Paving	0	48	0	90	320	40

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> Wastewater Pipeline - SCSA Sanitary Sewer

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

The CO2e emissions are reported as metric tons per phase.

Road Construction Emissions Model **Version 9.0.0**

Data Entry Worksheet

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a
yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	Wastewater Pipeline - SCSA Sanitary Sewer	
Construction Start Year	2025	Enter a Year between 2014 and 2040 (inclusive)
Project Type	1	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	4.50	months
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	2	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	4.40	miles
Total Project Area	1.60	acres
Maximum Area Disturbed/Day	0.02	acres
Water Trucks Used?	1	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/goodmaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing			
	Grading/Excavation	16.00		480.00
	Drainage/Utilities/Sub-Grade	16.00	560.00	
	Paving			
Asphalt	Grubbing/Land Clearing			
	Grading/Excavation			
	Drainage/Utilities/Sub-Grade			
	Paving	16.00	16.00	32.00

Mitigation Options

On-road Fleet Emissions Mitigation		Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation		Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to conf with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation). Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that can be modified by the user, although those modifications are optional.

irm compliance

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Notes:

Project Start Year ->	2026
Project Length (months) ->	7
Total Project Area (acres) ->	3
Maximum Area Disturbed/Day (acres) ->	0
Water Truck Used? ->	Yes

	Total Material Imported/Exported Volume (yd^3/day)		Daily VMT (miles/day)			
Phase	Soil	Asphalt	Soil Hauling	Asphalt Hauling	Worker Commute	Water Truck
Grubbing/Land Clearing	0	0	0	0	320	40
Grading/Excavation	496	0	930	0	400	40
Drainage/Utilities/Sub-Grade	576	0	1,080	0	400	40
Paving	0	48	0	90	320	40

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> Water Supply and Delivery Pipeline

Project Phases (Tons for all except CO2e. Metric tonnes for CO2e)	ROG (tons/phase)	CO (tons/phase)	NOx (tons/phase)	Total PM10 (tons/phase)	Exhaust PM10 (tons/phase)	Fugitive Dust PM10 (tons/phase)	Total PM2.5 (tons/phase)	Exhaust PM2.5 (tons/phase)	Fugitive Dust PM2.5 (tons/phase)	SOx (tons/phase)	CO2 (tons/phase)	CH4 (tons/phase)	N2O (tons/phase)	CO2e (MT/phase)

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

The CO2e emissions are reported as metric tons per phase.

Road Construction Emissions Model **Version 9.0.0**

Data Entry Worksheet

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a
yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	Water Supply and Delivery Pipeline	
Construction Start Year	2026	Enter a Year between 2014 and 2040 (inclusive)
Project Type	1	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	7.00	months
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	2	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	7.00	miles
Total Project Area	2.50	acres
Maximum Area Disturbed/Day	0.02	acres
Water Trucks Used?	1	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/goodmaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing			
	Grading/Excavation	16.00		496.00
	Drainage/Utilities/Sub-Grade	16.00	576.00	
	Paving			
Asphalt	Grubbing/Land Clearing			
	Grading/Excavation			
	Drainage/Utilities/Sub-Grade			
	Paving	16.00	16.00	32.00

Mitigation Options

On-road Fleet Emissions Mitigation		Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation		Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to conf with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation). Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that can be modified by the user, although those modifications are optional.

irm compliance

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Construction Periods	User Override of Construction Months	Program Calculated Months	User Override of Phase Starting Date	Program Default Phase Starting Date
Grubbing/Land Clearing		0.70		1/1/26
Grading/Excavation		3.15		1/23/26
Drainage/Utilities/Sub-Grade		2.10		4/29/26
Paving		1.05		7/2/26
Totals (Months)	7			

Note: Soil Hauling emission default values can be overridden in cells D61 through D64, and F61 through F64.

Soil Hauling Emissions User Input	User Override of Miles/Round Trip	Program Estimate of Miles/Round Trip	User Override of Truck Round Trips/Day	Default Values Round Trips/Day	Calculated Daily VMT

1.0 INTRODUCTION

The purpose of this report is to detail the findings of the biological reconnaissance surveys of the proposed Olivehurst Public Utility District (OPUD) South County Infrastructure Project Site in the community of Olivehurst in Yuba County, California. This Biological Technical Report includes a review of pertinent literature, a review of regulatory requirements, results of reconnaissance field surveys, and a preliminary analysis of general impacts of project implementation on biological resources.

Following this introduction, there is a description of the OPUD South County Infrastructure Project (Project), followed by the methodology section, which describes field studies and analytical methods used to assess the project site. The methodology section includes a review of the regulatory requirements; a review of literature concerning special-status species, sensitive habitats, and general biological conditions; and a description of field reconnaissance survey methods. The environmental setting describes abiotic and biotic conditions at the project site including climate, soils, typical habitats and associated plant and wildlife species, and special-status species reported in or near the project area. The final section details the anticipated impacts of project implementation along with suggested general mitigation measures to reduce project impacts to less than significant levels.

2.0 PROJECT DESCRIPTION

OPUD provides urban water and wastewater services within and adjacent to the community of Olivehurst in an unincorporated area of Yuba County (Figure 1). OPUD is proposing to expand its water and sewer systems to accommodate planned urban development within the recently annexed South Yuba County Service Area. The proposed Project is intended to provide water and sewer conveyance system improvements, including improvements to assist in the mitigation of sanitary sewer overflows (SSO) within the existing service area of historic Olivehurst, upgrades to the existing wastewater treatment plant, and construction of a water plant as part of a five component Project identified as the South County Infrastructure Project. Following are the five components of the proposed Project:

- Wastewater Pipeline SSO Reduction Measures
- Wastewater Treatment Plant Upgrades
- Wastewater Pipelines in the South County Service Area
- Water Plant and Distribution Pipelines
- Wheatland Wastewater Pipeline Connector

2.1 WASTEWATER PIPELINE SSO REDUCTION MEASURES (COMPONENT 1)

All facilities associated with wastewater Pipeline SSO Reduction Measures are located within the existing urbanized community of Olivehurst. Pipelines associated with Component 1 would be constructed within paved travel lanes of existing roadways. Two new pump stations would be constructed (PS-1 and PS-26) and an existing pump station (PS-2) would be fitted with upgraded equipment.

The identified collection system improvements are intended to reduce the hydraulic grade line in the Old Olivehurst sewage collection system, thereby reducing the possibility of overflows during peak rainfall events. SSO components to be constructed with implementation of the proposed project include:

- Increase the capacity of Pump Station 1 (PS-1), decommission and remove the existing pump station and replace with a new pump station at the same general location
- Construct a new 16-inch diameter force main from the new PS-1 to 14th Avenue
- Re-equip the existing PS-2 and revise the downstream piping from PS-2 so that flow will be diverted to a new PS-26 at McGowan Parkway and Mary Avenue.
- Replace the existing 8-inch force main in poor condition with a 12-inch force main on McGowan Parkway from PS-2 to PS-26.
- Abandon the existing 8-inch force main within McGowan Parkway from PS-26 to Donald Drive.
- Construct a new PS-26, sized to divert sewage from the existing 8-inch diameter gravity collector sewer in McGowan Parkway into the project pipeline.

2.2 WASTEWATER TREATMENT PLANT UPGRADES (COMPONENT 2)

Improvements and modifications to OPUD's wastewater treatment plant would take place within the existing plant site located at the westerly terminus of Mary Avenue. OPUD is implementing modifications to their wastewater collection system to provide SSO relief and accept wastewater from the City of Wheatland. An increase in Average Dry Weather Flows (ADWF) capacity would not be provided as part of the South County Infrastructure Project, because the WWTP has sufficient ADWF capacity to handle near term flow increases. However, peak wet weather flows (PWWF) are expected to increase as a result of SSO mitigation described above.

The improvements are required to increase the PWWF capacity of the WWTP, and to upgrade and replace existing equipment. The SSO mitigation improvements will result in up to 3.0 mgd of additional PWWF being conveyed to the WWTP during periods of significant rainfall. Increasing the amount of wastewater that the collection system can convey to the WWTP will result in lower hydraulic grade lines in the collection system, thereby resulting in fewer SSO events. WWTP improvements consist of the addition of new equipment, modification and upgrades to existing equipment, and the addition of a concrete lined Emergency Storage Basin at the south end of the plant site to act as an equalization basin that will store increased flows that occur during significant storms. A dewatering pump station will also be added in this area to allow for sending stored secondary effluent back to plant headworks. All of the proposed improvements would be within the developed and disturbed footprint of the existing WWTP.

2.3 WASTEWATER PIPELINES IN THE SOUTH COUNTY SERVICE AREA (COMPONENT 3) AND WHEATLAND WASTEWATER PIPELINE CONNECTOR (COMPONENT 5)

Facilities to be constructed within Components 3 and 5 are located primarily in an undeveloped area south of the existing community of Olivehurst. Pipelines would be constructed primarily within the paved travel lanes of existing roadways. These components consist of sewer pipelines, pump stations, and lift stations required to provide a backbone wastewater collection and transmission system to serve future demands for the South County Services Area consistent with the Yuba County General Plan and to convey City of Wheatland wastewater to the Olivehurst WWTP.

Wastewater system improvements include force mains and gravity sewer pipelines ranging in size from 8 to 30 inches in diameter. The size of the sewer conveyance system is based on the demands from the service area and the City of Wheatland. Some private facilities (e.g., Pacific Gas and Electric [PG&E] yard, Hard Rock Fire Mountain Casino, and Toyota Amphitheatre) are currently served by an on-site wastewater disposal system or another WWTP. Plans for connecting these proposed facilities to the OPUD's sewer collection system are assumed for sizing, but they may not connect until a later date. The estimated wastewater ADWF for the South County Service Area at buildout and City of Wheatland contributions is 5.0 mgd. This amount includes 1.5 mgd ADWF for the City of Wheatland.

Pipelines associated with Components 1, 3, and 5 are summarized in Table 1.

Table 1. Wastewater Pipeline Summary

Type	Size Range (inches)	Overall Length (feet)	Overall Length (miles)	Number of Pump Stations	Number of Lift Stations	Number of Crossings	
						Roadway	*Waterway*
Force Main	6 - 30	44,440	8.4	5	n/a	3	5
Sanitary Sewer	8 - 24	23,130	4.4	n/a	3	2	5
Total Length of Wastewater Pipelines	n/a	65,570	12.8	n/a	n/a	n/a	n/a

Source: Jacobs/MHM/Planning Partners 2023.

The vertical alignment of trench installed pipelines within roadways would maintain a minimum of 48 inches from the top of pipe to the pavement surface. Trench depths would range from 60 inches to 22 feet. All pipeline alignments would provide for a one-foot separation from the pipe edge to any existing utility being crossed while maintaining the minimum cover. Any existing utilities would be surveyed and potholed by the design engineer/team to determine the proposed vertical alignment and crossing method. At culvert crossing locations where trench installed pipeline is proposed within the paved roadway or shoulder, the pipeline will be installed under shallow culverts within the trench in the paved roadway without disturbance to the culvert or the waterway it conveys. For large waterway crossings, trenchless methods are proposed.

2.3.1 Pipeline Crossings

Trenchless installations at roadway and waterway crossings would be achieved using attachment to an existing bridge where possible, such as the wastewater crossing on McGowan Parkway Bridge across SR 70. Horizontal directional drill (HDD) or pipe ramming/auger bore trenchless installation methods are proposed where bridge attachment is not feasible. Table 2 outlines the trenchless stream and roadway pipeline crossing methodology proposed for wastewater pipeline crossings in Component 3 and water pipeline crossings in Component 4. Following is a brief summary of the trenchless pipeline installations and existing site conditions at the crossing locations:

<u>McGowan Parkway at SR 70 Crossing (Sewer Force Main)</u>

At this location the pipeline will be installed under SR 70 using HDD techniques. The HDD entry location, exit location and HDD workspace, including the pipe string location occur entirely within paved roadway of McGowan Parkway and an adjacent parking lot within an urban developed area (Figure 2D)

<u>Olive Avenue to Rancho Road at SR 65 Crossing (Sewer Force Main)</u>

At this location the pipeline will be installed under SR 65 using HDD techniques. The HDD entry location is located in upland annual grasslands adjacent to Olive Avenue. The HDD exit location is on the paved roadway and unpaved shoulder of Rancho Road. The pipe string staging area extends from a paved cul-de-sac into an undeveloped disturbed area between a residence and the railroad track with seasonally wet depressions (Figure 2E).

Rancho Road at Reeds Creek Crossing (Sewer Force Main and Water Main)

At this location the wastewater and water pipelines will be installed under Reeds Creek using HDD techniques. The HDD entry locations on both sides of Rancho Road are within an unpaved roadside area with roadside ditches and depressions that are seasonally inundated northwest of the Reeds Creek crossing. The HDD exit locations and pipe string staging areas on both sides of Rancho Road are within upland annual grasslands southeast of the Reeds Creek crossing (Figure 2F).

Rancho Road at Hutchinson Creek Crossing (Sewer Force Main and Water Main)

At this location the wastewater and water pipelines will be installed under Hutchinson Creek using HDD techniques. The HDD Entry locations on both sides of Rancho Road are within upland annual grassland areas with some tree cover. The HDD exit location and pipe string laydown area on the southwest side of Rancho Road is within upland annual grassland with Eucalyptus (*Eucalyptus globulus*) tree cover. The HDD exit location and pipe string laydown area northeast of Rancho Road is primarily within upland annual grasslands. There is a roadside ditch at this location, but it does not support seasonal inundation or wetland vegetation (Figure 2G).

Rosser Road to Shimer Road at SR 65 Crossing (Sewer Force Main)

At this location the wastewater pipeline will be installed under SR 65 using HDD techniques. The HDD entry location is within an unpaved area adjacent to Rosser Road and the HDD workspace is located in cattle grazed pastureland. Portions of this pasture northwest of the workspace appear to be wet meadow pastureland; however, the pasture was not surveyed due to access constraints. The HDD exit location and pipe string staging area are within a paved roadway (Shimer Road) (Figure 2H).

Rancho Road at Kimball Creek Crossing (Sewer Force Mains and Water Main)

At this location the wastewater and water pipelines will be installed under Kimball Creek using HDD techniques. The HDD entry locations on both sides of Rancho Road are within an unpaved roadside area with roadside ditches and depressions that are seasonally inundated northwest of the Kimball Creek crossing. The HDD exit location on the northeast side of Rancho Road is within an unpaved roadside area that is upland annual grassland. The pipe string staging area is primarily within upland annuals grassland with an adjacent seasonally wet depression. The HDD exit location and pipe string laydown area on southwest side of Rancho Road is within an upland annual grassland area and the road shoulder (Figure 2J).

Rancho Road at Virginia Road Crossing (Sewer Force Mains and Water Main)

At this location the wastewater and water pipelines will be installed under Virginia Creek using pipe ramming/auger bore techniques. The bore launch shafts and receiving shafts are within the paved roadway and unpaved shoulder for both trenchless crossings at this location. There are wet depressions within roadside ditches that are seasonally inundated on both sides of Rancho Road at this location (Figure 2L).

40 Mile Road at Kimball Creek Crossing (Sewer Force Main and Water Main)

At this location the pipelines will be installed under Kimball Creek using pipe ramming/auger bore techniques. The bore launch shafts and receiving shafts are within the paved roadway and unpaved shoulder for both trenchless crossings at this location (Figure 2O).

Table 2. Trenchless Crossing Details

Crossing Name	Utility	Crossing Type	Surface Length: Linear Feet	Bore Length: Feet	Entry Location	Entry Work Area	Exit Location	Exit Work Area	Pipe String Area

2.3.2 Pump Stations and Lift Stations

Most of the pump stations and lift stations are located in upland annual grasslands or disturbed and developed areas. Following is a brief summary of the pump station and lift station locations and details regarding the construction of pump stations and lift stations associated with the proposed wastewater pipeline are outlined in Table 3.

Pump station 1 and pump station 26 are both within vacant lots within urban areas. These areas support upland annual grasslands or ruderal (weedy) vegetation. Pump station 21 and lift station 24 are in upland annual grasslands adjacent to the paved roadway. Pump station 25 is located within a dirt parking lot and staging area east of 40 Mile Road. The pipeline connection to Pump station 25 may cross a roadside channel or ditch with wetland vegetation. Pump station 22 is within upland annual grassland adjacent to Rancho Road; however, this pump station is immediately adjacent to Kimball Creek and associated wetlands. Lift station 23 is partially within a rice field along Rancho Road and will remove a small portion of the field used for rice cultivation. The footprint of lift station 23 also extends into a wet depression within a roadside ditch that is seasonally inundated between Rancho Road and the rice field.

Table 3. Pump Station and Lift Station Details

Note: *– Potential improvements limited to existing disturbed area

2.4 WATER PLANT AND DISTRIBUTION LINES (COMPONENT 4)

Facilities to be constructed within Component 4 include a new water well and water plant east of Forty Mile Road. This component consists of a production well and water plant to meet a portion of the demand for treated water for municipal and industrial needs and fire protection, and a backbone distribution system to meet future treated water demands for the South County Services Area consistent with the Yuba County General Plan.

Water Plant

As proposed, the water plant (WP) would be constructed on a 0.95-acre site located east of Forty Mile Road and north of the newly constructed Hard Rock Casino. The WP would consist of a new water well (OPUD Well #35), well pump, reservoir, booster station, and chorine feed system. As planned, the new well would provide 1,500 gallons per minute (gpm), although ultimate production could approach 3,000 gpm depending upon the type and timing of future development within the WP service area. A new welded steel reservoir would be constructed with an approximate capacity of 1,017,000 gallons. The tank dimensions would be 76-foot diameter by 32-foot shell height. The tank color is planned to be equivalent to Engard's "Desert Sand" or Glidden's "Pelt" subject to final approval by the District. The booster station is designed to pump out of the reservoir and maintain a desired pressure of 65 pounds per square inch (psi) with a pressure range of between 60 and 70 psi in the water system. A chlorine feed system would inject chlorine to be used for disinfection as part of the WP's treatment process. A backup generator supplied by an on-site propane tank would be provided to power the WP if necessary. Water provided by the WP and transmitted to the regional grid in Forty Mile Road would be provided by a 24-inch pipeline from the WP to a proposed pipeline to be constructed along the southbound travel lane of Forty Mile Road.

Water needs during construction would be provided by a temporary above ground pipeline from an existing agricultural well south of the Hard Rock Casino which would be removed upon completion of construction.

Water Distribution Pipelines

This subcomponent consists of treated water pipelines required to provide a backbone water distribution system to serve future demands for the South County Services Area consistent with the Yuba County General Plan. Water system improvements include water pipelines ranging in size from 16 to 24 inches in diameter.

The size of the water distribution system is based on the projected demands from future urban uses within the South Yuba County Service area. Additionally, the water distribution system would connect with the existing OPUD water system serving the community of Olivehurst. Pipelines associated with Component 4 are summarized in Table 4.

Table 4. Treated Water Pipeline Summary

Type	Size Range (inches)	Overall Length (feet)	Overall Length (miles)	Crossings	
				Roadway	Waterway
Water Main	16 – 24	36,939	7.0	2	5

Source: Jacobs/MHM/Planning Partners 2023.

The vertical alignment of trench installed pipelines within roadways would maintain a minimum of 48 inches from the top of pipe to the pavement surface. Trench depths would range from 60 inches to 12 feet. All pipeline alignments would provide for a one-foot separation from the pipe edge to any existing utility being crossed while maintaining the minimum cover. Any existing utilities would be surveyed and potholed by the design engineer/team to determine the proposed vertical alignment and crossing method.

Trenchless installations at roadway and waterway crossings would be achieved using attachment to an existing bridge where possible, such as the water line crossing on the McGowan Parkway Bridge over SR 65. Horizontal directional drill (HDD) or pipe ramming/auger bore trenchless installation methods are proposed where bridge attachment is not feasible. Table 2 above outlines the trenchless stream and roadway pipeline crossing methodology proposed for wastewater pipeline crossings in Component 3 and water pipeline crossings in Component 4.

3.0 METHODOLOGY

3.1 LITERATURE REVIEW

Padre biologists reviewed available project information, county soil survey maps, topographic maps, and other environmental documents. The California Natural Diversity Database (CNDDB) was queried for records of special-status species reported within the Olivehurst and Wheatland, California quadrangles and the surrounding seven quadrangles (California Department of Fish and Wildlife [CDFW], 2022). A list of federally listed Threatened and Endangered species was obtained from the U.S. Fish and Wildlife Service (USFWS) (USFWS, 2022a). An unofficial species list was obtained from the National Marine Fisheries Service (NMFS) for the two quadrangles that the project occurs within (NMFS, 2022). The federal species lists and CNDDB query results are included in Appendix A and Appendix B. Special-status taxa that are known to exist or have the potential to exist on the project site were also identified through a review of relevant literature (California Native Plant Society [CNPS], 2022; Zeiner et al., 1988; 1990a, b). A query of the National Wetland Inventory (NWI) was reviewed for information regarding mapped waters and wetlands in the project area (USFWS, 2022b).

3.2 FIELD RECONNAISSANCE SURVEYS

Reconnaissance level field surveys were conducted by Padre biologists between February 15-17, 2022 to assess the biological resources and to determine the likelihood of occurrence for special-status species or sensitive and regulated habitats on the project site. Follow-up surveys were conducted in June 2022 for the purposes of detecting elderberry shrubs during the blooming season, and follow-up surveys were conducted of various aspects of the project in August and December 2022 and January 2023 to resurvey areas for changes to the project design and to review the depressional features along Rancho Road during the wet season to confirm areas of inundation.

Detection methods included direct observation with binoculars; examination and identification of tracks, scats, burrows/diggings, and carcasses/skeletal remains; and identification of vocalizations (calls and songs). No trapping or netting was performed during surveys. Plants not identified in the field were collected and returned to the lab for identification using standard taxonomic references (Baldwin, 2012). Prior to the field surveys, the CNDDB query was reviewed to identify occurrences of special-status plant and animal species in the project vicinity. During the field surveys, vegetative cover types and significant habitat features, such as wetlands, potential nest trees, and potential dens or burrow clusters, were noted and mapped for avoidance to the extent feasible during Project design and planning. Lists of plants and wildlife observed during surveys were compiled and are included in Appendix C and Appendix D.

It should be noted that some portions of the study area were on private property that was inaccessible during the field surveys, including the HDD workspace adjacent to Rosser Road. Reconnaissance surveys for this location were conducted using binoculars from the fence line and aerial imagery. Aquatic resource features were generally mapped based on surface indicators; an aquatic resource delineation was not performed.

4.0 ENVIRONMENTAL SETTING

4.1 LOCATION

The Project study area is located within the community of Olivehurst and unincorporated area of southern Yuba County approximately 40 miles north of Sacramento and four miles south of Marysville (Olivehurst and Wheatland, California 7.5-minute USGS quadrangle) (USGS, 1947; USGS, 1952) (Figure 1). The study area within the existing urbanized community of Olivehurst is surrounded by residential and commercial properties. The study area within the south County area is primarily surrounded by agricultural and rural residential land along with areas supporting industrial uses and sports and entertainment uses (Hard Rock Casino). There are several natural drainages that run from northeast to southwest across the study area.

4.2 GEOLOGY/GEOMORPHOLOGY

The project is situated in the Butte Sink-Sutter Basin subsection of the Great Valley Ecological Region of California (Miles and Goudey, 1997).

The Butte Sink-Sutter Basin subsection is on the alluvial plain between the Feather and Sacramento Rivers. Elevations in the subsection range from approximately 30 to 150 feet. Fluvial erosion and deposition are the main geomorphic processes (Miles and Goudey, 1997).

4.3 CLIMATE

The project site is situated in Climate Zone 8, which includes California's cold air basins of the Central Valley. This zone has hot summers and mild winters and is outside of the influence of the Pacific Ocean (Clark, 1985).

The nearest meteorological station (045385) is located in Marysville, just to the north of the project site. Based on the 110-year period of record (1897 through 2007) at the station, the average maximum monthly temperature ranges from 54.1°F in January to 96.3°F in July (Western Regional Climate Center, 2022). The average minimum monthly temperature ranges from 37.7°F in January to 61.3°F in July. The average annual temperature ranges from 49.0°F to 75.3°F. The average monthly precipitation ranges from 0.03 inches in July to 4.01 inches in January. The total average annual precipitation is 20.96 inches (Western Regional Climate Center, 2022).

4.4 SOILS

A review of the U.S. Department of Agriculture's Web Soil Survey for Yuba County (Natural Resource Conservation Service [NRCS], 2022) identified nine soil mapping units within the study area (Appendix E). These include Hollenbeck silty clay loam, 0 to 1 percent slopes (131); Hollenbeck-Urban land complex, 0-1 percent slopes (134); Conejo loam, 0 to 1 percent slopes, MLRA 17 (141); Conejo loam, 0 to 2 percent slopes, occasionally flooded, MLRA 17 (142); Conejo-Urban land complex, 0 percent slopes, MLRA 17 (143); Oakdale sandy loam, 0 to 5 percent slopes (197); Oakdale-Urban land complex, 0 to 1 percent slopes (198); San Joaquin loam, 0 to 1 percent slopes (214); Urban land-San Joaquin complex, 0 to 1 percent slopes (217). None of these soil mapping units are hydric, though five of them (131,134,143, 214, and 217) include minor components that are considered hydric.

4.5 HABITAT DESCRIPTIONS AND VEGETATION

The majority of the study area consists of lands within developed urban areas, disturbed habitat along roadway shoulders or in vacant lots, and land within or adjacent to agricultural fields. Wetlands and riparian cover types occur along the waterways at the trenchless crossing locations. The agricultural fields in the area are primarily used to produce rice and other grain crops. Disturbed areas and road shoulders that had vegetation present support annual grassland and ruderal cover types. Proposed pipeline alignments are limited to developed lands within the paved roadway and disturbed shoulder with minimal vegetation present. Workspace associated with HDD crossings are within natural and undeveloped lands or agricultural lands. Pump stations and lift stations are within developed and disturbed lands, vacant lots, natural and undeveloped lands, or agricultural lands.

Dominant species observed in annual grasslands and ruderal habitat include ripgut grass (*Bromus diandrus*), rye grass (*Festuca perennis*), soft chess (*Bromus hordeaceous*), wild oat (*Avena fatua*), Medusa head (*Elymus caput-medusae*), redstem filaree (*Erodium cicutarium*), yellow star thistle (*Centauria solstitialis*), black mustard (*Brassica nigra*), Dove's-foot geranium (*Geranium molle*), and California burclover (*Medicago polymorpha*).

There are several natural drainage crossings throughout the pipeline alignments. These include crossings of Hutchinson Creek, Reeds Creek, Kimball Creek, and Virginia Creek. At these crossings, the vegetation communities observed were a mix of natural riparian communities, emergent wetland vegetation, and annual grassland cover types. Dominant species observed at these drainage crossings varied from crossing to crossing. Kimball Creek supported predominantly emergent wetland vegetation with little or no riparian corridor. Hutchinson Creek and Reeds Creek supported a riparian corridor. Virginia Creek is a channelized canal that supports little to no vegetation (See Section 4.5.1 below for more detail regarding the drainage crossings). The dominant species observed at the drainage crossings that had emergent vegetation include dense stand of broad-leaved cattail (*Typha latifolia*) and tule (*Schoenoplectus acutus* var. *occidentalis*). Drainage crossings with a riparian canopy often included Valley oak (*Quercus lobata*), Oregon ash (*Fraxinus latifolia*), Fremont cottonwood (*Populus fremontii*), Eucalyptus (*Eucalyptus* sp.), willow (*Salix* sp.) and Himalayan blackberry (*Rubus armeniacus*) growing along the banks. Annual grasslands around these crossings had a cover of herbaceous species similar to the grasslands described above.

At multiple locations along the pipeline alignment, roadside ditches and depressions are present that support a range of hydrologic characteristics which affect the types of vegetation that grow. Ditches with prolonged or perennial inundation supported wetland species like broad-leaved cattail, iris-leaved rush (*Juncus xiphoides*), tall cyperus (*Cyperus eragrostis*), and creeping spikerush (*Eleocharis macrostachya*). The roadside ditches with a shorter hydroperiod supported more facultative wetland species like curly dock (*Rumex crispus*) and rye grass or were barren of vegetation. Many of these ditches supported algal matting or biotic crust on the ground's surface, an indicator of hydrology and inundation during the wet season.

See Figure 4 for site photos of locations described above, including photos of each of the drainage crossing locations. A complete list of plant species observed during the field survey is compiled in Appendix C.

4.5.1 Waters and Wetlands

The site was examined for evidence of regulated habitats, such as waters and wetlands, under regulatory authority of the U.S. Army Corps of Engineers (Corps) under Section 404 of the Clean Water Act. The National Wetland Inventory (NWI) map of the study area was reviewed to assist in the identification of waters and wetlands on the Site (USFWS, 2022b).

There are several riverine features identified on the NWI map within the project area. These include Hutchinson Creek, Reeds Creek, Kimball Creek, and Virginia Creek. In addition to the natural riparian crossings, NWI identifies several man-made features including stock ponds, irrigation canals, and the artificially flooded portions of the Olivehurst Public Utility District Wastewater Treatment Plant. In addition to the features mapped on NWI, there were many roadside ditches and depressions that had evidence of wetland vegetation and hydrology. The potential wetland areas were defined by the presence of hydrophytic vegetation and supported a combination of facultative (FAC), facultative-wetland (FACW), and obligate wetland (OBL) plant species. In addition, evidence of hydrology was commonly noted as in the form of algal matting and saturated soil.

The northernmost trenchless creek crossing is Reeds Creek on Rancho Road. Reeds Creek at the Rancho Road crossing has a mix of emergent wetland vegetation and shrubby riparian cover. Growing from the bed of the channel were dense stands of emergent wetland plants like tule and overhanging the banks were thick patches of Himalayan blackberry. In addition to the blackberry, willow trees and shrubs grew along the banks in varying densities. Reeds Creek is mapped as an intermittent waterway (USGS, 1952).

The next major riparian crossing along Rancho Road is Hutchison Creek. Hutchison Creek at this location supported a tall riparian canopy composed primarily of eucalyptus trees with some Valley oaks. Similar to Reed's Creek, dense blackberry briar patches cover much of Hutchison Creek's banks. There was very little emergent wetland vegetation growing from the channel. Hutchinson Creek is mapped as an intermittent waterway (USGS, 1952).

The next riparian crossing along Rancho Road is Kimball Creek. The Kimball Creek crossing can be characterized by two elements that make it distinct from the other creek crossings. On both the north and south sides of Rancho Road, the creek forms a wide sprawling wetland rather than a narrow and defined channel. Additionally, Kimball Creek can be characterized by an almost complete cover of dense cattail growing from the creek's bed. There was little to no riparian cover at this location with several scattered willows growing from the wetland area but not forming a canopy. As Kimball Creek flows to the southwest, it meets Forty Mile Road and the pipeline alignment crosses at that location as well. At the Forty Mile Road crossing of Kimball Creek, there was a thick dominant cover of cattail; however, the channel was narrower and water could be seen through the cattails. Kimball Creek is mapped as an intermittent waterway (USGS, 1952); however, based on a review of historic aerial imagery Kimball Creek appears to support summer water in the low flow channel as evidenced by imagery from August of 2016 and September of 2018 (GoogleEarth Pro, 2023).

The southernmost creek crossing on Rancho Road is Virginia Creek. Virginia Creek is a highly altered waterway that has been channelized to flow around the perimeter of agricultural farmland within the study area. There was no emergent wetland vegetation growing from Virginia Creek and the banks of the channel were barren. The top of bank supports weedy grassland

species like black mustard and no riparian canopy was present. Virginia Creek is not mapped on the USGS Wheatland, CA 7.5-minute quadrangle map (USGS, 1947) and based on historic aerial imagery appears to have been constructed sometime between 1988 and 1993 (GoogleEarth Pro, 2023).

The pipeline alignment crosses another significant waterway and wetland feature in the southern portion of the alignment along Forty Mile Road consisting of a channelized canal that's connected to the Virginia Creek canal and appears to have been constructed around the same time. This waterway is characterized by a wide sprawling wetland dominated by emergent wetland vegetation with no riparian corridor. The dominant species in the wetland was tule, although cattail was dominant in some areas. A channelized canal was approximately 15 feet wide, conveys water to the west through three large culverts under Forty Mile Road.

The Project is designed to avoid impacts to drainage crossings by using trenchless methods at all major waterway crossings. Trenchless methods include HDD crossings at some locations and pipe ramming or auger boring methods in the roadway at other locations. At these trenchless crossing locations, temporary impact footprints will be sited outside of the riparian community and/or adjacent wetlands. In several cases, culverted crossings may be trench installed within the paved roadway and beneath the existing shallow culverts without disturbance to the culverts or the waterway.

In addition to the waterway crossings, there are multiple roadside ditches and depressions that support a range of hydrologic characteristics. Roadside ditches that have been constructed for drainage were prevalent along much of the pipeline alignments in roadways. These features range from unvegetated roadside ditches or dry roadside ditches supporting a mix of upland or facultative wetland grasses to wet roadside ditches supporting emergent wetland vegetation. In addition, roadside depressions occur, primarily along Rancho Road and often in the low lying area between the roadway and the adjacent railroad tracks. Many of these depressions had indicators of hydrology and inundation during the wet season including algal mat or biotic crust formation. Some of these depressions support wetland plant species like creeping spikerush and California loostrife (*Lythrum hyssopifolia*). Because of their proximity to the road, these areas often had deep tire ruts from vehicular use during the wet season and are highly disturbed wet depressions.

4.6 WILDLIFE

Wildlife observed at the project site were characteristic of the region and the time of year that surveys were conducted. Species observed during the survey are listed in Appendix D. Special-status wildlife species occurring, or potentially occurring, within the study area are discussed in Section 4.7 below.

The vegetation communities within and surrounding the study area provide habitat for resident and migratory wildlife species. The composition, density, distribution, and physical characteristics of vegetative communities determine the diversity and abundance of wildlife species residing in the project area. Wildlife species observed and expected within the vegetative cover types present on the site are discussed below.

A large portion of the study area is in active agricultural production or is surrounded by urban development that limits use by wildlife. However, the waterways, riparian corridors and wetlands provide forage and cover for a variety of resident and migratory wildlife species. In

addition, certain types of agricultural fields, such as rice, can provide wildlife habitat. Surveys were conducted during the non-nesting season; therefore, many species observed are non-resident migratory species that would not be present in the project area during the spring and summer breeding season.

Some of the species observed include house finch (*Haemorhous mexicanus*), northern mockingbird (*Mimus polyglottos*), brewer's blackbird (*Euphagus cyanocephalus*), turkey vulture (*Cathartes aura*), and black phoebe (*Sayornis nigricans*). At the waterway crossings and in riparian habitat, some of the bird species observed included red-winged blackbird (*Agelaius phoeniceus*), marsh wren (*Cistothorus palustris*), American goldfinch (*Spinus tristis*), Nuttall's woodpecker (*Picoides nuttallii*), and ruby-crowned kinglet (*Regulus calendula*). Signs of mammals moving through the riparian corridors were observed for several species including raccoon (*Procyon lotor*), coyote (*Canis latrans*), and mink (*Mustela vison*).

Species observed in ponded agricultural fields included killdeer (*Charadrius vociferus*), greater yellowlegs (*Tringa melanoleuca*), great egret (*Ardea alba*). Long-range migratory birds including snow goose (*Chen caerulescens*), greater white-fronted goose (*Anser albifrons*), and Canada goose (*Branta canadensis*) were also observed in these ponded areas. Raptors observed soaring above the project site included red-tailed hawk (Buteo jamaicensis), northern harrier (Circus hudsonius), white-tailed kite (*Elanus leucurus*), red-shouldered hawk (*Buteo lineatus*), and American kestrel (*Falco sparverius*).

4.7 SPECIAL-STATUS SPECIES

Based on the literature review and species list from USFWS (Project Code: 2022-0002318) and NMFS, a list of special-status species that have been reported in the vicinity of the project site (Olivehurst quadrangle and surrounding eight quadrangles), or within Yuba County, has been compiled. Special-status species that have the potential to occur in the vicinity of the project site are listed in Table 5.

An analysis of the likelihood of occurrence for each species was conducted on the basis of species ranges, previous observations, contemporary sightings, and presence of suitable habitat elements within the study area. The Project site may be located outside of the known range of some species, or it may be within the geographic range for a certain species, but suitable habitat, such as chenopod scrub, chaparral, or cismontane woodland is absent within the study area. For the purpose of this analysis, potential special-status species that occur in the general area of the project and for which the project may provide habitat are discussed in greater detail in Sections 4.7.1 and 4.7.2 below.

Table 5. Special-Status Species Potentially Occurring in the Vicinity of the South County Infrastructure Project

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
PLANTS				
Astragalus tener var. *ferrisiae* Ferris' milk-vetch	CRPR 1B.1	Vernally mesic meadows and seeps and subalkaline flats of Valley and foothill grasslands at elevations ranging from 5 to approximately 245 feet. Blooms from April to May.	Low	Habitat along the pipeline alignment is poor quality and alkaline soils not present. Nearest occurrence (Occ. #16) is from 1891 and is approximately 3.9 miles north of the northernmost extent of the project.
Delphinium recurvatum Recurved larkspur	CRPR 1B.2	Chenopod scrub, valley and foothill grassland, cismontane woodland. On alkaline soils; often in valley saltbush or valley chenopod scrub. Found regionally in slightly alkaline beds of vernal pools. Occurs at elevations ranging from 10 to approximately 2,250 feet. Blooms from March to June.	None	No suitable habitat present. Nearest occurrence (Occ. #104) is from 1900 and is approximately 3.9 miles north of the northernmost extent of the project. This occurrence is considered extirpated and there are no recent occurrences near the project site.
Downingia pusilla Dwarf downingia	CRPR 2B.2	Valley and foothill grasslands and vernal pools at elevations ranging from 1 to 1,460 feet. Blooms from March to May.	Low	Potentially suitable habitat occurs in seasonally inundated depressions and ditches. Due to proximity to roads, habitat is highly disturbed by offroad vehicle use. The nearest occurrence (Occ. #95) from 1999 is approximately 2.8 miles east of the project site.
Hibiscus lasiocarpos var. *occidentalis* Woolly rose-mallow	CRPR 1B.2	Freshwater marshes and swamps, often on the side of levees at elevations ranging from sea level to approximately 400 feet. Blooms from June to September.	Low	Potentially suitable habitat occurs along waterways. Project activities will avoid waterways through trenchless installation methods. Nearest occurrence (Occ. #69) from 2009 is approximately 9.4 miles west of the project site in levees along the Sutter Bypass.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Legenere limosa Legenere	CRPR 1B.1	Vernal pools at elevations ranging from sea level to approximately 2,900 feet. Blooms from April to June.	Low	Potentially suitable habitat occurs in seasonally inundated depressions and ditches. Due to proximity to road habitat is highly disturbed by offroad vehicle use. The nearest occurrence (Occ. #52) from 1999 is approximately 4.7 miles northeast of the project site.
Monardella venosa Veiny monardella	CRPR 1B.1	Cismontane woodlands and Valley and foothill grasslands, usually in clayey soil, at elevations ranging from 195 to approximately 1,345 feet. Blooms from May to July.	None	No suitable habitat is present at the project site. One historic occurrence in the area is considered extirpated.
Navarretia leucocephala ssp. *Bakeri* Baker's navarretia	CRPR 1B.1	Mesic cismontane woodlands, lower montane coniferous forests, meadows and seeps, valley and foothill grasslands, and vernal pools. Typically occurs at elevations ranging from 15 to approximately 5,700 feet. Blooms from April to July.	Low	Potentially suitable habitat occurs at in seasonally inundated depressions and ditches. Due to proximity to road habitat is highly disturbed by offroad vehicle use. Nearest occurrence (Occ. #56) from 1999 is approximately 11.7 miles northwest of the project site.
Pseudobahia bahiifolia Hartweg's golden sunburst	FE, SE, CRPR 1B.1	Cismontane woodlands and Valley and foothill grasslands, often in acidic clayey soil, at elevations ranging from 50 to approximately 490 feet. Blooms from March to April.	None	No suitable habitat is present at the project site. One historic occurrence in the area is considered extirpated.
Sagittaria sanfordii Sanford's arrowhead	CRPR 1B.2	Assorted freshwater habitats including swamps and marshes at elevations ranging from 0 to 2130 feet. Blooms from May to October, sometimes into November.	Moderate	Potentially suitable habitat present at the waterway crossings along the pipeline alignment or in roadside ditches that have a long period of inundation. Project activities will avoid waterways through trenchless installation methods at waterway crossings. Nearest occurrence

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
				(Occ. #98) from 1955 is approximately 3.1 miles southwest of the project site.
Wolffia brasiliensis Brazilian watermeal	CRPR 2B.3	Shallow freshwater marshes and swamps at elevations ranging from 65 to approximately 330 feet. Blooms from April to December.	Moderate	Potentially suitable habitat present at drainage crossings along pipeline alignment with shallow ponded water. Project activities will avoid waterways through trenchless installation methods at waterway crossings. Nearest occurrence (Occ. #5) from 2002 is approximately 10.2 miles east of the project site.
INVERTEBRATES				
Branchinecta conservation Conservancy fairy shrimp	FE	Large, cool-water vernal pools with moderately turbid water where pools generally last until June; however, the shrimp are gone long before then.	Low	Wet depression and inundation in roadside ditches within the study area would not remain inundated for the duration of time typical of vernal pools that support this species. Nearest occurrence (Occ. #36) from 2012 is approximately 10.6 miles south of the southernmost extent of the pipeline alignment.
Branchinecta lynchi Vernal pool fairy shrimp	FT	Endemic to the grasslands of the central valley, central coast mountains, and south coast mountains, in astatic rain-filled pools. Regionally inhabits small, clear-water sandstone depression pools and grass swale, earth slump or basalt-flow vernal pools.	High	Potentially suitable habitat occurs in seasonally inundated depressions and ditches. Due to proximity to roads habitat in the study area is highly disturbed by offroad vehicle use; however, other occurrences in region occur in similar habitat. Two occurrences are located less than 0.5 miles from the northern portion of the project site. Occ #708 from 2007 was in an irrigation ditch along Bernice Avenue and occ #709 from 2013 occurs in pools

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
				surrounded by mowed grassland east of Powerline Road in Olivehurst.
Danaus plexippus Monarch butterfly	FC	Monarchs roost in eucalyptus, Monterey cypress, Monterey pine, and other trees in groves along the Pacific coastline of California, arriving starting in late October. Dispersal from these roosts generally begins in mid-February. Milkweed and nectar plant availability throughout the spring, summer and fall is important for monarch migration. In areas of the desert southwest, monarchs use nectar and milkweed plants throughout much of the year.	None	There is no suitable habitat (milkweed) to support this species within the study area. The nearest occurrence is over 60 miles southwest of the site.
Desmocerus californicus dimorphus Valley elderberry longhorn beetle	FT	Occurrences of the VELB are primarily in the vicinity of moist valley oak woodlands associated with riparian corridors in the lower Sacramento River and upper San Joaquin River drainages (U.S. Fish and Wildlife Service, 1984). Blue elderberry plants are obligate hosts for the VELB, providing a source of food and brood wood.	Low (Habitat present)	Surveys during the blooming season identified four elderberry shrubs within 165 feet (VELB encroachment buffer) along Rancho Road; however, these shrubs were east of the railroad and would not be impacted by the Project. A single elderberry shrub occurs on the shoulder of Forty Mile Road and within 20 feet of Project activities (VELB core area), but this shrub was very small and exposed to disturbance due to proximity to road and utility pole. No emergence holes occur and disjunct from riparian or other elderberry shrubs. Nearest occurrence of VELB (Occ. #193) from 1998 is approximately 0.4 miles south of the southernmost extent of the pipeline alignment; however, all elderberry shrubs at this location have been removed and the occurrence is considered extirpated.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
				The nearest recent occurrence (Occ. #190) from 2006 is approximately 3.8 miles west of the project site.
Lepidurus packardi Vernal pool tadpole shrimp	FE	Inhabits vernal pools and swales in the central valley containing clear to highly turbid water. Pools commonly found in grass-bottomed swales of unplowed grasslands. Some pools are mud bottomed and highly turbid.	Moderate	Potentially suitable habitat occurs in seasonally inundated depressions and ditches. Due to proximity to roads habitat in the study area is highly disturbed by offroad vehicle use. There are three occurrences located less than 1 mile from the northern portions of the project stie. Occurrence #380 from 2016 is located approximately 700 feet from the pipeline alignment on Mary Avenue in artificial seasonal wetlands. Occurrence #221 from 2004 is located approximately 0.3 miles from the wastewater treatment plant in a field that has since been developed.
FISHES				
Acipenser medirostris pop. 1 Green sturgeon – Southern DPS	FT	Anadromous fish species found in near shore marine and estuarine environments from Alaska to Baja California, Mexico. Green sturgeon depend on large rivers to spawn, typically in deep pools in large turbulent mainstem rivers. The Sacramento River watershed is the only confirmed present and historical spawning area. Spawning occurs in the Sacramento River and has recently been documented in the Feather River and Yuba River (tributaries to the Sacramento River).	None	No suitable habitat present. Project activities will avoid waterways through trenchless installation methods and will result in no impact to fish. Nearest known occurrences in Feather and Yuba River.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Hypomesus transpacificus Delta smelt	FT, SE	Endemic to the Sacramento/San Joaquin Delta, they occur in the Delta primarily below Isleton on the Sacramento River, below Mossdale on the San Joaquin River, and in Suisun Bay. Delta smelt mainly inhabits the freshwater-saltwater mixing zone of the estuary, except during its spawning season, when it moves into freshwater during the early spring months from March until May.	None	No suitable habitat present. Project activities will avoid waterways through trenchless installation methods and will result in no impact to fish.
Oncorhyncus mykiss irideus pop. 11 Steelhead – Central Valley DPS	FT	Sacramento and San Joaquin Rivers and their tributaries.	Low	Project activities will avoid waterways through trenchless installation methods and will result in no impact to fish.
Oncorhynchus tshawytscha pop. 11 Chinook salmon – Central Valley spring-run ESU	FT, ST	Sacramento and San Joaquin Rivers and their tributaries.	Low	Project activities will avoid waterways through trenchless installation methods and will result in no impact to fish.
Pogonichthys macrolepidotus Sacramento splittail	CSC	Slow moving rivers, lakes, and sloughs in the Sacramento San Joaquin valleys.	Low	Project activities will avoid waterways through trenchless installation methods and will result in no impact to fish.
AMPHIBIANS				
Rana draytonii California red-legged frog	FT, CSC	Marshes, lakes, reservoirs, ponds, slow moving segments of streams, and other usually permanent water in lowlands, foothill woodlands, and grasslands. Requires aquatic habitat with extensive emergent vegetation.	None	The project site is outside of the known range of the species. Nearest occurrence (Occ. #814) from 2005 is approximately 29.9 miles south of the project site.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Spea hammondii Western spadefoot	CSC	Primarily found in grasslands but can be found in other open areas of woodlands, coastal sage scrub, and chaparral. Breeding requires ponded water, often occurring seasonally from rainfall.	Low	Poor quality habitat occurs at in seasonally inundated depressions and ditches. Due to proximity to roads, habitat is highly disturbed by offroad vehicle use. Nearest occurrence (Occ. #1295) from 2016 is approximately 10.4 miles southeast of the project site
REPTILES				
Emys marmorata Western pond turtle	CSC	Ponds, marshes, rivers, streams and irrigation ditches with aquatic vegetation. Needs basking sites and suitable upland habitat (sandy banks, grassy open fields) for egg laying	Moderate	Potentially suitable habitat occurs at several of the drainage crossings along the pipeline alignment. Nearest occurrence (Occ. #334) from 1998 is approximately 2.2 miles south of the project site.
Thamnophis gigas Giant gartersnake	FT, ST	Freshwater marshes and streams with summer water, emergent wetland vegetation and suitable basking habitat. Has adapted to drainage canals and irrigation ditches. Rice fields in the Central Valley are known to support GGS.	Moderate	Suitable habitat within Kimball Creek and rice fields in the area. Rice fields have been shown to be suitable aquatic habitat in the absence of natural aquatic habitat. Nearest contemporary occurrence (Occ. #192) from 2014 is located in a rice field approximately 8.2 miles west of the project site.
BIRDS				
Accipiter cooperii Cooper's hawk	WL	Typical nesting and foraging habitat includes riparian woodland, dense oak woodland, and other woodland near water. Breeding range from Central Valley and Sierra Nevada and Coast ranges.	Moderate	Species could forage or nest within trees in or near the project site. Nesting occurrences of this species are not always reported to CNDDB although it is relatively common in the region of project.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Accipiter striatus Sharp-shinned hawk	WL	Species feeds and nests in oak and pine woodlands and preys mainly on small birds but will also eat small mammals and insects.	Low	Species could forage in the vicinity of the project site, primarily in forested riparian at crossings. Nesting habitat along the pipeline alignment is very limited.
Agelaius tricolor Tricolor blackbird	ST, CSC	Colonial nesting species. Nesting habitat is often found near a source of water and in emergent wetland, grassland, or agricultural cropland.	High	Suitable nesting habitat is present within the study area, primarily at riparian crossings or in nearby wetlands with emergent vegetation. Individuals were observed during field surveys. There are approximately 8 occurrences of tricolor blackbird within 0.5 miles of the pipeline alignment. Notably, occurrence #508 from 2014 is located along the pipeline alignment on Forty Mile Road in blackberry habitat.
Ammodramus savannarum Grasshopper sparrow	CSC	Forages and nests in grasslands, fields, and prairies. Often nests in open fields with tall grasses and forbes and may nest in overgrown pastures and hayfields.	Low	Species is a very rare breeder in the region surrounding the project site. Potentially suitable nesting habitat is present along the pipeline alignment in several locations that support weedy grasslands. Nearest occurrence (Occ. #3) from 1994 is approximately 10.4 miles east of the project site.
Athene cunicularia Burrowing owl	CSC, BCC	Dry, open short grass, treeless plains that are associated with burrowing species. Underground nesting habitat in burrows.	High	Suitable burrowing habitat is present in the berm at the southern end of the wastewater treatment plant. An extensive California ground squirrel colony was observed and several of the burrows showed sign of renovation by burrowing owl. Nearest contemporary occurrence (Occ. #2003) from 2016 is approximately 8.1 miles southeast of the project site.

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Branta hutchinsii leucopareia Cackling (=Aleutian Canada) goose	WL	Breeds in the Aleutian Islands and winters in the Central Valley of California. During the winter, it occurs in agricultural fields and pastures.	High (foraging) / None (nesting)	Overwintering foraging habitat is present in agricultural land surrounding the study area. Nearest occurrence (Occ. #12) from 1997 is located approximately 9.6 miles west of the project site.
Buteo swainsoni Swainson's hawk	ST, BCC	Breeds in stands with few trees in juniper-sage flats, riparian areas and in oak savanna. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	High	Suitable nesting habitat is present in study area within riparian corridors or other areas with large trees like Valley oak and eucalyptus. There are approximately 73 nesting occurrences within 10 miles of the pipeline alignment. Nearest occurrence (Occ. # 1529) from 2003 is less than 400 feet west of the pipeline alignment on Forty Mile Road.
Circus hudsonius Northern harrier	CSC	Forages and nests in freshwater and brackish marshes and their adjacent grasslands.	Present	Species was observed foraging over emergent wetland habitat during surveys. Potentially suitable nesting habitat occurs in grasslands that receive minimal levels of disturbance. Nearest occurrences (Occ #38) include nesting occurrences from 2000 at Beale Air Force Base approximately 4.5 miles east of the site.
Coccyzus americanus occidentalis Western yellow-billed cuckoo	FT, SE, CSC, BCC	During the summer breeding season, it can be rarely found in valley foothill and desert riparian habitats in California. Typically breeds in dense deciduous riparian vegetation.	Low	Potentially suitable habitat present at drainage crossings with riparian cover; however, riparian habitat in the Project area is lacking preferred size and density for nesting. Nearest occurrence (Occ. #91) from 1976 is approximately 2.9 miles northwest of the project site.
Elanus leucurus	FP	Rolling foothills / valley margins with scattered oaks and river bottomlands or	Present	Species was observed foraging near the project site during surveys. Potentially

Scientific Name **Common Name**	**Status[1]**	**Habitat**	**Likelihood of Occurrence**	**Rationale**
White-tailed kite		marshes next to deciduous woodland. Forages over grasslands, marshes, and oak savannas close to isolated, dense-topped trees for nesting and perching.		suitable nesting habitat is located within the study area primarily in riparian corridors with trees.
Laterallus jamaicensis coturniculus California black rail	ST, FP, BCC	Permanent resident of brackish and freshwater marshes with tall, dense, emergent vegetation.	Low	Potentially suitable habitat is present at waterway crossings in the study area with dense emergent vegetation; however, the likelihood of occurrence is low due to a paucity of occurrences in the region. Occurrences of the year-round resident Sierra Nevada populations of California black rail are located approximately 10 miles east of the project site. Occurrence #235 from 2006 is located approximately 8.4 miles west of project site adjacent to a rice field.
Melospiza melodia Song sparrow (“Modesto” population)	CSC	Marsh and riparian scrub; Resident of the north-central portion of the Central Valley. Nests in emergent freshwater marshes, riparian habitat, and vegetated irrigation canals.	High	Suitable habitat is present within the study area particularly at waterway crossings and wetland habitat. Song sparrows were observed during surveys. The nearest contemporary occurrence (Occ. #86) from 2005 is approximately 8.5 miles southwest of the project site.
Riparia riparia Bank swallow	ST	Can be found along rivers and streams along the steep eroded banks where they nest. Can also be found nesting in quarries and road cuts.	None	There is no suitable nesting habitat at any of the waterway crossings along the pipeline alignment. Although the species may pass through or forage in the area, there is no suitable nesting habitat present. Nearest occurrences are located along the Feather River approximately 3 miles west of the project site.

Scientific Name **Common Name**	**Status**[1]	**Habitat**	**Likelihood of Occurrence**	**Rationale**
Vireo bellii pusillus Least Bell's vireo	FE, SE	Typically nests in riparian habitat with dense shrub cover and a structurally diverse canopy.	Low	Potentially suitable nesting habitat present at riparian crossings along the pipeline alignment with dense tree and shrub cover. The species is very rare in the region. Nearest occurrence (Occ. #524) from 1878 is approximately 4 miles northwest of the project site. The nearest contemporary occurrence of this species is approximately 36 miles south of the project site.
MAMMALS				
Antrozous pallidus Pallid bat	CSC	Day roosts is caves and crevices; occasionally roosts in hollow trees and buildings.	Low	Preferred habitat is not present at the project site. Potentially suitable habitat present in snags along riparian crossings. Nearest occurrence (Occ. #425) from 2015 is approximately 9.3 miles south of the project site.
Corynorhinus townsendii Townsend's big-eared bat	CSC	Coniferous forests, deciduous riparian woodlands, and semi-desert and montane shrub lands. Roost in dark places like caves and buildings.	None	No suitable habitat present at the project site.

[1] Status:
FE = Federal Endangered
FT = Federal Threatened
FC = Federal Candidate
SE = California State Endangered
ST = California State Threatened
SCT = California State Candidate Threatened
SCT = California State Candidate Endangered
FP = CDFW Fully Protected
California Rare Plant Rank (CRPR) 1B.1 = Threatened in California and elsewhere, seriously threatened in California
CRPR 1B.2 = Threatened in California and elsewhere, moderately threatened in California
CRPR 2B = Plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3 = Plants about which more information is needed
CRPR 4 = Plants of limited distribution
CSC = California Species of Special Concern
BCC = USFWS Bird of Conservation Concern
WL = CDFW Watchlist

4.7.1 Special-Status Plants

4.7.1.1 Sanford's arrowhead (*Saggitaria sanfordii*)

Sanford's arrowhead is a CRPR 1B.2 species. This species occurs in shallow freshwater wetland habitat. It is a perennial herbaceous species that blooms from May to October. The nearest occurrence (Occ. #98) which is an occurrence from 1955 located approximately 3.1 miles southwest of the project site. There is potentially suitable habitat for this species within creeks and large ditches or depressions supporting prolonged hydroperiod.

4.7.1.2 Brazilian watermeal (*Wolffia brasiliensis*)

Brazilian watermeal is a CRPR 2B.3 species. This species occurs in shallow freshwater marshes with perennial water. It is a perennial herbaceous species that floats above the water and blooms from April to December. The nearest occurrence (Occ. #5) from 2002 is located approximately 10.2 miles east of the project site. There is potentially suitable habitat for this species within the perennially ponded areas in drainage crossings. The proposed Project will avoid impacts to these areas through trenchless installation methods at waterway crossings and perennial ponded habitat.

4.7.2 Special-Status Wildlife

4.7.2.1 Vernal pool fairy shrimp (*Branchinecta lynchi*)

Vernal pool fairy shrimp is a Federally threatened species that occurs through much of the Central Valley and as far south as the Santa Rosa Plateau in Riverside County. This species occurs in two types of vernal pools; pooled water in small depressions of sandstone outcrops surrounded by foothill grasslands, and ponded water in small swales or depression basins with grassy or muddy bottoms in un-plowed grasslands (Eriksen and Belk, 1999). The habitat characteristics typical of the pools that support the vernal pool fairy shrimp include small, cool water pools, low to moderate concentrations of dissolved solids, and short and unpredictable durations. The vernal pool fairy shrimp can also occur in wet depression features with an appropriate hydroperiod.

There are two occurrences located less than 0.5 miles from the northern portion of the project site (CNDDB, 2022) that occur in roadside habitat similar to wet depression habitat observed along Rancho Road. Occurrence 708 is an occurrence within an irrigation ditch on Bernice Avenue recorded in 2007. Occurrence 709 is within pools surrounded by mowed grassland east of Powerline Road in Olivehurst recorded in 2013. Potentially suitable habitat occurs in seasonally inundated ditches and depressions, primarily along Rancho Road (Figures 2A through 2T). Due to proximity to the roadway, habitat in the study area is often highly disturbed by offroad vehicle use, trash dumping, and other urban influences and may be suboptimal for fairy shrimp occurrence; however, given proximity to other occurrences of this species in similar roadside habitat, occurrence cannot be ruled out. The southern portion of the existing WWTP emergency storage basin also supports ponded areas in the wet season; however, because of it's location within the existing WWTP and the routine disturbance of this area associated with WWTP operations, it was not considered suitable habitat.

