with a public utility (i.e., PG&E) in carrying out undergrounding deployments (trenching or excavating) along the fiber routes, so fiber deployments could achieve up to 90% cost reduction in undergrounding cable placement. The second scenario ($11.4M) assumes the provider carries out the deployment as a standalone project.

See also 2021 Paradise Broadband Feasibility Study.

Potential Resources

Based on rate of return and/or time horizon, potential funding sources include the following:

- Private capital (i.e., equity, debt, internal funding)
- Public-private partnerships (i.e., publicly owned/privately enabled, privately owned/publicly supported, joint ownership)
- Government assistance (i.e., Federal and State infrastructure grants, subsidies, loans, tax credits)
- Upfront payment by target customers

Return on Investment

When combined with all other underground utilities, the high speed data network supports a utilities distribution which is safer and smarter for residents of and businesses in the Town of Paradise.

Timeline

0 to 5 years

1960

ADDED

SUPPORT FOR MOM-AND-POP BUSINESSES

Recovery Priority

Tier 2
Support for Mom-and-Pop Businesses is a Tier 2 priority as it is tied to construction of the sewer system.

Project Description
Support small, independent (and often family-owned) businesses that lost their buildings in the fire and desire to return. The cost of rebuilding in Paradise far exceeds insurance proceeds making stick built new construction cost prohibitive. This challenge is compounded by the fact that new commercial space must wait for implementation of the sewer project.

Small businesses comprise 99.9% of all businesses in the U.S. and were the foundation of Ridge commerce before the fire. They often rely on affordable costs in owned or leased older buildings to be competitive. Innovative solutions must be developed if displaced mom-and-pops are to return.

Lead
Paradise Ridge Chamber of Commerce

Partner
3-CORE

Action Steps
- Help match small, independent businesses seeking commercial space with existing available space
- Get the sewer system fully funded and built
- Explore lowing new-build construction costs through prefabricated and modular building systems

Cost Estimate
Not available

Potential Resources
- Conventional construction loans and mortgages
- The town is currently developing business assistance programs utilizing ARPA funds (American Rescue Plan Act). They expect to have the programs open for enrollment in December 2022.
- Small Business Adminitration (SBA) loans

Return on Investment
- Restoration of a critical part of Paradise's economy

Timeline
0 to 5 years

COMPLETED

RP30

2019 BUILDING ENERGY EFFICIENCY STANDARDS

Update

This recovery project has been completed. Applicants for building permits are now required to follow the 2019 Building Energy Efficiency Standards.

2019 BUILDING ENERGY EFFICIENCY STANDARDS

RP20

Recovery Priority

Tier 2

This project has a Tier 2 priority status. The 2019 Building Energy Efficiency Standards promotes sustainability through updated green building requirements for new construction and promotes financial stability by ensuring residents and property owners meet the requirements of their insurance companies to receive adequate benefits.

Project Description

The Title 24-2019 standard will go into effect on January 1, 2020. These requirements for solar panels, energy efficient technologies, and sustainable construction methods are more stringent than ever. Embracing these standards for Title 24 buildings would provide residents and property owners with numerous financial benefits. First, residents and property owners would be able to claim the required improvements from their insurance companies if their policy incorporated this provision. Second, residents and property owners should see a savings on utility bills through the use of community renewable energy resources, like rooftop solar panels.

In order to achieve these benefits and successfully apply the 2019 Building Energy Efficiency Standards to new Title 24 construction, this project should:

- Provide certainty to get started on rebuilding now, while eliminating future unknown costs for residents

Lead

- Town of Paradise

Action Steps

- Document and distribute a fact sheet, explaining the 2019 Building Energy Efficiency Standards to residents and property owners who are rebuilding

Cost Estimate

Not applicable

Potential Resources

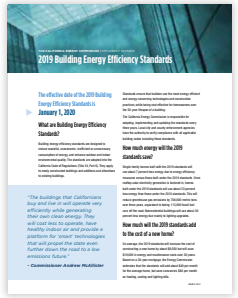
- Hazard Mitigation Grant Program (HMGP)
- Public Assistance (PA)
- U.S. Department of Energy (DOE)
- U.S. Environmental Protection Agency (EPA)

Return on Investment

Upgraded building energy efficiency standards, when implemented successfully, are designed to reduce the utility cost burden on residents, promote the conservation of energy and water, and support fire safety through design.

Timeline

0 to 1 years



PARADISE, CALIFORNIA

RETIRED

RP31

SUSTAINABLE STORMWATER AND DRAINAGE

Update

Sustainable Stormwater and Drainage has been retired as a stand-alone recovery project. The town is incorporating current best stormwater practices into the infrastructure and vertical development as Paradise is rebuilt. These initiatives are incorporated into the Town's Storm Drainage Master Plan (June 7, 2022) and Stormwater Management Program.

SUSTAINABLE STORMWATER AND DRAINAGE

RP 21

Recovery Priority

Tier 2
The level of priority is Tier 2. Most of the stormwater drainage system did not sustain physical damage in the fire. However, it is still important to the recovery. Water quality can be significantly improved as the community is rebuilt.

Project Description
Sustainable stormwater and drainage investments would decrease the quantity of runoff and improve the quality of water. A funded study would provide the town with critical information to make improvements, such as:

- Additional erosion control management to prevent erosion during recovery and protect the sensitive post-fire condition of the land
- Elimination of open ditches along evacuation routes and all public roads to improve safety
- Detention basins and bioswales to slow down and clean stormwater before it reaches natural systems

Lead
- Town of Paradise

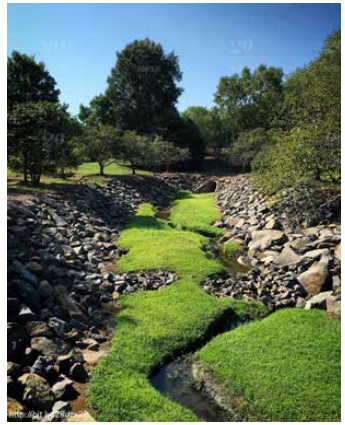
Action Steps
- New Storm Drainage Master Plan (current plan is from 1979)
- Secure funding
- Town-wide capacity and resiliency implementation based on Drainage Master Plan recommendations

Cost Estimate
Design and construction $250,000

Potential Resources
- Hazard Mitigation Grant Program (HMGP)
- Public Assistance (PA)

Return on Investment
The town would have cleaner stormwater and improved erosion control, including the reduction of open ditches, fast flowing water, and muddy runoff.

Timeline
0 to 5 years



RETIRED

RP32

SUSTAINABLE DEVELOPMENT

Update

The town is not pursuing Sustainable Development as originally conceived. However, many sustainability best practices are being incorporated into both infrastructure and residential construction per state and local regulations.

RP22

Recovery Priority

Tier 2

The Sustainable Development project has a Tier 2 priority status. This project promotes sustainability through land and infrastructure development and management over a long-term timeline as the town recovers and rebuilds.

Project Description

As Paradise rebuilds, the natural systems of the town are equally as important as the physically built infrastructure systems. Metric systems and ideas like the City Resilience Index could provide framework ideas and strategies for sustainable development that would minimize the negative impact of rebuilding on the natural systems of Paradise. While the City Resilience Index does not currently have an application for rural communities, the town could leverage a partnership with this agency and others like it to develop a toolkit for sustainable development in post-disaster areas.

To advance sustainable land development strategies, the town could:

- Seek incentives for low-impact and resilient design and land management
- Develop and adopt sustainable development standards and guidelines
- Partner to educate residents about low-impact models and options

Lead

- Town of Paradise

Action Steps

- Create partnerships with City Resilience Index, Cal OES Infrastructure Systems Recovery Support Function, and others to develop standards and guidelines for sustainable development in Paradise and other rural communities
- Develop and distribute educational information on sustainable land management and infrastructure development to residents
- Secure funding and create incentives for residents and property owners who engage in sustainable infrastructure and development projects

Cost Estimate

Not applicable

Potential Resources

- California Governor's Office of Emergency Services (Cal OES) Infrastructure Systems Recovery Support Function
- Hazard Mitigation Grant Program (HMGP)
- Public Assistance (PA)
- U.S. Department of Energy (DOE)
- U.S. Environment Protection Agency (EPA)

Return on Investment

Sustainable development strategies serve to support resiliency and fire safe infrastructure, while also promoting the town as an exemplary rural community.

Timeline

0 to 5 years

1964

RETIRED

RP33

SUSTAINABLE BUILDING PROGRAMS

Update

Given limited available funds, the town is prioritizing fire safety and building back over sustainable building programs.

SUSTAINABLE BUILDING PROGRAMS

RP 23

Recovery Priority

Tier 2

Sustainable Building Programs are a Tier 2 priority, as they demonstrate a willingness on the part of town leadership to invest in sustainable building practices for public buildings, recognizing the role that green design plays in promoting the town as a model, rural community during its rebuilding and recovery process.

Project Description

The Town of Paradise has a unique opportunity to be a model, rural community for fire safety and resiliency, as well as sustainability and green design. In the wake of the Camp Fire, the town should be a leader in fire-resistant and non-combustible building design. Throughout the rebuild and recovery effort, Paradise could become a destination for those who want to learn about these sustainable building strategies, including incorporation of LEED and USGBC principles in a rural context, application of California's stringent energy efficiency standards, matching efforts of sustainability with affordability, and Wildland-Urban Interface (WUI) compliance and execution.

In order to achieve this, the Sustainable Building Programs recovery project should include:

- Designing and constructing public buildings to meet stringent environmental and energy efficient standards and certifications
- Seeking financial incentives for residential and commercial owners to invest in ignition-resistant building materials that exceed WUI requirements

Lead

- Town of Paradise

Action Steps

- Create partnerships with LEED, USGBC, and others to develop standards and guidelines for sustainable and green building in high fire hazard rural communities like Paradise
- Develop and distribute education information on how individual residents and property owners can incorporate and benefit from sustainable, green, and fire safe design in the reconstruction of their homes and businesses
- Provide residents and property owners with a resource list of local builders, contractors, material providers, and others who specialize in locally sourced materials and are knowledgeable in green building design and construction
- Secure funding to support sustainable building efforts
- Create incentives for residents and property owners who exceed WUI requirements

Cost Estimate

Not applicable

Potential Resources

- Hazard Mitigation Grant Program (HMGP)
- Public Assistance (PA)
- U.S. Department of Energy (DOE)
- U.S. Environmental Protection Agency (EPA)

Return on Investment

When residents and property owners use sustainable building strategies and best green design practices, homes and businesses are more likely to be fire safe, ignition-resistant, and energy efficient, promoting an overall safer, more resilient Paradise.

Timeline

0 to 5 years

1965

NEW CIVIC CENTER

SUPERSEDED

RP34

Update

The New Civic Center has been superseded by the Facilities Maintenance and Upgrades recovery project.

NEW CIVIC CENTER

RP 24

Recovery Priority

Tier 3

Building a new civic center is desirable for the recovery and would be a significant improvement. However, it is not related to the fire damage. That requires this recovery project to be categorized as a Tier 3 priority.

Project Description

Town Hall should be co-located with police/fire in a hardened facility. This building(s) could be located on town-owned property adjacent to the community park. Creating a new civic center in the heart of the town would increase safety and bring these critical facilities, such as the Emergency Operations Center (EOC), into conformance with Wildland-Urban Interface building regulations. It could also anchor the revitalization of downtown.

Hardening would include ignition-resistant building materials, commercial windows, defensible space standards, protected communications and power, and backup generators.

Lead

- Town of Paradise

Action Steps

- Town of Paradise to conceptualize this facility in terms of program and performance requirements
- Town to apply for outside funding to do a feasibility study and cost estimate
- Town to apply for outside funding to build the new facility

Cost Estimate

Feasibility study and cost estimate	$150,000
30,000 SF facility (town hall/police/fire)	
Soft costs	$1,800,000–$2,200,000
Construction	$15,000,000–$18,000,000
Furniture, fixtures, and equipment	TBD

Potential Resources

- U.S. Economic Development Administration (EDA)
- Emergency Management Grant Program (EMGP)
- Town of Paradise

Return on Investment

Safety that comes with a consolidated and hardened Emergency Operations Center and hardened critical infrastructure. Centralized operational and communication efficiency.

Timeline

3 to 5 years

PARADISE, CALIFORNIA

Recovery Projects / Town-Led Projects 59

1966

RETIRED

RP35

OPPORTUNITY ZONE

Update

Special legislation that would allow Paradise to be designated an Opportunity Zone never materialized.

OPPORTUNITY ZONE

RP 25

Recovery Priority

Tier 3

Paradise was not designated as an Opportunity Zone before the fire, but may now qualify. This is desirable for recovery and as such is classified as a Tier 3 priority.

Project Description

The Opportunity Zone program was created to revitalize economically distressed communities using private investment rather than taxpayer dollars. By deferring capital gains for up to ten years, investors or groups of investors are incentivized to make long-term investments in areas that may historically have been underserved. While the Town of Paradise was not included in the first round of Opportunity Zone designations, it is possible the program could be amended, at which time the town should explore eligibility.

Lead

- Town of Paradise
- 3CORE

Partners

- U.S. Senate
- State Legislature
- Butte County
- Local investors
- Local developers
- Accounts and financial advisors

Action Steps

- Monitor and advocate for expansion of the current Opportunity Zone program — On April 3, 2018, Senators Marco Rubio (R-FL) and Rick Scott (R-FL) introduced the Disaster Opportunity Zones Act (DOZA), which will open Opportunity Zone designation to areas affected by 2018 natural disasters. The bill has been referred to the Senate Finance Committee for hearing.
- If expanded, create a prospectus on potential investment in Camp Fire burn area
- Educate policymakers regarding the importance of expanding these incentives
- Educate local investors/developers/CPAs/financial advisors on the benefits of Opportunity Zones

Cost Estimate

To be determined

Potential Resources

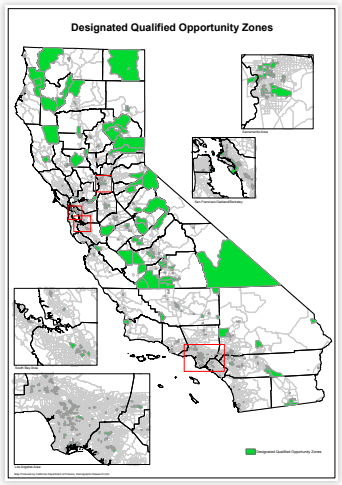
- California Opportunity Zones (CalOZ)
- Governor's Office of Business and Economic Development (GoBiz)
- U.S. Economic Development Administration (EDA)

Return on Investment

Incentives to invest in Paradise.

Timeline

To be determined — depends on potential policy changes



1967

PARTNER-LED PROJECTS

Partner-led projects are those which are being championed by various individuals, agencies, and organizations whose knowledge is directly applicable to each respective project. Within this section, projects are grouped together based on the category of the community vision they fall under — Safer, Welcoming, Stronger, Better, Greener. These projects range from Tier 1 to Tier 3 level of priority.

