

**Location:** City Hall – Council Chambers  
**Date:** May 23, 2023  
**Time:** 6:00 PM

## City Council Meeting Agenda

Mayor Jason Beebe, Council Members Steve Uffelman, Janet Hutchison, Shane Howard, Gail Merritt, Scott Smith, Raymond Law and City Manager Steve Forrester  
**ATTEND TELEPHONICALLY BY CALLING 346-248-7799 Meeting ID: 947 5839 2608 Passcode: 123456**

### Call to Order

### Flag Salute

### Additions to Agenda

### Consent Agenda

- [1.](#) Regular Meeting Brief 4-25-2023
- [2.](#) PD Property Conversion

### Visitors, Appearances and Requests

### Council Presentations

### Council Business

### Staff Reports and Requests

- [3.](#) City Manager's Report - Steve Forrester
- [4.](#) Prineville Renewable Energy Project (PREP) Update - Caroline Ervin

### Committee Reports

### Ordinances

- [5.](#) Ordinance No. 1284 - Adopting Changes to Prineville Municipal Code Chapter 131 - Jered Reid
- [6.](#) Ordinance No. 1285 - Adopting Changes to Prineville Municipal Code Chapter 93.59

### Resolutions

- [7.](#) Resolution No. 1555 - A Resolution for Crook County Enterprise Zone Boundary Re-Designation - Kelsey Lucas
- [8.](#) Resolution No 1556 - Consenting to Crook County Ordinance No 338 Adopting New Chapter to Reduce Incidents of Truancy From Crook County Public Schools - Jered Reid

### Visitors, Appearances and Requests

### Adjourn

*Agenda items maybe added or removed as necessary after publication deadline*

**CITY OF PRINEVILLE**  
**Regular Meeting Brief**  
387 NE Third Street – Prineville, OR 97754

City Council Meeting Brief  
April 25, 2023

**Council Members Present:**

Jason Beebe  
Shane Howard  
Janet Hutchison  
Ray Law  
Scott Smith  
Steve Uffelman

**Council Members Absent**

Gail Merritt

**Additions to the Agenda**

Discussion for May 9<sup>th</sup> Council Meeting under Council Business.

**Consent Agenda**

1. Regular Meeting Brief 4-11-2023

**Councilor Smith made a motion to approve consent agenda as presented. Motion seconded. No discussion on motion. All in favor, motion carried.**

**Visitors, Appearances and Requests**

No one came forward.

**Council Presentations**

None.

**Council Business**

2. Enterprise Zone Extension – **Public Hearing** – Kelsey Lucas

**Mayor Beebe opened the public hearing portion of the meeting.**

Kelsey Lucas – EDCO Prineville Area Director explained that this is basically to hear from other taxing districts regarding the Enterprise Zone and has nothing to add from her presentation at the previous meeting.

Jered Reid, City Attorney provided additional information regarding the four open forums that Ms. Lucas held for the taxing districts to attend and ask questions. Only one forum had anyone attending.

Ms. Lucas added that she did a presentation for the School Board and only comment was payment to bonds. There is a county meeting on May 3<sup>rd</sup> for public comment as well.

There were no questions from Council.

No one came forward and no written comments were received.

**Mayor Beebe closed the public hearing portion of the meeting.**

### **3. HB 3115 & Possible Ordinance Regulating Camping Within City Limits – Jered Reid**

Jered Reid, City Attorney referred to the memorandum in the packet that provided the legal background information on judicial decisions that have been made and the two house bills regarding public property. It essentially creates a mechanism for plaintiffs and homelessness to file suite. They have been having homelessness focus meetings regarding this.

Mr. Reid continued with the 8<sup>th</sup> Amendment of the Constitution and other cases such as Robinson v. California and Martin v. Boise and background of those cases. The Martin v. Boise case caused some confusion. Blake v. Grants Pass is in the 9<sup>th</sup> Circuit Court where they will take a look at it and will have an appeal. A couple of key points came from the Blake v. Grants Pass hearing and the Oregon Supreme Court determined that punishment is punishment.

HB 3115 comes into effect on July 1<sup>st</sup>, 2023. The objectionable language is very important and is defined to keep warm and dry. HB 3124 also goes into effect on July 1<sup>st</sup>. It will do such things as increasing notification time period from 24 hours to 72 hours. Chief Seymour has already been working on Lexipol to update the city policy to make sure it is compliant.

Governor Kotek provided funding that will be handled by Central Oregon Intergovernmental Council (COIC) for homelessness.

Mr. Reid explained that we are also looking at our other codes such as parking and RV's and will bring those forward as well.

Mr. Reid went through what cities cannot do and what they may do.

Councilor Hutchison asked if by amending the camping ordinance if it would eliminate any law suits against the city. Mr. Reid said that we can not prevent a lawsuit but can effect whether it is successful.

COIC got \$13.9 million for homelessness needs regionally and it needs to be spent relatively quickly and also has a wide range of what it can be used for.

There were no further questions.

Mr. Reid said the ordinances will be coming forward in probably late May which will have an emergency clause.

#### 4. May 9<sup>th</sup> City Council Meeting Discussion

We have determined that we will have a majority of council members absent from the May 9<sup>th</sup> meeting and will not have a quorum to conduct business and staff is looking for a motion to cancel the May 9<sup>th</sup> meeting.

**Councilor Law made a motion to cancel the May 9<sup>th</sup>, 2023 Council Meeting. Motion seconded. No discussion on motion. All in favor, motion carried.**

#### Staff Reports and Requests:

##### 5. City Manager's Report– Steve Forrester

Casey Kaiser, Public Works Director presented the City Manager's report on behalf of Steve Forrester.

Mr. Kaiser announced that the solar field is operational and is anticipated to offset electrical costs by approximately \$100,000. We are successfully metering and earning credits already.

Mr. Kaiser continued with the rest of the Manager's report adding that we are planning to pave the Barnes Butte Recreation Area (BBRA) on May 14<sup>th</sup> weather permitting, and a reminder that Council has the Priorities Strategy Workshop on June 7<sup>th</sup>.

Councilor Hutchison added that it was great that we could send a couple of our officers to participate in the ceremonies for fallen Officer Joe Johnson of Nysa.

#### Committee Reports

Councilor Hutchison provided an Ochoco Forest Collaboration meeting update explaining that they had a full member meeting. They also had a guest speaker that talked about prescribed fires, health and all of the considerations to be made for the prescribed burns. The smoke from prescribed burns also has an effect on wine grapes.

Councilor Smith attended a Central Oregon Area Commission on Transportation (COACT) meeting a couple of weeks ago and the biggest thing on the agenda is that California just passed a carb emissions law which is primarily directed first to government agencies. Oregon will likely follow suit with that. It will put a very difficult financial component on government agencies. Daimler did a presentation that talked about the difference between the cost of a semi chassis costing about \$150,000 and if it goes to electric vehicle (EV) will cost about \$500,000.

Councilor Smith also attended the Chamber meeting and they are looking at a fall festival likely in September and it sounds very interesting.

Mr. Kaiser added that he is an elected Chamber board member and his term ends June 30<sup>th</sup> and that the annual chamber dinner is on May 20<sup>th</sup>.

Mayor Beebe talked about the Finance Committee meeting he just attended and how informative it was.

Councilor Uffelman and Mayor Beebe were able to meet with US Senator Merkley and were able to talk about juniper remediation. Senator Merkley agreed that the remediation led into water. He is also very adamant about pushing for electric vehicles which led to the discussion of the electric vehicle that recently got stuck in the woods and had to be rescued. Senator Merkley will be pushing for EV infrastructure.

There were no other reports.

### **Ordinances:**

None.

### **Resolutions**

#### **6. Resolution No. 1552 – approving an IGA with the State of Oregon Department of Transportation for Roads Transportation Intersection Updates – Casey Kaiser**

Mr. Kaiser explained that this is a really simple agreement and ODOT likes to have these agreements in place before accessing city property. They want to put some warning signs up with some striping for the safety improvements being made to the intersection.

There were no questions.

**Councilor Smith made a motion to approve Resolution No. 1552. Motion seconded. No discussion on motion. All in favor, motion carried.**

#### **7. Resolution No. 1553 – Approving a Personal Services Agreement with Divergent Engineering Services, LLC to Provide Engineering Services Regarding Prineville Water Treatment**

Mr. Kaiser provided a summary of the purpose of this resolution and that detailed conversations regarding these findings were had at the last Council meeting.

Councilor Smith asked that paragraph 1. of the resolution be corrected to read “materials” rather than “martials”.

There were no further discussions.

**Councilor Hutchison made a motion to approve Resolution No. 1553 with the correction as stated. Motion seconded. Councilor Hutchison wanted to thank Public Works for having a public hearing to see if there was anyone else that had anything to say. No further discussions. All in favor, motion carried.**

**8. Resolution No. 1554 – Approving a Personal Services Agreement with Dowl, LLC to Provide Personal Services for Engineering Services Regarding Transportation Design – Casey Kaiser**

Mr. Kaiser provided background information stating that back in 2020, the city decided to move forward on a concept design to determine how much right of way (ROW) would be needed for this project. The initial design has been completed and the ROW acquisition was completed and with final design makes this project shovel ready. There is ARPA money involved for this project and DOWL has committed to having this completed within the timeline needed.

Discussions continued regarding having a signal required and the railroad crossing being incorporated.

No further discussions or questions.

**Councilor Howard made a motion to approve Resolution No. 1554. Motion seconded. No discussion on motion. All in favor, motion carried.**

**Visitors, Appearances and Requests:**

No one came forward.

**Adjourn**

**Councilor Smith made a motion to adjourn the meeting. Motion seconded. No discussion on motion. All in favor, motion carried.**

Meeting adjourned at 7:00 P.M.

**Motions and Outcomes:**

City Council,

The Prineville Police Department has the following firearms secured in its possession. I have itemized the firearms that were forfeited per court order and unclaimed found property.

I am requesting City Council approve the transfer of these firearms to Bullseye Firearms for store credit for Prineville Police Department utilization by Sergeant Gray, Rangemaster.

## Case #

<b>13000983</b> Item #1	Jennings J22 .22LR Serial/ 302911 Forfeit per Court Order
<b>19000686</b> Item #5	Harrington & Richardson Revolver Serial/416132 Found property
<b>19000686</b> Item #6	Iver Johnson Arms .32 revolver Serial/25320 Found property
<b>19000686</b> Item #7	unknown brand .32 revolver Serial/10825 Found Property
<b>19000686</b> Item #8	Harrington & Richardson Arms .32 Serial/366122 Found property
<b>21001210</b> Item #2	Ruger Air Hawk Elite II Air Rifle Forfeit per Court Order
<b>22000357</b> Item #1	Remington 783 7mm bolt action rifle Serial/RA33047A Held for safekeeping. Certified letter sent to owner, no response.

- 22001515** New England 22 rifle with scope  
Item #1 Serial/NN285511  
Surrendered by owner and held for 90 days.
- 22001515** FMJ single shot 45 pistol in box  
Item #2 Serial/A00058324  
Surrendered by owner and held for 90 days.
- 2300326** Glock 17 Gen 4  
Serial/YRL938

**The following cash items shall be turned over to Bullseye Firearms for store credit.**

- 13000119** \$69.61 cash and coins  
No information on owner. Advertised, no claims made.
- 18001480** One dollar bill  
Found property. Advertised, no claims made.
- 19000628** \$20 bill  
Found. Advertised, no claims made.
- 19000675** \$20 bill and \$10 bill  
Found. Advertised, no claims made.
- 19001554** One dollar bill  
Found. Advertised, no claims made.
- 19001759** \$90.16 cash and coins  
Multiple phone calls, message left. No response from next of kin.
- 19001821** \$6.00 in cash  
Found. Advertised, no claims made.

Thank you,

Amy Van Donk

# **City Manager Update to Council**

**May 23, 2023**

## **Public Safety / Dispatch**

Dispatch is hiring a new supervisor today after the extensive hiring process. Everything else is going good for dispatch.

Officer Jeff Coffman is coming up on his retirement in June. More details to follow on recognizing Jeff's outstanding 36-year career with the city. Summer event applications such as the Crooked River Round Up Stampede party and rodeo are starting to come in for the logistics review.

## **Public Works**

The 5K loop at Barnes Butte Recreation Area (BBRA) paving project is complete and people are already walking and biking it. PW will be coordinating with the Railroad crew for an upcoming crossing project. The Dunhan Street waterline project has been completed. A float control went down at the WWTP on Friday. The WWTP crew along with Smith Rock Electric worked late Friday night and again Saturday morning to get it repaired and back up and running.

## **Rail Road**

The Rail Road is remaining very busy and is looking at a significant project tamping and aligning tracks. McKay Creek Bridge will be getting some upgrades done to accommodate the heavier McCall Oil cars. There is a big trucking company that is looking at establishing a reload center in Oregon and will be visiting Prineville in June.

## **Meadow Lakes Golf**

Golf course revenues continue to be strong and will help with some of the much needed projects on the radar for the parking lot, cart paths rehabilitation and club house maintenance. The course is looking fantastic and ready for all of the summer time activity.

## **Airport**

The paving project is coming up for the airport. Bids for the T hangar building are due next week with hopes of having it completed by fall. The Forest Service is doing some training in preparation for the fire season and is stationing extra aircraft in Prineville that is usually at the Redmond airport. Wheels and Wings is coming up on June 11<sup>th</sup> from 1:00 PM to 5:00 PM which is being presented by Wild Ride Brewing. There will be a car & plane show, vendors, music and kids games.

## **Planning**

The zone change for the old hospital is moving along and will likely go before Council in June. The apartments on Madras Highway are moving ahead with financing. The industrial land subdivision is underway. Re-stripping of Highway 126 & O'Neil Highway will be taking place soon.

## **Human Resources**

With Darla's upcoming retirement, recruitment began to fill her position. After interviewing several candidates our own Karee Miller shined and has accepted the position beginning July 1<sup>st</sup>. Corina Ego has agreed to assume Karee's position for payroll specialist. Congratulations to both ladies!

Eight candidates have been invited to the interview process for the vacant public works utility worker position and recruitment is also underway for Planning and PD.

### **Information Technology**

The IT team has completed the upgrades for the public works system. They are also busy with spring site work and working on Fire Department vehicle upgrades.

### **Finance**

The Budget Committee had a capital improvement project update from staff and received the budget for the first budget meeting coming up on May 22<sup>nd</sup>. Council will be looking to adopt the budget on June 13<sup>th</sup>.

**City Recorder/Risk Management** – No Update

**City Legal** – No Update

### **EDCO**

EDCO has been busy facilitating the Center on Rural Innovation (CORI) community assessment of Prineville. EDCO provided an overview of this program to Council several months ago and is possible from a Meta funding match to participate. There have been many meetings between the city, the county, EDCO, and local businesses through this process. In the end we will have a complete assessment of Prineville's strengths and needs to continue fostering a positive economic environment.

### **Public Relations**

The city quarterly newsletter was released last week and we should have the results of how many people engaged with it soon.

### **Mayor/Council**

**Just a reminder, the Priorities Strategy Workshop has been successfully scheduled for June 7 at 5:00 P.M.**

### **Other**

In state legislation, the enterprise zone bills continue to be of concern with the proposed amendments and proposals to scale it back and to change the term before renewal at the state level again.

The state's revenue forecast has been released and is much more than what was estimated even as recently as March. Now its time for the Ways & Means Committee to start drafting budgets for state agencies, choosing from policy bills that have a cost associated with them and evaluating billions of dollars in requests for local projects.

# CHAPTER 1 – EXECUTIVE SUMMARY

---

## 1.1 INTRODUCTION & STUDY APPROACH

The City of Prineville (City) has a reputation for being a national leader in environmental protection and conservation with a commitment to investing in the long-term sustainability of the community. This is evidenced by multiple complex and award-winning projects under its belt, such as the Crooked River Wetlands and Aquifer Storage and Recovery (ASR) project. Similarly, to reduce wildfire risk and address western juniper infestation, the City is pursuing development of the Prineville Renewable Energy Project (PREP), a 24.9 MW biomass power plant to be located in Prineville.

In November of 2021, the City completed an engineering and design study that included a fuel supply assessment. The biomass power plant modeled in the study is designed to consume 191,000 bone dry tons of biomass fuel annually and produce more than 209,000 megawatt hours of power annually. The study concluded that enough biomass exists in the region to fuel the power plant and that the project was feasible.

To provide an objective third-party examination of the project’s environmental and economic impacts in the region, the City commissioned this study. Accordingly, this study’s objective is to quantify, to the extent possible, PREP’s environmental and economic impacts. The key environmental factors examined include: air quality, water availability, landfill use, forest health/productivity, and wildfire risk.

The general approach compares the preceding environmental characteristics under two scenarios: 1) WITHOUT PREP, and 2) WITH PREP. The region of study for this analysis is the four counties where the plant’s fuel is predominantly expected to be sourced: Crook, Jefferson, Deschutes, and Wheeler Counties. Chapter 2 provides an analysis of environmental conditions in a WITHOUT PREP scenario while Chapter 3 provides an assessment of the same environmental conditions in a WITH PREP scenario. Chapter 4 assesses the economic impact of the differing environmental conditions in the two scenarios. Finally, Chapter 5 provides a high-level assessment of technologies currently developing for capturing carbon from the atmosphere and permanently sequestering it back into the earth.

## 1.2 SUMMARY OF FINDINGS

This analysis found that developing a 24.9 MW biomass powerplant in Prineville could be expected to:

- Improve air quality due to less open-pile burning and lower risk of wildfire.
- Increase the availability of water by 2,650 to 44,000 acre-feet annually due to thinning about 1,900 acres of juniper woodlands per year.
- Divert about 10,000 bone dry tons of woody biomass material from nearby landfills per year.
- Reduce the risk of forest wildfire in the four-county region around Prineville by an estimated equivalent of 280 to 840 fewer acres burning annually.
- Increase the health and productivity of forests in the four-county region in terms of annual growth, benefiting wildlife and forest landowners.
- Provide local economic development benefits in the form of 54 to 67 new jobs at the PREP facility and supporting forestry and transportation sectors.
- Increase firm power generation in the region and reduce regional transmission import constraints.
- Decrease economic losses from wildfire in the region, including those associated with damage to infrastructure, losses to tourism and recreation, aesthetics, and air quality.

## CHAPTER 1 – EXECUTIVE SUMMARY

### 1.2.1 Environmental and Economic Benefits

The PREP would provide multiple environmental and economic benefits as summarized in **Table 1.1**. In sum, these environmental and economic benefits are expected to have an annual value of approximately \$21.7 million to \$70.1 million. Note the italicized sections of the table are all a subset of reduced wildfire risk.

**Table 1.1 – Summary of Quantified Environmental Effects of PREP and Associated Economic Value**

Type of Benefit	Annual Environmental Benefit	Approximate Annual Economic Value (2022\$, Millions)
Air Quality	Reduced emissions from avoided burning of logging slash due to burning of biomass in PREP. Estimated cumulative reduction of 4,400 to 6,535 tons per year of various pollutants. Reduction in adverse health effects, particularly for communities disproportionately vulnerable to air pollution such as the young, elderly, and those suffering from respiratory diseases.	\$14.2 to \$44.1
Juniper Water Use	Reduction in water use due to juniper removal: 2,650 AF in Year 1, rising to 44,000 AF in Year 20 reduced water usage, net water savings of 683 million gallons annually due to treatment of - dominated area. Reduced water demand for junipers is assumed to benefit groundwater-dependent ecosystems, instream flows, and/or human consumptive uses.	\$1.7 to \$3.4
Landfill (Wood Waste Diverted to PREP)	Divert 10,000 tons from Deschutes County landfill, providing cost savings related o yard debris grinding/transport.	\$0.4
Merchantable Timber	136 additional million board feet increase annually in merchantable timber.	\$0.01
Reduced Wildfire Risk	Decreased intensity/severity of wildfire on forests acres receiving thinning treatments, equivalent to ~280 to 840 fewer acres burned per year.	\$5.4 to \$22.2
<i>Wildfire Fighting</i>	<i>Reduced firefighting efforts on ~280 to 840 acres.</i>	<i>\$0.8 to \$1.1</i>
<i>Air Quality</i>	<i>Reduction of 600 to 1,800 tons of NO<sub>x</sub>, CO, VOC, PM from reduced biomass combustion from ~280 to 840 acres.</i>	<i>\$2.0 to \$13.2</i>
<i>Aesthetics/Visibility</i>	<i>0.1 to 0.2 days per year high visibility improvement.</i>	<i>\$0.1 to \$0.3</i>
<i>Infrastructure</i>	<i>Likely Neutral or Positive, depending on location of fire.</i>	<i>Likely Neutral or Positive</i>
<i>Recreation</i>	<i>Avoided recreation losses to recreators on ~4200 acres (840 acres for 5 years).</i>	<i>\$0 to \$.1</i>
<i>Wildlife</i>	<i>Likely Neutral or Positive, depending on the species.</i>	<i>Likely Neutral or Positive</i>
<i>Carbon</i>	<i>Reduced emission of 12,000 to 35,000 metric tons of CO<sub>2</sub>e, reducing adverse effects of climate change.</i>	<i>\$2.5 to \$7.5</i>
<b>Total</b>		<b>\$21.7 to \$70.1</b>

## CHAPTER 1 – EXECUTIVE SUMMARY

---

As the preceding table illustrates, the main benefits are associated with reduced air pollution due to combustion under controlled conditions instead of open-pile burning of logging slash at logging or forest health treatment sites, as the study assumes would occur WITHOUT PREP. Air pollution is reduced in the WITH PREP scenario because combustion is more complete and the emissions control equipment used at the boiler greatly reduces air pollutant emissions relative to open-pile burning.

Other benefits derive from expected reduced wildfire intensity on forest areas thinned to provide fuel for the PREP facility. In contrast, other renewable energy facilities, such as wind or solar, would not provide these values or environmental benefits, since other forms of renewable energy would not be expected to affect (or would have minimal expected effects on) forest health, wildfire risk, air quality, or water supply.

The PREP facility would also be expected to benefit area water supply, the value of merchantable timber, and diversion of wood waste from landfills. More detail about key environmental benefits, and the associated economic value, are as follows:

- The facility would eliminate the open-pile burning of an estimated 49,200 bone dry tons of logging slash, which translates into a reduction in the emission of 4,400 tons<sup>1</sup> per year of air quality pollutants (i.e., NO<sub>x</sub>, CO, VOC, and PM). Also, in a WITH PREP scenario where no sawmill is nearby to provide mill residuals as fuel, the tons of air pollutant emissions avoided from open-pile burning of logging slash is even greater, at more than 11,200 tons per year (see Section 3.5 for additional details). This decreased air pollution would provide health benefits estimated at \$14.2 million to \$44.1 million annually. This benefit would disproportionately benefit those most vulnerable to air pollution: the very young, the elderly, and those suffering from respiratory diseases. Further, compared to the rest of the state, the four-county region has a higher proportion of individuals living in poverty (14.6% in Crook County and approximately 20% in the other study area counties, compared to 14.1% across the state), and Jefferson County also has a higher proportion of Hispanic and non-white populations (20% versus statewide average of 14%). Reductions in health hazards, such as those anticipated from PREP, would likely disproportionately benefit these environmental justice populations as they are less likely to have high-quality HVAC systems that filter polluted air, are more likely to have employment in outdoor occupations such as agriculture, forestry, construction, or landscaping, and are more likely to have health conditions negatively impacted by wildfire smoke.
- The facility would allow treatment of an estimated 7,250 acres of land per year that is dominated by juniper trees, which translates into an estimated net annual savings of 683 million gallons of water (after accounting for water usage at the PREP facility), valued at \$1.7 million to \$3.4 million annually. This analysis assumes that reduced water demand on juniper lands increases instream flows, groundwater-dependent ecosystems, or human consumptive uses. See section 3.3 for additional details.
- The PREP facility would divert approximately 10,000 tons of wood waste from regional landfills annually since the material would instead be combusted at the power plant. Note the analysis only considered clean wood waste; wood waste treated with paint, preservative chemicals, etc. were not included. The estimated annual benefit to landfills is approximately \$0.4 million.

---

<sup>1</sup> Following standard convention, this report quantifies air quality pollutant tons in 'short' tons, equivalent to 2,000 pounds. Also following standard convention, however, greenhouse gas emissions are quantified in metric tons of carbon dioxide equivalent, equivalent to 2,204.6 pounds. Throughout the report the term 'tons' refers to short tons, except where otherwise noted as metric tons when referring to carbon dioxide equivalent emissions.

## CHAPTER 1 – EXECUTIVE SUMMARY

---

- The PREP facility would allow for more forest management treatments that are expected to reduce the intensity of wildfire in the four-county region; this reduction in intensity is expected to be roughly equivalent to 280 to 840 fewer acres burned annually by wildfire. Reductions in wildfire intensity and severity offer many benefits including reduced smoke air pollution, improved aesthetics/visibility from reduced smoke, and costs avoided relating to wildfire suppression, infrastructure damage, carbon emissions, recreation and tourism.
  - The estimated air quality benefit of 280 to 840 fewer acres<sup>2</sup> being burned each year is a reduction of between 600 and 1,800 tons of air pollutant emissions annually (NO<sub>x</sub>, CO, VOC, and PM) – see Section 3.4 for additional details. The health benefit of these avoided emissions is estimated to range from \$2.0 million to \$13.2 million.
  - The estimated reduction in greenhouse gas emissions from reduced biomass combustion in wildfire is 12,000 to 35,000 metric tons of carbon dioxide equivalent, valued at \$2.5 million to \$7.5 million annually.
  - Other benefits of reduced wildfire intensity are more challenging to quantify, but a conservative estimate is that other benefits associated with avoided wildfire costs and damages (including avoided fire suppression costs, avoided losses in recreation opportunities, and avoided visibility effects from smoke from the equivalent of approximately 280 to 840 fewer acres burning each year) would be in the range of \$0.9 million to \$1.5 million annually.

While it is clear that PREP provides some key environmental benefits, it is important to note that quantifying these benefits is challenging and uncertain. As such, all environmental effects and economic values should be interpreted as approximate estimates that provide an indication of the expected magnitude of benefits. In particular, projecting changes in wildfire risk and intensity due to forest treatments is highly uncertain; projecting economic values associated with that change in risk is even more uncertain. However, forest treatments are expected to reduce wildfire intensity, and this reduced intensity is expected to provide social and economic values. This analysis attempts to provide a rough approximation of the magnitude of those types of benefits.

Finally, regarding climate change effects of PREP, this analysis did not do a full carbon accounting of carbon or greenhouse gas-related effects; it focused solely on reductions associated with reduced wildfire emissions that are projected in relation to forest treatments related to PREP. It did not include carbon or air quality effects related to forest treatments or trucking of materials to the PREP facility, as these are expected to be minor in comparison to releases from the burning of forest materials. Given the range of values presented in the study, we expect that the true value (after factoring in these other effects) would likely fall within the range of estimates presented in the study.

---

<sup>2</sup> Each acre thinned is expected to result in lower fire intensity for approximately 20 years if wildfire were to occur on the treated acres. Accounting for the number of treatment acres, the number of acres at high risk of burning, and the average annual number of acres burned, we estimate that there would be approximately 1,120 acres with reduced fire intensity on an annual average basis due to the forest thinning. While the treatments may not reduce the average annual acres burned by wildfire in the four-county region, we assume that the thinning treatments will reduce the intensity of the fire on the treated acres by 25% to 75%. For this analysis regarding benefits of reduced wildfire on air quality and other environmental effects, we assume that reduction in fire intensity can be translated into reduced 'acre equivalents' burning. For example, an intensity reduction of 50% on two acres is assumed to be equivalent to reduction in all the forest burning on 1 "acre-equivalent". It follows then that the equivalent acres of fire reduction caused by the presence of the PREP facility is 280 acres to 840 acres per year (1,120 treated acres/burned per year x 25% to 75% fire intensity reduction on burned acres). For environmental benefits analysis, we assume that 100% of the biomass on these "acre-equivalents" is burned.

## CHAPTER 1 – EXECUTIVE SUMMARY

### 1.2.2 Economic Development Benefits

In comparison to other renewable energy facilities, the operation of PREP will provide local economic development benefits. First, more than three quarters of PREP’s operating costs are for fuel, hourly wages, and salaries and benefits for local jobs at the PREP facility and for forest sector jobs to gather and transport the fuel for PREP, as presented in **Table 1.2**. Additional jobs and income may be indirectly supported in other sectors that provide supplies to the facility (or to other suppliers) and that sell goods and services to employees whose income is related to PREP.

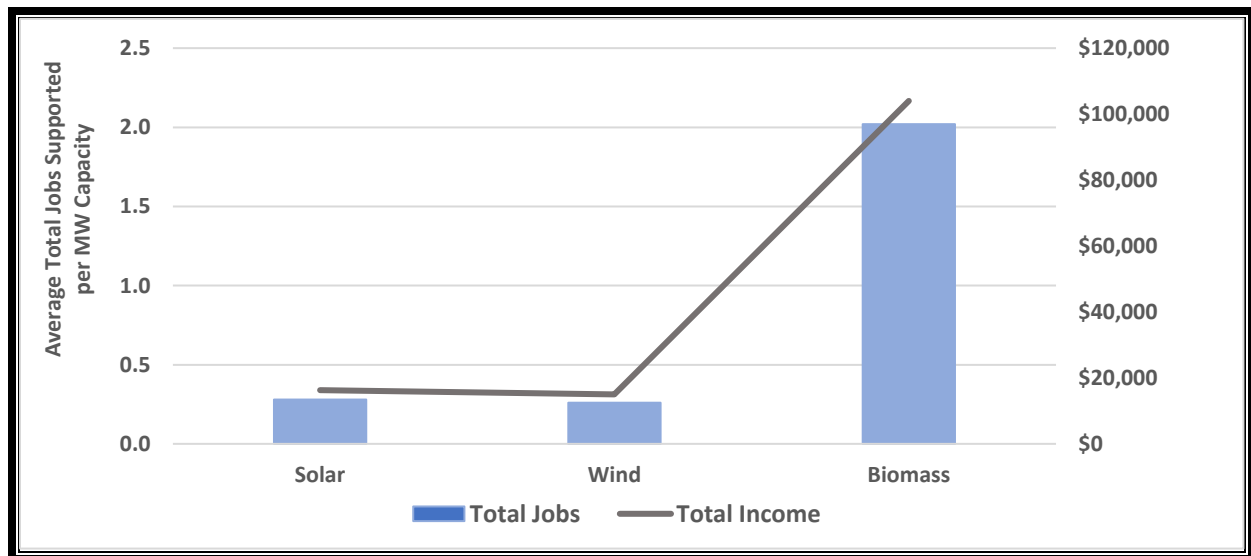

**Table 1.2 – Operations Employment and Income Supported by PREP: Key Sectors Only**

Sector	Employment		Compensation	
	Low	High	Low	High
PREP Facility	10	15	\$990,000*	\$990,000*
Biomass Fuel Trucking	24	28	\$1,500,000	\$1,750,000
Fuel Gathering/Processing	20	24	\$1,250,000	\$1,500,000
<b>Total</b>	<b>54</b>	<b>67</b>	<b>\$3,740,000</b>	<b>\$4,240,000</b>

\* Per the engineering report completed as part of the PREP feasibility study. Compensation was estimated, but the associated number of jobs was not reported.

For a comparison to other renewable energy facilities, in **Figure 1.1** we present data from the National Renewable Energy Laboratory that compares the local employment and income supported by a biomass plant to those of wind and solar facilities. As shown in the figure, for every MW of generation, biomass supports approximately seven times greater total income and employment (including direct employment/income at the energy facility and indirect/induced jobs supported in other sectors due to facility-related spending) than wind or solar facilities tend to support. Note that these are averages, and not necessarily the increased employment and income that the PREP facility would support relative to wind and solar power facilities.