4.7.2.2 Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*)

Valley elderberry longhorn beetle (VELB) is a federally threatened insect species. It is a moderate-sized, brightly colored, and sexually dichromatic beetle, and was listed as a Threatened species by the USFWS on August 10, 1980. The range of the VELB extends throughout California's Central Valley and associated foothills from about the 2,200-foot elevation contour on the east and the watershed of the Central Valley on the west According to Barr (1991), the evidence of VELB occurrence extends from Shasta County to the north, Kern County to the south, Placer and El Dorado counties to the east, and along the Middle River southwest of Stockton, San Joaquin County to the west.

Occurrences of the VELB are primarily in the vicinity of moist valley oak woodlands associated with riparian corridors in the lower Sacramento River and upper San Joaquin River drainages (U.S. Fish and Wildlife Service, 1984). Blue elderberry (*Sambucus mexicana)* plants are obligate hosts for the VELB, providing a source of food and broodwood. Because of the relatively large size of the VELB (0.5 to 1.0 inch), it is generally restricted to the larger branches and stems of older elderberry plants. Emergence holes are circular-to-slightly oval and usually 0.25 to 0.5-inch in diameter. Emergence holes are generally found on plants with branch and trunk girths with an average diameter of 3.3 inches but can occur in stems one inch or larger. Emergence holes have been found from a few inches above ground up to 10 feet, but over 70 percent are found are below 4 feet (Barr 1991).

The adult VELB lays eggs on the bark of the elderberry stem. The eggs hatch and the larvae bore into and feed upon the pith of the stem. When the larvae are ready to pupate, they bore exit holes in the stem, and then return to complete pupation. Adult beetles emerge from the pupae in late spring and can be found on foliage, flowers, stems, adjacent vegetation, or flying among elderberry plants between late April and early June. The entire life cycle is believed to encompass about two years from egg laying until the adults die (U.S. Fish and Wildlife Service, 1984).

The nearest recent occurrence (Occ. #190) is from 2006 and is approximately 3.8 miles west of the project site (CDFW, 2022). Surveys during the blooming season identified four elderberry shrubs within 165 feet (VELB encroachment buffer) of the project site along Rancho Road; however, these shrubs were east of the railroad and would not be impacted by the Project. A single elderberry shrub occurs on the shoulder of Forty Mile Road and within 20 feet (VELB core area) of proposed trench installed pipeline within the paved roadway. This shrub was very small though several stems were greater than one inch in diameter and is exposed to disturbance within the VELB Core Area due to its location at the edge of pavement on Forty Mile Road. No emergence holes occur on the shrub and this shrub is highly disjunct from riparian habitat and other elderberry shrubs. It is very unlikely this the VELB occurs in the study area, though habitat is present due to the presence of this single shrub.

4.7.2.3 Vernal pool tadpole shrimp (*Lepidurus packardi*)

Vernal pool tadpole shrimp is a Federally Endangered species. Vernal pool tadpole shrimp occurs in vernal pools within the Central Valley and the Sacramento-San Joaquin Delta east of San Francisco Bay (Rogers, 2001). This species inhabits freshwater habitats

containing clear to highly turbid water, with water temperatures ranging from 50 to 84 degrees Fahrenheit and pH ranging from 6.2 to 8.5.

There are three occurrences located less than one mile from the northern portion of the project stie. Occurrence #380 is located approximately 700 feet from the pipeline alignment on Mary Avenue in artificial seasonal wetlands recorded in 2016. Occurrence #221 is a 2004 occurrence located approximately 0.3 miles from the wastewater treatment plant in a field that has since been developed. Potentially suitable habitat occurs in seasonally inundated ditches and depressions. Due to proximity to the roadway, habitat in the study area is often highly disturbed by offroad vehicle use and may be suboptimal for tadpole shrimp occurrence.

4.7.2.4 Western pond turtle (*Emys marmorata*)

Western pond turtle (WPT) is a California species of special concern. The WPT occurs in open water habitats throughout much of California, although at much lower numbers and fewer localities than historical populations, especially in urban areas. WPT prefer slack or slow water habitats with dense stands of submergent or emergent vegetation for food and cover, and with abundant basking habitat. WPT are a semi-aquatic species inhabiting streams, marshes, ponds, and irrigation ditches within woodland, grassland, and open forest communities, but they require upland sites for nesting and over-wintering. Presence of nearby nesting sites and lack of exotic predators are also good habitat components (Bury, 1986).

The nearest occurrence (Occ. #334) is from 1998 and is approximately 2.2 miles south of the project site (CDFW, 2022). The project site has potentially suitable habitat for western pond turtle at several of the drainage crossings in the study area. There was, however, limited basking habitat identified during surveys and no western pond turtles were observed during field surveys.

4.7.2.5 Giant gartersnake (*Thamnophis gigas*)

Giant gartersnake (GGS) is a State and federally listed Threatened species found in emergent marsh habitats associated with waterways during spring and summer and hibernates in adjacent upland habitat during the winter. Due to extensive habitat loss, giant gartersnakes now inhabit remaining wetlands as well as highly modified habitats, such as agricultural areas. Active rice fields and their associated irrigations systems serve as an alternative habitat that is commonly used by giant gartersnake. These fields provide the habitat components typically required by giant gartersnake. Essential components of giant gartersnake habitat include:

- A fresh-water aquatic component with adequate water from early spring through fall to provide foraging habitat and cover;
- Emergent herbaceous wetland vegetation to provide foraging habitat, cover, and basking areas;
- An upland component near the aquatic habitat that can be used for thermoregulation, cover, and retreat; and

- An upland refugia component at higher elevation sites that will serve as winter hibernacula and provide cover and refuge from flood waters (Hansen and Brode, 1980; USFWS, 1997).

The nearest contemporary occurrence (Occ. #192) of GGS is a 2014 occurrence located in a rice field approximately 8.2 miles west of the project site. Potentially suitable habitat occurs within Kimball Creek and active rice fields in the area based on the presence of summer water, emergent wetland vegetation, and surrounding upland habitat. Reeds Creek may also provide potentially suitable habitat for GGS; however, the pipeline will be installed using trenchless techniques under Reeds Creek and all Project activities are setback more than 200 feet from Reeds Creek, and therefore will not impact GGS or its habitat at this location.

Hutchinson Creek has riparian cover and does not provide potential habitat for this species. Virginia Creek does not support emergent wetland vegetation thereby limiting its potential to provide suitable habitat for this species. Some other agricultural ditches or rice fields in the study area may provide suitable aquatic habitat for GGS; however, Project activities will be limited to pipeline installation activities within the paved roadway and will avoid disturbance to suitable aquatic or upland habitat at these locations.

4.7.2.6 Cooper's hawk (*Accipiter cooperii*)

Cooper's hawk is on the CDFW Watch List. These birds breed over much of California in forests, open woods and streamside trees. They utilize additional habitats for hunting, including chaparral and other scrub communities. Cooper's hawks have also become well adapted to heavily treed urban environments where they are commonly observed in public parks and around bird feeders. Nests can be built in a variety of trees, typically at heights ranging from 25 to 50 feet off of the ground. There are no recorded occurrences of this species near the project site and it was not observed during reconnaissance surveys (CDFW, 2022), however, nesting occurrences of this species are not commonly reported to CNDDB and this species is common in the region of the Project. Suitable foraging and nesting habitat for this species occurs along the pipeline alignment at forested riparian crossings.

4.7.2.7 Tricolored blackbird (*Agelaius tricolor*)

Tricolored blackbird is a state-listed Threatened species, California Species of Special Concern, and a Bird of Conservation Concern. The tricolored blackbird is a nomadic resident of the Sacramento and San Joaquin Valleys and lower foothills of the Sierra Nevada. This species is a colonial nesting species that nests near freshwater in dense cattails and bulrush, and also in thickets of willow, blackberry, wild rose, and tall herbs (Zeiner et al., 1990a). Estimates for colony size range from 15 to 47,000 birds. Flooded lands, pond margins, grass fields and agricultural fields constitute typical foraging habitat. Individual tricolored blackbirds were observed during field surveys along Forty Mile Road and Rancho Road.

There are approximately eight occurrences of tricolor blackbird within 0.5 miles of the pipeline alignment (CNDDB, 2022). Occurrence #508 is a 2014 occurrence located along the pipeline alignment on Forty Mile Road in a blackberry bramble that is still in

place near the southernmost waterway crossing. Suitable nesting habitat is present in many locations within the study area, but primarily at the waterway crossings with emergent vegetation and in the dense blackberry patch along Forty Mile Road.

4.7.2.8 Burrowing owl (*Athene cunicularia*)

Burrowing owl is a California Species of Special Concern and a Bird of Conservation Concern. The burrowing owl is a small, long-legged owl that differs from other species of owls by its use of underground burrows and its diurnal activity pattern (Mallette and Gould, 1976). It occurs throughout California except in humid northwest coastal forests and high mountains (Zeiner et al., 1990a). It's breeding range is dry, open short grass, treeless plains associated with burrowing mammals. It is also found on golf course, cemeteries, road rights-of-way, airports, vacant lots in residential areas, campuses, and fairgrounds (Haug et al., 1993).

Burrowing owls are semicolonial with 5 to 6 pairs per acre. The owls usually enlarge burrows excavated by ground squirrels or other fossorial species, but may excavate their own in soft, friable soils. The owls show a high level of site fidelity, and reuse burrows, but burrows may be used by different pairs in different years. Several burrows may be excavated with one used for nesting, while satellite burrows are used for escape, perching, and observation. They will also use pipes, culverts, debris piles, and nest boxes in areas where burrows are scarce. Burrows are generally surrounded by bare ground or short grass that afford unrestricted views. High perches and elevated areas with clear lines-of-sight, such as mounds, fences, or other structures, are used as for hunting and detecting predators including skunks, badgers, bobcats, coyotes, and barn owls.

The nearest recorded occurrence (Occ. #2003) is from 2016 and is approximately 8.1 miles southeast of the project site. Suitable burrowing owl habitat is present at the southern end of the wastewater treatment plant where an extensive California ground squirrel colony was observed on an earthen berm. Within this colony, several of the burrows showed signs of renovation by burrowing owls.

4.7.2.9 Swainson's hawk (*Buteo swainsoni*)

Swainson's hawk is a state-listed Threatened species and a Bird of Conservation Concern. This species breeds in open habitats in western North America from Alaska south to Mexico. It breeds in California, found mainly in the Central Valley, Klamath Basin, Northeastern Plateau, and Mojave Desert. It winters primarily on the pampas of southern South America, and Mexico, and a few winter in California, the southwestern U.S. and Florida.

This species forages in grassland or areas of sparse trees or shrubs, and often forages in agricultural areas in the Central Valley. It nests in the scattered trees within these habitats, particularly those along waterways. During the breeding season, it feeds primarily on small mammals and reptiles. During other seasons, large insects (especially grasshoppers) are the bulk of its diet.

In California, it usually arrives in March and April and departs in September or October. Loss of habitat is the major threat to this species in California. Residential and commercial development continues to replace Swainson's hawk habitat. Pesticides and

herbicides are also a major threat, particularly on their wintering grounds. They are also sensitive to disturbance while nesting and may abandon nests if disturbed before the eggs hatch.

The project site is in a region that has very high Swainson's hawk nesting activity. There are approximately 73 nesting occurrences within 10 miles of the study area. The nearest occurrence (Occ. # 1529) is from 2003 and is less than 400 feet west of the pipeline alignment on Forty Mile Road (CDFW, 2022). This species was not observed during field surveys because surveys were conducted during the winter when Swainson's hawk is not present in California. Suitable nesting habitat is present in many locations along the pipeline alignments particularly within riparian corridors with large trees like Valley oak, Fremont cottonwood, and eucalyptus. Swainson's hawk foraging habitat also occurs within agricultural fields and grasslands in the area.

4.7.2.10 Northern harrier (*Circus hudsonius*)

Northern harrier is a California Species of Special Concern. The Northern Harrier inhabits meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. It forages mostly on voles and other small mammals, birds, frogs, small reptiles, crustaceans, insects, and, rarely on fish. Breeding typically occurs April to September, with peak activity June through July. Destruction of wetland habitat, native grassland, and moist meadows, and the burning and plowing of nesting areas during early stages of breeding cycle, are major reasons for the decline (Remsen, 1978).

Nearest occurrences are nesting occurrences at Beale Air Force Base approximately 4.5 miles east. This species was observed foraging over emergent wetland habitat within the study area during surveys. Potentially suitable nesting habitat occurs in grasslands in the area that receive minimal levels of disturbance.

4.7.2.11 White-tailed kite (*Elanus leucurus*)

White-tailed kite is a California Fully Protected species. It is a small raptor with a total length of about 12 inches and is often identified from a distance by its hovering or "kiting" behavior while hunting. White-tailed kites primarily prey on voles and other diurnal mammals, but will occasionally prey on birds, insects, reptiles, and amphibians. It typically forages over open grasslands and emergent wetlands. White-tailed kites nest in dense foliage in treetops near grassy foothills, marshes, riparian woodland, savanna, and partially cleared fields. Preferred nesting trees include oak, willow, sycamores, or other tree stands. White-tailed kites range from western California and southwestern Oregon to southeastern Arizona, and along the Gulf Coast from Texas to Florida (Wheeler and Clark, 1995).

There are no recorded occurrences of this species near the project site; however, it was observed foraging in the study area during surveys. The project site provides suitable foraging habitat for this species and suitable nesting habitat is present in the area.

4.7.2.12 Song sparrow ("Modesto population") (*Melospiza medlodia*)

The Modesto population of the song sparrow is endemic to California, where it resides only in the north-central portion of the Central Valley. Highest densities occur in the Butte Sink area of the Sacramento Valley and in the Sacramento-San Joaquin Delta. Song sparrows breed from mid-March to early August and are resident species of the Sacramento Valley and Delta. Song sparrows are frequently seen within mature riparian corridors, such as the Cosumnes and Stanislaus Rivers, and less frequently within irrigation canals and levees. The Modesto population of song sparrow has an affinity for emergent freshwater marshes dominated by bullrush and cattails as well as riparian willow (*Salix* sp.) thickets. Song sparrows also nest in riparian forests of valley oak (*Quercus lobata*) with a sufficient understory of blackberry, along vegetated irrigation canals and levees (Shuford et al., 2008); however, nest appear to be more successful in early succession riparian wetland communities, such as restoration sites.

The nearest contemporary occurrence (Occ. #86) is a 2005 occurrence approximately 8.5 miles southwest of the project site. Suitable habitat is present within the study area particularly at waterway crossings and in emergent wetland habitat. Song sparrows were observed during surveys.

4.8 WILDLIFE CORRIDORS

Wildlife migration corridors are generally defined as connections between fragmented habitat patches that allow for physical and genetic exchange between otherwise isolated wildlife populations. Migration corridors may be local, such as those between foraging and nesting or denning areas, or they may be regional in extent. Migration corridors are not unidirectional access routes; however, reference is usually made to source and receiver areas in discussions of wildlife movement networks. "Habitat linkages" are migration corridors that contain contiguous strips of native vegetation between source and receiver areas. Habitat linkages provide cover and forage sufficient for temporary inhabitation by a variety of ground-dwelling animal species. Wildlife migration corridors are essential to the regional fitness of an area as they provide avenues of genetic exchange and allow animals to access alternative territories as fluctuating dispersal pressures dictate.

Within the study area there are several natural drainages and riparian corridors that provide suitable migratory corridors for an array of species. These drainages and riparian areas include Reeds Creek, Hutchinson Creek, Kimball Creek, and Virginia Creek and other smaller unnamed waterways. These creeks help to provide access for wildlife to move from foothill habitat areas to valley habitat areas, including the Feather River, Sutter National Wildlife Refuge, and other wildlife areas. At the drainage crossings within the study area, the vegetation communities observed were a mix of natural riparian communities, emergent wetland vegetation, and annual grassland cover types. Signs of mammals moving through the riparian corridors were observed for several species including raccoon, coyote, and mink.

The Project is designed to avoid impacts to the drainage crossings and associated riparian corridors using trenchless installation methods for pipeline crossings at these

locations. Impacts to wildlife corridors will be limited to indirect temporary disturbance during construction, primarily during daytime hours.

5.0 REGULATORY SETTING

5.1 FEDERAL REGULATIONS

5.1.1 Federal Endangered Species Act.

The federal Endangered Species Act (FESA), administered by the USFWS and the NMFS (collectively referred hereafter as the "Services"), provides protection to species listed as Threatened (FT) or Endangered (FE), or proposed for listing as Threatened (PFT) or Endangered (PFE). The Services maintain lists of species that are neither formally listed nor proposed but could be listed in the future. These federal candidate species (FC) include taxa for which substantial information on biological vulnerability and potential threats exists and are maintained in order to support the appropriateness of proposing to list the taxa as an endangered or threatened species.

Projects that will result in the "take" of a federally listed or proposed species (as defined by FESA Section 9) are required to consult with the Services. The objective of consultation is to determine whether the project will jeopardize the continued existence of a listed or proposed species, and to determine what mitigation measures will be required to avoid jeopardy. Consultations are conducted under Sections 7 or 10 of FESA depending on the involvement by the federal government.

Under Section 7, the Services are authorized to issue Incidental Take Permits (ITP) for the take of a listed species that results from, but is not the purpose of, carrying out an otherwise lawful activity conducted by the federal agency. A Biological Assessment is usually required as part of the Section 7 consultation to provide sufficient information for the Services to fully determine the project's potential effect on listed species. The Services must make one of three possible findings for each species potentially affected:

No effect: The proposed action will not affect the listed species or critical habitat;

Not likely to adversely affect: Effects of the proposed action on the listed species are expected to be discountable (extremely unlikely to occur), insignificant (minimal impact without take), or beneficial; and

Likely to adversely affect: An adverse effect may occur as a direct or indirect result of the proposed action, and the effect is not discountable, insignificant, or beneficial.

Section 10 consultation is conducted when there is no federal involvement in a project except compliance with FESA.

5.1.2 Magnuson-Stevens Fishery Conservation and Management Act.

The NMFS administers the Magnuson-Stevens Fishery Conservation and Management Act (MSA) (16 USC 1801 et seq.). The MSA is the primary law governing marine fisheries management in U.S. Federal waters. The MSA was first enacted in 1976 and amended in 1996. Amendments to the 1996 MSA require the identification of Essential Fish Habitat (EFH) for federally managed species and the implementation of measures to conserve and enhance this habitat. Any project requiring Federal authorization is required to complete and submit an EFH Assessment with the application and either show that no significant impacts to the essential habitat of managed species

are expected or identify mitigations to reduce those impacts. Under the MSA, Congress defined EFH as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity" (16 USC 1802(10)). The EFH provisions of the MSA offer resource managers a means to heighten consideration of fish habitat in resource management. Pursuant to section 305(b)(2), Federal agencies shall consult with the NMFS regarding any action they authorize, fund, or undertake that might adversely affect EFH.

5.1.3 Migratory Bird Treaty Act / Bald Eagle and Golden Eagle Protection Act

The USFWS administers the federal Migratory Bird Treaty Act (MBTA) of 1918 (16 USC 703-711) and the Bald Eagle and Golden Eagle Protection Act (16 USC 668-688). The MBTA prevents the removal of trees, shrubs, and other structures containing active nests of migratory bird species that may result in the loss of eggs or nestlings. Adherence to construction windows either before the initiation of breeding activities or after young birds have fledged is a typical step to protect migratory birds and comply with the MBTA. The Bald Eagle and Golden Eagle Protection Act prohibits the taking or possession of bald and golden eagles, their eggs, or their nests without a permit from the USFWS.

5.1.4 Clean Water Act

The Corps and the U.S. Environmental Protection Agency (EPA) regulate the discharge of dredge and fill material into jurisdictional "waters of the United States" and wetlands under Section 404 of the Clean Water Act.

The Corps is responsible for the issuance of permits for the placement of dredged or fill material into Waters of the U.S. (WoUS) pursuant to Section 404 of the Clean Water Act (33 USC 1344). As defined by the Corps at 33 CFR 328.3(a)(3), WoUS are those waters that are used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide; tributaries and impoundments to such waters; interstate waters including interstate wetlands; and, territorial seas.

The Corps asserts jurisdiction over traditional navigable waters (TNW) and adjacent wetlands. Under Corps and EPA regulations, wetlands are defined as: "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

In non-tidal waters, the lateral extent of Corps jurisdiction is determined by the ordinary high water mark (OHWM) which is defined as the: "…line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas." (33 CFR 328[e]).

5.1.5 Rivers and Harbors Act

The Corps regulates activities affecting "navigable waters of the United States" under Section 10 of the Rivers and Harbors Act of 1899 (33 USC 403). Navigable waters are defined as "…those waters of the United States that are subject to the ebb and flow of the tide shoreward to the mean high water mark and/or are presently used, or have been used in the past, or may be susceptible to use to transport interstate or foreign commerce." Structures or work under or over a navigable WoUS is considered to have an impact on the navigable capacity of the waterbody.

5.2 STATE REGULATIONS

5.2.1 California Endangered Species Act

CESA was enacted to protect fish, wildlife, and plant species in danger of, or threatened with, extinction in the State of California (Fish and Game Code §2051). CESA prohibits "take" of a state-listed species. Take is defined as "hunt, pursue, catch, capture, or kill or attempt to hunt, pursue, catch, capture, or kill" (Fish and Game Code §86). Under Section 2081 of CESA, CDFW may authorize an incidental take permit allowing the otherwise unlawful take of a SE or ST species.

CDFW maintains lists of Candidate-Endangered species (SCE) and Candidate-Threatened species (SCT). These candidate species are afforded the same level of protection as listed species. CDFW designates Species of Special Concern (SSC) that are species of limited distribution, declining populations, diminishing habitat, or unusual scientific, recreational, or educational value. These species do not have the same legal protection as listed species but may be added to official lists in the future. The SSC list is intended by CDFW as a management tool for consideration in future land use decisions.

5.2.2 Fully Protected Species, Fish and Game Code Sections 3511, 4700, 5050, and 5515

This section of the California Fish and Game Code provides particular and special state protection to a list of 37 wildlife species and prohibits take or possession "at any time" with few exceptions and the CDFW cannot authorize incidental take of fully protected species.

5.2.3 California Fish and Game Code Section 3503

This section of the California Fish and Game Code prohibits the take, possession or needless destruction of nests or eggs of birds. It also prohibits the take, possession, or destruction of hawks or owls and the nests or eggs of any hawk or owl.

5.2.4 California Native Plant Protection Act

CDFW manages the California Native Plant Protection Act (NPPA) of 1977 (F&G Code Section 1900, et seq.), which was enacted to identify, designate, and protect rare plants. There are 64 species, subspecies, and varieties of plants that are designated rare under the NPPA. F&G Code Section 1913 provides utilities with an exemption from CESA permitting requirements for listed plants within the utility right of way. Specifically, Section 1913(b) states: "…the removal of endangered or rare native plants from a canal, lateral ditch, building site, road, or other right-of-way by the owner of the land or his agent, or the

performance by a public agency or a publicly or privately owned public utility of its obligation to provide service to the public, shall not be restricted because of the presence of rare or endangered plants." Section 1913(c) of the CNPPA requires the landowner to provide the CDFW with at least 10 days' notice to allow for plant salvage prior to affecting the species. In addition to NPPA designated rare plants, all California Rare Plant Rank (CRPR) 1 (A and B), Rank 2 (A and B), Rank 3, and some Rank 4 plants meet the definition of Rare or Endangered under the CEQA Guidelines §15125 and/or §15380. Potential impacts to these species are considered during CEQA review of a proposed project.

5.2.5 California Fish and Game Code Section 1600

Pursuant to Section 1602 of the Fish and Game Code, a Lake or Streambed Alteration Agreement (LSAA) between the CDFW and state or local governmental agency, public utility, or private citizen is required before the initiation of a construction project that will: (1) divert, obstruct, or change the natural flow or the bed, channel, or bank of a river, stream, or lake; (2) use materials from a streambed; or (3) result in the disposal or deposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake. The CDFW claims jurisdiction over the bed, bank, and channel of drainage features with regard to activities regulated under Section 1602 of the California Fish and Game Code.

5.2.6 Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act mandates that waters of the State of California shall be protected. Current policy in California is that activities that may affect waters of the State shall be regulated to attain the highest quality. Waters of the State include any surface water or groundwater, including saline waters, and any aquatic features that meet the state definition of a wetland, within the boundaries of the state. The Porter-Cologne Act establishes that the state assumes responsibility for implementing portions of the federal Clean Water Act, rather than operating separate state and Federal water pollution control programs in California. Consequently, the state is involved in activities such as setting water quality standards, issuing discharge permits, and operating grant programs.

5.2.7 Clean Water Act

Pursuant to Section 401 of the Clean Water Act, the Corps cannot issue a federal permit until the State of California first issues a water quality certification to ensure that a project will comply with state water quality standards. The California State Water Resources Control Board or one of the nine Regional Water Quality Control Boards (RWQCB) issues water quality certifications.

5.2.8 Oak Woodland Protection

California Senate Concurrent Resolution No. 17 (1989) is a Senate resolution that requests that… "all state agencies having land use planning duties and responsibilities…to assess and determine the effects of their land use decisions or actions within any oak woodland" and that agencies ...preserve and protect native oak woodlands to the maximum extent feasible…or provide for replacement plantings where designated oak species are removed from oak woodlands".

The Oak Woodlands Conservation Act (Section 1363 of the Fish and Game Code) was enacted in 2001. The program, which is managed by the Wildlife Conservation Board, is intended to:

- Support and encourage voluntary, long-term private stewardship and conservation of California oak woodlands by offering landowners financial incentives to protect and promote biologically functional oak woodlands;
- Provide incentives to protect and encourage farming and ranching operations that are operated in a manner that protect and promote healthy oak woodlands;
- Provide incentives for the protection of oak trees providing superior wildlife values on private land, and;
- Encourage planning that is consistent with oak woodlands preservation.

5.3 LOCAL AND REGIONAL PLANS

5.3.1 Yuba County General Plan

The Yuba County General Plan contains goals and policies that are relevant to biological resource issues. The project site and pipeline alignments are within the County of Yuba and is therefore within the jurisdiction of this general plan. Policies within the general plan applicable to the proposed project are outlined below. The applicable sections of the General Plan are under the Natural Resources Element. Policies within the general plan applicable to the proposed project are outlined below (County of Yuba, 2011).

5.3.1.1 Biological Resources

Goal: Protect and restore habitat for special-status species that have the potential to occur in Yuba County.

Implementing Policies

Policy NR-5.1: New developments that could adversely affect special-status species habitat shall conduct a biological resources assessment and identify design solutions that avoid such adverse effects. If, after examining all feasible means to avoid impacts to special-status species habitat through project design, adverse effects cannot be avoided, then impacts shall be mitigated in accordance with guidance from the appropriate state or federal agency charged with the protection of the subject species, including pre-construction surveys conducted according to applicable standards and protocols, where necessary.

Policy NR-5.2: The County will coordinate its environmental review and mitigation requirements with the Yuba-Sutter NCCP/HCP, once adopted.

Policy NR-5.3: The County will support the continued development and implementation of the Yuba-Sutter NCCP/HCP, once adopted.

Policy NR-5.4: New developments shall be located and designed to preserve and incorporate existing native vegetation to the maximum extent feasible. Fire safety standards may override consideration of retaining existing vegetation in certain circumstances.

Policy NR-5.5: The County will support cooperative restoration, development, and promotion of natural resources with the U.S. Fish and Wildlife Service, the Army Corps of Engineers, the Bureau of Reclamation, the U.S. Forest Service, and other public agencies with an interest in the Yuba County's water and wildlife assets.

Policy NR-5.6: The County will seek funding to enhance and restore habitat along the Yuba River, in coordination with development of recreational facilities and public access.

Policy NR-5.7: New developments and public investments near Yuba County's streams and rivers shall be designed to avoid tree removal, erosion, or other modifications that would adversely affect salmonid habitat.

Policy NR-5.8: New private developments adjacent to riparian areas shall provide a buffer designed and maintained to preserve existing wildlife habitat; provide habitat conditions favorable to native local wildlife; restrict activities that may adversely affect wildlife habitat quality; and restore degraded habitat, where feasible.

Policy NR-5.9: New developments shall be designed to avoid the loss of jurisdictional wetlands. If loss is unavoidable, the County will require applicants to mitigate the loss on a "no net loss" basis through a combination of avoidance, minimization, restoration, and/or constructed wetlands, in accordance with federal and state law.

Policy NR-5.10: The County will encourage measures on agricultural lands that conserve or restore habitat.

Policy NR-5.11: The County will support the use of mitigation fees from the Yuba-Sutter Natural Community Conservation/Habitat Conservation Plan to fund preservation and restoration elements of the County's open space strategy.

Policy NR-5.12: Any new developments adjacent to the Spenceville Wildlife Refuge, Marysville Wildlife Area, Feather River Wildlife Area, Daugherty Hill Wildlife Area, or Starbend Fishing Access shall be buffered from wildlife areas or otherwise designed to avoid adverse direct and indirect effects on wildlife. Buffers related to firearm use, if necessary, should occur within the public wildlife area.

Policy NR-5.13: New developments that could adversely affect wildlife movement corridors shall conduct a biological assessment and avoid placing any temporary or permanent barriers within such corridors, if they are determined to exist on-site. Avoiding barriers to wildlife movement may be accomplished at the project or community plan level.

Policy NR-5.14: The County will discourage development that would substantially and adversely affect the designated winter and critical winter range of the Mooretown or Downieville deer herd.

Policy NR-5.15: Roads, water lines, sewer lines, drainage facilities, and other public facilities constructed to serve unincorporated County development shall be located and designed to avoid substantial impacts to stream courses, associated riparian areas, and wetlands, to the greatest extent feasible.

5.3.1.2 Trees and other Important Vegetation

Goal: Preserve the County's trees and other vegetation that provide aesthetic and habitat benefits.

Implementing Policies

Policy NR-10.1: Building placement, grading, and circulation should be planned to retain as much existing native vegetation as feasible, with a priority on preserving existing oak trees that have a diameter at breast height (dbh) of 6 inches or greater and all other trees that have a dbh of 30 inches or greater. The County's policies and standards for fire safety may override consideration of retaining existing vegetation in certain circumstances.

Policy NR-10.2: The County will encourage the preservation of healthy, attractive native vegetation during land development. Where this is not feasible, the County will require landscaping that uses climate-appropriate plant materials.

6.0 SIGNIFICANCE CRITERIA

The impact of the project on biological resources was evaluated in terms of mandatory findings of significance at Section 15065 of CEQA and Appendix G of the State CEQA Guidelines (Governor's Office of Planning and Research, 1999). The various components of the project were considered in association with site conditions and were evaluated against CEQA criteria and County General Plan policies pertaining to biological issues. In accordance with these CEQA Guidelines, a project will normally result in a significant impact if any of the following conditions would result from project implementation:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW, USFWS, or NMFS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulation, or by the CDFW, USFWS, or NMFS;
- Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery site;
- Conflict with any local polices or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and,
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan.

Additionally, the CEQA Guidelines Initial Study Land Use and Planning checklist notes that conflicts with applicable land use plans, policies, or regulations of an agency with jurisdiction over the project should be considered during a project's environmental review.

7.0 IMPACTS AND MITIGAITON MEASURES

Effects on biological resources in the Project area will be primarily temporary with permanent impact limited to above ground project features such as the WTP and lift stations and pump stations. There will be temporary impacts to wildlife habitat during pipeline installation and construction of above ground structures. General construction may temporarily alter the natural movement and behavior of wildlife in the Project area. Construction may also result in indirect impacts that affect the quality of habitat in the Project area.

7.1 IMPACT CATEGORIES

Short-term and long-term impacts are analyzed for the proposed project. Each impact statement is classified as to the level of significance, based on the significance thresholds from Section 6.0, and the availability of measures to feasibly mitigate project effects. Impact categories include:

- **Potentially Significant Impact** is an adverse effect that cannot be mitigated. This category of impact is one for which a solution has not been formulated, either because of the limits of technical and/or scientific knowledge, or unfeasibility from a technical, economic, and/or political perspective. Under CEQA, a Significant Unavoidable impact would require a “finding of overriding consideration” by the Lead Agency to approve the project;
- **Less than Significant with Mitigation** is an adverse environmental effect that can be mitigated to less than significant levels. Measures have been identified that can feasibly be implemented and will avoid the impact altogether by not taking a certain action or parts of an action; minimize impacts by limiting the degree or magnitude of the action and its implementation; rectify the impact by repairing, rehabilitating, or restoring the affected environment; or compensate for the impact by replacing or providing substitute resources or environments;
- **Less than Significant Impact** is an environmental effect that is less than significant or has no identified impact. These impacts may be adverse, but are not of a sufficient magnitude, intensity, or duration to disrupt the environment, and have no serious consequences. As a result, no mitigation is required; and
- **No Impact** is when the Project would not result in any impact in the category, or the category does not apply.

7.2 PROJECT IMPACTS

Effects on biological resources in natural or semi-natural areas due to development take the form of direct impacts, including habitat loss and fragmentation, introduction of barriers to movement and dispersion, and conversion of native communities to developed conditions. Development may also result in indirect impacts that affect the quality of habitat on the project site and in the project area. Indirect impacts include invasion of non-native plants into natural areas, noise disturbances, and declines in air and water quality. The proposed improvements associated with the South County Infrastructure Project are

primarily within developed areas in the community of Olivehurst and in developed roadways and disturbed areas in rural southern Yuba County. All of the proposed alignments for trench installed pipelines are within the paved roadway and disturbed shoulder, with the exception of short overland connections to permanent above ground features (e.g. WP, Lift Stations, and Pump Stations). Trenchless construction methods are proposed for large drainage crossings to avoid impacts to waterways and riparian habitat. Permanent above ground Project features are sited within upland areas and disturbed or developed areas to the extent feasible to minimize habitat loss.

The following analysis provides an assessment of potential impacts from the proposed Project activities and includes Project-specific applicant proposed measures, and/or prescribed mitigation measures to reduce impacts to special-status species or other biological resources to a level of less than significant.

7.2.1 Vegetation Communities

The permanent, above ground features associated with this Project will result in approximately 2.43 acres of conversion to developed lands. Construction of the Pump Stations and Lift Stations and the WP will occur in annual grassland, ruderal, developed, disturbed, and agricultural lands. Installation of the pipeline alignments using trench installation and bored trenchless methods will result in temporary impacts, primarily within the paved roadway and unvegetated road shoulder but include pipeline connections to pump stations, lift stations, and the WP through overland areas including annual grassland, disturbed lands, and roadside ditches and depressions that are seasonally inundated. HDD installed highway and waterway crossings will result in temporary impacts from the HDD workspace and the pipe string staging area. Table 6 summarizes the permanent and temporary impacts associated with the Project.

Table 6. South County Infrastructure Project Impacts

Feature	Cover Type	Impact Area (Acres)
Permanent Impacts		
Pump Station 1	Annual Grassland, Ruderal (urban vacant lot)	0.19
Pump Station 26	Annual Grassland, Ruderal (urban vacant lot)	0.46
Pump Stations 21	Annual Grassland	0.24
Lift Station 22	Annual Grassland	0.10
Lift Station 23	Agricultural (rice), Roadside ditch / depression (seasonally inundated)	0.12
Pump Station 25	Disturbed land (Unpaved parking lot)	0.23

Feature	Cover Type	Impact Area (Acres)
Pump Station 24	Annual Grassland	0.14
Water Plant	Disturbed land (Stockpile / staging area)	0.95
Temporary Impacts		
SR 70 HDD (McGowan Pkwy)	Developed land (paved roadway)	0.29
SR 65 HDD (Olive Ave – Rancho Rd)	Annual Grassland, Wet depression (seasonally inundated)	0.95
Reeds Creek HDD (Rancho Rd)	Disturbed land (road shoulder), Roadside ditch / depression (seasonally inundated), annual grassland, agricultural	0.88
Hutchinson Creek HDD (Rancho Rd)	Annual grassland, Disturbed land (road shoulder), agricultural	1.28
SR 65 HDD (Rosser Rd – Shimer Rd)	Grazed pasture, developed land (paved road)	0.69
Kimball Creek HDD (Rancho Rd)	Annual grassland, Roadside ditch / depression (seasonally inundated)	0.90
Virginia Creek Bore (Rancho Rd)	Developed land (paved road), disturbed land (road shoulder)	0.02
Kimball Creek Bore (Forty Mile Rd)	Developed land (paved road)	0.03
Trench Installed Pipeline[1]	Developed land (paved road), Disturbed land (road shoulder), Annual Grassland, Roadside ditch / depression (seasonally inundated)	--
[1]Total acreage not available for 32.6 miles of trench installed pipeline because trench width and depths are variable and not fully defined. Trench installed pipeline will occur primarily in existing roadways in developed and disturbed land.		

Temporary disturbance areas within or near sensitive areas (e.g. riparian corridors, waterways and wetlands, and suitable habitat for special-status species) will require work within designated workspace and delineation of the work areas to prevent encroachment on sensitive areas. Limited tree removal may occur in some of these work areas though the number, type, and size of trees that may need to be removed is unknown.

No mitigation is proposed for permanent or temporary impacts to developed lands, disturbed lands, and upland annual grasslands and ruderal areas. Yuba County does not have a tree ordinance that would require mitigation for the loss of individual oak trees and no mitigation for tree removal is proposed.

Cover types that are regulated habitats or potentially suitable habitat for special-status species will be addressed by recommended mitigation outlined by resource or species below.

7.2.2 Aquatic Resources

The proposed Project may result in impacts to aquatic resources at Lift Station 23, several of the HDD workspace areas, and several of the pipeline connection crossings. Additionally, the HDD waterway crossings will involve the use of drilling fluids that present the unlikely potential for inadvertent returns to the waterways. These aquatic resources may be regulated by the Corps under Section 404 of the Clean Water Act, the RWQCB under Section 401 of the Clean Water Act, and/or the CDFW under Section 1600 of the California Fish and Game Code. These areas were identified and mapped for the purposes of avoidance during biological reconnaissance surveys (Figures 2A through 2T). A preliminary aquatic resource delineation was not conducted as part of the reconnaissance surveys and full avoidance of these features may not be feasible; therefore, some of the following authorizations may be required:

- Clean Water Act Section 404 Discharge/Fill Permit by the Corps;
- Clean Water Act Section 401 Water Quality Certification by the CVRWQCB; and,
- Fish and Game Code Section 1600 Lake/Streambed Alteration Agreement with CDFW

Construction of the project may result in impacts to regulated aquatic resources. **(Potentially significant)**

Mitigation BIO-1:

BIO-1A: Prior to the initiation of construction, OPUD or its contractor shall conduct a preliminary aquatic resource delineation of the project site to define the limits of jurisdictional areas and determine the extent of project impacts. The delineation will be verified by the Corps. The verified delineation will provide OPUD with the impact acreage necessary for preparing a WoUS/Wetland Mitigation Plan and/or permit application if impacts to jurisdictional areas cannot be avoided. If the Project can fully avoid delineated aquatic resources, no further mitigation would be required. If the Project cannot fully avoid delineated aquatic resources, 1A-1 will apply.

1B-1: If project impacts to federal and state jurisdictional areas are identified, OPUD shall obtain all necessary permits for impacts to WoUS and wetlands from the Corps and RWQCB and/or for potential impacts to stream features from CDFW prior to project implementation. Implementation of the Project shall comply with all permit conditions. Compensatory mitigation must be consistent with the Corps' standards pertaining to mitigation type, location, and ratios, but will be accomplished with a minimum of 1:1 replacement ratio.

If compensatory mitigation is needed, OPUD may satisfy all or a portion of WoUS and wetlands mitigation through the purchase of "credits" at a mitigation bank approved by the Corps, RWQCB, and/or CDFW for compensatory mitigation of

impacts to hydrologically similar WoUS, or through other means, such as on- or off-site wetland creation, conservation easement, contribution to approved in-lieu habitat fund, etc. The mitigation plan must be approved by the permitting agencies and shall be implemented by OPUD subsequent to plan approval.

BIO-1B: The proposed HDD installations under regulated drainages have a small potential to "frac out" or inadvertently release drilling muds to the surface during the drilling operations. Because of the potential for a frac-out to impact waters and wetlands at the drainage crossings, OPUD or its contractor shall prepare and implement an Inadvertent Returns Contingency Plan that outlines the measures that will be taken to prevent inadvertent returns and outlines the response measures to be employed and response equipment to be maintained onsite for use in the unlikely event of an inadvertent return during drilling operations.

7.2.3 Special-Status Plants

The likelihood of occurrence of special-status plant species within Project disturbance areas is limited because most impacts are within cover types not known to support special status plants. Potential for occurrence of special-status plants within suitable habitat areas is limited due to the level of disturbance in roadside ditches and depressions that provide seasonally inundated habitat. Two plant species were identified as having a moderate potential for occurrence within creeks or large ditches or depressions that support a prolonged hydroperiod. The Project will avoid impacts to the drainage crossings through the use of trenchless pipeline construction methods; however, impacts to seasonally inundated ditches and depressions may provide habitat for Sanford's arrowhead, particularly in large ditch or depression features that support a prolonged hydroperiod, such as those along the southern portion of Rancho Road. Project impacts to some of these areas can not be avoided.

Because of this, there is some potential for Project related impact to special-status plants in locations where impacts to seasonally inundated ditches and depressions could not be avoided or where workspaces and trench installed pipeline will occur in close proximity to these features. Construction of these features may have an impact on special-status plants. **(Potentially significant)**

Mitigation BIO-2:

BIO-2A: Pre-construction special-status species plant surveys shall be conducted by OPUD or its contractor in all impact areas that provide potentially suitable habitat for special-status plants prior to initiating Project construction activities. All surveys shall be conducted in accordance with agency approved survey protocols during the appropriate blooming period. If no special-status species are identified in protocol surveys, no additional mitigation is required. If surveys determine that special-status species occur within impact areas, BIO-2B shall apply.

BIO-2B: If special-status plants are identified within Project impact areas, one of the following measures shall apply:

2B-1: If feasible, the Project shall be adjusted to avoid impacts to special-status plants. If modifications can be made to avoid special-status species, the installation of protective fencing may be necessary to prevent accidental encroachment. If

adjustment of construction areas or methods is not feasible, MM BIO 2B-2 shall apply.

2B-2: If there is no feasible alternative to special-status plant species impacts, OPUD shall mitigate for impacts to special-status plants. A Mitigation Plan shall be prepared and implemented that provides for plant salvage, transplantation, seed collection and replanting, and/or topsoil collection and replacement as appropriate for the species identified within the project impact area. Transplantation or seed placement shall be within suitable habitat within restored habitat after completion of construction for temporary impacts or within offsite habitat at a mitigation site for permanent impacts. The Mitigation Plan shall outline monitoring requirements to ensure successful establishment of special-status plants, performance criteria established are achieved, and no net loss of special-status plants after the prescribed monitoring period.

7.2.4 Special-Status Wildlife

7.2.4.1 Vernal Pool Branchiopods

Seasonally inundated wetlands, vernal pools, ditches and depressions provided suitable habitat for vernal pool branchiopods (VPBs) including the listed vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*). There are two occurrences of vernal pool fairy shrimp located less than 0.5 miles from the northern portion of the project site (CNDDB, 2022) that occur in seasonally inundated roadside habitat similar to wet ditch and depression habitat observed within the study area. There are no classic vernal pool landscapes within the study area, but potentially suitable habitat for VPBs occurs in seasonally inundated ditches and depressions that provide a sufficient hydroperiod primarily along Rancho Road (Figures 2A through 2T). Due to proximity to the roadway, habitat in the Project area is often highly disturbed by offroad vehicle use, trash dumping, and other urban influences and therefore may be suboptimal for fairy shrimp occurrence; however, given proximity to other occurrences of this species in similar roadside habitat, occurrence cannot be ruled out.

Project impacts to seasonally inundated ditches and depressions may provide habitat for VPBs, particularly the vernal pool fairy shrimp. Because of this, there is some potential for Project related impacts to VPBs in locations where impacts to seasonally inundated ditches and depressions could not be avoided or where workspaces and trench installed pipeline will occur in close proximity to these features. Construction of these features may have an impact on VPBs. **(Potentially significant).**

Mitigation BIO-3:

A Section 7 Consultation with USFWS shall be conducted to analyze the direct and indirect effects on listed species and to obtain regulatory permits and authorizations for impacts to listed species and loss of habitat. Measures and requirements outlined in agency authorizations may supersede the following measures.

Indirect Impacts:

The trench installed pipeline within Rancho Road is proposed to be constructed in or on the shoulder of the existing paved roadway and will not directly impact seasonally inundated ditch or depression features. Trench installation of the pipeline alignment on

this road will involve construction in close proximity to potentially suitable habitat for VPBs in seasonally inundated ditches and depressions immediately adjacent to the roadway. Additionally, HDD workspace at several locations occurs immediately adjacent to potentially suitable habitat for VPBs. Indirect impacts could occur in areas where construction will be in close proximity to seasonally inundated ditch and depression features. These include the following:

- Pipe string staging area off north end of Rancho Road at the SR 65 HDD crossing
- Trench installed pipelines in the paved roadway or disturbed road shoulder on Rancho Road
- Pipe string staging area adjacent to Shimer Road at the SR HDD crossing
- HDD workspace and pipe stating area southeast of Kimball Creek and northeast side of Rancho Road
- Bore pit locations in the paved road and disturbed road shoulder on Rancho Road at the Virginia Creek crossing.

BIO-3A: Trench excavation and stockpiling for pipeline installation shall be entirely located within the paved roadway or disturbed shoulder on Rancho Road in areas where seasonally wet ditches and depressions were mapped adjacent to the roadway. Equipment staging and trench excavation in these areas will be limited to designated workspace areas in the paved roadway and shoulder. To reduce the potential for indirect impacts to seasonally inundated ditches and depressions in close proximity to construction activities, but where no direct impacts will occur, the following measures shall apply:

3A-1: Prior to the initiation of construction, crews shall attend an environmental Awareness Training Program will include information regarding the potential presence of listed branchiopod species and the importance of avoiding impacts to these species and their habitat.

3A-2: All work shall be conducted during the dry season when potential habitat features on or near the proposed pipeline installation areas are dry.

3A-3: Fencing shall be placed and maintained to delineate the approved work areas and prevent encroachment on seasonally inundated ditch and depression features. A qualified biologist shall oversee the installation of fencing. Once fencing is installed, a biologist will inspect fencing weekly to ensure its integrity and effectiveness.

3A-4: All excavation, construction staging, and stockpiles shall be limited to paved roadways, disturbed shoulder, and approved work areas.

3A-5: Storm water BMPs (silt fencing and straw waddles) shall be placed around construction disturbance and dirt stockpiles to reduce potential for erosion and sedimentation into potential branchiopod habitat features.

3A-6: No application of water (e.g., dust suppression) shall occur in seasonally inundated ditch or depression features without additional measures (such as barriers and/or use of low flow water truck nozzles) in place to keep water out of potential or known VPB habitat features during the dry season.

3A-7: Any groundwater encountered within the trench excavation shall not be discharged to areas where seasonally inundated ditch or depression features are located.

Direct Impacts:

Direct impacts may occur in areas where impacts to seasonally inundated ditch and depressions cannot be avoided including HDD workspace areas at two of the drainage crossings and Lift Station 23. These include:

- Pipe string staging area off north end of Rancho Road at the SR 65 HDD crossing
- HDD workspace on the northwest side of the Reed Creek crossing on Rancho Road
- HDD workspace on the northwest side of the Kimball Creek crossing on Rancho Road
- Lift Station 23 and the pipeline connection to Lift Station 23

BIO-3B: If avoidance of habitat features as outlined in BIO-3A is not feasible and direct impacts (temporary or permanent) will occur to seasonally inundated ditch and depression features, compliance with one of the following mitigation measures (3B-1 or 3B-2) shall be required:

3B-1: Prior to the initiation of construction, surveys conducted in accordance with USFWS protocols shall be conducted in all potentially suitable habitat to be impacted. If protocol surveys determine that the seasonally inundated ditch and depression features are not occupied by federally listed vernal pool branchiopod species, no further mitigation is required for impact to species habitat (mitigation for jurisdictional aquatic features consistent with BIO-1 may still apply). If protocol surveys detect the presence of federally listed species, then the following measures shall be implemented:

(a) Prior to the initiation of construction, construction crews shall attend an Environmental Awareness Training Program will include information regarding the potential presence of listed branchiopod species and the importance of avoiding impacts to these species and their habitat.
(b) All work shall be conducted during the dry season when potential habitat features on or near the proposed pipeline installation areas are dry.
(c) Fencing shall be placed and maintained around any avoided (preserved) seasonally inundated ditch and depression features to prevent encroachment. A qualified biologist shall oversee the installation of fencing. Once fencing is installed, a biologist will inspect fencing weekly to ensure its integrity and effectiveness.
(d) A USFWS approved biologist shall monitor construction activities in known or potential vernal pool branchiopod habitat that results in temporary or permanent impacts.
(e) For temporary impacts that will be restored after construction, a Site Restoration Plan outlining requirements for topsoil collection, preservation, and

restoration will be prepared and approved by the USFWS. Implementation of the approved Plan shall include the following requirements at minimum. Prior to excavation in locations with potential or known vernal pool branchiopod habitat, the uppermost soil layer that may contain branchiopods eggs (cysts) shall be collected, labelled, and stored under appropriate climatic conditions until construction in temporary impact areas is complete. Once construction is complete, topsoil shall be placed back in the feature from which it was collected.

(f) For permanent impacts, loss of vernal pool branchiopod habitat shall be mitigated through the purchase of mitigation credits at a USFWS approved mitigation bank in accordance with mitigation ratios approved by the USFWS.

3B-2: If the applicant chooses not to conduct protocol-level surveys, they may assume presence of listed vernal pool branchiopod species within seasonally inundated ditch and depression features that provide potentially suitable habitat. If presence of listed species is assumed, then measures 3B-1(a) and 3B-1(f) outlined above shall apply to mitigate impacts to a less than significant level.

7.2.4.2 Valley Elderberry Longhorn Beetle

Surveys during the blooming season identified four elderberry shrubs within 165 feet (VELB encroachment buffer) of Project activities along Rancho Road; however, these shrubs were east of the railroad and would not be impacted by the Project by accidental encroachment. A single elderberry shrub occurs on the shoulder of Forty Mile Road and within 20 feet (VELB core area) of a proposed trench installed pipeline within the paved roadway. This shrub was very small, though several stems were greater than one inch in diameter. The shrub is exposed to frequent disturbance within 20 feet of the canopy due to its location at the edge of pavement on Forty Mile Road. No emergence holes occur on the shrub and this shrub is highly disjunct from riparian habitat and other elderberry shrubs. It is very unlikely that the VELB occurs, though habitat is present due to the presence of this single shrub and could be indirectly impacted **(Potentially significant).**

Mitigation BIO-4:

Implementation of the Project will not require removal of the shrub; however, a 20-foot protective buffer is not possible because that would extend the buffer into the paved travel lane. The following measures will ensure that the blue elderberry shrub is not directly impacted by the Project. Prior to the initiation of construction, a Section 7 Consultation with USFWS shall be conducted to analyze the direct and indirect effects on listed species and to obtain regulatory permits and authorizations for impact to listed species and loss of habitat. Measures and requirements outlined in agency authorizations may supersede the following measures.

BIO-4A: A 20-foot exclusion zone extending from the dripline of the shrub shall be maintained during construction in all directions away from the pavement. The exclusion zone will be reduced on the pavement side of the shrub to the edge of gravel roadway shoulder so that the fencing will not interfere with the roadway. Consistent with measures outlined by the USFWS to mitigate potential impacts to VELB, the following measures shall be implemented:

4A-1: Fence and flag the elderberry shrub to be avoided and provide a minimum setback of at least 20 feet from the dripline of the elderberry plant for ground disturbance activities (e.g. trenching) to ensure that activities will not damage or kill the elderberry shrub. Due to its location at the edge of pavement on Forty Mile Road, the 20-foot setback will be adjusted (reduced) consistent with the edge of the gravel road shoulder so that fencing does not interfere with the paved roadway.
4A-2: Prior to the initiation of any construction, environmental training shall brief the contractors and key employees of the need to avoid any impacts to the elderberry plants, and to advise them of penalties associated with damage or destruction of the plants. The work crew shall be instructed regarding the status of the VELB and the need to protect its elderberry host plant, and possible penalties for non-compliance with avoidance and minimization measures.
4A-3: A qualified biologist shall monitor the work area at project-appropriate intervals to assure that all avoidance and minimization measures are implemented. The amount and duration of monitoring will depend on the timing of Project activities, and shall be determined in coordination with the USFWS biologist.
4A-4: As much as feasible, all activities within 165 feet of the elderberry shrub, will be conducted outside the flight season of the VELB (March-July).
4A-5: No insecticides, herbicides, fertilizers, or other chemicals that might harm the VELB or its host plant shall be used within 100 feet of any elderberry plant with a stem measuring 1.0 inch or greater in diameter at ground level.
4A-6: Mechanical vegetation removal within the dripline of an elderberry shrub shall be limited to the season when adult VELB are not active (August-February) and shall avoid damaging the elderberry.
4A-7: Erosion control will be implemented, and the affected construction area shall be revegetated with appropriate native plants.

7.2.4.3 Giant Garter Snake

Potentially suitable habitat occurs within Kimball Creek and active rice fields in the Project area based on the presence of the three habitat components necessary to support giant garter snake (GGS), which include, aquatic habitat in the summer with emergent vegetation and a prey base, an upland component near aquatic habitat for thermoregulation and summer shelter in burrows, and an upland refugia component for use as winter hibernacula (USFWS, 1993). Reeds Creek may also provide potentially suitable habitat for GGS; however, the pipeline will be installed using trenchless techniques under Reeds Creek and all Project activities are setback more than 200 feet from Reeds Creek, and therefore will not impact GGS or its habitat at this location. Other suitable habitat in the study area, including agricultural ditches and rice fields along Forty Mile Road, were in areas where pipeline installation activities are limited to the paved roadway and will avoid impacts to suitable aquatic or upland habitat.

Impacts associated with the construction of Lift Station 22 adjacent to Kimball Creek will impact suitable upland habitat for GGS and the loss of a small portion of suitable aquatic habitat within the northwest corner of a rice field associated with construction of Lift Station 23, which will be inactive at the time of construction, will result in a small amount of suitable aquatic habitat for GGS (**Potentially Significant).**

Mitigation BIO-5:

BIO-5A: The Project will result in approximately 0.12-acre of loss of rice field for the construction of Lift Station 23 and 0.10-acre of upland grassland habitat adjacent to Kimball Creek. Because these features provide potentially suitable upland and aquatic habitat for GGS, the following measures are identified.

5A-1: Prior to the initiation of construction, construction staff shall attend an Environmental Awareness Training Program that will include information regarding identification of giant gartersnake and its habitat, protection measures for the species, and procedures to follow if a giant gartersnake or unknown snake is observed.

5A -2: Construction of Lift Station 23 will occur when the rice field is inactive and has been dry for a minimum of 15 days.

5A -3: Construction of Lift Station 22 and Lift Station 23 and the HDD installation of pipelines under Kimball Creek, including all activities within 200 feet of Kimball Creek and the rice field at LS 23, shall be restricted to the period between May 1 and October 1. This is the active period for GGS when the potential for direct mortality is reduced because GGS can actively avoid disturbance.

5A -4: Prior to the start of the Kimball Creek HDD, construction of Lift Station 22, or the construction of Lift Station 23, a qualified biologist shall conduct a preconstruction survey for GGS at these locations prior to the initiation of disturbance. Exclusion fencing shall be installed, as directed by the qualified biologist, to isolate the workspace within 200 feet of suitable aquatic habitat and exclude snakes from the work areas. Exclusion fencing will be buried at the base to prevent snakes from moving under the fence into the construction area. Exclusion fencing shall be maintained for the duration of work in these areas and shall be routinely inspected by the qualified biologist to ensure the fencing is intact and effective. The workspace shall be inspected prior to the start of work each day to ensure that no snakes have entered the work area.

5A -5: If a GGS is observed, the USFWS and CDFW shall be notified immediately. Construction will be suspended in the area until the snake leaves the site of its own volition.

5A -6: All excavations within 200 feet of suitable GGS habitat shall be covered or have escape ramps installed to prevent entrapment prior to the end of work each day. These excavations shall be inspected by the qualified biologist prior to the start of work the following day.

5A -7: Erosion control materials shall consist of tightly woven fibers and netting to prevent entanglement of reptiles and amphibians. No monofilament materials will be allowed.

7.2.4.4 Western pond turtle

The project site has potentially suitable habitat for western pond turtle at the drainage crossings and wetlands in the study area, though suitable basking habitat was limited.

Suitable habitat for western pond turtle includes aquatic habitat with basking sites available for thermoregulation and nearby upland breeding habitat. Because of the proximity of the Project to potential western pond turtle habitat, there is potential for impact to the western pond turtle. **(Potentially significant)**.

Mitigation BIO-6:

BIO-6A: A preconstruction survey for western pond turtle shall be conducted no more than 48 hours prior to the start of construction within 150 feet of the drainages or other suitable wetland habitat. If no western pond turtles are observed, no further mitigation is necessary. If a western pond turtle is observed within the Project area, a qualified biologist will relocate the individual to a suitable habitat location outside of the construction area. If a pond turtle nest is identified, exclusion fencing shall be placed a minimum of 25 feet around the nest and disturbance to the area will be avoided until the hatchlings have emerged. The nest will be monitored daily by the qualified biologist to ensure nestlings emerge to a suitable habitat area safely outside the construction zone.

7.2.4.5 Swainson's Hawks

Nest Disturbance. The state-threatened Swainson's hawk is known to nest and forage in the Project vicinity and suitable nest trees occur within the study area, particularly within riparian habitat with large trees surrounded by foraging habitat in agricultural fields and grasslands. The project site is in a region that has very high Swainson's hawk nesting activity. There are approximately 73 nesting occurrences within 10 miles of the study area. The nearest occurrence (Occ. # 1529) is from 2003 and is less than 400 feet west of the pipeline alignment on Forty Mile Road (CDFW, 2022). This species was not observed during field surveys because surveys were conducted during the winter when Swainson's hawk is not present in California.

Because Swainson's hawk is a State-listed species, and there are known nesting occurrences in the vicinity of the Project area, there is the potential that construction near Swainson's hawk nesting areas could disrupt breeding activities if construction occurs during the nesting season.

The following mitigation measure would reduce impacts to nesting Swainson's hawk resulting from Project construction **(Potentially significant).**

Mitigation BIO-7 – Nest Disturbance:

BIO-7A: If construction or vegetation removal work occurs outside of Swainson's hawk nesting season (August 31 to Feb 1), impacts to the Swainson's hawk would be avoided. Surveys would not be required for work conducted during that part of the year, and no further mitigation for nest disturbance would be required. If construction is scheduled to occur during the Swainson's hawk nesting season (Feb 1 to August 31), the following measures would be required to reduce impacts to a less than significant level.