Recommended Projects

- PID Water System
- **Fire Breaks (Buffer Zones)**
- **Manufactured Home Communities**
- Housing Affordability
- Housing Market Study
- Workforce Development Plan
- Chamber of Commerce
- Educational Campus/Resiliency Research Center
- Volunteers
- Live/Work Space for Entrepreneurs
- Construction Training Center
- Elementary and Secondary Education
- Healthcare Services
- **All Scales of Healthcare**
- Outdoor Destination
- Early Childhood Education
- Public Transportation
- Arts and Culture on the Ridge (Gold Nugget Museum and Norton Buffalo Hall)
- **Blue Zones**

COMPLETED

RP36

PID WATER SYSTEM

Update

The Paradise Irrigation District (PID) has cleared all waterlines of contamination. This includes mainline service as well as service lines to existing structures. They are also undertaking the extensive replacement of service lines to all new structures.

Water meters replacement is another element of planned upgrades within the district. PID was able to secure funding in 2022 to insure the long-term sustainability of the irrigation district. This recovery project is considered complete as the intent has been met.

PID WATER SYSTEM

RP 26

Recovery Priority

Tier 1

The water system sustained physical damage as a result of the disaster. Repairing the system is critical to fire safety and recovery. This is a primary community concern, leading to assignment as a Tier 1 priority.

Project Description

The Town of Paradise will support the Paradise Irrigation District (PID) in its mission to restore potable water throughout the town. Following the Camp Fire, PID re-pressurized the distribution system, repaired some of the leaks, and did initial water quality testing to determine that the distribution system had been contaminated with volatile organic compounds (VOCs). In response to the contamination, PID issued a "do not drink" advisory that is still in effect today as the system is repaired under the PID Recovery Plan protocols.

In order to determine restoration and service priority, each main within the PID system has been identified as a Category 1 through Category 4 main. Category 1 is a primary distribution main. Work will begin with Category 1 and continue for approximately two years (anticipated completion in early 2021) until all categories of service lines have been tested, repaired, and restored.

Lead

- Paradise Irrigation District

Partners

- Town Liaison Committee

Action Steps

The PID Water System Recovery Plan includes three steps:

1. Sample all service laterals and mains in the distribution system for VOCs. This will eventually total nearly 20,000 samples
2. Replace contaminated service laterals and flush contaminated mains
3. Restore potable water service to the system

In order to accomplish these steps, there are five actions to be executed:

1. Temporary customer supply
   a. Where possible, temporary customer supply will be above-grade pipe/hose from a service lateral outside the Sample Area
   b. In some cases, temporary customer supply will be a tank and booster pump providing non-potable domestic use flows only
   c. Once sampling of stagnated water lines is completed, the temporary water supply will be removed, and the customer reconnected to the PID water system
2. Recover water meters and appurtenances
3. Sample mains and service laterals
4. Repair and replace damaged system components
5. Reconnect customers to distribution system

Cost Estimate

Total Cost $53,000,000+

Potential Resources

- California Governor's Office of Emergency Services (Cal OES)
- Federal Emergency Management Agency (FEMA)

Return on Investment

The PID Water System will provide homeowners and business owners with potable water, a prerequisite for large scale rebuilding.

Timeline

0 to 2 years

NOTE: Information was taken from the Paradise Irrigation District Water System Recovery Plan issued on April 12, 2019

1969

ADDED

RP37

FIRE BREAKS (BUFFER ZONES)

Recovery Priority

Tier 1

Fire breaks are a key element of community-wide fire safety and serve as an instrumental mitigation measure with long-term impact. This proposal for a fire break around the perimeter of the town is a Tier 1 priority project.

Project Description

Implement and maintain a buffer zone between development and the wildlands to reduce fire risk, especially on the east side of town. As fuels are reduced, these areas can also double as an opportunity for hiking trails. The soon to be released *IBHS Wildfire Prepared Community Standards* are expected to include bufer zones as a fundamental mitigation measure.

Lead

- Paradise Recreation and Parks District (PRPD)

Partner

- FEMA and CalOES
- Town of Paradise
- The Nature Conservancy

Action Steps

- Perform a cost benefit analysis
- Develop a comprehensive rubric for analyzing and selecting property that will form a contiguous boundary and how that property should be programmed
- Establish program requirements, site standards, and fuels management plans for maintaining and stewarding the protective barrier
- Identify areas of vulnerability
- Execute maintenance agreements with existing landowners and propose opportunities for land acquisition
- Confirm potential sources for purchase, construction, and long-term maintenance funding
- Construct and maintain the fire break

Cost Estimate

The cost of property acquisition, park development, trail network extensions, and fuels management throughout the entire fire break will be determined during the initial planning funded by the FEMA Building Resilience in Communities Program.

Potential Resources

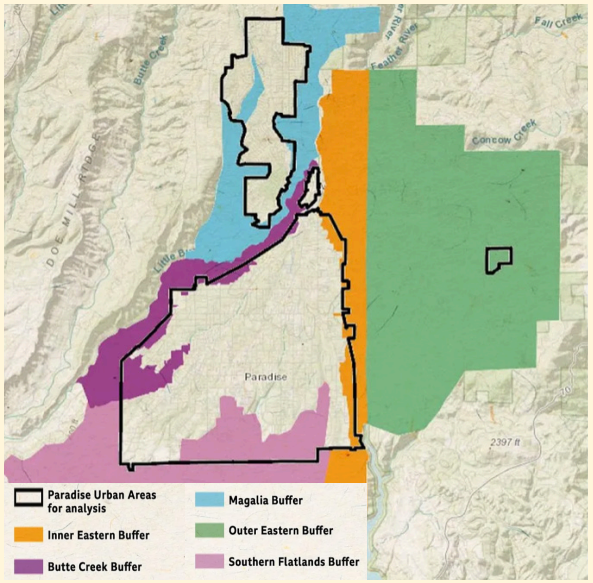
- $300K grant from FEMA's Building Resilience in Communities Program to perform a cost benefit analysis, establish priorities, and set up the programming and development rubric (Submitted in 2020, but waiting on agreement)
- Donation and Funding Program for Property Acquisition
  - $225k approved by the Sierra Nevada Conservancy in 2020 (designated for 2 properties - about 12 acres)
  - Donation (unincorporated area) completed 12/2021 for about 5 acres
  - Additional donations in progress for October 2022 including property near Bille Park (1.39 acres) and Feather River Place (3.44 acres), as well as a signing agreement for purchase (2.22 acres) and partial donation (7.4 acres) of property in Eastern Paradise

Return on Investment

It is anticipated that the creation of a fire break that fully surrounds the Town of Paradise would help reduce insurance costs by up to 40%. As well, initial cost benefit analysis research shows a 4:1 return on investment from damage reduction over 30 years with a fire break just on the eastern edge of Town. In addition to insurance reductions, a fire break could serve several functions beyond a protective barrier and passive green space. Other uses include: active park spaces, extended trail networks, and potential business opportunities that take responsible care of the town's boundary.

Timeline

- Study: 0-5 yeras
- Implementation: 5-15 years
- Maintenance: in perpetuity



1970

ADDED

RP38

MANUFACTURED HOME COMMUNITIES

Recovery Priority

Tier 2
This is a Tier 2 recovery priority like the Housing Affordability project in the original LTRP.

Project Description
Address the challenges to rebuilding the 36 privately-owned manufactured home parks destroyed in the fire. In general, funding has not been available to rebuild these parks and prepare manufactured home sites. However, the recently passed Senate Bill (SB) 197 expands authorized purposes for grants or loans under the Manufactured Housing Opportunity and Revitalization (MORE) Program (previously the Mobile Home Park Rehabilitation and Resident Ownership Program) for converting a mobile home park also to include: the acquisition, rehabilitation, reconstruction and replacement of a mobile home park; certain necessary repairs to health and safety deficiencies of a mobile home park; or reestablishment, including relocation, of a mobile home park. SB 197 also modifies the required conditions for program loans and grants for mobile home parks and individual low-income residents of such parks, including adding conditions for required affordability restrictions and permitting deferral of repayments for the full term of any loan.

The MORE program is likely to be used by some park owners; additional strategies must be developed to encourage the adaptive reuse of all vacant sites.

Lead
California Department of Housing and Community Development (HCD)

Action Steps
- Publicize the MORE program
- Further investigate strategies through the town's newly formed Housing Advisory Committee, including commissioning parks

Cost Estimate
To be determined

Potential Resources
MORE program

Return on Investment
Broadening housing opportunities and choices for residents that aspire to return.

Timeline
0 to 5 years

1971

HOUSING AFFORDABILITY

COMPLETED

RP39

Paradise Community Village has been rebuilt. The 36-unit neighborhood was completed and fully reoccupied, on its original site, in September 2021. There were approximately 250 initial applications with more than 60% being Camp Fire survivors. Proceeds to rebuild included insurance, a FEMA Public Assistance Grant, and private donations.

HOUSING AFFORDABILITY

RP 27

Recovery Priority

Tier 2
This project focuses on replacing Paradise Community Village, an affordable housing community that was lost in the disaster. It has a Tier 2 recovery priority. Rehousing those families will take pressure off of other regional housing needs.

Project Description
Much of the housing in Paradise prior to the fire was naturally occurring affordable housing. Given the cost of construction, it will be difficult to replicate the levels of housing affordability. There was also a small amount of subsidized workforce housing, including multi-family housing at Paradise Community Village. Paradise Community Village should be rebuilt by the Community Housing Improvement Program (CHIP) to replace the lost housing and services, in partnership with the Town of Paradise.

Paradise Community Village was completed in 2013 and included 36 units of multi-family housing, community amenities, and a community building. CHIP is required to rebuild what was lost, only changing any required upgrades to meet codes or fire safety mandates. To comply with IRS rules, there is a two-year timeframe for replacement, but CHIP has requested that the rebuild time be extended to 4 years.

Other future mixed-use partners could be involved in the rebuilding to achieve the live-work-learn-play vision for Paradise Community Village, in exploring options for rebuilding infrastructure. After the first phase of housing is replaced there could be opportunities for a second phase that meets the needs of the community (family, senior, or homeownership development).

Lead
- Community Housing Improvement Program (CHIP)

Partner
- Town of Paradise

Action Steps
1. Apply for IRS exception to extend the IRS required timeframe to rebuild the 36 units of housing and amenities from 2 to 4 years. Request has been made and a decision is pending.
2. Secure additional financing for rebuilding as costs to rebuild have escalated and new codes and requirements will increase the total development cost.
3. Explore partnership with potential adjacent mixed-use elements to complement the rental housing.
4. Repair the existing community wastewater system that supports the Paradise Community Village and other uses (additional housing, future soccer/sports complex, school, etc.). The existing system can be expanded to accommodate additional users.
5. Consider additional partnerships with complementary users during the rebuild of Paradise Community Village. If this occurs, additional funding to address signalization and road improvements will be required.

Cost Estimate

Development cost (materials, labor)	$11 million
Development soft costs	To be determined
Infrastructure	To be determined

Potential Resources
- Community Development Block Grant Disaster Recovery Program (CDBG DR)
- Federal Emergency Management Agency (FEMA) Public Assistance (PA) Grant
- Foundations and donations
- Traditional debt/mortgage financing

Return on Investment
This project takes advantage of dedicated funding sources for reconstructing Paradise Community Village to rebuild a stable community and rehouse 36 families with services and community amenities, which will help to reduce housing pressures in Paradise and Butte County. Many of the former residents wish to return to Paradise and reside at Paradise Community Village.

Timeline
2 to 4 years

PARADISE, CALIFORNIA

1972

COMPLETED

RP40

HOUSING MARKET STUDY

Update

A residential market study was completed for Butte, Tehama, and Glenn cocunties. This study, prepared by Peloton Research and Economics, was undertaken to help better understand the impacts of the Camp Fire on housing market conditions in the tri-county region. Funders included the North Valley Community Foundation, Butte Strong Fund, Fannie Mae, and Sierra Nevada.

The Study noted that "at the crux of all the housing challenges faced in the region, both pre- and post-fire, is the availability of affordable housing options. This issue is of greater importance now following the eliminiation of so much affordable housing stock back in Paradise and surrounding communities. In most cases these homes were not only affordable, but they were unsubsidized. It is extremely difficult to deliver market-rate affordable units in today's markets, though not impossible."

Key Objectives

- Update pre-Camp Fire baseline data to 2018 sources
- Provide more in-depth information on pre- and post-disaster market conditions
- Understand the dynamics leading to population out-migration
- Examine feasibility of new housing construction
- Identify opportunities for new housing in the region
- Create policies promoting housing production

Although not specific to Paradise, information about the town was included. Links to the study are included on the North Valley Community Foundation and Chico Builders Association websites.

HOUSING MARKET STUDY

RP 28

Recovery Priority

Tier 2
A market study is important to the recovery to quantify what was lost, what is in the pipeline and the projected need in the future. This is a Tier 2 priority.

Project Description
To ensure a mix of housing options and opportunities for the tri-county region, a market study should be undertaken. The study will include definitions for affordable, workforce, and attainable housing and provide pre-fire examples of each housing type from within the Town of Paradise and other tri-county communities. An analysis and breakdown of housing types in Paradise prior to the fire will be provided along with a current breakdown of the composition of housing units remaining.

Paradise should evaluate the results to benchmark the affordable/workforce housing lost and to set targets for replacing affordability that ensure a mixed-income community.

Lead
- Camp Fire Long-Term Recovery Group, Housing Subcommittee

Partners
- 3CORE
- Town of Paradise

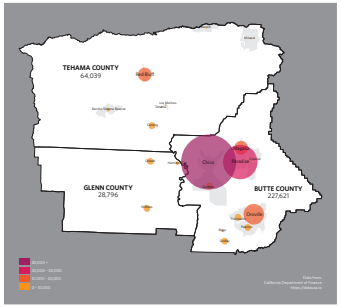
Action Steps
- Pre-Fire Household Composition, Housing Mix, and Market Conditions
  - Review pre- and post-fire composition of housing stock and housing market conditions in Paradise, Butte County, and the surrounding tri-county area
  - Provide breakdown of household types by income, housing type, tenure, family composition, household size, and age group
  - Aid community in establishing goals and target allocations for the re-introduction of mixed-income housing types, as well as identify tools and resources to assist in planning, encouraging, and implementing mixed-income housing
  - Understand the movements of children and families in the region
- Post-Fire Housing Issues including Availability, Affordability, and Future Mix
  - Analyze the impacts of Camp Fire victims on local housing resources by analyzing rental rates, occupancies, home sale prices, listing prices, and inventory of available homes
  - Identify and analyze sites capable of supporting new housing units
  - Analyze current residential developments under construction
- Feasibility of Building and Rebuilding
  - Analyze the feasibility of home construction in Paradise
- Future Development and Policy Recommendations to Meet Local Housing Needs
  - Provide calculations for future housing units and identify shortfalls, by housing type and income level, across the region
  - List of resources and incentives for mixed-housing types

Cost Estimate
Market study $35,000–$75,000

Potential Resources
- Foundations

Return on Investment
Empirical data that quantifies what was lost, what is in the pipeline and the projected need in the future.