**Figure 1.1 – Average Total Employment and Income Supported per MW: Biomass Compared to Solar and Wind**

## CHAPTER 1 – EXECUTIVE SUMMARY

---

By reducing wildfire and improving air quality, PREP also has the potential to support (or prevent the loss of) economic development. Wildfire can impact economic development by destroying resources and infrastructure, reducing tourism, and motivating people to live away from fire-damaged or fire-prone areas. For example, a 2021 survey conducted by the real estate brokerage firm Redfin found that natural disasters and extreme temperatures factored into the decision of almost half of Americans who planned to move in the next year (Rodriguez, 2021). Anecdotal accounts suggest that wildfire is a primary reason why some people move away from Western states, including Oregon and California, as well as a reason why some people choose not to move into these areas (Rodriguez, 2021; Allen, 2022; Hurdle, 2022; Lahr, 2020). Fewer people in these areas means fewer workers, fewer business owners, and fewer customers, all of which can hinder economic development.

Regarding wildfire impacts on tourism, a study of the 2017 wildfire season effects on the Oregon tourism economy estimated that the 1.2 million acres burned across the state that year resulted in \$60.7 million in lost visitor spending and \$18.8 million in lost earnings in 2017.<sup>3</sup> On average, each acre burned translated to nearly \$16 in reduced earnings in the year of the fire. During the 2020 wildfire season, Central Oregon also experienced a significant drop in tourism, with businesses adversely affected by the loss in revenue (Maher, 2022). In a recent article on how longer and fiercer wildfires are hurting areas reliant on tourism, the Bend Chamber of Commerce was cited as saying that “Living in Bend in 2020 was a like a summer that didn’t happen” (Maher, 2022). Wildfire can clearly reduce tourism; as such, reducing the prevalence of wildfire through initiatives such as PREP has the potential to support tourism and associated economic development.

Finally, PREP could provide potential economic development benefits by adding to the region’s power supply, and helping to alleviate transmission constraints that limit Central Oregon’s ability to attract new industry. A 2017 Bonneville Power Administration (BPA) analysis noted: “In order to increase overall capability to serve load in central Oregon, both main grid and local area infrastructure require reinforcement”. The 2017 BPA analysis identified options that could increase main grid capability and local area capability; one of the options was to increase local firm generation within the Redmond Import area. As noted by BPA, “...firm generation has the effect of offsetting main grid and local impacts from load within the area”. This is in contrast to wind and solar power generation options, which are intermittent and generate lower levels of electricity during peak winter demand periods and extreme weather events. The benefit of PREP in increasing local power supplies is not quantified economically in this report, but does provide improved overall power reliability and supply in the region while easing the existing transmission constraints.

---

<sup>3</sup> The original values in 2017 were adjusted to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022). Study available at: <https://industry.traveloregon.com/wp-content/uploads/2018/07/TO-2017-Wildfires-Impact-Report-Final.pdf>

## CHAPTER 2 – WITHOUT PREP ANALYSIS

---

This report chapter provides an analysis of environmental characteristics for the WITHOUT PREP scenario. Each of the following subsections is a specific environmental condition considered as part of the study.

### 2.1 FOREST HEALTH

Forest health is defined as creating forest conditions that directly satisfy human needs. Note, however, the definition is dependent on humans defining what those needs are. From an ecological perspective, forest health is defined as resilience, recurrence, persistence, and biophysical processes which lead to sustainable ecological conditions. For the purposes of this study, the focus is on forest health as it relates to the forest's ability to satisfy human needs.

The indicators of forest health for this study include: change in forest area over time, volume of merchantable standing trees per unit of forest area, total aboveground live biomass per unit of forest area, tree growth, and the total number of live trees per unit of forest area. The data measuring these indicators was gathered from the US Forest Service's Forest Inventory and Analysis (FIA) database. FIA is a nationwide program established in the 1930s whose mission is to collect, analyze, and report information about the status and trends of America's forests. This is accomplished by periodically revisiting permanently located forest inventory plots to gather data on forest type, site attributes, tree species, tree sizes, and overall tree condition. There is one plot for every 6,000 acres of forest land in the US, or about 325,000 plots scattered throughout the nation's forests. The plots are located on both publicly and privately owned land. The data for each indicator is described in each of the following subsections.

The FIA database defines two types of forest area including *Timberland* and *Forestland*. Timberland is forested land capable of producing more than 20 cubic feet of wood fiber/acre/year and that is not legally withdrawn from timber production. Examples of withdrawn areas are Wilderness, Roadless, National Park, etc. Forestland is defined as land stocked with at least 10% tree cover, but which cannot grow trees at a rate greater than 20 cubic feet/acre/year, and which is not currently developed for a non-forest use. Note that throughout the report, a variety of tables report statistics for timberland and forestland. Importantly, timberland is a subset of forestland; the totals for the two categories thus cannot be added together.

The FIA database can be queried to include/exclude data from different time periods. For this analysis, data from two time periods were selected including 2019, the most recently available data, and 2010. Changes between the two periods indicate a trend direction for each given forest health condition indicator.

#### 2.1.1 Forest Acres

**Table 2.1** illustrates the change in forested acres by owner type between 2010 and 2019 among Crook, Deschutes, Jefferson, and Wheeler Counties. As the data illustrates, there is a total of 3.5 million acres of forestland and there was a net increase in acreage of about 17,400 acres in 2019 versus 2010. Recall that timberland is a subset of forestland and as the data in the table shows, about 1.9 million acres or 55% of the forestland is timberland – land capable of growing significant volumes of timber and land that hasn't been reserved from timber production. The balance of about 1.6 million acres is the less productive forestland designation, which in the four-county region typically refers to juniper woodlands. Also, as perspective, the combined total land area of the four counties is just over 6.1 million acres. Thus, the 3.5 million acres of forestland covers nearly 57% of all land in the four-county region. However, the more productive timberland portion of forestland accounts for roughly 30% of the total land area in the four counties.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Table 2.1 – Change in Forest Area on Forestland and Timberland between 2010 and 2019 by Landowner Type in Crook, Deschutes, Jefferson, and Wheeler Counties (acres)**

2010	National Forest	Other Federal	State & Local	Private	Total
Forestland	1,602,192	615,614	25,415	1,261,242	3,504,462
Timberland	1,240,268	48,784	0	633,651	1,922,702
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	1,611,431	519,822	49,644	1,259,952	3,440,849
Timberland	1,256,223	55,865	2,474	689,131	2,003,693
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	9,239	-95,792	24,229	-1,290	-63,613
Timberland	15,955	7,081	2,474	55,480	80,991

**Figure 2.1A** provides a visualization of the extent of forestland and timberland in the four-county area. While not an exact match, the green areas essentially represent the combined forestland and timberland areas as determined from FIA data in the preceding table. As previously stated, the forestland (with timberland as a subset) comprises about 57% of all land in the four-county region. The figure is from the Oregon Wildfire Risk Explorer website (accessed at <https://tools.oregonexplorer.info>).

**Figure 2.1A – Current Vegetative Cover in Four-County Area**

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Figure 2.1B** illustrates where the major ownership falls within the four-county region (regardless of land use type). As the figure shows, major portions of the land base in the four-county region are under federal ownership. Note that the purple tribally owned lands in the figure are counted as private lands in the FIA database.

**Figure 2.1B – Ownership Map Within the Four-County Region**

### 2.1.2 Volume of Merchantable Standing Trees

**Table 2.2** illustrates change in merchantable volume of standing trees on forestland and timberland from 2010 to 2019 in the four counties. As shown, there are about 306 million more cubic feet of merchantable standing trees among the region's forests in 2019 than there were in 2010. The majority of the increase (264 million cubic feet) occurred on the timberland portion of the forested land base. Merchantable volume refers only to the portion of the trees that are suitable for conversion to products such as lumber, veneer, pulpwood, etc. The change in volume is a 7% increase, or an average of 0.7% per year.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Table 2.2 – Change in Merchantable Volume on Forestland and Timberland between 2010 and 2019 by Landowner Type in Crook, Deschutes, Jefferson, and Wheeler Counties (cubic feet in millions)**

2010	National Forest	Other Federal	State & Local	Private	Total
Forestland	3,213	179	4	846	4,242
Timberland	2,510	62	0	716	3,289
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	3,413	169	16	950	4,548
Timberland	2,666	66	8	813	3,553
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	200	-10	12	104	306
Timberland	155	4	8	97	264

### 2.1.3 Total Aboveground Live Biomass

**Table 2.3** illustrates changes in the total aboveground live biomass on forestland and timberland between 2010 and 2019. The data shows that in total in 2019 there were about 86 million bone dry tons<sup>4</sup> of biomass on forestland in the four-county region compared to 79 million in 2010, an increase of about 7 million bone dry tons. It also shows that about 60% of the increase was on national forest land, with virtually all of the rest of the increase on private lands. This data includes all portions of trees (e.g., limbs, tops, crooked sections, etc.). Thus, unlike the data in the preceding table, it is not limited to only the merchantable portion of trees. Nevertheless, the data are similar in terms of directional trends and the magnitude of the changes (i.e., 9% increase from 2010 to 2019).

**Table 2.3 – Change in Aboveground Biomass on Forestland and Timberland between 2010 and 2019 by Landowner Type in Crook, Deschutes, Jefferson, and Wheeler Counties (Bone Dry Tons in 1,000s)**

2010	National Forest	Other Federal	State & Local	Private	Total
Forestland	59,387	3,680	100	16,023	79,190
Timberland	46,205	1,150	0	13,298	60,652
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	63,926	3,596	338	18,622	86,482
Timberland	49,724	1,316	151	15,670	66,861
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	4,539	-84	239	2,599	7,293
Timberland	3,519	166	151	2,373	6,209

<sup>4</sup> A Bone Dry Ton (BDT) is a common measurement in forestry. It is the weight of a given volume of material after accounting for the portion of the material's weight that is moisture. For example, if a given volume of wood weighs 4,000 pounds, but 50% of the weight is water, then the material is equal to 1 bone dry ton.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

### 2.1.4 Number of Live Trees

**Table 2.4** shows how the number of live trees has changed on forestland and timberland in the four-county region between 2010 and 2019. The data shows that in 2019 there are about 134 million more standing trees in the four-county region than there were in 2010. Given a total of about 3.5 million acres of forested land in the four-county area, this equates on average to about an additional 41 trees per acre.

**Table 2.4 – Change in Number of Live Trees on Forestland and Timberland between 2010 and 2019 by Landowner Type in Crook, Deschutes, Jefferson, and Wheeler Counties (count of trees in millions)**

2010	National Forest	Other Federal	State & Local	Private	Total
Forestland	541	48	3	213	806
Timberland	435	13	0	147	594
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	585	64	5	286	940
Timberland	469	28	0	199	697
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	44	16	2	73	134
Timberland	34	15	0	53	102

### 2.1.5 Tree Growth

**Table 2.5** illustrates how the net annual tree growth volume has changed over time. As shown in the table, total annual net growth is about 655 thousand bone dry tons per year in 2019 compared to 653 thousand in 2010. Thus, growth is essentially stable overall. However, closer examination of the table shows that for the timberland portion of the forests, net annual growth in 2019 is lower by about 51,200 bone dry tons per year compared to 2017 (as denoted by the -51,240 in the lower rightmost cell of the table). This is due to higher levels of natural mortality driven by higher levels of insects, disease, drought, and wildfire. Finally, the data shows that in the four-county region, annual growth of forestland is just under 0.8% of the above ground biomass (655,306 BDT of net growth per year divided by 86.4 million bone dry tons of live merchantable standing biomass). On timberlands net growth per year is 1% (674,433 BDT of net growth per year divided by 66.9 million bone dry tons of live merchantable standing biomass).

**Table 2.5 – Change in Net Annual Growth of Live Trees on Forestland and Timberland between 2017 and 2019 by Landowner Type in Crook, Deschutes, Jefferson, and Wheeler Counties (bone dry tons)**

2017	National Forest	Other Federal	State & Local	Private	Total
Forestland	323,802	36,776	6,470	286,796	653,844
Timberland	445,237	18,523	4,720	257,193	725,674
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	359,531	33,643	4,722	257,409	655,306
Timberland	423,378	16,059	3,259	231,737	674,433
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	35,729	-3,132	-1,748	-29,387	1,462
Timberland	-21,859	-2,464	-1,462	-25,456	-51,240

## CHAPTER 2 – WITHOUT PREP ANALYSIS

### 2.2 HISTORICAL LEVEL OF FOREST MANAGEMENT ACTIVITY

As illustrated by **Table 2.6** the level of forest management activity, as inferred from annual timber harvest volumes, has been on a steady decline in the four-county region considered in the PREP analysis. The data<sup>5</sup> in the table shows the total annual timber harvest volume in board feet (Scribner) for each county and for the period 2002 to 2020. It has dropped from an average of 76,251 million board feet from 2002 to 2006 to an average of 48,000 million board feet from 2016 to 2020. Note, however, that all the decrease is in Deschutes, Jefferson, and Wheeler Counties. Timber harvests in Crook County have slightly increased in recent years, on average. Still, the overall trend in the four-county region is that timber harvests are declining at a rate of about 1.9 million board feet per year during the period 2002 to 2020.

**Table 2.6 – Annual Timber Harvest Volume in Four-County PREP Region between 2002 and 2020  
(Board Feet in Thousands, Scribner Log Scale)**

Year	Crook	Deschutes	Jefferson	Wheeler	Total
2002	8,088	43,066	32,207	17,742	101,103
2003	1,528	25,232	21,540	17,369	65,669
2004	2,931	35,306	33,268	7,921	79,426
2005	1,485	28,295	36,656	6,368	72,804
2006	10,479	24,956	13,809	13,011	62,255
2007	13,733	22,464	10,130	10,668	56,995
2008	4,659	36,080	12,959	4,206	57,904
2009	5,723	14,675	16,746	3,829	40,973
2010	3,239	19,339	8,338	1,244	32,160
2011	12,185	22,851	9,511	1,500	46,047
2012	10,435	20,192	1,670	5,899	38,196
2013	4,401	23,486	19,983	6,344	54,214
2014	9,252	27,488	10,111	4,706	51,557
2015	12,324	9,706	16,090	5,103	43,223
2016	3,573	26,988	16,000	5,727	52,288
2017	10,460	29,603	225	6,682	46,970
2018	5,757	37,029	1,430	6,948	51,164
2019	13,084	24,555	3,530	5,371	46,540
2020	8,775	28,547	517	5,201	43,040

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Table 2.7** illustrates the same data, but with annual harvests organized by landowner type. As the data shows, harvest volumes have fallen across all landowner types with the exception of the US Forest Service. This finding is counter to most other landowner timber harvest patterns in the US West, where the US Forest Service harvest volumes have typically declined since the early 1990s while harvests among other landowner types have held steady or increased. A key driving factor in declining harvest levels among other landowner types is the loss of markets for sawtimber in the region. For example, the Warm Springs Tribe shut down their sawmill in Warm Springs, OR in 2016. Similarly, the DR Johnson company closed a sawmill in Prairie City in 2008. That sawmill, however, restarted in the summer of 2022.

**Table 2.7 – Annual Timber Harvest Volume in Four-County PREP Region by Landowner Type between 2002 and 2020 (Board Feet in Thousands, Scribner Log Scale)**

Year	Industry	Non-Industrial Private	State	USFS	Other Public	Total
2002	30,111	39,602	0	30,878	512	<b>101,103</b>
2003	4,498	30,798	3	30,370	0	<b>65,669</b>
2004	13,390	32,248	5	33,783	0	<b>79,426</b>
2005	11,100	8,482	3	53,219	0	<b>72,804</b>
2006	18,055	16,806	2	27,392	0	<b>62,255</b>
2007	22,284	10,686	0	24,009	16	<b>56,995</b>

## CHAPTER 2 – WITHOUT PREP ANALYSIS

---

Recall from Table 2.1 that the US Forest Service managed lands in the four-county area account for about 50% of all timberland and forestland acres in the region. Thus, the management plans and actions of the US Forest Service are a significant determinant of the overall level of harvest activity in the region. Accordingly, US Forest Service staff were interviewed as part of the study about future timber harvest plans. The timber contracting staff indicated that in the near term (next 2 to 4 years), timber harvests will decline in the Ochoco and Deschutes National Forests. This is because both forests are slowing down timber sale preparation activity for a period of a few years. However, there is currently a 1-year backlog of timber sales planned, prepared, and ready to sell. There is also a 3-year backlog of timber sales with completed environmental analysis and planning, but which have yet to reach the final stages of being ready to sell. In the future, the Ochoco National Forest will sell about 12 million board feet of timber annually and the Deschutes will sell about 25 to 30 million board feet annually.

Also, the timber sale contracting staff said that if a biomass power plant were present, it would allow for increased utilization of fiber from most timber sales. In other words, on many current timber sales, utilization of non-saw log size material is optional. Current utilization standards are that sawlogs are defined as all pieces larger than 6" in diameter at the small end of the log and at least 16' long for ponderosa pine and 8' long for all other species. Thus, material 6" and smaller could be utilized at the PREP facility if it were to be developed. The staff said the utilization standard would likely change, but that it would involve a process of first determining the costs associated with increased utilization relative to the price the power plant can afford to pay for fuel.

### 2.3 WILDFIRE RISK

Western US forests have evolved with the regular occurrence of wildfire. However, beginning in the mid-1980s the area burned in seasonally dry forests of Western North America began a steady rise. Modeling suggests the trend will continue in a warming climate as protracted warmer and drier conditions will drive lower fuel moisture and longer fire seasons. The result will be increasing frequency and extent of fires compared to the twentieth century.<sup>6</sup>

#### 2.3.1 Historical Wildfire Levels in Four-County Area

As shown in **Figure 2.2**, over the period 2000 to 2021 there is an increasing trend in the area burned in wildfire in the four-county region (Crook, Deschutes, Jefferson, and Wheeler). It shows that based on the 20-year history for which wildfire data were available, the number of acres burned increased by an average of 818 acres per year. Also shown is that in the last 10 years there have been more frequent high-acreage fires. The data in the figure are from the Northwest Interagency Coordination Center large fire interactive web map.<sup>7</sup>

It should be noted, however, that the data used to build the model are limited to only 20 years. A data set with longer history would perhaps show different results. Also as illustrated by the figure, there is a lot of variability in the number of acres burned from year to year as seasonal weather patterns affect fuel moisture conditions, which in turn affect the extent and severity of wildfire in a given year. Still, the data are consistent with peer-reviewed academic research, which suggests that wildfire is increasing. The same research concludes that while the occurrence of wildfire is largely driven by climate conditions, forest managers can decrease fire intensity and severity and improve forest resilience to fir insects and drought

## CHAPTER 2 – WITHOUT PREP ANALYSIS

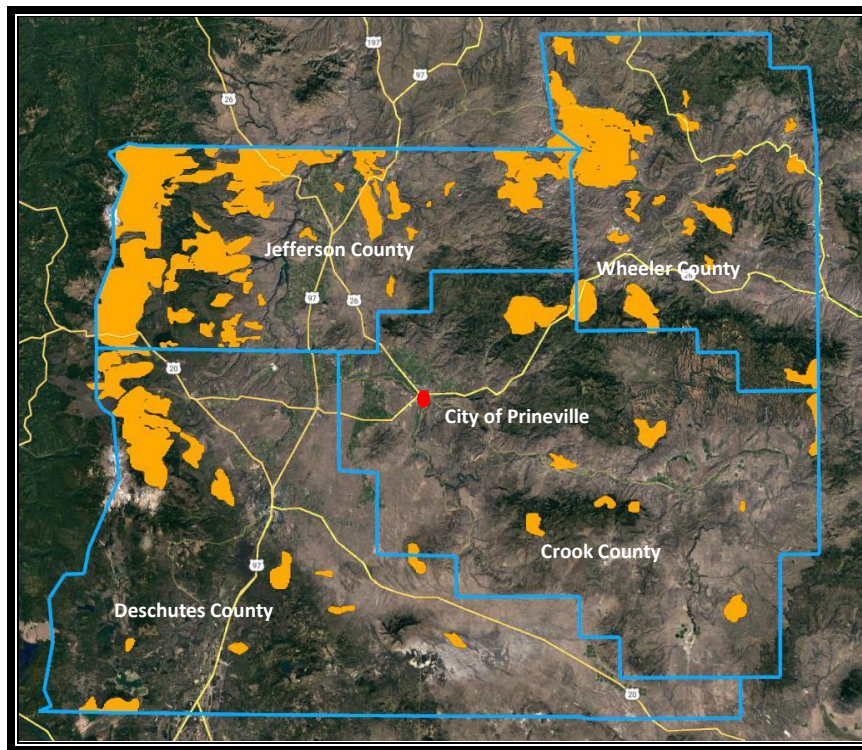

by implementing forest fuel treatments in a spatially strategic manner that reduces forest undergrowth fuel and decreases forest tree density, thereby increasing the health of remaining standing trees.

**Figure 2.2 – Annual Acres Burned by Wildfire in Four-County PREP Region**

**Figure 2.3** provides a graphic illustration of preceding data. It shows the four-county area considered in the PREP analysis with the area of wildfires that occurred between 2000 and 2021 highlighted in orange. During the period there were a total of 93 wildfires greater than 300 acres in size. The fires burned across a total of 684,701 acres. Note, however, that in several cases wildfire burned on the same acres more than once, but in a different year. Thus, the total area of wildfire burned includes some double counting of acres.

**Figure 2.3 – Map of Area Burned by Wildfire (Orange Shaded Areas) in Crook, Deschutes, Jefferson, and Wheeler Counties from 2000 to 2021**

**Table 2.8** further summarizes the number of fires and total acres burned by wildfire in the four-county area between 2000 and 2021. As the data in the table illustrates, Jefferson County has been by far the county

## CHAPTER 2 – WITHOUT PREP ANALYSIS

with the most area burned by wildfire during the period between 2020 and 2021. It has also been the county with the greatest number of fires, mainly because several of the fires that occurred there were extremely large, including the 2020 Lionshead Fire that burned a total of 204,588 acres including 65,500 in Jefferson County. Similarly, the 2003 Booth fire consumed a total of 90,734 acres, of which about 65,800 were in Jefferson County.

**Table 2.8 – Number of Wildfires and Acres Burned by County Between 2000 and 2021**

County	Number of Fires	Acres
Crook	10	48,989
Deschutes	16	116,735
Jefferson	42	362,831
Wheeler	25	156,146
<b>Total</b>	<b>93</b>	<b>684,701</b>

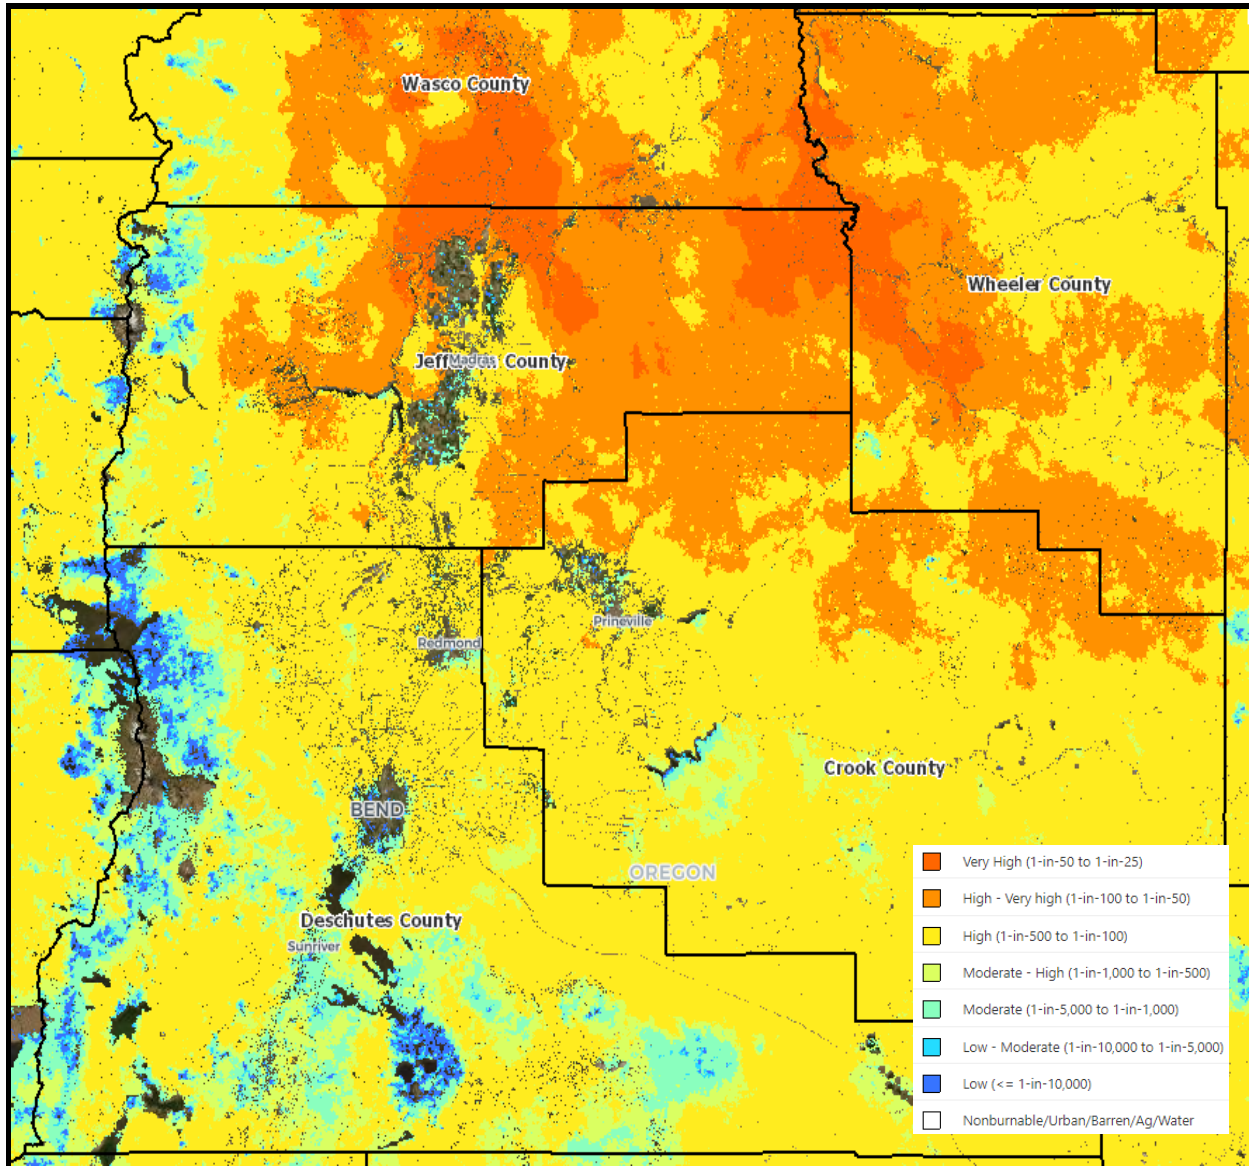

### 2.3.2 Future Wildfire Occurrence in the Four-County Area

Predicting the when, where, and severity of wildfires remains a “...daunting challenge to the field of risk and hazard science.”<sup>8</sup> Nevertheless, the Oregon Department of Forestry, the Oregon State Institute for Natural Resources, and the US Forest Service have all combined to develop the Oregon Wildfire Risk Explorer ([www.oregonexplorer.info](http://www.oregonexplorer.info)). It is a web-based mapping tool that allows users to better understand wildfire history and wildfire risk. **Figure 2.4** illustrates wildfire probability in the four-county region as assessed by the Oregon Wildfire Risk Explorer. As the figure illustrates, the areas generally north and east of Prineville are judged to be at the highest risk of wildfire. Note that the darker orange areas are highest risk, with an estimated Very High chance of wildfire with probability ranging between 1 in 25 to 1 in 50 (probability of a wildfire greater than 250 acres in size burning in a given location in a given year). The lighter orange color is rated as High to Very High wildfire risk, with a probability ranging between 1 in 50 and 1 in 100. The yellow areas are rated High risk of wildfire with probability ranging between 1 in 100 and 1 in 500.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

Figure 2.4 – Wildfire Probability Map in Four County Region (Source: Oregon Wildfire Risk Explorer)

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Table 2.9** provides an approximate quantification of the extent of area in each wildfire risk category in the four-county area. The data shows that across the entire four-county area, less than 20% of the land is rated in a category lower than High Risk. Conversely only about 3% of all land in the four-county area is rated in the Very High risk category.

**Table 2.9 – Wildfire Risk by County and Risk Category in the Four County Area (Acres)**

Acre Basis					
County	High	High to Very High	Very High	Other	Total
Crook	1,500,000	265,000	0	141,600	1,906,600
Deschutes	1,350,000	0	0	581,500	1,931,500
Jefferson	340,000	435,000	115,000	243,400	1,133,400
Wheeler	445,000	436,000	65,000	151,600	1,097,600
	3,635,000	1,136,000	180,000	1,118,100	6,069,100
Percentage Basis					
County	High	High to Very High	Very High	Other	Total
Crook	79%	14%	0%	7%	100%
Deschutes	70%	0%	0%	30%	100%
Jefferson	30%	38%	10%	21%	100%
Wheeler	41%	40%	6%	14%	100%
All (Volume Weighted)	60%	19%	3%	18%	100%

### 2.4 AIR QUALITY

There are two aspects of air quality to be considered as part of the analysis. Each is described in the following sections.

#### 2.4.1 Wildfire-Related Air Quality

Fine particulate matter suspended in the atmosphere is a form of air pollution, which causes the air to be hazy when levels are high. Fine particulates are referred to as PM 2.5, measuring as a count of particles in air that are  $\leq 2.5$  microns in diameter. As a point of reference, 2.5 microns is about 30 times narrower than the diameter of a human hair. Short-term exposure to air with high PM 2.5 levels can cause symptoms such as eye, nose, and throat irritation, lung irritation, coughing, runny nose, and shortness of breath. Long-term exposure can affect lung function and worsen medical conditions such as asthma and heart disease.

The standard for measuring PM 2.5 is the number of micrograms per cubic meter of air. A microgram equals to one millionth of a gram; there are 450 grams in a pound, thus a microgram is a very small unit of weight.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

In the US, the standard for what is considered safe PM 2.5 air quality is an annual average of 12 micrograms per cubic meter or less. The causes of PM 2.5 pollution are varied but include vehicle exhausts, the combustion of various fuels such as wood and coal, forest fires, etc. PM 2.5 levels elevate during events such as wildfire and when there is little wind to aid in mixing air.

**Figure 2.5** illustrates the average annual PM 2.5 level measured at Prineville. As the values show, PM 2.5 levels have generally averaged less than the US standard of 12 micrograms per cubic meter (the level below which is considered healthy with no risk to exposure). However, in 2020 the PM 2.5 measurement averaged 13 micrograms per cubic meter. This is almost certainly a direct result of large amounts of wildfire activity in the region in that year. However, another factor affecting PM 2.5 in the Prineville region is weather patterns in the wintertime, when inversions prevent air from moving in and out of the Prineville region. When inversions exist, particulates from wood stoves are almost certainly a key factor in raising PM 2.5 levels during the winter months.

It should also be noted that while the trendline and associated equation displayed on the chart show that over time PM 2.5 levels are rising, the data set only includes 13 years. A longer historical data set might show different trends. Also, as the data shows, there is a large amount of variability in the average annual PM 2.5 level from year to year. Thus, for example, the high levels in 2020 could be having an undue influence on the trendline.