BIO-7B: If project activities occur between February 1 to August 31, surveys shall be conducted by a qualified biologist for active Swainson's hawk nests. OPUD or its contractor shall conduct a protocol-level survey in conformance with the *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley,* (Swainson's Hawk Technical Advisory Committee, 2000) hereby incorporated by

reference. This protocol prescribes minimum standards for survey equipment, mode of survey, angle and distance to tree, speed, visual and audible clues, distractions, notes and observations, and timing of surveys. If the surveys show that there are no active Swainson's hawk nests within 0.25-mile of construction activities, then no further mitigation for nest disturbance will be required. If active Swainson's hawk nests are identified near the project area, a 0.25-mile nest protection buffer shall be identified, and the following measures shall be required:

> **7B-2:** Apply a nest protection buffer with a minimum distance of 0.25-mile from an active nest. Postpone Project activities within the nest protection buffer until after the young have fledged and are no longer dependent on the nest tree. The minimum nest protection buffer may be reduced in coordination with CDFW if existing site conditions, habituation to disturbance, proposed disturbance levels, and nest concealment or barriers between the nest and activities indicate a reduced buffer would be effective.
>
> **7B-3:** If it is not possible to postpone Project activities within the minimum nest protection buffer, construction activities may proceed with CDFW approval and monitoring of the nest by a qualified raptor biologist. If the monitoring biologist observes signs of distress, they shall have the authority to stop construction work and coordinate with CDFW to establish additional protection measures to ensure avoidance of nest abandonment prior to the re-start of Project activities.

BIO-7C: A written report summarizing the pre-construction survey results shall be provided to OPUD and CDFW within 30 days of survey completion.

Loss of Foraging Habitat: Swainson's hawks generally forage within 10 miles of their nest tree, and more commonly within five miles of their nest tree (CDFW, 1994). According to the CDFW Staff Report regarding Mitigation for Impacts to Swainson's Hawks (CDFW, 1994), the following vegetation types are considered small mammal and insect foraging habitat for Swainson's hawks: alfalfa; fallow fields; beet, tomato, and other low-growing row or field crops; dry-land and irrigated pasture; rice land (when not flooded); and cereal grain crops (including corn after harvest). Small disjunct parcels of habitat seldom provides foraging habitat; therefore, infill development in urbanized areas which have less than five acres of foraging habitat and are surrounded by existing urban development, would not be considered foraging habitat unless within 0.25-mile of a nest tree (CDFW, 1994).

Swainson's hawk is a state-listed species, because approximately 0.6-acre of foraging habitat (annual grassland and agricultural land) would be removed with construction of Pump Station 21 (0.24-acre), Lift Station 22 (0.10-acre), Lift Station 23 (0.12-acre) and Pump Station 24 (0.14-acre), and due to the abundance of potential nesting habitat in close proximity to the pipeline alignment, this would be a potentially significant impact, and the following compensatory mitigation would be required. **(Potentially significant).**

Mitigation BIO-8 – Foraging Habitat:

BIO-8A: If nesting occurrences of Swainson's hawks occur within 10 miles of the permanent impact areas (e.g. pump station, lift station, and WP sites) mitigation for loss of foraging habitat shall be required. Generally, CDFW requires mitigation for loss of Swainson's hawk foraging habitat based on the presence of active nests within 10 miles of the Project. If an active nest site occurs within ten miles of the Project, the applicant will be required by CDFW to provide off-site foraging habitat management lands at a specified Mitigation Ratio that is based on nest proximity to the project site, as follows:

Distance from Project Boundary	Mitigation Acreage Ratio*
Within 1 mile	1.00:1**
Between 1 and 5 miles	0.75:1
Between 5 and 10 miles	0.50:1
*Ratio means [acres of mitigation land] to [acres of foraging habitat impacted]. **This ratio shall be 0.5:1 if the acquired lands can be actively managed for prey production.	

CDFW provides options for off-site habitat management by fee title acquisition or conservation easement acquisition with a CDFW-approved management plan, and by the acquisition of comparable habitat. Mitigation credits may be obtained through a CDFW-approved mitigation bank for Swainson's hawk with a service area that covers the Project site.

7.2.4.6 Burrowing Owl

The burrowing owl, a California Species of Special Concern, is known to occur within grassland habitat in the region. Suitable burrowing owl habitat is present at the southern end of the wastewater treatment plant where an extensive California ground squirrel colony was observed on an earthen berm. Within this colony, several of the burrows showed signs of renovation by burrowing owls. Additionally, grassland habitat with ground squirrel burrows present could provide habitat. Due to the proximity of suitable habitat, impact to nesting burrowing owls could occur as a result of construction disturbance. Nest disturbance would be a potentially significant impact, and the following mitigation is recommended **(Potentially significant).**

Mitigation BIO-9

BIO-9A: A pre-construction survey of areas providing suitable burrowing owl habitat within 1,640 feet (500 meters) of construction at the WWTP shall be conducted by a qualified raptor biologist within 14 days prior to ground disturbance. Surveys shall follow guidelines outlined by CDFW in the *Staff Report on Burrowing Owl Mitigation* (CDFW, 2012).

If the required pre-construction surveys show there are no active burrowing owl nests within the 1,640 feet (500 meters) of construction activities, then no further mitigation for burrowing owl nest disturbance will be required. If occupied burrows are identified during surveys the following shall be required:

BIO-9B: If an occupied burrow is discovered during pre-construction surveys, a protective buffer consistent with CDFW guidelines shall be established. Appropriate protective buffers depend on the type of burrowing owl occurrence (nesting or overwinter), level of

project disturbance, and time of year that the disturbance occurs. Nest protective buffers consistent with CDFW guidelines are outlined below.

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting Site	April 1 – Aug 15	200 m	500 m	500 m
Nesting Site	Aug 16 – Oct 15	200 m	200 m	500 m
Nesting Site	Oct 16 – March 31	50 m	100 m	500 m

A reduced buffer may be implemented upon CDFW approval and based upon site specific conditions, nesting phenology, and the recommendation of the qualified biologist.

BIO-9C: A written report summarizing the pre-construction survey results shall be provided to OPUD and CDFW within 30 days of survey completion.

BIO-9D: If occupied burrows cannot be avoided, the applicant shall conduct a survey during the non-nesting season (September 30 through January 31) to identify occupied burrows within the disturbance footprint, exclude burrowing owls from burrows within the disturbance footprint, and then collapse the burrows in accordance with methodology outlined by the CDFW. Burrowing owl exclusion and burrow collapse must be conducted in coordination with CDFW and with the approval of CDFW.

7.2.4.7 Nesting Birds

The Project has the potential to impact nesting migratory birds, including special-status species such as tricolored blackbird, Modesto song sparrow, and other MBTA protected species. Suitable habitat for tree and ground-nesting raptors, including special-status species such as northern harrier, or white tailed kite occur in the Project area. Construction disturbance has the potential to impact nesting birds and the following mitigation is recommended **(Potentially significant).**

Mitigation BIO-10:

BIO-10A: If construction or vegetation removal work occurs outside of nesting season (August 31 to Feb 1), impacts would be avoided. Surveys would not be required for work conducted during this part of the year, and no further mitigation for nest disturbance would be required. If construction is scheduled to occur during nesting season (Feb 1 to August 31), the following measures would reduce impacts to a less than significant level.

BIO-10B: If vegetation removal or construction activities occur between February 1 to August 31, pre-construction surveys shall be conducted by a qualified biologist of suitable habitat within 500 feet of worksites and disturbance areas for passerines and within 0.25-mile of worksites and disturbance areas for raptors. Pre-construction surveys shall be conducted within 14 days prior to the start of construction of vegetation removal. If nests are identified, a suitable nest protection buffer shall be recommended by the qualified biologist based on the species, nest phenology, and site-specific conditions. Construction

activities shall be prohibited within the established buffer zones until the young have fledged. If a lapse in Project-related activities occurs for 14 days or longer during the nesting season, another focused survey shall be conducted before construction activities can be reinitiated.

BIO-10C: A written report summarizing the pre-construction survey results shall be provided to OPUD and CDFW within 30 days of survey completion.

7.3 EVALUATION OF COMPLIANCE WITH FEDERAL REGULATIONS

This biological technical report considers the potential for Project activities to affect biological resources protected by State and Federal regulation, including species listed as Threatened or Endangered by the FESA or CESA, wetlands and WoUS, and migratory birds protected by the MBTA (see Section 7.2 above for impacts analysis to resources protected by these regulations). This section of the report includes an analysis of compliance with other Federal Environmental Regulations related to biological resources.

7.3.1 Bald and Golden Eagle Protection Act

The Project has the potential to affect nesting bald or golden eagles protected by the Bald and Golden Eagle Protection Act. Implementation of Measure BIO-10 (Section 7.2) addresses the potential for Project activities to affect raptors, including eagles, and provides mitigation measures to reduce those impacts.

7.3.2 Federal Endangered Species Act and Fish and Wildlife Coordination Act

The Project has the potential to affect listed species. A Section 7 Consultation will be conducted between the Federal Lead Agency and the USFWS. A Biological Assessment has been prepared to facilitate the Section 7 Consultation and ensure compliance with the FESA.

The Project will not impact the waters of a stream or other water body by impounding, diverting, or deepening a channel or otherwise modify flow as a result of this Project and will not require compliance with the Fish and Wildlife Coordination Act.

7.3.3 Magnuson-Stevens Fishery Conservation and Management Act (MSA)

EFH is defined as "…those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity". "Waters", as used in this definition, are defined as "aquatic areas and their associated physical, chemical, and biological properties that are used by fish". These may include "…areas historically used by fish where appropriate; 'substrate' to include sediment, hard bottom, structures underlying the waters, and associated biological communities. Necessary" means, "the habitat required to support a sustainable fishery and the managed species' contribution to a healthy ecosystem." EFH is described as a subset of all habitats occupied by a species (NMFS, 1998).

The Olivehurst area is within the Honcut Headwaters-Lower Feather River and Upper Bear River-Below Camp Far West watersheds (Hydrologic Unit Code 18020159 and 18020126), which are mapped as Chinook salmon EFH. However, there is no potential for the Project to affect EFH because Project activities will avoid impacts to waterways through trenchless installation methods and will result in no impacts to fish.

7.3.4 Marine Mammal Protection Act

The Project has no potential to affect marine mammals due to the distance of the Project site from marine habitat and because marine mammals are not expected to occur within the Project area.

7.3.5 Migratory Bird Treaty Act

The Project has the potential to affect migratory birds protected by the MBTA. Implementation of measure BIO-10 (Section 7.2) addresses the potential for Project activities to affect bird species protected by the MBTA and provides mitigation measures to reduce those impacts.

7.3.6 Wetlands Protection (Section CWA Section 404 and 401 Wetlands)

Natural drainage crossings, wetlands, and other aquatic resources occur within the Project site that are potential waters of the U.S. and/or wetlands regulated under Sections 404 and 401 of the Clean Water Act. Project design measures such as trenchless pipeline installation under waterways are included in the Project Description to minimize the potential for impact to Waters of the U.S. Implementation of measure BIO-1 (Section 7.2) will ensure compliance with the Federal Clean Water Act.

7.3.7 Rivers and Harbors Act

There are no Navigable Waters of the U.S. on the project site, and Project implementation will have no effect on navigable waters of the U.S.

7.3.8 Wild and Scenic Rivers Act

The project site is within the Honcut Headwaters-Lower Feather River and Upper Bear River watersheds (Hydrologic Unit Code 18020159 and 18020126). There are no designated Wild and Scenic Rivers adjacent to the project site, and Project implementation will not affect any designated Wild and Scenic Rivers.

USFWS SPECIES LIST

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
Phone: (916) 414-6600 Fax: (916) 414-6713

In Reply Refer To: February 02, 2023
Project Code: 2022-0002318
Project Name: Olivehurst Public Utility District Water/Wastewater Improvements Project

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see https://www.fws.gov/birds/policies-and-regulations.php.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures see https://www.fws.gov/birds/bird-enthusiasts/threats-to-birds.php.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/birds/policies-and-regulations/executive-orders/e0-13186.php.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
(916) 414-6600

Project Summary

Project Code: 2022-0002318

Project Name: Olivehurst Public Utility District Water/Wastewater Improvements Project

Project Type: Water Supply Facility - Maintenance / Modification

Project Description: The proposed Project involves construction of a well site, water treatment plant, pump stations, and lift stations on approximately 2.5 acres of land, improvements within the existing wastewater treatment plant (WWTP) and the construction of approximately 13.6 miles of new water lines and sewer lines primarily in roadways or on the road shoulder, with some overland segments of pipeline alignment (approximately 3 miles of overland pipe). Additionally, 13 bore locations have been identified, seven bore crossings for pipeline installation under waterways, and six bore crossings for pipeline installation under highways.

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@39.05587985,-121.49323332098848,14z

Counties: Yuba County, California

Endangered Species Act Species

There is a total of 9 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

Birds

NAME	STATUS
Yellow-billed Cuckoo *Coccyzus americanus* Population: Western U.S. DPS There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/3911	Threatened

Reptiles

NAME	STATUS
Giant Garter Snake *Thamnophis gigas* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4482	Threatened

Fishes

NAME	STATUS
Delta Smelt *Hypomesus transpacificus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/321	Threatened

Insects

NAME	STATUS
Monarch Butterfly *Danaus plexippus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate
Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/7850	Threatened

Crustaceans

NAME	STATUS
Conservancy Fairy Shrimp *Branchinecta conservatio* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8246	Endangered
Vernal Pool Fairy Shrimp *Branchinecta lynchi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/498	Threatened
Vernal Pool Tadpole Shrimp *Lepidurus packardi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2246	Endangered

Flowering Plants

NAME	STATUS
Hartweg's Golden Sunburst *Pseudobahia bahiifolia* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/1704	Endangered

Critical habitats

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

APPENDIX C

PLANT LIST

Plant Species Observed at the OPUD South County Infrastructure Project Site

Common Name/Family	*Scientific Name*	Growth Habit	Wetland Indicator Status	Sensitivity / Listing Status	Native Status
EQUISETACEAE (Horsetail Family)					
Scouring rush	*Equisetum hymale* ssp. affine	H	FACW	N	
ADOXACEAE (Muskroot Family)					
Blue elderberry	*Sambucus mexicana*	S	FACU	N	
APIACEAE (Carrot Family)					
Coyote thistle	*Eryngium* sp.	H		N	
Fennel	*Foeniculum vulgare*	H	NL	I	
APOCYNACEAE (Dogbane Family)					
Narrow-leaved milkweed	*Asclepias fascicularis*	H	FAC	N	
ASTERACEAE (Sunflower Family)					
Western ragweed	*Ambrosia psilostachya*	H	FACU	N	
Mayweed	*Anthemis cotula*	H	FACU	I	
Coyote brush	*Baccharis pilularis*	S	NL	N	
Italian thistle	*Carduus pycnocephalus* ssp. *pycnocephalus*	H	NL	I	
Yellow star-thistle	*Centaurea solstitialis*	H	NL	I	
Common spikeweed	*Centromadia pungens*	H	FAC	N	
Chicory	*Cichorium intybus*	H	FACU	I	
Bull thistle	*Cirsium vulgare*	H	FACU	I	
Stinkwort	*Dittrichia graveolens*	H	NL	I	
Gumplant	*Grindelia* sp.	H			
Hayfield tarweed	*Hemizonia congesta* ssp. *luzulifolia*	H	NL	N	
Cat's-ear	*Hypochaeris glabra*	H	NL	I	
Prickly lettuce	*Lactuca serriola*	H	FACU	I	
Cudweed	*Pseudognaphalium* sp.	H			
Common groundsel	*Senecio vulgaris*	H	FACU	I	
Milk thistle	*Silybum marianum*	H	NL	I	
Prickly sow thistle	*Sonchus asper* ssp. asper	H	FAC	I	
Common dandelion	*Taraxacum officinale*	H	FACU	I	
Salsify	*Tragopogon porrifolius*	H	NL	I	
Cocklebur	*Xanthium strumarium*	H	FAC	N	
BORAGINACEAE (Borage Family)					
Fiddleneck	*Amsinckia* sp.	H		N	
Common fiddleneck	*Amsinckia menziesii*	H	NL	N	
BRASSICACEAE (Mustard Family)					
Mouse-ear cress	*Arabidopsis thaliana*	H	NL	I	
Black mustard	*Brassica nigra*	H	NL	I	
Field mustard	*Brassica rapa*	H	FUPL	I	
Shepard's purse	*Capsella bursa-pastoris*	H	FACU	I	
Few-seed bittercress	*Cardamine oligosperma*	H	FAC	N	
Mediterranean mustard	*Hirschfeldia incana*	H	NL	I	
Peppergrass	*Lepidium nitidum*	H	FAC	N	
Radish	*Raphanus sativus*	H	NL	I	
CARYOPHYLLACEAE (Pink Family)					
Common chickweed	*Stellaria media*	H	FACU	I	

Plant Species Observed at the OPUD South County Infrastructure Project Site

Common Name/Family	*Scientific Name*	Growth Habit	Wetland Indicator Status	Sensitivity / Listing Status	Native Status
CHENOPODIACEAE (Goosefoot Family)					
Russian thistle	*Salsola tragus*	H	FACU	I	
CONVOLVULACEAE (Morning-Glory Family)					
Bindweed	*Convolvulus arvensis*	H	NL	I	
CRASSULACEAE (Stonecrop Family)					
Moss pygmy weed	*Crassula tillaea*	H	FACU	I	
DIPSACACEAE (Teasel Family)					
Wild teasel	*Dipsacus fullonum*	H	FAC	I	
EUPHORBIACEAE (Spurge Family)					
Turkey mullein	*Croton setiger*	H	NL	N	
Spotted spurge	*Euphorbia maculata*	H	UPL	I	
FABACEAE (Legume Family)					
Spanish clover	*Acmispon americanus* var. *americanus*	H	UPL	N	
Bird's-foot trefoil	*Lotus corniculatus*	H	FAC	I	
Miniature lupine	*Lupinus bicolor*	H	NL	N	
California burclover	*Medicago polymorpha*	H	FACU	I	
Clover	*Trifolium* sp.	H			
Rose clover	*Trifolium hirtum*	H	NL	I	
Vetch	*Vicia* sp.	H			
Spring vetch	*Vicia sativa*	H	FACU	I	
Winter vetch	*Vicia villosa*	H	NL	I	
FAGACEAE (Oak Family)					
Valley oak	*Quercus lobata*	T	FACU	N	
GERANIACEAE (Geranium Family)					
Storksbill	*Erodium* sp.	H			
Long-beaked storksbill	*Erodium botrys*	H	FACU	I	
Redstem filaree	*Erodium cicutarium*	H	NL	I	
Cut-leaf geranium	*Geranium dissectum*	H	NL	I	
Dove's-foot geranium	*Geranium molle*	H	NL	I	
JUGLANDACEAE (Walnut Family)					
Northern California black walnut	*Juglans hindsii*	T	FAC	N	1B.1
LAMIACEAE (Mint Family)					
Vinegar weed	*Trichostema lanceolatum*	H	FACU	N	
MALVACEAE (Mallow Family)					
Cheeseweed	*Malva parviflora*	H	NL	I	
MONTIACEAE (Miner's Lettuce Family)					
Red maids	*Calandrinia menziesii*	H	NL	N	
Miner's lettuce	*Claytonia perfoliata*	H	FAC	N	
MYRTACEAE (Myrtle Family)					
Eucalyptus	*Eucalyptus* sp.	T		I	
Blue gum	*Eucalyptus globulus*	T	NL	I	
OLEACEAE (Olive Family)					
Oregon ash	*Fraxinus latifolia*	T	FACW	N	
Olive	*Olea europaea*	T	NL	I	
ONAGRACEAE (Evening Primrose Family)					

Plant Species Observed at the OPUD South County Infrastructure Project Site

Common Name/Family	*Scientific Name*	Growth Habit	Wetland Indicator Status	Sensitivity / Listing Status	Native Status
Willow herb	*Epilobium* sp.				
Panicled willow herb	*Epilobium brachycarpum*	H	NL	N	
Floating water primrose	*Ludwigia peploides*	H	OBL	I	
OROBANCHACEAE (Broom-Rape Family)					
Butter-and-eggs	*Triphysaria eriantha*	H	NL	N	
OXALIDACEAE (Oxalis Family)					
Bermuda buttercup	*Oxalis pes-caprae*	H	NL	I	
PAPAVERACEAE (Poppy Family)					
California poppy	*Eschscholzia californica*	H	NL	N	
PLANTAGINACEAE (Plantain Family)					
English plantain	*Plantago lanceolata*	H	FAC	I	
POLYGONACEAE (Buckwheat Family)					
Willow weed	*Persicaria lapathifolia*	H	FACW	N	
Knotweed	*Polygonum aviculare*	H	FAC	I	
Sheep sorrel	*Rumex acetocella*	H	FACU	I	
Curly dock	*Rumex crispus*	H	FAC	I	
RANUNCULACEAE (Buttercup Family)					
Buttercup	*Ranunculus* sp.	H			
ROSACEAE (Rose Family)					
Himalayan blackberry	*Rubus armeniacus*	V	FAC	I	
RUBIACEAE (Madder Family)					
Bedstraw	*Galium* sp.	H			
California button willow	*Cephalanthus occidentalis*	S	OBL	N	
SALICACEAE (Willow Family)					
Fremont cottonwood	*Populus fremontii* ssp. *fremontii*	T	NL	N	
Lombardy poplar	*Populus nigra*	T	NL	I	
Willow	*Salix* sp.	T	OBL		
Gooding's black willow	*Salix goodingii*	T	FACW	N	
Arroyo willow	*Salix lasiolepis*	T	FACW	N	
URTICACEAE (Nettle Family)					
Stinging nettle	*Urtica dioica*	H	FACW	N	
VERBENACEAE (Vervain Family)					
Verbena	*Verbena lasiostachys*	H	FAC	N	
VISCACEAE (Mistletoe Family)					
Oak mistletoe	*Phoradendron leucarpum* ssp. *tomentosum*	H	NL	N	
ZYGOPHYLLACEAE (Caltrop Family)					
Puncture vine	*Tribulus terrestris*	H	NL	I	
CYPERACEAE (Sedge Family)					
Sedge	*Carex* sp.	H			
Tall cyperus	*Cyperus eragrostis*	H	FACW	N	
Spikerush	*Eleocharis* sp.	H			
Creeping spikerush	*Eleocharis macrostachya*	H	FACW	N	
Tule	*Schoenoplectus acutus* var. *occidentalis*	H	OBL	N	
JUNCACEAE (Rush Family)					

Plant Species Observed at the OPUD South County Infrastructure Project Site

Common Name/Family	*Scientific Name*	Growth Habit	Wetland Indicator Status	Sensitivity / Listing Status	Native Status
Rush	*Juncus* sp.	H			
Baltic rush	*Juncus balticus* ssp. *ater*	H	FACW	N	
Lamp rush	*Juncus effusus*	H	FACW	N	
Iris-leaved rush	*Juncus xiphoides*	H	OBL	N	
POACEAE (Grass Family)					
Slender wild oat	*Avena barbata*	G	NL	I	
Wild oat	*Avena fatua*	G	NL	I	
Little quaking grass	*Briza minor*	G	FAC	I	
Ripgut grass	*Bromus diandrus*	G	NL	I	
Soft chess	*Bromus hordeaceus*	G	FACU	I	
Bermuda grass	*Cynodon dactylon*	G	FACU	I	
Salt grass	*Distichlis spicata*	G	FAC	N	
Barnyard grass	*Echinochloa crus-galli*	G	FACW	I	
Medusa head	*Elymus caput-medusae*	G	NL	I	
Brome fescue	*Festuca bromoides*	G	FACU	I	
Rattail sixweeks grass	*Festuca myuros*	G	FACU	I	
Rye grass	*Festuca perennis*	G	FAC	I	
Mediterranean barley	*Hordeum marinum* ssp. *gussoneanum*	G	FAC	I	
Hare barley	*Hordeum murinum* ssp. *leporinum*	G	FACU	I	
Dallis grass	*Paspalum dilatatum*	G	FAC	I	
Harding grass	*Phalaris aquatica*	G	FACU	I	
Annual blue grass	*Poa annua*	G	FAC	I	
Rabbitfoot grass	*Polypogon monspeliensis*	G	FACW	I	
Johnson grass	*Sorghum halepense*	G	FACU	I	
Purple needlegrass	*Stipa pulchra*	G	NL	N	
THEMIDACEAE (Brodiaea Family)					
Brodiaea	*Brodiaea* sp.	H		N	
Blue dicks	*Dipterostemon capitatus*	H	FACU	N	
TYPHACEAE (Cattail Family)					
Broad-leaved cattail	*Typha latifolia*	H	OBL	N	

Wetland Indicator Status

OBL = Obligate wetland species, occurs almost always in wetlands (>99% probability)
FACW = Facultative wetland species, usually found in wetlands (67-99% probability)
FAC = Facultative species, equally likely to occur in wetland and non-wetlands (34-66% probability)
FACU = Facultative upland species, not usually found in wetlands (1-33% probability)
UPL = Upland species, almost never found in wetlands (<1% probability)
NI = No indicator has been assigned due to a lack of information to determine indicator status
NL = Not listed, assumed upland species

Growth Habit	Native Status
G = Grass H = Herb S = Shrub T = Tree	N = Native I = Introduced

BIRDS		
ANATIDAE (Ducks, Geese, and Swans)		
Greater White-fronted Goose	*Anser albifrons*	M
Snow Goose	*Chen caerulescens*	M
Canada Goose	*Branta canadensis*	M
Mallard	*Anas platyrhynchos*	M
PHASIANIDAE (Partridges, Grouse, Turkeys, and Old World Quail)		
Ring-necked Pheasant	*Phasianus colchicus*	
Wild Turkey	*Meleagris gallopavo*	
COLUMBIDAE (Pigeons and Doves)		
Rock Pigeon	*Columba livia*	
Eurasian Collared-Dove	*Streptopelia decaocto*	
Mourning Dove	*Zenaida macroura*	M
TROCHILIDAE (Hummingbirds)		
Anna's Hummingbird	*Calypte anna*	M
CHARADRIIDAE (Lapwings and Plovers)		
Killdeer	*Charadrius vociferus*	M
SCOLOPACIDAE (Sandpipers, Phalaropes, and Allies)		
Greater Yellowlegs	*Tringa melanoleuca*	M
LARIDAE (Gulls, Terns, and Skimmers)		
California Gull	*Larus californicus*	M, WL
Herring Gull	*Larus argentatus*	M
PHALACROCORACIDAE (Cormorants)		
Double-crested Cormorant	*Phalacrocorax auritus*	M, WL
ARDEIDAE (Bitterns, Herons, and Allies)		M
Great Blue Heron	*Ardea herodias*	M
Great Egret	*Ardea alba*	M
CATHARTIDAE (New World Vultures)		
Turkey Vulture	*Cathartes aura*	M
ACCIPITRIDAE (Hawks, Kites, Eagles, and Allies)		
White-tailed Kite	*Elanus leucurus*	M, FP
Northern Harrier	*Circus hudsonius*	M, CSC
Red-shouldered Hawk	*Buteo lineatus*	M
Red-tailed Hawk	*Buteo jamaicensis*	M
PICIDAE (Woodpeckers and Allies)		
Nuttall's Woodpecker	*Picoides nuttallii*	M
Northern Flicker	*Colaptes auratus*	M
FALCONIDAE (Caracaras and Falcons)		
American Kestrel	*Falco sparverius*	M
TYRANNIDAE (Tyrant Flycatchers)		

Wildlife Species Observed at the OPUD South County Infrastructure Project Site

Common Name/ Family	*Scientific Name*	Sensitivity / Listing Status[1]
Black Phoebe	*Sayornis nigricans*	M
CORVIDAE (Jays and Crows)		
California Scrub-Jay	*Aphelocoma californica*	M
American Crow	*Corvus brachyrhynchos*	M
Common Raven	*Corvus corax*	M
SITTIDAE (Nuthatches)		
Red-breasted Nuthatch	*Sitta canadensis*	M
TROGLODYTIDAE (Wrens)		
Marsh Wren	*Cistothorus palustris*	M
REGULIDAE (Kinglets)		
Ruby-crowned Kinglet	*Regulus calendula*	M
TURDIDAE (Thrushes)		
American Robin	*Turdus migratorius*	M
MIMIDAE (Mockingbirds and Thrashers)		
Northern Mockingbird	*Mimus polyglottos*	M
STURNIDAE (Starlings)		
European Starling	*Sturnus vulgaris*	
PASSERIDAE (Old World Sparrows)		
House Sparrow	*Passer domesticus*	
FRINGILLIDAE (Fringilline and Cardueline Finches and Allies)		
House Finch	*Haemorhous mexicanus*	M
Lesser Goldfinch	*Spinus psaltria*	M
American Goldfinch	*Spinus tristis*	M
PARULIDAE (Wood-Warblers)		
Yellow-rumped Warbler	*Setophaga coronata*	M
EMBERIZIDAE (Emberizids)		
Savannah Sparrow	*Passerculus sandwichensis*	M
Song Sparrow	*Melospiza melodia*	M
White-crowned Sparrow	*Zonotrichia leucophrys*	M
Golden-crowned Sparrow	*Zonotrichia atricapilla*	M
ICTERIDAE (Blackbirds)		
Red-winged Blackbird	*Agelaius phoeniceus*	M
Tricolor Blackbird	*Agelaius tricolor*	ST, CSC
Western Meadowlark	*Sturnella neglecta*	M
Brewer's Blackbird	*Euphagus cyanocephalus*	M
MAMMALS		
TALPIDAE (Moles)		
Broad-footed Mole	*Scapanus latimanus*	
LEPORIDAE (Rabbits and Hares)		
Black-tailed Hare	*Lepus californicus*	
SCIURIDAE (Chipmunks, Squirrels, and Marmots)		
California Ground Squirrel	*Spermophilus beecheyi*	
GEOMYIDAE (Pocket Gophers)		
Botta's Pocket Gopher	*Thomomys bottae*	
CRICETIDAE (Deer Mice, Voles, and Relatives)		
Western Harvest Mouse	*Reithrodontomys megalotis*	

Wildlife Species Observed at the OPUD South County Infrastructure Project Site

Common Name/ Family	*Scientific Name*	Sensitivity / Listing Status[1]
California Vole	*Microtus californicus*

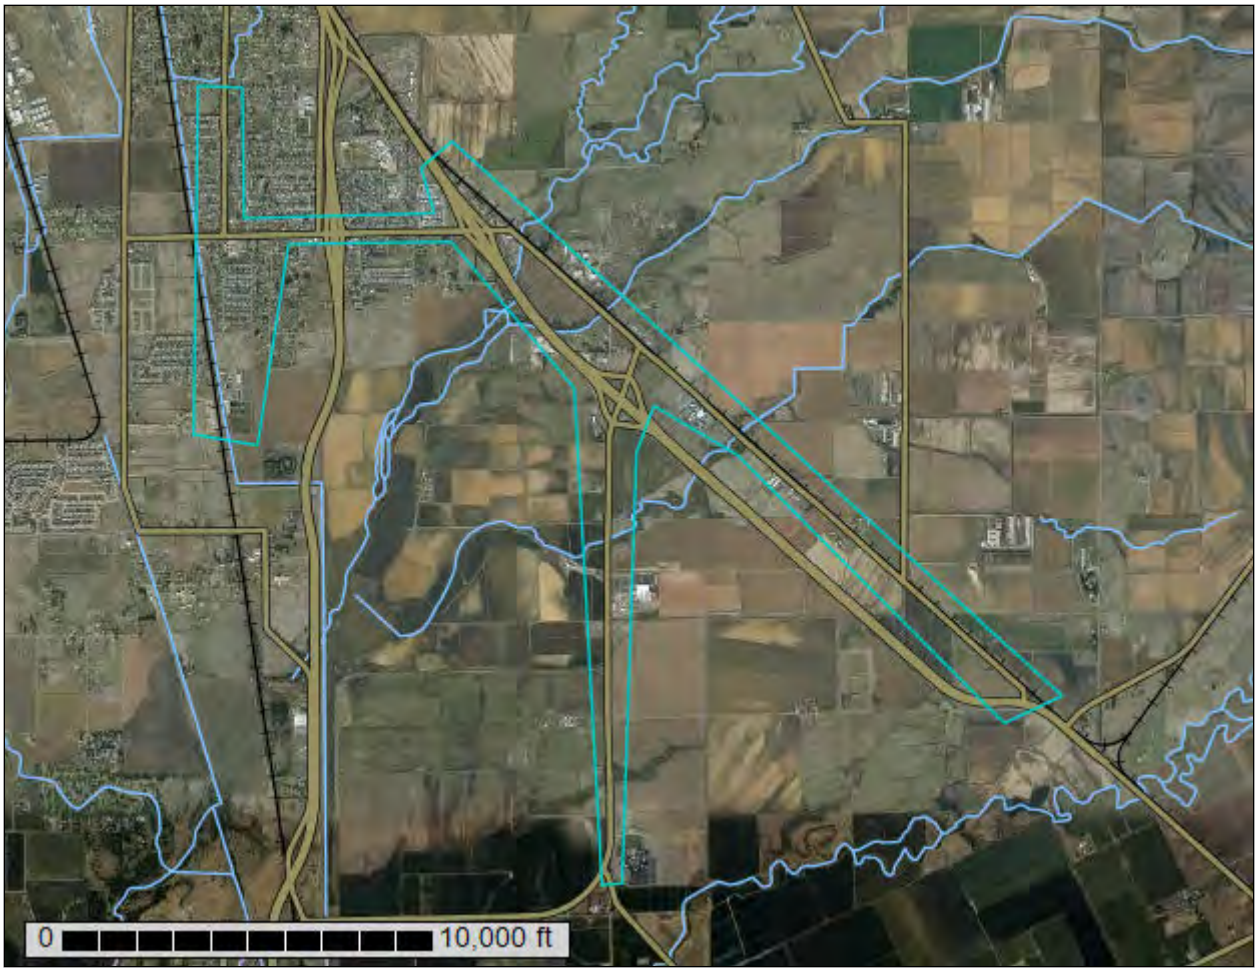
Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Yuba County, California

OPUD Water/Wastewater Improvement Project



February 24,

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Yuba County, California
Survey Area Data: Version 15, Sep 6, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 6, 2018—Jul 2, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties

and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Yuba County, California

131—Hollenbeck silty clay loam, 0 to 1 percent slopes

Map Unit Setting

National map unit symbol: hg3g
Elevation: 30 to 120 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 270 to 290 days
Farmland classification: Prime farmland if irrigated

Map Unit Composition

Hollenbeck, silty clay loam, and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hollenbeck, Silty Clay Loam

Setting

Landform: Basin floors
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Clayey alluvium

Typical profile

H1 - 0 to 8 inches: silty clay loam
H2 - 8 to 43 inches: silty clay
H3 - 43 to 47 inches: clay loam

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: 39 to 65 inches to duripan
Drainage class: Moderately well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 6.5 inches)

Interpretive groups

Description of Oakdale, Sandy Loam

Setting

Landform: Stream terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Mixed alluvium

Typical profile

H1 - 0 to 9 inches: sandy loam
H2 - 9 to 53 inches: sandy loam
H3 - 53 to 70 inches: loamy sand

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 7.9 inches)

Interpretive groups

Land capability classification (irrigated): 1
Land capability classification (nonirrigated): 3c
Hydrologic Soil Group: A
Hydric soil rating: No

Description of Urban Land

Typical profile

H1 - 0 to 60 inches: variable

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8s
Hydric soil rating: No

Minor Components

San joaquin

Percent of map unit: 10 percent
Hydric soil rating: No

Unnamed

Percent of map unit: 5 percent
Hydric soil rating: No

214—San Joaquin loam, 0 to 1 percent slopes

Map Unit Setting

National map unit symbol: hg6j
Elevation: 60 to 130 feet
Mean annual precipitation: 18 to 22 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 270 to 290 days
Farmland classification: Not prime farmland

Map Unit Composition

San joaquin, loam, and similar soils: 80 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of San Joaquin, Loam

Setting

Landform: Fan terraces
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Mixed alluvium

Typical profile

H1 - 0 to 16 inches: loam
H2 - 16 to 25 inches: clay
H4 - 25 to 35 inches: duripan

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches; 20 to 40 inches to duripan
Drainage class: Moderately well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Calcium carbonate, maximum content: 1 percent
Available water supply, 0 to 60 inches: Very low (about 2.4 inches)

Interpretive groups

Land capability classification (irrigated): 4s
Land capability classification (nonirrigated): 4s

Subject: **UPDATED DRAFT PRELIMINARY GEOTECHNICAL BASIS OF DESIGN REPORT**
Olivehurst Public Utilities District
South Yuba Sewer and Water Infrastructure Project
Olivehurst, California

Dear Mr. DeCou,

Blackburn Consulting (Blackburn) is pleased to submit this Updated Draft Preliminary Geotechnical Basis of Design Report for the Olivehurst Public Utilities District (OPUD) South Yuba County Sewer and Water Infrastructure project in Olivehurst, California. Blackburn prepared this report in accordance with our May 14, 2020 Proposal and August 21, 2020 Agreement. This updated report includes responses to Jacobs review comments. It does not include information on borings completed since our original report, because laboratory tests are pending.

Thank you for selecting Blackburn to be on your design team. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

1 INTRODUCTION

1.1 Purpose

Blackburn Consulting (Blackburn) prepared this Updated Draft Preliminary Geotechnical Basis of Design Report (Draft Preliminary GBODR) for the Olivehurst Public Utility District (OPUD) South Yuba Sewer and Water Infrastructure Project (Project) in Olivehurst, California. This report includes the responses to Jacobs' review comments. It does not include information on borings completed since our original report, because laboratory tests are pending. This report contains descriptions of the surface and subsurface conditions, site geology, and preliminary geotechnical design considerations.

Blackburn prepared this report for Jacobs Engineering Group (Jacobs) and the project design team to use during preliminary design. This report shall not be used for final design or relied upon by others, or for different locations or improvements without the written consent of Blackburn. The design considerations in this report are based on limited information and knowledge of the project alignment and structure locations. Blackburn will perform additional subsurface exploration, laboratory testing, engineering analysis and prepare a Final GBODR for final design.

This report contains separate sections for Sewer and Water Pipelines, Trenchless Pipeline Crossings, Pump Stations and Lift Stations, WWTP Improvements, and Water Tank and Booster Station. Each section contains subsections on subsurface conditions, laboratory test results, site geology and seismicity, ground water, and design considerations (except for trenchless crossings). Jacobs Engineering Group, Inc. is providing geotechnical design recommendations for the trenchless crossings separate from this report. Geotechnical information pertinent to each project component is repeated in each report section as necessary to facilitate ease of preliminary design by different companies that are using this report.

1.2 Scope of Services

To prepare this report, Blackburn:

- Discussed the proposed improvements with Mr. Steve DeCou and Ms. Myra Au (Jacobs); Mr. Sean Minard (MHM); Joe Domenichelli, Sara Rogers, and Daryl Heigher (Domenichelli and Associates); and Jim Carson (Affinity Engineering).
- Reviewed the Draft Preliminary Plan and Profile sheets provided by MHM.
- Reviewed available geotechnical information for the Olivehurst WWTP and Caltrans Log of Test Borings for bridge structures near the project alignment.
- Observed the subsurface conditions in forty-three borings drilled along the project alignment in August and September 2020 and in five test pits excavated at the Olivehurst Wastewater Treatment Plant on October 19, 2020.
- Performed laboratory tests on representative soil samples obtained from the exploratory borings.
- Performed preliminary engineering analysis and calculations to develop our preliminary design considerations.
- Reviewed and responded to Jacobs' comments on our December 11, 2020 Draft Preliminary Geotechnical Basis of Design Report.

DRAFT

1.3 Project Description and Location

The proposed project components include:

- About 8½ miles of 8" to 24" diameter sewer gravity and force main,
- About 9 miles of 24" diameter water force water main,
- One Highway 70 water line trenchless crossing,
- One Highway 70 sewer line trenchless crossing,
- Two Highway 65 sewer line trenchless crossings,
- Six to eight sewer and/or water line creek/canal crossings,
- Eight new sewer pump/lift stations.
- Olivehurst WWTP improvements consisting of a new secondary clarifier, concrete-lined equalization basin, and on-site piping.
- A new water well site including a 1 MG steel storage tank, booster station and on-site piping near the Hard Rock Hotel and Casino.

Figure 1 shows the general location of the proposed improvements and Figure 2 shows the site location.

2 PROJECT GEOLOGY AND SOIL SURVEY

2.1 Geology and Soil Survey

We reviewed geology maps and the United States Department of Agriculture's (USDA) Web Soil Survey (https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm). The "Geologic Map of the Late Cenozoic Deposits of the Sacramento Valley and Northern Sierra Foothills, California" (Helley and Harwood, 1985) shows the project is underlain by:

- Holocene Alluvium - unweathered gravel, sand, and silt deposited by present-day stream and river systems.
- Holocene Basin Deposits - Undivided as silt and clay derived from the same sources as modern alluvium. Thickness in the valley varies from 3 to 6 ft. along the perimeter up to 200 ft. in the center.
- Upper Member, Modesto Formation - unconsolidated, unweathered gravel, sand, silt, and clay. Deposits belonging to the upper member of the Modesto are only a few meters thick and generally form a thin veneer deposited on older alluvial deposits.
- Upper Member, Riverbank Formation - Unconsolidated but compact, dark-brown to red alluvium composed of gravel, sand, silt and clay.

Figure 3 shows the geologic formations within the project area.

The Fault Activity Map of California[1] does not identify Historic or Holocene age faults (displacement within the last 11,700 years) within or adjacent to the project site. The nearest mapped fault is the Late

[1] Jennings, Charles W., and Bryant, William A., 2010 Fault Activity Map of California: California Geological Survey, Geologic Data Map No. 6.

DRAFT

Quaternary Foothills Fault System, Spenceville fault, located about 12 miles to the east. The nearest active mapped fault is the Cleveland Hill Fault located approximately 25 miles north of the site.
The USDA web soil survey indicates that the site is underlain by mostly San Joaquin loam (Map Unit 214, 217) and also Hollenbeck silty clay loam (Map Unit 131, 134), Conejo Loam (Map Units 141, 142, 143), and Oakdale Sandy loam (Map Unit 197, 198). Table 2.1 presents classification properties of these soil units according to the USDA soil survey.

Table 2.1: USDA Soil Properties

Map Unit Name/Symbol	Depth (in)	USCS Classification	Percent fines	Liquid Limit	Plasticity Index
San Joaquin loam/214, 217	0 to 25	Silt, Silty Clay, Lean Clay	50 to 70	15 to 50	0 to 35
Hollenbeck silty clay loam/131, 134	0 to 43	Lean Clay, Fat Clay	85 to 95	40 to 60	20 to 35
Conejo loam/141,142,143	0 to 65	Lean Clay	58 to 79	31 to 49	13 to 25
Oakdale Sandy loam/197, 198	0 to 70	Silty Sand, Clayey Sand	15 to 50	20 to 30	0 to 10

Figure 4 shows where these USDA soil units underlie the project site.

3 SEWER AND WATER PIPELINES

3.1 Site Location and Description

The proposed Project sewer and water pipeline alignments extend along the following streets in and near Olivehurst in South Yuba County, California:

- Olivehurst Avenue between 11th Avenue and 14th Avenue.
- Mary Avenue.
- McGowan Parkway between Mary Avenue and Rancho Road.
- Olive Avenue from McGowan Parkway approximately 500 ft north, where it crosses Highway 65 to the cul de sac at the north end of Rancho Road.
- Rancho Road, from the northern cul de sac south to where it crosses Highway 65 to Morrison Road.
- Forty Mile Road from the Toyota Amphitheater to Rancho Road.
- Rossler Road from Forty Mile Road approximately 1250 ft north, where it crosses Highway 65 to the cul de sac at the south end of Shimer Road.
- Shimer Road.

DRAFT

Pipeline depths will generally range from 5 to 18 feet below the ground surface (bgs) based on input from design team members. However, final pipe sizes and depths have not been determined.

The pipeline alignment is generally level, with ground surface elevations ranging from about 60 to 70 feet and up to about 76 feet in the south.

The western portion of the pipeline along Olivehurst Ave, Mary Ave, McGowan Pkwy, and Olive Ave extends predominantly through residential portions of Olivehurst. Photos 1 through 3 show the conditions along these streets.

The eastern and southern pipeline alignments extend along rural roads (Rancho Rd, Morrison Rd, Forty Mile Rd, and Shimer Rd). The roads in these portions of the alignment are generally flanked by a drainage ditch on one or both sides. Photos 4 through 8 show the conditions along these streets.

Looking north along Project alignment near Station 404+60.

Appendix A1 shows the proposed pipeline alignments and Figure 2 shows the pipeline alignments, our approximate subsurface exploratory boring locations (all pipeline boring locations have been drilled and laboratory testing is ongoing)and the proposed improvements.

3.2 Geology, Soil Survey, Faulting

See Section 2.1 for a discussion of geology and faulting along the pipeline alignment. Figure 3 shows the mapped geologic units within the project site. Figure 4 shows the USDA soil types mapped within the project area. Figure 2.1 shows the mapped geologic formations and USDA soil types within each pipeline segment.

3.3 Field Work and Laboratory Testing

3.3.1 Exploratory Borings

Blackburn drilled, logged and sampled 43 borings along the pipeline alignments to characterize the site subsurface conditions. Our subcontractor, Taber Drilling, drilled the borings to depths ranging from about 15 to 50 feet below the existing ground elevation. Appendix A1 shows the proposed site improvements and approximate boring locations. The borings logs are included in Appendix A2 (does not include borings where laboratory testing is ongoing).

Taber drilled the borings using a combination of 4-inch diameter solid-stem auger and mud-rotary. Soil samples were obtained by Taber at various intervals using a 3.0-inch O.D. Modified California (MC) sampler (equipped with 2.4-inch diameter steel liners) or 2–inch O.D. Standard Penetration (SPT) sampler. Samples were driven with an automatic hammer, weighing 140-pounds and falling approximately 30-inches per blow. We also collected bulk samples at various depths within the borings.

DRAFT

Blackburn's project engineers/geologists Daniel Contreras, Luke Morrell, and Sophie Stuart logged the borings and retained samples for laboratory testing.

3.3.2 Laboratory Testing

We performed the following laboratory tests on representative soil samples from the exploratory borings:

- Unit weight and moisture content tests for in-situ soil property characterization.
- Sieve analysis and Plasticity index for soil classification.
- Direct shear and unconfined compression tests for soil strength analysis.
- Soil corrosivity (pH, resistivity, sulfate and chlorides) for corrosion considerations.

Refer to Section 3.5.8 for a description and evaluation of the corrosivity test results.

The boring logs in Appendix A2 show unit weight and moisture content results. Appendix A3 presents the other laboratory test results.

3.4 Subsurface Findings

3.4.1 General Subsurface Soil Conditions

We predominantly encountered very stiff to hard clay and sandy clay in borings drilled along the proposed alignment. We encountered medium dense to very dense sand and clayey sand lenses in scattered areas throughout the alignment. Some of the soil layers contained gravel.

Table 3.1 summarizes the subsurface soil conditions we encountered along the pipeline alignment.

DRAFT

3.4.2 Groundwater

We generally observed groundwater at depths of 23 to 29 feet below the ground surface in borings drilled August through September 2020. In three borings near Reeds Creek on Rancho Road, we observed groundwater at depths of 14 to 15 feet. We encountered groundwater 17 feet below the ground surface in one boring on Forty Mile Road just north of Kimball Creek.

Table 3.2 lists the borings and depths where we encountered groundwater.

Table 3.2: Groundwater Summary

Boring	Approximate Station	Boring Depth (ft)	Approximate Depth to Water (ft)
TC-2AA	19+60	51.5	29
TC-2C	300+10	51.5	27.5
TC-7A	321+30	51.5	23
TC-7B	323+30	51.5	15
TC-8A	329+60	51.5	14
TC-8B	331+10	51.5	15
TC-9A	349+70	51.5	25
TC-9B	351+20	51.5	25
TC-10A	400+00	51.5	24
TC-10B	402+60	51.5	24
TC-12A	147+50	51.5	24
TC-12B	149+80	51.5	17
TC-13	85+80	51.4	26
TC-14	427+90	41.5	28

We reviewed groundwater level data for nearby wells available at the California Department of Water Resources website (http://www.water.ca.gov/waterdatalibrary/) and using the Sustainable Groundwater Management Act (SGMA) data viewer (https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels). Based on this information, the depth to groundwater across the site typically ranges from 20 to 30 feet, although it occasionally is measured above 20 feet or below 30 feet. Relatively shallow perched water may occur within the near-surface soils during the winter and spring months, and adjacent to the existing canals and streams.

Groundwater and perched water levels can fluctuate due to changes in precipitation, creek levels, canal levels, irrigation, pumping of wells, and other factors.

3.4.3 Existing Pavement Sections

We drilled 30 of the 43 borings in the paved roadway.

DRAFT

- Along Olivehurst Ave, the pavement section consisted of about 6 to 9 inches of AC over 0 to 6 inches of AB.
- Along Mary Ave, the pavement section consisted of about 1 to 6½ inches of Asphalt Concrete (AC) over 0 to 3 inches of Aggregate Base (AB).
- Along McGowan Ave west of Highway 70, the pavement section consisted of about 6 inches of AC over 15 inches of AB.
- Along McGowan Ave east of Highway 70, the pavement section consisted of about 3 to 6 inches of AC over 3 to 6 inches of AB.
- Along Rancho Rd, the pavement section consisted of about 2½ to 9 inches of AC over 9 to 16 inches of AB (Boring P-16 had approximately 32 inches of AB).
- Along Forty Mile Rd, the pavement section generally consisted of about 6 to 7 inches of AC over 10 to 14 inches of AB (boring log TC-12A indicates 3 inches of AC over 4 inches of AB).

Table 3.1 includes approximate pavement section thickness encountered in each boring.

3.5 Preliminary Design Considerations – Sewer and Gravity Force Main

3.5.1 Alignment Ground Suitability

The ground conditions along the proposed pipeline alignment will be suitable for the planned improvements when constructed in accordance with the project plans, industry standards, and our geotechnical recommendations.

3.5.2 Geologic Hazards

- Faulting—The potential for surface rupture or creep due to faulting at the site is very low. The Fault Activity Map of California[2] and the Geologic Map of the Sacramento Quadrangle[3] does not identify Historic or Holocene age faults (displacement within the last 11,700 years) within or immediately adjacent to the site. The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone[4].
- Ground Shaking—For the Maximum Considered Earthquake, a peak horizontal ground acceleration (PGA) of approximately 0.21g could be expected.
- Liquefaction—Our investigation shows a soil profile that consists of stiff to hard clays and medium dense to dense silty and clayey sands that are not liquefiable. Therefore, the potential for damaging liquefaction at the site is very low.
- Landslides and Slope Stability—Due to the relatively low topographic relief and existing slope gradients we do not expect landslides or natural slope failure.

[3] Saucedo, G.J. and Wagner, D.L., et al, 1992, Geologic map of the Chico quadrangle, California, 1: 250,000: California Division of Mines and Geology, Regional Geologic Map 7A, scale 1: 250,000.

[4] Bryant, W.A., and Hart, E.W., 2007 (Interim Revision), Fault-Rupture Hazard Zones in California: California Department of Conservation, Division of Mines and Geology, Special Publication 42.

DRAFT

- Seismically Induced Settlement—During a seismic event, ground shaking can cause densification of granular soil that can result in settlement of the ground surface. Considering the cohesive soils and medium dense to very dense sandy soils observed in the borings, we consider the potential for significant seismically induced settlement to be very low.

3.5.3 Seismic Design

Based on the mapped geology and our subsurface exploration, most of the preliminary pipeline alignment is underlain by stiff soil and a Site Class "D" (California Building Code, 2019).

Table 3.3 presents the California Building Code[5] (CBC) design parameters for the alignment. These values are based on Blackburn's review of design parameters at the approximate midpoint of the pipeline alignment.

Table 3.3: 2019 CBC Seismic Design Parameters (Site Class D)	
S_s – MCE_R ground motion (0.2 second period)	0.496 g
S_1 – MCE_R ground motion (1.0 second period)	0.241 g
F_a – Site Coefficient	1.403
F_v – Site Coefficient	2.12[1]
S_{MS} – Adjusted MCE* Spectral Response Acceleration Parameter	0.696 g
S_{M1} – Adjusted MCE* Spectral Response Acceleration Parameter	0.511 g[1]
S_{DS} – Design Spectral Acceleration Parameter	0.464 g
S_{D1} – Design Spectral Acceleration Parameter	0.341 g[1]
Seismic Design Category	D[1]
**T_L – Long Period Transition Period	12 sec
PGA	0.21

* Maximum Considered Earthquake
** Figure 22-14, ASCE 7-16
1 – We assume that the seismic response coefficient, Cs, is determined by ASCE 7-16 Eq. (12.8-2) for values of T ≤ 1.5Ts and taken as equal to 1.5 times the value computed in accordance with either ASCE 7-16 Eq. (12.8-3) for TL ≥T > 1.5Ts or Eq. (12.8-4) for T > TL. Contact Blackburn to re-evaluate the above parameters if this assumption is not valid.

If the proposed design does not meet the exception noted above (note 1) a site-specific response analysis will be required for final design.

3.5.4 Soil Excavatability and Trench Stability

We anticipate that the site soil will be excavatable with a medium to large size excavator (such as a CAT 320 or similar).

[5] California Building Code, 2016, California Code of Regulations, Title 24, Part 2 (Volume 2); published by International Conference of Building Officials and the California Building Standards Commission (CBSC).

DRAFT

Open excavations 5 feet or deeper will require sloping and/or shoring in accordance with Section 8.4 of the Yuba County Standard Specifications and Cal OSHA requirements. For planning and preliminary design, anticipate sloping/shoring requirements within the soil along the alignment for Type A soil. Excavations near waterway crossings or where perched groundwater/seepage or a sand layer is encountered will require shoring/sloping requirements for a Type C soil (shoring or sloping at a gradient of 1.5:1).

The contractor is responsible for the safety of all temporary excavations and must provide trench sloping and shoring in accordance with current Cal OSHA requirements based on exposed soil and groundwater/seepage conditions. The contractor is also responsible for the protection of existing facilities and improvements. The Contractor must retain an engineer to evaluate the impact of construction traffic vibrations, actual soil conditions exposed in the open excavations, seepage and/or groundwater conditions, surcharges adjacent to excavations, proximity of excavations to existing structures, and other factors that may promote excavation wall instability or cause excavation related damage to existing facilities and improvements and adjust excavation sloping/shoring methods accordingly.

3.5.5 Trench Dewatering

We did not encounter groundwater in our pipeline borings at anticipated trench depths. We anticipate that groundwater/seepage could be encountered at/near trenchless crossings or perched at shallower depths along the project alignment. Section 3.4.2 shows the depth of groundwater encountered in our borings. Groundwater levels may be higher during the late fall through late spring months, resulting from higher water levels in creeks and precipitation infiltrating the shallow surficial soil and ponding above the hard clay layers. Similarly, landscape irrigation along the project alignment could infiltrate and pond above the hard clay layer.

Sump pumps should be adequate to dewater excavations if groundwater/seepage is encountered. during excavation. The contractor is solely responsible for design and performance of dewatering systems.

We strongly recommend scheduling the project excavations and backfill during the summer through early fall months to reduce potential groundwater/seepage impacts.

Dewatering needs may differ near creak crossings. Refer to Jacobs' trenchless crossing design for dewatering recommendations for trenches near creek crossings.

3.5.6 Trench Backfill and Compaction

3.5.6.1 Pipe Bedding and Pipe Zone Material

Support pipe on a minimum of 4-inches of granular bedding and in accordance with the pipe manufacturer's recommendations. Although we do not anticipate soft, unsuitable pipe subgrade at any particular location, it can occur where shallow perched groundwater conditions or sandy soils are encountered. If unsuitable subgrade conditions exist, notify the project engineer and Blackburn for review and mitigation recommendations. Typical mitigation, to achieve a stable and non-yielding subgrade suitable for pipe placement and backfilling, may include replacement of unsuitable subgrade with ¾-inch

DRAFT

minus crushed rock (minimum of 6 inches), enclosed in geotextile filtration fabric such as Mirafi 140N (or equivalent). A granular pipe zone material may also be used.

Native soils will contain a significant amount of fines (passing #200 sieve) and will not be suitable for bedding or pipe zone backfill. For pipe zone backfill material (which extends a minimum 12 inches above the top of pipe), Yuba County, Department of Public Works, Standard Plans and Specifications specifies the following:

1. ¾-inch crushed rock or clean sand compacted to 95% or
2. 2 sack slurry

Use a modulus of soil reaction (E') of:

- 2,000 psi for granular pipe zone backfill outlined above (or another approved granular material) if compacted to >85% relative compaction (ASTM D 1557) or 4,000 psi at >90%.
- 3,000 psi for native soils that consist of stiff to hard clays.

3.5.6.2 Trench Backfill

Yuba County Department of Public Works Trench Details show backfill within existing roadways is to be ¾-inch Class 2 AB compacted to 95% relative compaction (based on ASTM 1557) unless recommended by an engineer and approved by the County. Intermediate trench backfill above the pipe zone material may consist of native excavated soil provided the following recommendations are followed. Fill should be free of debris and concentrations of vegetation.

If import fill is required for trench backfill, it should be graded and have material properties as follows:

- 100% passing the 1-inch sieve
- 75% to 100% passing the #4 sieve
- Minimum 12% passing the #200 sieve
- Plasticity Index not greater than 20
- Free of debris and concentrations of vegetation.

Use ¾-inch Class 2 AB in the upper 12-inches of the trench within roadways.

3.5.6.3 Trench Backfill Compaction

It is important to achieve compaction of Pipe Bedding and Pipe Zone materials at the pipe haunches and spring line; compaction below the pipe spring line will be a difficult task for the contractor. Follow the pipe manufacturer's requirements for initial backfill to avoid damage to the pipe. To facilitate compaction in the pipe zone area (top of bedding up to 12 inches above pipe), use a trench width that provides a minimum clearance of 12 inches between the pipe and trench wall. We recommend a compaction demonstration section to test placement and compaction means and methods for each material type that will be used.

Moisture condition trench backfill above the Pipe Zone material to within 2% of optimum moisture content. Compact pipe backfill:

- To a minimum 92% relative compaction (based on ASTM 1557) below depths of 10 feet.