Timeline
0 to 1 years



64 Recovery Projects / Partner-Led Projects LONG-TERM COMMUNITY RECOVERY PLAN

UPDATED

RP41

WORKFORCE DEVELOPMENT PLAN

Recovery Priority

Tier 2
The workforce development plan is related to the economic damage caused by the disaster. It will help restore job security and financial stability to the region over the long-term. It remains a Tier 2 priority.

Project Description
Although still in the early stages, a new workforce training center for trades and a 3D printing center are the top priorities. A Notice of Funding Availability (NOFA) is scheduled to be issued in January 2023. What projects the town's partners can apply for will be better known then. In the meantime, a 3D printing course is offered through CSU Chico, which could be a feeder program, and the Rotary Club has formed a special committee.

A Workforce Development Plan should ensure that workforce needs are understood and that training opportunities adequately address those needs. There are many local job seekers who lost their jobs and business owners whose business were either lost or severely impacted by the Camp Fire. NoRTEC and the Alliance for Workforce Development (AFWD) have been working closely with partner agencies in Butte County to meet the new disaster related workforce needs. Original targeted activities included:

- Career and training services, including partnering with Butte College to ensure relevant training options are available
- Temporary clean-up jobs for impacted workers in the Camp Fire burn area
- Job Seeker services (assessments for employment and training needs, assistance with short term prevocational training, occupational skills training, paid work experiences, paid internships, On-the-Job (OJT) training, supportive services, career guidance and job search assistance and placement as needed)
- Evaluating needed vocational programs, trades, apprenticeships, and ROP programs
- Coordinating with the Laborers Local 185 Union and assisting in developing a plan to help get individuals employed through the Union
- Working with Cal Recycle/Cal OES to identify contractors hiring for debris cleanup
- Hosting job fairs for HAZWOPER certified individuals with the hiring contractors and also with the local laborers union, Business Recovery Forums, resume and application workshops for affected individuals, contractor workforce info session, and a Listening Session with Butte County businesses and State Agency resources
- Participating in the Camp Fire Business Recovery Task and Camp Fire Long Term Recovery Group
- Conducting business walks and outreach to the Paradise area to identify any needs of the new or reopening businesses
- Coordinating and participating in the North Valley Camp Fire Resource Round-up
- Coordinating services between various public and non-profit agencies to help identify individuals that need workforce development services

Lead
- NoRTEC (Northern Rural Training and Employment Consortium)
- AWFD
- Butte College

Partners
- Camp Fire Business Recovery Task Force
  - Chamber of Commerce
  - Butte College
  - Town of Paradise
  - City of Chico
  - Butte County
  - 3Core
  - Small Business Development Center (SBDC)
  - Small Business Administration (SBA)
  - Rotary Club

Additional Action Steps
- Respond to NOFA
- Implement based on qualifying projects

Cost Estimate
$18,700,000 allocated

Potential Resources
- CDBG-DR

Return on Investment
Meeting the workforce needs resulting from the Camp Fire. Also, helping job seekers and business owners impacted by the disaster.

Timeline
1 to 3 years

1974

UPDATED

RP42

CHAMBER OF COMMERCE

Recovery Priority

Tier 2
The Paradise Ridge Chamber of Commerce is a Tier 2 priority due to its role in the economic recovery from the disaster and its continued importance as a key entity in organizing small business support, promoting local opportunities, and attracting residents to the Ridge.

Project Description
As rebuilding has progressed, the Paradise Ridge Chamber of Commerce has been highly involved in supporting the evolving needs of its members, while also promoting and attracting new businesses and residents to the Ridge.

The Chamber of Commerce has addressed several action steps from the 2019 Long-Term Recovery Plan, including:

- Focusing on strategies that would support businesses and economic development on an individual, business-by-business basis after the Butte County Business Recovery Task Force terminated convening as a structured group
- Establishing sponsorships and applying for short-term grant opportunities to initialize a sustainable fiscal model for the Chamber
- Developing short and long-term work plans and goals for promoting local events and celebrations, attracting new rooftops and residents, and publishing the Ridge Business Journal and Ridge Rising Guides

In addition, the Chamber has focused on a series of initiatives that have supported the town's recovery and brought back residents and businesses to the Ridge, including:

- Advocating for a commercial sewer system and community-wide broadband through writing letters to legislators and keeping the business community updated on the progress
- Supporting the Valley Contractors Exchange's Construction Industry Workforce Initiatives by publicizing events and issues in the Chamber's media channels
- Partnering with local rebuild, workforce, and construction organizations to form the Home Builders Resource Connection to produce resources and events connecting potential residents with trades and providing comprehensive information about building in the Wildland Urban Interface (WUI)

Lead
Paradise Ridge Chamber of Commerce

Partner
- Town of Paradise and Butte County
- Business community

Additional Action Steps
- Establish a stronger partnership with the Town of Paradise to further economic development initiatives, pursue joint funding opportunities, and foster a greater sense of unity between both entities
- Fund and implement a multi-year campaign to attract residents to the Ridge
- Maintain and grow the Ridge Rising publications to continue attracting businesses, organizations, and residents to the region
- Identify staffing needs for the Chamber and develop a workplace and funding strategy to fill the gap

Cost Estimate (Spent and Projected)
$1.2 million spent across all of the Chamber of Commerce's various initiatives

Potential Resources
- Small grants on a project-by-project basis
- Public-private partnerships

Return on Investment
The Paradise Ridge Chamber of Commerce has created countless opportunities for residents and small businesses to call the Paradise community home through their small business support initiatives and culture-building publications. Continued support of the Chamber equates to continued growth and recovery of the Town of Paradise.

Timeline (2022 and forward)
The timeline is determined on a project-by-project basis.

SUPERSEDED

RP43

EDUCATIONAL CAMPUS/ RESILIENCY RESEARCH CENTER

Update

The Educational Campus/Resiliency Research Center has been superseded by the Workforce Development Plan recovery project.

RP31

EDUCATIONAL CAMPUS/ RESILIENCY RESEARCH CENTER

Recovery Priority

Tier 3

A postsecondary campus did not exist in Paradise before the fire. This is an opportunity that was created because of the fire. It is desirable for recovery and classified as a Tier 3 priority.

Project Description

Paradise would be the ideal location for the study of fire safety, fire hazard area ecology, disaster recovery best practices, hardening research, vocational training, building in harmony with nature, etc. The town should explore partnerships with existing institutions that could lead to satellite programs or even a physical presence in downtown.

The academic communities interest in Paradise after the Camp Fire is underscored by the over fifty academic institutions that have reached out to Chico State. Both Chico State and Butte College have been key institutional partners in supporting the Paradise recovery and rebuilding effort.

Chico State maintains 3,950 acres of diverse habitats known as the Big Chico Creek Ecological Reserve (BCCER) just west of Paradise. Approximately 85% of the Reserve burned in the Camp Fire. Goals of the Reserve include monitoring on-site natural resources and providing public outreach and education. The faculty has focused on creating a healing recovery and resiliency center since the disaster. The town should explore a potential partnership for a secondary meeting and educational facility in Paradise. Other Chico State efforts to support Paradise include, but are not limited to:

- Wildcats Rise Fire Recovery Fund and several other donation collection efforts
- Human Identification Laboratory effort to search for human remains after the Camp Fire
- Camp Fire Oral History Project
- GeoPlace Mapping Lab studying the fire's displacement effect

Butte College has supported the recovery and rebuilding of Paradise in the aftermath of the Camp Fire through two initiatives:

1. Economic and Workforce Development (EWD) unit, which includes the Small Business Development Center, Contract Education, and Training Place
2. Credit Certification and Degree Programs development to provide a pipeline of skilled employees to support industry

Lead

- Chico State University (CSU)
- Butte College

Partners

- Town of Paradise

Action Steps

- Town of Paradise Disaster Recovery Coordinator to establish a direct link with CSU and Butte College leadership
- Formulate a plan for moving forward with consensus goals and objectives
- Seek funding if needed

Cost Estimate

Programs and Facilities — To be determined

Potential Resources

- Butte College
- Chico State University (CSU)

Return on Investment

The Educational Campus and Resiliency Research Center can provide an academic focus on resiliency, job training related to the rebuilding efforts, and a possible broadening of educational opportunities in Paradise.

Timeline

0 to 5 years

1976

UPDATED

RP44

VOLUNTEERS

Recovery Priority

Tier 3
The Volunteers Recovery Project is a Tier 3 priority. Accepting and organizing the influx of volunteers to the Town of Paradise provides opportunities for residents to connect with additional resources they need for recovery, supports significant improvements to the damage from the Camp Fire, and boosts a sense of morale and community spirit in the wake of the disaster.

Project Description
Volunteer services are in abundance in the town, both as agencies within the community are trying to support the rebuilding of their town and as external groups are looking to lend a helping hand.

While there is still a steady influx of volunteer services to the Town of Paradise, there is no single organization or entity responsible for managing volunteers and directing them towards areas of most need. Individual organizations receiving volunteer support and services are currently managing their own efforts, and intend on continuing to do so.

Beyond this individualized response, The Camp Fire Collaborative exists to help provide disaster case management services to Camp Fire victims. Formerly the Camp Fire Long-Term Recovery Group (CFLTRG), the Camp Fire Collaborative transitioned to a collaborative model in the Spring of 2020. Made up of almost 100 non-profit, private, and public organizations, the Camp Fire Collaborative seeks to address the unmet needs of Camp Fire survivors by organizing volunteer assistance, in-kind donations, and accessing all available funding for survivors.

Lead
- Independent organizations
- Camp Fire Collaborative

Additional Action Steps
No additional action steps are needed at this time, as individual organizations will continue to hold ownership over their volunteer needs.

Cost Estimate (Spent and Projected)
Varies based on volunteer project and those engaged.

Potential Resources
No additional resources are needed at this time on a coordinate effort. Any potential resources will be acquired by individual organizations on a project-by-project basis.

Return on Investment
By allowing organizations in need of volunteer support and services to manage their own individual demands, the burden of responsibility is removed from a single, management organization and handled as needed by those seeking support and assistance. This allows individual organizations to curate their volunteer support, and the specific skill demands needed to complete projects.

Timeline (2022 and forward)
As the Town of Paradise continues to recover, there will be a fluctuating need for volunteers, with more specific timelines offered on a project-by-project basis.

LIVE/WORK SPACE FOR ENTREPRENEURS

Recovery Priority

Tier 3

This remains a Tier 3 priority project. Paradise had a small maker community before the fire. This recovery project contemplates leveraging vacant commercial buildings and sites to build on what was and encourage reinvestment. It is a tertiary priority that falls under Tier 3 initiatives.

Project Description

This recovery project is on hold pending the installation of a sewer system. Existing commercial space is at a premium until new commercial space is built.

The internet economy could allow the Ridge to be competitive in live/work space. Room now exists to house business start-ups requiring affordable work space with or without adjacent living quarters. Tax breaks and other incentives should be identified to seed this initiative.

Lead

Investors

Partners

- Town of Paradise
- Chico State Center for Entrepreneurship

Action Steps

- Identify potential sites
- Promote the opportunity
- Encourage private investment

Cost Estimate

Design and construction	To be determined

Potential Resources

ELEMENTARY AND SECONDARY EDUCATION

Recovery Priority

Tier 1
Rebuilding elementary and secondary schools in Paradise was a Tier 1 priority for the 2019 LTRP, and remains a Tier 1 priority. Safe, high-quality schools are a necessary prerequisite for families moving back and new families moving in.

Project Description
Paradise's public, charter, and private schools are instrumental in providing current and future families with high-quality, state-of-the-art programming and education on the Ridge. Since the 2019 Long-Term Recovery Plan, both Paradise Unified School District (PUSD) and Achieve Charter School have made significant investments in not only repairing and reopening schools, but also ensuring that those schools incorporate 21st-century best practices, learning models, and classroom environments.

Update from Paradise Unified School District
- Completed Paradise Ridge Elementary, which combines Paradise Elementary and Ponderosa Elementary, with a building that is twice the size of the old facility
- In front of Paradise Ridge Elementary, there have been substantial infrastructure improvements as a part of a program to provide safe routes to school, including a widened road with a safer turn lane and a large sidewalk in front of the school
- Paradise High School has reopened in its original facility, with a new gymnasium, softball field, tennis courts, and accessibility ramping
- A new Paradise High School facility is currently under construction
- Ridgeview High School is currently under construction, across the street from Paradise High School, and is slated for completion at the end of April 2023
- Cedarwood Elementary in Magalia has moved from temporary structures to permanent classrooms
- The 10-year goal for PUSD is to have all schools on the Ridge modernized and upgraded to their new standard of facility

Update from Achieve Charter School
Achieve Charter School reopened in Paradise in 2022 at the St. Thomas Moore site as a K-5 school

Lead
- Paradise Unified School District
- Achieve Charter School

Additional Action Steps

Paradise Unified School District
- Promote walkability around schools with necessary infrastructure improvements, including expanded and additional sidewalks
- Continue to secure funding to complete their anticipated projects list (reference cost estimate and projected investments table)
- Establish an approach to education that provides high-quality facilities and services to the residents of the Ridge, with advancements the community wouldn't have seen in 20-30 years prior to the Camp Fire

Achieve Charter School
- Evaluate a need for 5-8th grade charter school services, and provide as needed
- Perform strategic planning initiatives with local stakeholders, residents, the town, etc to figure out where the population is moving and what the demand on education will be
- Continue to implement trauma-informed care and practices id daily educational programming
- Plan to reopen Achieve Charter High School once there is a need in the community, anticipate in the next 3-5 years

Continued on next page

ELEMENTARY AND SECONDARY EDUCATION, CONTINUED

Cost Estimate (Spent and Projected)

Paradise Unified School District

- Spent
  - Overall, approximately $90–$100 million in investment in PUSD schools
  - Paradise High School — $23 million
  - Paradise Ridge Elementary — $23 million
- Projected Investments
  - $41 million remaining in $61 million bond package, with the next $10 million projected for use in the next few years

Achieve Charter School

- $4 million was spent on infrastructure and an additional $1 million on portable classrooms for Achieve Charter satellite campus in Chico, before returning to Paradise
- $300k to develop STEM lab in Chico and $600k in start-up costs to Paradise through the Silicon Schools Fund
- Thousands, not fully quantified, in philanthropic support

Paradise Unified School District Facilities Project Priorities List
Project Would Be Approved To Start Construction As Funding Becomes Available
Board Approved On 01/18/22

Potential Resources

Paradise Unified School District

- State of California
- Bond package

Achieve Charter School

- Paradise Recreation and Parks District
- Chico State University
- Paradise Rebuild Foundation
- Butte County Office of Education
- North Valley Community Foundation

Return on Investment

As stated in the 2019 LTRP, rebuilding a strong elementary and secondary school system and network of private and charter options is a prerequisite for the rebuilding of Paradise. Many families choose their communities based on the education options. In order for Paradise to rebuild and encourage families to move back, schools are essential.