**Figure 2.5 – Annual Average PM 2.5 Values (micrograms/cubic meter) in Prineville, Oregon from 2009 to 2021)**

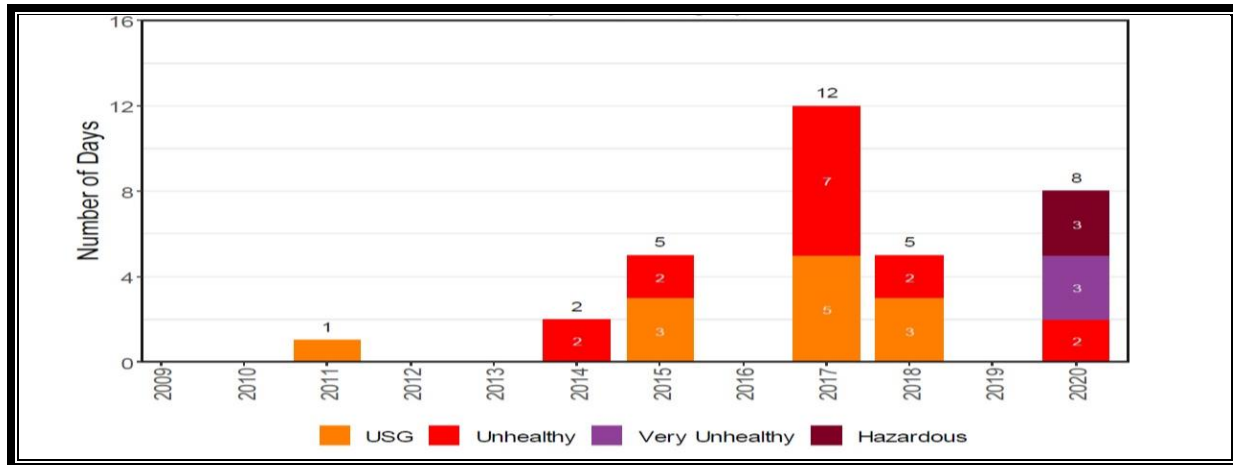

As previously described, a variety of factors could be affecting the PM 2.5 measurements at Prineville for the 2009 to 2022 period shown in the preceding table. However, according to a study<sup>9</sup> published by the Oregon Department of Environmental Quality, smoke from wildfire is causing increases in Air Quality Index values that are Unhealthy for Sensitive Groups (USG). Examples of these trends from that study include data from Eastern Oregon (Bend), which reveal that from 1987 to 2014, Bend had only 3 days where air quality was deemed unhealthy for sensitive groups, or an average of 0.11 days/year. However, from 2015 to 2021, Bend's total increased to 20 unhealthy days, 6 very unhealthy days, and 7 hazardous days, or an average of 5.5 days/year of air quality at unhealthy or worse levels. That is a fiftyfold increase in the number

<sup>9</sup> Wildfire Smoke Trends and Air Quality Index. June 2022. Oregon Department of Environmental Quality. Accessed at: <https://www.oregon.gov/deq/wildfires/Documents/WildfireSmokeTrendsReport.pdf>

## CHAPTER 2 – WITHOUT PREP ANALYSIS

of poor air quality days compared to the 1987 to 2014 period. More specific to the region for this study, **Figure 2.6** illustrates the upward trend in the number of days per year in Prineville where air quality is deemed unsafe for sensitive groups or worse. Like the Bend area, the number of unhealthy or worse air quality days has increased significantly in recent years in Prineville.

**Figure 2.6 – Prineville Wildfire Smoke by Air Quality Index Category  
(Number of Days for Each Air Quality Category)**

Note that the data in the preceding table shows the number of days per year that are deemed unsafe for groups at health risk from low air quality, or worse. The ratings are per the following air quality index (**Figure 2.7**), which is from the same Oregon Department of Environmental Quality Report.

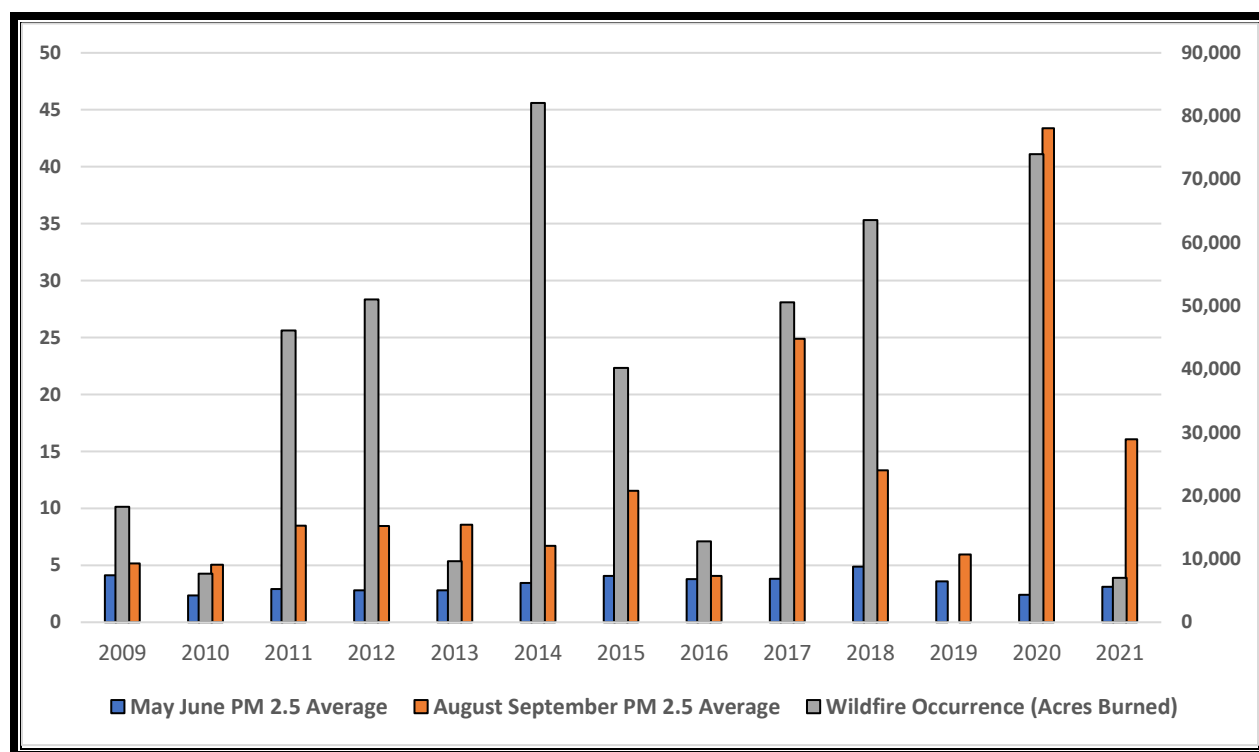

**Figure 2.7 – PM 2.5 Air Quality Index, Breakpoints, and Potential Health Effects**

AQI Category and Color	AQI value	PM2.5 (µg/m <sup>3</sup> ) 24-hr Aver.	Air Quality and Health
<b>Good</b>	0 to 50	0.0 to 12.0	Air quality is satisfactory. Air pollution poses little or no health risk.
<b>Moderate</b>	51 to 100	12.1 to 35.4	Air quality is acceptable; however, there may be a moderate health concern for a very small number of people. Respiratory symptoms are possible in people unusually sensitive to air pollution. Heart or lung disease (such as asthma) symptoms may be aggravated in people with cardiopulmonary disease and older adults. These groups should consider <i>reducing prolonged or heavy</i> outdoor exertion.
<b>Unhealthy for Sensitive Groups</b>	101 to 150	35.5 to 55.4	Members of sensitive groups may experience health effects. People with heart or lung disease may experience increased symptoms and premature mortality; older adults, pregnant women and children, are also among the groups most at risk of respiratory symptoms. These groups should <i>reduce prolonged or heavy</i> outdoor exertion. The general public is not likely to be affected.
<b>Unhealthy</b>	151 to 200	55.5 to 150.4	Everyone may begin to experience health effects; members of sensitive groups may experience more serious health effects. These groups should <i>avoid prolonged or heavy</i> exertion: People with heart or lung disease, children, pregnant women and older adults. Everyone else should <i>reduce prolonged or heavy</i> exertion.
<b>Very Unhealthy</b>	201 to 300	150.5 to 250.4	Health alert: everyone may experience more serious health effects. These groups should <i>avoid all</i> physical activity outdoors: People with heart or lung disease, children, pregnant women and older adults. Everyone else should <i>avoid prolonged or heavy</i> exertion.
<b>Hazardous</b>	>300	>250.5	Health warnings of emergency conditions. The entire population is more likely to be affected. See EPA AIRNow " <a href="#">Extremely High Levels of PM2.5: Steps to Reduce Your Exposure</a> " when PM2.5 levels are "Hazardous" or above on the AQI.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

Given the data in the preceding figure, PM 2.5 measures in Prineville were also analyzed in a different way, as shown in **Figure 2.8** which compares the average PM 2.5 levels in May and June, typically the lowest months, to August and September, typically the months with higher PM 2.5 concentrations during years with occurrence of wildfire. Thus, also plotted in the figure is the number of acres of wildfire that burned in each year in the four-county region. The data show a relatively strong correlation between the number of acres burned in a given year and high PM 2.5 levels in August and September.

**Figure 2.8 – Comparison of PM 2.5 levels at Prineville in May/June to August/September (left axis) and the Number of Acres Burned in Wildfire Each Year in the Four-County Area**

### 2.4.2 Open-Pile Logging Slash Burning Impacts on Air Quality

Logging slash is the debris left on the ground in a forest after logging operations. It typically consists of tree limbs, treetops where the diameter is too small for utilization as a sawlog or pulpwood, and otherwise unmerchantable tree stems. Oregon’s Forest Practices Act sets out administrative rules about how logging slash must be treated: this treatment protects any remaining trees in the forest, prepares it for regeneration of new seedlings, and reduces the threats of wildfire, insects, and disease. Options for slash treatment include lopping and scattering the slash, chipping/grinding the slash and removing it from the harvest site, and open-pile burning of slash piles. The following paragraphs provide an analysis of the fate of logging slash in a scenario in which the PREP facility exists.

First, it is important to establish the annual amount of logging slash generated. As illustrated in Table 2.6, annual timber harvests in the four-county region have averaged 44.7 million board feet (Scribner) during the period 2012 to 2021. However, BECK estimates that the presence of the PREP facility and the recent reopening of DR Johnson’s Prairie City sawmill will increase future average annual harvests in the four-county region by 10 million board feet (Scribner) annually. Thus, for the purpose of this analysis it is assumed that annual harvest in the four-county region will be 54.7 million board feet (Scribner).

## CHAPTER 2 – WITHOUT PREP ANALYSIS

Per the supply study completed as part of the PREP facility planning, it was estimated that an average of 0.9 bone dry tons of logging slash are generated per MBF of sawtimber harvested. In other words, for every thousand board feet of logs produced, there are an associated 0.9 bone dry tons of limbs, tops, and cull sections of the trees harvested to produce the sawtimber. This means that each year in the four-county area an estimated 49,200 bone dry tons of logging slash are generated (54.7 MMBF of sawtimber harvested/year times 0.9 BDT of logging slash per MBF).

Also, per forest products industry professionals familiar with logging practices in the region, virtually all logging slash is burned in slash piles. This is because typically after a tree is felled, the whole tree (i.e., limbs and top still intact) is skidded to a landing area. At the landing, a delimeter or processor removes the limbs and top to convert the tree stem into a log. Thus, the logging slash accumulates at a landing area and the landowners (or logging contractors) return in the fall/winter to burn the logging slash piles. Burning is less costly than chipping the material or lopping and scattering it back across the harvest unit.

Also, per a report<sup>10</sup> issued by the Washington Department of Natural Resources, open-pile burning of logging slash generates air pollutants at the rates shown in **Table 2.10**. As the data in the table indicates, an estimated 92 tons<sup>11</sup> of nitrogen oxides (NO<sub>x</sub>), 3,813 tons of carbon monoxide (CO), 246 tons of Volatile Organic Compounds (VOCs), and 400 tons of Particulate Matter are emitted annually from open-pile burning of slash. Key assumptions in the calculations are that all 49,200 bone dry tons of logging slash are open-pile burned each year and that this material contains an average of 12.5 MMBTU per ton.

**Table 2.10 – Emissions from Slash Pile Burning in Oregon**

Pollutant	Emission Rate (Pounds/MMBTU)	Annual Emissions (Short Tons)
NO <sub>x</sub>	0.3	92
CO	12.4	3,813
VOC	0.8	246
PM	1.3	400

### 2.5 WATER RESOURCES

As described by the Oregon Department of Agriculture’s Crooked River Agricultural Water Quality Management Area Plan<sup>12</sup>, water availability and quality have been constantly evolving since the mid-1800s, when European settlement began in the four-county region. Livestock grazing, agricultural irrigation, removal of frequent low-intensity fire from the landscape (which affected vegetation composition), and channelization of creeks and rivers to reduce flooding have all impacted water quality and quantity. Thus, there is a long and complicated history of water use, quality, and quantity.

Examining all aspects of the water-related issues is beyond the scope of this study. However, the significant increase in the number of juniper trees across Eastern Oregon landscapes over the last 100 plus years is a water-related element of significance to the PREP project. This is because juniper trees use significant amounts of groundwater and intercept significant amounts of rainwater. The PREP facility could combust

<sup>10</sup> Forest Biomass and Air Emissions. Washington Department of Natural Resources. Accessed at: [https://www.dnr.wa.gov/Publications/em\\_forest\\_biomass\\_and\\_air\\_emissions\\_factsheet\\_8.pdf](https://www.dnr.wa.gov/Publications/em_forest_biomass_and_air_emissions_factsheet_8.pdf)

<sup>11</sup> Air pollutant “tons” refers to a US short ton or 2,000 pounds.

<sup>12</sup> Crooked River Agricultural Water Quality Management Area Plan. Oregon Department of Agriculture. February 2021. Accessed at: <https://www.oregon.gov/ODA/shared/Documents/Publications/NaturalResources/CrookedRiverAWQMAreaPlan.pdf>

## CHAPTER 2 – WITHOUT PREP ANALYSIS

juniper trees removed from the landscape. Therefore, the following section provides an analysis of juniper and its impact on water supply. The value of water is analyzed in Chapter 4.

### 2.5.1 Increasing Juniper

Juniper, a tree native species to the region, has dramatically increased its presence across the landscapes of the Inland West largely due to less frequent wildfire. The trend is also true in the four-county region examined in this study. For example, according to data from the US Forest Service’s Forest Inventory and Analysis database, the number of juniper trees in the four-county region experienced a net increase of 15% from 2010 to 2019 as shown in **Table 2.11**. Expressed a different way, the total number of juniper trees estimated in the region increased to 141 million in 2019 from 122 million in 2010. Another trend apparent in the data is that majority of the increase has occurred on private lands.

**Table 2.11 – Change in Number of Live Juniper Trees on Forestland and Timberland between 2010 and 2019 by Landowner Type in Four-County Region (count of trees in millions)**

2010	National Forest	Other Federal	State & Local	Private	Total
Forestland	15	38	3	66	122
Timberland	8	3	0	12	23
2019	National Forest	Other Federal	State & Local	Private	Total
Forestland	14	39	5	83	141
Timberland	7	4	0	15	25
Difference	National Forest	Other Federal	State & Local	Private	Total
Forestland	(1)	1	2	17	19
Timberland	(0)	1	0	2	3

Similarly, **Table 2.12** displays data showing the increase in juniper acreage (i.e., areas where juniper is the dominant tree species present) between 1936 and 1999 in the four-county region.<sup>13</sup> As the data in the table shows, juniper acreage increased by about 64% between 1936 and 1999.

**Table 2.12 – Increase in Juniper Acreage in the Four-County Region Between 1936 and 1999 (acres in thousands)**

County	1999 Total Detailed Breakout								1999 Total	1936 Total	Increase
	National Forest		Other Federal		State & Local		Private				
	Timber Land	Forest Land	Timber Land	Forest Land	Timber Land	Forest Land	Timber Land	Forest Land			
Crook	42	2	287	107	32	0	424	242	1,136	509	627
Deschutes	0	0	176	88	16	32	32	13	357	329	28
Jefferson	112	1	32	0	0	0	218	142	505	63	442
Wheeler	6	2	96	16	0	0	238	151	509	50	459
<b>Total</b>	160	5	591	211	48	32	912	548	2,507	951	1,556

<sup>13</sup> The Western Juniper Resource of Eastern Oregon. PNW-RB-249. October 2005. [https://www.fs.usda.gov/pnw/pubs/pnw\\_rb249.pdf](https://www.fs.usda.gov/pnw/pubs/pnw_rb249.pdf)

## CHAPTER 2 – WITHOUT PREP ANALYSIS

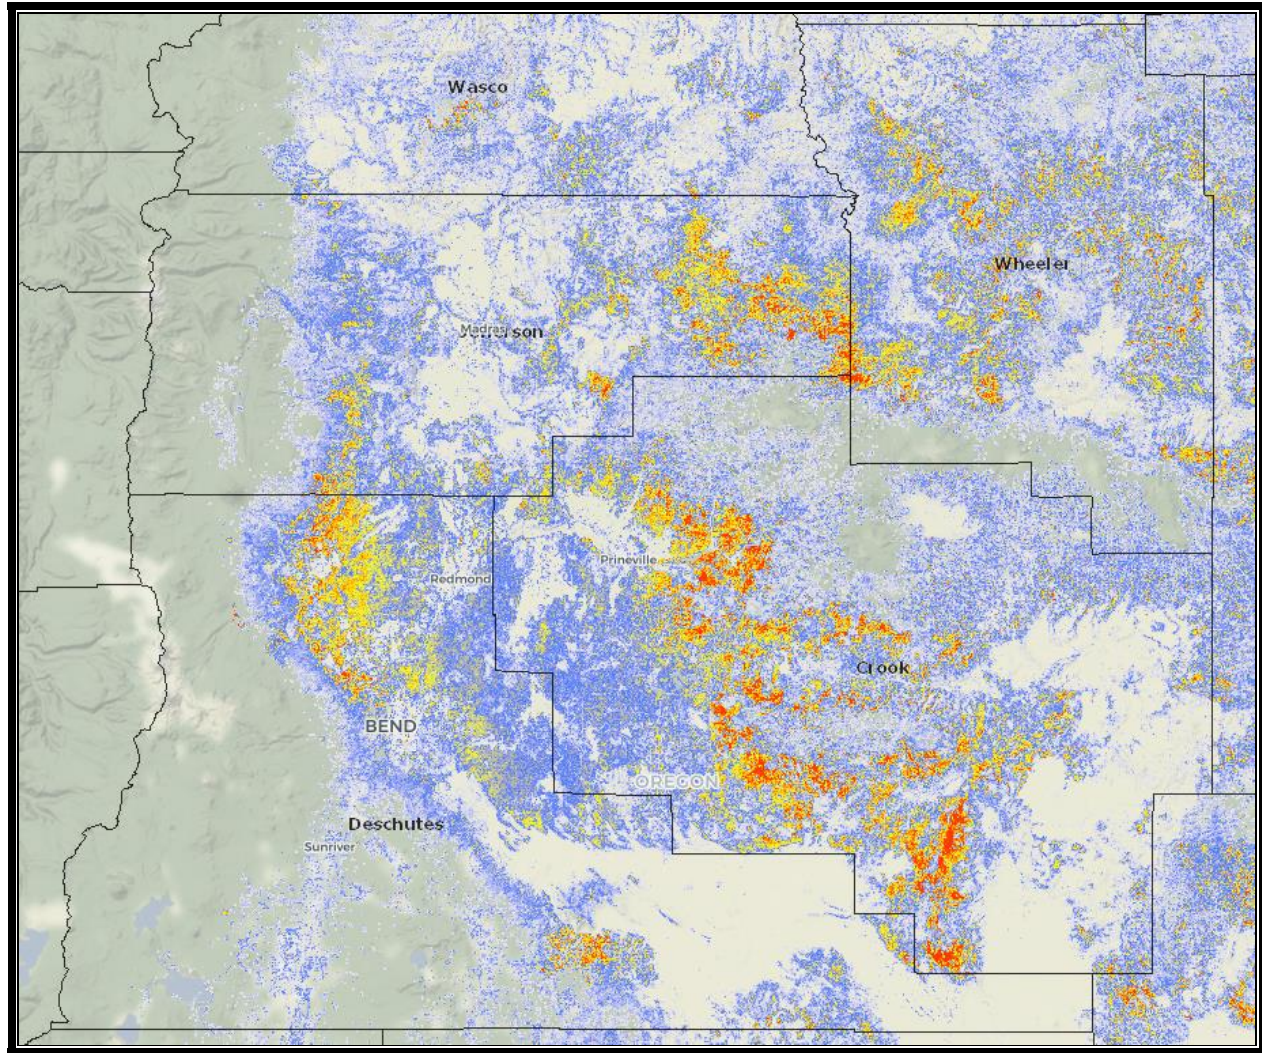

Another means of assessing juniper volume is to consider the amount of biomass per acre. Accordingly, data from the same USFS publication about juniper in Eastern Oregon was used to develop the data shown in **Table 2.13**. It shows that, on average, juniper totals about 1.9 bone dry tons of biomass per acre in Eastern Oregon. Note that because of the way the data was gathered in the USFS report, the volume per acre estimates shown in the table are averages for all 14 Eastern Oregon counties and is therefore not specific to the four-county region. Still, the broader averages are judged to be representative of the four-county region. Also note that volumes range from a low of less than 1 bone dry ton per acre to more than 8 bone dry tons per acre. Only about 10% of the juniper acres across the whole region are productive enough to produce 8 bone dry tons per acre.

**Table 2.13 – Average Juniper Volume per Acre in Eastern Oregon by Landowner Type and by Timberland and Forestland in 1999**

	National Forest		Other Federal		State & Local		Private		Timber Land Total	Forest Land Total	Grand Total
	Timber Land	Forest Land	Timber Land	Forest Land	Timber Land	Forest Land	Timber Land	Forest Land			
<b>Total Acres (in 1,000s)</b>	377	33	1,534	1,196	95	141	1,556	1,869	3,562	3,239	6,801
<b>Total BDT Juniper Biomass (in 1,000s)</b>	1578	120	5,113	199	357	47	4763	421	11,811	787	12,598
<b>BDT/Acre</b>	4.2	3.6	3.3	0.2	3.8	0.3	3.1	0.2	3.3	0.2	1.9

Finally, regarding the extent of juniper, **Figure 2.9** illustrates the range of juniper in the four-county region. The areas shaded red have the highest juniper densities, followed by orange and yellow areas also containing juniper at lower densities. The purple-colored areas are also dominated by juniper but have lower-density juniper forest cover than the red, orange, and yellow areas. As the figure shows, juniper is widespread throughout the four-county area. Sections of very high-density juniper forest are found in all four of the counties, but Crook County has the largest area and the densest area of juniper cover.

Figure 2.9 – Extent of Juniper Acreage in the Four County Region<sup>14</sup>

### 2.5.2 Juniper Water Usage

Research has shown that juniper water usage varies dramatically based on the key factors of tree size, time of year, and level of annual precipitation. Thus, creating a model of juniper usage is highly dependent on the level of those three variables. For example, a recent study completed in the Camp Creek watershed near Prineville, Oregon found that mature juniper trees, which are estimated to average 18” in diameter at breast height, consumed on average 4,347 gallons of water per year. In contrast, much smaller saplings, which average only about 1” in diameter at breast height, consume only 75 gallons of water per year on average. The study<sup>15</sup> results are shown in **Table 2.14**.

<sup>14</sup> The Western Juniper Resource of Eastern Oregon. PNW-RB-249. October 2005. Accessed at: [https://www.fs.usda.gov/pnw/pubs/pnw\\_rb249.pdf](https://www.fs.usda.gov/pnw/pubs/pnw_rb249.pdf)

<sup>15</sup> Water Use by Mature and Sapling Western Juniper Trees. Ricardo Mat-Gonzalez, et al, Rangeland Ecology & Management. 74 (2021) 110-113.

## CHAPTER 2 – WITHOUT PREP ANALYSIS

**Table 2.14 – Water Usage Among Differing Size Juniper Trees at Three Sites in Eastern Oregon**

	Trees/Acre		
	Mature	Saplings	Total

Site 3	651,268	8,190	643,078
<b>Average</b>	<b>599,019</b>	<b>8,055</b>	<b>590,964</b>
	Gallons of Water Used Per Tree Per Year		
Site 1	4,348	75	2,618
Site 2	4,347	75	2,174
Site 3	4,348	75	2,490
<b>Average</b>	<b>4,347</b>	<b>75</b>	<b>2,417</b>

For the purposes of this study, it was assumed that there is a constant, linear relationship between juniper tree diameter and water usage as shown in **Figure 2.10**. As the equation on the chart shows, each inch increase in tree diameter is associated with an approximate 250 gallon per year increase in water consumption.

**Figure 2.10 – Estimated Annual Water Consumption (Gallons/Year on Vertical Axis) Versus Tree Diameter (Tree Diameter in Inches at Breast Height on Horizontal Axis)**

## CHAPTER 2 – WITHOUT PREP ANALYSIS

Also, for the purposes of this study it was assumed that the distribution of juniper tree size per acre in the four-county area is represented by the values in **Table 2.15** below. As the top portion of the table illustrates, on average there are about 131 trees per acre in lands classified as juniper timberlands and 22.5 trees per acre on lands classified as juniper forestlands in Eastern Oregon. The second section down in the table shows the estimated average annual water usage per tree by tree diameter. These values are estimated from Figure 2.10. The third section down in the table shows the results of multiplying the average number of trees per acre for each diameter grouping by the estimated average annual water usage for each diameter grouping. As the results show, timberland juniper areas consume an average of 96,500 gallons of water per acre per year and forestland juniper areas consume an estimated 10,500 gallons of water per acre per year. Finally, the bottom portion of the table shows an adjustment to the annual per-acre water consumption of juniper forests. The adjustment accounts for precipitation that is intercepted from reaching the ground because of the presence of tree canopy cover. The adjustment assumes that on average across all juniper forest types, the canopy cover averages 40%<sup>16</sup> and that canopy cover is directly correlated to interception rate (i.e., 40% canopy cover = 40% rainfall interception rate).<sup>17</sup> As the results indicate, it is estimated that each acre of juniper timberland consumes (or intercepts) an average of nearly 161,000 gallons of water annually and each acre of juniper forestland consumes (or intercepts) about 17,500 gallons of water annually.

**Table 2.15 – Average Trees Per Acre for Juniper Forests for Forestland and Timberland Forest Types and Associated Estimated Annual Average Water Usage (Gallons/Year)**

Forest Type	Tree Diameter Category (Trees/Acre)													Total
	Seed-lings	1" to 2.9"	3" to 4.0"	5" to 6.9"	7" to 8.9"	9" to 10.9"	11" to 12.0"	13" to 14.9"	15" to 16.9"	17" to 18.9"	19" to 20.9"	21" to 28.9"	29+"

## CHAPTER 2 – WITHOUT PREP ANALYSIS

Given the data shown in the preceding table, it is also possible to estimate total juniper annual water usage in the four-county region. The top portion of **Table 2.16** shows the current estimated acres of juniper woodlands in the four-county area. As the data shows, there is an estimated total of 2.783 million acres. Note the value is estimated from the 1999 Eastern Oregon study<sup>18</sup> and assuming that juniper forested area increased at a rate of 0.5% per year from 1999 to 2021. The middle portion of the table contains the estimated average annual water consumption per acre for each juniper forest type as calculated in the preceding table. The bottom portion of the table is a calculation of total annual water consumption in juniper forests in the four-county area given the estimated acres of juniper and the estimated average annual consumption per acre. As the results indicate, in the four-county area it is estimated that juniper forests consume an average of 447 billion gallons of water annually.

**Table 2.16 – Estimated Juniper Forestland and Timberland Annual Water Consumption in the Four-County Area (Gallons per Year in 1,000s)**

Acres of Juniper in Each County (Acres in 1,000s)			
County	Timberland	Forestland	Total
Crook	872	390	1,261
Deschutes	249	148	396

<b>Total</b>	<b>305,755,028</b>	<b>142,066,188</b>	<b>447,821,215</b>

### 2.6 LANDFILL USAGE

The Crook County Landfill disposes of approximately 20,000 tons of wood construction and demolition waste annually in its unlined cell.<sup>19</sup> The landfill charges a tipping fee of \$40 per ton for this material. Since the material is placed in an unlined cell, which costs little to create or maintain, the tipping fee is a source of revenue for the landfill.

In contrast, the Knott Landfill in Deschutes County reports receiving about 18,000 annual tons of material removed from fire prevention treatment projects. However, this material is diverted from the landfill since the facility is projected to run out of space by 2029. Instead, the material is allowed to accumulate for several months, then a grinder processes it into smaller material for transportation to the landfill. The Deschutes County Landfill reports that the cost for grinding and transporting that material is about \$425,000 per year.<sup>20</sup>

## CHAPTER 3 – WITH PREP ANALYSIS

As previously described, the main objective of this study is to assess the environmental impacts of the proposed PREP biomass power plant. The assessment is based on measuring a variety of environmental conditions in a scenario where there is no biomass power plant (i.e., WITHOUT PREP as assessed in Chapter 2) and then estimating those environmental conditions in a scenario where there is a biomass power plant (WITH PREP as assessed in this chapter). The differences in the environmental factors in the two scenarios are interpreted as the impact of the PREP. Additionally, this study provides an assessment of the economic impact of the changes in environmental conditions arising from the PREP (see Chapter 4).

### 3.1 PREP OPERATING PARAMETERS

The City of Prineville commissioned a feasibility and fuel supply study for the proposed PREP. The study found that there is adequate fuel available and that the project is feasible if the plant is sized at 24.9 MW of power production capacity. Given these findings, **Table 3.1** below summarizes the PREP’s key operating parameters that help inform the WITH PREP scenario.

**Table 3.1 – Summary of WITH PREP Power Plant Operating Parameters**

Metric	Value	Units	Remarks
Plant Scale	24.9	MW	Facility “name plate” power generating capacity
Capacity Factor	96	% uptime	Percent of time the plant is operating
Operating schedule	8,410	Hours/year	Hours/year plant will operate
Gross Power Output	209,214	MWH/Year	Units of electricity produced/year
Station Load	2.2	MW	9% of gross output is station load
Annual Fuel Consumption	191,000	BDT/Year	Volume of wood fuel consumed per year
Employees	8	People	Direct employees

As the data in the table shows, the plant will have a power generating capacity of 24.9 MW. It will operate an average of 8,410 hours per year, which translates into annual production of 209,214 megawatt hours. Additionally, the equipment in the plant consumes 9% of the power generated (i.e., station load). However, the feasibility study’s financial analysis assumes that plant’s station load is purchased from an external power provider (e.g., BPA, or Pacific Power). Per the feasibility study, the plant will directly employ 8 people. Finally, given the preceding parameters, the plant will consume 191,000 bone dry tons of biomass fiber annually.

Specific to biomass fuel, the supply study identified six potential fuel sources including:

- Sawmill Residuals including bark, sawdust, planer shavings, and chips)
- Logging Slash including limbs, tops, and otherwise unmerchantable logging residuals
- Forest Fuels Reduction includes fiber from whole tree chipping of small diameter trees
- Wood Recycling Centers including biomass collected at municipal drop-off locations
- Landscape Supply including fiber such as bark/mulch gathered at landscape supply operations

## CHAPTER 3 – WITH PREP ANALYSIS

- Orchard Supply includes fiber gathered from replacing older orchard trees with new/younger crops

The PREP feasibility study does not specify the proportion of fuel that will be supplied from each source. However, a biomass supply study completed for the PREP provided an estimate for the proportion of fuel that would come from different sources under two scenarios, including a Without Sawmill Supply Case and a With Sawmill Case. Notably, at the time the biomass supply study was completed in August 2021 there were no existing nearby sawmills. However, a sawmill has since reopened in Prairie City, Oregon, which is located roughly 130 miles east of Prineville. Additionally, Neiman Enterprises operates a sawmill in Gilchrist, Oregon which is roughly 80 miles southwest of Prineville. Given these circumstances, the fuel supply scenarios estimated in the PREP biomass supply study were slightly modified based on the project team’s judgment about likely supply sources. The results are shown in **Table 3.2**.

**Table 3.2 – Proportion of PREP Fuel Among Potential Supply Sources Per PREP Supply Study**

Fuel Source	Without Sawmill Scenario		With Sawmill Scenario	
	Proportion in Without Sawmill Scenario	BDT/Year	Proportion in With Sawmill Scenario	BDT/Year
Logging Slash	65%	124,000	30%	57,000
Juniper Removals	15%	29,000	15%	29,000
Fuel Reduction	10%	19,000	10%	19,000
Sawmill Residuals	5%	10,000	40%	76,000
Urban Wood Waste	5%	10,000	5%	10,000
<b>Total</b>	100%	191,000	100%	191,000

As the data in the table shows, in the Without Sawmill Scenario the project is heavily reliant on fuel sourced directly from forests, with 85% of the supply consisting of logging slash, juniper removals, and fuel reduction projects. Conversely, in the With Sawmill Scenario, only 55% of the supply comes directly from the forest with the balance coming from sawmill residuals and urban wood waste. Both the Without Sawmill Scenario and the With Sawmill Scenario are given consideration in the following analysis of selected environmental conditions in a WITH PREP scenario.