DRAFT

- To a maximum of 90% relative compaction (based on ASTM 1557) above depths of 10 feet
- In roadways, compact upper 12-inches of AB subgrade to 95% relative compaction (based on ASTM 1557).

To protect the pipe, use a maximum loose lift thickness of 12 inches for the first lift of fill placed above the top of the pipe. Use a maximum loose lift thickness of 8 inches for subsequent lifts. . Jetting is not acceptable for compaction.

Test all trench backfill (bedding, pipe zone backfill, trench zone, etc.) at vertical increments of not more than 1 foot and at final grade or pavement subgrade. For horizontal testing frequency consider a frequency of at least one test for every 200 linear feet of pipe (both sides of pipe in pipe zone). Complete at least one compaction curve (Proctor) for each material type, source location (for import), and as changes in native materials occur. Material changes include a change in material designation based on the Unified Soil Classification System. Testing frequency can be adjusted based on contractor performance, ease of compaction, and material variability.

Soil excavated during pipe installation can have moisture contents well over optimum, especially during the winter and spring months or if perched water is encountered. In this case, it will be necessary to dry back the soil to within 2% of optimum moisture content prior to use as backfill.

3.5.6.4 Trench Backfill Settlement

The magnitude of potential trench backfill settlement will be largely dependent on the degree and uniformity of compaction; therefore, it is important that backfill materials and compaction are checked at frequent intervals to limit potential settlement.

3.5.7 Pipeline Thrust Blocks

We expect thrust blocks to be installed at depths greater than 10 feet. For design of thrust blocks, use a lateral bearing of 200 psf per foot of depth below the surface, up to a maximum of 3,000 psf.

3.5.8 Soil Corrosivity

Our sulfate and chloride content tests indicate that Type II or V Portland cement can be used for concrete mix design. Our pH and resistivity tests generally indicate that the onsite soil exhibits a corrosive to extremely corrosive potential to metal pipes. We are not corrosion consultants and cannot evaluate the potential corrosion impacts to metallic elements embedded in, or in contact with, the ground. A corrosion consultant should provide specific corrosion protection recommendations for buried metallic elements used at the site. Table 3.4 presents the soil corrosivity test results.

4 TRENCHLESS PIPELINE CROSSINGS

4.1 Site Location and Description

The sewer and water pipelines described in Sections 1.3 and 3.1 will use trenchless technologies to cross various waterways and Caltrans freeways. The final size, depths, and trenchless methods have not been determined at this time. Table 4.1 summarizes the location of each trenchless Caltrans crossing and Table 4.2 summarizes the location of each waterway crossing.

Table 4.1: Caltrans Crossing Locations			
Pipeline(s)	**Freeway Crossed**	**Upstream Road**	**Downstream Road**
Water & Sewer	Hwy 70	McGowan Pkwy	McGowan Pkwy
Sewer	Hwy 65	Rancho Rd	Olive Ave
Sewer	Hwy 65	Rossler Rd	Shimer Rd

The Highway 70 grade at the McGowan Pkwy crossing and the Highway 65 grade at the Rancho Rd to Olive Ave crossing are approximately 15 to 20 feet lower than the adjacent roadway grades. At the Highway 65 Rossler Rd to Shimer Rd crossing, the Highway 65 grade is at a similar elevation to the surrounding area.

DRAFT

Table 4.2: Waterway Crossing Locations			
Pipeline(s)	**Waterway Crossed**	**Alignment Road**	**Approximate station of waterway**
Water & Sewer	Reeds Creek	Rancho Rd	322+00
Water & Sewer	Reeds Creek	Rancho Rd	330+00
Water & Sewer	Hutchinson Creek	Rancho Rd	350+00
Water & Sewer	Kimball Creek	Rancho Rd	401+00
Water & Sewer	Culvert	Rancho Rd	428+00
Water	Unnamed creek	Morrison Rd	879+50
Water & Sewer	Culvert	McGowan Pkwy	83+50
Water & Sewer	Kimball Creek	McGowan Pkwy	149+00

The depths of the waterways vary from crossing to crossing. Near the waterway crossings, the roadway is generally lined with trees, bushes and other vegetation.

4.2 Geology

4.2.1 Geology

Tables 4.3 and 4.4 show the mapped geologic formation and USDA soil type within each proposed trenchless crossing area.

4.3 Field Work and Laboratory Testing

4.3.1 Exploratory Borings

To characterize the site subsurface conditions, Blackburn drilled, logged and sampled 17 borings near proposed sending and receiving shaft locations. Jacobs reviewed and approved of the boring locations. Our subcontractor, Taber Drilling, drilled the borings to depths ranging from ± 40 to 50 feet below existing site grades. Appendix B1 shows the proposed site improvements and approximate boring locations. We include the borings logs of borings drilled as of November 10, 2020 in Appendix B2.

Taber drilled the borings using 4-inch diameter solid-stem auger. Soil samples were obtained by Taber at various intervals using a 3.0-inch O.D. Modified California (MC) sampler (equipped with 2.4-inch diameter steel liners) or 2–inch O.D. Standard Penetration (SPT) sampler. Samples were driven with an automatic hammer, weighing 140-pounds and falling approximately 30-inches per blow. We also

DRAFT

collected bulk samples at various depths within the borings. Blackburn's project engineers/geologist Daniel Contreras, Luke Morrell, and Sophie Stuart logged the borings and retained samples for laboratory testing.

4.3.2 Laboratory Testing

Jacobs assigned laboratory tests for trenchless crossing borings. We performed the following laboratory tests on representative soil samples from the exploratory borings as requested:

- Sieve analysis and Plasticity index
- Unconfined compressive strength tests.

Appendix B3 presents the laboratory test results (as of November 10, 2020).

4.4 Subsurface Findings

4.4.1 General Subsurface Soil Conditions

Table 4.3 and 4.4 summarize subsurface soil conditions at the trenchless crossing alignments (based on borings drilled as of November 10th, 2020).

DRAFT

4.4.2 Groundwater

We generally observed groundwater at depths of 23 to 29 feet below the ground surface in our borings drilled August through September 2020. In three (3) borings near Reeds Creek on Rancho Road, we observed groundwater at depths of 14 to 15 feet. We encountered groundwater 17 feet below ground surface in our boring on Forty Mile Road just north of Kimball Creek.

Table 4.5 lists the borings where we encountered groundwater and depth to groundwater.

Table 4.5: Groundwater Summary

Boring	Approximate Station	Approximate Depth to Water (ft.)
TC-2AA	19+60	29
TC-2C	300+10	27.5
TC-7A	321+30	23

TC-12A	147+50	24
TC-12B	149+80	17
TC-13	85+80	26
TC-14	427+90	28

We reviewed groundwater level data for nearby wells available at the California Department of Water Resources website (http://www.water.ca.gov/waterdatalibrary/) and using the Sustainable Groundwater Management Act (SGMA) data viewer (https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels). Based on this information, the depth to groundwater at the site typically ranges from 20 to 30 feet, although it occasionally is measured above 20 feet. Relatively shallow perched water may occur within the near-surface soils during the winter and spring months, and adjacent to the existing canals and streams.

Groundwater and perched water levels can fluctuate due to changes in precipitation, creek and canal levels, irrigation, pumping of wells, and other factors.

4.4.3 Existing Pavement Sections

Table 4.6 shows approximate pavement conditions encountered in borings for the trenchless crossings.

5.2 Geology

Table 5.2 shows the geologic formation and USDA soil type mapped within each proposed lift/pump station location.

5.3 Field Work and Laboratory Testing

Field work or laboratory testing for pump or lift stations is ongoing at the time of this report. Blackburn will complete drilling borings and laboratory testing at each pump/lift station once the locations have been confirmed. The following subsurface sections are based on the exploratory borings Blackburn drilled, logged, and sampled for the pipeline and trenchless crossing preliminary design.

5.4 Subsurface Findings

5.4.1 General Subsurface Soil Conditions

Table 5.2 shows subsurface conditions in the borings drilled (as of November 10th, 2020) closest to the planned pump station/lift station location.

5.4.2 Groundwater

We generally observed groundwater at depths of 24 to 29 feet below ground surface in the borings drilled nearest the proposed pump/lift station locations in August through September 2020. In boring TC-12B (near proposed Pump Station #25) we measured groundwater at a depth of 17 feet below ground surface.

DRAFT

We reviewed groundwater level data for nearby wells available at the California Department of Water Resources website (http://www.water.ca.gov/waterdatalibrary/) and using the Sustainable Groundwater Management Act (SGMA) data viewer (https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels). Based on this information, the depth to groundwater at the site typically ranges from 20 to 30 feet, although it occasionally is measured above 20 feet. Relatively shallow perched water may occur within the near-surface soils during the winter and spring months, and adjacent to the existing canals and streams.

Groundwater and perched water levels can fluctuate due to changes in precipitation, creek and canal levels, irrigation, pumping of wells, and other factors.

Table 5.3 lists groundwater depth in the 2 borings nearest to each pump station in which the driller encountered groundwater.

5.5 Preliminary Design Considerations – Pump/Lift Stations

The final locations of the pump/lift stations have not been determined. Our subsurface investigation and laboratory testing will be completed once Jacobs determines the final locations and obtains the Rights-

DRAFT

of-Entry. Based on nearby borings completed for the pipeline and trenchless crossings, we anticipate the soil conditions within the proposed pump/lift station sites will be suitable for the planned facilities when constructed in accordance with the project plans, industry standards, and our final geotechnical recommendations. The recommendations below are for preliminary design only and will need to be finalized after we complete the site-specific borings, laboratory tests, and further analysis.

5.5.1 Geologic Hazards

- Faulting—The potential for surface rupture or creep due to faulting at the site is very low. The Fault Activity Map of California[6] and the Geologic Map of the Sacramento Quadrangle[7] does not identify Historic or Holocene age faults (displacement within the last 11,700 years) within or immediately adjacent to the site. The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone[8].
- Ground Shaking—For the Maximum Considered Earthquake, a peak horizontal ground acceleration (PGA) of approximately 0.21g could be expected.
- Liquefaction—Our investigation shows a soil profile that consists of stiff to hard clays and medium dense to dense silty and clayey sands that are not liquefiable. Therefore, the potential for damaging liquefaction at the site is very low.
- Landslides and Slope Stability—Due to the relatively low topographic relief and existing slope gradients, we do not expect landslides or natural slope failure.
- Seismically Induced Settlement—During a seismic event, ground shaking can cause densification of granular soil that can result in settlement of the ground surface. Considering the cohesive soils and medium dense soils observed in the borings, we consider the potential for significant seismically induced settlement to be very low.

5.5.2 Seismic Design

Based on the mapped geology and our boring data, use a Site Class “D” (stiff soil). Table 5.4 presents the 2019 *California Building Code* (Chapter 16) and ASCE 7-16 seismic design parameters for the site.

Seismic Design Category	D[1]
**T_L – Long Period Transition Period	12 sec
PGA	0.21

* Maximum Considered Earthquake
** Figure 22-14, ASCE 7-16
1 – We assume that the seismic response coefficient, Cs, is determined by ASCE 7-16 Eq. (12.8-2) for values of T ≤ 1.5Ts and taken as equal to 1.5 times the value computed in accordance with either ASCE 7-16 Eq. (12.8-3) for TL ≥T > 1.5Ts or Eq. (12.8-4) for T > TL. Contact Blackburn to re-evaluate the above parameters if this assumption is not valid.

If the proposed design does not meet the exception noted above (note 1) a site-specific response analysis will be required for final design.

5.5.3 General Grading Recommendations

5.5.3.1 Excavation Conditions

Based on the soil conditions and drilling performance for nearby explorations, excavation is likely possible with conventional equipment (common earthmoving equipment and large backhoe/excavator). The fine-grained and hard soil conditions can create slow excavation conditions.

5.5.3.2 Site Clearing

Prior to excavation or making any cuts and fills, remove existing underground utilities, foundations, vegetation (root balls and roots), debris, and other underground features in accordance with this Geotechnical Report. Remove loose and disturbed soil caused by the removal(s) and widen the excavation/depression so it is accessible to compaction equipment. Remove strippings from the site or use as landscape soil in designated areas.

5.5.3.3 Original Ground and Subgrade Preparation

After clearing, process and compact the exposed soil in at-grade, cut, and fill areas as follows:

- Scarify the exposed soil to a depth of approximately 8 inches.
- Moisture condition subgrade to within 3% of the optimum moisture content.
- Compact the subgrade soil to a minimum 90% relative compaction based on ASTM D1557

DRAFT

Where fill is placed on sloping ground, blade back slopes horizontally during placement of embankment fill to create a stepped (or benched) fill surface (such that a uniform, sloping fill surface is avoided). Benching must remove loose surficial soils and result in stepped benches, generally one to two feet in height and depth into the existing slope. The lower bench should be sloped a minimum of 2% into the slope. Where benching will interfere with existing structures, utilities, or vegetation, Blackburn can review modifications on a case-by-case basis.

5.5.3.4 General Fill Placement and Compaction

General Fill (not structure backfill) may consist of on-site soil. Fill should be free of debris and concentrations of vegetation.

If import fill is required, it should be graded and have material properties as follows:

- 100% passing the 1-inch sieve
- 75% to 100% passing the #4 sieve
- Minimum 12% passing the #200 sieve
- Plasticity Index not greater than 20
- Free of debris and concentrations of vegetation.
- Approval from Blackburn prior to placement

Place fill in maximum 8-inch thick loose lifts, moisture condition 1% to 2% above optimum, and compact to a minimum of 90% relative compaction based on ASTM D 1557 test procedure. Compact fill using a sheepsfoot or padded drum type roller.

Construct fill slopes no steeper than 2(H):1(V). To achieve adequate compaction on the face of fill slopes, over-build the slopes and then cut back to the design grade. Track-walking is not an adequate method to compact the face of slopes.

5.5.4 Dewatering

Dewatering may be required for installations greater than approximately 20 feet deep. Significant groundwater inflow may occur at the pump stations, particularly those located near water ways during winter and spring months.

Dewatering can consist of:

- Deep sumps within the excavation. Considering the presence of fine-grained soils and relatively flat lying bedding, sumps within the excavation are not likely to provide good drawdown.
- Well points. Well points will likely work better to cut off flow into the excavation and drawdown the water level over a larger area.

To facilitate work at the base of the excavation, groundwater should be drawn down at least 3 feet below the planned bottom of excavation. The need for dewatering can be reduced by planning excavations during the lowest anticipated seasonal water levels (expected during the late summer and fall months.

DRAFT

5.5.5 Temporary Excavations

Temporary excavations will require sloping and/or shoring in accordance with Cal OSHA requirements. Based on our subsurface exploration and laboratory testing, preliminary excavation and shoring design may be based on Type A soil to planned excavation depth that may be sloped at 3/4(H):1(V).

Where groundwater is present or cohesionless/uncemented granular soils are encountered, Type C soil conditions will apply and a 1.5(H):1(V) slope gradient is required.

The Contractor must retain an engineer to evaluate the impact of existing structures, traffic vibrations, actual soil conditions exposed in the open trenches, and other factors that may promote trench wall instability and adjust trench sloping/shoring accordingly. Surcharge loads such as trench spoils, equipment, etc. should not be placed adjacent to an open excavation (within a distance of ½ the height of the trench). ***The above is guideline information only.*** The contractor is responsible for the safety of all excavations and should provide appropriate excavation sloping and shoring in accordance with current Cal OSHA requirements and observe conditions observed during construction for necessary modification and safety.

5.5.6 Foundations

5.5.6.1 Below-Grade Foundations

5.5.6.1.1 Bearing Capacity

The pump/lift stations are below-grade structures and the net pressure exerted upon the subsurface will be similar to or less than the current soil pressure at the bottom of the pump station wet wells. Excavation for below-grade structures reduces the net pressure by removing soil that acts as a “preload” to the underlying soils, thus “unloading” the bearing materials before “loading” by placement of the structure.

We understand that below grade structures will use mat type foundations for support. For structures at depths greater than 15 feet:

- Use a maximum net contact pressure for mat foundation of 3,000 psf.
- Use a Modulus of Subgrade Reaction, k_s, equal to 25 pci.
- We expect settlement of mat foundations is expected to be less than 1 inch with differential settlement less than ½-inch across the pump station structure.
- Clean footing excavations of debris and loose soil prior to placing concrete.
- Blackburn must observe all footing excavations prior to reinforcement placement to verify competent bearing materials.
- For subgrade uniformity, Caltrans Class 2 aggregate baserock as underlayment (this is not geotechnically necessary provided a firm uniform subgrade is obtained). If an aggregate underlayment is used, place a minimum thickness of 6-inches and compact to a minimum of 95% relative compaction (per ASTM D 1557 test method).
- Crushed rock underlayment may also be used (and can benefit excavation dewatering). Underlay the crushed rock with a geotextile filter fabric (i.e., Mirafi 140N) and compact the rock with at least 6 passes of a static roller.

DRAFT

If isolated spread footings or piers are required for column support, Blackburn can provide additional recommendations when the planned design and approximate loading is available.

5.5.6.1.2 Structure Backfill

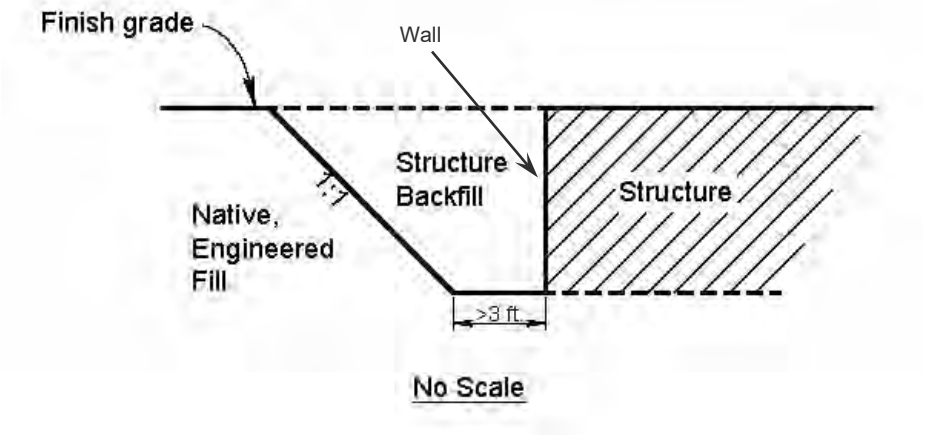
Native material encountered in our borings for the pipeline and trenchless crossings primarily consist of fine-grained soils and are not suitable for structure backfill.

Use the specifications in Table 5.5 for imported structure backfill for all below-grade structures:

Table 5.5: Import Structure Backfill Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
¾ inch	70-100	D6913	202
No. 4	50-100	D6913	202
No. 200	12-40	D6913	202
Plasticity			
Plasticity Index	<12	D4318	204

As shown below, the zone of placement for structure backfill should extend up from the base of the wall at a slope of 1(H):1(V) and at least 3 feet behind the wall.



- Moisture condition structure backfill to within 2% of optimum and place in maximum 8-inch thick, horizontal, loose lifts.
- Compact structure backfill to a minimum 92% relative compaction based on the ASTM D 1557 test method.

To minimize the residual lateral earth pressures on structure walls, restrict compaction equipment behind the walls (by load and distance from wall) so that wall design values are not exceeded. We

DRAFT

recommend compaction within a horizontal distance equal to one-half of the wall height (to a maximum distance of 5 feet), be completed with hand-operated equipment (i.e., jumping jack).

To minimize the potential for significant settlement around deep walls, controlled low strength material (CLSM) can be used to backfill to the surface or to a manageable depth (e.g., 10 feet below grade).

5.5.6.1.3 Lateral Earth Pressures

The pump/lift stations are below grade structures that will act as restrained retaining structures. Walls will retain compacted select native soils and/or imported soils meeting the requirement for structure backfill. For evaluation of lateral earth pressures, use the backfill equivalent fluid weights (EFW) for level ground conditions shown below in Table 5.6.

Table 5.6: LATERAL EARTH PRESSURES

Condition	Equivalent Fluid Weight (pcf)	Seismic Equivalent Fluid Weight (pcf)
At-Rest	85	6
Passive	150	140*

*Total passive EFW for passive condition

The above pressures assume structure backfill placed against the structure wall in accordance with our recommendations, a saturated (total) unit weight of approximately 135 pounds per cubic foot (pcf) and a minimum internal angle of friction of 32 degrees. Notify Blackburn if these assumptions are not valid so that we may assess the situation and provide additional recommendations, if necessary. Backfill with CLSM is an acceptable alternative.

For seismic loading, add the Seismic EFW to the at-rest EFW and apply the total force as a uniform load on the wall with a resultant located at 0.5H where H is the backfill height. We estimated the EFWs for seismic loading using the Mononobe-Okabe equation and a horizontal seismic acceleration coefficient, k_h, of approximately ½ the expected PGA (0.22). This k_h value assumes that the walls displace at least 1-inch during the design seismic event.

Surface loads (footings, storage, vehicle traffic) applied near the wall will increase the lateral pressure on the wall. A uniform surface load of 240 psf to 300 psf is often used to approximate construction traffic loading on walls. In general, if surface loads are closer to the edge of the retaining wall than three-fourths of the retained height, increase the design wall pressure by 0.5q over the area of the retaining wall. In this expression, q is the surface surcharge load in psf. This is a conservative procedure and lower design pressures may be applicable upon evaluation of individual surface loads and setback distances.

5.5.6.1.4 Buoyancy Resistance

Based on nearby borings we estimate a groundwater depth of approximately 20 feet, as discussed in Section 5.4.2. In undrained conditions, structures below a depth of approximately 20 feet, may be subjected to an uplift load (buoyancy). The uplift force will be resisted by the weight of the structure and the weight of the backfill overlying foundation extensions (if any).

DRAFT

If Jacobs designs foundation extensions to resist buoyancy forces, calculate the resistance against uplift due to the weight of the soil. Use a backfill total unit weight of 130 pcf above groundwater and 67 pcf below groundwater, with a soil wedge extending vertically up from foundation extensions

5.5.6.1.5 Lateral Resistance

Lateral resistance for retaining structures can be achieved through friction and passive earth pressures acting on the foundation. For design, use a coefficient of friction of 0.40 (below or above groundwater) at the base of the concrete footing and a passive earth pressure of 150 psf per foot of embedment depth. Limit passive earth pressures to a maximum of 3,000 psf (additional passive pressure can be evaluated for specific locations if necessary). Do not include the upper 1-foot of soil in passive resistance calculations. Where passive pressure or friction alone is used against sliding, use a minimum factor of safety of 1.5 for lateral stability (1.1 if seismic loading is included). Where both passive pressure and friction are used to resist sliding, use a minimum factor of safety of 2.0.

5.5.6.2 Minor Structures

Provided that the recommendations in this report are followed, we anticipate minor structures (such as valve vaults, etc.) may be founded on concrete mat or strip footings, or a compacted granular base (minimum of 6 inches of Class 2 baserock) if appropriate.

- Embed the foundations a minimum of 18 inches below the lowest adjacent prepared subgrade into firm native soil or compacted fill/backfill.
- Footings must be a minimum of 12 inches wide and sized not to exceed an allowable bearing capacity of 2,000 psf. The allowable bearing capacity may be increased by one-third if seismic and/or wind loads are included.
- If additional bearing capacity is required for specific minor structures, we can review and provide recommendations on a case-by-case basis.
- To resist lateral movement, use a coefficient of friction of 0.40 at the base of the foundation and an ultimate passive earth pressure of 150 psf (undrained condition) per foot of embedment depth up to a maximum of 2,000 psf. Ignore the upper one-foot of footing depth (below the lowest adjacent soil grade) in determination of the passive pressure. Both frictional resistance and passive earth pressure can be combined for lateral resistance; when combined, increase the safety factor against sliding from a minimum of 1.5 to 2.0.

5.5.7 Soil Corrosivity

Our sulfate and chloride content tests on pipeline samples indicate that Type II or V Portland cement can be used for concrete mix design. Our resistivity tests generally indicate that the onsite soils may exhibit corrosive to extremely corrosive conditions for metal pipes. We are not corrosion consultants and cannot evaluate the potential corrosion impacts to metallic elements embedded in or in contact with the ground. A corrosion consultant should provide specific corrosion protection recommendations for buried metallic elements used at the site.

DRAFT

6 WWTP IMPROVEMENTS

6.1 Site Location and Description

The proposed WWTP expansion will be constructed at the existing WWTP on Mary Ave in Olivehurst. The proposed secondary clarifier location is generally level and covered in gravel. The site for the proposed equalization basin is generally flat but depressed approximately 3 to 4 feet below the WWTP ground surface and is covered in seasonal grass and weeds. Photos 9 and 10 represent site conditions at the time of our October 19, 2020 site visit.

Photo 13: Secondary Clarifier

Looking northwest at proposed secondary clarifier location. Existing secondary clarifier can be seen on the left in the background.

DRAFT

Photo 14: Equalization Basin

Looking south across the proposed equalization basin. Existing slope along east side of basin can be seen in background.

6.2 Project Description

The proposed WWTP improvements consist of an additional secondary clarifier, a 30.7 Acre-ft concrete-lined equalization basin, a 4.37 Acre-ft Stormwater Detention Basin, and a 16-inch-diameter force main.

6.3 Previous Studies

Geotechnical conclusions and recommendations for the proposed secondary clarifier presented in this report are primarily based on the CH2M HILL WWTP Expansion and Upgrade Project Schematic Design – Preliminary Geotechnical Exploration Report, February 2004 (CH2M Report).

6.4 Geology

We reviewed geology maps and the United States Department of Agriculture's (USDA) Web Soil Survey (https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm) to infer likely subsurface conditions at the site. The "Geologic Map of the Late Cenozoic Deposits of the Sacramento Valley and Northern Sierra Foothills, California" (Helley and Harwood, 1985) generally maps Upper Member, Riverbank Formation under the site. Refer to Section 2.1 for a description of the Riverbank Formation.

The web soil survey indicates that the site is underlain by San Joaquin loam (214). The survey states this unit has the following relevant properties from 0 to 25 inches deep: Silt (ML), Silty Clay (CL-ML) and Clay (CL) with fines content ranging from 50 to 70 percent.

DRAFT

6.5 Field Work and Laboratory Testing

6.5.1 Exploratory Test Pits

Blackburn excavated, logged, and sampled 5 test pits to characterize the site subsurface conditions at the equalization basin site. Our subcontractor, Burke Construction, excavated the test pits to a depth of 8 feet below existing site grades. Appendix D1 shows the proposed site improvements and approximate test pit locations. The test pit logs are included in Appendix D2. Burke Construction excavated the test pits using a CAT 420 backhoe equipped with a 2-foot wide bucket. Blackburn's project engineer, Luke Morrell, logged the test pits, collected samples from various depths and retained samples for laboratory testing.

Blackburn drilled an exploratory boring for the clarifier but lab has not been completed at this time, so no recommendations in this report are based on conditions in Blackburn's boring.

6.5.2 Laboratory Testing

We have not completed laboratory tests on the samples collected from the equalization basin site.

6.6 Subsurface Findings

6.6.1 General Subsurface Soil Conditions

We generally encountered hard lean clay to sandy lean clay in the test pits, excavated October 19, 2020. In the southeast portion of the equalization basin (TP-5), we encountered dense clayey sand below a depth of approximately 2.5 feet.

The CH2M Report (2004) indicates that the subsurface soils in boring B8 near the proposed secondary clarifier location consist of:

- Approximately 3 feet of sandy clay over a lean clay with sand hardpan layer to approximately 8 feet below ground surface.
- Sandy clays and clayey sands from depths of about 8 to 23 feet,
- Sandy gravel from depths of 23 to 30 feet.
- Sandy clay and clayey sand to the maximum depth explored (41.5 ft).

6.6.2 Groundwater

We did not encounter groundwater in our test pits excavated October 19, 2020.

According to the CH2M Report (2004) and associated boring logs, perched groundwater was encountered in the sandy clay above the hardpan layer and groundwater was measured 20.7 feet below the ground surface near the proposed secondary clarifier location. The logs indicate that the groundwater elevation ranges from 29.8 to 33.3 feet across the WWTP site (CH2M Report does not specify datum used).

We reviewed groundwater level data for nearby wells available at the California Department of Water Resources website (http://www.water.ca.gov/waterdatalibrary/) and using the Sustainable Groundwater Management Act (SGMA) data viewer

DRAFT

(https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels). Based on this information, the groundwater elevation at the site typically ranges from 25 to 40 feet above mean sea level (NAVD88). Relatively shallow perched water may occur within the near-surface soils during the winter and spring months, and adjacent to the existing canals and streams.

Groundwater and perched water levels can fluctuate due to changes in precipitation, canal levels, irrigation, pumping of wells, and other factors.

6.7 Preliminary Design Considerations – WWTP Improvements

At the time of this report, basin design was not finalized. Blackburn will provide updated recommendations in the design-level geotechnical report based on final basin design.

6.7.1 Facility Ground Suitability

The soil conditions at the site are suitable for the planned facilities when constructed in accordance with the project plans, industry standards, and our geotechnical recommendations. Some of the more significant site limitations include the presence of clay soils that will not be suitable for structure backfill, and relatively shallow groundwater that may require dewatering for some structure installations.

6.7.2 Geologic Hazards

- Faulting—The potential for surface rupture or creep due to faulting at the site is very low. The Fault Activity Map of California[9] and the Geologic Map of the Sacramento Quadrangle[10] does not identify Historic or Holocene age faults (displacement within the last 11,700 years) within or immediately adjacent to the site. The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone[11].
- Ground Shaking— For the Maximum Considered Earthquake, a peak horizontal ground acceleration (PGA) of approximately 0.22g could be expected.
- Liquefaction—Our investigation shows a soil profile that consists of stiff to hard clays and medium dense to dense silty and clayey sands that are not liquefiable. Therefore, the potential for damaging liquefaction at the site is very low.
- Landslides and Slope Stability—Due to the relatively low topographic relief we do not expect landslides or natural slope failure.
- Seismically Induced Settlement—During a seismic event, ground shaking can cause densification of granular soil that can result in settlement of the ground surface. Considering the cohesive soils and medium dense soils observed in the borings, we consider the potential for significant seismically induced settlement to be very low.

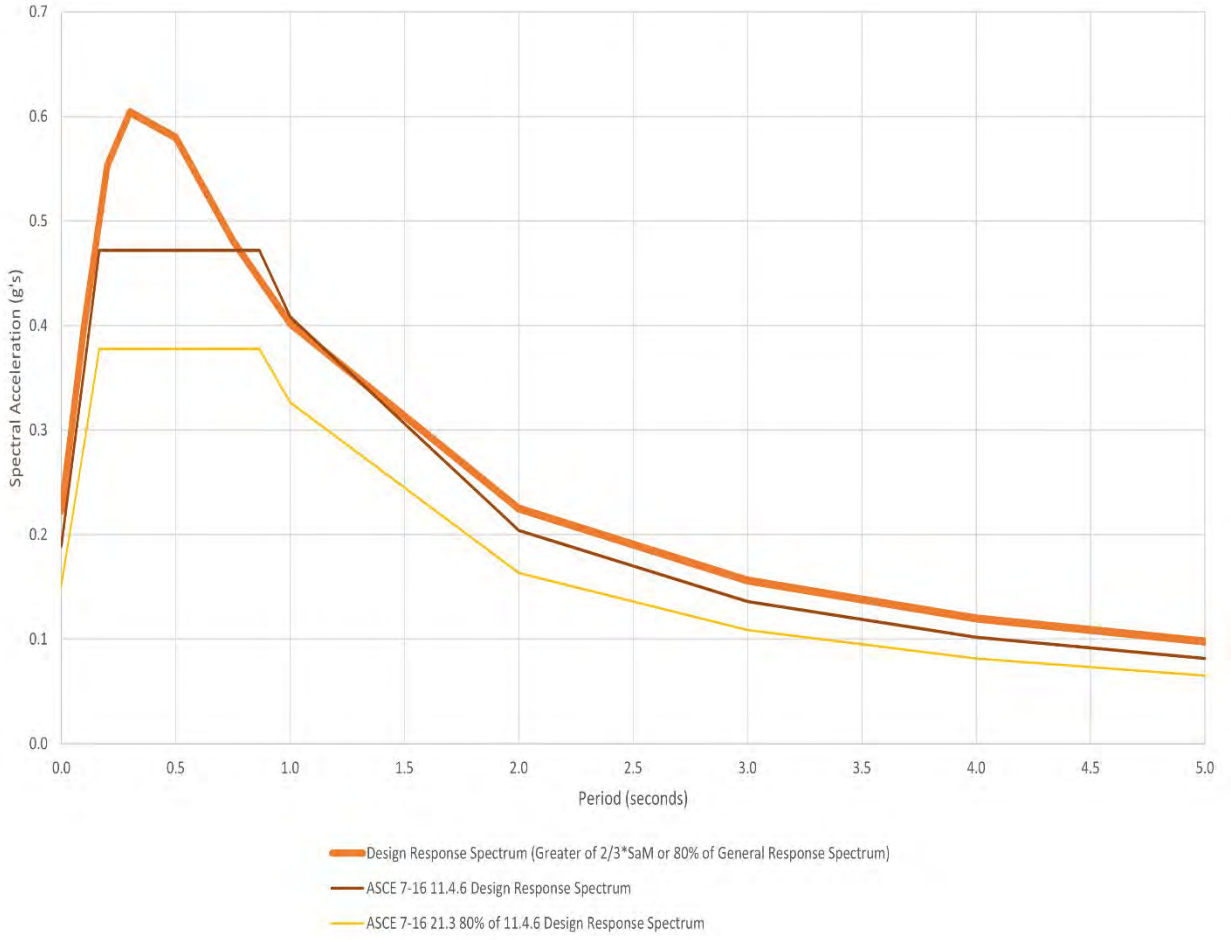
DRAFT

6.7.3 Seismic Design

We assumed, based in part on our boring data, an average shear wave velocity, V_{S30}, of 850 ft/sec that corresponds to a site class "D" (Section 2.3). Per ASCE 7-16 a site-specific analysis is required for a site class "D" site unless one of the exceptions noted in ASCE7-16, Section 11.4.8, is used. We understand that for this project the exception will not be used. Therefore, we performed a site-specific analysis per ASCE 7-16, Chapter 21. We analyzed probabilistic and minimum code values to develop a site-specific spectra for 5% damping. A deterministic analysis is not required because the largest spectral response acceleration of the probabilistic ground motion response calculated in accordance with ASCE 7-16 21.2.1 is less than 1.2 F_a. The recommended spectra are presented in Graph 2 and digitized spectral values in Table 2. Appendix D4 presents details of our site specific response analysis.



Graph : Site-Specific Design Spectra

Use the S_{MS}, S_{M1}, S_{DS}, and S_{D1} values in Table 3. We calculated the values in accordance with ASCE 7-16, Section 21.4 and 21.5.

DRAFT

[4]S_{D1} Maximum value of the product of TS_a (time multiplied by spectral acceleration value) for periods of 1 to 2 seconds for sites with V_{S30} of greater than 1,200 ft/s)
[5]The site-specific MCE_G peak ground acceleration (PGA_M) is the lesser of the probabilistic or deterministic mean peak ground acceleration.

6.7.4 General Grading Recommendations

6.7.4.1 Excavation Conditions

Based on the soil conditions and drilling performance, excavation is possible with conventional equipment (common earthmoving equipment and large backhoe/excavator). The fine-grained and hard soil conditions can create slow excavation conditions and is not suitable for structure backfill.

DRAFT

6.7.4.2 Site Clearing

Prior to trenching or making any cuts and fills, remove existing underground utilities, foundations, vegetation (root balls and roots), debris, and other underground features in accordance with this Geotechnical Report. Remove loose and disturbed soil caused by the removal(s) and widen the excavation/depression so it is accessible to compaction equipment. Remove strippings from the site or use as landscape soil in designated areas.

6.7.4.3 Original Ground and Subgrade Preparation

Process and compact the exposed soil in at-grade, cut, and fill areas as follows:

- Scarify the exposed soil to a depth of approximately 8 inches.
- Moisture condition subgrade to within 3% of the optimum moisture content.
- Compact the subgrade soil to a minimum 90% relative compaction based on ASTM D1557.

Where fill will be placed on or against slopes with a gradient of 5(H):1(V) or steeper, fill must be benched into the slope. Benching must remove loose surficial soils and result in stepped benches, generally one to two feet in height and depth into the existing slope. Where benching will interfere with existing structures, utilities, or vegetation, Blackburn can review modifications on a case-by-case basis.

For fills that are 5 feet or higher and placed on or against a slope with a gradient of 5:1 or steeper, provide a key at the toe of the fill slope. The key must be a minimum of 10 feet wide, one foot deep, sloped a minimum of 2% into the slope, and extend 2 feet beyond the fill toe. Where restricted access will not allow for a toe-bench 10 feet wide, the bench can be reduced to a minimum width of 6 feet provided the fill slope is less than 10 feet in height and the contractor can show that compaction equipment can achieve the specified compaction for the full width of the bench.

6.7.4.4 General Fill Placement and Compaction

General fill (**not trench or structure backfill**) may consist of on-site soil provided it contains no rocks larger than 4 inches in maximum dimension. Fill should be free of debris and concentrations of vegetation.

If import for general fill is required, it must be free of debris and meet the following requirements:

Table 6.4: General Backfill Import Requirements

Gradation		**Test Procedures**	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
No. 4	75-100	D6913	202
No. 200	12-100	D6913	202
Plasticity Index			
Less than 20		D4318	

- Approved by Blackburn prior to site delivery.

DRAFT

Place and compact fill as follows:

- Place fill in maximum 8-inch-thick loose lifts,
- Moisture condition the soil within 3% of optimum
- Compact the soil to a minimum 90% relative compaction based on ASTM D1557.

Test all fill at vertical increments of not more than 1 foot and at final grade or pavement subgrade. For horizontal testing frequency, use the following minimums:

- One test for every 100 square feet around structures
- One test for every 500 square feet for structure pads

Complete at least one compaction curve (Proctor) for each material type, source location (for import), and as changes in native materials occur. Material changes include a change in material designation based on the Unified Soil Classification System.

6.7.4.5 Fill Slopes

Construct fill slopes no steeper than 2(H):1(V). To achieve adequate compaction on the face of fill slopes, over-build the slopes and then cut back to the design grade. Track-walking is not an adequate method to compact the face of slopes.

6.7.5 Dewatering

Dewatering may be required for installations greater than approximately 15 feet deep (see Section 6.6.2). Significant groundwater inflow should be anticipated at the deeper excavations for the clarifier.

Dewatering can consist of:

- Deep sumps within the excavation. Considering the presence of fine-grained soils and relatively flat lying bedding, sumps within the excavation are not likely to provide good drawdown.
- Well points. Well points will likely work better to cut off flow into the excavation and drawdown the water level over a larger area.

To facilitate work at the base of the excavation, groundwater should be drawn down at least 3 feet below the planned bottom of excavation. The need for dewatering can be reduced by planning excavations during the lowest anticipated seasonal water levels (expected during the late summer and fall months).

6.7.6 Temporary Excavations

Temporary excavations will require sloping and/or shoring in accordance with Cal OSHA requirements. Based on previous subsurface explorations by CH2M Hill, preliminary excavation and shoring design may be based on Type A soil to planned excavation depth. For Type A soil conditions, temporary excavations may be sloped at ¾(H):1(V).

Where groundwater is present or cohesionless/uncemented granular soils are encountered, Type C soil conditions will apply and a 1.5(H):1(V) slope gradient is required.

DRAFT

The Contractor must retain an engineer to evaluate the impact of existing structures, traffic vibrations, actual soil conditions exposed in the open trenches, and other factors that may promote trench wall instability and adjust trench sloping/shoring accordingly. Surcharge loads such as trench spoils, equipment, etc. should not be placed adjacent to an open excavation (within a distance of ½ the height of the trench). ***The above is guideline information only.*** The contractor is responsible for the safety of all excavations and should provide appropriate excavation sloping and shoring in accordance with current Cal OSHA requirements and observe conditions observed during construction for necessary modification and safety.

6.7.7 Foundations

6.7.7.1 At-Grade Shallow Foundations

If the designers and contractors follow our grading and construction recommendations below, foundations for at grade structures can be supported on shallow strip footings and isolated spread footings. We expect footings for at-grade structures to be founded on compacted fill and/or firm native soils.

- Embed continuous strip and isolated footings a minimum of 18 inches into the lowest adjacent prepared subgrade.
- Both strip and isolated footings must be a minimum of 18 inches wide. Size strip and isolated footings not to exceed an allowable bearing capacity of 2,000 pounds per square foot (dead load plus live load). The allowable bearing capacity may be increased by one-third if seismic and/or wind loads are included.
- Total settlement is expected to be less than ¾-inch and differential settlement less than ½-inch over a length of 50 feet.
- To resist lateral movement, use a coefficient of friction of 0.40 psf at the base of the foundation and a passive earth pressure of 200 psf per foot of embedment depth up to a maximum of 2,000 psf. Ignore the upper one-foot of footing depth (below the lowest adjacent soil grade) in determination of the passive pressure. Both frictional resistance and passive earth pressure can be combined for lateral resistance; when combined, increase the safety factor against sliding from a minimum of 1.5 to 2.0.
- Concrete slabs with crushed rock underlayment may be designed using a Modulus of Subgrade Reaction, k_s, of 25 pounds per cubic inch (pci) in cut or fill locations where engineered fill is placed as recommended in this report.
- Clean footing excavations of debris and loose soil prior to placing concrete.
- Blackburn must observe all footing excavations prior to reinforcement placement to verify competent bearing materials.
- Slope the ground surface away from foundations at a minimum of 2 percent for a distance of at least 5 feet.

6.7.7.2 Below-Grade Foundations

6.7.7.2.1 Bearing Capacity

The planned clarifier is a below-grade structure and the net pressure exerted upon the subsurface will be similar to or less than the existing soil pressure at the bottom of the clarifier. Excavation for below-

DRAFT

grade structures reduces the net pressure by removing soil that acts as a "preload" to the underlying soils, thus "unloading" the bearing materials before "loading" by placement of the structure.

Below grade structures will use mat type foundations for support. For structures at depths greater than 20 feet:

- Use a maximum net contact pressure of 3,000 psf.
- Use a Modulus of Subgrade Reaction, k_s, equal to 25 pci.
- We expect settlement of mat foundations is expected to be less than 1 inch with differential settlement less than ½-inch over a distance of approximately 100 feet.
- Clean footing excavations of debris and loose soil prior to placing concrete.
- Blackburn must observe all footing excavations prior to reinforcement placement to verify competent bearing materials.
- For ground preparation and subgrade uniformity, Class 2 aggregate baserock can be used as underlayment (this is not geotechnically necessary provided a firm uniform subgrade is obtained). If an aggregate underlayment is used, place a minimum thickness of 6-inches and compact to a minimum of 95% relative compaction (per ASTM D 1557 test method).
- Crushed rock underlayment may also be used (and can benefit excavation dewatering). Envelope the crushed rock with a geotextile filter fabric (ie. Mirafi 140N) and compact the rock with a static roller.

Blackburn can provide additional recommendations when the planned design and approximate loading is available if isolated spread footings or piers are required for column support.

6.7.7.2.2 Structure Backfill

Native soils in approximately the upper 23± feet consist of lean clay which will not be suitable for structure backfill.

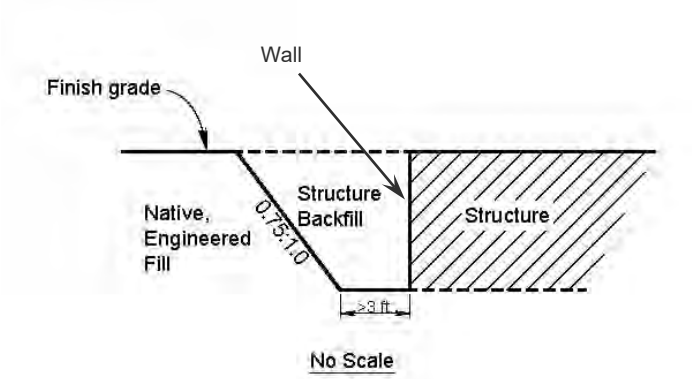
Blackburn must approve import structure backfill prior to delivery. Use the specifications in Table 6.5 for import structure backfill for all below-grade structures:

Table 5.5: Import Structure Backfill Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
¾ inch	70-100	D6913	202
No. 4	50-100	D6913	202
No. 200	12-40	D6913	202
Plasticity			
Plasticity Index	<12	D4318	204

As shown below, the zone of placement for structure backfill should extend up from the base of the wall at a slope of 0.75(H):1(V) and at least 3 feet behind the wall. Native, engineered fill may be placed beyond the structure backfill zone.

DRAFT



- Moisture condition backfill to within 2% of optimum and place in maximum 8-inch thick, horizontal, loose lifts.
- Compact backfill to a minimum 92% relative compaction based on the ASTM D 1557 test method.

To minimize the residual lateral earth pressures on structure walls, compaction equipment used behind the walls must be restricted (by load and distance from wall) so that wall design values are not exceeded. We recommend compaction within a horizontal distance equal to one-half of the wall height (to a maximum distance of 5 feet), be completed with hand-operated equipment (i.e., jumping jack). To minimize the potential for significant settlement around deep walls, controlled low strength material (CLSM) can be used to backfill to the surface or to a manageable depth (e.g., 10 feet below grade).

6.7.7.2.3 Lateral Earth Pressures

The below grade structure will act as retaining structure. Walls will retain compacted select imported soils meeting the requirement for structure backfill. For evaluation of lateral earth pressures, use the backfill equivalent fluid weights (EFW) for level ground conditions shown below in Table 5.6.

Table 6.6: LATERAL EARTH PRESSURES

Condition	Equivalent Fluid Weight (pcf)	Seismic Equivalent Fluid Weight (pcf)
At-Rest	85	6
Passive	150	140*

*Total passive EFW for passive condition

The above pressures assume structure backfill placed against the structure wall in accordance with our recommendations, a saturated (total) unit weight of approximately 135 pounds per cubic foot (pcf) and a minimum internal angle of friction of 32 degrees. Notify Blackburn if these assumptions are not valid so that we may assess the situation and provide additional recommendations, if necessary. Backfill with CLSM is an acceptable alternative.

DRAFT

For seismic loading, add the Seismic EFW to the at-rest or active EFW and apply the total force as a uniform load on the wall with a resultant located at 0.5H where H is the backfill height. We estimated the EFWs for seismic loading using the Mononobe-Okabe equation and a horizontal seismic acceleration coefficient, k_h, of approximately ½ the expected PGA. This k_h value assumes that the walls displace at least 1-inch during the design seismic event.

Surface loads (footings, storage, vehicle traffic) applied near the wall will increase the lateral pressure on the wall. A uniform surface load of 200 psf to 300 psf is often used to approximate construction traffic loading on walls. In general, if surface loads are closer to the edge of the retaining wall than three-fourths of the retained height, increase the design wall pressure by 0.5q over the area of the retaining wall. In this expression, q is the surface surcharge load in psf. This is a conservative procedure and lower design pressures may be applicable upon evaluation of individual surface loads and setback distances.

For drained conditions, provide adequate drainage to avoid build-up of hydrostatic pressures. Positive drainage for retaining walls should consist of a vertical layer of permeable material, such as a graded sand and gravel (graded to meet Caltrans Standard Specifications for Class 1, Type A Permeable Material), pea gravel, or crushed rock, at least 6 inches thick, positioned between the retaining wall and the backfill.
If pea gravel or crushed rock is used, place a nonwoven filter fabric between it and the backfill to prevent the drain from becoming clogged. A synthetic drainage fabric, such as Enkadrain (Colbond Geosynthetics Co.), Miradrain (TC Mirafi) or an equivalent, may be substituted for the permeable layer. Use care during installation to assure that the filter part of the material faces the backfill. Remove collected water by installing weep holes along the bottom of the wall or by a perforated drainage pipe along the bottom of the permeable material or drainage fabric continuously sloped towards suitable drainage facilities (i.e., gravity drain or sump pump).

6.7.7.2.4 Buoyancy Resistance

As discussed in Section 6.6.2, groundwater may occur at depths as shallow as 15 feet bgs. In undrained conditions, below grade structures may be subjected to an uplift load (buoyancy). The uplift force will be resisted by the weight of the structure and the weight of the backfill overlying foundation extensions (if any).

If foundation extensions are used to resist buoyant forces, calculate the resistance against uplift due to the weight of the soil. Use a backfill unit weight of 130 pcf above groundwater and 73 pcf below groundwater, with a soil wedge extending vertically up from foundation extensions.

6.7.7.2.5 Lateral Resistance

Lateral resistance for retaining structures can be achieved through friction and passive earth pressures acting on the foundation. For design, use a coefficient of friction of 0.40 (below or above groundwater) at the base of the concrete footing and an ultimate passive earth pressure of 200 psf per foot of embedment depth. Limit passive earth pressures to a maximum of 2,000 psf (additional passive pressure can be evaluated for specific locations if necessary). Decrease the passive pressure to 75 psf per foot of depth when below design groundwater levels. Do not include the upper 1-foot of soil in passive resistance calculations. Where passive pressure or friction alone is used against sliding, use a minimum factor of safety of 1.5 for lateral stability (1.1 if seismic loading is included). Where both passive pressure and friction are used to resist sliding, use a minimum factor of safety of 2.0.

DRAFT

6.7.7.3 Minor Structures

Provided that the recommendations in this report are followed, minor structures (such as valve or blow-off vaults, access ways, etc.) may be founded on concrete mat or strip footings, or a compacted granular base (minimum of 6 inches of Class 2 baserock) if appropriate.

- Embed the foundations a minimum of 18 inches below the lowest adjacent prepared subgrade into firm native soil or compacted fill/backfill.
- Footings must be a minimum of 12 inches wide and sized not to exceed an allowable bearing capacity of 2,000 psf. The allowable bearing capacity may be increased by one-third if seismic and/or wind loads are included.
- Concrete slabs with crushed rock underlayment may be designed using a Modulus of Subgrade Reaction, k_s, of 25 pci on structural fill placed as recommended in this report.
- If additional bearing capacity is required for specific minor structures, we can review and provide recommendations on a case-by-case basis.
- To resist lateral movement, use a coefficient of friction of 0.40 at the base of the foundation and a passive earth pressure of 200 psf per foot of embedment depth up to a maximum of 2,000 psf. Ignore the upper one-foot of footing depth (below the lowest adjacent soil grade) in determination of the passive pressure. Both frictional resistance and passive earth pressure can be combined for lateral resistance; when combined, increase the safety factor against sliding from a minimum of 1.5 to 2.0.

If necessary for evaluation of lateral loading on shallow vaults, use an At-Rest equivalent fluid weight of 65 pcf for the drained condition and 95 pcf for undrained. The drained condition assumes groundwater does not accumulate; the undrained condition would be applied below an assumed groundwater level.

We based these values on foundations bearing on native soil and native soil backfill compacted against vault walls.

6.7.8 Soil Corrosivity

We have not completed our subsurface explorations or laboratory testing for the proposed structures. Based on data from pipeline borings for similar materials (lean clays) we expect clay soils to be corrosive to extremely corrosive conditions to metal pipes. We are not corrosion consultants and cannot evaluate the potential corrosion impacts to metallic elements embedded in or in contact with the ground. A corrosion consultant should provide specific corrosion protection recommendations for buried metallic elements used at the site.

6.7.9 Concrete Slabs on Grade

6.7.9.1 Slab Underlayment

For minor structures, concrete slabs-on-grade may be used provided the contractor(s) prepares the structure pads in accordance with our grading recommendations and any addenda by Blackburn. Use a minimum slab thickness of 4 inches. Underlay the concrete slabs with a minimum of 4 inches of washed, crushed, and compacted rock to provide uniform support. Concrete reinforcement, doweling, curing, joint spacing, and mix design should conform to ACI guidelines. The above recommendations are not for

DRAFT

slabs subject to equipment or forklift loads. Moderately expansive clay potentially underlay the site. To mitigate potential expansive soil, consider a slab thickness of 6-inches with 8-inches of crushed rock.

6.7.10 Trench Backfill and Compaction

6.7.10.1 Pipe Bedding and Pipe Zone Material

Support pipe on a minimum of 4 inches of granular bedding and in accordance with the pipe manufacturer's recommendations. Although we do not anticipate soft, unsuitable pipe subgrade at any particular location, it can occur with shallow groundwater conditions and sandy soils. Notify the project engineer and Blackburn for review and mitigation recommendations if encountered. To achieve a stable and non-yielding subgrade suitable for pipe placement and backfilling, typical mitigation may include:

- Replacement of unsuitable subgrade with ¾-inch minus crushed rock (minimum of 6 inches)
- Enclose rock in geotextile filtration fabric such as Mirafi 140N (or equivalent).

A granular pipe zone material may be used. Native soils will contain a significant amount of fines (passing #200 sieve) and will **not** be suitable for bedding or pipe zone backfill. For pipe bedding and initial backfill material (which extends to 1 foot above the top of pipe) use material that meet the specification in Table 6.7.

Table 6.7: Pipe Bedding and Initial Backfill Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
¾ inch	90-100	D6913	202
No. 4	35-60	D6913	202
No. 30	10-30	D6913	202
No. 200	2-5	D6913	202
Sand Equivalent			
Minimum 25		D2974	

Blackburn considers the following materials to be suitable as alternative pipe zone (bedding) backfill material:

- Controlled Low Strength Material (CLSM)
- Controlled Density Fill (CDF)

6.7.10.2 Trench Backfill

Trench backfill above the Pipe Zone material may consist of excavated soils. Fill should be free of debris and concentrations of vegetation or clay soils and meet the specifications in Table 6.8.

DRAFT

Table 6.8: Intermediate Trench Backfill Requirements			
Gradation		**Test Procedures**	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
3 inch	100	D6913	202
No. 200	20-70	D6913	202
Organic Content			
Less than 3%		D2974	
Expansion Index			
Less than 20		D4829	

If import fill is required for trench backfill, it should be graded and have material properties as follows:

- 100% passing the 1-inch sieve
- 75% to 100% passing the #4 sieve
- Minimum 12% passing the #200 sieve
- Plasticity Index not greater than 20
- Free of debris and concentrations of vegetation.

Use ¾-inch Class 2 AB in the upper 12-inches of the trench within roadways.

6.7.10.3 Trench Backfill Compaction

Follow the pipe manufacturer's requirements for initial backfill to avoid damage to the pipe. To facilitate compaction in the pipe zone area (top of bedding up to 12 inches above pipe), use a trench width that provides a minimum clearance of 12 inches between the pipe and trench wall.

- Moisture condition trench backfill to within 2% of optimum moisture content and compact to a minimum 92% relative compaction (based on ASTM 1557) below 10 feet and 90% relative compaction (based on ASTM 1557) above 10 feet.
- Use a maximum compacted lift thickness of 8 inches unless field performance testing can demonstrate adequate compaction of thicker lifts.
- Jetting is not acceptable for compaction.

Test all trench backfill (bedding, pipe zone backfill, trench zone, etc.):

- At vertical increments of not more than 1 foot and at final grade or pavement subgrade.
- At horizontal testing frequencies of at least one test for every 200 linear feet of pipe (both sides of pipe in pipe zone).
- Complete at least one compaction curve (Proctor) for each material type, source location (for import), and as changes in native materials occur. Material changes include a change in material designation based on the Unified Soil Classification System.
- Testing frequency can be adjusted based on contractor performance, ease of compaction, and material variability.

DRAFT

Soil excavated during pipe installation can have moisture contents well over optimum, especially during the winter and spring months or if perched water is encountered. In this case, it will be necessary to dry back the soil to within 2% of optimum moisture content prior to use as backfill.

It is important to achieve compaction of pipe zone materials at the pipe haunches and spring line; compaction below the pipe spring line will be a difficult task for the contractor. We recommend a compaction demonstration section to test placement and compaction means and methods for each material type that will be used.

6.7.11 Equalization Basin Concrete Lining

Concrete pavement is proposed to line the Equalization Basin. Prepare the subgrade as discussed in Section 6.7.4.2 and 6.7.4.3. We understand the pavement will not be subject to regular wheel loads.

Design concrete pavement in accordance with American Concrete Institute (ACI) Guide for the Design and Construction of Concrete Parking Lots (ACI 330R-08).

- Use a modulus of subgrade reaction of 100 pci.
- Use a minimum of 6 -inches of concrete over 8 inches of Class 2 AB.
- Concrete reinforcement, doweling, curing, joint spacing, and mix design should conform to ACI guidelines.

Aggregate base (AB) should conform to Caltrans Class 2 requirements. Moisture condition and compact AB to a minimum 95% relative compaction based on ASTM D1557. Prior to placing concrete, the aggregate base should be stable under the weight of a loaded water truck. Mitigate unstable areas as recommended by Blackburn.

Concrete pavement must meet the following requirements:

- Minimum 28-day compressive strength of 3,500 psi.
- Joint spacing will be determined by the structural engineer in accordance with ACI 350-06.

The Civil Engineer should design the final joint types/spacing and appropriate concrete mix design.

7 WATER TANK AND BOOSTER STATION

7.1 Site Location and Description

The OPUD South Yuba Sewer Infrastructure Project includes a 1 MG steel storage tank, water well, booster station, and on-site piping. Appendix E1 shows the proposed improvement location.

The proposed water tank and booster station will be constructed in a vacant lot northeast of the existing Casino water tank. Based on aerial photographs the lot appears to be free of vegetation and graded level.

DRAFT

7.2 Previous Studies

To prepare this section of the report, Blackburn reviewed Geocon Consultants, Inc.'s "Geotechnical Investigation – Enterprise Rancheria Casino, October 2014" (Geocon Investigation) and limited explorations from our pipeline exploration for the OPUD project. We will perform site-specific subsurface explorations, laboratory testing, and analysis to provide final design recommendations for the water tank and booster station.

7.3 Geology

We reviewed geology maps and the United States Department of Agriculture's (USDA) Web Soil Survey (https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm). The "Geologic Map of the Late Cenozoic Deposits of the Sacramento Valley and Northern Sierra Foothills, California" (Helley and Harwood, 1985) shows the site underlain by the Upper Member, Riverbank Formation that consists of unconsolidated, but compact, dark brown to red, alluvium composed of gravel, sand, silt, and clay.

The web soil survey indicates that the site is underlain by San Joaquin loam (214). The survey states this unit has the following relevant properties from 0 to 25 inches deep: Silt (ML), Silty Clay (CL-ML) and Clay (CL) with fines content ranging from 50 to 70 percent.

7.4 Subsurface Findings

7.4.1 General Subsurface Soil Conditions

In Blackburn boring TC-12A, drilled on September 9, 2020 approximately 2,000 feet from the proposed tank site, we generally encountered stiff to very stiff lean clay and silt with sand within the upper 15 feet underlain by approximately 15 feet of medium dense clayey sand and sand with silt. Hard silt from 30 feet to 40 feet underlain by very dense sand with silt to maximum depth explored (51.5 feet).