Investing in high-quality education options for children leads to better health, educational attainment, jobs/careers, and future buying power.

The work of Paradise Unified School District and Achieve Charter School is already well on its way to ensuring that Paradise is envied for its high-quality, state-of-the-art education amenities. Continued investments will only continue to elevate the educational opportunities for current residents and attract new residents to the Ridge.

Timeline (2022 and forward)

HEALTHCARE SERVICES

Update

Healthcare Services has been superseded by the new All Scales of Healthcare recovery project

SUPERSEDED

RP 48

HEALTHCARE SERVICES

RP 35

Recovery Priority

Tier 2

Access to healthcare is an important issue to the community and rebuilding the healthcare system to meet the needs of the community is a Tier 2 priority project.

Project Description

Health services should be matched to the needs of the community as Paradise grows back.

Primary care and specialist services would be replaced in Paradise so that people have regular access to their doctors and do not have to leave the community to get care. Emergency services should also be replaced. Health and wellness should be incorporated into the design of the community.

Lead

- Feather River Health Care
- Oroville Hospital
- Butte County EMS

Partners

- Town of Paradise

Action Steps

- Support SB 156, which would issue a special permit to allow a general acute care hospital to offer emergency stabilization services in the community
- Replace and grow primary care and specialist services in Paradise so that people have regular access to their doctors and do not have to leave the community to get care
- Match the needs of the population with the health services as the community grows back
- Replace access to emergency service facilities
- Develop preventative health care and fitness facilities in partnership with healthcare providers
- Incorporate health and wellness into the design of the community, including walking and biking trails, parks, and active recreation amenities

Cost Estimate

Preventative health/wellness facilities	To be determined
Primary care office	To be determined
Medical specialists' offices	To be determined
Emergency care facility	To be determined

Potential Resources

- State of California
- Private healthcare systems

Return on Investment

Preventative, primary, specialist, and emergency healthcare are foundational amenities for a complete community. Investing in whole-person and preventative health has measurable benefits and reduces future public healthcare costs. Furthermore, the availability of healthcare is a threshold for returning to the community and therefore becomes a critical component of attracting returning and new residents.

Timeline

0 to 5 years

1981

ADDED

RP49

ALL SCALES OF HEALTHCARE

Recovery Priority

Tier 1

Access to healthcare was an important issue to the community immediately following the Camp Fire, and continues to be a critical issue for the Ridge. Rebuilding the healthcare system to meet the needs of the community has been elevated to a Tier 1 priority project.

Project Description

The objective of this effort is to restore all scales of healthcare to the Town of Paradise. Although deemed infeasible at this time, healthcare providers have shifted the conversation to forming a robust clinic system, with strong primary care services, and fortifying this with in-person or telehealth specialized medicine.

While the discussion of providing services and making healthcare accessible on the Ridge continues, it is critical that healthcare providers engage in a dialogue with residents of Paradise and the other Ridge communities over their major concerns and work to address those concerns through restoring critical services.

One major concern is the Adventist Health Feather River Hospital facility that was severely damaged during the Camp Fire, which left a significant gap in healthcare services and the perceived feeling of securing in Paradise and on the Ridge. Services including hospitalization and emergency care, urgent and immediate care, and primary care are still missing, despite a few efforts to increase providers in the community, including the immediate and rapid care clinic that opened in 2019.

Lead

- Adventist Health
- Butte County EMS
- Additional healthcare providers

Action Steps

- Put together a task force with Adventist Health Staff and Community Leaders to have a structured entity supporting the development and provision of healthcare services on the Ridge
- Develop a fortified and robust clinic system which creates the opportunity for community medicine
- Hold a public forum in Paradise to hear from residents about major concerns regarding a perceived lack of local healthcare services
- Acknowledge resident frustration with opaque systems, and discuss concerns related to emergency care and hospital services being accessible on the Ridge
- Continue to identify missing critical services and establish a trajectory for fulfilling the gap
- Establish resources for transportation to critical services

Cost Estimate

Projected costs for increasing healthcare services and amenities on the Ridge are to be determined, until healthcare providers can be identified and expanded services discussed.

Potential Resources

- Private and alternative healthcare providers
- State of California
- Town of Paradise

Return on Investment

Preventative, primary, specialist, and emergency healthcare are foundational amenities for a complete community. Investing in whole-person and preventative health has measurable benefits and reduces future public healthcare costs. Furthermore, the availability of healthcare is a threshold for returning to the community and therefore becomes a critical component for attracting returning and new residents.

Timeline

Continued conversations with residents, local community leaders, the Town of Paradise, and healthcare providers will determine the timeline for continuing to infuse the Ridge with additional healthcare services.

1982

UPDATED

RP50

OUTDOOR DESTINATION

Recovery Priority

Tier 2

The parks fared well during the Camp Fire, sustaining relatively minor damage. However, following the Camp Fire and during the COVID-19 Pandemic, the parks and public open spaces in Paradise and on the Ridge have served as a critical element of community infrastructure. Therefore, these outdoor destinations have been elevated from a Tier 2 priority status in the 2019 LTRP to a Tier 1.

Project Description

As rebuilding has continued, the Paradise Recreation and Parks District (PRPD) has pursued a rapid schedule for rebuilding community park spaces, growing their existing networks, and finding innovative ways to be involved in conversations around resilience and disaster preparedness.

PRPD has addressed several action steps from the 2019 Long-Term Recovery Plan, including:

- Proposing a fuels and landscape management task force and strike team for fuel reduction, invasive species reduction, and beautification (currently unfunded)
- Investing in enhancements to current PRPD parks and trails, including Bille Park, Oak Creek Park, Moore Road Park, and an extension of the Yellowstone Kelly Trail
- Assisting the Paradise Senior Center, now Paradise Community Center, on their continued rebuilding work

While the Parks Master Management Plan (PMMP) is currently stalled, there are aspirations to see each park on the Ridge with an interim management plan that identifies uses, manages vegetation, and strategically allocates funding and staff resources. The completion of this interim management plan has a much shorter anticipated timeline for completion, while the PMMP awaits further development.

In addition, PRPD has focused on a series of new initiatives that have supported the town's continued recovery, rebuilding, and resilience work, including:

- Addressing future park design and improvements to incorporate refuge areas and fire-preparedness amenities
- Proposing a natural fire break around the Town of Paradise perimeter

Lead

Paradise Recreation and Parks District (PRPD)

Additional Action Steps

- Pursue funding to add staffing and management capacity
- Explore opportunities for state investment in local parks, so as to foster increased support and awareness
- Propose, construct, and maintain demonstration projects that explore wildfire risk reduction concepts
- Develop resiliency programs, in partnership with Chico State, to work with youth on nature and forestry awareness, guided nature therapy walks, and natural methods for stress relief
- Grow existing parks on the edges of the town to make space and necessary connections for the fire break project

Cost Estimate (Spent and Projected)

- Spent
  - $8 million for workforce development and improvements to Oak Creek Park
  - $1 million for Bille Park hazard tree removal
- Received
  - $5.2 million for full-service new park - Lakebridge Park (Magalia)
  - $600k for Magalia Paradise Lake Loop Trail
  - $1.4 million for bike flow course, adventure play, ropes course, etc. at Bille Park
  - $170k for improvements to Oake Creek Park (wildland trailhead)
  - $6 million for Noble Park (pursued but not received)
  - $20k for Yellowstone Kelly Trail improvement study
- Anticipated
  - $1.4 million (decision by 12/2022) for a new park in Butte Creek Canyon (will need a total of $2.5 million)

Potential Resources

- FEMA
- Town of Paradise
- State of California
- Independent partnerships and grant opportunities

Return on Investment

Because of their importance as evacuation routes and areas of refuge during disasters, the Paradise Recreation and Parks District network of parks, trails, and open spaces are vital assets to safety and quality of life in Paradise. Investment in this network will result in an increased sense of security, while also providing a critical amenity for current and future Ridge residents.

Timeline (2022 and forward)

Timeline is determined on a project-by-project basis.

1983

UPDATED

RP51

EARLY CHILDHOOD EDUCATION

Recovery Project Priority

Tier 2

The Early Childhood Education recovery project focuses on replacing the childhood education slots lost in the Camp Fire. The project has a Tier 2 priority related to helping support families and educational achievement in young children.

Project Description

Intended to replace the educational foundation for young children and family support that vanished in the Camp Fire, the restoration of early childhood education on the Ridge has faced some major roadblocks to completion since the 2019 report. As initially projected, over 1,000 slots of licensed capacity for early learning (or childhood education) and child care were lost in Paradise. Numbers for services, as developed post-Camp Fire, are as follows:

	2018 Pre Camp Fire	2018/2019 Post Camp Fire	2022 Child Care
Licensed Childcare Centers	6	3; 1 center in Paradise was able to reopen	3
Family Child Care Homes	32	6 standing after the fire, 3 stayed open	5; 2 of the 3 in Paradise still open
Family, Friend, and Neighbor Providers	62	Unknown	15
License Exempt Centers (i.e. Boys and Girls Club)	4	2	3

In 2018, a Child Care Task Force was established to address the urgent need for child care in the communities impacted by the Camp Fire. This group includes representatives from the Local Child Care Planning Council, Valley Oak Children's Services, Butte County Office of Education, Community Care Licensing, local school districts, parks departments, local colleges, and others. Outcomes from this group include conducting and analyzing the Local Child Care Planning Council County-Wide Needs Assessment, identifying the indirect impacts of the fire, and proposing services that can mitigate those effects.

Lead

- Butte County Office of Education
- Valley Oak Children's Services
- Office of Resource and Referral

Additional Action Steps

- Provide enhanced referral support by identifying families that would help fulfill specific needs for families and centers
- Create resource awareness for all scales of child care providers and services
- Identify disaster preparedness measures and develop protocols for trauma-informed care for students and staff
- Develop a formal system for tracking unlicensed childcare providers and sharing resources to become licensed
- Secure funding to reinstate and rebuild pre-Camp Fire facilities
- Create incentives and unlock partnerships to secure adequate staffing

Cost Estimate (Spent and Projected)

Cost to restore early childhood education services is on a project-by-project basis as new facilities open or previous facilities are reopened.

Potential Resources

- COVID and AARPA funding
- CA Development Infrastructure Grant — $150 million available for major construction
- North Valley Community Foundation
- First 5 Butte — $1 million committed for planning and creation of Family Resource Centers in disinvested communities
- Office of Resource and Referral
- Town of Paradise and Butte County

Return on Investment

As stated in the 2019 LTRIP, this return-on-investment for quality early childhood (0–5) education has been well documented. National studies show a 4x to 12x return per dollar invested in early childhood education.

In the long term, providing high-quality childhood education options for families leads to better health, educational attainment, jobs/careers, and future buying power.

In the short term, the availability of childhood education and childcare slots influences the ability of parents of young children to work, earn family income and raise incomes in the community. Quality early childhood education options are also a critical amenity that young families will evaluate before moving to Paradise, making investing in early childhood education a tool in attracting and marketing Paradise to future residents.

Timeline (2022 and forward)

10+ Years

1984

UPDATED

RP52

PUBLIC TRANSPORTATION

Recovery Priority

Tier 3
The public transit system on the Ridge did not sustain physical damage in the fire and has returned to limited service based on the current population and demand. Priority for upgraded and additional public transportation will depend on rates-of-return to the Ridge and, therefore, will remain a Tier 3 priority.

Project Description
Although the public transportation system did not suffer physical damage from the Camp Fire, population displacement and uneven, disparate returns to the town have reduced routes and demand for transit service. While the 2019 LTRP indicated a need for transit service to return to pre-fire levels, a desire for expanded routes to better serve the community, and a proposal for bus shelters at major stops, these transit service improvements are not feasible for implementation at this time.

In order to establish realistic priorities, the Butte County Association of Governments (BCAG) conducted a Post Camp Fire Study in 2021 and will perform a ridership study in 2023. These studies look at the population in the county over the short-term and long-term to project potential points of demand increase and where additional services will be needed to respond to this demand. The results will inform the 2024 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and other projects.

Butte Regional Transit (BRT) is open to providing additional services if met by demand, or explore alternative transit options to increase access on the Ridge. Programs BRT is exploring including:

- The Paradise Transit Center
- Paradise Dial-A-Ride (a non-fixed, door-to-door service between Paradise and downtown Chico)
- Non-Emergency Medical Transportation (Projected for study in early 2023, a new service to the Ridge a few days a week to improve access to doctors' visits, local pharmacies, etc.)

Lead
Butte Regional Transit

Partner
Town of Paradise

Additional Action Steps
- Continue to evaluate population return on the Ridge and match the public transit service options to this demand
- Further research and gauge interest in additional, proposed projects that may better serve the community

Cost Estimate (Spent and Projected)
Cost estimate on a project-by-project basis

Potential Resources
- Butte County Association of Governments (BCAG)
- Federal Transit Administration (FTA)
- State resources
- Town of Paradise

Return on Investment
As Paradise's population increases and transit service becomes more frequent, public transportation will serve residents who might not otherwise have mobility access to the services and amenities they need.

Timeline (2022 and forward)
Timeline to be determined once demand increases.

UPDATED

RP53

ARTS AND CULTURE ON THE RIDGE (Gold Nugget Museum And Norton Buffalo Hall)

Recovery Priority

Tier 3

The Gold Nugget Museum, Norton Buffalo Hall, and the expanded arts and culture hub adjacent to the future Downtown Paradise are a Tier 3 priority because they will provide a thriving arts and culture destination for Paradise as it continues to rebuild and recover, restoring hope and reminding residents and visitors alike of Paradise's uniqueness and strong community spirit.

Project Description

During the 2019 Long-Term Recovery Planning Process, the Gold Nugget Museum and Paradise Community Guilds – both corners of arts and culture in Paradise – were exploring a partnership to build a new Norton Buffalo Hall within a walkable downtown Paradise. This idea expanded in January 2019 to imagine a co-located Gold Nugget Museum and Norton Buffalo Hall. The goal of this partnership was to address the need for collective action in the face of losing audience and membership. Since then, efforts have expanded to envision a new arts and culture campus curated by the PATCH Collaborative, including space for Gold Nugget Museum, Paradise Arts Center, Theater on the Ridge, Norton Buffalo Hall, and outdoor amphitheater, Nuggetville, and the Gem and Mineral Society.