### 3.2 PREP FACILITY ECONOMIC IMPACT FACTORS

The PREP facility will increase economic activity in the Prineville region, both during construction and while operational. The plant’s design and construction has an estimated cost of \$145.5 million as categorized in **Table 3.3**. The potential economic impacts of these expenditures on the Prineville region is discussed in Section 4.6.

## CHAPTER 3 – WITH PREP ANALYSIS

**Table 3.3 – Estimated Capital Cost of PREP Facility (\$ in millions)**

Capital Cost Item	Capital Cost (\$ in millions)
Design and Supply of Boiler & Auxiliaries	48.7
Construction (Equipment, Mechanical)	69.6
Land Purchase	3.2
Project Development	1.6
Private Transmission	5.0
Construction Interest	9.6
Incidental & Contingency	7.8
<b>Total</b>	<b>145.5</b>

Another factor affecting PREP’s economic impact on the Prineville Region is the facility’s annual revenues and operating costs, which are summarized in **Table 3.4**. The economic impacts of these annualized revenues and operating costs on the Prineville region are discussed in Section 4.6. Note that the values shown in the table are from the second year of operation, which is when the plant would be projected to achieve full operational capacity. Thus, it reflects the impact of an assumed 2% per year escalation factor on all costs and revenues. Also note that regarding the power sales revenue, the plant’s feasibility was modeled prior to the passage of the Inflation Reduction Act, which contained significant provisions for aiding biomass power. Thus, the power sales value shown in the table would likely be lower if the power plant is developed.

**Table 3.4 – PREP Facility Estimated Annual Operating Revenues and Costs**

Revenue/Cost	Type	Rate (\$)	Units	Annual Total \$
Power Sales Revenue	Revenue	122.40	\$/MWH	25,607,797
Biomass Fuel	Cost	52.48	\$/BDT	10,032,234
Labor & Benefits	Cost	4.71	\$/MWH	986,366
Chemicals & Consumables	Cost	2.63	\$/MWH	549,984
Maintenance	Cost	3.00	\$/MWH	627,811
Utilities	Cost	5.39	\$/MWH	1,127,678
Ash Handling	Cost	1.29	\$/MWH	270,878
All other	Cost	1.25	\$/MWH	261,982
Insurance	Cost	1.46	\$/MWH	306,114
Legal & Accounting	Cost	0.49	\$/MWH	102,000
<b>Total Operating Cost</b>		<b>* 68.18</b>	<b>\$/MWH</b>	<b>* 14,265,047</b>

\* Total is only sum of annual operating costs. Annual revenue from power sales is not included in the total.

Regarding the biomass fuel consumed at the PREP facility, **Table 3.5** provides additional detail about the various sources of fuel and economic impacts. As the first and second columns on the left side of the table illustrate, there is a Without Sawmill scenario and a With Sawmill scenario. For each scenario, the annual

## CHAPTER 3 – WITH PREP ANALYSIS

total volume of fuel is included. In the third column from the left is the average bone dry tons of fuel per truckload given assumed average moisture content of each fuel (i.e., 40% for logging slash, juniper and fuel reduction fuels, 50% for sawmill residuals, and 20% for urban wood waste). The fourth column from the left is a calculation of the number of truckloads needed/year for each fuel type, which is calculated by dividing the total BDT/Year by the BDT/truckload. The fifth column from the left is the estimated number of round trips per day each truck can make when hauling fuel. The sixth column from the left is how many days per year hauling is open. Note the analysis accounts for the number of days per week the facility is open to receiving material. It also accounts for periods during the year when trucks have limited ability to haul due to weather and when roads are closed to heavy trucks in the spring while the thawing frost leaves them susceptible to damage. Finally, the last column on the right is the estimated number of trucks and drivers needed to deliver the total annual volume of fuel required at the PREP facility. Note the values in the last column are calculated by dividing the total amount of truckloads/year for each fuel type by the capacity of each truck (roundtrips/day x days/year). The calculated values have been rounded up to the nearest whole number of drivers. As the results indicate, the PREP facility would create between 24 and 28 full-time truck driver jobs for transporting fuel from the various supply sources to the PREP facility.

**Table 3.5 – PREP Facility Trucking Jobs Created**

Without Sawmill	Total BDT / Year	BDT / Truckload	Truckloads / Year	Average Roundtrips / Day	Days / Year	Trucks/Drivers Needed
Logging Slash	124,000	15.00	8,267	2.5	250	14
Juniper Removals	29,000	15.00	1,933	2.5	250	4
Fuel Reduction	19,000	15.00	1,267	2.5	250	3
Sawmill Residuals	10,000	12.50	800	2	250	2
Urban Wood Waste	10,000	20.00	500	2	250	1
<b>Total</b>	<b>191,000</b>		<b>12,767</b>			<b>24</b>
With Sawmill	Total BDT / Year	BDT / Truckload	Truckloads / Year	Average Roundtrips / Day	Days / Year	Trucks/Drivers Needed
Logging Slash	57,000	15.00	3,800	2.2	250	7
Juniper Removals	29,000	15.00	1,933	2.5	250	4
Fuel Reduction	19,000	15.00	1,267	2.5	250	3
Sawmill Residuals	76,000	12.50	6,080	2	250	13
Urban Wood Waste	10,000	20.00	500	2	250	1
<b>Total</b>	<b>191,000</b>		<b>13,580</b>			<b>28</b>

The PREP facility would also create in-woods jobs associated with fuel gathering and processing. Accordingly, **Table 3.6** provides an estimate of the number of in-woods jobs created for carrying out those activities. As the table illustrates, between 20 and 24 jobs would be created for gathering and processing fuel depending on the scenario. Note a “side” is a term used to refer to a work crew. The BDT Produced per Side per Year and the number of Jobs per Side are estimated from similar operations in the Pacific Northwest. There are fewer in-woods jobs in the Without Sawmill scenario because more of the fuel for the PREP facility would come from the sawmill instead of in the woods, requiring fewer workers.

**Table 3.6 – In-Woods Jobs Created by PREP**

Without Sawmill	Total BDT / Year	BDT Produced / Side / Year	Sides Needed	Jobs / Side	Total Jobs
Logging Slash	124,000	40,000	3	3	9
Juniper Removals	29,000	15,000	2	5	10
Fuel Reduction	19,000	20,000	1	5	5
<b>Total</b>			<b>6</b>		<b>24</b>

With Sawmill	BDT/Year	BDT Produced / Side / Year	Sides Needed	Jobs / Side	Total Jobs
Logging Slash	57,000	40,000	1.5	3	5
Juniper Removals	29,000	15,000	2	5	10
Fuel Reduction	19,000	20,000	1	5	5
<b>Total</b>			<b>4.5</b>		<b>20</b>

**3.3 WATER RESOURCES**

As described in Section 3.1, the PREP facility is projected to consume annually 29,000 bone dry tons of fuel that arise from thinning juniper woodlands. This circumstance is true for both the With and Without sawmill scenarios. According to the fiber supply assessment completed for the PREP project, the volume of juniper fuel per acre treated averages 8 BDT for private lands and 3 BDT for public lands in Central Oregon. Additionally, the same study found that as many as 13,000 acres of juniper lands could be treated per year in the supply area. The preceding figures indicate that as much as 112,250 bone dry tons of juniper fuel could be available annually. Thus, the assumption of 29,000 BDT/year is well within the capacity of the supply area to produce fuel for the PREP facility.

For the purposes of this study, it was assumed the juniper treatments would yield an average of 4 bone dry tons per acre, which is slightly conservative given the volume per acre estimates in the PREP project’s fuel supply study, but slightly higher than the average volume per acre estimated in the juniper water usage studies already described in Chapter 2. Given the average volume per acre assumption (4 BDT/acre) and the assumption that the plant will consume an average of 29,000 BDT of juniper fuel/year, it is estimated that the PREP project will contribute to the treatment of 7,250 acres per year.

Also, based on the information in Table 2.14 in Chapter 2, water consumption per acre in juniper forests ranges between about 17,000 gallons per year in juniper woodlands and nearly 161,000 gallons per year in juniper forestlands. Given the higher density of juniper in the forestland acres, it was assumed that 80% of the annual treatments are on forestland acres and 20% on woodland acres. Focusing on the more densely stocked woodlands not only provides higher volumes to the PREP facility, but also treats the lands most in need of density reduction. Given this assumption it is estimated that, on average, each juniper acre treated consumes 132,250 gallons of water per year (160,930 x 0.8 + 17,539 x 0.2).

Another assumption necessary in the analysis is estimating the proportion of the standing juniper volume removed during treatments. Given the long-term juniper encroachment observed across the entire PREP supply area, it was assumed that 100% of the juniper would be removed. This means that if each acre of juniper treated consumes 132,250 gallons of water per year, and all juniper trees are removed, then an estimated 119,000 gallons of water per year are instead free to replenish aquifers and streams (132,500 gallons per year x 0.9 safety factor to account for water consumed by remaining sage and other plants).

## CHAPTER 3 – WITH PREP ANALYSIS

Finally, saving an average of 119,000 gallons of water per acre and treating 7,250 acres per year translates into the PREP facility freeing up an estimated 893,000,000 gallons of water annually.

It is also important to note that the PREP facility will use water for a variety of purposes. Perhaps the most obvious is that water is boiled to produce steam, which passes through a turbine to generate power and then is condensed back to liquid form, and the process repeats. Per the PREP project engineer, the total amount of water cycling through the process is about 23,500 gallons per minute. Fortunately, the process is mostly a closed loop where the water is continuously recycled through the same process. Some water, however, needs to be added into the system to make up for various losses. These include evaporation from the cooling tower system, water droplet drift, cooling tower blowdown (prevents mineral buildup in the water), ash wetting, and other miscellaneous losses.

**Table 3.7** summarizes the water loss in the system. Note the total of the water lost is called “make-up” water since it is the amount of water that must be added back into the system to make up for the amount that is lost. As the data in the table indicates, the PREP facility would require a water input of 400 gallons per minute to replenish various water losses in the boiler turbine/generator system. It is also important to note that the 400 gallon per minute water loss estimate is based on a system that uses conventional water-based cooling towers. Water usage can be significantly reduced using air-cooled systems. However, doing so comes with the penalty of higher capital cost and less efficient power production. An air-cooled system was not modeled in the feasibility study.

**Table 3.7 – Summary of Make-Up Water Requirements at the PREP Facility**

Type of Water Loss	Amount Lost (Gallons Per Minute)
Cooling Tower Evaporation	282
Water Droplet Drift (from cooling tower)	19
Cooling Tower Blowdown	38
Other Uses (ash wetting, selective non-catalytic reduction, deaerator vent, etc.)	30
Loss in Thermal Extraction Process	18
Boiler Blowdown	13
<b>Total</b>	<b>400</b>

Given the PREP facility’s need for 400 gallons of water per minute, the annual water usage of the plant is calculated to be 210 million gallons per year. While 210 million gallons of water usage per year is significant, it is roughly 23% of the water that is estimated to be “saved” each year by thinning juniper trees in the four-county supply area. In other words, the presence of the PREP facility is estimated to save about 3.25 times more water than it will consume. The economic value of this net water conservation in the Prineville region is analyzed in Section 4.2.

### 3.4 LANDFILL USAGE

In both the With Sawmill and Without Sawmill scenarios, the PREP facility is projected to consume 10,000 bone dry tons of urban wood waste/year. Per discussion with the Deschutes County Landfill managers, that amount is approximately equal to the amount of wood waste they could divert from their incoming material, which currently costs them about \$425,000 per year to process.

## CHAPTER 3 – WITH PREP ANALYSIS

### 3.5 AIR QUALITY

There are several air quality aspects associated with the PREP facility. Each is addressed in the following subsections.

#### 3.5.1 Open-Pile Logging Slash Burning Versus Controlled Boiler Combustion

As described in Section 2.4.2, open-pile burning of 49,200 bone dry tons of logging slash causes the emission of a combined total of about 4,500 tons of air pollutants into the atmosphere each year in the four-county area. In the WITH PREP scenario, that same amount of logging slash material would be combusted. However, instead of the combustion happening in open, uncontrolled conditions, in the WITH PREP scenario the logging slash is combusted in the controlled conditions of a boiler, which is designed to maximize combustion. Per the engineering report completed as part of the PREP feasibility study, the 24.9 MW powerplant is projected to emit the volume of pollutants shown in **Table 3.8** (second column from the right). The column on the far right in the table shows the annual reduction in air pollutants because of burning logging slash in controlled conditions versus open-pile burning. As the results indicate, in the WITH PREP scenario emissions of air pollutants are reduced by 97%. A key assumption in the analysis (per the PREP facility feasibility study engineer) is that the boiler will fire at a rate of 390 MMBTU/hour.

**Table 3.8 – WITH PREP Facility - Logging Slash Emissions**

Pollutant	WITHOUT PREP Annual Emissions (Tons)	PREP Facility Emission Rate (Pounds/MMBTU)	WITH PREP Annual Emissions* (Tons)	Difference in WITH vs. WITHOUT PREP (Tons of Annual Reduction)
NO <sub>x</sub>	92	0.136	60	32
CO	3,813	0.145	64	3,749
VOC	246	0.0384	17	229
PM	400	0.027	12	388
<b>Total</b>	<b>4,551</b>		<b>152</b>	<b>4,399</b>

\* Emissions represent only the proportion of total combustion that is logging slash (i.e., about 25%).

Additionally, in a Without Sawmill scenario, the PREP facility is estimated to consume a total of 124,000 BDT/year of logging slash. This means that more than 74,800 bone dry tons of logging slash per year would come to the PREP facility from outside the four-county region (124,000 total minus 49,200 from the four-county region). WITHOUT PREP, the fate of that additional logging slash material is open-pile burning. Therefore, it is appropriate to estimate the emissions reductions in a Without Sawmill scenario across a broader region. The results are displayed in **Table 3.9**, which shows that emissions decrease by more than 11,200 tons per year by combusting the additional 74,800 bone dry tons of logging slash in the controlled conditions of the PREP boiler under a Without Sawmill scenario. Note as described in Chapter 4, this phase of analysis does not account for carbon emissions associated with the diesel combusted to transport the fuel to the PREP facility.

**Table 3.9 – Without Sawmill - Logging Slash Emissions**

<b>Pollutant</b>	<b>WITHOUT SAWMILL Annual Emissions - based on 124,000 BDT/Year of logging slash (Tons)</b>	<b>PREP Facility Emission Rate (Pounds/MMBTU)</b>	<b>WITH PREP Annual Emissions (Tons)</b>	<b>Difference in WITH vs. WITHOUT PREP (Tons of Annual Reduction)</b>
NO <sub>x</sub>	233	0.136	105	128
CO	9610	0.145	112	9498
VOC	620	0.0384	30	590
PM	1008	0.027	21	987
<b>Total</b>	<b>11,470</b>		<b>268</b>	<b>11,203</b>

**3.5.2 Wildfire Impacts on Air Quality**

Another aspect of air quality associated with the PREP project is that a total of 48,000 BDT per year of the fuel is projected to be sourced from either juniper thinning (29,000 BDT/year) or forest thinning projects (19,000 BDT/year). Both types of activities reduce the likelihood of wildfire by reducing the amount of fuel on the landscape. As previously described, the thinning will occur on an average of 8,900 acres per year. Thus, over a 20-year period a total of 178,000 acres of land will have been treated.

Per table 2.9 in Chapter 2, there are an estimated total of 4.951 million acres of high to very high wildfire risk in the four-county area. This, in turn, means that over a 20-year period, a total of 3.9% of the highest at-risk acres will have been treated (178,000 divided by 4,951,000). Each acre thinned is expected to provide fire reduction benefits for approximately 20 years. While the treatments may not reduce the average annual acres burned by wildfire in the four-county region (31,112 acres/year), it is judged that the thinning treatments will reduce the intensity of the fire on the treated acres by 25% to 75%.<sup>21</sup> For use in this analysis regarding benefits of reduced wildfire on air quality and other environmental effects, we assume that reduction in fire intensity can be translated into reduced ‘acre equivalents’ burning; so for example, an intensity reduction of 50% on two acres is assumed to be equivalent to reduction in all the forest burning on 1 acre-equivalent. It follows then that the equivalent acres of fire reduction caused by the presence of the PREP facility is 280 acres to 840 acres per year (3.9% of at-risk acres treated x 31,112 acres/burned per year x 25% to 75% fire intensity reduction on burned acres).<sup>22</sup>

**Table 3.10** provides an estimate of wildfire-related air pollutant emissions avoided, assuming that an estimated 280 to 840 acre equivalents of wildfire will not occur due to the presence of the PREP facility. Note the estimate of 280 acre equivalents is considered the Base Case, but the columns to the right show the impacts assuming the thinning treatments are more effective at reducing fire intensity (i.e., 50% = 560 acre equivalents per year and 75% = 840 acre equivalents per year). Aside from the acre equivalents per

<sup>21</sup> This is based on several sources in the literature indicating that mechanical treatments may not reduce total area burned but reduce the level of intensity of wildfire.

<sup>22</sup> We believe this is a reasonable approach as the vast majority of wildfire-related economic benefits are related to combustion of forest materials (i.e., air quality and carbon benefits), and the fire intensity should be directly related to the amount of material combusted and the associated air quality and carbon benefits.

## CHAPTER 3 – WITH PREP ANALYSIS

year reduction in wildfire intensity, another key assumption in the analysis is that on average, the standing timber volume in the four-county area is 23.1 BDT/acre per USFS FIA data. This means that a total of 6,500 BDT of biomass combustion is avoided (280 acre equivalents x 23.1 BDT/acre). Also note the same assumptions were used in this analysis as were used for preceding logging slash analysis (i.e., the BTUs per ton of wood fiber combusted and emissions rates in pounds per million BTUs are all the same). This in turn translates into less air pollutants emitted because of the PREP facility by the amounts shown in the table. The economic impacts of air quality benefits of reduced wildfire on the Prineville region are analyzed in Section 4.6.2.

**Table 3.10 – Wildfire-Related Annual Air Pollutant Emissions Avoided by Presence of PREP Facility**

Air Pollutant	Emission Rate (Pounds per MMBTU)	Annual Emissions Avoided @ 25% Intensity Reduction (Tons)	Annual Emissions Avoided @ 50% Intensity Reduction (Tons)	Annual Emissions Avoided @ 75% Intensity Reduction (Tons)
NO <sub>x</sub>	0.30	12	24	36
CO	12.4	501	1,003	1,504
VOC	0.80	32	65	97
PM	1.30	53	105	158
Total		598	1,197	1,795

### 3.6 CARBON IMPACTS OF WILDFIRE AVOIDED

As described in the preceding section, the presence of the PREP facility is judged to reduce wildfire risk by an estimated 280 equivalent acres per year (or 560 and 840 acre-equivalents per year at differing levels of fire intensity reduction). **Table 3.11** illustrates the estimated carbon dioxide emissions of wildfire avoided at the three different fire reduction intensity levels. Key assumptions in the analysis are: an average of 23.1 BDT of biomass per acre in the four-county region, that 50% of the weight of the biomass is carbon, and that tons of carbon convert to carbon dioxide equivalents at a rate of 3.67 CO<sub>2</sub>e/ton of carbon. PREP would also result in *increased* carbon dioxide emissions related to trucking of logging slash and operation of mechanical thinning equipment; a very rough approximation of these emissions indicates that they may be in the range of approximately 4,500 tons of CO<sub>2</sub>e annually. Note that due to uncertainty in this estimate and its small value relative to the large range in CO<sub>2</sub>e from reduced wildfire risk, we do not directly compute subtract the equipment emissions from the values shown in Table 3.11.

**Table 3.11 – Annual Tons of Carbon Dioxide Equivalent Avoided by Presence of PREP**

Carbon Dioxide Equivalent Emissions Avoided @ 25% Intensity Reduction (CO <sub>2</sub> e Tons)	Carbon Dioxide Equivalent Emissions Avoided @ 50% Intensity Reduction (CO <sub>2</sub> e Tons)	Carbon Dioxide Equivalent Emissions Avoided @ 75% Intensity Reduction (CO <sub>2</sub> e Tons)
11,869	23,738	35,606

### 3.7 FOREST HEALTH

This section focuses on forest health effects of PREP, live biomass and number of live trees, and merchantable timber volume. Note that changes in the amount of carbon stored as standing timber in regional forests was not included in the analysis since recent analysis has shown that forest carbon storage has had mixed and inconclusive results.<sup>23</sup>

#### 3.7.1 Forest Acres

As identified in Section 2.1.1, the forested area in the four-county region increased by 0.3% from 2010 to 2019 (an increase of 17.4 thousand acres on a total forested area of 5.43 million acres). In this case, the observed change in forested area in the region is so small that it is judged insignificant. However, what is important is that in a WITH PREP scenario, landowners have an option for selling biomass from their lands to the PREP facility. In other words, the presence of the PREP facility means forest management activities (e.g., forest thinning and wildfire risk reduction treatments) are much less costly because there is a market for the materials removed during the treatments. This creates an incentive for forest landowners to maintain their lands as forests as opposed to converting them to other uses. Therefore, in a WITH PREP scenario the conclusion is that the area of forested land in the four-county region will remain stable for the foreseeable future.

#### 3.7.2 Total Aboveground Live Biomass & Number of Live Trees

As described in Sections 2.1.3 and 2.1.4 both the volume of aboveground live biomass and the number of live trees have been increasing by about 1% and 1.7% per year respectively between 2010 and 2019. These findings are consistent with a finding of increasing merchantable standing volume. These findings have limited environmental impact or direct economic on the region. However, these trends underscore how a facility such as PREP can utilize the increasing levels of wood fiber on the landscape, and thereby reduce the risk of wildfire by targeting treatments to areas deemed most susceptible to wildfire.

#### 3.7.3 Volume of Merchantable Standing Trees & Tree Growth

The analysis in Section 2.1.5 concluded that WITHOUT PREP, the volume of merchantable standing trees in the four-county region was increasing by 0.8% per year on forestland and at 1.0% per year on timberland. In a WITH PREP scenario, where forest management activity (e.g., pre-commercial thinning, commercial thinning, sawtimber, and wildfire risk reduction harvests) are all taking place at higher levels, it is estimated that standing timber inventory would increase at a rate of 2.5% per year on timberland and 1.5% per year on forestland for the useful life of the PREP facility.<sup>24</sup> This means that the incremental increases in standing inventory due to PREP are 0.7% on forestland (1.5% projected minus 0.8% currently) and 1.5% on timberland (2.5% projected minus 1.0% currently). These estimates of annual growth rates are consistent with published reports about actively managed forested lands in Eastern Oregon.<sup>21</sup>

**Table 3.12** illustrates the estimated annual increase in growth that will be achieved as landowners begin more intensively managing their forestlands by carrying out thinning operations. As the table shows, thinning is expected to increase average annual growth by 50 board feet of growth per acre per year on forestland and 90 board feet per acre per year on timberland (see the first two rows of the table). The bottom two rows of the table show the annual increase in stumpage value expected to accrue to

<sup>24</sup> Personal Communication. Steve Courtney, former timber manager at Malheur Lumber Company. 9/28/22.

## CHAPTER 3 – WITH PREP ANALYSIS

landowners due to actively thinning 1,950 acres per year. The table shows that the annual increase in value is estimated to be \$9,100 when forestland is included and \$15,300 on timberland. Both are a benefit to landowners, but the increased values are very modest. The increased value from extra annual timber growth could become more significant if the fuel supply recipe for the PREP facility included a greater proportion of fuel from forest thinning treatments. Key assumptions in the analysis are that there are 0.52 MBF Scribner per 100 cubic feet, annual growth increase by 0.8% on forestland and 1% on timberland relative to current growth rates, and that stumpage rates in the region average \$85/MBF across all species and log sizes.<sup>21</sup>

**Table 3.12 – Estimated Increase in Standing Timber Inventory Value Arising from More Active Forest Management in a WITH PREP Scenario**

Metric	Landowner Type				Weighted Average
	National Forest	Other Federal	State & Local	Private	
Forestland Extra Growth (MBF Scribner/Year/Acre)	0.09	0.01	0.01	0.03	0.05
Timberland Extra Growth (MBF Scribner/Year/Acre)	0.11	0.06	0.17	0.06	0.09
Estimated Increase in Stumpage Value (\$) Forestland	14,604	2,242	2,222	5,199	9,114
Estimated Increase in Stumpage Value (\$) Timberland	18,292	10,183	27,871	10,168	15,283

## CHAPTER 4 – ECONOMIC VALUE OF PREP EFFECTS

This section estimates the economic value of the preceding chapter’s analysis of the PREP biomass power plant’s environmental effects. The section addresses the same parameters as the preceding sections: water resources, landfill usage, air quality, carbon, forest health, and wildfire risk. Additionally, in the Other Benefits section, the effects of PREP on easing the power and transmission constraints in the region and its effects on economic development are discussed.

### 4.1 AIR QUALITY

As discussed in Section 3.6, the PREP initiative is expected to improve air quality by reducing smoke and emissions associated with burning of logging slash, as well as diminished forest fire intensity due to forest thinning. This will result in lower emission levels than the region currently experiences from slash burning and wildfire. This section presents the potential health value of the air quality improvements that are projected to result directly from PREP (reduced burning of logging slash, as summarized in **Table 4.1** below based on information presented in Section 3.6 above); all benefits of reduced wildfire risk, including air quality benefits, are separately discussed in Section 5.6 below. Health benefits of improvements to air quality are typically valued by estimating the avoided health-related costs of poor air quality. These include premature deaths, money spent on medical treatments, and lost time at work. In addition to health benefits, there may be visibility and other aesthetic benefits of improved air quality; these benefits are expected to be greatest due to reduction in wildfire risk (i.e., visibility is likely most affected by wildfire). Potential effects of PREP on aesthetics are discussed in Section 5.6 below.

**Table 4.1 – Estimated Reduction in Air Emissions due to PREP  
(Change in Logging Slash Emissions)**

Pollutant	With Sawmill (Tons of Annual Reduction)	Without Sawmill (Tons of Annual Reduction)
NO <sub>x</sub>	32	-10
CO	3,749	5636
VOC	229	331
PM	388	578
<b>Total</b>	<b>4,399</b>	<b>6,535</b>

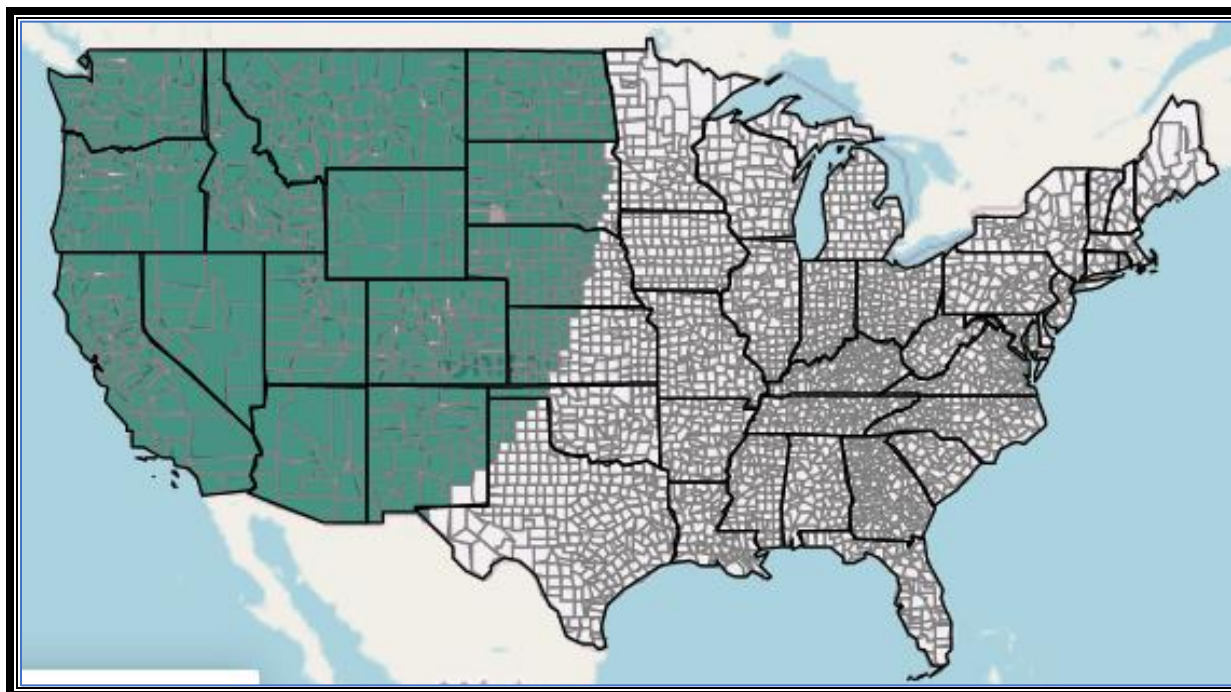

\* Emissions are only for the proportion of total combustion that is logging slash (i.e., about 25%).

\* A negative value indicates an increase in emissions.

#### 4.1.1 Population Affected

The health benefits of improved air quality depend on the population size and demographics of people affected by the change in air quality. Changes in air quality in Central Oregon have nationwide impacts; air pollutants disperse over large geographic areas, contributing to air quality problems and associated health problems throughout the western United States (see **Figure 4.1**). The per capita effects, however, are largest for individuals in the local area, particularly for individuals who are most sensitive to air quality changes.

Figure 4.1 – Geographic Extent of Health Impacts from Air Pollution in Central Oregon

Source: (U.S. EPA, 2021)

The four local counties with changes in total air pollutants released because of PREP (i.e., the counties where logging slash burning will decrease) had a total population of nearly 250,000 people in 2020 (U.S. Census Bureau, 2020). Of this population, approximately 25% (62,000 people) are in age groups that are particularly sensitive to poor air quality: the very young (under 5 years) and the old (over 65). The adult prevalence of asthma in Oregon is 10.6% (Centers for Disease Control and Prevention, 2022). If the four-county region's population experiences a similar rate of asthma, an estimated 21,000 adults in this region have asthma. Additionally, approximately 5% of the U.S. adult population suffers from chronic lung diseases including chronic obstructive pulmonary disorder, emphysema, and chronic bronchitis (National Center for Health Statistics, 2022). At this rate, the region's population has nearly 10,000 people who suffer from lung conditions. In total in the region, there are approximately 93,000 people in these age groups or with these health conditions that are especially vulnerable to poor air quality; these would be the populations most likely to benefit from air quality improvements generated by PREP. **Table 4.2** summarizes the relevant demographics in the region.

## CHAPTER 4 – ECONOMIC ANALYSIS

<sup>3</sup> Estimated by applying the 2020 state asthma rate to the population over 18 years, which was estimated by applying the percent of population 18 years in 2020 ACS data to the total population in the 2020 decennial census (U.S. Census Bureau, 2020; Centers for Disease Control and Prevention, 2022).

<sup>4</sup> Estimated by applying the 2020 national lung disease rate to the population over 18 years, which was estimated by applying the percent of population 18 years in 2020 ACS data to the total population in the 2020 decennial census (U.S. Census Bureau, 2020; National Center for Health Statistics, 2022).

## CHAPTER 4 – ECONOMIC ANALYSIS

As indicated in the bold values in **Table 4.3** below, compared to the rest of the state, the four-county region also has a higher proportion of individuals living in poverty, and Jefferson County also has a higher proportion of Hispanic and non-white populations. Reductions in health hazards, such as those anticipated from PREP, would benefit these environmental justice populations.

**Table 4.3 – Region Low Income and Minority Population Proportions, 2020 Census and 2018 American Community Survey Data**

Population	Oregon	Crook County	Deschutes County	Jefferson County	Wheeler County
% Hispanic	14%	7%	9%	<b>20%</b>	6%

<sup>1</sup> Identifying as some other race than white, or as white and another race.

The Central Oregon region currently has occasional impacts from very poor air quality. **Table 4.4** summarizes the number of poor air quality days for cities in the region over the last five years. The worst air impacts are often caused by wildfires, which are likely to become more frequent and severe in the coming decades (U.S. Department of Agriculture, n.d.).