The Geocon Investigation (2014) indicates that the subsurface soils across the Casino site consist of:

- Approximately 2.5 to 4 feet of moderately to highly expansive clay (the upper 1 to 1.5 feet of which is loose due to disturbance by agricultural operations), underlain by
- Very stiff to hard clays and silts with varying sand contents and sands with varying fines contents to the maximum depth explored (41.5 feet).
- Some zones of cementation encountered throughout the subsurface soil profile.

7.4.2 Groundwater

In our borings TC-12A and TC-12B, drilled September 9, 2020, we measured groundwater at depths of 24 and 17 feet (respectively) below ground surface.

Geocon's Investigation for the casino drilled only one boring deeper than 27 feet. That boring log (Boring B1) indicates groundwater at 29 ft below ground surface.

We reviewed groundwater level data for nearby wells available at the California Department of Water Resources website (http://www.water.ca.gov/waterdatalibrary/) and using the Sustainable Groundwater Management Act (SGMA) data viewer

DRAFT

(https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#gwlevels). Based on this information, the depth to groundwater at the site typically ranges from 20 to 30 feet, although it occasionally is measured above 20 feet. Relatively shallow perched water may occur within the near-surface soils during the winter and spring months, and adjacent to the existing canals and streams.

Groundwater and perched water levels can fluctuate due to changes in precipitation, canal and creek levels, irrigation, pumping of wells, and other factors.

7.5 Preliminary Design Considerations – Water Tank and Booster Station

7.5.1 Facility Ground Suitability

The site will be suitable for the planned facilities when constructed in accordance with the project plans, industry standards, and our geotechnical recommendations.

7.5.2 Geologic Hazards

- Faulting—The potential for surface rupture or creep due to faulting at the site is very low. The Fault Activity Map of California[12] and the Geologic Map of the Sacramento Quadrangle[13] does not identify Historic or Holocene age faults (displacement within the last 11,700 years) within or immediately adjacent to the site. The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone[14].
- Ground Shaking— For the Maximum Considered Earthquake, a peak horizontal ground acceleration (PGA) of approximately 0.21g could be expected.
- Liquefaction—Our investigation shows a soil profile that consists of stiff to hard clays and medium dense to dense sands ad silty and clayey sands that are not liquefiable. Therefore, the potential for damaging liquefaction at the site is very low.
- Landslides and Slope Stability—Due to the relatively low topographic relief we do not expect landslides or natural slope failure.
- Seismically Induced Settlement—During a seismic event, ground shaking can cause densification of granular soil that can result in settlement of the ground surface. Considering the cohesive soils and medium dense to dense soils observed in the borings, we consider the potential for significant seismically induced settlement to be very low.

7.5.3 Seismic Design

Based on the mapped geology and nearby boring data, use a Site Class “D” (stiff soil). Table 7.1 presents the 2019 *California Building Code* (Chapter 16) and ASCE 7-16 seismic design parameters for the site.

[12] Jennings, Charles W., and Bryant, William A., 2010 Fault Activity Map of California: California Geological Survey, Geologic Data Map No. 6.
[13] Saucedo, G.J. and Wagner, D.L., et al, 1992, Geologic map of the Chico quadrangle, California, 1: 250,000: California Division of Mines and Geology, Regional Geologic Map 7A, scale 1: 250,000
[14] Bryant, W.A., and Hart, E.W., 2007 (Interim Revision), Fault-Rupture Hazard Zones in California: California Department of Conservation, Division of Mines and Geology, Special Publication 42.

DRAFT

Table 7.1: 2019 CBC Seismic Design Parameters (Site Class D)	
S_s – MCE_R ground motion (0.2 second period)	0.495 g
S_1 – MCE_R ground motion (1.0 second period)	0.24 g

S_{MS} – Adjusted MCE* Spectral Response Acceleration Parameter	0.695 g
S_{M1} – Adjusted MCE* Spectral Response Acceleration Parameter	0.509 g[1]
S_{DS} – Design Spectral Acceleration Parameter	0.464 g
S_{D1} – Design Spectral Acceleration Parameter	0.339 g[1]
Seismic Design Category	C[1]
**T_L – Long Period Transition Period	12 sec
PGA	0.213

* Maximum Considered Earthquake
** Figure 22-14, ASCE 7-16
1 – We assume that the seismic response coefficient, Cs, is determined by ASCE 7-16 Eq. (12.8-2) for values of T ≤ 1.5Ts and taken as equal to 1.5 times the value computed in accordance with either ASCE 7-16 Eq. (12.8-3) for TL ≥T > 1.5Ts or Eq. (12.8-4) for T > TL. Contact Blackburn to re-evaluate the above parameters if this assumption is not valid.

If the proposed design does not meet the exception noted above (note 1) a site-specific response analysis will be required for final design.

7.5.4 General Grading Recommendations

7.5.4.1 Excavation Conditions

Based on the soil conditions and drilling performance, excavation is possible with conventional equipment (common earthmoving equipment and large backhoe/excavator). The fine-grained and hard soil conditions can create slow excavation conditions and is not suitable for structure backfill.

7.5.4.2 Site Clearing

Prior to making any cuts and fills, remove existing underground utilities, foundations, vegetation (root balls and roots), debris, and other underground features in accordance with this Geotechnical Report. Remove loose and disturbed soil caused by the removal(s) and widen the excavation/depression so it is accessible to compaction equipment. Remove strippings from the site or use as landscape soil in designated areas.

7.5.4.3 Original Ground and Subgrade Preparation

The site has historically been covered by agricultural fields. To avoid loose disturbed soils and adverse settlement, overexcavate the tank footprint and 5 feet beyond to a depth of 3 feet below existing grade. After overexcavation, compact the exposed soil at the bottom of the excavation as follows:

- Scarify the exposed soil to a depth of approximately 8 inches.

DRAFT

- Moisture condition subgrade to within 3% of the optimum moisture content.
- Compact the subgrade soil to a minimum 90% relative compaction based on ASTM D1557.
- Backfill the excavation with General Fill as recommended below.

7.5.4.4 General Fill Placement and Compaction

General fill (**not trench or structure backfill**) may consist of on-site soil provided it contains no rocks larger than 3 inches in maximum dimension. Fill should be free of debris and concentrations of vegetation.

If import for general fill is required, it must be free of debris and meet the following requirements:

Table 7.2: General Backfill Import Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
No. 4	75-100	D6913	202
No. 200	12-100	D6913	202
Plasticity Index			
Less than 20		D4318	

- Approved by Blackburn prior to site delivery.

Place and compact general fill as follows:

- Place fill in maximum 8-inch-thick loose lifts,
- Moisture condition the soil within 3% of optimum
- Compact the soil to a minimum 90% relative compaction based on ASTM D1557.

Test all fill at vertical increments of not more than 1 foot and at final grade or pavement subgrade. For horizontal testing frequency, use the following minimums:

- One test for every 100 square feet around structures
- One test for every 500 square feet for structure pads

Complete at least one compaction curve (Proctor) for each material type, source location (for import), and as changes in native materials occur. Material changes include a change in material designation based on the Unified Soil Classification System.

7.5.5 Dewatering

We do not expect deep excavations for the water tank construction. Dewatering may be required for installations greater than approximately 15 feet deep (see Section 7.4.2).
Dewatering can consist of:

DRAFT

- Deep sumps within the excavation. Considering the presence of fine-grained soils and relatively flat lying bedding, sumps within the excavation are not likely to provide good drawdown.
- Well points. Well points will likely work better to cut off flow into the excavation and drawdown the water level over a larger area.

To facilitate work at the base of the excavation, groundwater should be drawn down at least 3 feet below the planned bottom of excavation. The need for dewatering can be reduced by planning excavations during the lowest anticipated seasonal water levels (expected during the late summer and fall months).

7.5.6 Temporary Excavations

Temporary excavations will require sloping and/or shoring in accordance with Cal OSHA requirements. Based on our subsurface explorations for other portions of the Project, preliminary excavation and shoring design may be based on Type A soil to planned excavation depth. For Type A soil conditions, temporary excavations may be sloped at ¾(H):1(V).

Where groundwater is present or cohesionless/uncemented granular soils are encountered, Type C soil conditions will apply and a 1.5(H):1(V) slope gradient is required.

The Contractor must retain an engineer to evaluate the impact of existing structures, traffic vibrations, actual soil conditions exposed in the open trenches, and other factors that may promote trench wall instability and adjust trench sloping/shoring accordingly. Surcharge loads such as trench spoils, equipment, etc. should not be placed adjacent to an open excavation (within a distance of ½ the height of the trench). ***The above is guideline information only.*** The contractor is responsible for the safety of all excavations and should provide appropriate excavation sloping and shoring in accordance with current Cal OSHA requirements and observe conditions observed during construction for necessary modification and safety.

7.5.7 Foundations

7.5.7.1 Shallow Foundations

We expect the tank foundation to consist of a perimeter (ring) footing, with a compacted baserock interior.

- Embed the footing a minimum of 18 inches into the lowest adjacent prepared subgrade.
- Footings must be a minimum of 18 inches wide.
- Size footings not to exceed an allowable bearing capacity of 3,000 pounds per square foot (dead load plus live load). The allowable bearing capacity may be increased by one-third if seismic and/or wind loads are included.
- Clean footing excavations of debris and loose soil prior to placing concrete.
- Blackburn must observe all footing excavations prior to reinforcement placement to verify competent bearing materials.
- Slope the ground surface away from foundations at a minimum of 2 percent for a distance of at least 5 feet.

DRAFT

- To resist lateral movement, use a coefficient of friction of 0.35 psf at the base of the foundation and a passive earth pressure of 200 psf per foot of embedment depth up to a maximum of 3,000 psf. Ignore the upper one-foot of footing depth (below the lowest adjacent soil grade) in determination of the passive pressure. Both frictional resistance and passive earth pressure can be combined for lateral resistance; when combined, increase the safety factor against sliding from a minimum of 1.5 to 2.0.
- Based on typical Riverbank soils we anticipate total settlement to be less than 1-2 inches and differential settlement less than ½-inch over a length of 50 feet. We anticipate approximately half of the total settlement will occur during loading of the foundations and half will occur when the tank is filled.

7.5.7.2 Minor Structures

Provided that the recommendations in this report are followed, minor structures may be founded on concrete mat or strip footings, or a compacted granular base (minimum of 6 inches of Class 2 baserock) if appropriate.

- Embed the foundations a minimum of 18 inches below the lowest adjacent prepared subgrade into firm native soil or compacted fill/backfill.
- Footings must be a minimum of 12 inches wide and sized not to exceed an allowable bearing capacity of 2,000 psf. The allowable bearing capacity may be increased by one-third if seismic and/or wind loads are included.
- Concrete slabs with crushed rock underlayment may be designed using a Modulus of Subgrade Reaction, k_s, of 25 pounds per cubic inch (pci) in cut or fill locations where engineered fill is placed as recommended in this report.
- If additional bearing capacity is required for specific minor structures, we can review and provide recommendations on a case-by-case basis.
- To resist lateral movement, use a coefficient of friction of 0.40 at the base of the foundation and a passive earth pressure of 200 psf per foot of embedment depth up to a maximum of 2,000 psf. Ignore the upper one-foot of footing depth (below the lowest adjacent soil grade) in determination of the passive pressure. Both frictional resistance and passive earth pressure can be combined for lateral resistance; when combined, increase the safety factor against sliding from a minimum of 1.5 to 2.0.

If necessary for evaluation of lateral loading on shallow vaults, use an At-Rest equivalent fluid weight of 65 pcf for the drained condition and 95 pcf for undrained. The drained condition assumes groundwater does not accumulate; the undrained condition would be applied below an assumed groundwater level.

We based these values on foundations bearing on native soil and native soil backfill compacted against vault walls.

7.5.8 Soil Corrosivity

We have not completed our subsurface explorations or laboratory testing for the proposed structures. Based on data from pipeline borings for similar materials (lean clays) we expect clay soils to be corrosive to extremely corrosive conditions to metal pipes. We are not corrosion consultants and cannot evaluate

DRAFT

the potential corrosion impacts to metallic elements embedded in or in contact with the ground. A corrosion consultant should provide specific corrosion protection recommendations for buried metallic elements used at the site.

7.5.9 Concrete Slabs on Grade

7.5.9.1 Slab Underlayment

For minor structures, concrete slabs-on-grade may be used provided the contractor(s) prepares the structure pads in accordance with our grading recommendations and any addenda by Blackburn. Use a minimum slab thickness of 4 inches. Underlay the concrete slabs with a minimum of 4 inches of washed, crushed, and compacted rock to provide uniform support. Concrete reinforcement, doweling, curing, joint spacing, and mix design should conform to ACI guidelines. The above recommendations are not for slabs subject to equipment or forklift loads. Moderately expansive clay potentially underlay the site. To mitigate potential expansive soil, consider a slab thickness of 6 -inches with 8-inches of crushed rock.

7.5.10 Trench Backfill and Compaction

7.5.10.1 Pipe Bedding and Pipe Zone Material

Support pipe on a minimum of 4 inches of granular bedding and in accordance with the pipe manufacturer's recommendations. Although we do not anticipate soft, unsuitable pipe subgrade at any particular location, it can occur with shallow groundwater conditions and sandy soils. Notify the project engineer and Blackburn for review and mitigation recommendations if encountered. To achieve a stable and non-yielding subgrade suitable for pipe placement and backfilling, typical mitigation may include:

- Replacement of unsuitable subgrade with ¾-inch minus crushed rock (minimum of 6 inches)
- Enclose rock in geotextile filtration fabric such as Mirafi 140N (or equivalent).

A granular pipe zone material may be used. Native soils will contain a significant amount of fines (passing #200 sieve) and will **not** be suitable for bedding or pipe zone backfill. For pipe bedding and initial backfill material (which extends to 1 foot above the top of pipe) use material that meet the specification in Table 7.3.

Table 7.3: Pipe Bedding and Initial Backfill Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
1 inch	100	D6913	202
¾ inch	90-100	D6913	202
No. 4	35-60	D6913	202
No. 30	10-30	D6913	202
No. 200	2-5	D6913	202
Sand Equivalent			
Minimum 25		D2974	

DRAFT

Blackburn considers the following materials to be suitable as alternative pipe zone (bedding) backfill material:

- Controlled Low Strength Material (CLSM)
- Controlled Density Fill (CDF)

7.5.10.2 Trench Backfill

Trench backfill about the Pipe Zone material may consist of excavated soils. Fill should be free of debris and concentrations of vegetation or clay soils and meet the specifications in Table 7.4.

Table 7.4: Intermediate Trench Backfill Requirements

Gradation		Test Procedures	
Sieve Size	**Percent Passing**	**ASTM**	**Caltrans**
3 inch	100	D6913	202
No. 200	20-70	D6913	202
Organic Content			
Less than 3%		D2974	
Expansion Index			
Less than 20		D4829	

If import fill is required for trench backfill, it should be graded and have material properties as follows:

- 100% passing the 1-inch sieve
- 75% to 100% passing the #4 sieve
- Minimum 12% passing the #200 sieve
- Plasticity Index not greater than 20
- Free of debris and concentrations of vegetation.

Use ¾-inch Class 2 AB in the upper 12-inches of the trench within roadways.

7.5.10.3 Trench Backfill Compaction

Follow the pipe manufacturer's requirements for initial backfill to avoid damage to the pipe. To facilitate compaction in the pipe zone area (top of bedding up to 12 inches above pipe), use a trench width that provides a minimum clearance of 12 inches between the pipe and trench wall.

- Moisture condition trench backfill to within 2% of optimum moisture content and compact to a minimum 92% relative compaction (based on ASTM 1557) below 10 feet and 90% relative compaction (based on ASTM 1557) above 10 feet.
- Use a maximum compacted lift thickness of 8 inches unless field performance testing can demonstrate adequate compaction of thicker lifts.
- Jetting is not acceptable for compaction.

Test all trench backfill (bedding, pipe zone backfill, trench zone, etc.):

- At vertical increments of not more than 1 foot and at final grade or pavement subgrade.

DRAFT

- At horizontal testing frequencies of at least one test for every 200 linear feet of pipe (both sides of pipe in pipe zone).
- Complete at least one compaction curve (Proctor) for each material type, source location (for import), and as changes in native materials occur. Material changes include a change in material designation based on the Unified Soil Classification System.
- Testing frequency can be adjusted based on contractor performance, ease of compaction, and material variability.

Soil excavated during pipe installation can have moisture contents well over optimum, especially during the winter and spring months or if perched water is encountered. In this case, it will be necessary to dry back the soil to within 2% of optimum moisture content prior to use as backfill.

It is important to achieve compaction of pipe zone materials at the pipe haunches and spring line; compaction below the pipe spring line will be a difficult task for the contractor. We recommend a compaction demonstration section to test placement and compaction means and methods for each material type that will be used.

8 RISK MANAGEMENT

This report provides preliminary design considerations only. Blackburn has not completed the field work, lab testing, and analysis necessary to provide final design recommendations. Blackburn could not complete the necessary work because alignments were not finalized and rights of entry to properties were not obtained in time for Blackburn to plan, coordinate, and execute field investigations at the locations of proposed improvements.

Blackburn will submit a final report after all field work, lab testing, and analysis has been completed.

Our experience and that of our profession clearly indicates that the risks of costly design, construction, and maintenance problems can be significantly lowered by retaining the geotechnical engineer of record to provide additional services during design and construction. For this project, retain Blackburn to:

- Review and provide comments on the civil plans and specifications prior to construction.
- Attend a preconstruction meeting with the owner, general contractor, earthwork contractor, underground contractor and other parties associated with the management, oversite and process of demolition and earthwork prior to site clearing, grubbing and demolition of existing structures to review geotechnical recommendations, testing requirements and project schedule.
- Observe removal of underground utilities, foundations, vegetation (root balls and roots) and other underground features in accordance with the project plans, specifications and this Geotechnical Report including loose soil generated from the removal.
- Monitor construction to check and document our report assumptions. At a minimum, Blackburn should monitor grading, overexcavation and recompaction of building pad areas, trench backfill, pavement subgrade and aggregate base compaction, and footing excavations.
- Update this report as design changes occur, 2 years or more lapse between this report and construction, and/or site conditions have changed.

DRAFT

If we are not retained to perform the above applicable services, we are not responsible for any other party's interpretation of our report, and subsequent addendums, letters, and discussions.

9 LIMITATIONS

Blackburn performed services in accordance with generally accepted geotechnical engineering principles and practices currently used in this area. This report is for preliminary design only and shall not be used for final design. Where referenced, we used ASTM or Caltrans standards as a general (not strict) *guideline* only. We do not warranty our services.

Blackburn based this report on the current site conditions. We assumed the soil and ground water conditions encountered in our borings are representative of the subsurface conditions across the site. Actual conditions between these locations could be different.

Blackburn completed a Phase 1 Initial Site Assessment for the project. Refer to Blackburn's report dated October 15, 2020 for our evaluation of on-site hazardous material.

Appendices A2, B2, and D2 present our exploratory boring logs and test pit logs. The lines designating the interface between soil types are approximate. The transition between soil types may be abrupt or gradual. Our recommendations are based on the final logs, which represent our interpretation of the field logs, laboratory test results and general knowledge of the site and geological conditions.

Refer to Appendix G (Important Information about This Geotechnical Engineering Report, Geoprofessional Business Association, 2019) for additional limitations regarding this report.

Modern design and construction is complex, with many regulatory sources/restrictions, involved parties, construction alternatives, etc. It is common to experience changes and delays. The owner should set aside a reasonable contingency fund based on complexities and cost estimates to cover changes and delays.

- Class B (various age), moderately constrained location
- Class B (various age), inferred location

Class B Faults -
Geologic evidence demonstrates the existence of a fault or suggests Quaternary deformation, but either (1) the fault might not extend deeply enough to be a potential source of significant earthquakes, or (2) the currently available geologic evidence is too strong to confidently assign the feature to Class C but not strong enough to assign it to Class A.

BLACKBURN CONSULTING

BORING RECORD LEGEND

CONSISTENCY OF COHESIVE SOILS

Descriptor	Unconfined Compressive Strength (tsf)	Pocket Penetrometer (tsf)	Torvane (tsf)	Field Approximation
Very Soft	< 0.25	< 0.25	< 0.12	Extrudes between fingers when squeezed
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS

Descriptor	SPT N_{60} - Value (blows / foot)
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE

Descriptor	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS

Descriptor	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE

Descriptor		Size
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS

Descriptor	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION

Descriptor	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptors and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), Section 2, for tables of additional soil description components and discussion of soil description and identification.

FIELD AND LABORATORY TESTS

C	Consolidation (ASTM D 2435)
CL	Collapse Potential (ASTM D 5333)
CP	Compaction Curve (ASTM D 698 & 1557, CTM 216)
CR	Corrosion, Sulfates, Chlorides (CTM 643, CTM 417, CTM 422)
CU	Consolidated Undrained Triaxial (ASTM D 4767)
DS	Direct Shear (ASTM D 3080)
EI	Expansion Index (ASTM D 4829)
M	Moisture Content (ASTM D 2216)
OC	Organic Content (ASTM D 2974)
P	Permeability (ASTM D 5084)
PA	Particle Size Analysis (ASTM D 6913 & 7928)
PI	Liquid Limit, Plastic Limit, Plasticity Index (ASTM D 4318)
PL	Point Load Index (ASTM D 5731)
PM	Pressure Meter
PP	Pocket Penetrometer
R	R-Value (CTM 301)
SE	Sand Equivalent (CTM 217)
SG	Specific Gravity (AASHTO T100)
SL	Shrinkage Limit (ASTM D 4943)
SW	Swell Potential (ASTM D 4546)
TV	Pocket Torvane
UC	Unconfined Compression - Soil (ASTM D 2166) Unconfined Compression - Rock (ASTM D 7012)
UU	Unconsolidated Undrained Triaxial (ASTM D 2850)
UW	Unit Weight (ASTM D 7263)
VS	Vane Shear (AASHTO T223 / ASTM D 2573)

SAMPLER GRAPHIC SYMBOLS

- Standard Penetration Test (SPT)
- California Sampler (2" ID)
- Modified California Sampler (2.4" ID)
- Shelby Tube
- Piston Sampler
- NX Rock Core
- HQ Rock Core
- Bulk Sample
- Other (see remarks)

DRILLING METHOD SYMBOLS

- Auger Drilling
- Rotary Drilling
- Dynamic Cone or Hand Driven
- Diamond Core

WATER LEVEL SYMBOLS

- First Water Level Reading (during drilling)
- Static Water Level Reading (short-term)
- Static Water Level Reading (long-term)

BLACKBURN CONSULTING

BORING RECORD LEGEND

CONSISTENCY OF COHESIVE SOILS

Descriptor	Unconfined Compressive Strength (tsf)	Pocket Penetrometer (tsf)	Torvane (tsf)	Field Approximation
Very Soft	< 0.25	< 0.25	< 0.12	Extrudes between fingers when squeezed
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS

Descriptor	SPT N_{60} - Value (blows / foot)
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE

Descriptor	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS

Descriptor	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE

Descriptor		Size
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS

Descriptor	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION

Descriptor	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptors and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), Section 2, for tables of additional soil description components and discussion of soil description and identification.

BORING RECORD LEGEND

CONSISTENCY OF COHESIVE SOILS

Descriptor	Unconfined Compressive Strength (tsf)	Pocket Penetrometer (tsf)	Torvane (tsf)	Field Approximation
Very Soft	< 0.25	< 0.25	< 0.12	Extrudes between fingers when squeezed
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS

Descriptor	SPT N_{60} - Value (blows / foot)
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE

Descriptor	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS

Descriptor	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE

Descriptor		Size
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS

Descriptor	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION

Descriptor	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptors and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), Section 2, for tables of additional soil description components and discussion of soil description and identification.

Appendix D3: Laboratory Tests for WWTP not complete at the time of this Report

APPENDIX C: Site-Specific Design Spectra Calculation

In this appendix we present the details of our site-specific ground motion analysis performed in accordance with Chapter 21 of ASCE 7-16 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures*. We calculated:

- Site Classification D per ASCE 7-16 Table 20.3-1.
- Probabilistic geometric mean (MCE_G[1]) and risk targeted maximum considered earthquake (MCE_R[2]) response spectra for a 5% damped, 2% probability of exceedance within a 50 year period (2,475 year return period).
- Design Earthquake (DE[3]) response spectra.
- Design acceleration parameters.
- Maximum considered earthquake geometric mean (MCE_G) peak ground acceleration (PGA_M).

C1.0 PROBABILISTIC SEISMIC HAZARD ANALYSIS

Methodology

We performed a site-specific probabilistic ground motion analysis in accordance with ASCE 7-16 Section 21.2.1.2. A probabilistic analysis is used because the location, recurrence interval, and magnitude of future earthquakes are uncertain.

To develop the site-specific probabilistic MCE_R response spectra we:

1. Used the United States Geological Survey (USGS) Unified Hazard Tool[4] to develop uniform hazard curves for spectral periods ranging from 1 to 5 seconds and calculate the MCE_G response spectra.
2. Applied scaling factors (per ASCE 7-16,21.2) to each hazard curve to calculate the maximum response in the horizontal plane.
3. Used the scaled hazard curve data and the USGS Risk-Targeted Ground Motion Calculator[5] to develop the risk targeted ground motion for selected periods (maximum of 5 seconds).
4. Plotted the risk targeted ground motion at selected periods to create the site-specific MCE_R response spectra.

[1] MCE_G - The most severe earthquake effects considered by ASCE 7-16 without adjustment for targeted risk.
[2] MCE_R - The most severe earthquake effects considered by ASCE 7-16 adjusted to the orientation considered to provide the maximum horizontal response.
[3] DE – The earthquake effects that are 2/3 of the corresponding risk-targeted maximum consider MCE_R effects.
[4] https://earthquake.usgs.gov/hazards/interactive/
[5] https://earthquake.usgs.gov/designmaps/rtgm/

DRAFT

Results

Figure C-1 shows the calculated site-specific MCE_G and MCE_R probabilistic spectra.

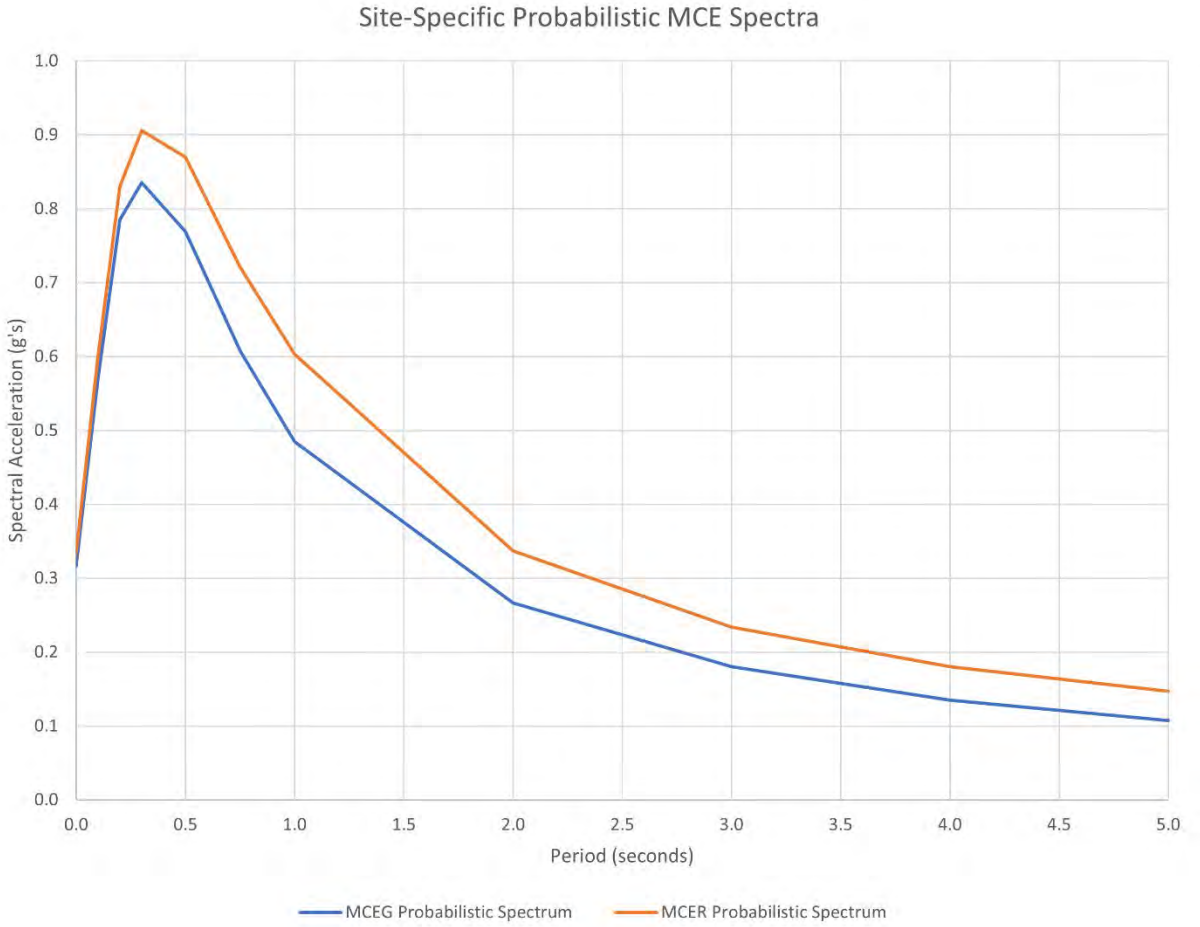

Figure C-1 – MCE_G (Geometric mean) and MCE_R (Risk Targeted) site-specific spectra for 2% probability of exceedance in 50 years.

DRAFT

Table C-1 shows the calculated spectral values for the probabilistic MCE_R and MCE_G spectra.

Table C-1: Probabilistic MCE_R and MCE_G Spectral Accelerations (g's)

Period	Probabilistic MCE_G Spectra	Scaled Probabilistic MCE_R Spectra
0	0.317	0.334
0.1	0.570	0.600
0.2	0.785	0.830
0.3	0.835	0.906
0.5	0.769	0.870
0.75	0.607	0.721
1	0.485	0.603
2	0.266	0.337
3	0.180	0.234
4	0.135	0.180
5	0.108	0.147

Figures C-2 through C-5 show the deaggregation of the probabilistic seismic hazard results for MCE_G hazard level for the PGA, 0.2, 1, and 5 second periods. The faults that dominate the hazard at the site are:

- PGA and 0.2 second periods - The Great Valley Mysterious Ridge and Hunting Creek-Bartlett Springs connector.
- 1 second period - The San Andreas fault, Hunting Creek-Bartlett Springs connector, Great Valley Mysterious Ridge, and Rodgers Creek-Healdsburg.
- 5 second period - The San Andreas fault and Hunting Creek-Bartlett Springs connector[6]

[6] Deaggregation results show the Cascadia Megathrust governs at the 5 second period, however we reference only the San Andreas fault and Hunting Creek-Bartlett Springs connector because the Cascadia Megathrust is over 120 miles away.

DRAFT

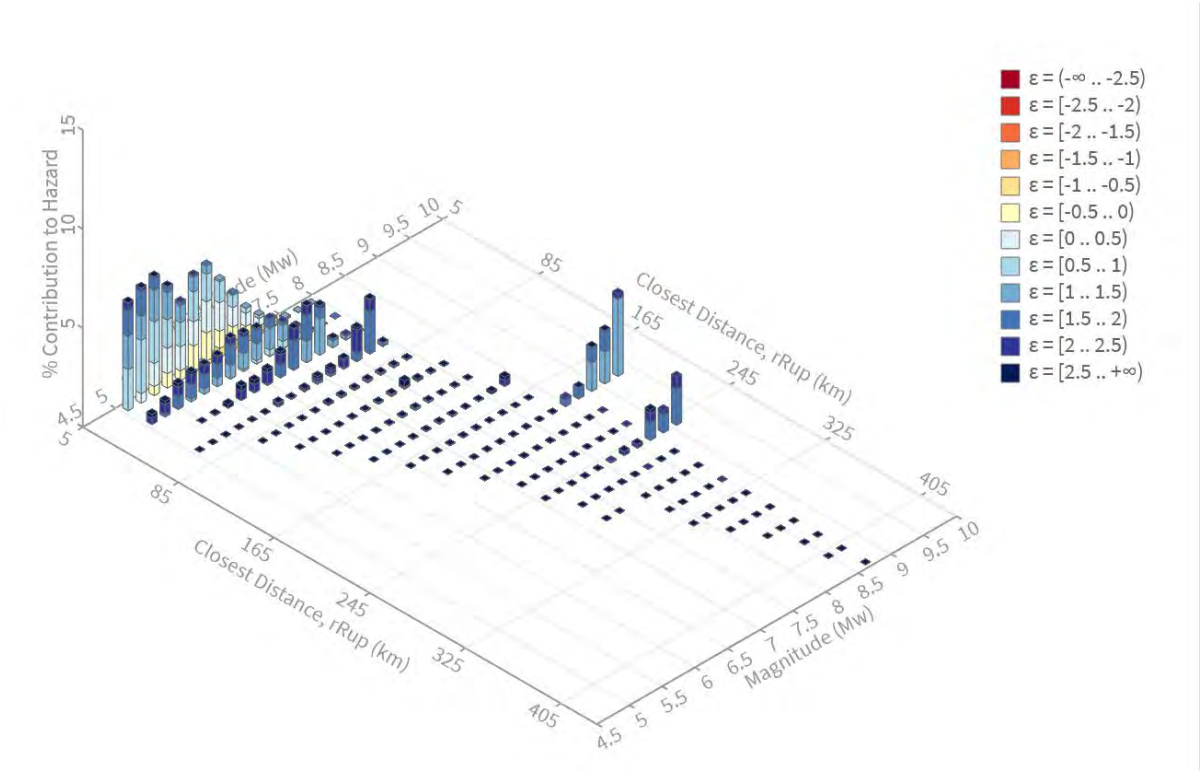

Figure C-2- Deaggregation for PGA (MCE_G)

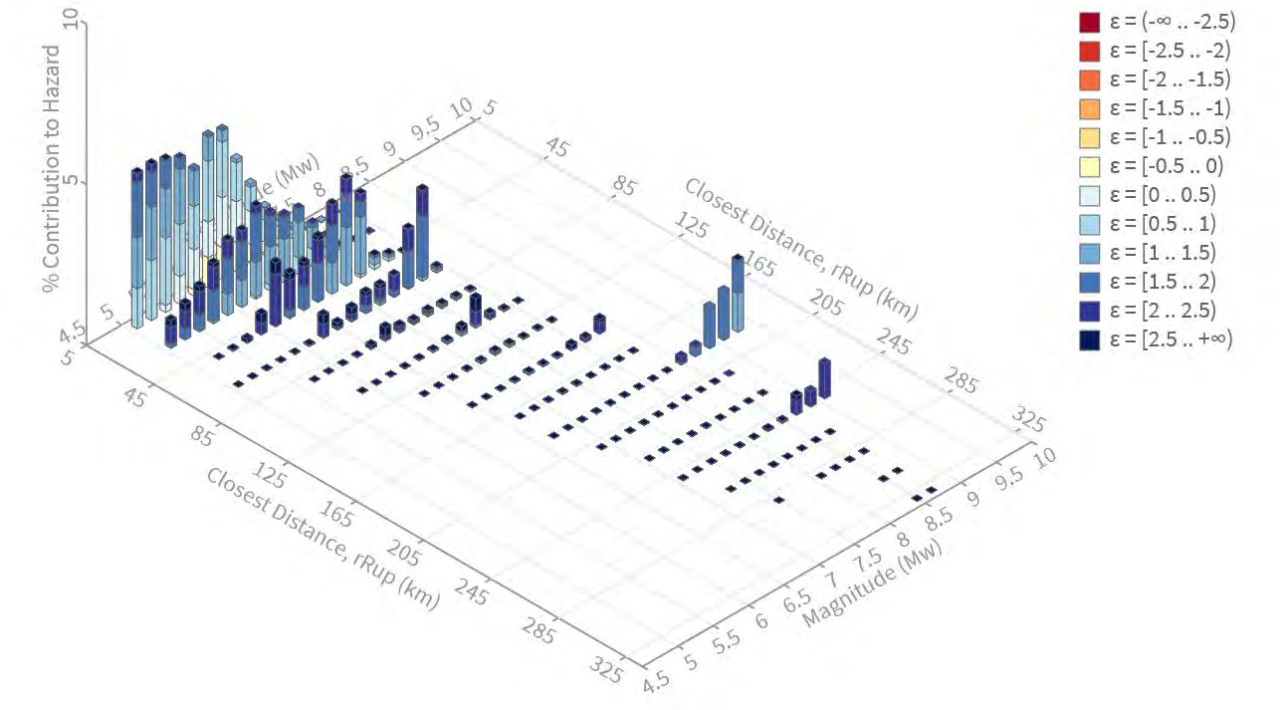

Figure C-3- Deaggregation for 0.2 seconds (MCE_G)

DRAFT

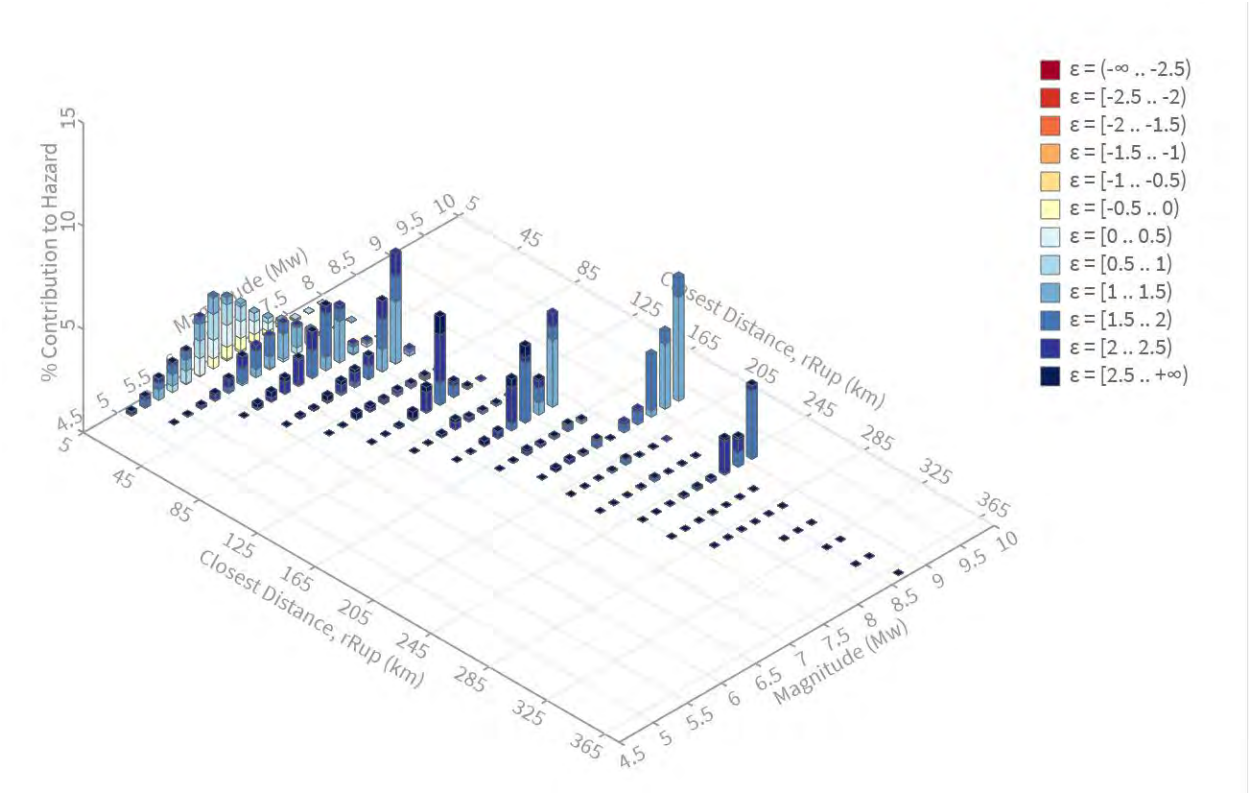

Figure C-4- Deaggregation for 1 second (MCE_G)

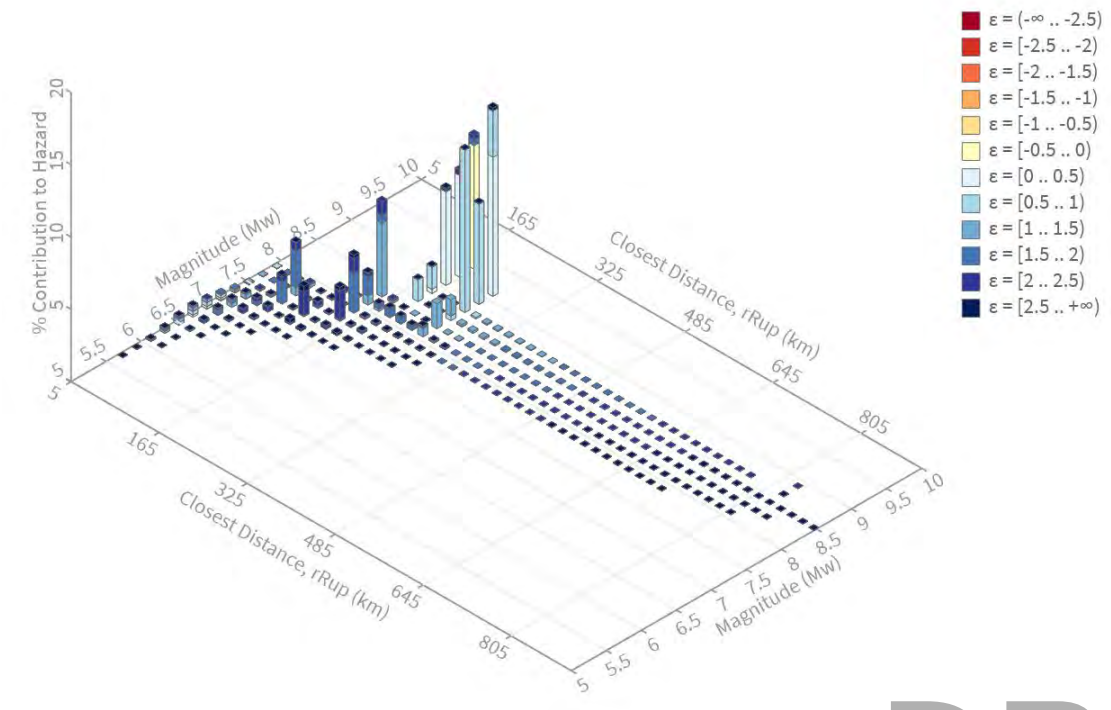

Figure C-5- Deaggregation for 5 second (MCE_G)

DRAFT

C2.2 Deterministic Analysis

The ASCE 7-16 Amendment for 21.2.3 states that when the largest probabilistic spectral response acceleration is less than 1.2 F_a, the site-specific MCE_R shall be taken as the site-specific probabilistic spectrum. This amendment applies to our site; therefore, a deterministic site-specific spectrum was not calculated.

C2.3 Recommended Site-Specific MCE_R and Design Response Spectra

Figure C-6 and Table C-2 compare the calculated site-specific probabilistic MCE_R spectra, the MCE_R spectra calculated in accordance with ASCE 7-16 Section 11.4.7, 80% value of the ASCE 7-16 Section 11.4.7 MCE_R spectra, and the recommended MCE_R spectra.

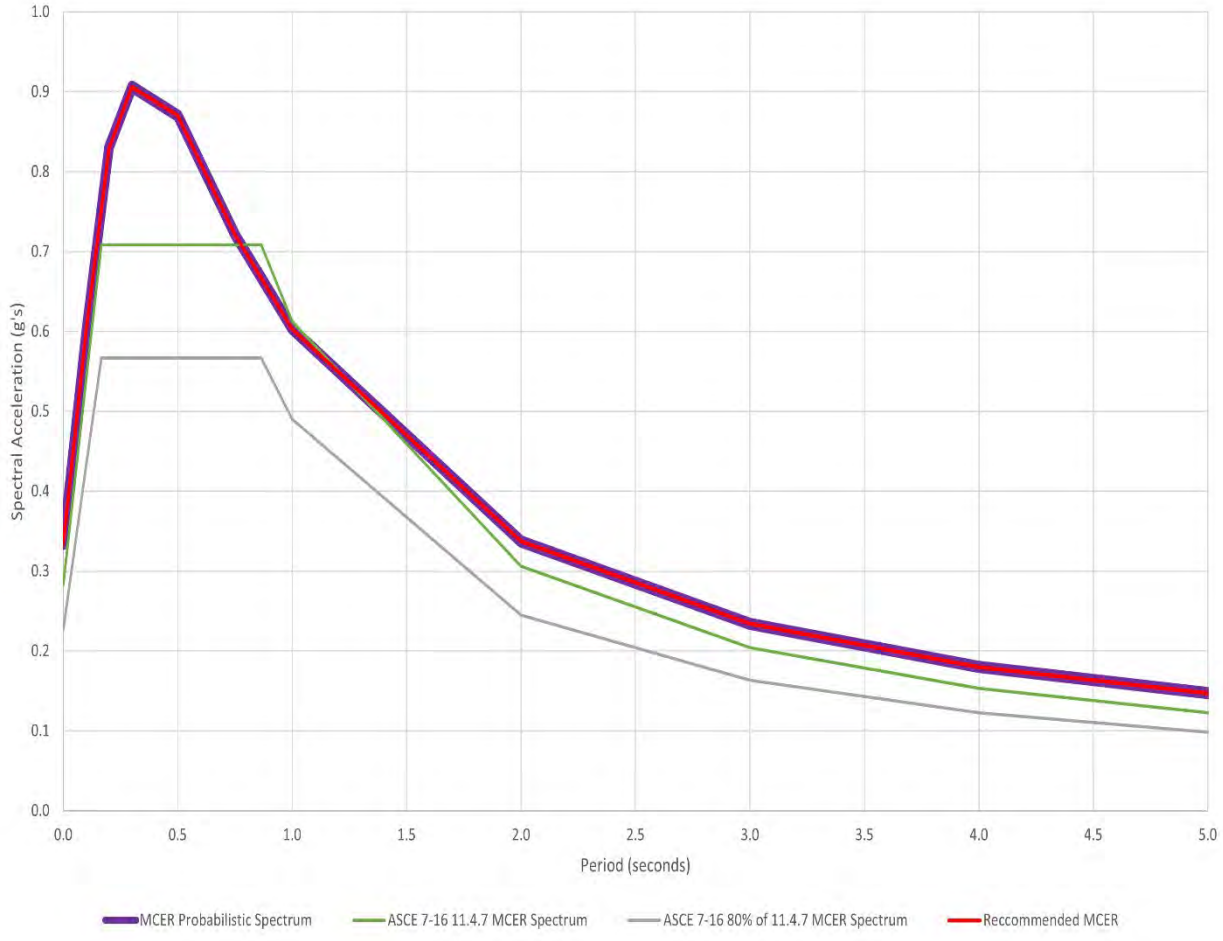

Figure C-6 – Site-Specific Probabilistic MCE_R Spectrum, ASCE 7-16 Section 11.4.7 MCE_R Spectrum, 80% of ASCE 7-16 Section 11.4.7 MCE_R Spectrum, and the recommended MCE_R Spectrum.

DRAFT

Table C-2: Comparison of Recommended and ASCE 7-16 Section 11.4.7 Spectra				
Period	**Site-Specific Recommended MCE_R Spectrum**	**ASCE 7-16 11.4.7 MCE_R Spectrum**	**80% of the ASCE 7-16 11.4.7 MCE_R Spectrum**	**Recommended MCE_R Spectrum**
0	0.335	0.283	0.227	0.335
0.1	0.600	0.539	0.431	0.600
0.166	0.760	0.708	0.567	0.760
0.2	0.830	0.708	0.567	0.830
0.3	0.906	0.708	0.567	0.906
0.5	0.870	0.708	0.567	0.870
0.75	0.722	0.708	0.567	0.722
0.865	0.660	0.708	0.567	0.660
1	0.603	0.613	0.490	0.603
2	0.337	0.306	0.245	0.338
3	0.234	0.204	0.163	0.234
4	0.180	0.153	0.123	0.180
5	0.147	0.123	0.098	0.147

For this site the site-specific probabilistic spectra controls the site response for all periods.

ASCE 7-16 Section 21.3 defines the design response spectrum (DE) as 2/3 times the site-specific MCE_R spectrum. The design spectral response acceleration at any period is not taken as less than 80% of spectral acceleration determined in accordance with ASCE 7-16, Section 11.4.6, where F_a is determined using Table 11.4-1 and F_v is determined using Section 21.3. Figure C-7 and Table C-3 present the calculated DE response spectra, the ASCE 7-16 section 11.4.6 Spectrum, and 80% of the ASCE 7-16 11.4.6 Spectrum. The site-specific design response spectrum is greater than the response spectrum calculated using ASCE 7-16 Section 11.4.6 for all periods and therefore governs the recommended design response spectrum.

DRAFT

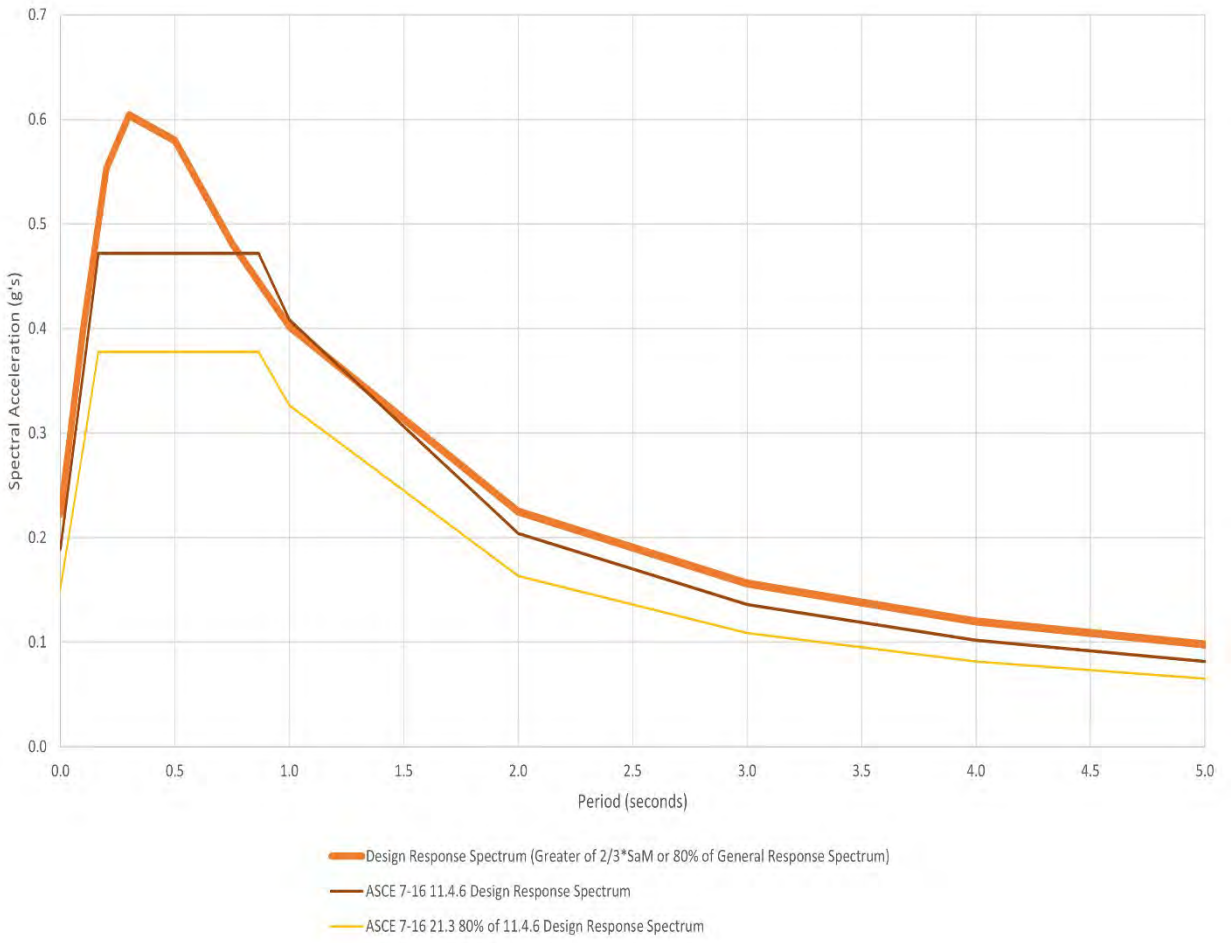

Figure C-7 – Design Response Spectrum (Greater of 2/3*SaM or 80% of General Response Spectrum), ASCE 11.4.6 Design Response Spectrum, and 80% of 11.4.6 Design Response Spectrum.

Olivehurst Public Utility District Wastewater Treatment Plant Expansion and Upgrade Project Schematic Design—Preliminary Geotechnical Exploration Report

PREPARED FOR: Olivehurst Public Utility District (OPUD)

PREPARED BY: Allen Evans/CH2M HILL

DATE: February 13, 2004

Introduction

This technical memorandum (TM) presents the preliminary results of the geotechnical exploration for the Olivehurst Wastewater Treatment Plant (plant) Phase 1 and 2 expansion and upgrade project. The project includes construction of new facilities and modifications to existing facilities to expand treatment capacity. The geotechnical exploration consisted of observing and testing surface and subsurface soil conditions in areas where new or remodeled facilities are planned. This TM was to provide initial geotechnical recommendations for the preliminary design and construction, and recommendations will be reevaluated when final facility layout and designs are established. To accomplish this, the scope of work includes the following:

- Conduct a site visit to observe site layout and existing surface soil conditions.
- Perform subsurface exploration using soil borings.
- Conduct laboratory testing to evaluate engineering properties of subsurface soils.
- Analyze subsurface conditions for the proposed facilities.
- Recommend preliminary design criteria for foundations, excavation and backfill, and lateral earth pressure for purposes of the preliminary design.

Project Description

The proposed treatment plant expansion is located in Olivehurst, California. The layout of the existing is show on Figure 4-1. New facilities include influent screening and grit removal facilities, influent pump station, primary effluent distribution box, potential headworks expansion, primary clarifier, oxidation ditches, secondary clarifiers, flow equalization basin, filter influent pump station, tertiary filters, chemical storage/feed building, anaerobic digesters, and solids handling building. In addition, modifications to change the chlorine contact basin to an ultraviolet disinfection system, and modifications to the control building will be made. To accommodate the facility expansion, a new levee will be constructed on the northwest side of the plant. The new levee will extend approximately 200 feet north of the existing levee.