Gold Nugget Museum Update

The new home of the Gold Nugget Museum is located at 475-479 Pearson Road, across the street from the original building. The conversion of a former transmission shop, the new Gold Nugget Museum, is pretty much complete with design and is continuing to be built out. However, in the meantime, the museum is open to the public and has already seen over 3,000 visitors. The first exhibit at the museum to open featured the PG&E equipment that failed on the morning of November 8, 2018, leading to the Camp Fire, the genesis of a wide range of feelings and emotions from all visitors. The Gold Nugget Museum continues to be the keeper of culture and commemoration in the town. Its full build-out will provide residents and visitors the opportunity to learn of the Paradise of the past and the Paradise to come.

The PATCH Collaborative Update

The Paradise Arts, Theater, and Culture Hub, otherwise known as the PATCH Collaborative, is a collective of arts and culture organizations dedicated to establishing a thriving arts and culture campus in close proximity to the future downtown Paradise. The PATCH Collaborative includes the following organizations: Gold Nugget Museum, Norton Buffalo Hall, Theater on the Ridge, Paradise Arts Center, Paradise Recreation and Parks District, and Mechoopda Tribal Council. Exploration and development are underway to identify property adjacent to currently owned land that would total 8-9 acres for the campus.

UPDATED

RP54

ARTS AND CULTURE ON THE RIDGE, CONT. (Gold Nugget Museum And Norton Buffalo Hall)

Melton Design Group

Melton Design Group

Additional Action Steps

Gold Nugget Museum

- Complete construction on the Gold Nugget Museum, and continue retrofitting the future exhibition space to provide increased educational opportunities and exhibits to the public

The PATCH Collaborative

- Continue conversations with Paradise Recreation and Parks District about the land where the previous Gold Nugget Museum was located for its use as a potential home for Paradise Arts Center, Theater on the Ridge, outdoor amphitheater, and Norton Buffalo Hall
- Complete due diligence on all adjacent property and potential sites for acquisition
- Acquire property
- Generate a development plan for the future arts and culture campus that all partners agree on
- Promote and execute a $25 million capitol campaign

Cost Estimate (Spent and Projected)

Gold Nugget Museum

- $214k grant from the North Valley Community Foundation
- A grant from Paradise Rotary Club for Gold Nugget Museum office space

The PATCH Collaborative

- $50k grant for administrator/assistant position
- $25 million capital fundraising campaign
- Seek additional funding opportunities for potential property acquisition and supplemental build-out support

Potential Resources

- USDA Rural Communities grants
- North Valley Community Foundation
- Paradise Rotary Club

Return on Investment

The Gold Nugget Museum and Norton Buffalo Hall promote a thriving civic spirit, encouraging Paradise's future as an arts and culture destination. With the expanded vision from the PATCH Collaborative, access to arts and culture amenities will be expanded and both residents and visitors to the Town of Paradise will be able to experience the magnitude of this community's joy and resilience.

Timeline (2022 and forward)

5 to 10 years

1987

ADDED

RP55

BLUE ZONES

Recovery Priority

Tier 3

Blue Zones is a policy and design framework that could help represent and promote Paradise's overall health as the town continues to recover and rebuild. Achieving a formal Blue Zones Community certification is a Tier 3 priority; however, the individual framework elements which support this certification are prioritized in other recovery projects.

Project Description

Paradise should seek to achieve certification as a Blue Zones community in the future, leveraging the work that has already been done and will be done in the collective recovery effort.

Blue Zones began in a quest to find environmental causes and commonalities between communities that statistically have populations with longer lifespans, low rates of disease, healthier lifestyles, etc. This initial research was condensed into a rubric and framework approach that communities can utilize to achieve Blue Zones certification.

The application of this methodology for Paradise is unique. The Blue Zones framework was not designed for disaster recovery, and teams of local organizations are already working in Paradise to impact wellness, support longevity, and promote sustainability through a variety of independent projects and initiatives. As a result, the objective of Blue Zones as a recovery project is to emphasize the Blue Zones model as a leading thought initiative that individual organizations can consider when executing individual projects and efforts.

Lead

Adventist Health's Feather River Health Foundation

Partner

- Local organizations and interested individuals
- Paradise Citizen's Alliance
- Rebuild Paradise Foundation
- Town of Paradise

Action Steps

- Use principles from the Blue Zones framework to help guide healthier rebuilding on a project-by-project basis
- Prioritize walking and biking via road improvements and trails
- Create gathering spaces to nurture community
- Design homes that promote health and resiliency
- Establish collaborative conversations and volunteer opportunities between interested individuals and organizations doing recovery work on the Ridge, so as to understand how the collective community effort could be framed as a Blue Zones community in the future

Potential Resources

- Adventist Health
- Volunteer organizations

Timeline

Achieving a Blue Zones community certification is typically a five-year process; however, the uniqueness of Paradise's recovery effort and future pursuit of certification will determine the timeline.

1988

Parallel Initiatives

1989

Photo Provided by Stephen Klessel of Rebuild Paradise Foundation

PARALLEL INITIATIVES

Rebuilding is a group effort; multiple organizations doing great work creates a stronger support system.

In the years since the Camp Fire, hundreds of residents, organizations, and local businesses have volunteered time, money, and support in the name of Paradise's recovery. The 2019 report was intended to help guide these efforts, make connections between related initiatives, and look farther into the future. The resulting Long-Term Recovery Plan (LTRP) was therefore very comprehensive. However, the sheer magnitude of rebuilding, market unpredictability, and many other external factors spawned many other initiatives that have run parallel to the original recovery projects. Although not necessarily associated with the original 2019 report, these projects have fulfilled many short-term needs.

This chapter contains many, but not all, of the parallel initiatives that are in varying stages of completion. While some have been incorporated into new or updated recovery projects, the following projects are independently successful and likely do not require the support of this document. Rather, this chapter is intended to acknowledge and celebrate the many achievements of Paradise's strong community network.

Some of the organizations that are engaged in parallel initiatives that have aided in Paradise's long-term recovery include:

- Habitat for Humanity
- Wells Fargo
- Theatre on the Ridge
- Valley Contractors Exchange
- Hope Plaza
- Camp Fire Collaborative
- Butte County Local Food Network
- Paradise Performing Arts Center
- Paradise Alliance Church
- Youth on the Ridge Community Foundation
- Paradise Stronger
- Community Housing Improvement Program (CHIP)
- 3CORE
- North Valley Community Foundation
- Construction Training Center

Thanks to Paradise Citizens Alliance for organizing and compiling many of the following updates.

1990

HABITAT FOR HUMANITY

Project Description
With the intent to serve Camp Fire survivors who want to return to Paradise but may not have all the resources necessary to build back on their own, Habitat for Humanity of Butte County has hugely impacted Paradise's affordable housing stock.

Habitat expects to remain focused on rebuilding efforts in Paradise for the next 20 years at the current rate. Partnered with Trilogy Construction, the increased rate of construction has helped bring many residents back. Currently, the organization controls 19 properties in various stages of production:

- Summer 2022
  - Entering production on ten homes
  - Construction to be completed on five homes
- Fall 2022
  - Entering production on two homes
  - Construction to be completed on one home

The typical timeline for each home is less than six months from Habitat's acquisition of the lot to move-in day. Two or three months before construction is completed, a family is matched to the home based on their ability to pay the mortgage and provide a down payment. The family is required to invest 250 sweat equity hours that can be achieved by assisting with construction and/or participating in community events, embedding them into the caring and resourceful Paradise community.

Obstacles
A few obstacles remain that hinder Habitat's ability to achieve its ambitious goals. Primarily, the organization needs more help to find and access government funding sources that help push home-building forward.

The enhanced speed of construction, thanks to the new partnership with Trilogy Construction, is a double-edged sword; instead of the traditional 4 to 5 months of construction, building time has been reduced to 2 to 3 months. While this increase in productivity is commendable, it also decreases the amount of time the organization has to match a family with the home and the window of time that the family has to meet the 250-hour volunteer requirement. Making this matching process more efficient is a priority moving forward.

Immediately after the Camp Fire, volunteers worldwide traveled to Paradise to help relieve pressure and rebuild. Those first responders have since moved on, but because the local workforce is still undersized for the demand, outside volunteer groups could still greatly impact rebuilding for Paradise residents with the greatest needs. However, outside volunteer groups require lots of infrastructure and housing that still does not exist locally.

Timeline
Approximately 20 years

Blue Flamingo

Local construction workers and volunteers assist in homebuilding.

Blue Flamingo

Increasing the amount of affordable housing stock in Paradise is Habitat's primary goal.

1991

WELLS FARGO

Project Description
Intending to educate community members about funding opportunities for rebuilding, the Paradise Wells Fargo team has helped bring down financial barriers to rebuilding. Understanding customers' short-term and long-term goals allow the team to identify appropriate strategies for families' financial needs.

THEATRE ON THE RIDGE

Project Description
Now celebrating its 47th year, Theatre on the Ridge offers the best in local talent through the performing arts. Since the Camp Fire, theater has returned to a challenging environment due to the COVID-19 Pandemic and continues to prioritize the safety and health of its staff, volunteers, and visitors. Despite this challenge, more than five shows have run since 2019.

Community volunteers and staff have been highly involved in rebuilding, maintaining, and beautifying the Theatre's facilities since the fire and will continue to enhance the premises indefinitely. The Theatre is committed to providing a vitally important piece of community and arts appreciation in Paradise in perpetuity.

VALLEY CONTRACTORS EXCHANGE (VCE)

Project Description

VCE is a group of contractors, developers, and construction professionals that are dedicated to the growth and prosperity of the local construction industry. VCE is a key player in assisting Paradise residents rebuild.

Multiple projects are in progress:

- Hands On Tools Mobile Construction Training
  - Mobile classroom with tool storage
  - Run by volunteer construction industry professionals
  - Focus on training young people in concrete finishing, mechanical (HVAC), electrical, and plumbing
  - Provides industry-recognized 80-hour NCCER CORE curriculum basic construction training
- Chico High Tiny Home Build for Bear Fire Survivor
  - VCE leads a group of Chico High School students in a Design Build Competition in Sacramento hosted by the Construction Industry Education Foundation (CIEF)
  - Provides education on Wildland Urban Interface (WUI) compliancy
- Chocolate Fest
  - VCE members assist local youth from Ridgeview and Paradise High School in a youth playhouse blitz build

Although primarily an support association for industry professionals, VCE is intended to be more than "a place for plans," with a focus on community outreach, education, and business enhancement.

HOPE PLAZA

Project Description
Intended as a gift to the Ridge community, Hope Plaza is a memorial of the Camp Fire tragedy as well as a show of gratitude for the lifesaving efforts of first responders.

Hope Plaza will be located at 6148 Skyway Drive, on the corner of Skyway and Foster on a lot known as the "triangle." This location serves as a gateway to the new downtown area.

Funded entirely through private donations and with the assistance of local pro-bono construction professionals, Hope Plaza is still fundraising. More than $233,000 has been raised to date. Construction is set to begin in May 2022.

Obstacles
Funding is ongoing. The original cost estimate of $1.5 million was significantly reduced thanks to the pro-bono work of local contractors, but more sponsorship will help see the project to the finish line.

Timeline
1 to 2 years

CAMP FIRE COLLABORATIVE

Project Description
The Camp Fire Collaborative (CFC) is a collection of over 50 nonprofit, private, and public organizations working to address the unmet needs of Camp Fire survivors outside of federal and state assistance. Since the fire, the CFC coordinated up to 11 Disaster Case Management (DCM) agencies with 100 case managers, contacting 8,000 households and opening more than 5,000 cases. Today, the CFC facilitates 5 DCM agencies with 36 case managers who manage 426 cases. The CFC anticipates the need to assist in another 1,000 cases over the next two years.

The CFC holds a weekly Simple Unmet Needs Roundtable (UMNRT) where DCMs present vetted cases requesting material assistance up to $15,000. To date, through multiple funding partners, the UMNRT has funded 1,400 cases to a total of $3.6 million. Additionally, CFC engages with the volunteer rebuild organizational partners to continue the focus of their efforts for Camp Fire survivors.

The CFC opened their new offices at 6241 Skyway in Paradise on August 5, 2022.

Obstacles
The CFC is relocating its office to the Ridge and is searching for a new location.

BUTTE COUNTY LOCAL FOOD NETWORK

Project Description

Founded on the idea that local food systems are critical in feeding healthy, growing communities, the Butte County Local Food Network has multiple projects in progress.

- Farmers Marketmobile
  - Every Sunday at Magalia Community Center, healthy, fresh food is available for purchase
  - Creates a link between farmers and communities that supports the health and economy of both
  - Offers an "Angel Program" for those still recovering from the financial impact of the Camp Fire
- The Garden BLITZ
  - Community members can purchase or apply to win a package that includes a raised bed box, plants, and other materials needed to install a garden
  - "Garden Raising" event with volunteers to assist in the construction of garden beds in community members' backyards
- Local Food Assessment
  - Thanks to donations, a study was conducted on Butte County's food system to help guide decision-making on further projects.

PARADISE PERFORMING ARTS CENTER

Project Description

Founded to provide a community performance space, the Paradise Performing Arts Center hosts the Northern California Ballet, Paradise Community Chorus, Paradise Community Band, and the Paradise Symphony Orchestra. Thanks to donations from the North Valley Community Foundation, facility upgrades including stage floor repair, painting, carpeting, and lighting have been the latest focus. The schedule of 2022 events is full of community and holiday performances, including Paradise Stronger and KZFR.

PARADISE ALLIANCE CHURCH

Project Description

With a focus on community-building events, the Paradise Alliance Church continues to supports Paradise residents throughout the rebuilding process.

Current events and support programs include:

- Thursday Night Community Dinners
- Samaritan's Purse home partnership and assistance program
- FRAP's fuel reduction and tree removal programs
- Personal and financial assistance for Camp Fire survivors
- Propane assistance for residents living in trailers
- New home celebration gifts
- Faith-based outreaches for all age groups.

YOUTH ON THE RIDGE COMMUNITY FOUNDATION

Project Description

Dedicated to the support of non-profit organizations that provide educational, enrichment, recreational, and leadership opportunities for youth in Paradise, the foundation raises vital funds and awareness through the annual Paradise Chocolate Fest.

Current beneficiaries of the Youth of the Ridge Community Foundation include:

- Achieve Charter School
- Boy Scouts Troop 316
- Children's Community Charter School
- Cub Scouts Troop 316
- Girl Scouts
- Gold Nugget Museum
- Mindful Littles
- Northern California Ballet
- Paradise Friends of the Library
- Paradise High School Football
- Paradise High School Woodshop

PARADISE STRONGER

Project Description
Paradise Stronger is an organization invested in the wellness of the residents on the ridge, offering functional fitness classes for all ages and abilities including seniors, disabled adults, and troubled teens at the Skyway facility.