**Table 4.4 – Local Region Number of Days with Poor Air Quality<sup>1</sup> by City**

### 4.1.2 Health Value of Improved Air Quality

Numerous studies have focused on the social costs of air pollutants, but local impacts depend on the source of emissions, local climatic conditions, and the specific population exposed to the emissions. This section presents the potential health value of the air quality improvements projected to result from PREP. Health improvements to air quality are typically valued by estimating the avoided health-related costs of poor air quality, which include premature deaths, money spent on medical treatments, and lost time at work. There are a variety of studies estimating the health benefits of improved air quality.

Because of the importance of estimating impacts on the specific local population, we use the U.S. Environmental Protection Agency’s Co-Benefits Risk Assessment (COBRA) Health Impacts Screening and Mapping Tool. The COBRA tool compiles estimates from peer-reviewed studies and allows users to model the health impacts at the county level for changes in PM, NO<sub>x</sub>, and VOC emissions. Estimated impacts are

## CHAPTER 4 – ECONOMIC ANALYSIS

specific to the source of emissions, whose relevant sector categories include “Natural Resources” and “Fuel Combustion: Electric Utility.” Pollutant impacts are broken down by specific health conditions (such as acute bronchitis) and ranges are provided for the expected change in annual cases and associated monetary values. Because pollutant emissions can travel great distances in the atmosphere, the estimated monetary values include impacts to other counties and states. The COBRA tool indicates that emissions in Central Oregon can have health impacts as far east as the Great Plains states and as far south as the Mexican border (as shown in the Figure 4.1).

To estimate the benefits of avoided carbon monoxide (CO), we used a 2015 study by Shindell that modeled the economic impacts of various air pollutants including carbon monoxide. This study found that one ton of CO has average health costs of between \$274 and \$342 (Shindell, 2015).<sup>25</sup> As shown in **Table 4.5** below, with these methods we estimate that the total health cost savings (benefits) from PREP-avoided air pollutants associated with logging slash is in the range of \$14.2 million to \$44.1 million. The impacts of PM constitute roughly 90% of the health benefits.

**Table 4.5 – Estimated Value of Health Benefits of Avoided Emissions from Logging Slash**

Pollutant	Annual Emissions Avoided Under PREP (tons)		Cost per Ton of Emissions <sup>1</sup>		Cost Savings of Emissions Avoided Under PREP	
	Low	High	Low	High	Low	High
NO <sub>x</sub>	32	-10	\$12,100	\$27,258	\$390,000	-\$270,000
CO	3,749	5,636	\$274	\$342	\$1,030,000	\$1,930,000
VOC	229	331	\$4,822	\$10,862	\$1,100,000	\$3,600,000
PM	388	578	\$30,082	\$67,240	\$11,670,000	\$38,860,000
Total	4,399	6,535	N/A	N/A	\$14,190,000	\$44,120,000

<sup>1</sup> Source for NO<sub>x</sub>, VOC, and PM costs: (U.S. EPA, 2021). All costs were adjusted from 2017 dollars to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022). Each pollutant was modeled separately in COBRA using a 3% discount rate, estimating the health costs without PREP (using the “Natural Resources” sector category) and subtracting the health costs with PREP (using the “Fuel Combustion: Electric Utility” sector category).<sup>26</sup> For avoided wildfire emissions, the “Miscellaneous” sector and “Agriculture & Forestry” subsector categories were used. Source for CO costs: (Shindell, 2015). All costs were adjusted from 2007 dollars to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

### 4.2 WATER RESOURCES

Reduced water usage in forests thinned in association with PREP (see Section 3.4) could offer numerous benefits. Primary water uses in the region include agriculture, recreation, public and domestic drinking water supply, and habitat (including instream flows and groundwater-dependent ecosystems). The primary watersheds where juniper would be thinned and used in the PREP Facility include the Upper Deschutes, Middle Deschutes, Crooked River, and Mid-John Day / Bridge Creek watersheds. This section

<sup>25</sup> All costs were adjusted from 2007 dollars to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022). Estimates represent the global average, with the range representing discount rates between 1.4% and 5%.

<sup>26</sup> COBRA limits the total number of emissions that can be modeled by sector category in its database. In some cases, the amount was less the emissions with or without PREP. Where possible, the total emissions were modeled in COBRA; when not possible, one ton of pollutant was modeled and the health costs were multiplied by the total tons of emissions.

## CHAPTER 4 – ECONOMIC ANALYSIS

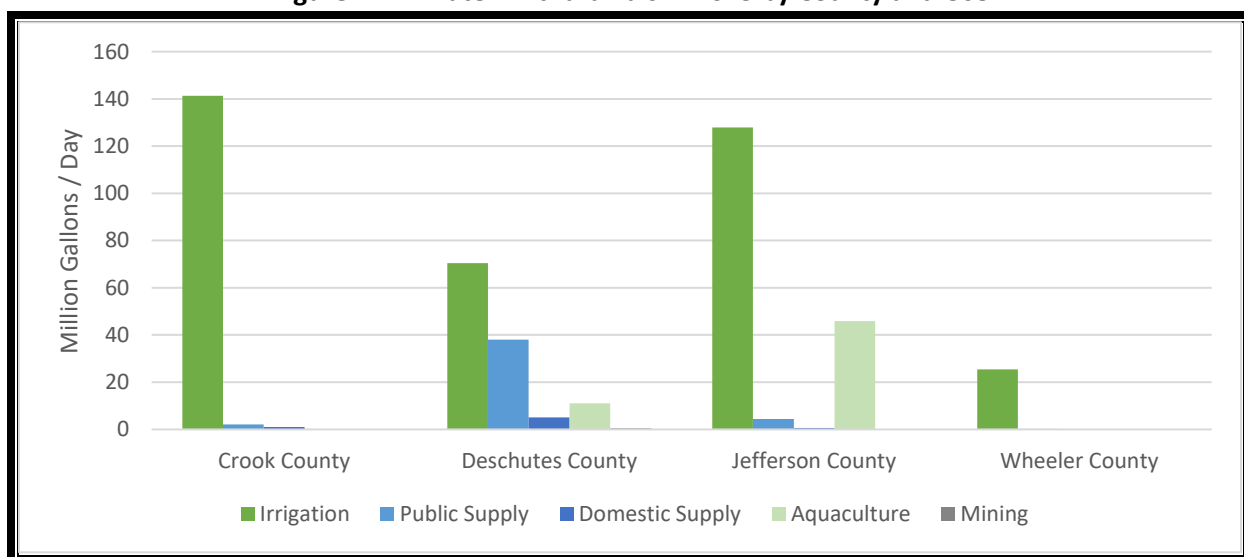

describes the water uses, regional water supply conditions, and associated value of conserved water in these watersheds.

### 4.2.1 Water Use Overview

Agriculture is the largest water user in the region, accounting for 86% of the water rights in the Upper Deschutes Basin and 60% of the water rights in the Middle Fork Subbasin of the John Day River (Demars, 2022; Oregon Department of Agriculture, 2019). Almost 90% of the Deschutes’s flow in Bend is diverted to irrigation (Mucken & Bateman, 2017). Groundwater is also used for agricultural purposes (irrigation and watering livestock); however, surface water constitutes most irrigation water supplies (see **Table 1.1**). Water is also used for municipal, commercial, and industrial purposes. In Central Oregon, municipal water is primarily supplied through groundwater (Upper Deschutes River Basin Study Work Group, 2019).

As shown in **Figure 4.2**, data from the United States Geological Survey on water withdrawals for consumptive uses (including irrigation, public and domestic water supplies, and industrial uses) in the four-county region indicates that irrigation is by far the dominant consumptive water use (USGS, 2022). Public and domestic water is a relatively large source of water withdrawals in Deschutes County but is relatively minor in the other three counties. Jefferson County has relatively large surface water withdrawals for aquaculture. In total for the four counties, irrigation and livestock consume roughly 365 million gallons per day, of which around 93% comes from surface water. Public and domestic supplies consume just over 50 million gallons per day with 85% coming from groundwater. Aquaculture (used only in Deschutes and Jefferson Counties) consumes about 57 million gallons per day, all of it surface water. Mining and other industrial uses consume less than 1 million gallons per day, which all comes from groundwater (USGS, 2022).

**Figure 4.2 – Water Withdrawals in 2015 by County and Use**

Source: Highland Economics analysis of USGS Water Data by County

In addition to consumptive water uses, aquatic riverine habitats depend on instream flow to support fish and amphibians. Reservoirs, lakes, streams, and rivers support a diverse set of aquatic life in Central Oregon, some of which are endangered. In the Deschutes and John Day River Basins, surface and groundwater have been found to be closely interconnected, with groundwater flowing into surface waterways and surface water seeping into the ground. For this reason, new groundwater withdrawals in

## CHAPTER 4 – ECONOMIC ANALYSIS

---

Oregon must be mitigated with a similar amount of water placed instream to offset the potential impact to surface water flows (Mucken & Bateman, 2017).

A variety of recreational activities also depend on instream flow in Central Oregon: fishing, motorboating, whitewater rafting, tubing, swimming, and stand-up paddleboarding. Water rights protecting recreational uses are often held by public entities with recreation missions. Examples on the Deschutes and John Day Rivers include the Oregon Department of Fish and Wildlife and the U.S. Forest Service (Deschutes, Ochoco, and Mount Hood National Forests).

### 4.2.2 Water Shortages in the Region

The region is experiencing irrigation water shortages, which are projected to increase in the future. And agriculture has been the principal industry of the Middle Fork of the John Day River, which provides irrigation water primarily for hay and livestock grazing (Bureau of Land Management, 1999). The Deschutes River supplies water to seven irrigation districts which serve roughly 123,000 acres of cropland, pasture, and residential landscapes in the Upper Deschutes Basin (Headwaters Economics, 2017). In this basin (including the Tumalo, Whychus, and Crooked systems), agricultural water uses consume approximately 720,000 acre-feet (AF) per year, which accounts for roughly 30% to 85% of the total inflows into the basin depending on amount of precipitation and snowmelt. In average and wet years, shortages for irrigation water total approximately 30,000 AF and in dry years about 160,000 AF. Climate models indicate that temperatures in the area may increase by 2.8°C (4.9°F) over the next 50 years, which would increase demand for irrigation water. The same models predict that snowmelt and precipitation could occur earlier in the year, decreasing the supply of water in summer months (Upper Deschutes River Basin Study Work Group, 2019). These changes make it likely that farms in the region will experience even greater water shortages in the coming decades.

Municipal (and quasi-municipal) water use in the Deschutes Basin totals approximately 40,000 AF per year, which comes primarily from groundwater. To meet the demands of cities and private water suppliers in the basin in the next 50 years, it is estimated that additional supplies of 16,000 AF per year will be needed for permanent mitigation, that is, water placed instream to offset groundwater pumping (Upper Deschutes River Basin Study Work Group, 2019). Of all counties in Oregon, Deschutes County is expected to have one of the highest increases for municipal/industrial water needs by 2050 (Mucken & Bateman, 2017). The City of Prineville is expected to need 5,100 AF in mitigation water from the Crooked River to support future economic development (Hardin, 2011).

In terms of water to support fish and wildlife, the Deschutes and Crooked River Basins host several aquatic species whose populations are low enough to warrant special protections. These include the redband trout, summer steelhead, Chinook salmon, and the Oregon spotted frog. Wintertime flow levels are the limiting factor for aquatic habitat in much of the Upper Deschutes; however, the Crooked River also suffers from low summer and fall flow levels (Hardin, 2011). While there are instream water rights in place to protect aquatic ecosystems, in an average year, instream flows fall short by 108,000 AF; in dry years, 175,000 AF. In some reaches of the river, twice as much flow is needed to meet ecological objectives than is currently protected by instream water rights (Upper Deschutes River Basin Study Work Group, 2019). To meet ecological objectives for the Crooked River, an additional 41,600 AF would be required in a median water year, and in some years, flows drop to less than 15% of the level needed to support fish habitat (Deschutes River Alliance, 2020; Kohn, 2022; Hardin, 2011).

## CHAPTER 4 – ECONOMIC ANALYSIS

---

In the Middle Deschutes River (the stretch below Bend and above Lake Billy Chinook), summer is the most problematic time for low flows. Median flows in this stretch do not meet the instream targets for the months of April through October. In the three decades between 1968 and 1997, the Middle Deschutes met its instream flow targets less than 5% of days in May through August (Golden & Aylward, 2006).

Aquatic habitats rely not only on an adequate quantity of water, but water of the proper temperature. Water that is too warm cannot support some species and their life cycles. For example, salmon and trout rearing requires water temperatures to be below 18°C (Upper Deschutes Watershed Council, 2021). High water temperatures impact aquatic habitats in both the Deschutes and John Day River Basins and are directly related to the amount of instream flow (as well as other factors such as riparian shade and air temperatures). Observations of the Middle Deschutes between 2001 and 2019 show that water temperatures commonly exceeded the 18°C standard between April 21 and September 30 (Upper Deschutes Watershed Council, 2021).

The John Day Basin supports populations of rainbow trout, smallmouth bass, and channel catfish, as well as good spawning habitat conditions for steelhead and resident trout. The middle section of the John Day River serves as a migration corridor for spring Chinook salmon and summer steelhead. However, similar to the Deschutes Basin, the habitat quality is limited by low flows (during the summer) and high water temperatures (Bureau of Land Management, 1999).

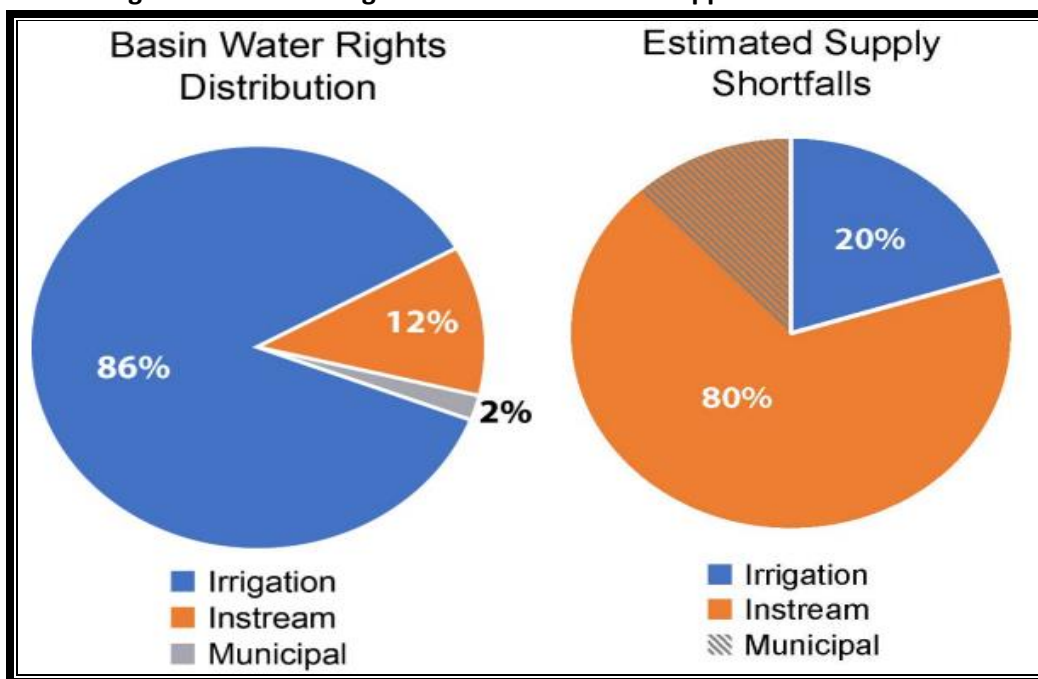

Both the Deschutes and John Day Rivers support a variety of recreation activities that require instream flow. These include fishing, boating, floating, and swimming. Both rivers also have sections that are protected for being 'wild,' 'scenic,' and 'recreation' reaches. The Middle John Day River is classified as both a Federal Wild and Scenic River and a State Scenic Waterway from Clarno to Service Creek (Bureau of Land Management, 1999). All three reaches of the Crooked River are classified as a Federal Wild and Scenic River (Bureau of Land Management, n.d.).

Instream flows in the Deschutes and John Day Rivers are sometimes insufficient to meet recreation purposes. On the Middle John Day River, boating typically occurs between the months of April and July, after which flow levels are too low to allow access (Bureau of Land Management, 1999). This section of the river is popular, with at least one annual tally at 9,200 boater-days (Bureau of Land Management, 1999). If instream flow were increased through the late summer and early fall, it could facilitate more boating recreation.

On the Crooked River, there are multiple sections offering the potential for whitewater rafting. However, the river rarely has adequate instream flows to make this type of recreation possible. In most months of the year, the average monthly flow is less than one-third the minimum flow needed to support whitewater rafting (Stafford & O'Keefe, 2008; U.S. Geological Survey, 2007).

**Figure 4.3** shows the water rights distribution and shortages by use in the Upper Deschutes Basin. As the righthand pie chart illustrates, instream flow experiences the vast majority (80%) of supply shortfalls, followed by irrigation (20%), and municipal. The latter is shown as an overlay with instream shortages because water for mitigating groundwater pumping is dedicated instream (Upper Deschutes River Basin Study Work Group, 2019).

Figure 4.3 – Water Rights and Shortfalls in the Upper Deschutes Basin

Note: Municipal shortages are shown as an overlay with instream shortages because water for mitigating groundwater pumping is dedicated instream. Source: (Upper Deschutes River Basin Study Work Group, 2019).

**4.2.3 Per Acre-Foot Value of Water**

As discussed in the last section, there are regional shortages of water for instream, agricultural, and municipal uses. These shortages increase the value of water. In the remainder of this section, we present information regarding the value of water in the region and discuss the implications for the value of conserved water related to juniper forest treatment associated with PREP (an estimated 119,000 gallons of water conserved per acre of juniper treatment).

Decreased water use by junipers can increase water availability, which can potentially benefit hydrologic processes, such as aquifer recharge and streamflow in central Oregon (Mata-Gonzalez, Abdallah, & Ochoa, 2021). Water use is particularly high in the summertime. The value of water conserved from juniper treatment will dramatically vary depending on the final use of the water; if the conserved water has only localized groundwater benefits or only marginally enhances instream flows in any creek or river, then the value may be relatively low. If the increased water availability were to increase surface water supplies and benefit agriculture or other water users, then economic value could be higher.

We assume that the bulk of the conserved water is used for environmental purposes, either enhancing groundwater or surface water flows. Some of this water may benefit agricultural users – the primary consumptive users of water in the region. As such, we estimate that the per AF value of water conserved due to juniper treatment is approximately \$50 to \$100 per AF per year based on the following information:

1. **Prices paid for instream flow augmentation by environmental buyers throughout the western United States**<sup>27</sup>— As quantitative information on how instream flows would change due to juniper thinning (and how this would in turn improve fish and wildlife populations) is not available, the analysis is not able to directly measure the economic benefit of enhanced instream flow. As such, the value of conserved water is estimated in this section using the prices paid by environmental groups, federal agencies, and other funders of conservation for environmental water in the western United States.<sup>28</sup> Water rights leases and purchases for environmental purposes across the western United States were analyzed in a 2003 paper (Loomis, Quattlebaum, Brown, & Alexander, 2003). Across 35 lease transactions for instream flows, the annual price was \$76 per AF per year.<sup>29</sup> Another analysis of western water transactions in the period 2000 to 2009 found that the purchase price of environmental water varied from just over \$0 to nearly \$1,600 per AF per year, with a median price of approximately \$80 per AF per year (Bren School of Environmental Science & Management, 2017). This indicates that organizations are willing to pay these types of values for environmental enhancement.<sup>30</sup>
2. **Value of water to irrigators in the Deschutes Basin**— As discussed above, irrigation is the largest source of water withdrawals in the region. We estimate the value of water based on the increased net value from hay and grain crop<sup>31</sup> production that can result from increased water supply. Several economic analyses associated with Deschutes Basin watershed planning and environmental assessment (EA) studies have recently estimated the value of water to irrigation districts in Central Oregon, including to Arnold, Lone Pine, Ochoco, Tumalo, and Swalley Irrigation Districts. These studies model the value to farmers (in terms of net increase in profits) that are generated from each additional acre-foot of irrigation water made available to the “typical” irrigator growing alfalfa hay in the region. Estimates from these studies of the marginal value of

---

<sup>27</sup> While these values are in fact costs rather than a measurement of benefit, the amounts paid in the past for water to enhance instream flow represent the minimum value to the funding entities of instream flow (benefits as perceived by funding entities are expected to at least equal costs, or funding would not be provided). As most water rights transactions for environmental purchases are to enhance fish habitat, this value is expected to be a conservative proxy for the value to the public of enhanced fish habitat and fish populations. These values also represent the cost of increasing instream flow, similar to the data on costs of water conservation projects and may significantly underestimate the full value of instream flow augmentation.

<sup>28</sup> It is important to note that the value paid in these transactions is the cost to environmental organizations to enhance instream flow. The transaction data indicate that these organizations are willing to pay at least this amount for environmental water, and so implicitly must view the benefit to be at least this great. However, benefits may be much greater as these transaction prices do not represent the benefit of environmental water to all of society.

<sup>29</sup> All values were adjusted for inflation from 1999 dollars to 2022 dollars using the Implicit Price Deflator for Gross Domestic Product (GDP) (Bureau of Economic Analysis, 2022). Note also that there are lease transactions in the Deschutes Basin to enhance instream flow; however, these transactions are typically short-term leases for farmers that are temporarily idling land for a variety of purposes and thus are not expected to reflect the value of water in agricultural production.

<sup>30</sup> However, it is also important to note that the amount paid per AF tends to decline with an increase in water volume traded; using this same database and weighting the purchase price by the water volume sold decreases the average permanent sale transaction price to \$20 per AF per year. There are also some short-term lease transactions in the Deschutes Basin with lease price of approximately \$10 to \$20 per AF per year; these leases are short-term leases, typically agreed to by farmers that are temporarily idling land in the Deschutes Basin. All transaction prices, including these lower values, represent the *cost* to environmental organizations to enhance instream flow, and indicate that these organizations are willing to pay *at least* this amount for environmental water, but these transaction prices do not represent the benefit of environmental water to all of society. As such, we focus on the range of values, particularly the median prices, that are presented in the broader literature that indicate much higher general willingness to pay to protect instream flows throughout the Western United States.

<sup>31</sup> These are the predominant crops grown in the region, although higher value crops are also grown. We use the value of water to hay and grain, as these crops are generally the first to be fallowed in the face of water shortages rather than higher valued crops. Hay can serve as a “water buffer” crop for irrigators: Farmers with multiple crops and an uncertain water supply can prioritize irrigation to higher value crops and irrigate hay to the extent water is available. This strategy can help ensure water for high-value crops, generate greater hay yields and revenues in water-rich years, and minimize losses in years of water shortage. For these reasons, the water value to hay production can act as a useful indicator of the marginal value of water to agriculture.

water– the value of each additional acre foot of water applied to an existing irrigated acre of alfalfa – ranges from roughly \$125 to \$260 per AF.<sup>32</sup> The average value of water (the total profits divided by the total water applied, representing average value of water applied to a new acre of alfalfa) from the studies is much lower, ranges from approximately \$60 to \$95 per as shown in **Table 4.6**.

**Table 4.6 – Estimated Value of Water for Alfalfa Hay Production in the Deschutes and Crooked River Watersheds**

Irrigation District	Marginal Value per AF (2022\$) <sup>1</sup>	Average Value per AF (2022\$) <sup>2</sup>
Lone Pine Irrigation District <sup>3</sup>	\$223	\$94
Arnold Irrigation District <sup>4</sup>	\$263	\$85
Central Oregon Irrigation District <sup>5</sup>	N/A	\$60
Ochoco Irrigation District <sup>6</sup>	\$125	\$92
Swalley Irrigation District <sup>7</sup>	N/A	\$86
Tumalo Irrigation District <sup>8</sup>	N/A	\$94

Note: All values were adjusted from their respective dollar years to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

<sup>1</sup> The marginal value is the value of an additional unit or the last unit added.

<sup>2</sup> The average value is calculated by dividing the net returns by the total water applied.

<sup>8</sup> (Farmers Conservation Alliance, 2018)

3. **Cost of irrigation water conservation projects**—The costs of past piping projects in the Deschutes Basin highlight the willingness of funding entities to pay for water conservation and instream flow augmentation in the region. In the Deschutes Basin, roughly 90 projects have restored approximately 80,000 AF of water instream (Central Oregon Irrigation District, 2016). Additionally, six major irrigation canal piping projects have been approved with total estimated costs of nearly \$205 million, which will save an estimated 47,267 AF per year when all projects are completed as summarized in **Table 4.7**.<sup>33</sup> On a combined average annual basis, these projects save water at a cost of \$109 per AF per year.<sup>34</sup> Individual project costs range from \$70 to \$345 per AF of water conserved.

<sup>32</sup> All values were adjusted from their respective dollar years to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

<sup>33</sup> These include piping projects for Arnold, Central Oregon, Lone Pine, Ochoco, Swalley, and Tumalo Irrigation Districts (Farmers Conservation Alliance, 2022; Farmers Conservation Alliance, 2020; Farmers Conservation Alliance, 2021; Farmers Conservation Alliance, 2020; Farmers Conservation Alliance, 2018; Farmers Conservation Alliance, 2018). All costs were adjusted from their respective dollar years to 2022 dollars using the Implicit Price Deflator for Gross Domestic Product (Bureau of Economic Analysis, 2022).

<sup>34</sup> Annualized costs were calculated using an amortization period of 100 years and a discount rate of 2.25%.

**Table 4.7 – Estimated Cost of Conserved Water Piping Projects in the Deschutes and Crooked Watersheds**

Irrigation District	Watershed	AF of Savings Per Year	Cost of Project (million 2022\$) <sup>1</sup>	Cost per AF per Year <sup>2</sup>

Ochoco ID	Crooked	2,513	\$34.34	\$345

<sup>1</sup> All costs were adjusted from their respective dollar years to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

<sup>2</sup> Annualized costs were calculated using an amortization period of 100 years and a discount rate of 2.25%.

- 4. Cost of municipal water supply augmentation projects**— As noted above, to meet the demands of cities and private water suppliers in the basin in the next 50 years, it is estimated that additional supplies of 16,000 AF per year will be needed for permanent mitigation; that is, water placed instream to offset groundwater pumping (Upper Deschutes River Basin Study Work Group, 2019). To meet growth in its demand, the City of Prineville recently invested in an aquifer storage and recovery (ASR) project to augment the City’s water supply during peak demand periods. Water is collected during the winter months when supplies are higher and demand is lower, and is stored in the aquifer for use during the higher water demand and lower water supply summer months. The ASR water treatment facility including water lines and well retrofit cost approximately \$12.9 million, while the booster pump station and utility lines associated with the project cost \$8.2 million, and the water rights cost approximately \$1 million (Klann, 2022). Annualizing this total cost of \$22.1 million over 30 years translates into an annualized cost of approximately \$1.63 million. The City estimates that approximately 75% of the City’s water demand is tied to this facility, or approximately 1,726 acre-feet annually (Klann, 2022). Dividing the annualized cost of \$1.63 million by the 1,726 acre-feet of water supported by this facility translates into a cost of approximately \$944 per AF. This indicates a very high willingness to pay for municipal water; in fact, municipal water supplies are typically the highest valued use of water. However, as noted above, we do not expect that the water conserved from juniper treatments would be available to augment municipal supplies. Therefore, we do not use the value of water to municipalities as an indicator of the value of water from PREP-related water conservation.

**4.2.4 Value of Water Conserved from PREP**

As discussed in Section 3.4, juniper thinning associated with the PREP facility would reduce forest water usage, thereby conserving water. For every acre thinned, an estimated 119,000 gallons would be saved annually, or approximately 0.4 AF of water annually. So, using the value of \$50 to \$100 per AF estimated in the previous section and multiplying this by 0.4 AF conserved, we estimate in the first year after thinning a value of approximately \$18 to \$37 of value per acre thinned. However, water savings continue after the

## CHAPTER 4 – ECONOMIC ANALYSIS

---

first year of thinning. In this analysis, we assume that this water savings decreases 3% every year post-thinning; in other words, in the second year after thinning, water savings would decrease to 115,430 gallons per acre (119,000 multiplied by 97%). To estimate the total value through time of the cumulative water savings, we project the water savings over a 20-year time horizon, which equates to 6.07 AF for every acre thinned (or 2,200 AF over 7,500 acres thinned). Then we multiply this water savings by the present value of money received in the future, discounting future values by 3% annually to account for society's preference to receive benefits today versus in the future. As shown in **Table 4.8**, the cumulative value over the next 20 years of water conservation for every acre thinned is estimated at between \$237 and \$474 dollars per acre. The PREP facility is projected to treat approximately 7,250 acres annually. As such, we estimate benefits of juniper thinning at between \$1.72 million and \$3.44 million annually (in addition to the acreage currently remediated). This thinning is projected to result in a range of water savings, increasing in each year from 2,650 AF in Year 1 to 44,000 AF (in Year 20, and every consecutive year, assuming 7,250 acres of juniper continue to be thinned annually) of conservation, as more and more thinned acres provide water savings benefits (See **Table 4.9**).

PREP will also use some water, although this is a small amount compared to the water conservation from juniper thinning. As discussed in Section 3.4, the water use by PREP is estimated at 210 million gallons per year, or 644 AF annually. Relative to the forest-related water savings, this is a very small amount on an annual basis, particularly after several years of cumulative effects of thinning. However, assuming that the PREP water use likely has the same opportunity cost and value as changes in juniper forest water usage (i.e., potential effects on groundwater levels and instream flows), then the net opportunity cost of the 644 AF per year of water usage by the facility is estimated at \$32,000 to \$64,000 annually. This reduces the estimated value of net water savings from juniper thinning and the PREP facility to \$1.69 million to \$3.37 million annually.

**CHAPTER 4 – ECONOMIC ANALYSIS**

### 4.3 LANDFILL USAGE

In both the With Sawmill and Without Sawmill scenarios, the PREP facility is projected to consume 10,000 bone dry tons of urban wood waste/year. One source of wood waste is yard debris that is taken to landfills in the region. The Deschutes County landfill, for example, received approximately 5,500 tons (not bone dry) of yard debris last year through events in its FireFree Yard Debris Disposal program (a program to reduce wildfire risk by creating defensible space) in which local residents can drop off yard debris at no charge. In total, including yard debris received at other times, the Deschutes County landfill received approximately 17,000 tons last year (Centola, 2022). The landfill has a composting operation for this waste, but as volume has been exceeding capacity, they have begun grinding it and burying the waste in the landfill. The cost to the landfill is approximately \$35 per ton to grind and haul this yard debris. Purchase of this material by the PREP facility (expected to be roughly equal to the cost to grind and haul) would cover the cost of grinding and hauling the debris, resulting in an economic benefit to Deschutes County of approximately \$350,000 (\$35 per ton multiplied by 10,000 bone dry tons). The Crook County landfill may also benefit from purchase of its wood waste, but its clean wood stream is only approximately 1,100 tons of clean wood waste (pallets) and yard waste annually.

Further, for Deschutes County, the landfill has a limited lifespan, with a capacity expected to be reached in 2029. All cells in the landfill are lined, which means that development of additional landfill space is more expensive (in contrast, Crook County uses an unlined cell for its wood waste disposal). To the extent that yard debris waste can be diverted from the landfill to PREP, this would also result in a benefit to Deschutes County by extending the life of the landfill. Additionally, the landfill has a requirement by the Oregon Department of Environmental Quality regarding the amount of waste that is diverted (recycled or otherwise reused) from the landfill; sending yard debris to PREP is expected to help them meet this recycling requirement.

As another potential benefit, combustion of the wood waste would result in less methane generation at the landfill (the wood anaerobically decomposes in the landfill, resulting in methane which is a potent greenhouse gas). Although the EPA WARM model provides estimates of the change in carbon dioxide equivalent released from wood waste in landfills, we do not include an estimate of this benefit as it does not provide data to enable a comparison of the net change in carbon dioxide equivalent of combustion versus anaerobic decomposition.

### 4.4 FOREST HEALTH

This section describes two potential socioeconomically significant effects on forest health: merchantable timber value, and fish and wildlife values.