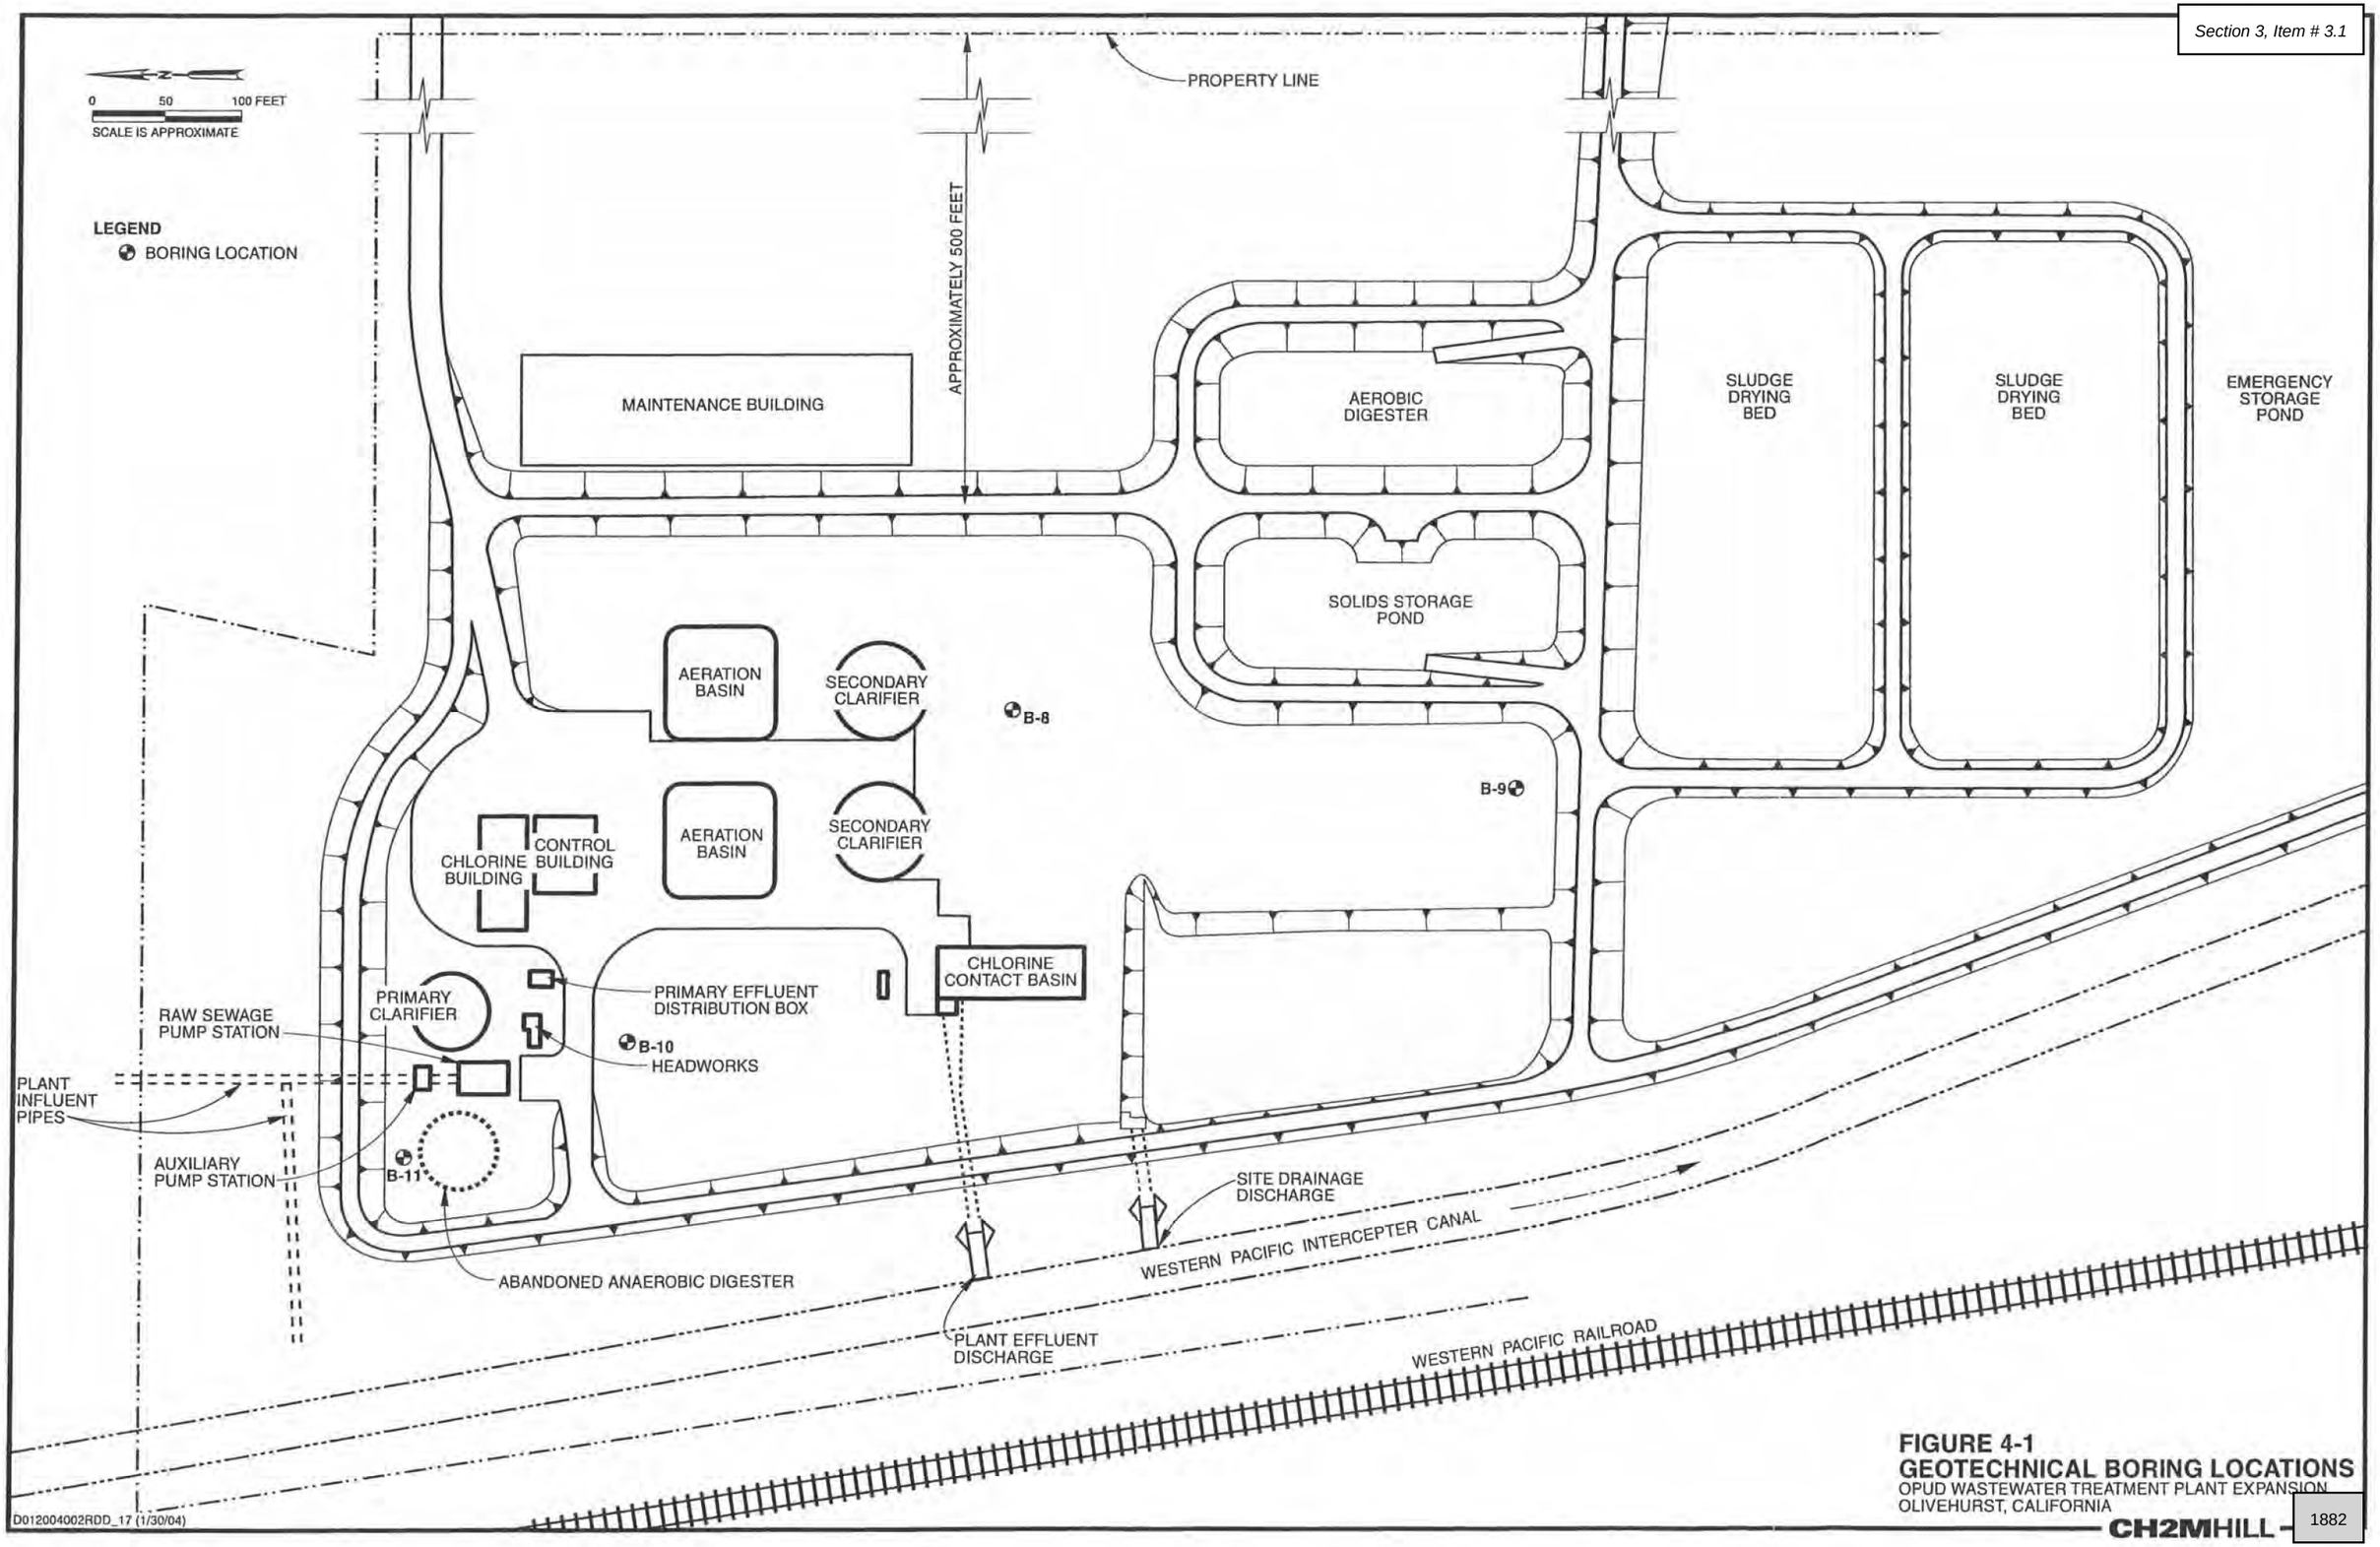

FIGURE 4-1
GEOTECHNICAL BORING LOCATIONS

OLIVEHURST, CALIFORNIA

D012004002RDD_17 (1/30/04)

CH2MHILL

The area proposed for anaerobic digesters and solids handling building is occupied by the existing solids storage ponds. The area proposed for the flow equalization basin is currently a portion of the emergency storage pond. Locations of the influent screening and grit removal facilities, influent pump station, primary effluent distribution box, and primary clarifiers are proposed for the area north of the plant's north levee into the a portion of the farm field north of the plant. All other facilities are proposed for areas unoccupied by structures. Yard piping may be present in these areas.

Previous Geotechnical Exploration

The previous geotechnical exploration report prepared by CH2M HILL was reviewed. The geotechnical investigation was performed in 1975 for the expansion and modernization of the plant.

Field Exploration

The field exploration was performed on January 12 and 13, 2004, and consisted of a site reconnaissance and subsurface exploration. The site reconnaissance was conducted to observe existing site conditions, topography, and surface soil and water conditions. The subsurface exploration consisted of drilling four borings at the locations shown in Figure 4-1. Soil borings were performed by using a CME-550 track-mounted drill rig equipped with an 8-inch OD hollow-stem auger. The borings were advanced to depths between 25 and 40 feet below ground surface (bgs).

In situ testing and soil sampling were performed in the borings using the Standard Penetration Test (SPT) in accordance with ASTM D1586 at approximately 5-foot intervals throughout the depth of each boring. The SPT provides a disturbed sample of the soil and an empirical indication (N-value) of the soil density. Additional sampling was performed by driving modified California samplers lined with 2.5-inch-diameter sleeves and by hydraulically pushing 3-inch-diameter, thin-walled steel Shelby tubes into the soil at various depths in the borings.

The field exploration was directed by CH2M HILL geotechnical personnel. The soils encountered were visually classified in approximate accordance with ASTM D2488 (visual-manual procedure for description of soils). Soil boring logs are included in Attachment 4-1. Upon completion of drilling, the soil borings were backfilled with cement gout to the ground surface using the hollow-stem auger to tremmie the grout to the bottom of the boring.

Geology

The plant is located in the Great Valley geologic province. The plant is underlain by the Victor Formation of Pleistocene age. The Victor Formation is composed of interbedded sand, silt, and clay with lenses of gravel. The formation includes some meandering stream channel deposits of poorly sorted cobble, gravel and sand. Shallow materials typically contain hardpan. Infiltration rates are very low.

Subsurface Conditions

The general area around the site is a very flat, poorly drained plain used primarily for farmland. The plant facilities are surrounded by 6 to 10 feet tall levees, with the levee road at Elevation 63. The elevation inside the levees varies between Elevations 52 and 59.

The upper 3 to 5 feet of subsurface material consists of sandy clay. The sandy clay was soft and saturated in the unpaved areas around the existing structures. The grassy area at B-10 did not have a saturated upper layer due to drainage provided by underdrains from the old sludge drying bed. Under this upper layer, a hard, sandy clay that compromises the Victor Formation hardpan was encountered up to 8 feet bgs. Pocket penetrometer readings in the hardpan were greater than 4.5 tons per square foot (tsf), the maximum reading on the instrument. Penetration was less than 0.1 inch. The hardpan was underlain by layers of medium dense to dense clayey sand, and stiff to very stiff sandy clay. Pocket penetrometer readings in these soils were all greater that 3 tsf. In Borings B-8 and B-9, a 6- to 7-foot-thick gravely sand and sandy gravel layer was encountered at Elevation 31 . At Boring B-10, a gravely sand layer was encountered from elevation from 42 to 39 feet, and no similar layer was encountered at Boring B-11. In Borings B-8 and B-9 the gravel layer was underlain by multiple layers of clayey sand and sandy clay. The gravel layer in B-10 was underlain by clayey sand to Elevation 29. Under this clayey sand, a sandy silt was encountered. At Boring B-11, clayey sand layer was found from the surface to 23 feet bgs that was underlain by silty sand.

Groundwater was encountered in all borings at approximately Elevation 33. These water levels were taken at the time of drilling inside of the hollow-stem auger. Drilling was paused for 10 minutes before measuring the water level, however, it should be noted that the water levels on the boring logs were not allowed enough time to reach equilibrium. Site groundwater levels may also vary depending on the season. Surface water was encountered in the first soil layer and it is believed this water is perched on the hardpan layer.

Laboratory Testing

A testing program was developed to provide classification and engineering properties of the soils. Particle-size Analysis of Soils (ASTM D422), Particles Passing the No. 200 sieve (ASTM C1140), Moisture Content (ASTM D2216), Atterberg Limits (ASTM D4318), Unit Weight (ASTM D2937), Direct Shear Testing (ASTM D3080), and Modified Proctor (ASTM D1557) tests were conducted on selected soil samples. Test results are summarized and included in Attachment 4-2.

Site Seismicity

Probabilistic Seismicity

A probabilistic assessment of the peak ground acceleration of the site was obtained from published U.S. Geological Survey (USGS) and California Geological Survey (CGS) sources. As part of the National Seismic Hazard Mapping Project (2002), a peak ground acceleration of 0.12g was obtained, with the probability of exceedance of 10 percent in 50 years.

Using the probabilistic 1996 Caltrans California Seismic Hazard Map, the maximum credible earthquake (MCE) is magnitude 6.5 produced by the Prairie Creek-Spencerville-Dentman

fault estimated to be approximately 12 miles east of the site. Based on this map, the estimated peak ground acceleration (PGA) is 0.2 g.

1997 UBC Design Criteria

Table 4-1 presents UBC seismic coefficients and factors for the plant. The subsurface material is stiff to hard sandy clay and medium to dense clayey sand.

TABLE 4-1

N_V	1.0	16-T

Recommendations

Excavation

All anticipated structures are listed in Table 4-2, together with their estimated excavation depths. Some structures require deep excavations up to approximately 21 feet bgs. As described previously, subsurface materials consist of sandy clay, clayey sand, and gravel. The subsurface materials are anticipated to be excavatable with conventional equipment. Highly organic, soft surface soils should be stripped a minimum of 3 feet outside structure foundation areas. It is anticipated that soils other that highly organic soils can be stockpiled for use backfill. Softer near surface soil may be stockpiled for use in the levee after vegetation and roots are removed.

The final excavation bottom for any structure should be cleared of loose material and compacted to at least 90 percent of its maximum dry density in accordance with ASTM D1557 before placing any concrete. The base of all excavations should be approved by a geotechnical specialist to verify its capability to support the overlying structure without unacceptable settlement.

Where excavations are required adjacent to existing structures, excavations should not be carried below the base of the existing footings unless there is a stable slope 1:1 or flatter that will not ravel or cause loss of support to the existing structure.

TABLE 4-2
Excavation and Foundation Depths for Structures Requiring Deep Excavation
Olivehurst Waste Water Treatment Plant Phase 1 and 2 Expansion and Upgrade Schematic Design

Structure	Existing Ground Surface Elevation	Estimated Depth to Bottom of Lowest Foundation (ft)	Elevation at Bottom of Excavation

RAS/WAS Pump Station	57	Slab on Grade	53
Anaerobic Digesters	53	5	46
Solids Handling Building	53	Slab on Grade	51
Levee	56	56	52

Fill and Backfill

Imported granular fill should be used as backfill under below grade structures. Granular fill should be placed in loose lifts not exceeding 8 inches, moisture conditioned as necessary, and compacted to at least 95 percent of its maximum dry density in accordance with ASTM D1557 within influence zones of structures unless otherwise recommended below. The influence zone is defined as the area beneath a structure within planes sloped downward and outward at a 60° angle from the horizontal measured from the outermost footing element. A minimum of 12 inches of imported granular fill should be placed under shallow foundations. A minimum of 6 inches of granular fill should be placed below floating slabs. Granular fill should be placed in loose lifts not exceeding 8 inches, moisture conditioned as necessary, and compacted to at least 95 percent of its maximum dry density in accordance with ASTM D1557.

Native soil obtained from onsite excavations, blended to provide a homogeneous mixture, and free of soft surface soils and organic material and debris, may be used as backfill around structures. It may also be used as backfill in areas of over-excavation for shallow foundations not requiring granular fill. Native soil backfill should be placed in loose lifts not exceeding 8 inches, and compacted to at least 90 percent of its maximum dry density and within 2 percent of optimum moisture content in accordance with ASTM D1557. The backfill should be placed and compacted in even lifts around the structure perimeter.

Processed native material including softer near surface soils may be used as fill for construction of levee expansions. Fill should be placed in loose lifts not exceeding 8 inches, moisture conditioned as necessary, and compacted to at least 90 percent of its maximum dry

density in accordance with ASTM D1557. The levee slopes should be constructed at a maximum slope of 2:1, horizontal to vertical, to match existing slopes.

Groundwater Design Considerations

Multiple excavations will extend near the top of the estimated groundwater level found at the time of drilling; therefore, some dewatering may be required. Depending on the season, surface water perched on the hardpan layer may drain into the excavation and will require additional control measures to prevent inflow.

Review of previous geotechnical explorations performed at the site provide limited information on the variability of groundwater elevations at the site. No regular monitoring using peizometers has been performed to determine the response of groundwater levels to the filling of Western Pacific Interceptor Canal. The 100-year flood elevation of 60 is higher that the site elevation. Unknown gravel layers that could connect the area outside the levee to the structures inside the levee may exist. Because of these uncertainties, design of below-grade structures should use the ground surface as the static water level.

Lateral Earth Pressures

Restrained structure exterior walls should be designed to resist at-rest earth pressures. Walls free to move about the top should be designed to resist active pressures. Passive pressures may be used to resist lateral forces. Walls should be designed to resist the static lateral equivalent fluid pressures shown in Table 4-3 plus any equipment or earth surcharge loads. Concrete footings and slabs cast against undisturbed soil may use a sliding friction factor of 0.4 in resisting lateral loads.

TABLE 4-3
Lateral Earth Pressures
Olivehurst Public Utility District Wastewater Treatment Plant Expansion and Upgrade Project Schematic Design

	Equivalent Fluid Pressures (pcf)		
Soil Type—Drainage Condition	**Active**	**At-rest**	**Passive**
Native—Drained	40	60	350
Native—Undrained	90	100	200
Imported Granular Backfill – Drained	40	60	400
Imported Granular Backfill – Undrained	80	90	275

Note: Assumed Values: Native γ : 114 pcf; φ: 30 °, γ_{sat} : 130 pcf; Imported γ_{sat} : 140 pcf; φ: 35 °

Ground motion during earthquakes tends to increase the earth pressure above static levels. Retaining walls should be designed to resist a dynamic active lateral force increase of $16*H^2$ pounds per linear foot of wall, which acts at a height of 0.6*H above the base of the wall (H = height of wall). The dynamic lateral force increase should be used in addition to the static active earth pressure force.

Foundations

The proposed structures should be supported on foundations similar to those that have been successfully used for similar facilities at this plant. Based on a visual reconnaissance of the existing facilities, there is no evidence of significant settlement, either total or

differential. New facilities should be supported on strip footings, mat foundations, rectangular column footings, or combinations as required to provide support.

The shallow foundations for the filtration building, RAS/WAS pump station, anaerobic digesters, and solids handling building should be designed for a maximum allowable net bearing pressure of 2,000 pounds per square foot (psf). Total post-construction settlement for these near-grade structures is expected to be less than 0.75 inch. Footings should be placed a minimum of 1.5 feet below finish grade. Mat foundations should be keyed a minimum of 1 foot below finish grade. All other belowgrade structures should be designed for a maximum allowable net bearing pressure of 2,500 pounds per square foot (psf). Loads from these structures are not expected to be significantly greater than the current overburden pressures, therefore, total post-construction settlement is expected to be less than 0.5 inch. An increase of up to one-third of the allowable bearing pressure may be used for short-term loading such as wind, seismic, or equipment loading.

Construction Observation and Testing

If any unusual conditions are encountered at the footing locations, a geotechnical specialist should review the excavation bottom and determine if revisions are needed. Compaction testing and periodic fill observations should be performed during placement of engineered fill. Photos should be taken to document specific conditions.

Limitations

This technical memorandum has been prepared for the exclusive use of the Olivehurst Public Utility District for specific application to Phase 1 and 2 plant expansion and upgrade schematic design. It has been prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, express or implied, is made.

The analyses and preliminary recommendations contained in this report are based on the data obtained from our exploratory borings for the proposed structures. These borings indicate subsurface conditions only at specific locations and times, and only to the depths penetrated. They do not necessarily reflect strata variations that may exist between such locations. Subsurface conditions and water levels at other locations may differ from conditions occurring at these indicated locations. The passage of time may result in a change in the conditions at these locations. If variations in subsurface conditions from those described are noted during construction, recommendations in this report must be re-evaluated.

In the event that any changes in the nature, design, or location of the facilities are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed and conclusions of this report modified or verified in

writing by CH2M HILL. CH2M HILL is not responsible for any claims, damages, or liability associated with the interpretation of subsurface data or reuse of the subsurface data or engineering analyses without the express written authorization of CH2M HILL.

APPENDIX F

Blackburn Response to Jacobs Comments on December 11, 2020 Draft Preliminary Geotechnical Basis of Design Report

Comment Number	Subject	Page Label	Status	Author	Date	Comments	2/3/2021 Blackburn Response
1			✓	mtwede	14/01/2021	Suggest including pipeline borings with total depths and "not encountered" in depth to water column.	The previous table (3.1) includes all borings and the depth to ground water. Table 3.2 is intended to pull out and focus only on the borings in which we encountered ground water to show the information concisely in one location/table. We will revise the wording in the ground water column of table 3.1 to say "Not Encountered" rather than "NA" for borings that did not encounter ground water.
	Text Box	18					
2	Text Box	22		mtwede	13/01/2021	Not sure how native soil can be used when it consists mostly of clay? see next comment.	See response to comment #4 below.
3	Text Box	22		mtwede	13/01/2021	Please provide estimated E' of native soil in case the trench width requires a composite E' to be used.	Our borings show the pipe zone will be withing stiff to hard clays. We will recommend a E' of 3,000 psi for the native, undisturbed soils.
4	Text Box	22		mtwede	13/01/2021	Was this meant to say if native soil meets these requirements, it is okay to use as fill? It would be difficult to separate out suitable material, and more reasonable to abide by Class 2 AB requirements for fill within roadways.	We are revising our report to recommend that native soil can be used for intermediate backfill provided it is free of debris and observable concentrations of organics. We are revising our report to recommend that if import fill is required for pipeline backfill, the import fill must meet the following: 100% passing the 1-inch sieve, 75% to 100% passing the #4 sieve, at least 12% passing the #200 seive, and a Plasticity Index not greater than 20.
5	Callout	23	✓	mtwede	14/01/2021	12" Seems excessive for trench compaction equipment	We will reword to state: "To protect the pipe, use a maximum loose lift thickness of 12 inches for the first lift of fill placed above the top of the pipe. Use a maximum thickiness of 8 inches for subsequent lifts."
6	Text Box	23		mtwede	13/01/2021	In roadways, 1 inch of settlement for 15 foot deep trench is not likely to be acceptable. Can this be reduced using Class 2 AB instead of the specified imported fill?	Agreed. We will reword to state: "The magnitude of potential trench backfill settlement will be largely dependent on the degree and uniformity of compaction; therefore, it is important that recommend backfill methods are perfromed and compaction checked at frequent intervals to limit potential settlement." This is regardless of whether the backfill is AB or soil.
7	Text Box	44	✓	mtwede	14/01/2021	Can drained EFW values be used above some maximum depth?	The EFWs we recommended are valid for buoyant soil conditons or near-saturated soil and consider the range of backfill materials that could be used. Rereading this section, we now think that using the word "undrained" could be misleading/misunderstood. Therefore, we will replace "undrained EFW" with simply "EFW". We are performing additonal evalution of these values and may update them in our Revised Draft Preliminary Report.
8	Callout	48		KELLOGJA	08/01/21	Please verify that the design groundwater elevation for facilities at the WWTP is 15 feet below finish grade. Can the design groundwater be defined with a specific elevation as the finish grade across the site varies? a.It is assumed that the new EQ basin will be constructed at roughly the same elevations as the existing EQ basin which has a maximum depth of approximately 24 feet. It is assumed that the center of the new secondary clarifier will be approximately 19 feet below finish grade. Please provide groundwater design considerations/mitigations for structures founded below the design groundwater elevation.	We will updated ground water information and refer to design ground water elevations rather than depths. Jacobs informed us last year that the new EQ basin would be about be 10 to 11 feet deep and therfore about 5 to 7 ft deeper than the depth of the current basin at that loation. Based on that depth, we understood that it will not be below groundwater. We will address ground water conditions at the new for clarifier after we drill the exploations for the clarifer.
9	Callout	50		KELLOGJA	08/01/21	Please provide the site-specific response analysis. The clarifier structure design base shear is calculated per ASCE 7-16 section 15.7, and thus, the exceptions from ASCE 7 section 11.4.8 are not applicable.	We can complete a site-specific analysis. Is site-specific analysis requested at the water tank site also?
10	Callout	53	✓	KELLOGJA	08/01/21	The secondary clarifier will not be constructed 20 deep. The top of the circumferential perimeter foundation will likely be around 14ft minimum below finish grade, with the perimeter foundation bottom around 15.5ft below finish grade. Please revise the section as required.	We will provide recommendations appropriate to whatever depth is used. Please note, comment on page 48 says clarifier will be 19' below grade
11	Callout	60	✓	KELLOGJA	08/01/21	Joint spacing will be greater than 12ft and associated reinforcing will be selected to exceed the requirements of ACI 350-06 Table 7.12.2.1 to accommodate the joint spacing utilized. Please revise this section to not limit the joint spacing. If desired, the joint spacing criteria of ACI 350-06 can be referenced, or the joint spacing criteria can be deferred on the structural engineer.	We will remove limits and reference ACI 350-06
12	Callout	60	✓	KELLOGJA	08/01/21	Two different minimum slab and subgrade thicknesses are listed, 4" over 6" and 6" over 8". Note that the slab will have a 6" minimum thickness to provide proper cover over the reinforcing and clearances for waterstop, so the reference to the 4" minimum thickness can be deleted to avoid confusion. Please clarify if expansive soil is required to be considered.	Will replace 4" concrete over 6" AB with 6" concrete over 8" AB

UPDATED DRAFT PRELIMINARY GEOTECHNICAL BASIS OF DESIGN REPORT

Olivehurst Public Utilities District

South Yuba Sewer and Water Infrastructure Project

Olivehurst, CA

APPENDIX G

Important Information about This Geotechnical Engineering Report, Geoprofessional Business Association, 2019

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, you can benefit from a lowered exposure to problems associated with subsurface conditions at project sites and development of them that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed herein, contact your GBA-member geotechnical engineer. Active engagement in GBA exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Understand the Geotechnical-Engineering Services Provided for this Report

Geotechnical-engineering services typically include the planning, collection, interpretation, and analysis of exploratory data from widely spaced borings and/or test pits. Field data are combined with results from laboratory tests of soil and rock samples obtained from field exploration (if applicable), observations made during site reconnaissance, and historical information to form one or more models of the expected subsurface conditions beneath the site. Local geology and alterations of the site surface and subsurface by previous and proposed construction are also important considerations. Geotechnical engineers apply their engineering training, experience, and judgment to adapt the requirements of the prospective project to the subsurface model(s). Estimates are made of the subsurface conditions that will likely be exposed during construction as well as the expected performance of foundations and other structures being planned and/or affected by construction activities.

The culmination of these geotechnical-engineering services is typically a geotechnical-engineering report providing the data obtained, a discussion of the subsurface model(s), the engineering and geologic engineering assessments and analyses made, and the recommendations developed to satisfy the given requirements of the project. These reports may be titled investigations, explorations, studies, assessments, or evaluations. Regardless of the title used, the geotechnical-engineering report is an engineering interpretation of the subsurface conditions within the context of the project and does not represent a close examination, systematic inquiry, or thorough investigation of all site and subsurface conditions.

Geotechnical-Engineering Services are Performed for Specific Purposes, Persons, and Projects, and At Specific Times

Geotechnical engineers structure their services to meet the specific needs, goals, and risk management preferences of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client.

Likewise, geotechnical-engineering services are performed for a specific project and purpose. For example, it is unlikely that a geotechnical-engineering study for a refrigerated warehouse will be the same as one prepared for a parking garage; and a few borings drilled during a preliminary study to evaluate site feasibility will not be adequate to develop geotechnical design recommendations for the project.

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project or purpose;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, the reliability of a geotechnical-engineering report can be affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying the recommendations in it. A minor amount of additional testing or analysis after the passage of time – if any is required at all – could prevent major problems.

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read the report in its entirety. Do not rely on an executive summary. Do not read selective elements only. *Read and refer to the report in full.*

You Need to Inform Your Geotechnical Engineer About Change

Your geotechnical engineer considered unique, project-specific factors when developing the scope of study behind this report and developing the confirmation-dependent recommendations the report conveys. Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the elevation, configuration, location, orientation, function or weight of the proposed structure and the desired performance criteria;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project or site changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept*

responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface using various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing is performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgement to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team through project completion to obtain informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, they are not final, because the geotechnical engineer who developed them relied heavily on judgement and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* exposed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a continuing member of the design team, to:

- confer with other design-team members;
- help develop specifications;
- review pertinent elements of other design professionals' plans and specifications; and
- be available whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction-phase observations.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for information purposes only.* To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. This happens in part because soil and rock on project sites are typically heterogeneous and not manufactured materials with well-defined engineering properties like steel and concrete. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually provide environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures.* If you have not obtained your own environmental information about the project site, ask your geotechnical consultant for a recommendation on how to find environmental risk-management guidance.

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, the engineer's services were not designed, conducted, or intended to prevent migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration. Confront the risk of moisture infiltration*** by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

Subject: **PHASE 1 INITIAL SITE ASSESSMENT**
OPUD Yuba County Sewer and Water Infrastructure Project
Olivehurst, California

Mr. DeCou,

Blackburn Consulting (Blackburn) prepared this Phase 1 Initial Site Assessment (ISA) for the OPUD Sewer and Water Infrastructure Project located in Yuba County, California. The purpose of the ISA is to identify hazardous and potentially hazardous materials issues that may significantly impact the Project. Blackburn prepared this ISA in accordance with our May 14, 2020 proposal.

As always, Blackburn appreciates the opportunity to be part of your team. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

Laura Long
On behalf of

Matthew Kinney
Project Geologist II

EXECUTIVE SUMMARY

Blackburn Consulting (Blackburn) prepared this Initial Site Assessment (ISA) for Jacobs Engineering Group (Jacobs) for the Olivehurst Public Utilities District (OPUD) Yuba County Sewer and Water Infrastructure Project (Project) in Olivehurst and unincorporated areas of Yuba County, California. Figure 1 presents the Vicinity Map. Jacobs, in cooperation with OPUD and Yuba County, proposes to construct new water and sewer utility infrastructure. All work is planned within existing right-of-way, except for the pump and lift station locations which have not been determined.

The purpose of this ISA is to identify Recognized Environmental Conditions[1] (RECs), Historical Recognized Environmental Conditions (HRECs), and potential RECs, collectively referred to herein as RECs, that may be present within or adjacent to the Project limits. We prepared this ISA in general conformance with the American Society of Testing and Materials (ASTM) Standard E1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process".

The following section summarizes the RECS identified within and adjacent to the Project limits. Blackburn further discusses these conditions in the body of this ISA.

RECs Located Within the Project Limits

APN 014-270-002: OPUD Wastewater Treatment Facility - Public Utilities District 3908 Mary Avenue

A 2,500-gallon diesel above ground tank (AST) is located at this facility. There are no indications of a release of diesel to soil or groundwater.

Recommendation: No additional assessment.

RECs Located Adjacent to the Project Limits

Four sites located immediately adjacent to the project alignment were identified with high risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these adjacent parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If excavation is planned within the right-of-way (ROW) adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials.

[1] Blackburn uses the term Recognized Environmental Condition (REC) in general compliance with ASTM E1527-13, which defines the meaning as *"The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment, (2) under conditions indicative of a release to the environment or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies. Conditions determined to be de minimus are not recognized environmental conditions*."

- **APN 014-143-026: Tower Mart #60/Cheaper #60**, 1976 McGowan Parkway

  Two single-walled 10,000-gallon gasoline underground storage tanks (USTs) tanks were removed in 1986. One 8,000-gallon diesel and three 12,000-gallon gasoline tanks were installed in 2004. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed in 2008. Potential contaminants of concern (COC) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gas (TPH-g) and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX).

- **APN 014-510-033: Marysville Forest Products/Erickson Group Limited**, 4083 Rancho Road

  Two USTs were reportedly removed after a leak was detected. A reported release of diesel to soil was recorded in 1992. Documentation was not found to verify impacted soil was excavated. The regulatory case was closed on July 14, 1993. The site was formerly occupied by a wood treating facility. Pentachlorophenol (PCP) was used as an anti-fungal wood treatment. PCP was released to soil during site operations. Site soil is also impacted with volatile organic compounds (VOCs) from the maintenance shop and dioxins at the ash disposal and burn areas. The horizontal and vertical extent of impacts is unknow. The Regional Water Quality Control Board (RWQCB) regulatory case is currently open. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, BTEX, VOCs, dioxins, and PCP.

- **APN 014-280-065: PG&E North Valley Materials**, 3736 Rancho Road

  One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX

- **APN 014-270-079: Flying U Ranch**, 3718 Forty Mile Road

  A 13,500-gallon AST of unknown fuel type is identified at the site. The location of the AST was not identified during site reconnaissance. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

Five sites located immediately adjacent to the project alignment were identified with medium risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Fuel storage tanks are present on these adjacent parcels. There is no evidence in the records review to suggest releases have occurred from the tanks or hazardous material issues from these sites will impact the Project, however, there is a potential to encounter residual contamination at these sites. If plans for acquisition change to include one or more of these sites, a Phase II Environmental Site Assessment to further investigate potential hazardous materials within the acquisition areas will be necessary.

- **APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro**, 3374 Forty Mile Road

  This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents. Violations were reported for failure to properly label hazardous waste containers, and failure to properly store and label used batteries.

- **APN 014-360-014: Frank Hofman Ranch**, 3002 Forty Mile Road

  This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

- **APN 014-510-018: Livingston Concrete**, 2571 Rosser Road

  This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

- **APN 014-510-021: Roger L. Murray**, 3938 Shimer Road

  This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. The AST is located at the southeast corner of the parcel, adjacent to the project. The AST had secondary containment, but the AST is within twenty feet of the project limits.

- **APN 015-060-075: Tollcrest Dairy,** 3355 Virginia Road, Wheatland

  A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

Three sites located north of the project alignment on Olivehurst Avenue were identified with high risk RECs. The project limits do not currently extend to these sites. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If the project limits are extended to include excavation within the ROW adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

- **APN 013-072-011: Gee Property**, 4880 Olivehurst Avenue

  The site is currently vacant but was formerly occupied by a fueling station. Two gasoline underground storage tanks (USTs) were removed in 1988 and one UST removed in 2019. Soil samples from the UST excavation indicated a release had occurred. Low levels of total petroleum hydrocarbons (TPHs) were detected in groundwater. The regulatory case was closed on January 10, 2020.

- **APN 013-081-015: AGV Corner Market**, 4881 Olivehurst Avenue

  The site is an active gas station. Currently a 20,000-gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

- **APN 013-130-060: Former E-Z Serve**, 4867 Olivehurst Avenue

  Three USTs were removed in 1989 and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017.

A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

General Contamination Issues

The following general contamination issues were identified within the Project limits.

Yellow traffic stripes

Yellow traffic stripes are known to contain heavy metals, such as lead and chromium, at concentrations in excess of the hazardous waste thresholds established by the *California Code of Regulations* and may produce toxic fumes when heated.

Recommendation: If the Project includes removal of yellow traffic striping, remove and dispose of in accordance with Caltrans Standard Special Provisions for Hazardous Waste.

Aerially Deposited Lead (ADL)

ADL has been found to occur in soils adjacent to highways and high use roadways. The lead is presumably from the historical use of leaded gasoline and subsequent exhaust emissions. There is potential for encountering ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and, therefore, have the potential to be impacted with ADL.

Recommendation: A soil screening to evaluate the potential presence of ADL within the Project limits should be performed. An appropriate soil management plan will need to be developed for soil containing significant concentrations of ADL.

Southern Pacific Railroad

An active railroad is adjacent to the east side of Rancho Road. Soils located adjacent to railroad tracks may be impacted by on-going railroad operations. Potential contaminants at these locations commonly include petroleum hydrocarbons, semi-volatile organic compounds (SVOCs), heavy metals, and pesticides.

Recommendation: Conduct a limited subsurface soil screening for potential contaminants in the upper 1.5 feet where soil will be disturbed adjacent to the railroad.

Asbestos Containing Material (ACM) and Lead in Buildings Materials

Structures constructed pre-1989 have the potential to contain ACM/Lead materials. Aerial photographs identify structures along the project alignment as developed prior to 1989.

Recommendation: If parcels are acquired as part of the Project any structures on those parcels should be evaluated for the presence of lead and asbestos containing materials. Any structure to be modified or demolished as part of the Project must be surveyed for the presence of ACM and Lead by a certified Asbestos Inspector prior to building demolition/modification.

Transformers

Our scope did not include an inventory of past and present transformers. We observed pole-mounted transformers and power lines within the existing right-of-way.

Recommendation: If the relocation of power facilities or high voltage power lines is required, existing transformers should be checked for the presence of PCBs or other hazardous materials by the utility owner, and if present, properly remediated and disposed. Identification and remediation of old transformers is the responsibility of the utility owner.

Organochlorine Pesticides (OCPs)

Historical topographic maps from 1947 and 1949 depict an orchard in the southeastern ½-mile alignment of Rancho Road and the eastern 1/3-mile alignment of Morrison Road.

Recommendation: Conduct a shallow soil screening to evaluate the potential presence of OCPs within the footprint of the former orchard in the Project limits.

1 INTRODUCTION

Blackburn completed this Phase 1 Initial Site Assessment (ISA) for the OPUD Sewer and Water Infrastructure Project (Project) located in Yuba County California. The purpose of the ISA is to identify Recognized Environmental Conditions[2] (RECs), Historical Recognized Environmental Conditions (HRECs), and potential RECs, collectively referred to herein as RECs, that may be present within and/or adjacent to the Project limits.

To conduct this ISA, Blackburn:

- Reviewed historical aerial photographic coverage and topographic map coverage for the Project area and surrounding properties for indications of potential sources of contamination.
- Performed federal, state, and county records review for indications of the use, misuse, or storage of hazardous and/or potentially hazardous materials on or near the Project area.
- Conducted a site inspection on September 9, 2020 to observe current land use and indications of potential contamination, as well as hazardous and potentially hazardous waste issues for the Project area.
- Performed state records review of the on-line regulatory databases GeoTracker and EnviroStor, to determine if known site impacts and/or previous environmental work exist for the Project area.
- Reviewed the general site geology, groundwater, and soil conditions through published maps and literature.

Blackburn prepared this report for Jacobs Engineering Group (Jacobs) and the project design team to use during design and construction. This report shall not be used or relied upon by others, or for different locations or improvements without the written consent of Blackburn.

2 PROJECT LOCATION AND DESCRIPTION

2.1 Location and Description

The Project spans approximately 12.2 miles within the town of Olivehurst and surrounding areas. The Project alignment includes the OPUD Wastewater Treatment Plant located on Mary Avenue, and portions of the following alignments:

- Olivehurst Avenue from 7th Avenue to approximately 170 feet south of 11th Avenue;
- Mary Avenue from OPUD wastewater treatment plant to McGowan Parkway;
- McGowan Parkway from Mary Avenue to Rancho Road;

[2] BCI uses the term Recognized Environmental Condition (REC) in general compliance with ASTM E1527-13, which defines the meaning as "*The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment, (2) under conditions indicative of a release to the environment or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies. Conditions determined to be de minimus are not recognized environmental conditions.*"

- Olive Avenue from McGowan Parkway to approximately 100 feet to the north, then east crossing under Highway 65 to the northern terminus of Rancho Road;
- Rancho Road from its northern end to Morrison Road;
- Morrison Road from Highway 65 to Forty Mile Road;
- Forty Mile road from the Toyota Amphitheater to Rancho Road;
- Slaughterhouse Road from Forty Mile Road to northwest for approximately 0.4 miles, crossing Highway 65 to the western terminus of Plute Road;
- Plute Road from its westernmost extent to Shimer Road; and
- Shimer Road from Plute Road to Rancho Road.

Pump and lift stations locations will be installed on privately owned parcels, however these locations have not been finalized.

The Project location with Project limits is shown on Figure 1, Vicinity Map. Site-specific features are shown on Figures 2a-e.

2.2 Geology and Physical Setting

The site lies within the Great Valley Geomorphic Province of California, which is a large, elongated, northwest-trending structural trough. The Province is subdivided into two major divisions designated as the Sacramento and San Joaquin Valleys. These valleys have been filled to their present elevation with thick sequences of sediment, ranging in age from Jurassic to present day, creating a nearly flat-lying alluvial plain that extends from the Tehachapi Mountains in the south to the Klamath Mountains in the north. The western and eastern boundaries of this province are formed by the California Coast Ranges and the Sierra Nevada, respectively.

The study area is located on an alluvial plain in the Sacramento Valley located approximately 2.2 miles east of the Feather River at its closest point. The underlying deposits are mapped by Saucedo, G.J. and Wagner D.L. (1981) as alluvium, natural levee and channel deposits, basin deposits, Modesto Formation, and the Riverbank Formation. This formation is composed of fine-grained soils such as clay, silts, sand and gravel.

The site topography is generally flat, except near Highway 65 and Highway 70, where the topography slopes toward the highways. The site elevations, excluding areas near the Highways, range between 55 feet above mean sea level (msl) in the western portion of the Project and 75 feet above msl in the easternmost portion of the Project.

2.3 Surface Water, Groundwater, Wells

The Site lies within the South Yuba Subbasin where groundwater flow direction is generally to the southwest toward the Feather River, though flow directions vary both locally and seasonally. The study area is east of the Feather River, south of the Yuba River, and north of the Bear River. Blackburn reviewed groundwater level data made available at California Department of Water Resources (DWR) website www.water.ca.gov/waterdatalibrary. The groundwater beneath the site rises to within approximately 40

feet of the ground surface for up to six months of the year. Depth to groundwater during the rest of the year is approximately 45 feet below ground surface. Surface/storm water is directed by sidewalk curb, gutter and drains. The general flow direction is to the south and west towards the Feather River, except in area in proximity to Hutchison Creek and Reed Creek, which transect the Project in multiple areas flowing southwest toward the Feather River.

2.4 Current Land Use

Most of the Project area consists of roadways which traverse rural areas of Yuba County, with a portion of the project limits transecting the town of Olivehurst. Land adjacent to the Project along Rancho Road is zoned as agricultural industrial and light industrial. Land along Morrison Road is designated as sports entertainment district and employment center district. Land adjacent to Forty Mile Road is designated for agricultural use and sports entertainment. Land near the OPUD Wastewater treatment Facility on Mary Road is designated for use as public utilities land as well as single-family residential.

2.5 Historic Land Use

Land use adjacent to the project limits varies throughout the project alignment. Blackburn reviewed historical aerial photography, topographic maps, and Sanborn maps to identify conditions that may indicate potential hazardous materials issues within the Project limits.

2.5.1 Aerial Photograph Review

Blackburn reviewed the following historic aerial photography to identify conditions that may indicate potential hazardous materials issues within or adjacent to the Project area. The listing includes aerial photo flight year, source, scale, and a brief description of observed conditions. Copies of aerial photographs are provided in Appendix A.

Aerial Photograph Review

The following aerial photos were reviewed:

1947 Photo by Agriculture and Soil Conservation Service, Scale 1" =2,000'
1954 Photo by Army Mapping Service, Scale 1" =2,000'
1977 Photo by USGS, Scale 1" =2,000'
1987 Photo by USGS, Scale 1" =2,000'
1998 Photo by USGS, Scale 1" =2,000'
2005 Photo by National Agriculture Information Program (NAIP), Scale 1" =2,000'
2009 Photo by NAIP, Scale 1" =2,000'
2014 Photo by NAIP, Scale 1" =2,000'
2018 Photo by NAIP, Scale 1" =2,000'

Areas of the Project limits south of Morrison Road along Forty Mile Road are not shown on Aerial Photographs. This includes the area that is now the Toyota Amphitheater.

1947: Improved roads, Rancho Road, Forty Mile Road, Morrison Road, and McGowan Road are depicted in their present-day alignments. The town of Olivehurst is visible north of the Project limits. Agricultural

use is visible along the alignment. Rural residences are visible near the project alignment. Hutchinson Creek and Reed Creek transect the project alignment in multiple locations similar to present day. A large industrial facility is adjacent to the north side of Rancho Road in the location that is currently the Marysville Forest Products/Erikson Group Limited facility.

1954: Additional development of roads and residences in the south portion of Olivehurst. Olivehurst is generally in its present-day footprint.

1977: Highway 65 transects the project limits. Highway 70 appears under construction and transects the project limits. What is now a PG&E facility is adjacent to the south of the Project limits on Rancho Road. Mary Road appears on the map, along with the OPUD wastewater treatment facility. Additional residences appear along Morrison Road. A commercial/industrial facility is at the intersection of Slaughterhouse Road and Forty Mile Road. A mobile home park is at the intersection of Olive Avenue and McGowan Parkway. Additional residences and commercial businesses appear along the Project alignment within the town of Olivehurst.

1987: The OPUD wastewater Treatment Facility appears to expand to the south.

1998: No significant changes.

2005: An additional commercial facility is adjacent to the south of Rancho Road southeast of the PG&E facility.

2009: No significant changes.

2014: No significant changes.

2018: The Project alignment and surrounding area appear as they are today.

2.5.2 Topographic Map Review

Blackburn reviewed the following topographic maps for features that may indicate an impact to the Project. This summary includes noted changes within and adjacent to the Project location as recorded on the maps. Copies of the topographic maps are provided in Appendix B.

1910 Wheatland 7.5-minute Quad, Scale 1:24,000,
1911 Ostrom 7.5-minute Quad, Scale 1:24,000,
1947 Wheatland 7.5-minute Quad, Scale 1:24000,
1949 Wheatland 7.5- and 15-minute Quad, Scale 1:24000,
1952 Olivehurst 7.5-minute and Marysville 15-minute Quads, Scale 1:24,000
1973 Olivehurst and Wheatland 7.5-minute Quads, Scale 1:24000, and
2015 Olivehurst and Wheatland 7.5-minute Quads, Scale 1:24000.

1910 and 1911: Western Pacific Railroad and the Marysville Line of the Southern Pacific Railroad are depicted on the map near the project alignment. The development of Ostrom is depicted near the present-day intersection of Highway 65 and Forty Mile Road. Structures are depicted sparsely near the

project alignment along present-day Forty Mile Road, Morrison Road, and Rancho Road. Hutchinson Creek and Reed Creek are depicted near their present-day alignments transecting the Project. Plumas Lake is depicted approximately one mile south and west of the Project limits.

1947, 1949, and 1952: The town of Olivehurst, including Olivehurst Avenue, what is now Mary Road, and McGowan Road (Parkway) are depicted, as are residences and structures along their alignments. A commercial or industrial facility is depicted to the north of what is now Rancho Road between Reed Creek and Hutchinson Creek. This facility is in the same location as the present-day Marysville Forest Products/Erikson Group Limited facility. An orchard is depicted in the southeastern portion of the project alignment encompassing the intersection of present-day Highway 65, Morrison Road, and Rancho Road.

1973: The OPUD wastewater treatment facility is depicted in its present-day location. Several additional structures are depicted at the Marysville Forest Products/Erikson Group Limited facility. Highways 65 and 70 are depicted in their present-day alignments. A mobile home park is depicted at the intersection of Olive Drive and McGowan Parkway. The orchard is no longer depicted near the southeastern corner of the Project alignment. Additional commercial/industrial facilities are depicted in the area between Rancho Road and Highway 65. Additional roads and residential structures are depicted within the town of Olivehurst in the vicinity of Olivehurst Avenue and McGowan Parkway.

2015: Structures and land uses are not depicted on this map. The town of Olivehurst is depicted as it is today.

2.5.3 Sanborn® Map Review

Environmental Risk Information Services (ERIS) searched the Sanborn Maps Library for the Site and surrounding area. The ERIS search did not return Sanborn Maps (fire insurance) covering the Site or the surrounding area. Appendix C contains ERIS's Sanborn Map Report.

3 RECORDS REVIEW

3.1 County, State and Federal Records Review

ERIS, a commercial data base search firm, performed a radius search for the study area on August 20, 2020. The search includes a review of county, state, federal and ERIS proprietary databases. The maximum search radius is 1 mile from the outline of the Project area. Sites with adequate address information are plotted on ERIS's site plan "Map: 1.0 Mile Radius". ERIS lists sites with inadequate address information in their "Unplottable Summary" and does not provide mapped locations. Blackburn reviewed the 13 "unplottable sites" identified by ERIS and determined that only the PG&E facility, which is located on Rancho Road though identified on Morrison Road in the report, is located adjacent to the Project area. The complete EDR report is included in Appendix D.

3.2 Summary of Records Search

Blackburn reviewed the databases for facilities within ½-mile of the Project alignment with a potential to impact project operations. Our review of records identified the following sites with potentially hazardous material conditions at, adjacent to, or considered close enough to the project site to potentially impact

the project. 50 facilities within a ½-mile radius of the Project are listed in the Records Search. Below, we summarize the database records.

3.2.1 RECs Within the Project Alignment

APN 014-270-002: OPUD Wastewater Treatment Facility/Olivehurst Public Utilities District/Western Water Constructors, Inc., 3908 Mary Avenue, Olivehurst, CA

Databases: Yuba CUPA, AST, FINDS, HAZNET, HIST Manifest, ICIS, YUBA UST, CERS TANK, RCRA NonGen
A 2,500-gallon diesel AST is located at this facility. No additional information is provided in the records search.

3.2.2 RECs Adjacent to the Project Alignment (Medium and High Risk)

The following sites have conditions such as above ground or underground fuel storage tanks that are considered RECs to the project. The RECs include releases of petroleum hydrocarbons or other hazardous materials that may have resulted in residual impacts within the Project alignment.

APN 013-072-011: Gee Property, 4880 Olivehurst Avenue, Olivehurst, CA
Database: GeoTracker

Formerly occupied by a fueling station. Two gasoline USTs were removed in 1988. Soil samples from the UST excavation indicated a release had occurred. An additional UST was excavated in 2019. Low levels of TPH as diesel was detected in groundwater. Low concentrations of motor oil were detected in stockpile sampling. The regulatory case was closed on January 10, 2020. The site is within the service area of OPUD.

APN 013-081-015: AGV Corner Market, 4881 Olivehurst Avenue, Olivehurst, CA
Database: GeoTracker

The site is an active gas station. Currently a 20,000 gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

APN 013-130-060: Former E-Z Serve, 4867 Olivehurst Avenue, Olivehurst, CA
Databases: GeoTracker, LUST

On August 30, 1989, three USTs were removed, and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017. A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

APN 014-143-026: Tower Mart #60/Colonial Energy CE/Fred and Liquor 60/Cheaper #60, 1976 McGowan Parkway, Olivehurst, CA
Databases: Delisted TNK, Emissions, GeoTracker, FINDS/FRS, Yuba CUPA, LUST, HHSS, HAZNET, Yuba UST, CERS TANK, UST, Emissions, HIST TANK, RCRA NonGen

In 1986, two single-walled 10,000-gallon fuel tanks were removed from the site. In 2004 four USTs were installed including one 8000-gallon diesel and three 12,000-gallon gasoline tanks. This fueling station is a hazardous waste generator. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed on January 31, 2008.

APN 014-270-079: Flying U Ranch, 3718 Forty Mile Road, Olivehurst, CA
Databases: Yuba CUPA, AST, CERS TANK

A 13,500-gallon AST of unknown fuel type is identified at the site. The CERS TANK database identifies violations including failure to dispose of hazardous waste within 180 days, and failure to inspect hazardous waste storage areas weekly.

APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro, 3374 Forty Mile Road, Olivehurst, CA
Databases: AST, RCRA NonGen, Yuba CUPA, CERS TANK

This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents. Violations were reported for failure to properly label hazardous waste containers, and failure to properly store and label used batteries.

APN 014-280-065: PG&E North Valley Materials, 3736 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, Delisted TNK, AST, HHSS, Yuba UST, HIST TANK, Delisted CTNK, RCRA SQG, CHMIRS, LUST

One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. The CHMIRS database lists this facility as having a leak of 5-10 gallons of insulating oil (no PCB content).

APN 014-360-014: Frank Hofman Ranch, 3002 Forty Mile Road, Olivehurst, CA
Databases: Yuba CUPA, HHSS, Yuba UST, HIST TANK

This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

APN 014-510-018: Livingston Concrete, 2571 Rosser Road, Olivehurst, CA
Databases: Yuba CUPA, CERS TANK, Emissions

This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

APN 014-510-021: Roger L. Murray, 3938 Shimer Road, Olivehurst, CA
Databases: Yuba CUPA, AST, Delisted CTNK

This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. No additional information is provided in the records search.

APN 014-510-033: Marysville Forest Products/Erickson Group Limited/Sun Gro Horticulture/Berdex Forest Products, Inc., 4083 Rancho Road, Olivehurst, CA
Databases: RCRA SQG, Yuba CUPA, Cleanup Sites, LUST, EnviroStor, HHSS, Yuba UST, Delisted HAZ, Emissions, HIST TANK, RCRA NonGen

Marysville Forest Products is a hazardous waste generator that reported a release of diesel to soil on June 18, 1992. Impacted soil was excavated and the regulatory case was closed on July 14, 1993.

Erickson Group Limited is a former wood treating facility. Pentachlorophenol (PCP) was released to soil during site operations. Soil remediation occurred and groundwater monitoring indicates that groundwater was not impacted by the release. The regulatory case is currently open. As of June 18, 2020, a Phase 1 ESA was requested by a potential buyer of the property.

APN 015-060-075: Tollcrest Dairy, 3355 Virginia Road, Wheatland, CA
Databases: Yuba CUPA, AST, CERS TANK

A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

3.2.3 Sites identified Adjacent to the Project Alignment (Low Risk)

The following sites are listed in the searched database for storage and handling of hazardous materials and other hazardous materials conditions that are not considered RECs to the project. If these parcels are acquired as part of the project, additional assessment should be conducted.

Frankenstein Motors/McCinskey's Frankenstein Motors, 3906 Shimer Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ, RCRA NonGen

This facility is identified in the Yuba CUPA and CERS HAZ databases as a hazardous waste generator. This database identifies a violation on September 27, 2016 for failure to manage used oil and/or fuel filters, label portable tanks appropriately, and submit an emergency response plan for hazardous materials release.

JS West Propane-Marysville Storage, 2698 Plute Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ

No information regarding this facility is provided in the listed databases.

Livingston's Concrete, 2572 Rosser Road, Olivehurst, CA
Database: FINDS/FRS

This facility is identified as a ready-mix concrete business. No additional information is provided in the records search.

AT&T California, Ostrom Road and Rancho Road, Olivehurst, CA
Database: CERS HAZ

This facility is identified as a chemical storage facility. No additional information is provided in the records search.

3948 Shimer Road, Olivehurst, CA
Databases: NCDL, CDL
This facility was identified on February 1, 2006 as being an illegal drug lab where hazardous materials were stored.

C**enturylink Olivehurst**, 3365 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ

This facility is identified in the CERS HAZ database as a chemical storage facility. No additional information is provided in the records search.

Verizon Wireless Olivehurst, 3359 Forty Mile Road, Olivehurst, CA
Database: Yuba CUPA

No information is listed in the searched database.

Yetter Steel Corp., 3548 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, Delisted Haz

This business is listed as a hazardous waste generator. No additional information is provided in the records search.

Sprint Nextel, 3516 Rancho Road, Olivehurst, CA
Database: Yuba CUPA

No information regarding this site is in the searched database.

United Truck Dismantlers/ Rocliff Enterprises, Inc., 2488 McGowan Parkway, Olivehurst, CA
Databases: FINDS/FRS, Yuba CUPA, HAZNET, HIST Manifest, CERS HAZ, RCRA NonGen

This facility is a hazardous waste generator that operates an oil/water separator and disposes of oil-containing waste.

Verizon Wireless McGowan Parkway, 4404 Rancho Road, Marysville, Ca
Databases: FINDS/FRS, Yuba CUPA, CERS HAZ

This facility is listed in the CERA HAZ database as being a chemical storage facility. No regulatory action, spills, or leaks are identified in the records search.

2352 McGowan Parkway/Highway 65 & McGowan Parkway, Olivehurst, CA
Database: CDL

This address is listed in the searched database as an illegal drug lab that was reported in May 2000.

Rocking S Livestock, 3380 Rancho Road, Wheatland, CA
Database: Yuba CUPA

No information is provided in the records search.

Via Grande Way, Space 19, Olivehurst, CA
Database: CDL

This listing is a residence in a mobile home park located at the intersection of Olive Avenue and McGowan Parkway that was reported to be an illegal drug lab in March 2003.

Highway 70 & McGowan Parkway, Olivehurst, CA
Database: CDL

This location is the location of a vehicle that contained illegal drug lab equipment.

NRC/UPRR, Virginia Road & Rancho Road, Wheatland, CA
Database: CHMIRS

This location is listed in the searched databases as the location of a natural gas line leak, and an auto vs. train collision that resulted in the spill of an unknown amount of an undisclosed fluid. No regulatory action was documented regarding the spill.

Dollar General #14976, 1990 McGowan Parkway, Olivehurst, CA
Databases: Yuba CUPA, HAZNET, FINDS/FRS, CERS HAZ, RCRA NonGen

This business generates hazardous waste that is transported offsite.

Burrow Garage, 1909 McGowan Parkway, Olivehurst, CA
Databases: FINDS/FRS, Yuba CUPA, HAZNET, Delisted HAZ

This business is listed in the searched records as a hazardous waste generator that disposes of liquids with halogenated organic compounds. No violations, spills, or regulatory actions are documented in the records search.

Verizon Wireless Olivehurst, 3076 Rancho Road, Wheatland, CA
Databases: CERS HAZ, Yuba CUPA

This facility is listed as a chemical storage facility. No additional information is provided in the records search.

AT&T Corp, 4242 Deaton Drive, Olivehurst, CA
Database: CERS HAZ

This business is listed in the searched database as a chemical storage facility. No regulatory violations, spills, or leaks are documented for this facility.

Kubich Lumber, 1630 Rancho Road, Marysville, CA
Database: HAZNET

This business is listed in the HAZNET database. No additional information is identified in the records search.