Paradise Stronger is very active in the community through events including:

- Green Paradise Garden collaboration to complete a community teaching garden to be used for gardening, nutrition, and cooking classes
- Paradise Recreation & Parks District partnership to form the Ridge Hiking Association to lead monthly community hikes in and around Butte County
- Adventist Health collaboration to host monthly "Walk with a Doc" wellness education events
- A Simple Gesture relaunch that provides food for local pantries on the ridge
- Chocolate Chase and Phoenix 5K

COMMUNITY HOUSING IMPROVEMENT PROGRAM (CHIP)

Project Description

Following the rebuilding of Paradise Community Village, CHIP is proud to announce the expansion of a mutual self-help housing program in Paradise. Current Paradise lot-owners who lost their home in the Camp Fire and would like to partner with CHIP to rebuild may be eligible. CHIP is also currently involved with a few additional multi-family projects in the town, along with a mobile home park they have purchased for redevelopment.

CONSTRUCTION TRAINING CENTER

Project Description
Hands On Tools is a mobile construction training program hosted by the Valley Contractors Exchange with the intent to train the potential workforce in basic construction skills and safety while repairing or building community projects, assisting volunteer build organizations, or for people in need that have been impacted by the Camp Fire. The Hands on Tools Mobile Construction Training (MCT) program has a four-pronged approach to recruiting and upskilling the construction workforce:

- Introduction to construction: providing training and mentorship to youth to empower, engage, and employ them in well playing, upwardly mobile construction jobs
- Mobile Construction Training: providing basic construction safety and skills training, while assisting with community projects or volunteer build organizations
- Mobile UpSkill Training: providing upskilling in trades based on locally identified industry needs
- Construction Industry Safety Training: as required by CalOSHA

To date, the Mobile Construction Training program has introduced construction as a career choice to over 900 students in Butte and Glen Counties. The Valley Contractors Exchange will continue to pursue funding opportunities as the program continues to grow and thrive.

ONLINE SURVEY

Resident feedback regarding on-going projects and changing needs in the community.

To gather feedback on the current state of progress and the general reception of the recovery projects first outlined in 2019, Paradise residents were asked to complete an online survey. The questions on this survey covered a wide range of topics, including all five categories of recovery projects (Safer, Welcoming, Stronger, Better, and Greener), as well as some administrative and engagement questions to gauge the effectiveness of community outreach methods.

The residents' answers to these questions guided the development of the new and in-progress recovery projects. The following pages reference all the responses to these questions received via the online survey.

1. Hello. Please tell us about yourself:

PUBLIC MEETING

Resident feedback on the first draft of new and updated recovery projects.

Creating an open dialogue between community members, town leadership, and the design team is imperative to update the recovery project list accurately. The first draft of recovery project updates was presented at an open forum to gauge specific concerns on each topic. Each attendee was asked to rate each project as positive (green if Paradise resident, blue if not) or negative (red if Paradise resident, yellow if not). Additionally, sticky notes were provided for specific comments.

Recovery projects were adjusted, added, and/or eliminated using the attendees' feedback to best achieve residents' immediate and long-term needs. The following pages are images of the boards shared at the public meeting, with the feedback recorded directly on the board and with volunteer facilitators.

General Comments

What else should we know about the Town of Paradise's recovery progress?

Comments* from April 28 Public Meeting

- Thank you Town of Paradise with moving forward
- Sustainable, fire wise, ecological education, community center, TEK, camp fire restoration project
- Indoor recreation (bowling, movie theater)
- When sewers come in businesses will need financial assistance for hook-up/ connection
- Movie theater, more drive in restaurants
- More signs for community events. Re-use old signs?
- Market to bring commerce and business
- Waterpark
- Community Rec Center with indoor facilities
- Yard wast facility & recycle yard
- Town owned solar
- independent renewable energy systems
- Reseeding forests
- Community art for tourism branding
- Keep up the good work!
- Skate park
- Indoor/outdoor pool
- California Constitution Article 1 Section 28(b)(17)
- We need things for youth to do on the Ridge-Skate Park
- Stop water from leaving our area

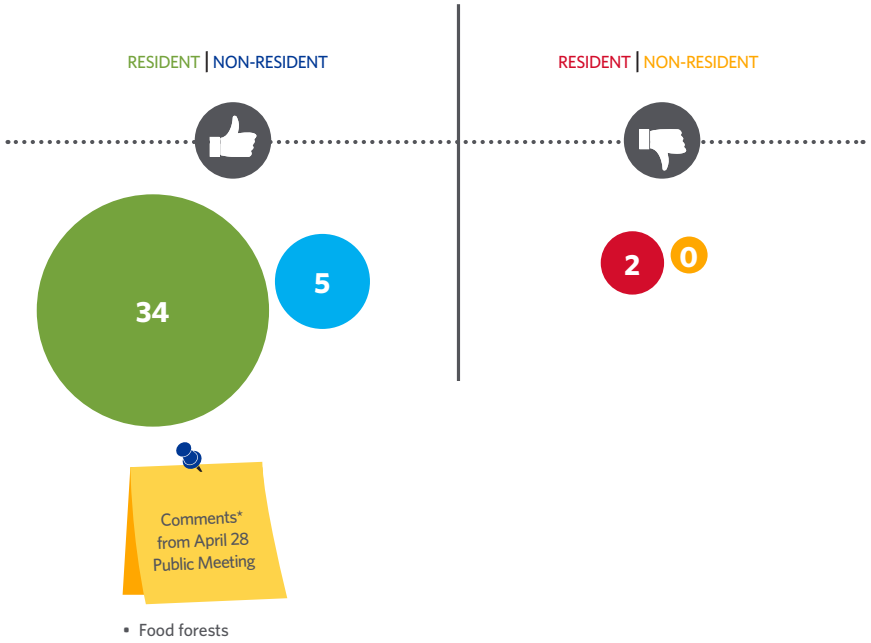
Fire Breaks

Recovery Project

Create a fire break between development and the wildlands as a way to reduce fire risk, especially along the east side of Town. The fire break could also double as an area for hiking trails. Paradise Recreation and Parks District (PRPD) should be the lead in securing funding, acquiring property/easements, and maintaining the break.



** Information has not been fact-checked by the Town of Paradise*

SAFER WELCOMING STRONGER BETTER GREENER

Prioritizing Road Reconstruction

Recovery Project

Acknowledge resident frustration with the damaged condition of streets by improving community awareness on the reconstruction schedule. The Town should make a Paving Map available on their website and coordinate with PG&E, Comcast, AT&T, and PID to create an online interactive tool for residents to see the schedule for undergrounding on a street-by-street basis.

Comments* from April 28 Public Meeting

- MOU County/Town road decisions
- Easier to read maps
- Improve communication between construction/town and residents
- Green utility progress meter
- More widenings

SAFER WELCOMING STRONGER BETTER GREENER

Firesafe Home Improvements

Recovery Project

Publish a list of recommendations that follow future Wildland-Urban Interface (WUI) Code updates (as coordinated by the Insurance Institute for Business & Home Safety (IBHS) and seek grants for fire safe home improvements to increase safety and reduce homeowners' insurance premiums. The Town should take the lead in educating residents and continue to seek subsidy sources that would allow Paradise homeowners to make additional fire safe home improvements.

Contractor Accountability

Recovery Project

Address the fact that approximately one-third of survey respondents report that they have been taken advantage of by a contractor working on their property since the fire. The Contractor State Licensing Board (CSLB) has enforcement ability in this case. Possible initiatives could include:

- Have CSLB step up enforcement efforts
- Start an online community online forum where residents can post reviews
- Require contractors to post their contact information on jobsites
- Confirm contractors are in good standing at the time they pull permits

Comments* from April 28 Public Meeting

- No brainer, of course
- Private road damage from construction and no plans/money to repair?
- Fired contractors had good rating with CSLB
- Anyone doing (?) management must be LIC and town needs to verify INS workers comp etc
- Town LIC is required for everything, but no enforcement
- Owner/Builder allowed for unlicensed contracting
- Put down $200,000+ and contractor vanished
- No licensed required for fire prevention provided by State – a problem
- FEMA & OES Damage
- By your contractor or 3rd party contractor
- Aurora Ridge Homes

New Insurance Alternatives

Recovery Project

Find insurance alternatives to help protect against limited options and rising insurance costs in the Wildland-Urban Interface (WUI). Community-wide fire safe improvements can reduce risk and thereby lower insurance premiums. As rebuilding progresses, options to be explored include:

- Create community-based insurance
- Collaborate with insurance companies on fire safe improvements
- Amend the Fair Plan so that it allows residents to get a mortgage and covers larger multi-family developments

SAFER | **WELCOMING** | STRONGER | BETTER | GREENER

Focus on Attainable & Workforce Housing

Recovery Project

Priority should be given to the re-creation of lost attainable and workforce housing that is affordable to families with a median income between 80 to 180% of Butte County Area Median Income (AMI). Planning for attainable/workforce rental units along the planned sewer line should be done concurrently with the sewer project to accelerate the timeline. Bringing back Manufactured Home Communities could also underpin this initiative.

Comments* from April 28 Public Meeting

- No brainer, of course
- Includes attainable single-family homes
- Top priority — gentrification only serves a small percent — affordable, sustainable workers need built housing
- Can't afford housing for my workers — makes it hard to retain them
- Rescind 750sf minimum housing size. Tiny houses are part of the solution!
- Always felt like we had enough affordable housing and especially apartments

** Information has not been fact-checked by the Town of Paradise*

SAFER | **WELCOMING** | STRONGER | BETTER | GREENER

Manufactured Home Communities

Recovery Project

Tackle the factors that are causing the rebuilding of Manufactured Home Communities (regulated by the state) to lag behind scattered site home building. Hurdles include lack of insurance proceeds, regrading of home sites, replacing private roads, undergrounding on-site electric and communication, and repairing on-site sewer treatment.

Subsidy is required to keep site costs affordable to residents. Flexibility should be built into CDBG DR funding by California Department of Housing and Community Development (HCD) to permit state subsidy.

Comments* from April 28 Public Meeting

- Loved new welcome sign and bring back Clark Road sign "Welcome to Paradise"
- Bring back "You are Ascending into Paradise" on Clark Road
- Fine balance between safety and erosion control
- Would like to see more shade structures in lieu of trees
- Progress would have a requirement for landscape
- Hold educational meetings/workshops on best native and drought resistant plants
- We need a monarch park
- Paradise Garden Club volunteers to help organize plantings
- We need some kind of theme
- Something special that identifies us downtown or along the streets
- Be careful when planting trees close together when they mature
- Beautify the bike path with flowers, shrubs Milkweed?
- Partner with the Camp Fire Restoration Project
- Towns need to do better education on "why" need to clear vegetation
- Would rather be safer than beautiful
- A flyer that says why we need to be cleared
- Not charge for the organization medallions on "Welcome" sign to non-profits
- Coordinate between Town and Butte Co. to remove trees on private property that are in the county
- Need to clear the rest of the dead trees off private property

** Information has not been fact-checked by the Town of Paradise*

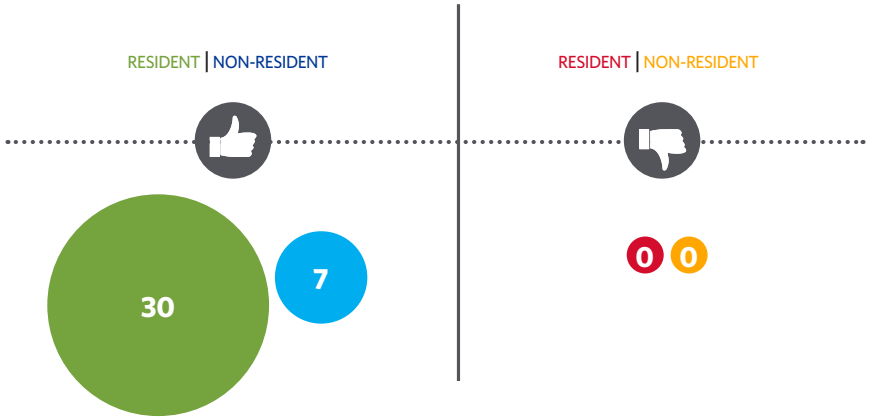
Walkability & Bikeability

Recovery Project

Connect walking and biking facilities into neighborhoods and create extensions of the multi-use path network that is already being implemented along main public streets. Given that this was identified as a high priority for survey respondents, the Town should look for opportunities for pedestrian and bike infrastructure, like sidewalks and multi-use paths, as streets are rebuilt.



Comments* from April 28 Public Meeting

- Important vital
- Great for community as a whole
- Safety — Safer streets/Safety
- Yes, of course! Yes
- Ability to access golf carts? Lights along paths
- Promotes health
- Don't even have to think about it. No sidewalk is dangerous
- My kids want to get to school safely & be able to walk/bike
- No brainer good idea
- Would help businesses if people could walk there
- Love the new walking path by PRES
- Safety
- Yes! Connect bike paths to other areas
- Not useful for my age and disabilities
- Current bike trail not used enough
- Nice, but not as important as other things

COMMUNITY DEVELOPMENT BLOCK GRANT-DISASTER RECOVERY (CDBG-DR) PRIORITY PROJECTS

The following is a summary of project submitted by the Town for CDBG-DR funding

2062

Town of Paradise
Public Works/Engineering Department
5555 Skyway
Paradise, CA 95969
(530) 872-6291

Project Name:

Sewer Project

Project Priority:

#1

Project Scope:

The Paradise Sewer Project includes all of the components and activities necessary to convert the core part of the Town (the Sewer Service Area) from on-site septic tank treatment to wastewater conveyance and treatment at the Chico Water Pollution Control Plant (WPCP).

Project Description:

The Paradise Sewer Project consists of three primary components: 1) a wastewater collection system consisting of service connections of individual parcels within a designated service area to sewer lines and lift stations; 2) an 18-mile export pipeline to convey Paradise wastewater to the Chico WPCP; and 3) connection to the Chico WPCP where the Paradise wastewater will be treated.

Funding:

Total Cost: $184,675,000

Pre-Construction Cost: $32,326,000

Construction Cost: $152,349,000

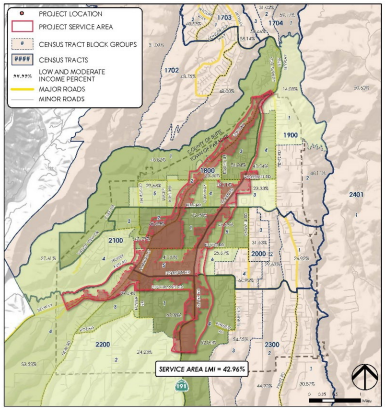
Existing Funding Resource: DFA/USDA

Unmet Need Pre-Construction: $29,926,000

Unmet Need Construction: $152,349,000

Long Term Recover Plan Tier and Project:

1 – Sewer System



Town of Paradise

5555 Skyway
Paradise, CA 95969
(530) 872-6291

Project Name:

On-System Road Rehabilitation

Project Priority:

#2

Project Scope:

The On-System Road Rehabilitation Project repairs damaged sections of roadway and re-striping when necessary to rehabilitate 32 miles of roadway segments of on-system roadway. The project includes a combination of pavement rehabilitation strategies depending on the severity of damage, modifications to nine signalized intersections, and construction of 48 ADA compliant curb ramps.