#### 4.4.1 Merchantable Timber Value

As described above in Section 3.8 and presented in Table 3.12, due to thinning activities related to PREP, this analysis projects that owners of timberland and forestland in the four-county region can expect an increase in merchantable timber of .05 to .09 MBF per year per acre thinned. As discussed in Section 3.8, this increased growth rate is projected to benefit the landowner for 20 years post-thinning treatment, with value assumed to be equal to approximately \$85 in stumpage value (value paid to the landowner for standing timber). **Table 4.10** summarizes the value over 20 years of each year's thinning of 1,950 acres. Accounting for the passage of time (using a real discount rate of 3% annually), the total present value over 20 years of increased growth from each year's thinning is estimated at \$196,000 in stumpage value (note

## CHAPTER 4 – ECONOMIC ANALYSIS

that due to discounting this is less than the approximately \$250,000 in estimated increased stumpage value presented in Section 3.8). Annualized, this value is equivalent to approximately \$12,000 annually; this represents the approximate increased value in merchantable timber each year from PREP-associated thinning.

**Table 4.10 – Estimated Present Value of Merchantable Timber from 1 Year of Thinning (1,950 acres)**

Year	Increase in MBF from thinning 1,950 acres in Year 1	Value to Landowner Per MBF (Discounted to Present Value)	Value of Thinning 1,950 Acres (Discounted to Present Value)
1	150.7	\$85.00	\$12,810
2	150.7	\$82.52	\$12,436
3	150.7	\$80.12	\$12,074
4	150.7	\$77.79	\$11,723
5	150.7	\$75.52	\$11,381
6	150.7	\$73.32	\$11,050
7	150.7	\$71.19	\$10,728
8	150.7	\$69.11	\$10,415
9	150.7	\$67.10	\$10,112
10	150.7	\$65.15	\$9,817
11	150.7	\$63.25	\$9,531
12	150.7	\$61.41	\$9,254
13	150.7	\$59.62	\$8,984
14	150.7	\$57.88	\$8,723
15	150.7	\$56.20	\$8,469
16	150.7	\$54.56	\$8,222
17	150.7	\$52.97	\$7,982
18	150.7	\$51.43	\$7,750
19	150.7	\$49.93	\$7,524
20	150.7	\$48.47	\$7,305
<b>Over 20 Years, Total Present Value</b>	3014	N/A	\$196,290
<b>Annualized Value Over 20 Years</b>	3014	N/A	\$11,900

### 4.4.2 Fish and Wildlife Values

In addition to effects on merchantable timber, forest health can also affect fish and wildlife, which can have economic and social effects related to aesthetics, recreation, and cultural/conservation values. Effects on fish and wildlife of forest thinning and mechanical treatments are complex and vary by resource, landscape, climate, species types, and treatment type. As noted in a 2021 assessment of the effects of fuel treatments in a conifer forest in the Southern California Sierra on a variety of environmental

## CHAPTER 4 – ECONOMIC ANALYSIS

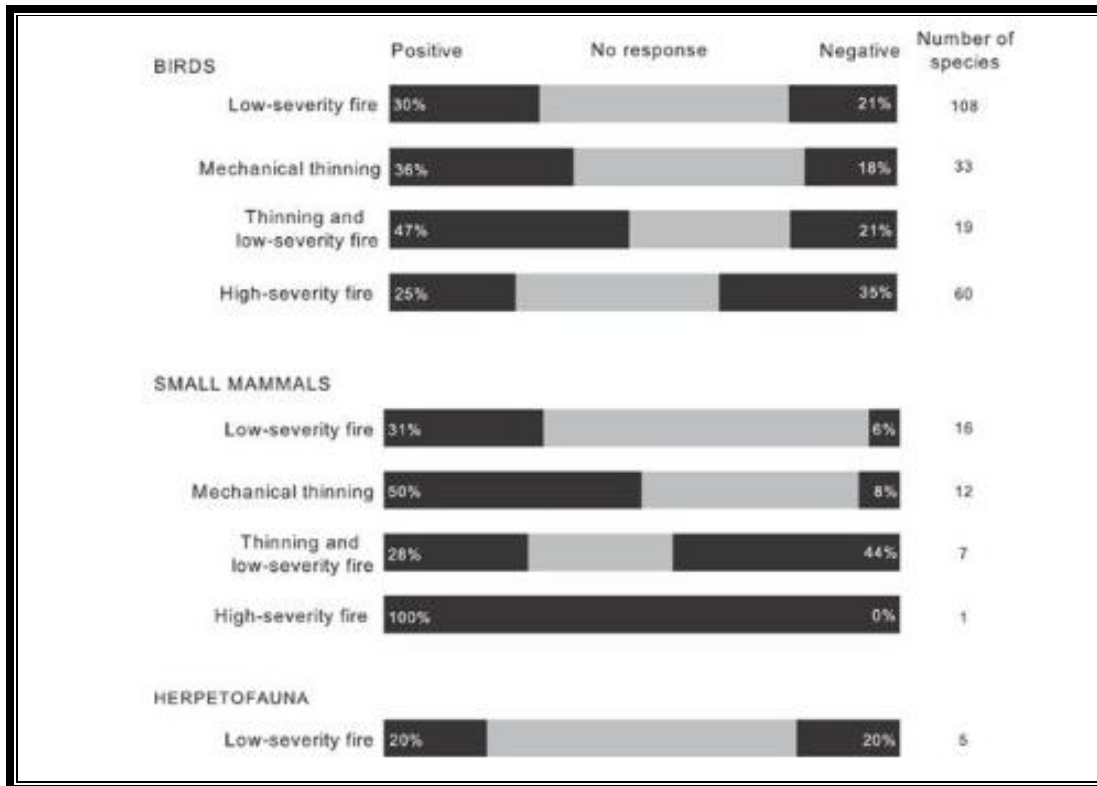

---

parameters (Burke, Tague, Kennedy, & Moritz, 2021), “the wide range of covarying factors that both affect and are affected by fuel treatments combine to make predicting the net effects of a given treatment difficult”. However, a 2012 review (Stephens, et al., 2012) of the diverse research on the effects of forest fuel reduction treatments in the United States found that mechanical treatments reduce fire risk with “few unintended consequences since most ecosystem components (vegetation, soils, wildlife, bark beetles, carbon sequestration) exhibit very subtle effects or no measurable effects at all.” Given the complexity of these factors, we acknowledge that there may be beneficial or adverse effects on vegetation, fish, and wildlife from treatments, but do not attempt to quantify those effects in this study. Summarized below are the findings from the 2012 review regarding vegetation and wildlife (effects on fish were not analyzed in the study):

Vegetation: The 2012 review found that effects of mechanical fuel treatments are variable in their effects on understory plant communities due to differences in treatments and vegetation composition. Treatment may modify or add to organic material, introduce exotic species, and/or damage some non-target vegetation; it also provides increased light to the understory and reduces competition among trees and other vegetation. Accordingly, the observed pattern in studies is that mechanical treatments result in increased understory vegetation productivity and diversity, similar to that seen following a low- to moderate-intensity fire (although mechanical treatments alone do not provide recruitment conditions conducive to species needing fire for regeneration). The review concluded that in ponderosa pine forests, the risk of mechanical treatments on forest overstory is low, while the risk in the understory is low to medium (due to potential for exotic species introduction).

Wildlife: The review compared studies of fuel reduction treatments, low/moderate-severity fires, and high-severity fires in the four years post-treatment (there is a lack of studies for longer term post-treatment analysis). As shown in **Figure 4.4**, all types of treatments and fires may have positive and negative effects, depending on the species. However, as shown in the figure and as concluded in the review, “the similarity in the responses of birds and small mammals to thinning and low-severity prescribed fire suggests that, at the stand scale and in the short term (0–4 years), thinning may adequately mimic low-severity fire in terms of its effects on these taxa”. However, the review also noted that the “levels of regeneration of vegetation, fuel dynamics, and nutrient cycling following prescribed fire and following thinning differed substantially” and that “the long-term effects of these two treatments [prescribed fire and mechanical thinning] on wildlife require further investigation before these results can be fully integrated into management”.

#### 4.5 WILDFIRE RISK

Wildfires bring numerous economic costs; they can take lives and destroy homes. Wildfires can damage infrastructure, including highways, airports, and railroads, which require new funding to repair. Fire damages timber resources that are an important part of Oregon’s economy. Other business sectors lose revenue when fires hamper consumer access or disrupt the ability to get supplies and products. Evacuations cost money for those who must flee the fire (both in terms of time and money expended), and strain the resources of government entities that support the evacuation effort. Injuries resulting from the fire impose healthcare costs, suffering, and lost wages. Wildfires adversely affect air and water quality as well as wildlife habitat. Further, post-fire impacts (including flooding and erosion) can harm both human systems (property and infrastructure) and ecosystems that support fish and wildlife (Western Forestry Leadership Coalition, 2010). Finally, aesthetics and recreation in fire-damaged areas can be suspended or reduced in quality, which can reduce quality of life and recreation value.

Perhaps the most salient cost of wildfire is the damage to physical capital: telecommunication and transportation networks, buildings, and water, electricity, and gas infrastructure. The cost of this damage has been increasing in recent years along with number and sizes of fires, the average area burned, and the length of the fire season (Wibbenmeyer & McDarris, 2021; Feo, Mace, Brady, & Lindsey, 2020). As more people move into the wildland-urban interface (WUI), the number of homes and other structures vulnerable to wildfire is increasing (Burke, et al., 2020; Bliss & Patino, 2021). To protect these communities, more effort is required to prevent and suppress fires, protect infrastructure, and evacuate

## CHAPTER 4 – ECONOMIC ANALYSIS

---

people in imminent danger, which has increased these costs in recent years (Wibbenmeyer & McDarris, 2021).

In addition to the built environment, wildfire imposes significant costs on human health. Fires can harm people directly (for example, 85 people were killed in the Camp Fire in 2018), or harm them indirectly through smoke inhalation and by exacerbating mental health problems. Smoke from wildfires travels long distances and contributes to premature deaths, respiratory and circulatory problems, and lost days of work and recreation (Wibbenmeyer & McDarris, 2021; Burke, et al., 2020; Feo, Mace, Brady, & Lindsey, 2020; Cullen, 2020). These result in economic costs associated with healthcare expenses, lost wages, and lower quality of life. As described in Section 5.5.2, the health costs associated with wildfire smoke are considerable.

Ecosystems are also affected by wildfire. While fire can be helpful and even necessary for some ecosystems, high intensity wildfires can dramatically alter ecosystems, some of which are rare, sensitive, and highly valued by people. For example, the Castle Fire in 2020 destroyed 10% of the world’s mature giant sequoias (Wibbenmeyer & McDarris, 2021). Not only are terrestrial habitats burned, but aquatic ecosystems can be adversely affected when high sediment runoff from adjacent wildfire affected areas moves into waterways. Of course, wildfire also results in vast emissions of smoke. By releasing greenhouse gases (including carbon dioxide, methane, and carbon monoxide), wildfire contributes to climate change and the myriad of costs associated with it (Wibbenmeyer & McDarris, 2021; Shindell, 2015; Feo, Mace, Brady, & Lindsey, 2020).

In Oregon in recent years, wildfire has taken an increasing toll. For example, in 2017, 717,212 acres burned in Oregon (Oregon Department of Forestry, 2018). Almost 20,000 structures statewide were threatened, with 10 homes and 20 other structures destroyed. Over 7,600 people were evacuated. Wildfire caused traffic delays and road closures, as well as poor air quality due to wildfire smoke. The Oregon Health Authority reported that visits to emergency rooms and urgent care centers statewide, including 583 asthma-related visits, were 86% higher than expected in the first full week of September when many wildfires were burning in the State (Oregon Department of Forestry, 2018).

Wildfires can thus impose large social, economic, and environmental costs. PREP, which is expected to reduce annual wildfire acre equivalents by approximately 280 to 840 acres, has the potential to deliver economic benefits by reducing wildfire costs. This section presents data on some of these economic costs of wildfire, and the potential associated benefits of the PREP in reducing the fuels that increase wildfire severity and magnitude in Central Oregon.

### 4.5.1 Wildfire Suppression Costs

As noted by the U.S. Department of the Interior (US Department of Interior, n.d.): “Reducing fuels makes wildfires less intense and easier to control with fewer people, making it one of the most effective ways to build an efficient, proactive program to safely manage wildfire.” This section provides information on the cost of wildfire suppression, and the potential reduction in these costs with the reduced wildfire severity in Central Oregon that is projected to occur due to PREP.

On land protected by the Oregon Department of Forestry (ODF), 47,165 acres burned in 2017. On these lands, the Oregon Department of Forestry spent \$45.9 million to fight these fires, for an average of \$974

## CHAPTER 4 – ECONOMIC ANALYSIS

per acre (Oregon Department of Forestry, 2018).<sup>35</sup> This compares to \$45.1 million in ODF annual average large fire suppression costs over the period 2008 to 2017, across 33,806 acres burned, for an average cost per acre burned of \$1,334 (all expressed in 2022 dollars). This is in addition to the base-level ODF fire protection budget of \$55.2 million in the 2017 to 2019 biennium.<sup>36</sup> Applying the estimated per-acre cost to fight wildfire of \$1,334 (as shown in **Table 4.11**) to the acre-equivalents of reduced wildfire (due to reduced intensity), we estimate the potential fire suppression cost savings of PREP-associated forest treatments at \$320,000 to \$1,120,000 annually (see **Table 4.12**).

**Table 4.11 – Wildfire Suppression Costs in Oregon 2008-2017**

Year	ODF Large Fire Gross Suppression Costs, Millions (2022 Dollars)	Acres Burned	Suppression Costs Per Acre Burned
2008	\$17.5		
2009	\$14.7		
2010	\$6.6		
2011	\$3.9		
2012	\$8.9		
2013	\$153.4	104,167	\$1,473
2014	\$90.6	53,387	\$1,697
2015	\$88.5	86,629	\$1,022
2016	\$21.0	5,661	\$3,710
2017	\$45.9	47,165	\$974
<b>10-Year Average (2008-2017)</b>	<b>\$45.1</b>	<b>33,806</b>	<b>\$1,334</b>

## CHAPTER 4 – ECONOMIC ANALYSIS

### 4.5.2 Air Quality

Reduced wildfire intensity is expected to result in reduced air pollutant emissions, as estimated in Section 3.6. Using the data and methods described in Section 5.1 above, we estimate the health benefit of reduced wildfire smoke in the region at \$2.0 million to \$13.2 million, as shown in **Table 4.13**.

**Table 4.13 – Estimated Value of Health Benefits of Avoided Emissions from Reduced Wildfire**

Pollutant	Annual Emissions Avoided Under PREP (tons)		Cost per Ton of Emissions <sup>1</sup>		Cost Savings of Emissions Avoided Under PREP	
	Low	High	Low	High	Low	High
NO <sub>x</sub>	12	36	\$12,100	\$27,258	\$150,000	\$980,000
CO	501	1,504	\$274	\$342	\$140,000	\$510,000
VOC	32	97	\$4,822	\$10,862	\$150,000	\$1,050,000
PM	53	158	\$30,082	\$67,240	\$1,590,000	\$10,620,000
Total	598	1,795	N/A	N/A	\$2,030,000	\$13,160,000

<sup>1</sup> Source for NO<sub>x</sub>, VOC, and PM costs: (U.S. EPA, 2021). All costs were adjusted from 2017 dollars to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022). Each pollutant was modeled separately in COBRA using a 3% discount rate, estimating the health costs without PREP (using the “Natural Resources” sector category) and subtracting the health costs with PREP (using the “Fuel Combustion: Electric Utility” sector category).<sup>37</sup> For avoided wildfire emissions, the “Miscellaneous” sector and “Agriculture & Forestry” subsector categories were used. Source for CO costs: (Shindell, 2015). All costs were adjusted from 2007 dollars to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

### 4.5.3 Greenhouse Gas Emissions

Carbon dioxide (CO<sub>2</sub>) is a greenhouse gas (GHG) that warms the earth by trapping heat in the atmosphere. Burning forest material emits carbon dioxide. As discussed in Section 3.7, if the PREP facility reduces the severity of wildfire, less GHG might be emitted. Through carbon capture, it is also possible that the PREP could reduce the amount of GHG emitted, compared to burning of logging slash in the WITHOUT PREP scenario (although this effect was not quantified in section 3.7, and is thus not valued here).

Reduced GHG emission from reduced wildfire offers the benefit of climate change cost reduction. Climate change is expected to impact all regions of the US and nearly every economic sector, including transportation, energy, water supply systems, agriculture and forestry, fisheries, and tourism.<sup>38</sup> There are different methods of estimating the value of reduced atmospheric carbon, including the value revealed by trading in carbon markets, values placed on carbon through policy, the cost of carbon sequestration projects, and the social cost of carbon (SCC), which is an estimate of the true economic value of avoiding damages caused by climate change. As the SCC is the true economic value of climate change mitigation, this study uses the SCC as the basis for the valuation of reduced carbon emissions associated with PREP.

<sup>37</sup> COBRA limits the total number of emissions that can be modeled by sector category in its database. In some cases, the amount was less the emissions with or without PREP. Where possible, the total emissions were modeled in COBRA; when not possible, one ton of pollutant was modeled and the health costs were multiplied by the total tons of emissions.

<sup>38</sup> Center for Integrative Environmental Research (CIER), University of Maryland. “The US Economic Impacts of Climate Change and the Costs of Inaction”. October 2007. Chapter 3. Accessed online at <http://cier.umd.edu/documents/US%20Economic%20Impacts%20of%20Climate%20Change%20and%20the%20Costs%20of%20Inaction.pdf>

## CHAPTER 4 – ECONOMIC ANALYSIS

There is a considerable range of estimates in the economics literature; even within a study, the range can vary widely under different assumptions and climate change scenarios. However, several recent studies have converged on a central estimate value of approximately \$210 per metric ton of CO<sub>2</sub><sup>39</sup>. These include a study published in the journal *Nature* (Rennert, et al., 2022) by researchers at Stanford and Resources for the Future (a well-respected non-profit research institution), and a recent draft SCC estimate released by the US Environmental Protection Agency (U.S. Environmental Protection Agency, 2022).

This is a higher value than that currently used by the federal Interagency Working Group (IWG)<sup>40</sup> on the Social Cost of Carbon (SCC). The SCC developed by the IWG, currently estimated at \$58 per ton, is intended to include (but is not limited to) changes in net agricultural productivity, human health, property damages from increased flood risk, and the value of ecosystem services due to climate change.<sup>41</sup> The value from the IWG is based on older data and estimates and is currently undergoing revision by the IWG. We use the values more recently published by the EPA and Stanford/RFF, as these values incorporate more recent and updated representation of current climate science and understanding of the effects of climate change on agriculture, energy use, sea-level rise, mortality, and economic uncertainty.

As described in the Section 3.6, forest treatments associated with the PREP facility are roughly estimated to reduce wildfire risk by 280 to 840 acre-equivalents per year, with an estimated annual reduction in emissions of 11,869 to 35,606 metric tons of reduced releases in carbon dioxide equivalent. At a value of \$210 per metric ton, this equates to a range in avoided climate change costs of \$2.5 million to \$7.5 million annually (see **Table 4.14**). Note that this is not a full carbon accounting, but a rough estimate of carbon dioxide emitted from avoided wildfire. The analysis does not take into account the energy use and associated greenhouse gas emission associated with the thinning treatments (transportation emissions, equipment use emissions, etc.). It also does not account for the trucking emissions associated with transporting logging slash to PREP.

**Table 4.14 – Avoided Climate Change Costs due to Reduced Wildfire Risk Associated with PREP**

Parameter	Avoided Climate Effects @ 25% Intensity Reduction, 240 acres	Avoided Climate Effects @ 50% Intensity Reduction, 560 acres	Avoided Climate Effects @ 75% Intensity Reduction, 840 acres
Reduced Emissions (CO <sub>2</sub> e Tons)	11,869	23,738	35,606
Reduced Costs (2022 Dollars)	\$2,490,000	\$4,980,000	\$7,480,000

<sup>39</sup> The EPA study presents a central estimate of 190 per metric ton in 2020 dollars; the Stanford/Resources for the Future study presents a central estimate of \$185 in 2020 dollars. Updating these to 2022 dollars results in a value of approximately \$210 per metric ton.

<sup>40</sup> A working group of federal regulatory agencies that has developed a SCC for use in regulatory impact analyses to estimate the dollar damages per unit of carbon emissions.

<sup>41</sup> In February 2021, the IWG updated its estimates of the SCC. They estimated that in the year 2022, at a 3% discount rate, the SCC value was \$53.22 per MT in 2020 dollars (Interagency Working Group on Social Cost of Greenhouse Gases, 2021). We adjust this value for inflation to roughly \$58 per MT in 2022 dollars using the GDP Implicit Price Deflator.

### 4.5.4 Aesthetics

Fires also can result in a reduction in aesthetics and amenities, which can be reflected in a decline in property values. For example, one study that examined the impact of a wildfire on home values in Colorado found that property values in a nearby town dropped roughly 15% within five years after the fire. While the price declines could be attributable to the perception of wildfire risk, the author concluded that the declines could reflect the loss of amenities in the burned area (Loomis, 2004). Similarly, a study of properties in Montana indicated that proximity to and view of areas burned by wildfire had large and persistent negative effects on home values (Stetler, Venn, & Calkin, 2010). Homes within 3 miles of a wildfire were about 14% lower than equivalent homes at least 12 miles from a fire, and homes 3 to 6 miles away were around 8% lower. The results also showed that when a nearby burned area was not visible from a home, it had no effect on a home's value.

Other studies estimate people's willingness to pay to preserve visibility and scenic views. For example, one study conducted in 1991 found that visitors to a Portland area vista were, on average, each willing to pay approximately \$275 to be certain of a 50-mile view for a summer (Crocker & Shogren, 1991); converted to a daily value and assuming 100 days of summer, this corresponds to approximately \$2.75 per day of 50-mile protected views<sup>42</sup>. This same study found an average willingness to pay by visitors to a wilderness area in Central Oregon of approximately \$27 per day of their visit for permanent protection and certainty of 185-mile visibility<sup>43</sup>. Another study of residents in Northwest New Mexico found that the willingness to pay to improve visibility (or accept compensation for a decrease in visibility) varied from approximately \$20 to \$300 per month per household (or approximately \$1 to \$10 per day per household)<sup>44</sup>, depending on income level and type of improvement (Rowe, d'Arge, & Brookshire, 1980). These studies indicate that that value of improved visibility may be approximately \$1 to \$30 per day per household, depending on the sensitivity of the viewer to visibility declines, the degree of change in visibility, and the number of days of visibility improvement.

To apply this to the change in visibility that may result from reduced wildfire due to the PREP, we use the historic data on poor air quality days in Central Oregon. As presented in Table 4.2, there are an average of 7.5 poor air quality days in Central Oregon; as smoke is now the most significant contributor to poor visibility in the West, we assume that these poor air quality days are due to wildfire, and that these poor air quality days cause poor visibility. As discussed above in Section 3.6.2, we estimate that the PREP may decrease the amount of wildfire in the region by approximately 1% to 3%. We therefore assume that PREP would decrease the number of poor air quality and poor visibility days by approximately 1% to 3%, or approximately 0.1 to 0.2 days annually. As visibility is expected to be heavily impaired in poor air quality days, we conservatively assume the value per household of this reduction in poor visibility days is around the midpoint of the range from the literature, or approximately \$10 to 15 per day. As such, we estimate the visibility value of PREP (related to reduced wildfire) per household in Central Oregon is approximately \$1 to \$3 per household annually (.1 to .2 days annually multiplied by \$10 to \$15 per day). As there are approximately 100,000 households in the four-county region, we very roughly estimate the potential value of the visibility improvements from reduced wildfire smoke at approximately \$100,000 to \$300,000

---

<sup>42</sup> Note that the value in the original study was \$117.57; this was inflated to 2022 dollars using the GDP implicit price deflator.

<sup>43</sup> Note that the value in the original study was \$11.48; this was inflated to 2022 dollars using the GDP implicit price deflator.

<sup>44</sup> Note that the value in the original study was \$5 to \$70 per month; this was inflated to 2022 dollars using the GDP implicit price deflator.

## CHAPTER 4 – ECONOMIC ANALYSIS

annually (see **Table 4.15**). Note that this does not take into account the potential improved visibility and aesthetics associated with reduced logging slash burning.

**Table 4.15 – Estimated Value of Visibility/Aesthetic Benefits of Avoided Emissions from Reduced Wildfire (Rough Approximate)**

Parameter	# of Low Visibility Days Avoided	
	Low	High
# of Low Visibility Days Avoided	0.1	.2
Cost Per Day (2022 \$'s) of Low Visibility Per Household	\$10	\$15
Regional Households	100,000	100,000
Value of Visibility/Aesthetic Improvements Under PREP (2022 \$'s)	~\$100,000	~\$300,000

### 4.5.5 Recreation

Wildfire and associated smoke can also affect recreation opportunities and recreation value. During wildfire events, and for several years following fires, recreation areas in and around burned areas may be closed to recreational users. Even after recreation areas are accessible, the value of recreation may be affected due to changes in recreation quality and access. This section provides a very preliminary overview of the magnitude of potential recreation value that may be increased by reduced fire severity and magnitude on Central Oregon public lands due to PREP. This section focuses on net value of recreation opportunities to the recreator. Changes in recreation value can also affect the tourism economy; this economic development value is not estimated in this study.

The four-county study area is encompassed in the Prineville District of the Bureau of Land Management (see **Figure 4.5**), which stretches south from the Columbia River to the Great Basin and stretches east to the Blue Mountains and West to the Cascade crest. Approximately half of the Prineville District of the BLM is public land managed by the US Forest Service (33%), the Bureau of Land Management (13%), or the Bureau of Indian Affairs (5%), while nearly all remaining lands are private (US Bureau of Land Management, n.d.). Assuming this same land distribution in the four-county area, and further assuming that fuel treatment occurs equally on public lands versus private lands, then approximately 50% of the fuel treatments will benefit recreation on public lands. In other words, we assume that approximately half of fuel treatments would occur on public lands that may affect recreation values. So of the 280 to 840 acre-equivalents of reduced fire effects, we assume 140 to 420 will be on public lands that may affect recreation values. Further, we multiply this acreage by five to factor in effects of smoke on recreation on other lands, and also the fact that the effects of fire on recreation may last five years post-fire. Cumulatively, then, on average with PREP there may be approximately 700 acres to 2,100 fewer acres on public lands that would be affected by current or past fires on which recreation quality or opportunities could be limited. We now turn to data on recreation visitor usage on public lands in the region to estimate the potential effects on recreation value of changes in quality or access.

## CHAPTER 4 – ECONOMIC ANALYSIS

**Table 4.16 – Visitation Data at National Forests in the Four-County Region**

Forest	Annual Forest Visitation Estimate Total	Overnight Forest Visits	Additional Recreation Days from Overnight Visits	Total Recreation Days (Forest Visits + Additional Days from Overnight Visits)	National Forest Acreage	Recreation Days/Acre
Deschutes	2,087,000	248,000	744,000	2,831,000	1,600,000	1.8
Ochoco	116,000	31,000	93,000	209,000	850,000	0.2
Umatilla	168,000	17,000	51,000	219,000	1,400,000	0.2
<b>Total</b>	<b>2,371,000</b>	<b>296,000</b>	<b>888,000</b>	<b>3,259,000</b>	<b>3,850,000</b>	<b>0.8</b>

Source: National Forest Service Visitor Use Monitoring Data for the Ochoco (2019), Deschutes (2018), and Umatilla (2018) National Forests (US Forest Service, n.d.). Note that for each overnight visit, there are three additional days of visitation as overnight visitors tend to spend four total days in the region. Acreage data in each national forest is from the National Forest Foundation (National Forest Foundation, n.d.).

In terms of economic value to the visitor, we use estimates of the average net value or benefit of recreation visits to national forests in the Pacific Northwest, US Forest Service Region 6, as published by the US Forest Service in 2017 (Rosenberger, White, Kline, & Cvitanovich, 2017). These values range from approximately \$40 to \$130 per person per recreation day, with the average value (weighted across primary activities engaged in) estimated at \$82.<sup>45</sup> We use the value of \$82 per recreation visitor day, and apply that to the estimated number of visitor days that may benefit from reduced wildfire severity due to PREP, as shown in **Table 4.17**. The results indicate an annual benefit (in terms of avoided recreation losses from wildfire) to recreators of approximately \$50,000 to \$140,000.

**Table 4.17 – Rough Estimated Recreation Value of Reduced Wildfire Associated with PREP**

Parameter		Low Value	High Value
A	Reduced Acreage Affected by Fire	280	840
B	Portion of Treated Acreage that is Public Land (A*B)	50%	50%
C	Acreage on Public Lands (B*C)	140	420
D	Years of Recreation Affects	5	5
E	Acreage Affected by Fire Each Year (C*D)	700	2,100
F	Average Recreation Visitor Days per Acre	0.8	0.8
G	Potentially Affected Recreation Visitor Days (E*F)	560	1,680
H	Value per Visit	\$82	\$82
<b>Approximate Preserved Recreation Value (G*H)</b>		<b>~\$50,000</b>	<b>~\$140,000</b>

<sup>45</sup> Note that the study values were presented in 2016 dollars, and were estimated to range from \$33.15 to \$108.38, with a weighted average value of \$68.64. The values are updated to 2022 dollars using the GDP implicit price deflator.

## CHAPTER 4 – ECONOMIC ANALYSIS

---

### 4.6 ECONOMIC DEVELOPMENT BENEFITS

The preceding subsections (subsections 5.1 to 5.5) estimate the potential economic benefits of the PREP facility; these are benefits related to environmental effects can be compared to the project costs. Additionally, there are economic development benefits related to local employment and income growth. These are benefits that accrue to the region that are not traditionally included in a cost/benefit analysis (unless it can be shown that people would be unable to obtain similar employment in this region, or any other region of the state or country). However, the economic development benefits of the facility would likely be a net gain to the local area in terms of total available employment and income to local residents. There are three types of economic development benefits to the region: 1) employment opportunities at PREP, and at associated businesses that supply or benefit from the presence of PREP in the region, 2) increased regional power supply to help ease transmission constraints in the region, and 3) potential economic development benefits associated with reduced wildfire. These are addressed in turn below.

#### 4.6.1 PREP-Supported Employment and Income

As discussed in Section 3.2, PREP will cost approximately \$145.5 million to design and build, of which \$69.6 million is construction cost. This construction expenditure will support in jobs and income in the local area, not just in the construction sector, but in other, related sectors. Using the JEDI (Jobs and Economic Development Impact Model) from the National Renewable Energy Laboratory, construction of a biofuel plant of 25 MW may support (assuming construction in one year) approximately 160 jobs and \$12.5 million in earnings statewide in Oregon for the year of construction (National Renewable Energy Laboratory, 2021); if construction were longer, the annual effects would be proportionally diminished. These are very rough approximations of the magnitude of the employment and income as these were not modeled specifically based on the proposed PREP project.

The PREP facility will also directly provide jobs and income through employment at the facility and in forest-sector jobs, as well as other sectors that will provide inputs to the facility and its suppliers. Further, the income to employees at PREP and supplier businesses will be spent in the local economy, further generating economic activity at local businesses. As discussed in Section 3.2, payroll (including benefits) at PREP is estimated to be approximately \$990,000 annually, which would correspond to approximately 10 to 15 jobs. Additionally, an estimated 24 to 28 trucking jobs and 20 to 24 forest sector jobs (or a total of 44 to 52 jobs) would be supported by thinning treatments and material transport to the PREP facility. Assuming total compensation of approximately \$30 per hour, this is an additional \$2.7 million to \$3.2 million in labor compensation associated with PREP. In sum, in the transportation and forestry sectors, and at the PREP facility itself, there may be approximately 54 to 67 jobs and \$3.6 to \$4.1 million in employee compensation supported by PREP (see **Table 4.18**). Additional jobs and income may be indirectly supported in other sectors that provide supplies to the facility (or to other suppliers) and that sell goods and services to employees whose income is related to PREP.