3.2.4 RECs at Facilities identified within ½-mile of the Project alignment

Marysville Army Airfield/Yuba County Airport/G.N. Dibble, Inc./Public Works Airport Shop, 1300 and 1364 Sky Harbor Drive, Olivehurst, CA (1/2-mile west)

This facility is listed in the GeoTracker and EnviroStor online databases.

This 972-acre facility was constructed in 1941 and served as both a staging area for aircraft that applied herbicides and insecticides to surrounding agricultural properties, as well as a military installation that facilitated firearms training, aircraft storage, and aircraft refueling. In 1999, seven USTs and 790 tons of contaminated soil were removed from this facility. In 2014 A&M, a consultant working on behalf of the Central Valley Regional Water Quality Control Board (CVRWQCB), conducted a soil and groundwater investigation at the Site. Analysis of soil and groundwater samples collected during the investigation indicated that no contamination was present from petroleum hydrocarbons or volatile organic compounds (VOCs). The regulatory case was closed on July 21, 2015.

Two open regulatory cases are ongoing at this facility in relation to pesticide and herbicide releases to soil that occurred because of past uses. This facility is approximately 1/2 -mile west and downgradient of the Project alignment and is therefore not a REC for the Project.

3.3 City Directory Review

Blackburn reviewed the historical city directory. The City Directory review did not identify any conditions that are not already identified in other sections of this ISA. The City Directory Image Report is provided in Appendix E.

3.4 Title Documents Review

Title documents were not provided for this assessment.

4 RECONNAISSANCE INFORMATION

Blackburn completed a site reconnaissance on September 9, 2020. The purpose of the visual survey is to collect information regarding potential hazardous material contamination including identification of evidence of current and/or past use, evident storage of toxic or hazardous materials, the presence of onsite ponds, landfills, drywells, waste streams or other disposal units, visible soil contamination, above ground or underground storage tanks, drums, barrels and other storage containers. Photos from the site visit are in Appendix F. Observations were made from accessible portions of the study area.

The observations generally support the descriptions and background data above. Additional observations are presented in Section 3.2.1.

5 OWNER INTERVIEWS

Per ASTM, past owners, operators, and/or occupants of the subject property who are likely to have material information regarding the potential for contamination at the subject property shall be contacted

to the extent that they can be identified and that the information likely to be obtained is not duplicative of information already obtained from other sources.

Blackburn did not conduct interviews with property owners. Lack of contact with the owners of property adjacent to the Project is a data gap but is not expected to change the conclusions of this ISA.

6 DATA GAPS

In accordance with ASTME E1527-13, this section discusses data gaps in the documents we obtained and reviewed as part of this ISA and discusses the significance. ASTM E1527-13 defines a data gap as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." In our opinion, we did not observe a data gap significant enough to change the conclusions of this ISA.

7 FINDINGS, CONCLUSIONS, AND RECOMMENDATIONS

The scope of this ISA was directed at:

- Determining if hazardous materials exist at or near the Project area at concentrations likely to warrant mitigation pursuant to regulations;
- Identifying sites RECs and/or potential RECs within and adjacent to the proposed Project area which could affect the design, constructability, feasibility, and/or the cost of the proposed Project; and
- Identify potential site contamination issues.

The assessment identified the following environmental conditions that should be considered for present and future planning for the proposed Project.

RECs Located Within the Project Limits

APN 014-270-002: OPUD Wastewater Treatment Facility - Public Utilities District 3908 Mary Avenue

A 2,500-gallon diesel above ground tank (AST) is located at this facility. There are no indications of a release of diesel to soil or groundwater.

Recommendation: No additional assessment.

RECs Located Adjacent to the Project Limits

Four sites located immediately adjacent to the project alignment were identified with high risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these adjacent parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If excavation is planned within the right-of-way (ROW) adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials.

- **APN 014-143-026: Tower Mart #60/Cheaper #60**, 1976 McGowan Parkway

  Two single-walled 10,000-gallon gasoline underground storage tanks (USTs) tanks were removed in 1986. One 8,000-gallon diesel and three 12,000-gallon gasoline tanks were installed in 2004. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed in 2008. Potential contaminants of concern (COC) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gas (TPH-g) and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX).

- **APN 014-510-033: Marysville Forest Products/Erickson Group Limited**, 4083 Rancho Road

  Two USTs were reportedly removed after a leak was detected. A reported release of diesel to soil was recorded in 1992. Documentation was not found to verify impacted soil was excavated. The regulatory case was closed on July 14, 1993. The site was formerly occupied by a wood treating facility. Pentachlorophenol (PCP) was used as an anti-fungal wood treatment. PCP was released to soil during site operations. Site soil is also impacted with volatile organic compounds (VOCs) from the maintenance shop and dioxins at the ash disposal and burn areas. The horizontal and vertical extent of impacts is unknow. The Regional Water Quality Control Board (RWQCB) regulatory case is currently open. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, BTEX, VOCs, dioxins, and PCP.

- **APN 014-280-065: PG&E North Valley Materials**, 3736 Rancho Road

  One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX

- **APN 014-270-079: Flying U Ranch**, 3718 Forty Mile Road

  A 13,500-gallon AST of unknown fuel type is identified at the site. The location of the AST was not identified during site reconnaissance. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

Five sites located immediately adjacent to the project alignment were identified with medium risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Fuel storage tanks are present on these adjacent parcels. There is no evidence in the records review to suggest releases have occurred from the tanks or hazardous material issues from these sites will impact the Project, however, there is a potential to encounter residual contamination at these sites. If plans for acquisition change to include one or more of these sites, a Phase II Environmental Site Assessment to further investigate potential hazardous materials within the acquisition areas will be necessary.

- **APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro**, 3374 Forty Mile Road

  This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents.

  Violations were reported for failure to properly label hazardous waste containers, and failure to

properly store and label used batteries.

- **APN 014-360-014: Frank Hofman Ranch**, 3002 Forty Mile Road

  This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

- **APN 014-510-018: Livingston Concrete**, 2571 Rosser Road

  This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

- **APN 014-510-021: Roger L. Murray**, 3938 Shimer Road

  This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. The AST is located at the southeast corner of the parcel, adjacent to the project. The AST had secondary containment, but the AST is within twenty feet of the project limits.

- **APN 015-060-075: Tollcrest Dairy,** 3355 Virginia Road, Wheatland

  A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

Three sites located north of the project alignment on Olivehurst Avenue were identified with high risk RECs. The project limits do not currently extend to these sites. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If the project limits are extended to include excavation within the ROW adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

- **APN 013-072-011: Gee Property**, 4880 Olivehurst Avenue

  The site is currently vacant but was formerly occupied by a fueling station. Two gasoline underground storage tanks (USTs) were removed in 1988 and one UST removed in 2019. Soil samples from the UST excavation indicated a release had occurred. Low levels of total petroleum hydrocarbons (TPHs) were detected in groundwater. The regulatory case was closed on January 10, 2020.

- **APN 013-081-015: AGV Corner Market**, 4881 Olivehurst Avenue

  The site is an active gas station. Currently a 20,000-gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

- **APN 013-130-060: Former E-Z Serve**, 4867 Olivehurst Avenue

Three USTs were removed in 1989 and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017. A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

General Contamination Issues

The following general contamination issues were identified within the Project limits.

Yellow traffic stripes

Yellow traffic stripes are known to contain heavy metals, such as lead and chromium, at concentrations in excess of the hazardous waste thresholds established by the *California Code of Regulations* and may produce toxic fumes when heated.

Recommendation: If the Project includes removal of yellow traffic striping, remove and dispose of in accordance with Caltrans Standard Special Provisions for Hazardous Waste.

Aerially Deposited Lead (ADL)

ADL has been found to occur in soils adjacent to highways and high use roadways. The lead is presumably from the historical use of leaded gasoline and subsequent exhaust emissions. There is potential for encountering ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and, therefore, have the potential to be impacted with ADL.

Recommendation: A soil screening to evaluate the potential presence of ADL within the Project limits should be performed. An appropriate soil management plan will need to be developed for soil containing significant concentrations of ADL.

Southern Pacific/Union Pacific Railroad

An active railroad is adjacent to the east side of Rancho Road. Soils located adjacent to railroad tracks may be impacted by on-going railroad operations. Potential contaminants at these locations commonly include petroleum hydrocarbons, semi-volatile organic compounds (SVOCs), heavy metals, and pesticides.

Recommendation: Conduct a limited subsurface soil screening for potential contaminants in the upper 1.5 feet where soil will be disturbed adjacent to the railroad.

Asbestos Containing Material (ACM) and Lead in Buildings Materials

Structures constructed pre-1989 have the potential to contain ACM/Lead materials. Aerial photographs identify structures along the project alignment as developed prior to 1989.

Recommendation: If parcels are acquired as part of the Project any structures on those parcels should be evaluated for the presence of lead and asbestos containing materials. Any structure to be modified or demolished as part of the Project must be surveyed for the presence of ACM and Lead by a certified Asbestos Inspector prior to building demolition/modification.

Transformers

Our scope did not include an inventory of past and present transformers. We observed pole-mounted transformers and power lines within the existing right-of-way.

Recommendation: If the relocation of power facilities or high voltage power lines is required, existing transformers should be checked for the presence of PCBs or other hazardous materials by the utility owner, and if present, properly remediated and disposed. Identification and remediation of old transformers is the responsibility of the utility owner.

Organochlorine Pesticides (OCPs)
Historical topographic maps from 1947 and 1949 depict an orchard in the southeastern ½-mile alignment of Rancho Road and the eastern 1/3-mile alignment of Morrison Road.

Recommendation: Conduct a shallow soil screening to evaluate the potential presence of OCPs within the footprint of the former orchard in the Project limits.

8 QUALIFICATIONS

This ISA was prepared by Laura Long. I declare that, to the best of my professional knowledge and belief, I meet the definition of an environmental professional as defined in Section 312.10 of 40 Code of Federal Regulations (CFR) 312 and have the specific qualifications based on education, training, and experience to assess a property of its nature, history, and setting of the subject property. I have performed all appropriate inquiries in general conformance with the standards and practice set forth in 40 CFR 312.

9 LIMITATIONS

The accompanying ISA summarizes the findings and opinions of Blackburn, with regard to the potential for hazardous materials to be present on the properties at concentrations likely to warrant mitigation under current statutes and guidelines. Our findings and opinions are based on information obtained on given dates or provided by specified individuals, through records review, site review, and related activities. Conditions can change after we have made our observations. We cannot warrant or guarantee that hazardous materials do not exist at the described site. To further reduce your risk, an extensive invasive exploration may be necessary.

Blackburn prepared this ISA for the specific use of our client and applies only to the Project area. We are not responsible for interpretations by others of data presented in this ISA. This ISA does not represent a legal opinion. No warranty is expressed or implied. We base our conclusions in this ISA on judgment and experience. We performed this work in accordance with generally accepted standards of practice existing in northern California at the time of the assessment.

The governmental records portion of this ISA is derived from public records and is updated on a continual basis. For this reason, we do not advise you to use this information to base a decision after one (1) year of the issue date of this ISA. Also, conditions at the site can and will change over time. Please contact Blackburn to revise this ISA to reflect new information.

Subject: **PHASE 1 INITIAL SITE ASSESSMENT**
OPUD Yuba County Sewer and Water Infrastructure Project
Olivehurst, California

Mr. DeCou,

Blackburn Consulting (Blackburn) prepared this Phase 1 Initial Site Assessment (ISA) for the OPUD Sewer and Water Infrastructure Project located in Yuba County, California. The purpose of the ISA is to identify hazardous and potentially hazardous materials issues that may significantly impact the Project. Blackburn prepared this ISA in accordance with our May 14, 2020 proposal.

As always, Blackburn appreciates the opportunity to be part of your team. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

Laura Long

EXECUTIVE SUMMARY

Blackburn Consulting (Blackburn) prepared this Initial Site Assessment (ISA) for Jacobs Engineering Group (Jacobs) for the Olivehurst Public Utilities District (OPUD) Yuba County Sewer and Water Infrastructure Project (Project) in Olivehurst and unincorporated areas of Yuba County, California. Figure 1 presents the Vicinity Map. Jacobs, in cooperation with OPUD and Yuba County, proposes to construct new water and sewer utility infrastructure. All work is planned within existing right-of-way, except for the pump and lift station locations which have not been determined.

The purpose of this ISA is to identify Recognized Environmental Conditions[1] (RECs), Historical Recognized Environmental Conditions (HRECs), and potential RECs, collectively referred to herein as RECs, that may be present within or adjacent to the Project limits. We prepared this ISA in general conformance with the American Society of Testing and Materials (ASTM) Standard E1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process".

The following section summarizes the RECS identified within and adjacent to the Project limits. Blackburn further discusses these conditions in the body of this ISA.

RECs Located Within the Project Limits

APN 014-270-002: OPUD Wastewater Treatment Facility - Public Utilities District 3908 Mary Avenue

A 2,500-gallon diesel above ground tank (AST) is located at this facility. There are no indications of a release of diesel to soil or groundwater.

Recommendation: No additional assessment.

RECs Located Adjacent to the Project Limits

Four sites located immediately adjacent to the project alignment were identified with high risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these adjacent parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If excavation is planned within the right-of-way (ROW) adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials.

[1] Blackburn uses the term Recognized Environmental Condition (REC) in general compliance with ASTM E1527-13, which defines the meaning as *"The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment, (2) under conditions indicative of a release to the environment or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies. Conditions determined to be de minimus are not recognized environmental conditions*."

- **APN 014-143-026: Tower Mart #60/Cheaper #60**, 1976 McGowan Parkway

  Two single-walled 10,000-gallon gasoline underground storage tanks (USTs) tanks were removed in 1986. One 8,000-gallon diesel and three 12,000-gallon gasoline tanks were installed in 2004. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed in 2008. Potential contaminants of concern (COC) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gas (TPH-g) and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX).

- **APN 014-510-033: Marysville Forest Products/Erickson Group Limited**, 4083 Rancho Road

  Two USTs were reportedly removed after a leak was detected. A reported release of diesel to soil was recorded in 1992. Documentation was not found to verify impacted soil was excavated. The regulatory case was closed on July 14, 1993. The site was formerly occupied by a wood treating facility. Pentachlorophenol (PCP) was used as an anti-fungal wood treatment. PCP was released to soil during site operations. Site soil is also impacted with volatile organic compounds (VOCs) from the maintenance shop and dioxins at the ash disposal and burn areas. The horizontal and vertical extent of impacts is unknow. The Regional Water Quality Control Board (RWQCB) regulatory case is currently open. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, BTEX, VOCs, dioxins, and PCP.

- **APN 014-280-065: PG&E North Valley Materials**, 3736 Rancho Road

  One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX

- **APN 014-270-079: Flying U Ranch**, 3718 Forty Mile Road

  A 13,500-gallon AST of unknown fuel type is identified at the site. The location of the AST was not identified during site reconnaissance. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

Five sites located immediately adjacent to the project alignment were identified with medium risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Fuel storage tanks are present on these adjacent parcels. There is no evidence in the records review to suggest releases have occurred from the tanks or hazardous material issues from these sites will impact the Project, however, there is a potential to encounter residual contamination at these sites. If plans for acquisition change to include one or more of these sites, a Phase II Environmental Site Assessment to further investigate potential hazardous materials within the acquisition areas will be necessary.

- **APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro**, 3374 Forty Mile Road

  This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents. Violations were reported for failure to properly label hazardous waste containers, and failure to properly store and label used batteries.

- **APN 014-360-014: Frank Hofman Ranch**, 3002 Forty Mile Road

  This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

- **APN 014-510-018: Livingston Concrete**, 2571 Rosser Road

  This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

- **APN 014-510-021: Roger L. Murray**, 3938 Shimer Road

  This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. The AST is located at the southeast corner of the parcel, adjacent to the project. The AST had secondary containment, but the AST is within twenty feet of the project limits.

- **APN 015-060-075: Tollcrest Dairy,** 3355 Virginia Road, Wheatland

  A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

Three sites located north of the project alignment on Olivehurst Avenue were identified with high risk RECs. The project limits do not currently extend to these sites. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If the project limits are extended to include excavation within the ROW adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

- **APN 013-072-011: Gee Property**, 4880 Olivehurst Avenue

  The site is currently vacant but was formerly occupied by a fueling station. Two gasoline underground storage tanks (USTs) were removed in 1988 and one UST removed in 2019. Soil samples from the UST excavation indicated a release had occurred. Low levels of total petroleum hydrocarbons (TPHs) were detected in groundwater. The regulatory case was closed on January 10, 2020.

- **APN 013-081-015: AGV Corner Market**, 4881 Olivehurst Avenue

  The site is an active gas station. Currently a 20,000-gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

- **APN 013-130-060: Former E-Z Serve**, 4867 Olivehurst Avenue

  Three USTs were removed in 1989 and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017.

A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

General Contamination Issues

The following general contamination issues were identified within the Project limits.

Yellow traffic stripes

Yellow traffic stripes are known to contain heavy metals, such as lead and chromium, at concentrations in excess of the hazardous waste thresholds established by the *California Code of Regulations* and may produce toxic fumes when heated.

Recommendation: If the Project includes removal of yellow traffic striping, remove and dispose of in accordance with Caltrans Standard Special Provisions for Hazardous Waste.

Aerially Deposited Lead (ADL)

ADL has been found to occur in soils adjacent to highways and high use roadways. The lead is presumably from the historical use of leaded gasoline and subsequent exhaust emissions. There is potential for encountering ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and, therefore, have the potential to be impacted with ADL.

Recommendation: A soil screening to evaluate the potential presence of ADL within the Project limits should be performed. An appropriate soil management plan will need to be developed for soil containing significant concentrations of ADL.

Southern Pacific Railroad

An active railroad is adjacent to the east side of Rancho Road. Soils located adjacent to railroad tracks may be impacted by on-going railroad operations. Potential contaminants at these locations commonly include petroleum hydrocarbons, semi-volatile organic compounds (SVOCs), heavy metals, and pesticides.

Recommendation: Conduct a limited subsurface soil screening for potential contaminants in the upper 1.5 feet where soil will be disturbed adjacent to the railroad.

Asbestos Containing Material (ACM) and Lead in Buildings Materials

Structures constructed pre-1989 have the potential to contain ACM/Lead materials. Aerial photographs identify structures along the project alignment as developed prior to 1989.

Recommendation: If parcels are acquired as part of the Project any structures on those parcels should be evaluated for the presence of lead and asbestos containing materials. Any structure to be modified or demolished as part of the Project must be surveyed for the presence of ACM and Lead by a certified Asbestos Inspector prior to building demolition/modification.

Transformers

Our scope did not include an inventory of past and present transformers. We observed pole-mounted transformers and power lines within the existing right-of-way.

Recommendation: If the relocation of power facilities or high voltage power lines is required, existing transformers should be checked for the presence of PCBs or other hazardous materials by the utility owner, and if present, properly remediated and disposed. Identification and remediation of old transformers is the responsibility of the utility owner.

Organochlorine Pesticides (OCPs)

Historical topographic maps from 1947 and 1949 depict an orchard in the southeastern ½-mile alignment of Rancho Road and the eastern 1/3-mile alignment of Morrison Road.

Recommendation: Conduct a shallow soil screening to evaluate the potential presence of OCPs within the footprint of the former orchard in the Project limits.

1 INTRODUCTION

Blackburn completed this Phase 1 Initial Site Assessment (ISA) for the OPUD Sewer and Water Infrastructure Project (Project) located in Yuba County California. The purpose of the ISA is to identify Recognized Environmental Conditions[2] (RECs), Historical Recognized Environmental Conditions (HRECs), and potential RECs, collectively referred to herein as RECs, that may be present within and/or adjacent to the Project limits.

To conduct this ISA, Blackburn:

- Reviewed historical aerial photographic coverage and topographic map coverage for the Project area and surrounding properties for indications of potential sources of contamination.
- Performed federal, state, and county records review for indications of the use, misuse, or storage of hazardous and/or potentially hazardous materials on or near the Project area.
- Conducted a site inspection on September 9, 2020 to observe current land use and indications of potential contamination, as well as hazardous and potentially hazardous waste issues for the Project area.
- Performed state records review of the on-line regulatory databases GeoTracker and EnviroStor, to determine if known site impacts and/or previous environmental work exist for the Project area.
- Reviewed the general site geology, groundwater, and soil conditions through published maps and literature.

Blackburn prepared this report for Jacobs Engineering Group (Jacobs) and the project design team to use during design and construction. This report shall not be used or relied upon by others, or for different locations or improvements without the written consent of Blackburn.

2 PROJECT LOCATION AND DESCRIPTION

2.1 Location and Description

The Project spans approximately 12.2 miles within the town of Olivehurst and surrounding areas. The Project alignment includes the OPUD Wastewater Treatment Plant located on Mary Avenue, and portions of the following alignments:

- Olivehurst Avenue from 7th Avenue to approximately 170 feet south of 11th Avenue;
- Mary Avenue from OPUD wastewater treatment plant to McGowan Parkway;
- McGowan Parkway from Mary Avenue to Rancho Road;

[2] BCI uses the term Recognized Environmental Condition (REC) in general compliance with ASTM E1527-13, which defines the meaning as "*The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment, (2) under conditions indicative of a release to the environment or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies. Conditions determined to be de minimus are not recognized environmental conditions.*"

- Olive Avenue from McGowan Parkway to approximately 100 feet to the north, then east crossing under Highway 65 to the northern terminus of Rancho Road;
- Rancho Road from its northern end to Morrison Road;
- Morrison Road from Highway 65 to Forty Mile Road;
- Forty Mile road from the Toyota Amphitheater to Rancho Road;
- Slaughterhouse Road from Forty Mile Road to northwest for approximately 0.4 miles, crossing Highway 65 to the western terminus of Plute Road;
- Plute Road from its westernmost extent to Shimer Road; and
- Shimer Road from Plute Road to Rancho Road.

Pump and lift stations locations will be installed on privately owned parcels, however these locations have not been finalized.

The Project location with Project limits is shown on Figure 1, Vicinity Map. Site-specific features are shown on Figures 2a-e.

2.2 Geology and Physical Setting

The site lies within the Great Valley Geomorphic Province of California, which is a large, elongated, northwest-trending structural trough. The Province is subdivided into two major divisions designated as the Sacramento and San Joaquin Valleys. These valleys have been filled to their present elevation with thick sequences of sediment, ranging in age from Jurassic to present day, creating a nearly flat-lying alluvial plain that extends from the Tehachapi Mountains in the south to the Klamath Mountains in the north. The western and eastern boundaries of this province are formed by the California Coast Ranges and the Sierra Nevada, respectively.

The study area is located on an alluvial plain in the Sacramento Valley located approximately 2.2 miles east of the Feather River at its closest point. The underlying deposits are mapped by Saucedo, G.J. and Wagner D.L. (1981) as alluvium, natural levee and channel deposits, basin deposits, Modesto Formation, and the Riverbank Formation. This formation is composed of fine-grained soils such as clay, silts, sand and gravel.

The site topography is generally flat, except near Highway 65 and Highway 70, where the topography slopes toward the highways. The site elevations, excluding areas near the Highways, range between 55 feet above mean sea level (msl) in the western portion of the Project and 75 feet above msl in the easternmost portion of the Project.

2.3 Surface Water, Groundwater, Wells

The Site lies within the South Yuba Subbasin where groundwater flow direction is generally to the southwest toward the Feather River, though flow directions vary both locally and seasonally. The study area is east of the Feather River, south of the Yuba River, and north of the Bear River. Blackburn reviewed groundwater level data made available at California Department of Water Resources (DWR) website www.water.ca.gov/waterdatalibrary. The groundwater beneath the site rises to within approximately 40

feet of the ground surface for up to six months of the year. Depth to groundwater during the rest of the year is approximately 45 feet below ground surface. Surface/storm water is directed by sidewalk curb, gutter and drains. The general flow direction is to the south and west towards the Feather River, except in area in proximity to Hutchison Creek and Reed Creek, which transect the Project in multiple areas flowing southwest toward the Feather River.

2.4 Current Land Use

Most of the Project area consists of roadways which traverse rural areas of Yuba County, with a portion of the project limits transecting the town of Olivehurst. Land adjacent to the Project along Rancho Road is zoned as agricultural industrial and light industrial. Land along Morrison Road is designated as sports entertainment district and employment center district. Land adjacent to Forty Mile Road is designated for agricultural use and sports entertainment. Land near the OPUD Wastewater treatment Facility on Mary Road is designated for use as public utilities land as well as single-family residential.

2.5 Historic Land Use

Land use adjacent to the project limits varies throughout the project alignment. Blackburn reviewed historical aerial photography, topographic maps, and Sanborn maps to identify conditions that may indicate potential hazardous materials issues within the Project limits.

2.5.1 Aerial Photograph Review

Blackburn reviewed the following historic aerial photography to identify conditions that may indicate potential hazardous materials issues within or adjacent to the Project area. The listing includes aerial photo flight year, source, scale, and a brief description of observed conditions. Copies of aerial photographs are provided in Appendix A.

Aerial Photograph Review

The following aerial photos were reviewed:

1947 Photo by Agriculture and Soil Conservation Service, Scale 1" =2,000'
1954 Photo by Army Mapping Service, Scale 1" =2,000'
1977 Photo by USGS, Scale 1" =2,000'
1987 Photo by USGS, Scale 1" =2,000'
1998 Photo by USGS, Scale 1" =2,000'
2005 Photo by National Agriculture Information Program (NAIP), Scale 1" =2,000'
2009 Photo by NAIP, Scale 1" =2,000'
2014 Photo by NAIP, Scale 1" =2,000'
2018 Photo by NAIP, Scale 1" =2,000'

Areas of the Project limits south of Morrison Road along Forty Mile Road are not shown on Aerial Photographs. This includes the area that is now the Toyota Amphitheater.

1947: Improved roads, Rancho Road, Forty Mile Road, Morrison Road, and McGowan Road are depicted in their present-day alignments. The town of Olivehurst is visible north of the Project limits. Agricultural

use is visible along the alignment. Rural residences are visible near the project alignment. Hutchinson Creek and Reed Creek transect the project alignment in multiple locations similar to present day. A large industrial facility is adjacent to the north side of Rancho Road in the location that is currently the Marysville Forest Products/Erikson Group Limited facility.

1954: Additional development of roads and residences in the south portion of Olivehurst. Olivehurst is generally in its present-day footprint.

1977: Highway 65 transects the project limits. Highway 70 appears under construction and transects the project limits. What is now a PG&E facility is adjacent to the south of the Project limits on Rancho Road. Mary Road appears on the map, along with the OPUD wastewater treatment facility. Additional residences appear along Morrison Road. A commercial/industrial facility is at the intersection of Slaughterhouse Road and Forty Mile Road. A mobile home park is at the intersection of Olive Avenue and McGowan Parkway. Additional residences and commercial businesses appear along the Project alignment within the town of Olivehurst.

1987: The OPUD wastewater Treatment Facility appears to expand to the south.

1998: No significant changes.

2005: An additional commercial facility is adjacent to the south of Rancho Road southeast of the PG&E facility.

2009: No significant changes.

2014: No significant changes.

2018: The Project alignment and surrounding area appear as they are today.

2.5.2 Topographic Map Review

Blackburn reviewed the following topographic maps for features that may indicate an impact to the Project. This summary includes noted changes within and adjacent to the Project location as recorded on the maps. Copies of the topographic maps are provided in Appendix B.

1910 Wheatland 7.5-minute Quad, Scale 1:24,000,
1911 Ostrom 7.5-minute Quad, Scale 1:24,000,
1947 Wheatland 7.5-minute Quad, Scale 1:24000,
1949 Wheatland 7.5- and 15-minute Quad, Scale 1:24000,
1952 Olivehurst 7.5-minute and Marysville 15-minute Quads, Scale 1:24,000
1973 Olivehurst and Wheatland 7.5-minute Quads, Scale 1:24000, and
2015 Olivehurst and Wheatland 7.5-minute Quads, Scale 1:24000.

1910 and 1911: Western Pacific Railroad and the Marysville Line of the Southern Pacific Railroad are depicted on the map near the project alignment. The development of Ostrom is depicted near the present-day intersection of Highway 65 and Forty Mile Road. Structures are depicted sparsely near the

project alignment along present-day Forty Mile Road, Morrison Road, and Rancho Road. Hutchinson Creek and Reed Creek are depicted near their present-day alignments transecting the Project. Plumas Lake is depicted approximately one mile south and west of the Project limits.

1947, 1949, and 1952: The town of Olivehurst, including Olivehurst Avenue, what is now Mary Road, and McGowan Road (Parkway) are depicted, as are residences and structures along their alignments. A commercial or industrial facility is depicted to the north of what is now Rancho Road between Reed Creek and Hutchinson Creek. This facility is in the same location as the present-day Marysville Forest Products/Erikson Group Limited facility. An orchard is depicted in the southeastern portion of the project alignment encompassing the intersection of present-day Highway 65, Morrison Road, and Rancho Road.

1973: The OPUD wastewater treatment facility is depicted in its present-day location. Several additional structures are depicted at the Marysville Forest Products/Erikson Group Limited facility. Highways 65 and 70 are depicted in their present-day alignments. A mobile home park is depicted at the intersection of Olive Drive and McGowan Parkway. The orchard is no longer depicted near the southeastern corner of the Project alignment. Additional commercial/industrial facilities are depicted in the area between Rancho Road and Highway 65. Additional roads and residential structures are depicted within the town of Olivehurst in the vicinity of Olivehurst Avenue and McGowan Parkway.

2015: Structures and land uses are not depicted on this map. The town of Olivehurst is depicted as it is today.

2.5.3 Sanborn® Map Review

Environmental Risk Information Services (ERIS) searched the Sanborn Maps Library for the Site and surrounding area. The ERIS search did not return Sanborn Maps (fire insurance) covering the Site or the surrounding area. Appendix C contains ERIS's Sanborn Map Report.

3 RECORDS REVIEW

3.1 County, State and Federal Records Review

ERIS, a commercial data base search firm, performed a radius search for the study area on August 20, 2020. The search includes a review of county, state, federal and ERIS proprietary databases. The maximum search radius is 1 mile from the outline of the Project area. Sites with adequate address information are plotted on ERIS's site plan "Map: 1.0 Mile Radius". ERIS lists sites with inadequate address information in their "Unplottable Summary" and does not provide mapped locations. Blackburn reviewed the 13 "unplottable sites" identified by ERIS and determined that only the PG&E facility, which is located on Rancho Road though identified on Morrison Road in the report, is located adjacent to the Project area. The complete EDR report is included in Appendix D.

3.2 Summary of Records Search

Blackburn reviewed the databases for facilities within ½-mile of the Project alignment with a potential to impact project operations. Our review of records identified the following sites with potentially hazardous material conditions at, adjacent to, or considered close enough to the project site to potentially impact

the project. 50 facilities within a ½-mile radius of the Project are listed in the Records Search. Below, we summarize the database records.

3.2.1 RECs Within the Project Alignment

APN 014-270-002: OPUD Wastewater Treatment Facility/Olivehurst Public Utilities District/Western Water Constructors, Inc., 3908 Mary Avenue, Olivehurst, CA

Databases: Yuba CUPA, AST, FINDS, HAZNET, HIST Manifest, ICIS, YUBA UST, CERS TANK, RCRA NonGen
A 2,500-gallon diesel AST is located at this facility. No additional information is provided in the records search.

3.2.2 RECs Adjacent to the Project Alignment (Medium and High Risk)

The following sites have conditions such as above ground or underground fuel storage tanks that are considered RECs to the project. The RECs include releases of petroleum hydrocarbons or other hazardous materials that may have resulted in residual impacts within the Project alignment.

APN 013-072-011: Gee Property, 4880 Olivehurst Avenue, Olivehurst, CA
Database: GeoTracker

Formerly occupied by a fueling station. Two gasoline USTs were removed in 1988. Soil samples from the UST excavation indicated a release had occurred. An additional UST was excavated in 2019. Low levels of TPH as diesel was detected in groundwater. Low concentrations of motor oil were detected in stockpile sampling. The regulatory case was closed on January 10, 2020. The site is within the service area of OPUD.

APN 013-081-015: AGV Corner Market, 4881 Olivehurst Avenue, Olivehurst, CA
Database: GeoTracker

The site is an active gas station. Currently a 20,000 gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

APN 013-130-060: Former E-Z Serve, 4867 Olivehurst Avenue, Olivehurst, CA
Databases: GeoTracker, LUST

On August 30, 1989, three USTs were removed, and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017. A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

APN 014-143-026: Tower Mart #60/Colonial Energy CE/Fred and Liquor 60/Cheaper #60, 1976 McGowan Parkway, Olivehurst, CA
Databases: Delisted TNK, Emissions, GeoTracker, FINDS/FRS, Yuba CUPA, LUST, HHSS, HAZNET, Yuba UST, CERS TANK, UST, Emissions, HIST TANK, RCRA NonGen

In 1986, two single-walled 10,000-gallon fuel tanks were removed from the site. In 2004 four USTs were installed including one 8000-gallon diesel and three 12,000-gallon gasoline tanks. This fueling station is a hazardous waste generator. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed on January 31, 2008.

APN 014-270-079: Flying U Ranch, 3718 Forty Mile Road, Olivehurst, CA
Databases: Yuba CUPA, AST, CERS TANK

A 13,500-gallon AST of unknown fuel type is identified at the site. The CERS TANK database identifies violations including failure to dispose of hazardous waste within 180 days, and failure to inspect hazardous waste storage areas weekly.

APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro, 3374 Forty Mile Road, Olivehurst, CA
Databases: AST, RCRA NonGen, Yuba CUPA, CERS TANK

This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents. Violations were reported for failure to properly label hazardous waste containers, and failure to properly store and label used batteries.

APN 014-280-065: PG&E North Valley Materials, 3736 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, Delisted TNK, AST, HHSS, Yuba UST, HIST TANK, Delisted CTNK, RCRA SQG, CHMIRS, LUST

One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. The CHMIRS database lists this facility as having a leak of 5-10 gallons of insulating oil (no PCB content).

APN 014-360-014: Frank Hofman Ranch, 3002 Forty Mile Road, Olivehurst, CA
Databases: Yuba CUPA, HHSS, Yuba UST, HIST TANK

This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

APN 014-510-018: Livingston Concrete, 2571 Rosser Road, Olivehurst, CA
Databases: Yuba CUPA, CERS TANK, Emissions

This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

APN 014-510-021: Roger L. Murray, 3938 Shimer Road, Olivehurst, CA
Databases: Yuba CUPA, AST, Delisted CTNK

This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. No additional information is provided in the records search.

APN 014-510-033: Marysville Forest Products/Erickson Group Limited/Sun Gro Horticulture/Berdex Forest Products, Inc., 4083 Rancho Road, Olivehurst, CA
Databases: RCRA SQG, Yuba CUPA, Cleanup Sites, LUST, EnviroStor, HHSS, Yuba UST, Delisted HAZ, Emissions, HIST TANK, RCRA NonGen

Marysville Forest Products is a hazardous waste generator that reported a release of diesel to soil on June 18, 1992. Impacted soil was excavated and the regulatory case was closed on July 14, 1993.

Erickson Group Limited is a former wood treating facility. Pentachlorophenol (PCP) was released to soil during site operations. Soil remediation occurred and groundwater monitoring indicates that groundwater was not impacted by the release. The regulatory case is currently open. As of June 18, 2020, a Phase 1 ESA was requested by a potential buyer of the property.

APN 015-060-075: Tollcrest Dairy, 3355 Virginia Road, Wheatland, CA
Databases: Yuba CUPA, AST, CERS TANK

A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

3.2.3 Sites identified Adjacent to the Project Alignment (Low Risk)

The following sites are listed in the searched database for storage and handling of hazardous materials and other hazardous materials conditions that are not considered RECs to the project. If these parcels are acquired as part of the project, additional assessment should be conducted.

Frankenstein Motors/McCinskey's Frankenstein Motors, 3906 Shimer Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ, RCRA NonGen

This facility is identified in the Yuba CUPA and CERS HAZ databases as a hazardous waste generator. This database identifies a violation on September 27, 2016 for failure to manage used oil and/or fuel filters, label portable tanks appropriately, and submit an emergency response plan for hazardous materials release.

JS West Propane-Marysville Storage, 2698 Plute Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ

No information regarding this facility is provided in the listed databases.

Livingston's Concrete, 2572 Rosser Road, Olivehurst, CA
Database: FINDS/FRS

This facility is identified as a ready-mix concrete business. No additional information is provided in the records search.

AT&T California, Ostrom Road and Rancho Road, Olivehurst, CA
Database: CERS HAZ

This facility is identified as a chemical storage facility. No additional information is provided in the records search.

3948 Shimer Road, Olivehurst, CA
Databases: NCDL, CDL
This facility was identified on February 1, 2006 as being an illegal drug lab where hazardous materials were stored.

C**enturylink Olivehurst**, 3365 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, CERS HAZ

This facility is identified in the CERS HAZ database as a chemical storage facility. No additional information is provided in the records search.

Verizon Wireless Olivehurst, 3359 Forty Mile Road, Olivehurst, CA
Database: Yuba CUPA

No information is listed in the searched database.

Yetter Steel Corp., 3548 Rancho Road, Olivehurst, CA
Databases: Yuba CUPA, Delisted Haz

This business is listed as a hazardous waste generator. No additional information is provided in the records search.

Sprint Nextel, 3516 Rancho Road, Olivehurst, CA
Database: Yuba CUPA

No information regarding this site is in the searched database.

United Truck Dismantlers/ Rocliff Enterprises, Inc., 2488 McGowan Parkway, Olivehurst, CA
Databases: FINDS/FRS, Yuba CUPA, HAZNET, HIST Manifest, CERS HAZ, RCRA NonGen

This facility is a hazardous waste generator that operates an oil/water separator and disposes of oil-containing waste.

Verizon Wireless McGowan Parkway, 4404 Rancho Road, Marysville, Ca
Databases: FINDS/FRS, Yuba CUPA, CERS HAZ

This facility is listed in the CERA HAZ database as being a chemical storage facility. No regulatory action, spills, or leaks are identified in the records search.

2352 McGowan Parkway/Highway 65 & McGowan Parkway, Olivehurst, CA
Database: CDL

This address is listed in the searched database as an illegal drug lab that was reported in May 2000.

Rocking S Livestock, 3380 Rancho Road, Wheatland, CA
Database: Yuba CUPA

No information is provided in the records search.

Via Grande Way, Space 19, Olivehurst, CA
Database: CDL

This listing is a residence in a mobile home park located at the intersection of Olive Avenue and McGowan Parkway that was reported to be an illegal drug lab in March 2003.

Highway 70 & McGowan Parkway, Olivehurst, CA
Database: CDL

This location is the location of a vehicle that contained illegal drug lab equipment.

NRC/UPRR, Virginia Road & Rancho Road, Wheatland, CA
Database: CHMIRS

This location is listed in the searched databases as the location of a natural gas line leak, and an auto vs. train collision that resulted in the spill of an unknown amount of an undisclosed fluid. No regulatory action was documented regarding the spill.

Dollar General #14976, 1990 McGowan Parkway, Olivehurst, CA
Databases: Yuba CUPA, HAZNET, FINDS/FRS, CERS HAZ, RCRA NonGen

This business generates hazardous waste that is transported offsite.

Burrow Garage, 1909 McGowan Parkway, Olivehurst, CA
Databases: FINDS/FRS, Yuba CUPA, HAZNET, Delisted HAZ

This business is listed in the searched records as a hazardous waste generator that disposes of liquids with halogenated organic compounds. No violations, spills, or regulatory actions are documented in the records search.

Verizon Wireless Olivehurst, 3076 Rancho Road, Wheatland, CA
Databases: CERS HAZ, Yuba CUPA

This facility is listed as a chemical storage facility. No additional information is provided in the records search.

AT&T Corp, 4242 Deaton Drive, Olivehurst, CA
Database: CERS HAZ

This business is listed in the searched database as a chemical storage facility. No regulatory violations, spills, or leaks are documented for this facility.

Kubich Lumber, 1630 Rancho Road, Marysville, CA
Database: HAZNET

This business is listed in the HAZNET database. No additional information is identified in the records search.

3.2.4 RECs at Facilities identified within ½-mile of the Project alignment

Marysville Army Airfield/Yuba County Airport/G.N. Dibble, Inc./Public Works Airport Shop, 1300 and 1364 Sky Harbor Drive, Olivehurst, CA (1/2-mile west)

This facility is listed in the GeoTracker and EnviroStor online databases.

This 972-acre facility was constructed in 1941 and served as both a staging area for aircraft that applied herbicides and insecticides to surrounding agricultural properties, as well as a military installation that facilitated firearms training, aircraft storage, and aircraft refueling. In 1999, seven USTs and 790 tons of contaminated soil were removed from this facility. In 2014 A&M, a consultant working on behalf of the Central Valley Regional Water Quality Control Board (CVRWQCB), conducted a soil and groundwater investigation at the Site. Analysis of soil and groundwater samples collected during the investigation indicated that no contamination was present from petroleum hydrocarbons or volatile organic compounds (VOCs). The regulatory case was closed on July 21, 2015.

Two open regulatory cases are ongoing at this facility in relation to pesticide and herbicide releases to soil that occurred because of past uses. This facility is approximately 1/2 -mile west and downgradient of the Project alignment and is therefore not a REC for the Project.

3.3 City Directory Review

Blackburn reviewed the historical city directory. The City Directory review did not identify any conditions that are not already identified in other sections of this ISA. The City Directory Image Report is provided in Appendix E.

3.4 Title Documents Review

Title documents were not provided for this assessment.

4 RECONNAISSANCE INFORMATION

Blackburn completed a site reconnaissance on September 9, 2020. The purpose of the visual survey is to collect information regarding potential hazardous material contamination including identification of evidence of current and/or past use, evident storage of toxic or hazardous materials, the presence of onsite ponds, landfills, drywells, waste streams or other disposal units, visible soil contamination, above ground or underground storage tanks, drums, barrels and other storage containers. Photos from the site visit are in Appendix F. Observations were made from accessible portions of the study area.

The observations generally support the descriptions and background data above. Additional observations are presented in Section 3.2.1.

5 OWNER INTERVIEWS

Per ASTM, past owners, operators, and/or occupants of the subject property who are likely to have material information regarding the potential for contamination at the subject property shall be contacted

to the extent that they can be identified and that the information likely to be obtained is not duplicative of information already obtained from other sources.

Blackburn did not conduct interviews with property owners. Lack of contact with the owners of property adjacent to the Project is a data gap but is not expected to change the conclusions of this ISA.

6 DATA GAPS

In accordance with ASTME E1527-13, this section discusses data gaps in the documents we obtained and reviewed as part of this ISA and discusses the significance. ASTM E1527-13 defines a data gap as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." In our opinion, we did not observe a data gap significant enough to change the conclusions of this ISA.

7 FINDINGS, CONCLUSIONS, AND RECOMMENDATIONS

The scope of this ISA was directed at:

- Determining if hazardous materials exist at or near the Project area at concentrations likely to warrant mitigation pursuant to regulations;
- Identifying sites RECs and/or potential RECs within and adjacent to the proposed Project area which could affect the design, constructability, feasibility, and/or the cost of the proposed Project; and
- Identify potential site contamination issues.

The assessment identified the following environmental conditions that should be considered for present and future planning for the proposed Project.

RECs Located Within the Project Limits

APN 014-270-002: OPUD Wastewater Treatment Facility - Public Utilities District 3908 Mary Avenue

A 2,500-gallon diesel above ground tank (AST) is located at this facility. There are no indications of a release of diesel to soil or groundwater.

Recommendation: No additional assessment.

RECs Located Adjacent to the Project Limits

Four sites located immediately adjacent to the project alignment were identified with high risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these adjacent parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If excavation is planned within the right-of-way (ROW) adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials.

- **APN 014-143-026: Tower Mart #60/Cheaper #60**, 1976 McGowan Parkway

  Two single-walled 10,000-gallon gasoline underground storage tanks (USTs) tanks were removed in 1986. One 8,000-gallon diesel and three 12,000-gallon gasoline tanks were installed in 2004. A release of gasoline and diesel to soil and groundwater occurred sometime before 2003. Groundwater monitoring in April 2005, did not identify detectable amounts of constituents. The regulatory case was closed in 2008. Potential contaminants of concern (COC) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gas (TPH-g) and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX).

- **APN 014-510-033: Marysville Forest Products/Erickson Group Limited**, 4083 Rancho Road

  Two USTs were reportedly removed after a leak was detected. A reported release of diesel to soil was recorded in 1992. Documentation was not found to verify impacted soil was excavated. The regulatory case was closed on July 14, 1993. The site was formerly occupied by a wood treating facility. Pentachlorophenol (PCP) was used as an anti-fungal wood treatment. PCP was released to soil during site operations. Site soil is also impacted with volatile organic compounds (VOCs) from the maintenance shop and dioxins at the ash disposal and burn areas. The horizontal and vertical extent of impacts is unknow. The Regional Water Quality Control Board (RWQCB) regulatory case is currently open. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, BTEX, VOCs, dioxins, and PCP.

- **APN 014-280-065: PG&E North Valley Materials**, 3736 Rancho Road

  One 10,000-gallon AST of unknown contents, one 8,000-gallon gasoline UST, and one 12,000-gallon diesel UST are located at this facility. This facility operates as a staging area for PG&E operations throughout the area. A release of diesel to soil from a UST was reported on November 3, 1992. Contaminated soil was removed from the facility, and a No Further Action Letter was issued on March 1, 1993. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX

- **APN 014-270-079: Flying U Ranch**, 3718 Forty Mile Road

  A 13,500-gallon AST of unknown fuel type is identified at the site. The location of the AST was not identified during site reconnaissance. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

Five sites located immediately adjacent to the project alignment were identified with medium risk RECs. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Fuel storage tanks are present on these adjacent parcels. There is no evidence in the records review to suggest releases have occurred from the tanks or hazardous material issues from these sites will impact the Project, however, there is a potential to encounter residual contamination at these sites. If plans for acquisition change to include one or more of these sites, a Phase II Environmental Site Assessment to further investigate potential hazardous materials within the acquisition areas will be necessary.

- **APN 014-280-046: Alfaro Farms/Jean Pierre Alfaro**, 3374 Forty Mile Road

  This farm is listed in the searched databases as having a 15,000-gallon AST of unknown contents.

  Violations were reported for failure to properly label hazardous waste containers, and failure to

properly store and label used batteries.

- **APN 014-360-014: Frank Hofman Ranch**, 3002 Forty Mile Road

  This business is listed as a hazardous waste generator. A UST of unknown contents and volume was located at the site. The Yuba UST database lists the UST status as closed. No spills or leaks were reported at this facility.

- **APN 014-510-018: Livingston Concrete**, 2571 Rosser Road

  This facility is listed in the searched databases as operating an AST. Violations are reported and include failure to provide training to oil-handling personnel.

- **APN 014-510-021: Roger L. Murray**, 3938 Shimer Road

  This facility is listed as having a 5,000-gallon AST storing an unknown fuel type. The AST is located at the southeast corner of the parcel, adjacent to the project. The AST had secondary containment, but the AST is within twenty feet of the project limits.

- **APN 015-060-075: Tollcrest Dairy,** 3355 Virginia Road, Wheatland

  A 10,200-gallon AST is located at this facility. The AST is not located on the west side of the parcel near the project alignment. No additional information is provided in the records search.

Three sites located north of the project alignment on Olivehurst Avenue were identified with high risk RECs. The project limits do not currently extend to these sites. These sites are listed in Section 3.2.2 and are identified on Figures 2a-c. Documented impacts to soil or groundwater are present on or have been remediated at these parcels. There is a potential that impacts from these parcels extend into the right-of-way (ROW) adjacent to the parcel. There is a potential to encounter residual contamination during excavation.

Recommendation: If the project limits are extended to include excavation within the ROW adjacent to these parcels, conduct a Phase II screening of the soil within the area of excavation to assess the presence of potential hazardous materials. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

- **APN 013-072-011: Gee Property**, 4880 Olivehurst Avenue

  The site is currently vacant but was formerly occupied by a fueling station. Two gasoline underground storage tanks (USTs) were removed in 1988 and one UST removed in 2019. Soil samples from the UST excavation indicated a release had occurred. Low levels of total petroleum hydrocarbons (TPHs) were detected in groundwater. The regulatory case was closed on January 10, 2020.

- **APN 013-081-015: AGV Corner Market**, 4881 Olivehurst Avenue

  The site is an active gas station. Currently a 20,000-gallon compartmentalized gasoline and diesel tank is in the same excavation area as the former UST. A release of gasoline to soil and groundwater occurred at this facility sometime prior to 2001. The most recent groundwater monitoring event conducted at the facility occurred in May 2011 and demonstrated that groundwater beneath the facility has residual impacts from gasoline related constituents. The regulatory case was closed on June 25, 2012.

- **APN 013-130-060: Former E-Z Serve**, 4867 Olivehurst Avenue

Three USTs were removed in 1989 and a release of gasoline was discovered. Soil and groundwater were impacted. Groundwater monitoring was conducted from sometime before 2004 until 2017. A No further Action letter was issued by the CVRWQCB and the regulatory case was closed on November 22, 2019.

General Contamination Issues

The following general contamination issues were identified within the Project limits.

Yellow traffic stripes

Yellow traffic stripes are known to contain heavy metals, such as lead and chromium, at concentrations in excess of the hazardous waste thresholds established by the *California Code of Regulations* and may produce toxic fumes when heated.

Recommendation: If the Project includes removal of yellow traffic striping, remove and dispose of in accordance with Caltrans Standard Special Provisions for Hazardous Waste.

Aerially Deposited Lead (ADL)

ADL has been found to occur in soils adjacent to highways and high use roadways. The lead is presumably from the historical use of leaded gasoline and subsequent exhaust emissions. There is potential for encountering ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and, therefore, have the potential to be impacted with ADL.

Recommendation: A soil screening to evaluate the potential presence of ADL within the Project limits should be performed. An appropriate soil management plan will need to be developed for soil containing significant concentrations of ADL.

Southern Pacific/Union Pacific Railroad

An active railroad is adjacent to the east side of Rancho Road. Soils located adjacent to railroad tracks may be impacted by on-going railroad operations. Potential contaminants at these locations commonly include petroleum hydrocarbons, semi-volatile organic compounds (SVOCs), heavy metals, and pesticides.

Recommendation: Conduct a limited subsurface soil screening for potential contaminants in the upper 1.5 feet where soil will be disturbed adjacent to the railroad.

Asbestos Containing Material (ACM) and Lead in Buildings Materials

Structures constructed pre-1989 have the potential to contain ACM/Lead materials. Aerial photographs identify structures along the project alignment as developed prior to 1989.

Recommendation: If parcels are acquired as part of the Project any structures on those parcels should be evaluated for the presence of lead and asbestos containing materials. Any structure to be modified or demolished as part of the Project must be surveyed for the presence of ACM and Lead by a certified Asbestos Inspector prior to building demolition/modification.

Transformers

Our scope did not include an inventory of past and present transformers. We observed pole-mounted transformers and power lines within the existing right-of-way.

Recommendation: If the relocation of power facilities or high voltage power lines is required, existing transformers should be checked for the presence of PCBs or other hazardous materials by the utility owner, and if present, properly remediated and disposed. Identification and remediation of old transformers is the responsibility of the utility owner.

Organochlorine Pesticides (OCPs)
Historical topographic maps from 1947 and 1949 depict an orchard in the southeastern ½-mile alignment of Rancho Road and the eastern 1/3-mile alignment of Morrison Road.

Recommendation: Conduct a shallow soil screening to evaluate the potential presence of OCPs within the footprint of the former orchard in the Project limits.

8 QUALIFICATIONS

This ISA was prepared by Laura Long. I declare that, to the best of my professional knowledge and belief, I meet the definition of an environmental professional as defined in Section 312.10 of 40 Code of Federal Regulations (CFR) 312 and have the specific qualifications based on education, training, and experience to assess a property of its nature, history, and setting of the subject property. I have performed all appropriate inquiries in general conformance with the standards and practice set forth in 40 CFR 312.

9 LIMITATIONS

The accompanying ISA summarizes the findings and opinions of Blackburn, with regard to the potential for hazardous materials to be present on the properties at concentrations likely to warrant mitigation under current statutes and guidelines. Our findings and opinions are based on information obtained on given dates or provided by specified individuals, through records review, site review, and related activities. Conditions can change after we have made our observations. We cannot warrant or guarantee that hazardous materials do not exist at the described site. To further reduce your risk, an extensive invasive exploration may be necessary.

Blackburn prepared this ISA for the specific use of our client and applies only to the Project area. We are not responsible for interpretations by others of data presented in this ISA. This ISA does not represent a legal opinion. No warranty is expressed or implied. We base our conclusions in this ISA on judgment and experience. We performed this work in accordance with generally accepted standards of practice existing in northern California at the time of the assessment.

The governmental records portion of this ISA is derived from public records and is updated on a continual basis. For this reason, we do not advise you to use this information to base a decision after one (1) year of the issue date of this ISA. Also, conditions at the site can and will change over time. Please contact Blackburn to revise this ISA to reflect new information.

Hazardous Waste Handler Details

Sequence No: 1
Receive Date: 20080630
Handler Name: BRCO CONSTRUCTORS
Source Type: Temporary
Federal Waste Generator Code: 1
Generator Code Description: Large Quantity Generator

Waste Code Details

Hazardous Waste Code: D001
Waste Code Description: IGNITABLE WASTE

Hazardous Waste Code: D002
Waste Code Description: CORROSIVE WASTE

Hazardous Waste Code: F003
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: F005
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Past Use that Caused Contam: LAND DISPOSAL / FILL, SCHOOL - ELEMENTARY, TRANSFORMER REPAIR
Potential Media Affected: SOIL
Potential Contamin of Concern:

LEAD, ORGANOCHLORINE PESTICIDES (8081 OCPS), POLYCHLORINATED BIPHENYLS (PCBS)

SITE HISTORY:

Marysville Joint Unified School District (District) is proposing new construction on approximately 7.5-acres of the existing 8.36-acre Johnson Park Elementary School campus. Prior to development of the school, the site was used as dry pastureland for cattle grazing. Construction of the school was completed in 1964 and has been an elementary school since that time. Several portable classrooms have also been added to the campus. Concerns at the site are: current and former structures, a pole-mounted transformer, and a stockpile of soil. The stockpiled soil is reported to be from off-site grading activities, adjacent to an existing freeway, for placement of a water tank located near and to the northwest of the site. The stockpiled soil is to be incorporated into the site.

The main administration, classroom and multipurpose building located in the southern portion of the campus and the tennis courts that straddle the northern boundary are not part of the site. Areas within five-feet of the admin/classroom multipurpose building are also not part of the site, with the exception of a small area along the northeastern rear side of the building, where a building expansion will abut the existing structure.

A Phase I Addendum discusses soil sampling results for organochlorine pesticides (OCPs) used as termiticides, lead from lead based paint and polychlorinated biphenyls (PCBs) from electrical transformers. Samples were collected around three portables north of the admin building and in a grid pattern over two former storage buildings and analyzed for lead. Samples were collected around two non-conforming (NC) buildings and analyzed for lead and OCPs. Samples were also collected at the base of a pole-mounted electrical transformer and analyzed for PCBs. All lead results were below levels of concern with the highest concentration of 73 milligrams per kilogram (mg/kg). PCBs were not detected above the reporting limit of 20 micrograms per kilogram (ug/kg). The OCP results identified dieldrin at concentrations above the California Human Health Screening Level (CHHSL), 35 ug/kg, at the larger non-conforming (NC1) building. On the south side of building NC1, dieldrin was detected at 54 ug/kg and in a stepout at 79 ug/kg in discrete soil samples collected from the surface. The Phase 1 recommends additional investigation maybe required.

A PEA purposes to investigate possible soil impacted from:
- OCPs used as termiticides at the two former storage buildings;
- Lead due to lead-based paint at a drainage grate associated with area along the northeastern rear side of the Admin building where the expansion will abut the existing structure.
- Lead due freeway exhaust at the 250 cubic yards of stockpiled soil. The soil was generated from land located adjacent to an existing freeway.
- Additional samples will be collected to help delineate the dieldrin impacted soil on the south side of building NC1.

On June 16, 2009 PEA sampling was conducted. The analytical results are as follows:
- Former storage buildings - OCPs were not not detected above their respective analytical method reporting limits in both the surface and subsurface soil samples.
- Northeastern side of Admin building and Stockpiled soil - Lead was detected below levels of concern at 7.5, 15, and 20 mg/kg.
- South side of buiding NC1 - Dieldrin was detected above the CHHSL in two discrete surface samples: SO-2 at 45 mg/kg and SO-3 at 94 mg/kg. Based on the current results, sample location SO-3 is not defined to the south or west. Therefore, additonal delineation sampling for dieldrin is required.

On July 31, 2009 additional delineation sampling around sample location SO-3 was conducted with a DTSC approved a Technical Memorandum. The soil sampling consisted of two five foot and two 10-foot step out locations. The 10-foot step out locations were archived pending the results of the two 5-foot step out locations. All analytical results show that dieldrin is below the CHHSL.

PEA report was sent out for public comment from Sept. 6, 2009 through October 5, 2009 and a public hearing was held on Sept. 15, 2009. The PEA report recommends no further action based on the PEA risk assessment indicating that the site has not been significantly impacted.

On October 8, 2009, DTSC approved the PEA report with a no further action recommendation.

Site History:

Marysville Joint Unified School District (District) is proposing new construction on approximately 7.5-acres of the existing 8.36-acre Johnson Park Elementary School campus. Prior to development of the school, the site was used as dry pastureland for cattle grazing. Construction of the school was completed in 1964 and has been an elementary school since that time. Several portable classrooms have also been added to the campus. Concerns at the site are: current and former structures, a pole-mounted transformer, and a stockpile of soil. The stockpiled soil is reported to be from off-site grading activities, adjacent to an existing freeway, for placement of a water tank located near and to the northwest of the site. The stockpiled soil is to be incorporated into the site.

The main administration, classroom and multipurpose building located in the southern portion of the campus and the tennis courts that straddle the northern boundary are not part of the site. Areas within five-feet of the admin/classroom multipurpose building are also not part of the site, with the exception of a small area along the northeastern rear side of the building, where a building expansion will abut the existing structure.