Project Description:

The project will repair 32 miles of on-system roadways that sustained heavy damage in the wake of the Camp Fire and debris removal efforts. The critical condition of the current roadways risks pavement failure and creates unsafe road conditions. The project will improve safety along public roads that are part of the federal-aid system. These arterial roadways are either evacuation routes or primary east-west connections to the evacuation routes.

Funding:

Total Cost: $55,439,200

Pre-Construction Cost: $3,504,000

Construction Cost: $51,935,200

Existing Funding Resource: FHWA-Emergency Relief

Unmet Need Pre-Construction: $876,000

Unmet Need Construction: $12,983,800

Project Name:

Off-System Road Rehabilitation

Project Priority:

#3

Project Scope:

The Off-System Road Rehabilitation Project repairs damaged sections of roadway and re-striping when necessary to rehabilitate 47 miles of roadway segments of on-system roadway. The project also upgrades non-compliant ADA curb ramps.

Project Description:

The project will repair 47 miles of off-system roadways that sustained heavy damage in the wake of the Camp Fire. The critical condition of the current roadways risks pavement failure and creates unsafe road conditions. The project will improve safety along public roads that are not part of the federal-aid system. These roads include local roads and rural minor collectors, which provide evacuation routes connecting to the federal-aid system.

Funding:

Total Cost: $45,043,700

Pre-Construction Cost: $3,064,000

Construction Cost: $41,979,700

Existing Funding Resource: FEMA – Public Assistance

Unmet Need Pre-Construction: $766,000

Public Works/Engineering Department
5555 Skyway
Paradise, CA 95969
(530) 872-6291

Project Name:

Pearson Class I

Project Priority:

#3

Project Scope:

The Pearson Class I Path project will construct 2.3-miles of Class I facility and 50 ADA ramps from Clark Road to Pentz Road.

Project Description:

The project proposes a separated Class I facility to improve access to key destinations including Downtown Paradise, Paradise Memorial Park, and K-12 schools. The Class I facility will be 10-feet wide to provide bi-directional lanes for people walking and bicycling, will include dark sky pathway lighting to retain the Town's rural characteristics, and will provide 50 ADA ramps to improve mobility for people in wheelchairs and with strollers.

Funding:

Total Cost: $13,554,857

Pre-Construction Cost: $1,254,100

Construction Cost: $12,300,757

Existing Funding Resource: None

Unmet Need Pre-Construction: $1,254,100

Unmet Need Construction: $12,300,757

Project Name:

On-System Sign Replacement

Project Priority:

#4

Project Scope:

The On-System Sign Replacement Project involves sign removal, sign installation and reset of roadside signs and flashing beacons at 122 locations damaged in the 2018 Camp Fire. The project is partially funded through FHWA Emergency Relief.

Project Description:

The project will replace damaged roadway signs along federal aid routes to improve safety. Signage types include stop, no parking, signs alerting to fire station access, speed limit, curves ahead, street markers, prepare to stop/stop ahead, merge left, school crossing, flashing beacons, hospital/police, no outlet, wildlife crossing, etc.

Funding:

Total Cost: $285,200

Pre-Construction Cost: $26,000

Construction Cost: $259,200

Existing Funding Resource: FHWA-Emergency Relief

Unmet Need Pre-Construction: $6,500

Unmet Need Construction: $64,800

Project Name:

Roe Road Phase 1

Project Priority:

#4

Project Scope:

Roe Road Phase 1 Project will construct a new three lane 1.25-mile roadway with wide shoulders. The project will include a Class I multi-use pathway, ADA curb ramps, storm drain infrastructure, and intersections with Pentz Road, Edgewood Lane, and South Libby Road.

Project Description:

Roe Road Phase 1 project is part of a five-phase project to construct a new east-west roadway connection between Skyway and Pentz Road. The proposed project will construct 1.25-miles of roadway between South Libby Road and Pentz Road to improve circulation and connectivity throughout the Town and provide alternative ingress/egress routes for residential neighborhoods. The project will also construct a parallel Class I bikeway for travel by people walking and bicycling and provides first responders a dedicated bi-directional travel lane during emergency events.

Funding:

Total Cost: $60,400,000

Pre-Construction Cost: $14,500,000

Construction Cost: $45,900,000

Existing Funding Resource: None

Unmet Need Pre-Construction: $14,500,000

Unmet Need Construction: $45,900,000

Town of Paradise
Public Works/Engineering Department
5555 Skyway
Paradise, CA 95969
(530) 872-6291

Project Name:

Pearson Road Reconfiguration

Project Priority:

#5

Project Scope:

The Pearson Road Reconfiguration project involves restriping the roadway, adding a Class II bike lane, pavement slurry seal, and sidewalk and curb ramp reconstruction in compliance with current ADA standards along a 0.17-mile segment of roadway.

Project Description:

The Pearson Road Reconfiguration project will redefine and restripe the existing space between existing curb lines to provide increased evacuation capacity, add defined space for bicyclists and/or pedestrians, enhance the business setting, and provide a safer overall street environment than encourages commercial redevelopment. The project includes slurry seal and reconstructing pedestrian ramps to ADA standards and minor sidewalk improvements where necessary.

Funding:

Total Cost: $600,000
Pre-Construction Cost: $78,300
Construction Cost: $521,700
Existing Funding Resource: None

Project Name:

Oliver Curve Pathway Phase I

Project Priority:

#32

Project Scope:

The Oliver Curve Pathway Phase I project will construct 3,696 linear feet of a 10-foot-wide Class I multi-use facility complete with 2-foot-wide shoulders, lighting, and storm drain accommodations. Additional improvements include 17 new ADA ramps, 1 new crosswalk, and retaining walls.

Project Description:

The Oliver Curve Pathway Project Phase I proposes a Class I pathway on Oliver Road, stretching three-quarters of a mile from Skyway to Bille Road. The multi-use facility is 10 feet wide with 2-foot shoulders and includes 17 ADA ramps, pathway lighting, and retaining walls along Honey Run Creek. The project will provide improved access for people walking and bicycling to access destinations throughout Town including improved connectivity to the Yellowstone Kelly Heritage Trail.

Funding:

Total Cost: $5,403,547

Pre-Construction Cost: $699,100

Construction Cost: $4,704,447

Existing Funding Resource: Congestion Mitigation and Air Quality

Project Name:

Pentz Road Widening

Project Priority:

#7

Project Scope:

The Pentz Road Widening project will widen Pentz Road from Skyway to the southern Town limits to include a 12-foot-wide center turn lane, widened shoulders, and a multi-use pathway. The project builds upon the FHWA disaster recovery efforts that are rehabilitating the existing roadway pavement.

Project Description:

Pentz Road serves as a primary north-south ingress/egress route for Town residents. Widening the road will improve evacuation efficiency along this route, provide an adequate shoulder to park disabled vehicles and reduce fire fuel proximity to the traveling public. The project proposes a 10-foot-wide Class I multi-use facility with 2-foot shoulders, lighting, storm drain accommodations, ADA ramps, and crossing surface improvements.

Funding:

#8

Project Scope:

The Early Warning System project will design, install, and implement a network of emergency warning systems for the purpose of rapid hazard notification.

Project Description:

This project will provide an early warning system with multiple notification channels, including IPAWS/WEA, AM Radio, SMS, social media, and outdoor siren/speakers capable of broadcasting audible alert tones and clear voice messages. The siren/speaker system will be installed in 21 locations throughout Paradise. The system is intended to have battery backup, AC, solar power, user friendly cloud-based software, and a reliable connection that is not reliant on local power or cell towers.

Funding:

Total Cost: $3,207,400

Pre-Construction Cost: $7,400

Construction Cost: $3,026,875

Project Name:

Elliott Road Extension

Project Priority:

#9

Project Scope:

The Elliott Road Extension Project will extend the existing roadway 0.7-miles from its easterly terminus to Pentz Road. The extension will include a two-lane roadway with sidewalks, bike lanes, and lighting.

Project Description:

The project will extend Elliott Road 0.7-miles east to Pentz Road and provide alternative ingress/egress for the neighborhood as well as interconnectivity between primary evacuation routes within Town. The project also supports daily multimodal access and circulation needs of the community. The project improves access to evacuation routes, completes missing road segments, reduces dead-end streets, reduces fire fuel proximity to the roadway, and is consistent with Town Long-Term Recovery Plan.

Funding:

Total Cost: $7,050,742

Project Name:

Pentz/Pearson Intersection Improvements

Project Priority:

#9

Project Scope:

The Pentz/Pearson Intersection Improvements project will increase capacity with the construction of additional turn lanes and will provide for large vehicle turning radius. The project will require right-of-way acquisition.

Project Description:

The Pentz/Pearson Intersection Improvements project will construct additional turn lanes and a traffic signal system or a roundabout at the existing narrow, All-Way Stop Controlled Pentz/Pearson intersection. Additional capacity and large vehicle turning space is needed at this location for more efficient emergency services. The control type decision will be made early, during the engineering feasibility study phase of the project. The project includes right-of-way acquisition in the intersection vicinity which is required to accommodate the larger intersection footprint that is anticipated.

Project Name:

Neal Road Rehabilitation

Project Priority:

#10

Project Scope:

The project rehabilitates approximately 1.63 miles of Neal Road within the Town limits between Skyway and Wayland. The project work includes 1-inch Cold Plane and 3-inch asphalt concrete (AC) overlay for the entire roadway section with digout areas of 12-inch asphalt AC for sections with severe rutting and cracking damage.

Project Description:

Neal Road is an on-system, principal arterial, major connector route in from the Town of Paradise to State Route 99 (SR 99) and it is designated as a federal aid route within the Town Limits. Neal Road is one of the primary routes between the Neal Road Landfill just east of SR 99 and the Town. The rehabilitation consists of asphalt concrete overlays and structural section repair (digouts) for severely damaged locations.

Buschmann Extension

Project Priority:

#12

Project Scope:

Buschmann Extension project will construct a 0.74-mile two lane road extension from easterly terminus at Clark Road (State Route 191) to South Libby Road. The project will include two travel lanes, wide shoulders, sidewalks, storm drainage infrastructure, and bridge over Clear Creek.

Project Description:

Bushmann Road is an east-west route located south of Pearson Road, surrounded by mixed land uses including residences, schools, and parks. The route currently accesses one evacuation route within Town, and the project proposes to extend Buschmann Road 0.74-miles east to connect with residential dead-end street South Libby Road. The project will provide ingress/egress routes for neighborhoods in the South Libby Road area and provide more direct access to an evacuation route, Clark Road.

Project Name:

Sawmill Extension South

Project Priority:

#13

Project Scope:

The Sawmill Road Extension South project constructs a 0.6-mile two-lane roadway extension from its southerly terminus to connect to South Libby Road. The Project will include wide shoulders, Class I path, and storm drainage infrastructure.

Project Description:

Sawmill Road is a dead-end residential street extending south of Pearson Road, resulting in limited ingress/egress options for residents on Sawmill Road as well as residents on 17 directly adjoining dead-end residential streets. The existing network creates hazardous conditions where high volumes of vehicle traffic overload Sawmill Road to access evacuation routes. The project will extend Sawmill Road by 0.6-miles to connect with South Libby Road and provide an alternative ingress/egress for the neighborhood residents surrounding both roadways as well as access to the future Roe Road Phase 1.

Forest Service Road Improvements & Extension

Project Priority:

#22

Project Scope:

The project acquires the right of way and improves approximately 1,940 feet of Forest Service Road by removing a layer of existing pavement via Cold Plane (CP) and resurfacing with hot mix asphalt overlay (HMA). In addition, the project extends the road from its current east-west alignment 900 feet west to connect to Skyway. Improvements include paving, striping, new shoulders, bike lane, and drainage facilities.

Project Description:

The project improves and extends Forest Service Road, an east-west route connecting Clark Road to a public roadway. Butte County Fire Station 35 is at the corner of Forest Service Road and Moore Road. The improved roadway will provide a missing connection between Skyway and Clark Road, primary evacuation routes for the community.

#23

Project Scope:

The General Plan Update project will complete a comprehensive General Plan and Zoning Ordinance update. The Town's General Plan has not been updated since 1994.

Project Description:

Updating development goals and reaffirming land use patterns is central to recovery. A comprehensive General Plan Update will be a community-driven process that allows for meaningful community engagement and aligns local priorities and needs to post-fire reconstruction.

Funding:

Project Name:

Changeable Message Sign Network

Project Priority:

#24

Project Scope:

The Changeable Message Sign Network project provides approximately 10 mobile, changeable message signs equipped with remote and manual programming capabilities that can be mounted to trailers as needed.

Project Description:

The Changeable Message Sign Network project will provide approximately 10 mobile (trailer mounted) changeable message signs to be deployed along evacuation routes and at key intersections in the Town of Paradise during emergency events. The signs are intended to be equipped with remote programming/controls, noting that wireless communications could potentially be down during an emergency and manual programming would then be required. Some signs may be used regularly or during pending events to relay important information.

Funding:

Total Cost: $130,000

Pre-Construction Cost: $15,000

Construction Cost: $115,000

Project Name:

Sewer Service Area Specific Plan

Project Priority:

#24

Project Scope:

The Sewer Service Area Specific Plan project will analyze the impacts of installing a sewer system in the Town's Downtown and Commercial areas.

Project Description:

The project will study the impacts of constructing a sewer system along Skyway, Pearson Road, and Clark Road as well as in Downtown. The specific plan will study how the sewer system will influence commercial and residential rebuilding efforts, land use patterns, and economic revitalization.

Funding:

Total Cost: $800,000

Pre-Construction Cost: $800,000

Construction Cost: N/A

Paradise, CA 95969
(530) 872-6291

Project Name:

Clark Spot Widening

Project Priority:

#25

Project Scope:

The Clark Road Spot Widening Project will widen 0.22-miles of Clark Road between Wagstaff Road and Bille Road to include a 12-foot wide two way left turn lane.

Project Description:

Clark Road serves as a primary evacuation route for not only the Town but also the communities of Magalia, Paradise Pines, DeSabla, Lovelock, and Sterling City. There is a critical chokepoint between Wagstaff Road and Bille Road. The chokepoint is a result of a one-lane reduction from five to four lanes, where the roadway loses a two way left turn lane for 0.22-miles. During evacuation events, Clark Road will serve one-way vehicle throughput, whereas the lane reduction will force lane merging and cause evacuation efficiency delays.

Funding:

Total Cost: $1,684,300

Pre-Construction Cost: $194,300

Construction Cost: $1,490,000

Project Name:

Clark Class I

Project Priority:

#26

Project Scope:

The Clark Road Class I Path Project will construct 3.4-miles of paved Class I facility, 12 ADA camps, 1 new crosswalk, and 1 rectangular rapid flashing beacon (RRFB) from Skyway to Pearson Road.