## CHAPTER 4 – ECONOMIC ANALYSIS

**Table 4.18 – Operations Employment and Income Supported by PREP: Key Sectors Only**

Sector	Employment		Compensation	
	Low	High	Low	High
PREP Facility	10	15	\$990,000	\$990,000
Trucking	24	28	\$1,500,000	\$1,750,000
Forestry (Woods)	20	24	\$1,250,000	\$1,500,000
<b>Total</b>	<b>54</b>	<b>67</b>	<b>\$3,740,000</b>	<b>\$4,240,000</b>

For a comparison to other renewable energy facilities, we present data from the National Renewable Energy Laboratory in **Table 4.19** and **Figure 4.6** that compare the local employment and income supported by a biomass plant compared to wind and solar facilities. As shown in the table, for every MW of generation, biomass supports approximately seven times more total income and employment (including direct employment/income at the energy facility and indirect/induced jobs supported in other sectors due to facility-related spending) than wind or solar facilities tend to support. Note that these are averages, and not necessarily the increased employment and income that the PREP facility would support relative to wind and solar.

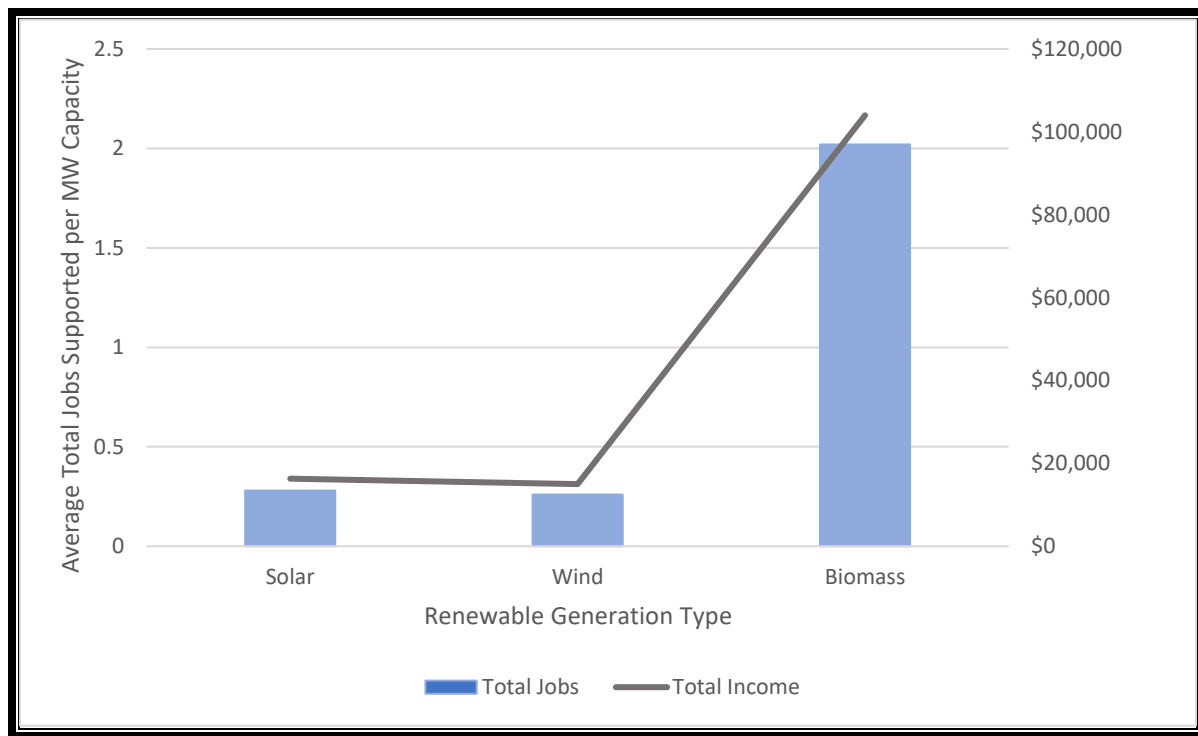

## CHAPTER 4 – ECONOMIC ANALYSIS

**Table 4.19 – Operations Employment and Income Supported by Renewable Energy Facilities:  
Averages Across Projects**

Source of Renewable Energy	Operating Economic Contribution per MW			
	Direct Jobs	Direct Income	Total Jobs <sup>1</sup>	Total Income <sup>1</sup>
Solar	0.19	\$11,108	0.28	\$16,309
Wind	0.04	\$2,333	0.26	\$15,000
Biomass	0.50	\$20,000	2.02	\$104,000

Source: (National Renewable Energy Laboratory, 2021)

### 4.6.2 Power Supply

Power demands in Prineville have dramatically increased in recent decades with the data centers that have begun operating in the region. A power crunch became apparent in 2017 when the City was approached by an energy-intensive manufacturer potentially interested in constructing a factory in Prineville, and the City learned that its available power supply would not be adequate to power the factory, jeopardizing that economic development opportunity and potentially other opportunities

<sup>46</sup> Impacts per MW were estimated by dividing the jobs and income by the nameplate capacity. For each model, all default values were kept except for the following: The location was changed to Oregon, the construction year was changed to 2023, and the dollar year was changed to 2022.

## CHAPTER 4 – ECONOMIC ANALYSIS

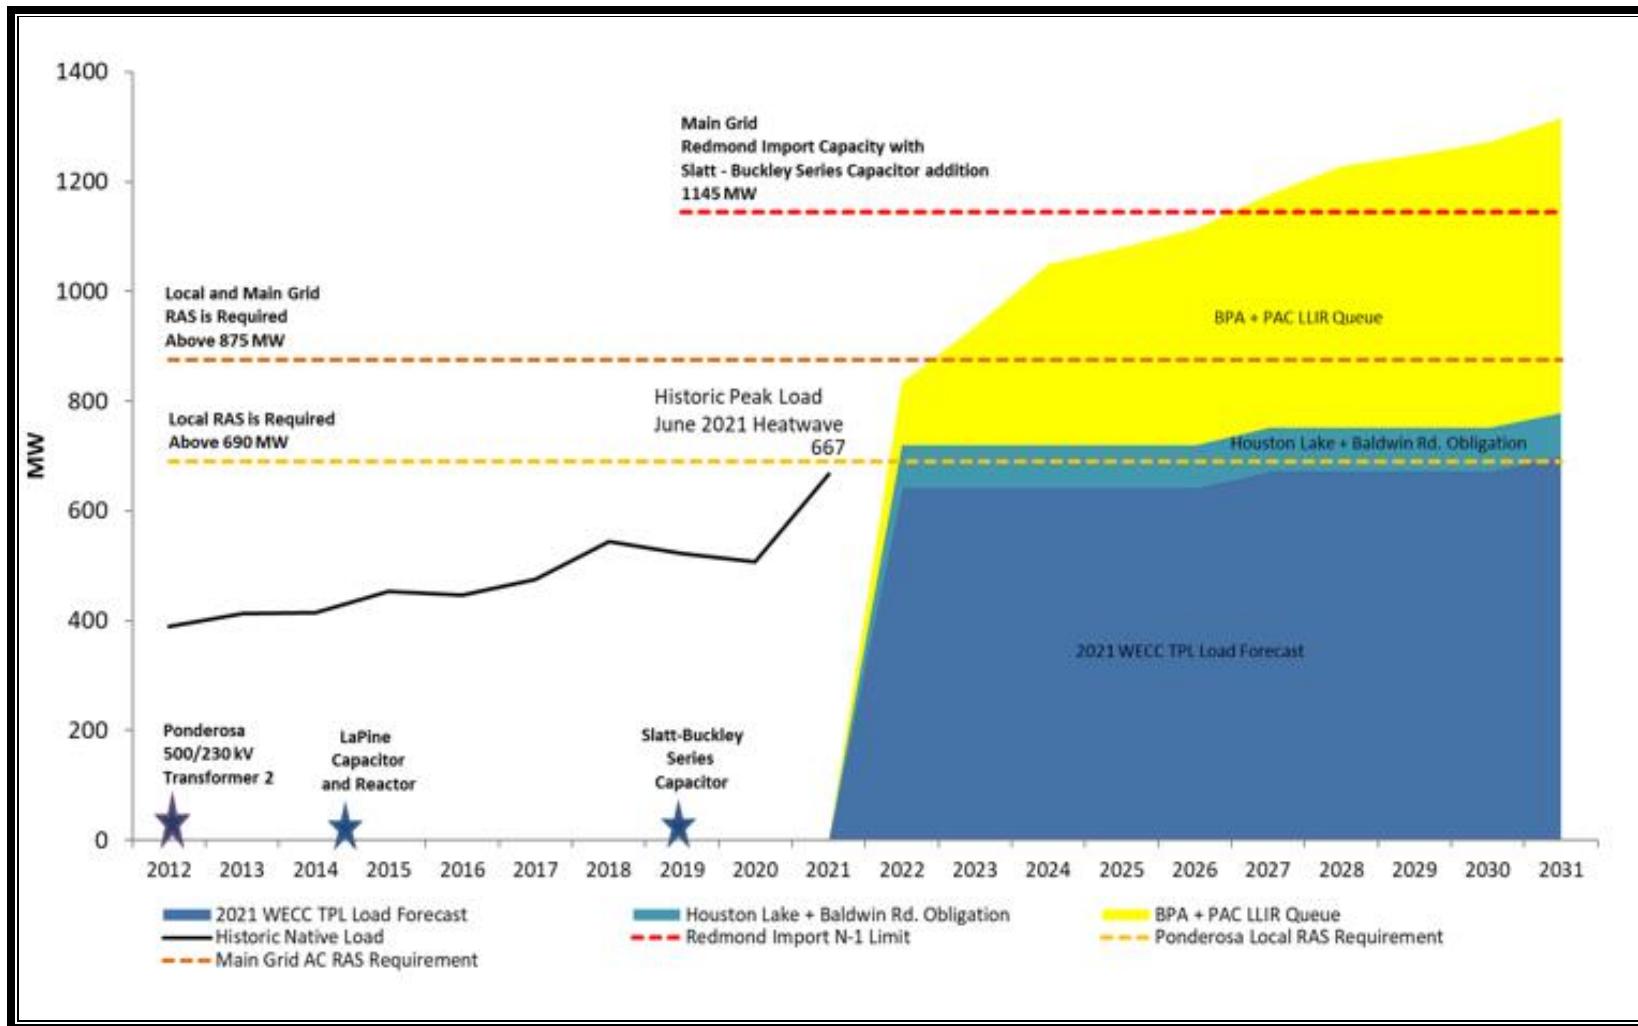

---

(Rogoway, 2017). While the Pacific Northwest generates enough power overall, the Central Oregon region is constrained by transmission capacity.

According to the 2021 Bonneville Power Administration Transmission Planning and Transmission Needs study, electricity demand in the Central Oregon region (which spans from Redmond to Prineville south to La Pine and Sunriver), is projected to reach 823 MW in the summer and 945 MW in the winter in 2030 (Bonneville Power Administration, 2021). The main grid capacity in Central Oregon is now 875 MW after completion of the Slatt-Buckley series capacitor at the Slatt substation. To increase loads beyond 875 MW, Bonneville Power Administration (BPA) has proposed implementing a main grid RAS (remedial action scheme) and a local RAS that could enable a Redmond Import level of 1145 MW (see **Figure 4.6**). The blue- and yellow-shaded sections of the figure indicate line and load interconnection requests (LLIR) compared to the main and local area grid limits (dashed lines) at the Redmond Import location.

In response to a meeting in September 2017 with customers and stakeholders in Prineville, BPA provided in December 2017 an analysis of potential upgrades or options to provide load service and transmission infrastructure adequacy in the Central Oregon region (Bonneville Power Administration, 2017). As noted in the analysis, “In order to increase overall capability to serve load in central Oregon, both main grid and local area infrastructure require reinforcement.” The 2017 analysis identified options that could increase main grid capability and options that could increase local area capability; one of those options was to increase local firm generation within the Redmond Import area. As noted by BPA, “firm generation has the effect of offsetting main grid and local impacts from load within the area”. The benefit of PREP in increasing local power supplies is not quantified economically, but is a benefit in terms of increasing overall power reliability and supply in the region and easing the existing transmission constraints.

Figure 4.6 – Redmond Power Import Summer Limits

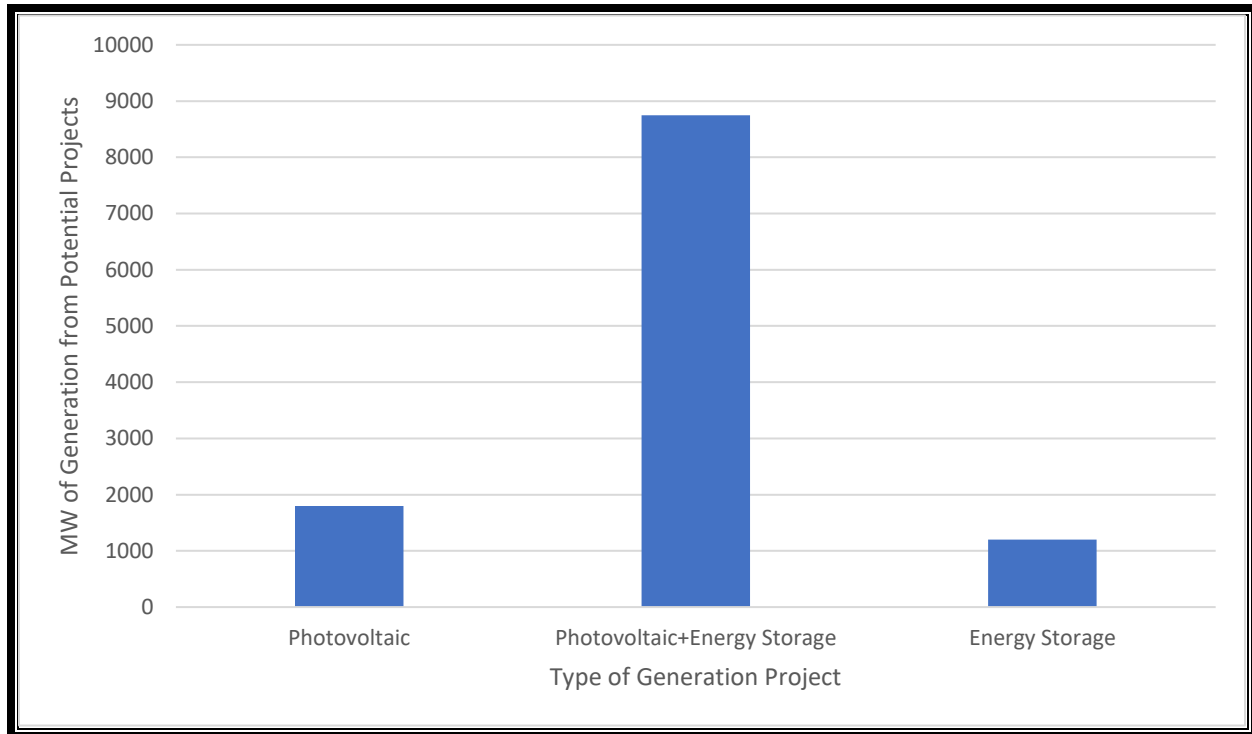

Source: Bonneville Power Administration, provided by City of Prineville

## CHAPTER 4 – ECONOMIC ANALYSIS

In November of 2022, BPA provided an additional update to the City of Prineville and other stakeholders on transmission and power planning in the region. This update included data on interest expressed by power producers on interconnection to the transmission system; Crook, Sherman, Wasco, and Morrow were the top four counties where energy developers had expressed interest in developing power generation facilities. Note that these are projects that have contacted BPA about transmission interconnection; the likelihood of any of these projects being built is not known. The vast majority of this potential future generation is solar, much of which may be coupled with some energy storage, as shown in **Figure 4.7**.

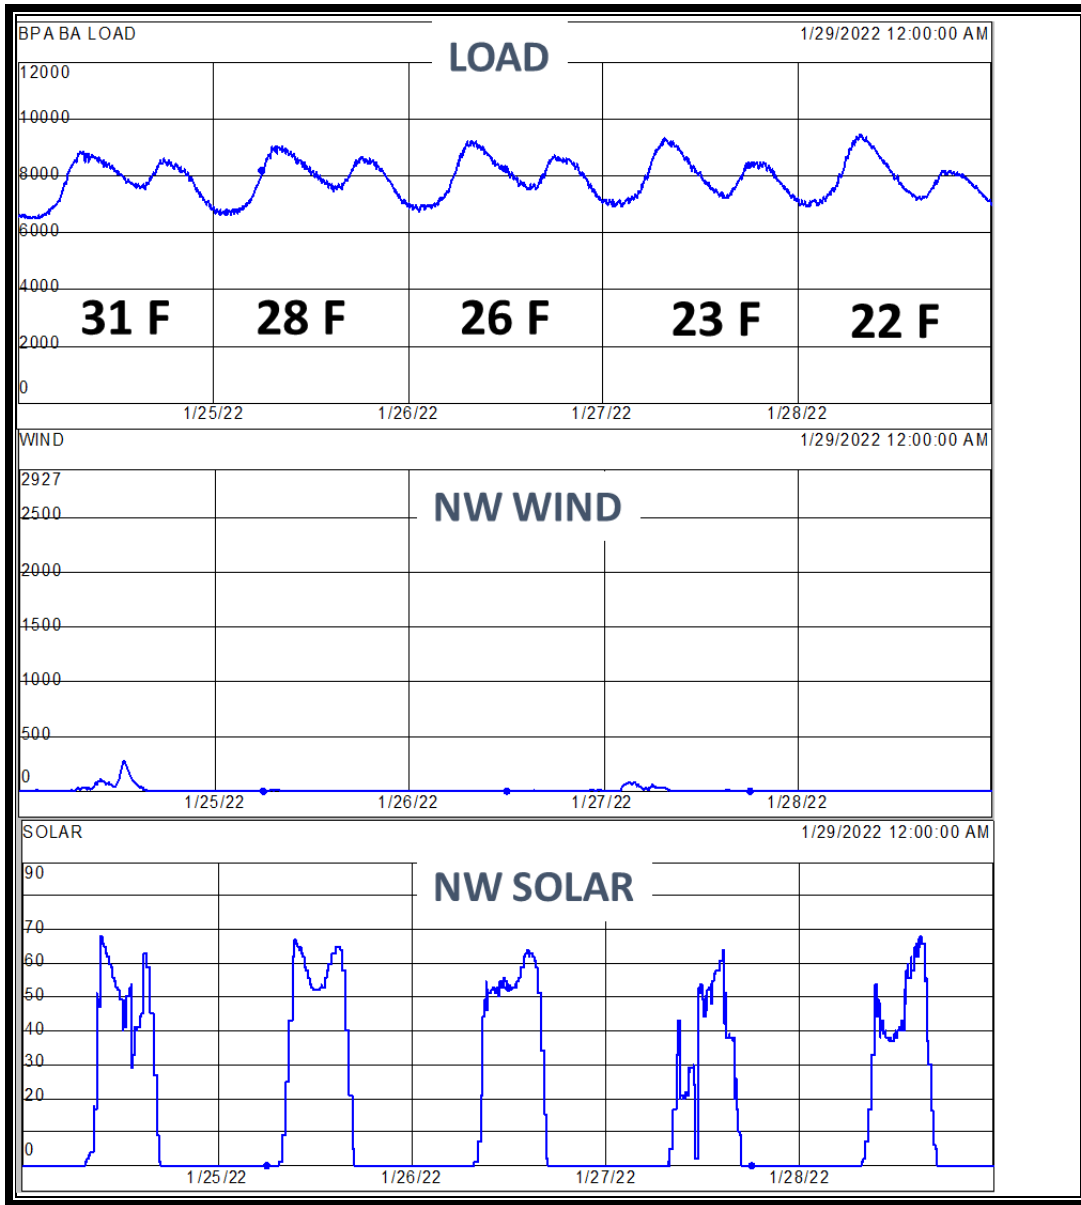

**Figure 4.7 – Generation Connection Interest in Crook County (November 2022)**

Source: Interconnection BPA Queue, Bonneville Power Administration data provided by City of Prineville

For solar power to assist with power constraints, particularly during the winter peak period, is critical. As shown in **Figure 4.8**, also from BPA data, solar output during winter months is low and variable, and snow cover can be an issue, while terrestrial wind generation is very low during extreme temperature conditions. As such, solar or wind projects need energy storage in order for them to contribute to meet these load peaks during winter. This is a major advantage of firm power, such as the PREP facility, as it provides constant power to meet demand during all times and is not intermittent – unlike solar and wind, which need energy storage to provide more consistent power.

Figure 4.8 – Load Demand Compared to NW Wind and Solar Energy Generation in Winter Weather Conditions

Source: Bonneville Power Administration data provided by City of Prineville

**4.6.3 Reduced Wildfire Threat to Economic Development**

By reducing wildfire and improving air quality, PREP has the potential to support (or prevent the loss of) economic development. Wildfire can impact economic development by destroying resources and infrastructure, reducing tourism, and motivating people to live away from fire-damaged or fire-prone areas.

There is some evidence to suggest that the threat of wildfire causes some people to move out of or avoid moving to wildfire-prone areas. In a 2021 survey conducted by real estate brokerage firm Redfin, almost half of Americans who planned to move in the next year said that natural disasters and extreme

## CHAPTER 4 – ECONOMIC ANALYSIS

---

temperatures factored into their decision to relocate (Rodriguez, 2021). Anecdotal accounts suggest that wildfire is a primary reason why some people move away from Western States, including Oregon and California, as well as a reason why some people choose not to move into these areas (Rodriguez, 2021; Allen, 2022; Hurdle, 2022; Lahr, 2020). Fewer people in these areas mean fewer workers, fewer business owners, and fewer customers, all of which can hinder economic development.

However, not all migrants are being dissuaded by the risk of wildfire. Data on migration trends and housing construction show that wildfire-prone areas are increasingly popular destinations for relocating Americans (Bliss & Patino, 2021; Samuel, 2021; Popovich & Plumer, 2022; Rao, Konings, Yebra, Diffenbaugh, & Williams, 2022). There are several reasons why people might choose to live in an area where wildfire threatens their home. One is ignorance of the risk: some movers and home builders are simply unaware they are locating to an area that has a significant risk of wildfire. Affordability is another reason. Building in the wildland-urban interface (which often carries a higher risk of wildfire in the Western US) is often cheaper than building in more developed areas, and affordable housing in safer areas is frequently in short supply (Rao, Konings, Yebra, Diffenbaugh, & Williams, 2022; Popovich & Plumer, 2022).

It is important to note that increased populations in wildfire-prone areas does not indicate a preference for wildfire. It is safe to say that nearly all homeowners are averse to living in wildfire-prone areas, but some are willing to accept the risk in exchange for other benefits (and others may not be aware of the risk). Regarding economic development, the relevant point is that wildfire risk may reduce the likelihood that someone will choose to live in a fire-prone area, and for each person that makes this choice, the risk of wildfire has reduced a potential source of economic development and economic activity (i.e., a potential employee, business owner, or customer). So even though some people may still choose to move to areas with wildfire risk, the area could have experienced greater economic development had the risk of fire been removed or reduced.

In addition, wildfire can negatively impact economic development by reducing tourism. One study examined the impacts of the 2017 wildfire season on the 2018 Oregon tourism economy. Approximately 1.2 million acres burned across the state in that year, which the study estimated to cause \$60.7 million in lost visitor spending and \$18.8 million in lost earnings in 2017.<sup>47</sup> In that year, the Chetco Bar fire burned over 191,000 acres (almost entirely in Curry County). This fire was estimated to reduce tourism spending in the area by roughly \$6 million, with \$1.5 million lost in associated earnings (Dean Runyan Associates, Inc., 2018). On average, each acre burned translated to nearly \$16 in reduced earnings in the year of the fire.

The study assessed the potential future tourism-related economic impacts by surveying local businesses and organizations. Nearly half of survey respondents believed that wildfires would have an adverse effect on their business in 2018, primarily because their area would have less appeal to visitors. More than 30% of respondents reported that they believed their organization would lose future revenue because the fire reduced the scenic appeal of the area (Dean Runyan Associates, Inc., 2018). In this way, wildfire can reduce tourism; logically, reducing the prevalence of wildfire through initiatives such as PREP has the potential to support tourism.

During the 2020 wildfire season, Central Oregon also experienced a significant drop in tourism, with businesses adversely affected from the loss in revenue (Maher, 2022). In a recent article on how longer,

---

<sup>47</sup> The original values in 2017 were adjusted to 2022 dollars using the Implicit Price Deflator for GDP (Bureau of Economic Analysis, 2022).

## CHAPTER 4 – ECONOMIC ANALYSIS

---

more intense wildfires are hurting areas reliant on tourism, Bend Chamber of Commerce CEO Katy Brooks was cited as saying that “Living in Bend in 2020 was a like a summer that didn’t happen” (Maher, 2022). Wildfire can clearly reduce tourism; it follows that reducing the prevalence of wildfire through initiatives such as PREP has the potential to support tourism.

### CHAPTER 5 – CARBON CAPTURE TECHNOLOGY

---

#### 5.1 CARBON CAPTURE

Many believe that reducing society's carbon emissions in the future will not do enough to avoid social, economic, and environmental impacts from an associated change in climate. Therefore, there is interest in going a step further by capturing and sequestering carbon from the atmosphere. Thus, an emerging area of focus is on the technologies for capturing carbon dioxide formed during power generation and other industrial processes, and then sequestering the captured carbon dioxide so that it is not emitted into the atmosphere.

The technologies are not yet well developed or commercialized, but there is significant support for advancing them. For example, in January 2020 Microsoft Corporation announced a carbon-negative commitment. Their goal is that by 2030 Microsoft will be carbon negative and by 2050 Microsoft will have removed from the environment all the carbon the company has emitted either directly or by electrical consumption since it was founded in 1975. At the same time, the company pledged deployment of \$1 billion in capital in a new Climate Innovation Fund to accelerate the development of carbon reduction and removal technologies.

There are three general types of carbon capture technology<sup>48</sup> including:

- **Post-combustion:** Capturing carbon (as CO<sub>2</sub>) from the flue gas of a combustion process. This carbon capture technology would most likely be applied at a power plant that burns coal or natural gas. Coal and natural gas-fired power plants constitute roughly two-thirds of all power generation in the US and they produce roughly 25% of all carbon dioxide emissions annually in the US, or about 1.25 billion metric tons of carbon dioxide per year. As of 2021, planned or already deployed post-combustion carbon capture technology had the capacity to capture 40 million metric tons of carbon dioxide annually. Thus, the current capture rate of this technology is only 0.03% of annual output – a very small proportion.
- **Oxyfuel:** Combusting fuels in a pure oxygen environment so that nearly all of the waste gas is CO<sub>2</sub> and water vapor. The water is then condensed and the CO<sub>2</sub> gas is stored. Currently this technology has very high capital costs, consumes large amounts of energy, and is hampered by various operational challenges.
- **Pre-combustion:** The technology is generally applied to coal gasification where the syngas produced from gasifying coal produces carbon monoxide and hydrogen. The hydrogen is then captured and combusted to produce power, while the carbon monoxide is reacted with water to produce CO<sub>2</sub> which is then stored. Current estimates are that the cost of operating this technology is about \$60 per metric ton, not including costs for storage or utilization.

#### 5.2 CARBON STORAGE AND/OR UTILIZATION

After the carbon dioxide is captured, it is typically compressed and deeply chilled so that it becomes a fluid. It is then typically transported by pipeline to a storage site. From the storage site, the carbon dioxide is often injected into deep underground geological formations. In some cases, the carbon dioxide injected deep within the earth is physically trapped and therefore is considered sequestered from the atmosphere. However, a focus of interest in the context of the Western US is injecting the carbon dioxide deep

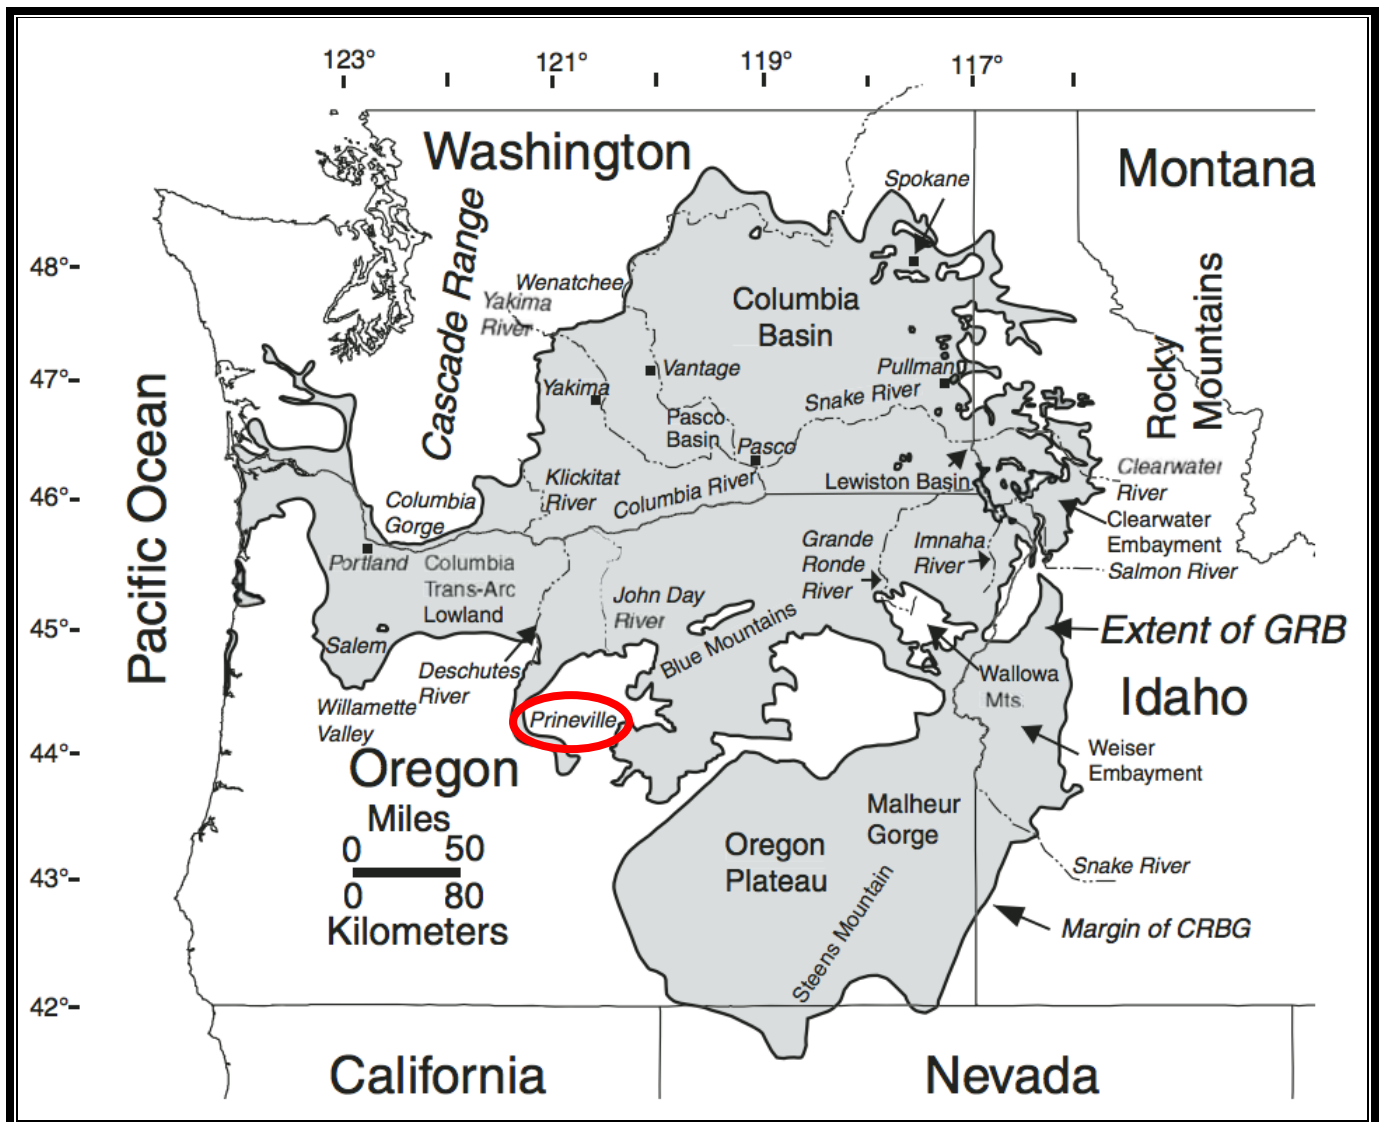

---

<sup>48</sup> Much of the information in this section of the report is from: Resources for the Future, accessed at: <https://www.rff.org/publications/explainers/carbon-capture-and-storage-101/> and from the US Department of Energy, <https://www.energy.gov>

## CHAPTER 5 – CARBON IMPACTS & CARBON CAPTURE TECHNOLOGY

underground into basalt rock formations. The basalt formations are deeply buried rocks deposited from volcanic eruptions that have occurred over millions and billions of years. The basalt formations typically contain small amounts of magnesium and calcium, which allow the basalt to transform into stable forms of calcite and dolomite when exposed to carbon dioxide through a mineralization process deep within the earth. Much of Washington and Oregon, including the region around Prineville, is underlain by large basalt rock formations that would form a key component of any carbon storage project to be located in the region. The formations are believed to have formed about 20 million years ago when magma from massive eruptions erupted from a volcanic hotspot that is now believed to reside near Yellowstone Volcano in Northwest Wyoming. The magma flowed hundreds of miles to the north and west, which resulted in the widespread basalt formations shown in **Figure 5.1**.