Project Description:

The project proposes a separated Class I facility to improve connections to key destinations including Downtown Paradise, Paradise Memorial Park, Terre Ashe Recreation Center, and Moore Road Park. The Class I facility will be 10-feet wide to provide bi-directional lanes for people walking and bicycling, will include dark sky pathway lighting to retain the Town's rural characteristics, and will provide 12 ADA ramps to improve mobility for people in wheelchairs and with strollers. A new crosswalk with a RRFB will be installed to improve visibility of pedestrians and bicyclists at the crossing.

Libby Road Extension

Project Priority:

#26

Project Scope:

The Libby Road Extension will construct a 0.25-mile facility between Nunneley Road and Elliott Road. The project will include two travel lanes, wide shoulders, sidewalks, and storm drainage infrastructure.

Project Description:

Libby Road is a north-south corridor within the Town with a critical missing link between Nunneley Road and Elliott Road. The 0.25-mile missing roadway segment will be completed by the proposed project to provide Town residents an alternative ingress/egress route connecting with evacuation corridors. The project will also improve the existing Libby Road from Pearson Road to Nunneley Road.

Funding:

Project Name:

On-System Hardscape Replacement

Project Priority:

#26

Project Scope:

The On-System Hardscape Replacement Project involves removal and replacement of damaged concrete curb, gutter, and sidewalk at 22 locations along on-system roads that are part of the federal-aid system. The project is partially funded through FHWA Emergency Relief.

Project Description:

The project will repair damaged hardscape along on-system roads to improve safety. The Town's hardscape sustained heavy damage in the wake of the Camp fire. Damaged areas pose a hazard to pedestrians and bicyclists. Consistent with the Long-Term Recovery Plan, the project repairs will support an interconnected path system and walkable downtown.

Funding:

Total Cost: $767,100

Shay Lane Extension

Project Priority:

#27

Project Scope:

The Shay Lane Extension project constructs a 0.07-mile roadway from its southerly terminus to Center Pine Drive. The extension will consist of a two-lane roadway with wide shoulders, sidewalks, and storm drainage infrastructure.

Project Description:

The project will extend Shay Lane by 0.07-miles to connect with Center Pine Drive and Stark Lane, providing an alternative ingress/egress route to connect with Pentz Road. The project improves access to evacuation routes, completes missing road segments, reduces dead-end streets, reduces fire fuel proximity to the roadway and is consistent with the Town Long-Term Recovery Plan.

Funding:

Total Cost: $849,633

Pre-Construction Cost: $348,128

Storm Drain Master Plan

Project Priority:

#27

Project Scope:

Develop a master plan to guide the implementation of new comprehensive drainage infrastructure improvements that will provide safe and effective management of storm water runoff. The plan will review 100 miles of existing stormwater infrastructure and study future needs, including impacts from the 2018 Camp Fire.

Project Description:

The project will develop a Storm Drain Master plan to effectively implement drainage and infrastructure improvements to protect the Town from storm water runoff. The plan would provide the Town with critical information to prioritize and implement needed storm water infrastructure improvements that will decrease the quantity of runoff, reduce risk of flooding and improve the quality of water.

Project Name:

Moore Road Improvements

Project Priority:

#28

Project Scope:

The project acquires the right of way and improves 2,413.12 linear feet (approximately 0.5 miles) of Moore Road to a public roadway. The project removes a layer of existing pavement via Cold Plane (CP) and resurfaces with hot mix asphalt overlay (HMA). Improvements include paving, pavement marking, sidewalks, and storm drain infrastructure.

Project Description:

The project improves Moore Road, a north-south route connecting Forest Service Road through Herb Lane to the northern limit of Skyway. Rehabilitation of Moore Road will improve egress/ingress of emergency response vehicles. This project combined with the Forest Service Road Improvements & Extension project, increase access to Skyway and Clark Road are primary evacuation routes for the community.

Residential Ignition Resistant Improvement Program

Project Priority:

#28

Project Scope:

The Residential Ignition Resistant Improvement Program will update protocols for assessing compliance with current codes and standards for structures that survived the Camp Fire. It will also develop improvements as well as establish the process for improvement applications/application approval and subsequent improvement implementation.

Project Description:

This project is split between two phases. Phase one is update protocols for assessing compliance with current codes and standards for structures that survived the Camp Fire. After the process is developed, the Town would then begin accepting and approval of applications through completion of the actual project. Phase two will consist of approving projects and notifying the homeowner to proceed with the approved scope of work.

Project Name:

Toyon Lane Reconstruction

Project Priority:

#29

Project Scope:

The scope includes acquisition of a 0.5 mile long, privately-owned roadway and reconstruction of the roadway to two lanes with shoulders to improve circulation, emergency preparedness, response, and provide an additional north-south evacuation route for area residents.

Project Description:

Toyon Lane is currently a private road that connects Roe Road and Foster Road. It is approximately 0.5 miles long. Acquiring the road and reconstructing it to Town standards will improve circulation and access by providing another north-south connector that will increase evacuation capacity, improve public safety, and provide compatibility for affordable multi-family housing for the region. In addition, an extension of Roe Road is planned to establish a cross-town connection to Neal Road, a primary evacuation route.

Traffic Management Center

Project Priority:

#30

Project Scope:

The Traffic Management Center project will construct a central Traffic Management Center (TMC) hub, including acquiring appropriate computer and software systems and will require hiring trained personnel to monitor signals.

Project Description:

The project would construct a Traffic Management Center (TMC) for the Town of Paradise. The TMC will be the central hub for Town control of the roadway network during an emergency, particularly the signalized intersections (approximately 16 signals). Within the TMC, trained personnel will be able to monitor traffic signals in-real time and manage the signals and roadway system. TMC personnel will have the ability to share information and coordinate with state and local authorities during emergencies.

Town of Paradise

Council Agenda Summary

Date: November 7, 2022

Agenda Item: 6(j)

ORIGINATED BY:	Colette Curtis, Recovery and Economic Development Director
REVIEWED BY:	Kevin Phillips, Town Manager
SUBJECT:	Business Assistance Program Guidelines
LONG TERM RECOVERY PLAN:	Yes

COUNCIL ACTION REQUESTED:

1. Consider approving the guidelines for the Commercial Sign Removal Program; and the Business Investment Grant Program; or
2. Give alternate direction to staff. (ROLL CALL VOTE)

Background:

On July 12, 2022, Paradise Town Council approved the 2022-23 Budget, which included $200,000 for business assistance programs from the American Rescue Plan Act (ARPA) funds. Generally, these funds were designated to be used for:

1. A program to remove commercial signs after the Camp Fire.
2. A program or programs to assist new and existing businesses in Paradise.

On August 9 ,2022, Paradise Town Council appointed two of its members to sit on a committee to draft guidelines for these programs – Councilmember Jody Jones and Councilmember Steve Culleton. The committee met four times between September 14 and October 27, 2022 and was comprised of representatives from the Chamber of Commerce, 3CORE, Councilmembers Jones and Culleton, and Town staff.

Analysis:

Through discussion, the Business Assistance Program Committee developed guidelines for two programs to assist local Paradise businesses:

1. The Commercial Sign Removal Program**:** A grant program which will pay for the removal of commercial signs left after the fire that are either damaged or no longer associated with a standing business on the property. $100,000 total has been allocated for this program, and applications will be accepted until funds are expended.
2. The Business Investment Grant Program: A program for new and existing businesses which provides $5,000 grants to new and existing businesses as an incentive and a thank you for investing in Paradise. This grant has two components:
    - **a.** For newly established and existing businesses: $75,000 total available on a lottery basis.
    - **b.** For new businesses: $25,000 total available until funds are expended.

The full program guidelines and applications are available following this agenda summary.

Both programs will be advertised directly to business and property owners, as well as broadly for general community awareness.

Financial Impact:

These programs will be funded by American Rescue Plan Act (ARPA) Funds and have been budgeted in the Recovery and Economic Development Department budget.

Town of Paradise
Business Investment Grant (BIG) Program Guidelines

The Town of Paradise Business Investment Grant Program is funded through the American Rescue Plan Act (ARPA) of 2021. The purpose of this program is to financially assist existing, new, and returning businesses in Paradise after the 2018 Camp Fire.

Assistance through this program is provided in the form of a grant of $5,000. After the application period, grants will be awarded on a lottery basis until all allocated funds have been exhausted. A total of $100,000 has been allocated for this program. $75,000 will be available through the lottery process to existing and newly opened businesses. $25,000 will be retained to be granted to new businesses as they open.

This is a grant and will be reported to the Internal Revenue Service as Income. Awardees will be required to execute a grant agreement and W-9.

Eligible business applicants must meet the following criteria:

- For-profit business located within the Town of Paradise Town limits.
- Evidence of a current business license, and if applicable, a Fictitious Business Name Statement.
- Business owners who own property or who lease property.
- If an applicant is a tenant, a copy of the lease will also be required.
- New businesses must show an active building permit, certificate of occupancy, lease, or proof of property ownership.

The following will make a business ineligible for funding through this program:

- Having previously received federal funding through CARES or ARPA funding for the same purpose. Applicant must self-attest to not using these grant funds for the same purpose as other federal, state, or local funding received.
- Debarred by the federal government. *
- Outstanding local, state, federal tax liens or judgements. *

**Verified through credit check. No minimum credit score required.*

Town of Paradise
Commercial Sign Removal Program Guidelines

The Town of Paradise Commercial Sign Removal Program (Program) is funded through the American Rescue Plan Act (ARPA) of 2021. The purpose of this Program is to assist former and current Paradise businesses with the cost to remove free-standing commercial signs after the 2018 Camp Fire. After the fire, many commercial signs remained, damaged and undamaged, on properties without a standing commercial structure. The Town of Paradise Commercial Sign Removal Program will pay for free-standing commercial signs to be removed which:

1. Were damaged by the Camp Fire.
2. Are undamaged but are located on a vacant property.

Grants will be awarded on a first come first serve basis, until all allocated funds have been expended. A total of $100,000 has been allocated for this program. After an application is approved, the Town will work with the business and contractor to have the sign removed and will pay the contractor directly for the service.

Contractors will be selected by the applicant and must hold an active license for sign removal (C-21 License – Building Moving and Demolition). Appropriately licensed contractors may be found on the Contractors State Licensing Board website: https://www.cslb.ca.gov/OnlineServices/CheckLicenseII/ZipCodeSearch.aspx.

This is a grant and will be reported to the Internal Revenue Service as Income. Awardees will be required to execute a grant agreement and W-9.

Eligible business applicants must meet the following criteria:

- Sign is located within Town of Paradise Town limits.
- Property owners or business owners who own property or who lease property.
- If an applicant is a tenant, a Landlord's Consent must be provided confirming the property owner's approval of the sign removal. A copy of the lease will also be required.
- Applicant must have no outstanding local, state, or federal tax liens nor judgements. *
- Applicant must not be debarred by the federal government. *

**Verified through credit check. No minimum credit score required.*

Council Agenda Summary **Agenda Item: 6(k)**

Date: November 7, 2022

ORIGINATED BY:	Susan Hartman, Community Development Director – Planning & Wastewater
REVIEWED BY:	Kevin Phillips, Town Manager
SUBJECT:	Short-term Rental Discussion
LONG TERM RECOVERY PLAN:	No

COUNCIL ACTION REQUESTED:

1. Consider discussion and providing staff with consensus on proposed standards for an Ordinance relating to the creation of short-term rental zoning regulations to present for adoption at a future council meeting; or,
2. Provide alternative direction to town staff.

Background:

At the September 13, 2022 Town Council meeting, staff and council members had a discussion as to the possibility of creating a short-term rental ordinance that would allow for home rentals that were less than 31 days. Currently, only bed and breakfast facilities are potentially permitted as short-term rentals in residential zones. Different standards, from jurisdictions already regulating short-term rentals, were reviewed and discussed. At the end of the conversation, staff was directed to prepare a list of proposed standards for Council consideration before formally drafting an Ordinance for Planning Commission review.

Analysis:

Local zoning regulations can be used to establish various standards for short-term rentals. These regulations may be aimed at attempting to address some of the following issues:

- Development of a detailed definition for short-term rentals and/or hosted homestays.
- Requirements for providing off-street parking.
- Noise and nuisance provisions or reference(s) to other ordinances addressing such issues.
- Minimum setback from other off-site short-term rentals. A particular interval of feet may be used to assure that a given area that may be more desirable than another does not become overly saturated with short-term rentals.
- Limits to occupancy levels by the numbers of available bedrooms – or for units served by on-site septic systems.
- Proof of code compliance, fire safety measures, adequate water and electrical service, or other utilities or infrastructure that may be of particular concern.
- Requirements for notifying neighbors, or perhaps even for their agreement.
- Limitations on the total number of nights per year the unit can be rented.

- Imposition of a special use permit or conditional use permit requirement, allowing for scrutiny of the factual characteristics of a short-term rental property before allowing such a use.
- Limiting the number of short-term rentals on a single site.
- Setting thresholds and processes for permit revocation.

Based on research of neighboring jurisdictions' short-term rental ordinances and discussion with councilmembers at the September 13, 2022 Town Council meeting, staff proposes the following standards for Council consideration:

Category	Proposed Standard
Planning Permit Required	Yes – Administrative Permit (no hearing)
Business License	Yes & TOT
Renewal Frequency	Business license – annually
Setback from other STRs	None
Threshold for Revocation	Any violation grounds for revocation
Quiet hours	10pm-7am (PMC times for music and loudspeakers)
Max number of occupants	2/bedroom
Max number of rental rooms	None
Max number of rentals on lot	None
Min/Max annual nights per mo/yr	None
Max number of STRs townwide	None
Hosted homestay (Room rental with owner on-site)	Yes
Parking rules	1 on-site space per bedroom
Zoning districts	All that allow residential use
Property Owner/Manager	Available 24/7 and within 30 minutes
Neighborhood noticing	Yes, within 300' and on a private road
Special events	Prohibited
Exterior Signage	Prohibited
Interior posting requirements	Inside – contact info, evacuation info & rules
Fire Inspection	Yes, annually (extinguisher, alarms, defensible space)
Transferrable permit	No

In addition to the proposed standards, staff recommends the following prohibitions and restrictions:

- No incidental camping in tents or RVs/travel trailers.
- No open wood burning pits, bonfires, or campfires.
- When a Red Flag Warning is in effect, all sources of outdoor open flame are prohibited.
- Structures with deed restrictions or agreement restricting its use as affordable housing shall not be used for short-term rentals.
- Short-term rentals are not allowed in structures not constructed for residential occupancy under the California Building Code.
- Short-term rentals shall not be rented during construction, remodeling, additions, or an active building permit.

Financial Impact:

If a future ordinance is ultimately adopted, additional TOT revenues would potentially be realized as currently non-compliant short-term rentals became permitted and tracked for compliance. The staff cost for review and issuance of the zoning permit and the fire prevention inspections would be covered by the Council-adopted fees for those services. The cost of tracking software, to physically locate rentals being advertised, cost neighboring jurisdictions in the range of $10,000 per year.