**Figure 5.1 – Columbia River Basin Basalt Formation Map<sup>49</sup>**

<sup>49</sup> Map accessed at: <https://www.usgs.gov/observatories/cvo/columbia-river-basalt-group-stretches-oregon-idaho>

## CHAPTER 5 – CARBON IMPACTS & CARBON CAPTURE TECHNOLOGY

---

Another way of dealing with captured CO<sub>2</sub> involves finding uses for it. It is sometimes used for Enhanced Oil Recovery (EOR), which is the process of injecting carbon dioxide into an underground oil formation. Injecting carbon dioxide increases the pressure within the formation, which allows more oil to be recovered. In some cases, the carbon dioxide reacts with the oil in the formation, allowing it to become mobile and thereby available for recovery. While injecting carbon dioxide into a process to gather more of a carbon-producing material may seem counterproductive to efforts for reducing atmospheric carbon, research has shown that typically much more carbon dioxide must be injected into an oil formation than is released from the oil that is recovered.

### 5.3 BIOMASS ENERGY CARBON CAPTURE AND STORAGE

Generating heat/energy from biomass and capturing and storing the resulting carbon dioxide is of particular interest for the PREP. This is because biomass, through the photosynthesis process of plants, removes carbon from the atmosphere. If biomass is then combusted to produce heat/power and the resulting carbon dioxide is captured and permanently stored, the process could be a technology with negative carbon emissions so long as the carbon emissions associated with the growing, harvesting, transporting, and processing of the biomass do not outweigh the carbon captured.

The technology is of particular interest in the forests of the US West where, on many publicly owned lands, the current amount of biomass per acre is generally thought to be greater than historical levels. Thus, relatively large amounts of biomass naturally occur within an economical transport distance of a biomass power plant, a scenario where sustainability concerns are limited. A recent study<sup>50</sup> estimated that globally there is the potential to permanently sequester 3.4 to 5.2 billion tons of carbon dioxide per year via biomass energy carbon capture and storage. The cost estimate for biomass energy carbon capture and storage range from a low of \$20 per ton of carbon dioxide sequestered to a high of \$200 per ton.

From a technology perspective, biomass power generation is widely used, well understood, and has been used commercially at industrial scale for many decades. However, while carbon capture technology is well understood, it has yet to be fully commercialized with only a few small-scale demonstration projects completed to date. Still, several of the demonstration projects are backed by well-funded organizations. For example, Drax is a renewable energy company operating a portfolio of biomass, hydroelectric, and pumped hydro storage power-generating plants in the United Kingdom. The company's power plants initially combusted coal, but in 2013 started switching to co-firing coal and biomass (wood pellets). In 2020, the company announced plans to end all commercial power generating operations involving coal combustion and a planned switch to 100% biomass combustion.

The company also announced in 2019 plans to become a carbon-negative company by 2030, requiring them to implement carbon capture and storage technology. Several years ago, they deployed a test-scale biomass energy carbon capture and storage facility at North Yorkshire, England. The key to their process is injecting a "c-capture solvent" into the process to "collect the carbon dioxide for efficient processing and ultimately storage." See **Figure 5.2**. In mid-July 2022, Drax announced submission of plans to the United Kingdom's Planning Inspectorate to develop two bioenergy carbon capture storage units at its North Yorkshire biomass power plant.<sup>51</sup> Pending approval, construction could start in 2024. The project will cost

---

## CHAPTER 5 – CARBON IMPACTS & CARBON CAPTURE TECHNOLOGY

nearly 10 billion dollars and the two units combined will capture and store at least 8 million metric tons of carbon dioxide per year. It will be the largest carbon capture and storage project in the world.

Figure 5.2 – Biomass Energy Carbon Capture and Storage at Drax Power Station<sup>52</sup>

### 5.4 SUMMARY OF BIOMASS ENERGY CARBON CAPTURE AND STORAGE

Biomass energy carbon capture and storage is a developing technology that is generating interest from companies seeking to be leaders not only in reducing the carbon-related environmental impacts of their operations, but reversing their carbon impacts by becoming “carbon negative.” There are several variations of the technology, but up to this point none have been widely deployed.

The major limiting factor appears to be the high cost of implementing and operating the technology, with estimated costs ranging as high as \$200 per ton of carbon dioxide permanently stored. The current costs are much higher than carbon’s value in markets driven by government-imposed carbon emissions curbs (e.g., California’s Cap and Trade program). For example, in 2021 the weighted average value of carbon offset transfers was about \$15 per ton of carbon dioxide and about \$25 per ton for allowance transfers.<sup>53</sup> What is less clear is the value of carbon among voluntary or incentive-based markets that are driven by corporate sustainability reporting programs such as the Microsoft and Drax examples cited in this report.

Another issue that creates uncertainty is that there is no universally accepted method for accounting carbon offsets and carbon storage. Nor are there widely accepted protocols for differentiating between high-quality and less-worthy carbon reduction and/or storage projects. For example, there currently is no well-defined mechanism in the marketplace that recognizes the full value of capturing a ton of carbon already in the atmosphere and permanently storing it underground, versus credits for storing carbon for a

## **CHAPTER 5 – CARBON IMPACTS & CARBON CAPTURE TECHNOLOGY**

---

limited time in forests, buildings, etc., or reducing the carbon emissions of already existing infrastructures. In summary, it appears carbon capture is a potentially viable technology, but at the current time there are significant technological and economical risks associated with its deployment.

**ORDINANCE NO. 1284  
PRINEVILLE, OREGON**

**AN ORDINANCE ADOPTING CHANGES TO PRINEVILLE MUNICIPAL CODE  
CHAPTER 131**

**Whereas**, the City of Prineville (“City”) desires to allow individuals and families that are temporarily experiencing the effects of homelessness to camp in relatively safe and sanitary locations while they are actively seeking access to stable and affordable housing.

**Whereas**, the City desires to establish codes related to camping in the City to allow for legal camping during reasonable time periods, while protecting sensitive areas of the City that are disproportionately impacted by the negative effects of such activity.

**Whereas**, the City desires to discourage camping in areas where such activities fundamentally undermine the public’s ability to use that public property for its intended purpose and creates unsafe and unsanitary living conditions, which can threaten the general health, welfare, and safety of the City and its inhabitants.

**Whereas**, the City encourages the active participation of all concerned persons, organizations, businesses, and public agencies to work in partnership with the City and the homeless community to address the short and long-term impacts of homelessness in the community.

**Whereas**, the City wishes to amend City of Prineville Municipal Code Chapter 131 Camping in Certain Places to conform with Oregon House Bill 3115.

**NOW, THEREFORE, THE PEOPLE OF THE CITY OF PRINEVILLE DO  
ORDAIN AS FOLLOWS:**

- 1. Purpose.** It is found and declared that:
  - a. From time-to-time persons establishes campsites on sidewalks, public rights-of-way, under bridges, and so forth;
  - b. Such persons, by such actions create unsafe and unsanitary living conditions which pose a threat to the peace, health, and safety of themselves and the community;
  - c. Camping, lying, or sleeping on a playground or sports field fundamentally undermines the public’s ability to use that public property for its intended purpose;
  - d. Camping, lying, or sleeping on rights-of-way, or in a manner that obstructs sidewalks, prevents the public’s ability to use that public property for its intended purpose and can in some situations result in imminent threats to life;

e. These regulations are meant strictly to regulate the use of publicly owned property, and are not intended to regulate activities on private property; and

f. The enactment of this provision is necessary to protect the peace, health, and safety of the City of Prineville and its inhabitants.

2. The Prineville City Council hereby revokes Chapter 131 in its entirety and replaces it as set forth on Exhibit A, attached hereto and incorporated herein.

3. **Severability.** If any court of competent jurisdiction declares any Section of this Ordinance invalid, such decision shall be deemed to apply to that Section only and shall not affect the validity of the Ordinance as a whole or any part thereof other than the part declared invalid.

4. **Emergency Declared.** An emergency is deemed to exist and this Ordinance shall go into effect July 1, 2023.

Presented for the first time at a regular meeting of the City Council held on \_\_\_\_\_ 2023, and the City Council finally enacted foregoing ordinance this \_\_\_\_\_ day of \_\_\_\_\_, 2023.

\_\_\_\_\_  
Rodney J. Beebe, Mayor

ATTEST:

\_\_\_\_\_  
Lisa Morgan, City Recorder

## CHAPTER 131: CAMPING IN CERTAIN PLACES

### Section

<b>131.01</b>	<b>Definitions</b>
<b>131.02</b>	<b>Camping Prohibited in Certain Places</b>
<b>131.03</b>	<b>Scheduling and Notice of Campsite Cleanup</b>
<b>131.04</b>	<b>Removal, Storage and Retrieval of Personal Property</b>
<b>131.98</b>	<b>Nonexclusive Remedy</b>
<b>131.99</b>	<b>Penalty</b>

### **131.01. Definitions.**

As used in this Chapter, the following terms and phrases shall have the meaning set forth herein:

“Camp” or “Camping” means to pitch, erect, create, or occupy camp facilities for the purposes of habitation, as evidenced by the use of camp paraphernalia.

“Campsite” means any place where one or more persons have established temporary sleeping accommodations by use of camp facilities and/or camp paraphernalia.

“Camp Facilities” include, but are not limited to, tents, bivouacs, huts, other temporary or portable shelters, and vehicles or recreation vehicles as defined by Oregon law.

“Camp Paraphernalia” includes, but is not limited to, tarpaulins, cots, beds, sleeping bags, blankets, mattresses, hammocks, or other sleeping material, or non-City designated cooking facilities and similar equipment.

“Park Areas” means publicly owned grounds providing passive and active recreation opportunities, including but not limited to, Ochoco Creek Park, Gervis/Library Park, Crooked River Park, Kilowatt Field/Harwood Park, Davidson Field, Gary Ward Park, Rimrock Park/Youth Fishing Pond, Pioneer Park, Yellowpine Park, Barnes Butte Recreational Area, Mountain View Park, and Crooked River Wetlands Complex.

“Parking Lot” means a developed location that is designated for parking motor vehicles, whether developed with asphalt, concrete, gravel, or other material.

“Public Property” means any real property or structure owned, leased, or managed by a public agency, including public rights-of-way and utility easements. A public agency includes, but is not limited to, the City of Prineville, Crook County, Oregon Department of Transportation, Crook County Parks and Recreation District, Crook County Cemetery Board, and Crook County School District.

“School” means a public or private institution or a child care facility.

“Store” or “Storage” means to put aside or accumulate for use when needed, to put for safekeeping, to place or leave in a location.

“Waterway” means a river, canal, or other route for the travel of water.

**131.02. Camping Prohibited in Certain Places**

This section’s regulations are meant strictly to regulate the use of public property within the City of Prineville and are not intended to regulate activities on private property.

(A) Except as expressly authorized by the City of Prineville Municipal Code, it shall be unlawful for any person to establish or occupy a campsite at any time on the following Public Property:

- (1) All Park Areas;
- (2) On sidewalks in a manner reducing the clear, continuous width of less than five feet;
- (3) All public property located within 1,000 feet of a school; and
- (4) Within 100 feet of a waterway.

(B) Except as expressly authorized by the City of Prineville Municipal Code, it shall be unlawful for any person to camp or maintain a campsite on any public property during the hours of 7:00 a.m. to 9:00 p.m.

(C) Except as expressly authorized by the City of Prineville Municipal Code, it shall be unlawful for any person to store personal property, including camp facilities and camp paraphernalia, on any public property during the hours of 7:00 a.m. to 9:00 p.m.

(D) Except as expressly authorized by the City of Prineville Municipal Code, it shall be unlawful to knowingly leave personal property unattended on public property during the hours of 7:00 a.m. to 9:00 p.m. Personal property left unattended may be removed and disposed by the City, in accordance with Oregon law, if:

- (1) The property poses an immediate threat to public health, safety or welfare; or
- (2) The property has been posted with a written notice in accordance with Oregon law.

(E) Notwithstanding the provisions of this Chapter, the City Manager or designee may temporarily authorize camping or storage of personal property by written order that specifies the period of time and location:

- (1) In the event of emergency circumstances;
- (2) In conjunction with a special event permit; or

- (3) Upon finding it to be in the public interest and consistent with City Council goals and policies.

### **131.03 Scheduling and Notice of Campsite Cleanup**

(A) Cleanup of unlawful campsites will be scheduled on an as-needed bases by the Chief of Police or designee.

(B) Permanent signs may be posted advising that camping is prohibited. Whether or not a permanent sign is posted, a specific dated and timed notice will be posted and distributed in the area of a scheduled cleanup at least 72 hours before the cleanup.

(C) Notwithstanding subsection (A) and (B) of this section, cleanup of campsites may occur immediately and without notice if the Chief of Police or designee determines that either of the following conditions exists:

- (1) When there are grounds for law enforcement officials to believe that illegal activities other than camping are occurring at an established campsite;

- (2) In the event of an exceptional emergency at an established campsite, including, but not limited to, possible site contamination by hazardous materials, a public health emergency, or other immediate danger to human life or safety.

- (3) If a funeral service is scheduled with less than 72 hours' notice at a cemetery at which there is a camping site, or a camping site is established at the cemetery less than 72 hours before the scheduled service, the written notice required under subsection (B) of this section may be posted at least 24 hours before the cleanup.

### **131.04 Removal, Storage and Retrieval of Personal Property.**

(A) Any property removed by the City shall be held and disposed of pursuant to Oregon law if not claimed within 30-days after removal.

(B) Individuals may claim their property, without a fee, by contacting the Police Department within 30 days.

(C) Items that have no apparent utility or are in unsanitary condition may be immediately discarded.

(D) Weapons, controlled substances other than prescription medication and items that appear to be either stolen or evidence of a crime shall be retained and disposed of by the Police Department in accordance with applicable legal requirements for the property in question.

### **131.98 Nonexclusive Remedy**

The remedies described in this chapter shall not be the exclusive remedies of the City for violations of this Chapter.

**131.99 Penalties and Enforcement.**

(1) Violation of any provision of this Chapter is punishable by a fine not less than \$50.00 nor more than \$250.00 for the first offense, and for the second and subsequent offenses, not less than \$100.00, nor more than \$1,000.00.

(2) Each day that a violation occurs will be considered a separate offense.

(3) In addition to any other penalties that may be imposed, any campsite used for overnight sleeping in a manner not authorized by this Chapter or other provisions of this code shall constitute a public nuisance and may be abated in accordance with Oregon law.

**ORDINANCE 1285  
PRINEVILLE, OREGON**

**AN ORDINANCE ADOPTING CHANGES TO PRINEVILLE MUNICIPAL CODE  
CHAPTER 93.59**

**Whereas**, Chapter II, Section 4 of the City of Prineville Charter provides:

Powers. The city has all powers that the constitutions, statutes and common law of the United States and Oregon expressly or impliedly grant or allow the city, as fully as this charter specifically enumerated each of those powers.

**Whereas**, State law codified as ORS 105.550 to 105.600, Abatement of Nuisance, provides the City of Prineville specific authority to abate certain public nuisance activities that affects the health, safety and welfare of its community; and

**NOW, THEREFORE, THE PEOPLE OF THE CITY OF PRINEVILLE DO  
ORDAIN AS FOLLOWS:**

1. Section 93.59 of the Prineville Municipal Code is amended to read as shown on Exhibit A, attached hereto and incorporated herein.

2. **Emergency Declared.** An emergency is deemed to exist and this Ordinance shall go into effect July 1, 2023.

Presented for the first time at a regular meeting of the City Council held on \_\_\_\_\_ 2023, and the City Council finally enacted foregoing ordinance this \_\_\_\_ day of \_\_\_\_\_, 2023.

\_\_\_\_\_  
Rodney J. Beebe, Mayor

### 93.59 Parking

- A. No person shall cause any vehicle or personal property to be parked or stored in such a way as to obstruct the flow of traffic on a public right-of-way or the movement of pedestrians on a public sidewalk.
- B. No vehicle or personal property located on a public right-of-way, a sidewalk or on public property shall be permitted for more than 72 consecutive hours; provided, that any basketball stand that does not interfere with the flow of traffic or pedestrians, or create a substantial safety hazard, may be located in the right-of-way for more than 72 hours. Movement of a vehicle within a 500-foot radius shall not extend the time limits for parking violations pursuant to this section.
- C. Within residential neighborhoods, no commercial vehicle which exceeds 8,000 pounds gross weight, 21 feet in length or eight feet in height shall be parked in the street unless it is a vehicle that is routinely on standby and necessary to use under emergency circumstances. Semi-trailers are prohibited.
- D. Whenever a vehicle is placed in a manner or location which constitutes an obstruction to traffic or hazard in public safety or is parked in a manner that violates this chapter, within the City limits of the City of Prineville, the City may cause the vehicle to be towed pursuant to provisions established in ORS 98.805, 98.810, 98.812, and 98.818. The owner of such vehicle is responsible to the City or any private towing and storage operator pursuant to the provisions of ORS 98.812 and 98.818. The City shall also have any remedies available under this chapter including, without limitation, the ability to sell a removed vehicle as abandoned property.
- E. If any vehicle is impounded and stored under the provisions of this chapter or any other provision of the Prineville Municipal Code, or pursuant to any other lawful authority, said vehicle shall not be released by the person to whom possession thereof is delivered until all charges connected with the removal, towing, and storage of such vehicle have been fully paid.
- F. For purposes of this section, vehicle means any device in, upon or by which any person or property is or may be transported or drawn upon a public highway and includes vehicles that are propelled or powered by any means, which includes, but is not limited to boats, trailers, motorhomes, and travel trailers.

**RESOLUTION NO. 1555  
PRINEVILLE, OREGON**

**A RESOLUTION FOR CROOK COUNTY ENTERPRISE ZONE BOUNDARY RE-  
DESIGNATION**

**Whereas**, the City of Prineville (“City”) and Crook County (“County”) are currently sponsors of the Crook County Enterprise Zone, a rural enterprise zone pursuant to ORS 285C.400-ORS 285C.420 (“Zone”).

**Whereas**, pursuant to Oregon law, the Zone terminates July 1, 2023, if not renewed prior to that date.

**Whereas**, in order for the Zone to be renewed, the application must be submitted on or before June 1, 2023.

**Whereas**, City and County desire to continue sponsorship of an enterprise zone to encourage new business investment, job creation, higher incomes for local residents, and greater diversity of economic activity.

**Whereas**, City and County have formally advised and received consultation from the Oregon Business Development Department (“OBDD”) according to ORS 285C.078.

**Whereas**, the enterprise zone has a total area of 8.93 square miles and it meets other statutory limitations on size and configuration and is depicted on the map attached as Exhibit A and described on the attached Exhibit B, both incorporated herein.

**Whereas**, the proposed enterprise zone contains significant land that is reserved for industrial use, as indicated by land use zoning maps attached to the Application, consistent with comprehensive plans acknowledged by the Land Conservation and Development Commission. Such industrial sites are accessible, service or serviceable, and otherwise ready for use and further development.

**Whereas**, the designation of an enterprise zone does not grant or imply permission to develop land within the Zone without complying with prevailing zoning, regulatory and permitting processes and restrictions for applicable jurisdictions; nor does it indicate any intent to modify those processes or restrictions, except as otherwise and in accordance with comprehensive plans.

**Whereas**, the City appreciates the impacts that a designated enterprise zone would have and the property tax exemptions that eligible business firms might receive therein, as governed by ORS Chapter 285C and other provisions of Oregon law.

**Whereas**, all of the other municipal corporations, school districts, special service districts, other than City and County, that receive operating revenues through the levying of ad valorem taxes on real and personal property in any area of the proposed enterprise zone were

sent notice and invited to a public meeting held April 25, 2023, regarding this proposal, in order for City and County to effectively consult with these other local taxing districts.

**Now, Therefore, the City of Prineville Resolves as follows:**

1. Under ORS 285C.065, City proposes and applies for a re-designation of an Oregon Enterprise Zone made up of the properties shown on Exhibit A and described on Exhibit B to be named the Crook County Enterprise Zone, and requests that the Director of Business Oregon order the re-designation of this enterprise zone as a rural enterprise zone.
2. Kelsey Lucas, Prineville/Crook County Director with Economic Development for Central Oregon (“EDCO”), is authorized to submit the enterprise zone application for the City and to make any substantive or technical change to the application materials, as necessary, after adoption of this Resolution.
3. City will give priority to the use in the proposed enterprise zone, if re-designated, of any economic development or job training funds received from the federal government, consistent with ORS 285C.065(3)(d).
4. Upon re-designation, Kelsey Lucas, Prineville/Crook County Director for EDCO, is appointed as the local zone manager for the Crook County Enterprise Zone.
5. City will comply with the requirements and provisions of ORS 285C.105 and otherwise fulfill its duties under ORS 285C.050 to 285C.250.
6. City commits, within six months of re-designation, to implement and to confirm for the OBDD its fulfillment of such duties, as specified in OAR Chapter 23 Division 668, including, but not limited to, preparation of a list or map of local lands and buildings owned by the state or by a municipal corporation within the enterprise zone that are not being used or designated for a public purpose and that have appropriate land use zoning, and to make efforts for making such real property available for lease or purchase by authorized business firms under ORS 285C.110.

Approved by the City Council this \_\_\_\_ day of May, 2023.

**RESOLUTION 1556  
PRINEVILLE, OREGON**

**A RESOLUTION CONSENTING TO CROOK COUNTY ORDINANCE 338 AMENDING  
TITLE 9 OF CROOK COUNTY CODE, ADOPTING A NEW CHAPTER TO REDUCE  
INCIDENTS OF TRUANCY FROM CROOK COUNTY PUBLIC SCHOOLS**

**Whereas**, the Crook County Court passed Ordinance No. 338, an Ordinance Amending Title 9 of the Crook County Code, Adopting a New Chapter to Reduce Incidents of Truancy from Crook County Public Schools (“Ordinance”).

**Whereas**, to be applicable within the City of Prineville, Ordinance must be consented to by the City Council pursuant to ORS 203.040.

**Now, Therefore, the City of Prineville Resolves as follows:**

1. The City Council of Prineville hereby consents to Ordinance 338, attached to this Ordinance and incorporated herein, allowing Crook County jurisdiction regarding students in Kindergarten through 12<sup>th</sup> grades, enrolled in a full-time public school located within the incorporated City of Prineville.

Approved by the City Council this \_\_\_\_ day of May, 2023.

\_\_\_\_\_  
Rodney J. Beebe, Mayor

ATTEST:

\_\_\_\_\_  
Lisa Morgan, City Recorder

2023-026

I, Cheryl Seely, County Clerk for Crook County, Oregon, certify that the instrument identified herein was recorded in the Clerk records.

Cheryl Seely - County Clerk

**IN THE COUNTY COURT OF THE STATE OF OREGON  
FOR THE COUNTY OF CROOK**

**AN ORDINANCE AMENDING TITLE  
9 OF THE CROOK COUNTY CODE,  
ADOPTING A NEW CHAPTER TO  
REDUCE INCIDENTS OF TRUANCY  
FROM CROOK COUNTY PUBLIC  
SCHOOLS**

**ORDINANCE 338**

**WHEREAS**, Oregon state law requires all minors enrolled in Kindergarten through 12<sup>th</sup> grades to attend school on a regular basis; and

**WHEREAS**, the Oregon Department of Education, via Oregon Administrative Rule 581-020-0631 defines chronic absenteeism as missing 10 percent or more of school days; and

**WHEREAS**, chronic absenteeism has been shown to dramatically reduce student academic achievement, reduce graduation rates, increase student mental health issues, and increase incarceration rates; and

**WHEREAS**, as a metric, school districts are held accountable to maintain a high number of students enrolled in school who are not considered chronically absent; and

**WHEREAS**, attendance at school is the necessary basis for the most fundamental education for children, and such education is necessary for the continuing growth and progress of a healthy society, economy, and community; and

**WHEREAS**, the educational entities that comprise the Crook County School District desire to have a county-wide truancy program that endows law enforcement and school officials with the authority to issue infraction citations and take other action with regard to students and a student's parent, guardian or other responsible adult who fails to comply with school attendance requirements of State laws or rules.

///

ORDINANCE 338 AMENDING TITLE 9 OF THE CROOK COUNTY CODE, ADOPTING A NEW CHAPTER TO REDUCE INCIDENTS OF TRUANCY FROM CROOK COUNTY SCHOOLS

NOW, THEREFORE, the Crook County Court ordains as follows:

**Section One:** A new chapter is added to the Crook County Code to read as follows:

Chapter 9.05  
Truancy from Crook County Schools

**Sections:**

**9.05.010 Title**  
**9.05.015 Authority and Purpose**  
**9.05.020 Jurisdiction**  
**9.05.025 Definitions**  
**9.05.030 Prohibited Conduct**  
**9.05.035 Violation Proceeding**  
**9.05.040 Penalties**  
**9.05.045 Separate Offense**  
**9.05.050 Severance**

**9.05.010 Title**

This chapter shall be known as "Truancy from Crook County Schools."

**9.05.015 Authority and Purpose**

- (1) The Crook County Court has authority to regulate matters of County concern within the County, under the provisions of the Constitution of the State of Oregon and the revised statutes of the State of Oregon.
- (2) This chapter applies to students in Kindergarten (K) through 12<sup>th</sup> grades, enrolled in a full-time public school located within Crook County, including the incorporated City of Prineville, the city council of which has consented pursuant to ORS 203.040.
- (3) This chapter does not apply to students attending private schools located within Crook County.
- (4) The purpose of this chapter is to create rules for enforcement procedures intended to reduce the incidents of truancy within public schools in Crook County. It is in the best interest of a student to attend school regularly and complete the educational courses of study.

**9.05.020 Jurisdiction**

The Crook County Circuit Court has jurisdiction and venue over infractions and proceedings in this chapter.

ORDINANCE 338 AMENDING TITLE 9 OF THE CROOK COUNTY CODE, ADOPTING A NEW CHAPTER TO REDUCE INCIDENTS OF TRUANCY FROM CROOK COUNTY SCHOOLS

**9.05.025 Definitions**

- (1) "Chronically Absent" or "Chronic Absenteeism" means a Student is not attending School for 10 percent or more School days in a School year.
- (2) "Law Enforcement Official" means Crook County Sheriff Deputy, Prineville Police Officer, School Resource Officer, or any person that meets the definition of Peace Officer under ORS 161.015(4).
- (3) "Public School in Crook County" or "School" means a full-time school operated by Crook County School District.
- (4) "Responsible Adult" means a person at least eighteen (18) years of age, who is the parent, guardian, or other authorized adult to have the care or custody of a Student.
- (5) "School Official" means any personnel appointed or designated by a School or the Crook County School District, including but not limited to principal, vice-principal, superintendent, resource officer, or truancy enforcement specialist.
- (6) "Student" means a minor between the ages of 5-17 or an 18 year old person who has not completed the 12<sup>th</sup> grade and is enrolled in a Public School in Crook County.

**9.05.030 Prohibited Conduct**

- (1) Except as otherwise provided herein, Students are required to attend School regularly. It is unlawful for a Student to be Chronically Absent from School as described in this chapter.
- (2) Every Responsible Adult having the custody or care of a Student shall make every reasonable effort to assist the Student to comply with this chapter, and shall send the Student to School and maintain the Student in School so that the Student is not Chronically Absent.
- (3) This chapter does not limit or supersede any provisions of Oregon law, which exempts certain children from compulsory school attendance (ORS 339.030); neither does this ordinance limit the duties, powers, and responsibilities of public school officials.

**9.05.035 Proceedings**

- (1) A Law Enforcement Official or School Official may issue a citation to a Student and Responsible Adult for violating this chapter as set out in section 9.05.030, above.
- (2) Prior to issuing a citation, a School Official shall provide the Student and Responsible Adult with written notification to include the following:
  - (a) The Student is required to attend School, and the Student is deemed Chronically Absent in violation of this chapter and Oregon Administrative Rule.

(b) The failure of a Responsible Adult to send the Student to School and maintain the Student in School so that the Student does not miss greater than 10 percent of School days is a violation of this chapter.

(c) The Student and Responsible Adult may be cited to the Crook County Circuit Court for Chronic Absenteeism under this chapter.

(d) The Student and Responsible Adult must attend a conference with a designated School Official on a specified date and time where expectations for the Student's regular attendance at School will be outlined.

(e) The Student and Responsible Adult have the right to request an evaluation if the Student is not on an individualized education program (IEP). If the Student is on an IEP, the right to request a review of the IEP.

(3) Following the notification and process in 9.05.035(2), above, if the Student remains Chronically Absent in violation of this chapter or the Student or Responsible Adult fails to attend the conference described in 9.05.035(2)(d), an infraction citation will be issued. The citation will direct the Student, if the Student is in grades 4 through 12, and the Responsible Adult to appear at the Crook County Circuit Court on a date and time certain.

(4) If a Responsible Adult fails to appear at the date and time on the citation, the Circuit Court shall continue the matter and issue an order to show cause for the Responsible Adult to appear. A warrant will be issued for the Responsible Adult who fails to appear at the show cause proceeding.

#### **9.05.040 Penalties**

(1) Order to Attend School. Upon finding a violation of this chapter, the Circuit Court shall order the Student to attend School and not miss 10 percent or more of School days; and order the Responsible Adult to send the Student to School and maintain the Student in School so that the Student misses fewer than 10 percent of School days.

(2) Conditions. In addition to the order to attend School, the Circuit Court will impose conditions the Student, Responsible Adult, or both must meet or comply with for violating this chapter. Conditions imposed by the Circuit Court may include, but are not limited to:

(a) Set future dates and times for the Student and Responsible Adult to personally appear and provide progress reports demonstrating the Student's proof of attendance, current grades, other School-related information requested by the Circuit Court, and compliance with other conditions, if any.

(b) At the expense of the Responsible Adult, order the Student, the Responsible Adult, or both, to complete age-appropriate and relevant classes, groups, or programs in Crook County or online, including but not limited to: a parent mentor program; support groups that promote mental, behavioral, and emotional wellness; Wraparound; job assistance; community and mental

health services; truancy intervention classes; and academic classes for the Student after School or on the weekend.

(3) Civil Penalty. Impose a civil penalty on the Responsible Adult for an initial infraction up to \$500 for the first offense, and \$500 for each subsequent offense.

(4) The Circuit Court, School Official, or a Law Enforcement Official will, when the circumstances warrant, refer a Responsible Adult to the Crook County District Attorney's Office for prosecution in Crook County Circuit Court under ORS 163.577(1)(c).

**9.05.045 Separate Offense**

Each violation of this chapter shall be deemed a separate offense.

**9.05.050 Severability**

In the event that any part of this chapter shall be held by a court of competent jurisdiction to be invalid or unenforceable, the remaining sections shall be unaffected and remain in full force and effect.

**Section Two:** If any court of competent authority invalidates a portion of this Ordinance 338, the remaining portions will continue in full force and effect.

**Section Three:** Ordinance 338 being immediately necessary for health, welfare, and safety of the people of Crook County, and emergency is hereby declared to exist, and this Ordinance 338 shall become effective upon signing.