A Phase I Addendum discusses soil sampling results for organochlorine pesticides (OCPs) used as termiticides, lead from lead based paint and polychlorinated biphenyls (PCBs) from electrical transformers. Samples were collected around three portables north of the admin building and in a grid pattern over two former storage buildings and analyzed for lead. Samples were collected around two non-conforming (NC) buildings and analyzed for lead and OCPs. Samples were also collected at the base of a pole-mounted electrical transformer and analyzed for PCBs. All lead results were below levels of concern with the highest concentration of 73 milligrams per kilogram (mg/kg). PCBs were not detected above the reporting limit of 20 micrograms per kilogram (ug/kg). The OCP results identified dieldrin at concentrations above the California Human Health Screening Level (CHHSL), 35 ug/kg, at the larger non-conforming (NC1) building. On the south side of building NC1, dieldrin was detected at 54 ug/kg and in a stepout at 79 ug/kg in discrete soil samples collected from the surface. The Phase 1 recommends additional investigation maybe required.

A PEA purposes to investigate possible soil impacted from:
- OCPs used as termiticides at the two former storage buildings;
- Lead due to lead-based paint at a drainage grate associated with area along the northeastern rear side of the Admin building where the expansion will abut the existing structure.
- Lead due freeway exhaust at the 250 cubic yards of stockpiled soil. The soil was generated from land located adjacent to an existing freeway.
- Additional samples will be collected to help delineate the dieldrin impacted soil on the south side of building NC1.

On June 16, 2009 PEA sampling was conducted. The analytical results are as follows:
- Former storage buildings - OCPs were not not detected above their respective analytical method reporting limits in both the surface and subsurface soil samples.
- Northeastern side of Admin building and Stockpiled soil - Lead was detected below levels of concern at 7.5, 15, and 20 mg/kg.
- South side of buiding NC1 - Dieldrin was detected above the CHHSL in two discrete surface samples: SO-2 at 45 mg/kg and SO-3 at 94 mg/kg. Based on the current results, sample location SO-3 is not defined to the south or west. Therefore, additonal delineation sampling for dieldrin is required.

On July 31, 2009 additional delineation sampling around sample location SO-3 was conducted with a DTSC approved a Technical Memorandum. The soil sampling consisted of two five foot and two 10-foot step out locations. The 10-foot step out locations were archived pending the results of the two 5-foot step out locations. All analytical results show that dieldrin is below the CHHSL.

PEA report was sent out for public comment from Sept. 6, 2009 through October 5, 2009 and a public hearing was held on Sept. 15, 2009. The PEA report recommends no further action based on the PEA risk assessment indicating that the site has not been significantly impacted.

On October 8, 2009, DTSC approved the PEA report with a no further action recommendation.

School District: MARYSVILLE JOINT UNIFIED SCHOOL DISTRICT
APN: 014-550-013-000
Cleanup Status: NO FURTHER ACTION AS OF 7/11/2012
Cleanup Oversight Agencies: DTSC - SITE CLEANUP PROGRAM - LEAD AGENCY
Site Type: SCHOOL
Office: NORTHERN CALIFORNIA SCHOOLS & SANTA SUSANA
Past Use that Caused Contam: AGRICULTURAL - ROW CROPS, RESIDENTIAL AREA
Potential Media Affected: SOIL, UNDER INVESTIGATION
Potential Contamin of Concern:

DIOXIN (AS 2,3,7,8-TCDD TEQ), LEAD, ORGANOCHLORINE PESTICIDES (8081 OCPS), POLYNUCLEAR AROMATIC HYDROCARBONS (PAHS), UNCATEGORIZED

SITE HISTORY:

According to the Phase I, the 0.17-acre property is located at 4347 Evelyn Drive in Olivehurst, California (Site). The Site is identified by the Yuba County Assessor's Office as Parcel Number 014-550-013-000, and is currently undeveloped. The Site is located in a residential area and borders the Lindhurst High School (LHS) to the north. The Marysville Joint Unified School District (District) owns the Site and plans to develop the Site as a paved access walkway route to the LHS. Since at least the 1940s, the Site has been historically used for agricultural activities. A single-family residence was constructed in around 1978 and was demolished in 2008. The Phase I concludes that the only recognized environmental conditions (RECs) at the Site are lead, asbestos containing materials, and organochlorine pesticides (OCPs) and recommends that soil sampling and analysis program be performed.

On May 21, 2012, DTSC concurred with the Phase I recommendation and issued an approval letter with a further action determination. DTSC also indicated that fire specific contaminants such as polycyclic aromatic hydrocarbons (PAHs) and metals should be added as RECs. The District is not seeking funding from the California Department of Education (CDE) and therefore is exempt from DTSC oversight.

On October 19, 2012, the District notified DTSC that they will address the potential soil hazards during the development of the site. The District indicated that the potential contaminants will no longer present a hazard after construction of the landscaping and walkway, creating a cap on top of the existing soil.

DTSC considers this project complete.

Site Type: SCHOOL
Office: NORTHERN CALIFORNIA SCHOOLS & SANTA SUSANA
Past Use that Caused Contam: NONE
Potential Media Affected: OTHER GROUNDWATER AFFECTED (USES OTHER THAN DRINKING WATER), SOIL VAPOR
Potential Contamin of Concern:

BENZENE, TPH-GAS

SITE HISTORY:

According to the Phase I Addendum, the modernization project covers approximately
25 acres of the 34 acre existing Lindhurst High School site. The original Lindhurst High School was built in 1974 and the site was undeveloped grassland prior to construction of the school. Based on the Phase I Environmental Assessment findings, the only recognized environmental conditions at the site were lead from lead-based paint, organochlorine pesticides (OCPs) from termiticide application, and polychlorinated biphenyls (PCBs) from an electrical transformer.

The Phase I Addendum presents the findings of the soil investigation for lead, OCPs, and PCBs. The Phase I Addendum concludes PCBs were not detected above their respective analytical reporting limits, lead was detected at concentrations from <2.5 to 62 milligrams per kilogram, and that dieldrin was detected in the composite sample at a concentration of 15 micrograms per kilogram, but below the respective analytical method in the four discrete soil samples that comprised the composite sample. Consequently, the Phase I Addendum recommends no further action for the site.

On Novemeber 5, 2008 DTSC approved the Phase I Addendum with a no further action determination.

Received Issue Date: 2/11/2005
Action: * Verbal Communication
Doc Link:
Title Description Comments:

2:57pm BPK spoke with Lorraine Sawyer of ATC and associates, Lorraine Sawyer is filling in for Drew Vanowen(previous Project Manager) resigned. I

notified Lorraine that we had not recieved the 3rd and 4th QMR2004. Lorraine informed me that she would ship out the 3rd QMR asap and that for some unknown reason Drew Vanowen told the rp not to sample for 4th QMR 2004. ATC sampled for the 1st QMR2005 on 2-11-2005 and will get the information to us. BPK

Monitoring Report Third Quarter 2004

Action Type: Other Regulatory Actions
Action Date: 7/20/2004
Received Issue Date: 7/20/2004
Action: Staff Letter
Doc Link:
Title Description Comments:

Letter directing RP to complete at least 1 addional round of groundwater monitoring and sampling work prior to initiating a NFAR request.

Action Type: Enforcement/Orders
Action Date: 7/19/2004
Received Issue Date: 7/19/2004
Action: * Historical Enforcement
Doc Link:
Title Description Comments:

Reviewed 2nd Qtr 2004 QMR and EDF compliance. EDF data present and reviewed. TPHd detected in the three site monitoring wells this quarter (range of 110 to 270 ug/l), but lab notes that pattern does not match typical diesel signature. Note that diesel reported 7/31/03 and 5/06/04, but not oct or jan events. Changes in groundwater table does not appear to account for differing data.

Action Type: Other Regulatory Actions
Action Date: 7/19/2004
Received Issue Date: 7/19/2004
Action: * Verbal Communication
Doc Link:
Title Description Comments:

Discussed site conditions with Jeanne Homsey of ATC Associates, Inc. Need to "explain" the sudden increase in TPHd concnetrations in the three site monitoring wells prior to moving forward with a NFAR evaluation.

Action Type: Reports
Action Date: 7/7/2004

Violations

Violation Date: 05/11/2015 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2715(c)(2) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715(c)(2)
Violation Notes:

Returned to compliance on 05/11/2015. The 87 and diesel spill buckets had liquid in them. The liquid was removed at the time of inspection.

Violation Description:

Failure to comply with one or more of the following: maintain the spill bucket in good condition, containment free of debris/liquid, and/or to remove the contents of the spill bucket when a release/leak/spill was observed.

Violations

Violation Date: 05/11/2015 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2715 - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715
Violation Notes:

Returned to compliance on 05/26/2015. Alarms from Dec. 2014 were not mentioned on the DO report. They were documented by the facility.

Violation Description:

Failure to comply with one or more of the designated operator monthly inspection requirements: failed to inspect the monthly alarm history report; attach a copy of the alarm history; failed to inspect for the presence of liquid or debris in the spill container/spill bucket and under dispenser containment; failed to inspect the under dispenser containment to ensure that monitoring equipment is placed in the proper position; failure to inspect for liquid or debris in the containment sump where an alarm occurred or for which there is no record of a service visit; or failure to check that all testing and maintenance has been completed and documented.

Violations

Violation Date: 05/13/2014 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2715(c)(2) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715(c)(2)
Violation Notes:

Returned to compliance on 05/13/2014. Unleaded spill bucket had liquid in it. Removed at the time of the inspection.

Violation Description:

Failure to comply with one or more of the following: maintain the spill bucket in good condition, containment free of debris/liquid, and/or to remove the contents of the spill bucket when a release/leak/spill was observed.

Violations

Violation Date: 04/19/2016 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Yuba County Environmental Health Department
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Notes:

Returned to compliance on 04/27/2016. The operator has propane stored in reusable cylinders including returned empty or partially empty containers

that exceed 55 gallons or 200 cubic feet. The inventory item is required to be submitted in a revised submittal in CERS.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date: 05/13/2014 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2715 - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715
Violation Notes:

Returned to compliance on 05/19/2014. Alarms were not documented after review of the monthly alarm history.

Violation Description:

Failure to comply with one or more of the designated operator monthly inspection requirements: failed to inspect the monthly alarm history report; attach a copy of the alarm history; failed to inspect for the presence of liquid or debris in the spill container/spill bucket and under dispenser containment; failed to inspect the under dispenser containment to ensure that monitoring equipment is placed in the proper position; failure to inspect for liquid or debris in the containment sump where an alarm occurred or for which there is no record of a service visit; or failure to check that all testing and maintenance has been completed and documented.

Violations

Violation Date: 04/19/2016 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Yuba County Environmental Health Department
Citation: 22 CCR 12 66262.34(d) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(d)
Violation Notes:

Returned to compliance on 04/27/2016. Hazardous waste (fuel contaminated water) drum had exceeded 180 days of accumulation. The operator confirmed the waste had already been scheduled to be disposed by a proper hazardous waste hauler.

Violation Description:

Failure to dispose of hazardous waste within 180 days (or 270 if waste is transported over 200 miles) for the generator who generates less than 1000 kilogram per month, but more than 100 kilograms per month.

Violations

Violation Date: 05/11/2015 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2636(f)(2) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2636(f)(2)
Violation Notes:

Returned to compliance on 05/11/2015. 89 line detector failed, was replaced and retested. Test passed.

Violation Description:

Failure of the pressurized piping to meet one or more of the following requirements: monitored at least hourly with the capability of detecting a release of 3.0 gallons per hour, and will restrict the flow of product through the piping or trigger an alarm when a release occurs.

Violations

Violation Date: 04/19/2016 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Yuba County Environmental Health Department
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Notes:

Returned to compliance on 04/27/2016. The hazardous waste labels had become non-legible other than the accumulation start dates.

Violation Description:

Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Violations

Violation Date: 05/11/2015 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2715(f) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2715(f)
Violation Notes:

Returned to compliance on 05/26/2015. Documented training was last completed in Feb. 2014.

Violation Description:

Failure to comply with one or more of the following: provide training to facility employee(s) responsible for proper operation and maintenance every 12 months

and/or

train new employee(s) who are responsible for proper operation and maintenance within 30-days of hire

and/or

to have at least one employee present during operating hours that has been trained in the proper operation and maintenance of the UST system.

Violations

Violation Date: 05/20/2013 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2712(i) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(i)
Violation Notes:

Returned to compliance on 05/23/2013. Monitoring Response Plan had not been approved by the CUPA.

Violation Description:

Failure to maintain on site an approved monitoring plan.

Violations

Violation Date: 05/11/2015 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: HSC 6.7 25291 - California Health and Safety Code, Chapter 6.7, Section(s) 25291
Violation Notes:

Returned to compliance on 05/11/2015. The diesel fill sump, UDC 7-8, and 89 turbine sump had liquid in them. It was removed at the time of inspection.

Violation Description:

Failure to maintain under-dispenser containment, sumps, and/or other secondary containment in good condition and/or free of debris/liquid.

Violations

Violation Date: 04/19/2016 ***Violation Source:*** CERS
Violation Program: UST ***Violation Division:*** Yuba County Environmental Health Department
Citation: 23 CCR 16 2636(f)(2) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2636(f)(2)
Violation Notes:

Returned to compliance on 04/19/2016. Electronic LLD failed during testing. The LLD was replaced and successfully retested during the inspection.

Violation Description:

Failure of the pressurized piping to meet one or more of the following requirements: monitored at least hourly with the capability of detecting a release of 3.0 gallons per hour, and will restrict the flow of product through the piping or trigger an alarm when a release occurs.

Enforcements

LEAD

SITE HISTORY:

The Olivehurst Elementary School Expansion Site consists of 6.3 acres of the existing 10.5-acre elementary school campus. The existing school was built in 1951. The expansion site currently contains several pre-1993 portable structures and re-furbished play fields. A Phase I report recommended investigating the perimeters of pre-1993 portable structures, for potential lead impacts to the soil from weathering lead-based paint. Also, sampling for organochlorine pesticide impacts to the soil around the library and non-conforming used building was recommended.

In response to the recommendations in the Phase I report, Marysville Unified School District submitted a Phase I Addendum for review. The Phase I Addendum includes results for lead and organochlorine pesticides (OCP) in shallow soil samples collected from around the perimeter of the existing and former structures. One of 39 samples collected and analyzed for lead, exceeded the screening value of 255 mg/kg; OCPs were not detected. The Phase I Addendum recommends no further action.

Comments on the Phase I Addendum were sent via email. The District prepared a response to the comments. Based on the findings of the Phase I, Phase I Addendum and the additional information, DTSC issued a No Action determination for the site on February 27, 2009.

LEAD, ORGANOCHLORINE PESTICIDES (8081 OCPS), POLYCHLORINATED BIPHENYLS (PCBS), UNDER INVESTIGATION

Site History:

The Marysville Joint Unified School District (District) first developed the 19-acre school in approximately 1956. The District prepared the Phase I in preparation for an onsite expansion project and emergency placement of 18 portable classrooms. The expansion project and placement of the portables will only use a portion of the 19-acre school, and the Phase I is limited to those areas.

The Phase I Report (approved on August 20, 2008) identified lead-based paint and termiticides in shallow soil around the perimeter of existing buildings, and potential polychlorinated biphenyls (PCBs) from on-site electrical transformers as the only recognized environmental conditions (RECs) identified at

the site. The Phase I recommended further investigation under a Phase I addendum. A Phase I Addendum investigation showed elevated levels of dieldrin in shallow soil around Buildings A, C, and the preschool. The Phase I Addendum (approved on December 11, 2008) identified the potentially affected and unaffected portions of the site. DTSC received a Form 4.14 request and a request for partial site approval from the District on October 14, 2008. Based on the Phase I Addendum, DTSC approved the 4.14 and granted partial site approval for construction on the unaffected areas of the campus on November 14, 2008..

A PEA workplan (approved on April 1, 2009) identified activities to evaluate potential impacts from a former gasoline underground storage tank (UST) and to delineate OCPs (chlordane, dieldrin, and toxaphene) around several structures. The PEA report (approved on November 10, 2009) indicated that there was no impacts to shallow soil from the UST; however, the PEA concluded that soils in the planter box on the north side of Building A, the southeast side of Building C, and around the pre-school building have been impacted by OCPs. The PEA recommended a removal action to excavate and dispose of soil impacted by OCPs above the respective CHHSLs.

A Removal Action Workplan (RAW) for excavation and disposal of 75 cubic yards of OCP-impacted soil was submitted for review on September 15, 2009. DTSC approved the RAW for public comment on December 21, 2009. Public comment ended on February 3, 2010. No comments were received on the RAW. The RAW was approved for implementation on February 4, 2010. The RAW was implemented on February 10, 2010, and field work was completed on March 12, 2010. A total of 75 cubic yards of OCP-contaminated soil was excavated from the site and shipped to a Class II landfill in Wheatland, California, as non-hazardous waste. A Removal Action Completion Report (RACR) was submitted for review on March 23, 2010, and approved as final on June 8, 2010, with a "no further action" determination.

Local Agency:	YUBA COUNTY	**Case Worker:**	THG
CUF Case:	YES	**File Location:**	

Potential Media of Concern: Aquifer used for drinking water supply
How Discovered Description:
Calwater Watershed Name: Marysville - Olivehurst (515.20)
DWR GW Subbasin Name: Sacramento Valley - South Yuba (5-021.61)
Disadvantaged Community: Severely Disadvantaged Community
Site History:

The case was opened following an unauthorized release from an underground storage tank system at the subject site. A summary of the site history is available in the enclosure attached to the 11/22/2019 No Further Action Required letter. This document can be founds by clicking on either the "Cleanup Status History", "Regulatory Activities" or the "Site Maps/Documents" tabs. Though much of the Site-related documents are on GeoTracker, for a complete site history the case files at the CVRWQCB and Yuba County Environmental Health should be consulted.

Cleanup History Link: https://geotracker.waterboards.ca.gov/profile_report_include?global_id=T0611500026&tabname=regulatoryhistory
Potential Media of Concern: AQUIFER USED FOR DRINKING WATER SUPPLY
User Defined Beneficial Use:
DWR GW Sub Basin: Sacramento Valley - South Yuba (5-021.61)
Calwater Watershed Name: Marysville - Olivehurst (515.20)
Post Closure Site Management:
Future Land Use:
Cleanup Oversight Agencies: CENTRAL VALLEY RWQCB (REGION 5S) (LEAD) - CASE #: 580038
CASEWORKER: THOMAS H GAVIGAN
YUBA COUNTY
CASEWORKER: CLARK PICKELL
Gndwater Monitoring Freque: # OF WELLS MONITORED - QUARTERLY : 8, OTHER : 4

REASONS FOR QUARTERLY OR MONTHLY OR OTHER GROUNDWATER MONITORING:
Assessment Incomplete - Additional wells were installed
Well Being Sampled During Remedial Action for Progress Assessment - Will evaluate mobile extraction system
Other - Recommend discontinuing sampling of four wells: MW-8, MW-12, PMW-13, and MW-9
Designated Beneficial Use Desc: Municipal and Domestic Supply, Agricultural Supply, Industrial Service Supply, Industrial Process Supply
Site History:

The case was opened following an unauthorized release from an underground storage tank system at the subject site. A summary of the site history is available in the enclosure attached to the 11/22/2019 No Further Action Required letter. This document can be founds by clicking on either the "Cleanup Status History", "Regulatory Activities" or the "Site Maps/Documents" tabs. Though much of the Site-related documents are on GeoTracker, for a complete site history the case files at the CVRWQCB and Yuba County Environmental Health should be consulted.

2017 Soil and Soil Gas Evaluation Report - A typographical error remains on page 10 in the revised report submitted 15 December 2017. The typographical error: "...sample analysis were 50 mg/kg (ppb) for all constituents." mg/kg is ppm (parts per million). The laboratory report shows that reporting limits were in micrograms per kilogram [(ug/kg), parts per billon/ppb] but the text on page 10 is not correct.

Telephone call with Consultant - 24 August 2017, 13:15, I (DFS) called Rafael Gallardo at Environmental and Geological Solutions, Rafael asked if they should conduct a third quarter 2017 groundwater sampling event, and if so, should they do it before or after the soil sampling event. Rafael also asked about whether to do additional remediation. I (DFS) told Rafael I would discuss the issues with my senior and get back to him with an answer.

NOTIFICATION OF LEAD CASE WORKER CHANGE AND QUARTERLY MONITORING REPORT REVIEW, E-Z SERVE NO. 100792, 4867 OLIVEHURST AVENUE, OLIVEHURST, YUBA COUNTY (LUSTIS NO. 580038) Letter to RP: request corrected third quarter 2016 report corrected and resubmitted by 24 February 2017 to GeoTracker. [this was completed 2/3/2017]. Please submit information about the location of the former waste oil UST and associated drain to GeoTracker by 17 March 2017. Also include a work plan with a scope of work to obtain soil samples at 4.5, 9.5, 15, and 20 feet below ground surface (bgs) from at least two locations adjacent to the waste UST or its former location, and at a sufficient number of locations along the drain. Submit by 30 April 2017 the first quarter 2017 quarterly report to GeoTracker. Submit by 24 February 2017 to GeoTracker the EDF data of the four 2016 quarterly sampling events

Action Type: Response Requested - Reports
Action Date: 5/16/2011
Received Issue Date: 12/24/2012
Action: Final Remedial Action Report / Corrective Action Report
Doc Link:
Title Description Comments:

- Staff reviewed the 23 March 2011 Fourth Quarter 2010 Groundwater Monitoring Report. The two existing dual-phase extraction wells and ten of the site's eleven monitoring wells were sampled. Contaminants were detected in six monitoring and the two extraction wells with the highest concentrations detected in on-site monitoring well PMW-2A. GAI recommends continuing quarterly groundwater monitoring and installing one additional air sparge well (AS-2) and three four-inch diameter dual-phase extraction wells (DPE-3 through DPE-5) to complete the remediation design, likely using HVDPE, for the site. GAI's recommendations seem reasonable. By 16 May 2011 submit your remedial action plan that includes a work plan to install the air sparge and extraction wells at the site. In addition, by 30 July 2011, submit your second quarter 2011 analytical data. Because naphthalene was detected during previous sampling events, include this analyte in your analytical suite.

Longitude: -121.552203
School District: MARYSVILLE JOINT UNIFIED SCHOOL DISTRICT
APN: 013120011000
Cleanup Status: NO FURTHER ACTION AS OF 11/15/2010
Cleanup Oversight Agencies: DTSC - SITE CLEANUP PROGRAM - LEAD AGENCY
Site Type: SCHOOL
Office: NORTHERN CALIFORNIA SCHOOLS & SANTA SUSANA
Past Use that Caused Contam: SCHOOL - ELEMENTARY
Potential Media Affected: SOIL, SOIL VAPOR
Potential Contamin of Concern:

BENZENE, CHLORDANE, DDT, DIELDRIN, TPH-GAS

SITE HISTORY:

According to an October 2008 Phase I ESA prepared for the site by Padre Associates, Inc., and submitted as background, the project site represents approximately 6.5 acres of the existing Ella Elementary School (Ella ES). The site is currently being assessed for potential petroleum hydrocarbon impacts to site groundwater and soil vapor as a result of releases from two fuel service stations across the street from Ella ES. A groundwater monitoring well on the Ella ES property has identified the presence of benzene in site groundwater. A 1952 USGS topographic map shows the presence of Ella ES and surrounding areas as residential development. The earliest aerial photograph (1969) shows the presence of Ella ES and surrounding areas as residential development. An 1895 topographic map shows the site and surrounding areas as undeveloped land.

A PEA Workplan was approved by DTSC on February 11, 2009 to evaluate the site for petroleum hydrocarbon impacts to site soils, soil gas and groundwater from the adjacent fuel service station, residual arsenic in surface soils from the potential pre-1939 agricultural use, residual termiticide chemicals (organochlorine pesticides) in surface soils from the presence of building structures, and lead in surface soils from weathering of lead-based paint from the presence of building structures. As noted in the PEA Workplan, groundwater at the site occurrs at approximately 20 feet below ground surface.

Soil sampling proposed in the approved PEA Workplan was conducted on the site on April 8, 2009, however, soil gas sampling was postponed due to saturated soil conditions at the site as a result of rain events. The groundwater sampling program was to be conducted at the same time as the soil gas sampling program. The soil gas and groundwater sampling was ultimately conducted at the site between June 29 and 30, 2009. The results of the soil gas and groundwater sampling indicated concentrations of TPH and BTEX in soil gas and groundwater beneath the site, but below risk levels of concern. Concentrations of OCPs (chlordane and dieldrin) were detected along the north, west and south walls of the bathroom structure exceeding risk levels.

The PEA report was received by DTSC on February 16, 2010, and put out for public comment from March 8 to April 6, 2010. On July 16, 2010, DTSC issued a PEA Approval letter with a conditional No Further Action. The condition is for Marysville JUSD to keep informed on the E-Z Serve site investigation and clean-up progress, and to report to DTSC if groundwater in well MW-4 exceeds 3.6 micrograms per liter (ug/L) for benzene, 35 ug/L for ethylbenzene and 52 ug/L for napthalene.

School District:
Past Use that Caused Contam: RECYCLING - SCRAP METAL
Potential Media Affected: SOIL
Potential Contamin of Concern:

LEAD, TPH-MOTOR OIL

Site History:

The Keystone Automotive site consists of five parcels of land on approximately six acres in Olivehurst, CA. In 1970, the property owner purchased the 5066 Powerline Road parcels and operated there as an auto repair garage/dismantling shop. In 1977, the 5079 Powerline Road property located across the street was acquired and operated as a small body shop. The auto dismantling business continued whereby fluids were drained from vehicles. Engines and transmissions were sold to the public and the remaining unsellable cars/parts were crushed for disposal to be recycled for metal.

In 2004, a Preliminary Endangerment Assessment (PEA) was performed by URS Corporation and the PEA report was finalized in 2005. Soil samples were collected at 25 onsite locations to depths no greater than 5 feet below ground surface (bgs). A groundwater sample was collected from a temporary well. The PEA found lead present in site soils at a 95% upper confidence limit (UCL) of 302 mg/kg. No Federal Primary and Secondary Maximum Contaminant Levels (MCL) or California MCLs were exceeded except for chromium in the single groundwater sample collected. Based on the recommendations of the PEA, a Land Use Covenant (LUC) was negotiated with the property owner and document 2007R-014982 was recorded at Yuba County Recorder on August 31, 2007 to limit the use of four parcels. These four parcels were Yuba Assessor's Parcel Numbers (APNs) 013-492-002, 013-493-011, 013-493-012 and 013-520-019. Parcel 013-492-002 is north of Powerline Road. The other three parcels are south of Powerline Road. All parcels have changed hands several times since the placement of the LUC. In 2007, owner of parcel 013-493-011 entered into a Voluntary Cleanup Agreement (Docket Number HSA-VCA 07/08-070) with DTSC. The parcel was subsequently redeveloped into a Rite Aid store. In 2014, a Little Caesars Pizza Restaurant was built next to the Rite Aid Store, occupying a portion of parcel 013-493-012. In 2018, DTSC approved a Soil Management Plan from the new owner of parcel 013-492-002 north of Powerline Road. The parcel is to be combined with its neighboring parcel (not within restricted area) and redeveloped into an Arco AMPM gas station. The construction of the Arco AM/PM was completed in December 2019. A total of 1182.57 tons of soils were removed from the construction. The soils were characterized as non-hazardous waste and disposed of at the Recology Facility at Dixon, CA. The parcel south of the Rite Aid store, APN 013-520-019, remains vacant.

Site History:

Aerial pesticide applicators washed their planes on a washpad at the airport. The wash waters ran into a ditch. Sampling done in 1979 showed endosulfan and toxaphene in washpad sludges. The California RWQCB reported that rinsing terminated in 1981. Description of Hazardous Wastes: Endosulfan I (300 parts per million (ppm)), Endosulfan II (90 ppm), dichlorodiphenyldichloroethylene (DDE) (3.5 ppm), and dichlorodiphenyltrichloroethane (DDT) (16 ppm) are the contaminants of most concern found at the site. Threat to Public Health and the Environment: The airport is located near Marysville (pop. 10,000) and Olivehurst (pop. 9,000). No critical habitats of endangered species are nearby. The soil underlying the site consists of layers of sands and gravel. There is a possibility that the pollutants may migrate to the groundwater and/or surface water. Since one of the aerial applicators' sites is unfenced, there is a possibility that the public may come in contact with the contaminated soil.

Cleanup Oversight Agencies: DTSC - SITE CLEANUP PROGRAM - LEAD AGENCY
School District:
Past Use that Caused Contam: ABOVE GROUND STORAGE TANKS, AIRCRAFT MAINTENANCE, AIRFIELD OPERATIONS, FIRING RANGE - SMALL ARMS ETC..., FUEL - AIRCRAFT STORAGE/ REFUELING, FUEL - VEHICLE STORAGE/ REFUELING
Potential Media Affected: OTHER GROUNDWATER AFFECTED (USES OTHER THAN DRINKING WATER), SOIL
Potential Contamin of Concern:

POLYNUCLEAR AROMATIC HYDROCARBONS (PAHS), TPH-JET FUEL, TPH-MOTOR OIL, TPH-DIESEL, TPH-GAS

Site History:

Site hosted typical improvements for an airfield, as well as utilities and sewage treatment, water supply and storage, skeet range, barracks, and various repair shops. Although most of the structures have been removed, a few are still in use by the County Roads Dept., Airport Maintenance Facility, and a school. A UST situated next to the county building is currently used to store gasoline. It is assumed that DOD-built USTs still remain at the taxiway turnouts. Pump islands, vent and fill pipes, and pump pits were observed at two locations, and at a third, appear to have been paved over. These facilities have not been used since the 1940s, and are in derelict condition. Also located on the property are two concrete saddles for an AST, and a DHS warning sign designating the spot as a hazardous waste area. DHS has taken care of the site.

FROM THE CORPS PUBLIC GIS SYSTEM: Property Description - The 971.83-acre site is 3 miles south of Marysville in Yuba County, California. The site is currently owned by Yuba County as a public airport. The County is currently using one Department of Defense (DoD) installed underground storage tank (UST) and two DoD installed buildings.

Property History - The U.S. Army Corps of Engineers constructed the airport in 1941. The U.S. acquired the airport (833 leased acres) from Yuba County and an adjacent parcel (138.83 fee acres) from a private owner between 1942 and 1943. The Army used the site as an air support command base for Camp Beale. The War Assets Administration returned the 833 leased acres on 18 August 1947 and the 138.83 fee acres on 20 September 1948 to Yuba County by quitclaim deeds. Several potential USTs are located on-site.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

Facility Response Plan: FRP

List of facilities that have submitted Facility Response Plans (FRP) to EPA. Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit Facility Response Plans (FRPs). Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments.

Government Publication Date: Mar 26, 2020

National Priority List: NPL

National Priorities List (Superfund)-NPL: EPA's (United States Environmental Protection Agency) list of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action.

Government Publication Date: Jun 26, 2020

National Priority List - Proposed: PROPOSED NPL

Includes sites proposed (by the EPA, the state, or concerned citizens) for addition to the NPL due to contamination by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.

Government Publication Date: Jun 26, 2020

Deleted NPL: DELETED NPL

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Government Publication Date: Jun 26, 2020

SEMS List 8R Active Site Inventory: SEMS

The Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted.

Government Publication Date: May 22, 2020

Inventory of Open Dumps, June 1985: ODI

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

SEMS List 8R Archive Sites:

The Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time.

Government Publication Date: May 22, 2020

EPA Report on the Status of Open Dumps on Indian Lands: IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

Comprehensive Environmental Response, Compensation and Liability Information System - CERCLIS: CERCLIS

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

CERCLIS - No Further Remedial Action Planned: CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens: CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jan 30, 2014

RCRA CORRACTS-Corrective Action: RCRA CORRACTS

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: May 4, 2020

RCRA non-CORRACTS TSD Facilities: RCRA TSD

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites listed as treatment, storage and/or disposal facilities of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Government Publication Date: May 4, 2020

RCRA Generator List: RCRA LQG

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Large Quantity Generators (LQGs) generate 1,000 kilograms per month or more of hazardous waste or more than one kilogram per month of acutely hazardous waste.

Government Publication Date: May 4, 2020

RCRA Small Quantity Generators List:

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Small Quantity Generators (SQGs) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month.

Government Publication Date: May 4, 2020

RCRA Conditionally Exempt and Very Small Quantity Generators List: RCRA CESQG

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Conditionally Exempt and Very Small Quantity Generators (VSQG and CESQG) generate 100 kilograms or less per month of hazardous waste, or one kilogram or less per month of acutely hazardous waste. Additionally, VSQG and CESQG may not accumulate more than 1,000 kilograms of hazardous waste at any time.

Government Publication Date: May 4, 2020

RCRA Non-Generators: RCRA NON GEN

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: May 4, 2020

Federal Engineering Controls-ECs: FED ENG

Engineering controls (ECs) encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Feb 26, 2020

Federal Institutional Controls- ICs: FED INST

Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's (United States Environmental Protection Agency) expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site.

Government Publication Date: Feb 26, 2020

Emergency Response Notification System: ERNS 1982 TO 1986

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System: ERNS 1987 TO 1989

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System: ERNS

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Nov 25, 2019

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database:

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Sep 3, 2019

FEMA Underground Storage Tank Listing: FEMA UST

The Federal Emergency Management Agency (FEMA) of the Department of Homeland Security maintains a list of FEMA owned underground storage tanks.

Government Publication Date: Dec 31, 2017

Petroleum Refineries: REFN

List of petroleum refineries from the U.S. Energy Information Administration (EIA) Refinery Capacity Report. Includes operating and idle petroleum refineries (including new refineries under construction) and refineries shut down during the previous year located in the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, and other U.S. possessions. Survey locations adjusted using public data.

Government Publication Date: Jul 10, 2020

Petroleum Product and Crude Oil Rail Terminals: BULK TERMINAL

List of petroleum product and crude oil rail terminals made available by the U.S. Energy Information Administration (EIA). Includes operable bulk petroleum product terminals located in the 50 States and the District of Columbia with a total bulk shell storage capacity of 50,000 barrels or more, and/or the ability to receive volumes from tanker, barge, or pipeline; also rail terminals handling the loading and unloading of crude oil that were active between 2017 and 2018. Petroleum product terminals comes from the EIA-815 Bulk Terminal and Blender Report, which includes working, shell in operation, and shell idle for several major product groupings. Survey locations adjusted using public data.

Government Publication Date: Jan 13, 2020

LIEN on Property: SEMS LIEN

The EPA Superfund Enterprise Management System (SEMS) provides LIEN information on properties under the EPA Superfund Program.

Government Publication Date: May 22, 2020

Superfund Decision Documents: SUPERFUND ROD

This database contains a listing of decision documents for Superfund sites. Decision documents serve to provide the reasoning for the choice of (or) changes to a Superfund Site cleanup plan. The decision documents include Records of Decision (ROD), ROD Amendments, Explanations of Significant Differences (ESD), along with other associated memos and files. This information is maintained and made available by the US EPA (Environmental Protection Agency).

Government Publication Date: Apr 27, 2020

State

State Response Sites: RESPONSE

A list of identified confirmed release sites where the Department of Toxic Substances Control (DTSC) is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. This database is state equivalent NPL.

Government Publication Date: Jul 14, 2020

EnviroStor Database: ENVIROSTOR

The EnviroStor Data Management System is made available by the Department of Toxic Substances Control (DTSC). Includes Corrective Action sites, Tiered Permit sites, Historical Sites and Evaluation/Investigation sites. This database is state equivalent CERCLIS.

Government Publication Date: Jul 14, 2020

Delisted State Response Sites: DELISTED ENVS

Sites removed from the list of State Response Sites made available by the EnviroStor Data Management System, Department of Toxic Substances Control (DTSC).

Government Publication Date: Jul 14, 2020

Solid Waste Information System (SWIS): SWF/LF

The Solid Waste Information System (SWIS) database made available by the Department of Resources Recycling and Recovery contains information on solid waste facilities, operations, and disposal sites throughout the State of California. The types of facilities found in this database include landfills, transfer stations, material recovery facilities, composting sites, transformation facilities, waste tire sites, and closed disposal sites.
Government Publication Date: May 1, 2020

EnviroStor Hazardous Waste Facilities: HWP
A list of hazardous waste facilities including permitted, post-closure and historical facilities found in the Department of Toxic Substances Control (DTSC) EnviroStor database.
Government Publication Date: Jul 14, 2020

Sites Listed in the Solid Waste Assessment Test (SWAT) Program Report: SWAT
In a 1993 Memorandum of Understanding, the State Water Resources Control Board (SWRCB) agreed to submit a comprehensive report on the Solid Waste Assessment Test (SWAT) Program to the California Integrated Waste Management Board (CIWMB). This report summarizes the work completed to date on the SWAT Program, and addresses both the impacts that leakage from solid waste disposal sites (SWDS) may have upon waters of the State and the actions taken to address such leakage.
Government Publication Date: Dec 31, 1995

Land Disposal Sites: LDS
Land Disposal Sites in GeoTracker, the State Water Resources Control Board (SWRCB)'s data management system. The Land Disposal program regulates of waste discharge to land for treatment, storage and disposal in waste management units. Waste management units include waste piles, surface impoundments, and landfills.
Government Publication Date: Jul 15, 2020

Leaking Underground Fuel Tank Reports: LUST
List of Leaking Underground Storage Tanks within the Cleanup Sites data in GeoTracker database. GeoTracker is the State Water Resources Control Board's (SWRCB) data management system for managing sites that impact groundwater, especially those that require groundwater cleanup (Underground Storage Tanks, Department of Defense and Site Cleanup Program) as well as permitted facilities such as operating Underground Storage Tanks. The Leak Prevention Program that overlooks LUST sites is the SWRCB in California's Environmental Protection Agency.
Government Publication Date: Jul 15, 2020

Delisted Leaking Storage Tanks: DELISTED LST
List of Leaking Underground Storage Tanks (LUST) cleanup sites removed from GeoTracker, the State Water Resources Control Board (SWRCB)'s database system, as well as sites removed from the SWRCB's list of UST Case closures.
Government Publication Date: Jul 15, 2020

Solid Waste Disposal Sites with Waste Constituents Above Hazardous Waste Levels: SWRCB SWF
This is a list of solid waste disposal sites identified by California State Water Resources Control Board with waste constituents above hazardous waste levels outside the waste management unit.
Government Publication Date: Sep 20, 2006

Permitted Underground Storage Tank (UST) in GeoTracker: UST
List of Permitted Underground Storage Tank (UST) sites made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency (EPA).
Government Publication Date: Jul 12, 2020

Proposed Closure of Underground Storage Tank Cases: UST CLOSURE
List of UST cases that are being considered for closure by either the California Environmental Protection Agency, State Water Resources Control Board or the Executive Director that have been posted for a 60-day public comment period.
Government Publication Date: Jul 7, 2020

Historical Hazardous Substance Storage Information Database: HHSS
The Historical Hazardous Substance Storage database contains information collected in the 1980s from facilities that stored hazardous substances. The information was originally collected on paper forms, was later transferred to microfiche, and recently indexed as a searchable database. When using this database, please be aware that it is based upon self-reported information submitted by facilities which has not been independently verified. It is unlikely that every facility responded to the survey and the database should not be expected to be a complete inventory of all facilities that were operating at that time. This database is maintained by the California State Water Resources Control Board's (SWRCB) Geotracker.
Government Publication Date: Aug 27, 2015

Aboveground Storage Tanks:

A statewide list from 2009 of aboveground storage tanks (ASTs) made available by the Cal FIRE Office of the State Fire Marshal (OSFM). This list is no longer maintained or updated by the Cal FIRE OSFM.

Government Publication Date: Aug 31, 2009

Oil and Gas Facility Tanks: TANK OIL GAS

Locations of oil and gas tanks that fall under the jurisdiction of the Geologic Energy Management Division of the California Department of Conservation (CalGEM) (CCR 1760). CalGEM was formerly the Division of Oil, Gas, and Geothermal Resources (DOGGR).

Government Publication Date: Jul 21, 2020

Delisted Storage Tanks: DELISTED TNK

This database contains a list of storage tank sites that were removed by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency (EPA) and the Cal FIRE Office of State Fire Marshal (OSFM).

Government Publication Date: Jul 21, 2020

California Environmental Reporting System (CERS) Tanks: CERS TANK

List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Aboveground Petroleum Storage and Underground Storage Tank regulatory programs. The CalEPA oversees the statewide implementation of the Unified Program which applies regulatory standards to protect Californians from hazardous waste and materials.

Government Publication Date: May 12, 2020

Site Mitigation and Brownfields Reuse Program Facility Sites with Land Use Restrictions: LUR

The Department of Toxic Substances Control (DTSC) Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents land use restrictions that are active. Some sites have multiple land use restrictions.

Government Publication Date: Jul 14, 2020

Hazardous Waste Management Program Facility Sites with Deed / Land Use Restrictions: HLUR

The Department of Toxic Substances Control (DTSC) Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Government Publication Date: Apr 8, 2020

Deed Restrictions and Land Use Restrictions: DEED

List of Deed Restrictions, Land Use Restrictions and Covenants in GeoTracker made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency. A deed restriction (land use covenant) may be required to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

Government Publication Date: Jul 15, 2020

Voluntary Cleanup Program: VCP

List of sites in the Voluntary Cleanup Program made available by the Department of Toxic Substances and Control (DTSC). The Voluntary Cleanup Program was designed to respond to lower priority sites. Under the Voluntary Cleanup Program, DTSC enters site-specific agreements with project proponents for DTSC oversight of site assessment, investigation, and/or removal or remediation activities, and the project proponents agree to pay DTSC's reasonable costs for those services.

Government Publication Date: Jul 14, 2020

GeoTracker Cleanup Program Sites: CLEANUP SITES

A list of Cleanup Program sites in the state of California made available by The State Water Resources Control Board (SWRCB) of the California Environmental Protection Agency (EPA). SWRCB tracks leaking underground storage tank cleanups as well as other water board cleanups.

Government Publication Date: Jul 15, 2020

Delisted County Records: DELISTED COUNTY

Records removed from county or CUPA databases. Records may be removed from the county lists made available by the respective county departments because they are inactive, or because they have been deemed to be below reportable thresholds.

Government Publication Date: Aug 11, 2020

Delisted California Environmental Reporting System (CERS) Tanks:

This database contains a list of Aboveground Petroleum Storage and Underground Storage Tank sites that were removed from in the California Environmental Protection Agency (CalEPA) Regulated Site Portal.

Government Publication Date: May 12, 2020

Historical Hazardous Substance Storage Container Information - Facility Summary: HIST TANK

The State Water Resources Control Board maintained the Hazardous Substance Storage Containers listing and inventory in th 1980s. This facility summary lists historic tank sites where the following container types were present: farm motor vehicle fuel tanks; waste tanks; sumps; pits, ponds, lagoons, and others; and all other product tanks. This set, published in May 1988, lists facility and owner information, as well as the number of containers. This data is historic and will not be updated.

Government Publication Date: May 27, 1988

Tribal

Leaking Underground Storage Tanks (LUSTs) on Indian Lands: INDIAN LUST

LUSTs on Tribal/Indian Lands in Region 9, which includes California.

Government Publication Date: Apr 8, 2020

Underground Storage Tanks (USTs) on Indian Lands: INDIAN UST

USTs on Tribal/Indian Lands in Region 9, which includes California.

Government Publication Date: Apr 8, 2020

Delisted Tribal Leaking Storage Tanks: DELISTED ILST

Leaking Underground Storage Tank facilities which have been removed from the Regional Tribal LUST lists made available by the EPA.

Government Publication Date: Apr 14, 2020

Delisted Tribal Underground Storage Tanks: DELISTED IUST

Underground Storage Tank facilities which have been removed from the Regional Tribal UST lists made available by the EPA.

Government Publication Date: Apr 14, 2020

County

Yuba County - UST List: YUBA UST

A list of inactive UST sites, active UST sites and active UST tank information. This is provided by the Yuba County Environmental Health Department.

Government Publication Date: Jan 9, 2017

Yuba County - CUPA Facilities List: YUBA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Yuba County. This list is made available by Yuba County Environmental Health Division which is the CUPA for all areas of the County.

Government Publication Date: Aug 10, 2020

Additional Environmental Record Sources

Federal

PFOA/PFOS Contaminated Sites: PFAS NPL

List of sites where PFOA or PFOS contaminants have been found in drinking water or soil. Made available by the Federal Environmental Protection Agency (EPA).

Government Publication Date: Jul 7, 2020

Facility Registry Service/Facility Index: FINDS/FRS

The Facility Registry Service (FRS) is a centrally managed database that identifies facilities, sites, or places subject to environme
environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, and data collected from EPA's Central Data Exchange registrations and data management personnel. This list is made available by the Environmental Protection Agency (US EPA).
Government Publication Date: Mar 25, 2020

Toxics Release Inventory (TRI) Program: TRIS

The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U. S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment.
Government Publication Date: Feb 19, 2020

Perfluorinated Alkyl Substances (PFAS) Releases: PFAS TRI

List of Toxics Release Inventory (TRI) facilities at which the reported chemical is a Per- or polyfluorinated alkyl substance (PFAS) included in the Environmental Protection Agency (EPA)'s consolidated PFAS Master List of PFAS Substances. The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment.
Government Publication Date: Feb 19, 2020

Perfluorinated Alkyl Substances (PFAS) Water Quality: PFAS WATER

The Water Quality Portal (WQP) is a cooperative service sponsored by the United States Geological Survey (USGS), the Environmental Protection Agency (EPA), and the National Water Quality Monitoring Council (NWQMC). This listing includes records from the Water Quality Portal where the characteristic (environmental measurement) is in the Environmental Protection Agency (EPA)'s consolidated PFAS Master List of PFAS Substances.
Government Publication Date: Dec 20, 2019

Hazardous Materials Information Reporting System: HMIRS

US DOT - Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Incidents Reports Database taken from Hazmat Intelligence Portal, U.S. Department of Transportation.
Government Publication Date: Jan 8, 2020

National Clandestine Drug Labs: NCDL

The U.S. Department of Justice ("the Department") provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.
Government Publication Date: Mar 19, 2020

Toxic Substances Control Act: TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI).
Government Publication Date: Apr 11, 2019

Hist TSCA: HIST TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.
Government Publication Date: Dec 31, 2006

FTTS Administrative Case Listing: FTTS ADMIN

An administrative case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

FTTS Inspection Case Listing: FTTS INSP

An inspection case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

Potentially Responsible Parties List: PRP

Early in the cleanup process, the Environmental Protection Agency (EPA) conducts a search to find the potentially responsible parties (PRPs). EPA looks for evidence to determine liability by matching wastes found at the site with parties that may have contributed wastes to the site.

Government Publication Date: May 22, 2020

State Coalition for Remediation of Drycleaners Listing: SCRD DRYCLEANER

The State Coalition for Remediation of Drycleaners (SCRD) was established in 1998, with support from the U.S. Environmental Protection Agency (EPA) Office of Superfund Remediation and Technology Innovation. Coalition members are states with mandated programs and funding for drycleaner site remediation. Current members are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

Government Publication Date: Nov 08, 2017

Integrated Compliance Information System (ICIS): ICIS

The Integrated Compliance Information System (ICIS) is a system that provides information for the Federal Enforcement and Compliance (FE&C) and the National Pollutant Discharge Elimination System (NPDES) programs. The FE&C component supports the Environmental Protection Agency's (EPA) Civil Enforcement and Compliance program activities. These activities include Compliance Assistance, Compliance Monitoring and Enforcement. The NPDES program supports tracking of NPDES permits, limits, discharge monitoring data and other program reports.

Government Publication Date: Nov 18, 2016

Drycleaner Facilities: FED DRYCLEANERS

A list of drycleaner facilities from the Integrated Compliance Information System (ICIS). The Environmental Protection Agency (EPA) tracks facilities that possess NAIC and SIC codes that classify businesses as drycleaner establishments.

Government Publication Date: Jan 20, 2020

Delisted Drycleaner Facilities: DELISTED FED DRY

List of sites removed from the list of Drycleaner Facilities (sites in the EPA's Integrated Compliance Information System (ICIS) with NAIC or SIC codes identifying the business as a drycleaner establishment).

Government Publication Date: Jan 20, 2020

Formerly Used Defense Sites: FUDS

Formerly Used Defense Sites (FUDS) are properties that were formerly owned by, leased to, or otherwise possessed by and under the jurisdiction of the Secretary of Defense prior to October 1986, where the Department of Defense (DoD) is responsible for an environmental restoration. This list is published by the U.S. Army Corps of Engineers.

Government Publication Date: Jan 28, 2020

PHMSA Pipeline Safety Flagged Incidents: PIPELINE INCIDENT

A list of flagged pipeline incidents made available by the U.S. Department of Transportation (US DOT) Pipeline and Hazardous Materials Safety Administration (PHMSA). PHMSA regulations require incident and accident reports for five different pipeline system types.

Government Publication Date: Oct 31, 2019

Material Licensing Tracking System (MLTS): MLTS

A list of sites that store radioactive material subject to the Nuclear Regulatory Commission (NRC) licensing requirements. This list is maintained by the NRC. As of September 2016, the NRC no longer releases location information for sites. Site locations were last received in July 2016.

Government Publication Date: Oct 31, 2019

Historic Material Licensing Tracking System (MLTS) sites: HIST MLTS

A historic list of sites that have inactive licenses and/or removed from the Material Licensing Tracking System (MLTS). In some cases, a site is removed from the MLTS when the state becomes an "Agreement State". An Agreement State is a State that has signed an agreement with the Nuclear Regulatory Commission (NRC) authorizing the State to regulate certain uses of radioactive materials within the State.

Government Publication Date: Jan 31, 2010

Mines Master Index File: MINES

The Master Index File (MIF) contains mine identification numbers issued by the Department of Labor Mine Safety and Health Administration (MSHA) for mines active or opened since 1971. Note that addresses may or may not correspond with the physical location of the mine itself.

Government Publication Date: May 1, 2020

Alternative Fueling Stations: ALT FUELS

List of alternative fueling stations made available by the US Department of Energy's Office of Energy Efficiency & Renewable Energy. Includes Biodiesel stations, Ethanol (E85) stations, Liquefied Petroleum Gas (Propane) stations, Ethanol (E85) stations, Natural Gas stations, Hydrogen stations, and Electric Vehicle Supply Equipment (EVSE). The National Renewable Energy Laboratory (NREL) obtains information about new stations from trade media, Clean Cities coordinators, a Submit New Station form on the Station Locator website, and through collaborating with infrastructure equipment and fuel providers, original equipment manufacturers (OEMs), and industry groups.

Government Publication Date: Jun 22, 2020

Registered Pesticide Establishments: SSTS

List of active EPA-registered foreign and domestic pesticide-producing and device-producing establishments based on data from the Section Seven Tracking System (SSTS). The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 7 requires that facilities producing pesticides, active ingredients, or devices be registered. The list of establishments is made available by the EPA.

Government Publication Date: Mar 31, 2020

Polychlorinated Biphenyl (PCB) Notifiers: PCB

Facilities included in the national list of facilities that have notified the United States Environmental Protection Agency (EPA) of Polychlorinated Biphenyl (PCB) activities. Any company or person storing, transporting or disposing of PCBs or conducting PCB research and development must notify the EPA and receive an identification number.

Government Publication Date: Oct 9, 2019

State

Dry Cleaning Facilities: DRYCLEANERS

A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial, linen supply, commercial laundry, dry cleaning and pressing machines - Coin Operated Laundry and Dry Cleaning. This is provided by the Department of Toxic Substance Control.

Government Publication Date: May 5, 2020

Delisted Drycleaners: DELISTED DRYCLEANERS

Sites removed from the list of drycleaner related facilities that have EPA ID numbers, made available by the California Department of Toxic Substance Control.

Government Publication Date: May 5, 2020

Non-Toxic Dry Cleaning Incentive Program: DRYC GRANT

A list of grant recipients of the Non-Toxic Dry Cleaning Incentive Program made available by the California Air Resources Board (CARB). The program provides grants to eligible dry cleaning businesses to assist them in transitioning away from PERC machines to alternative non-toxic and non-smog forming technologies.

Government Publication Date: Feb 28, 2018

Per- and Polyfluoroalkyl Substances (PFAS): PFAS

List of sites from the State Water Resources Control Board (SWRCB)'s GeoTracker at which one or more of the potential contaminants of concern are in the PFAS Master List of PFAS Substances made available by the Environmental Protection Agency (US EPA).

Government Publication Date: Jul 15, 2020

PFOA/PFOS Groundwater: PFAS GW

A list of water wells from the Groundwater Ambient Monitoring and Assessment Program (GAMA) Groundwater Information System with the groundwater chemical perfluorooctanoic acid (PFOA) (NL = 0.014 UG/L) or perfluorooctanoic sulfonate (PFOS) (NL = 0.013 UG/L). The GAMA Groundwater Information System search is made available by California Water Boards.Y

Government Publication Date: Apr 16, 2020

Hazardous Waste and Substances Site List - Site Cleanup:

The Hazardous Waste and Substances Sites (Cortese) List is a planning document used by the State, local agencies and developers to comply with the California Environmental Quality Act requirements in providing information about the location of hazardous materials release sites. This list is published by California Department of Toxic Substance Control.

Government Publication Date: May 26, 2020

List of Hazardous Waste Facilities Subject to Corrective Action: DTSC HWF

This is a list of hazardous waste facilities identified in Health and Safety Code (HSC) § 25187.5. These facilities are those where Department of Toxic Substances Control (DTSC) has taken or contracted for corrective action because a facility owner/operator has failed to comply with a date for taking corrective action in an order issued under HSC § 25187, or because DTSC determined that immediate corrective action was necessary to abate an imminent or substantial endangerment.

Government Publication Date: Jul 18, 2016

EnviroStor Inspection, Compliance, and Enforcement: INSP COMP ENF

A list of permitted facilities with inspections and enforcements tracked in the Department of Toxic Substance Control (DTSC) EnviroStor.

Government Publication Date: Jul 20, 2020

School Property Evaluation Program Sites: SCH

A list of sites registered with The Department of Toxic Substances Control (DTSC) School Property Evaluation and Cleanup (SPEC) Division. SPEC is responsible for assessing, investigating and cleaning up proposed school sites. The Division ensures that selected properties are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy the new school.

Government Publication Date: Jul 14, 2020

California Hazardous Material Incident Report System (CHMIRS): CHMIRS

A list of reported hazardous material incidents, spills, and releases from the California Hazardous Material Incident Report System (CHMIRS). This list has been made available by the California Office of Emergency Services (OES).

Government Publication Date: Apr 20, 2020

Hazardous Waste Manifest Data: HAZNET

A list of hazardous waste manifests received each year by Department of Toxic Substances Control (DTSC). The volume of manifests is typically 900,000 - 1,000,000 annually, representing approximately 450,000 - 500,000 shipments.

Government Publication Date: Oct 24, 2016

Historical California Hazardous Material Incident Report System (CHMIRS): HIST CHMIRS

A list of reported hazardous material incidents, spills, and releases from the California Hazardous Material Incident Report System (CHMIRS) prior to 1993. This list has been made available by the California Office of Emergency Services (OES).

Government Publication Date: Jan 1, 1993

Historical Hazardous Waste Manifest Data: HIST MANIFEST

A list of historic hazardous waste manifests received by the Department of Toxic Substances Control (DTSC) from year the 1980 to 1992. The volume of manifests is typically 900,000 - 1,000,000 annually, representing approximately 450,000 - 500,000 shipments.

Government Publication Date: Dec 31, 1992

Historical Cortese List: HIST CORTESE

List of sites which were once included on the Cortese list. The Hazardous Waste and Substances Sites (Cortese) List is a planning document used by the State, local agencies and developers to comply with the California Environmental Quality Act requirements for providing information about the location of hazardous sites.

Government Publication Date: Nov 13, 2008

Cease and Desist Orders and Cleanup and Abatement Orders: CDO/CAO

The California Environment Protection Agency "Cortese List" of active Cease and Desist Orders (CDO) and Cleanup and Abatement Orders (CAO). This list contains many CDOs and CAOs that do NOT concern the discharge of wastes that are hazardous materials. Many of the listed orders concern, as examples, discharges of domestic sewage, food processing wastes, or sediment that do not contain hazardous materials, but the Water Boards' database does not distinguish between these types of orders.

Government Publication Date: Feb 16, 2012

California Environmental Reporting System (CERS) Hazardous Waste Sites:

List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the following regulatory programs: Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, RCRA LQ HW Generator. The CalEPA oversees the statewide implementation of the Unified Program which applies regulatory standards to protect Californians from hazardous waste and materials.

Government Publication Date: May 12, 2020

Delisted Environmental Reporting System (CERS) Hazardous Waste Sites: DELISTED HAZ

This database contains a list of sites that were removed from the California Environmental Protection Agency (CalEPA) in the following regulatory programs: Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, RCRA LQ HW Generator.

Government Publication Date: Nov 29, 2018

Sites in GeoTracker: GEOTRACKER

GeoTracker is the State Water Resource Control Boards' data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater. This is a list of sites in GeoTracker that aren't otherwise categorized as LUST, Land Disposal Sites (LDS), Cleanup Sites, or sites having Waste Discharge Requirements (WDR). This listing includes program types such as Underground Injection Control (UIC), Confined Animal Facilities (CAF), Irrigated Lands Regulatory Program, plans, and non-case information.

Government Publication Date: Jul 15, 2020

Waste Discharge Requirements: WASTE DISCHG

List of sites in California State Water Resources Control Board (SWRCB) Waste Discharge Requirements (WDRs) Program in California, made available by the SWRCB via GeoTracker. The WDR program regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

Government Publication Date: Jul 15, 2020

Toxic Pollutant Emissions Facilities: EMISSIONS

A list of criteria and toxic pollutant emissions data for facilities in California made available by the California Environmental Protection Agency - Air Resources Board (ARB). Risk data may be based on previous inventory submittals. The toxics data are submitted to the ARB by the local air districts as requirement of the Air Toxics "Hot Spots" Program. This program requires emission inventory updates every four years.

Government Publication Date: Dec 31, 2018

Clandestine Drug Lab Sites: CDL

The Department of Toxic Substances Control (DTSC) maintains a listing of drug lab sites. DTSC is responsible for removal and disposal of hazardous substances discovered by law enforcement officials while investigating illegal/clandestine drug laboratories.

Government Publication Date: Jun 30, 2018

Tribal

No Tribal additional environmental record sources available for this State.

County

No County additional environmental databases were selected to be included in the search.

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

RE: CITY DIRECTORY RESEARCH
OPUD Sewer and Water
N/A Olivehurst, CA

Thank you for contacng ERIS f or an City Directory Search for the site described above. Our staff has conducted a reverse lisng City Dir ectory search to determine prior occupants of the subject site and adjacent properes. W e have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Lisng Dir ectories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either uliz ed the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as mulple digiz ed directories. These do not claim to be a complete collecon of all r everse lisng city dir ectories produced.

ERIS has made every effort to provide accurate and complete informaon but shall not be held liable f or missing, incomplete or inaccurate informaon. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are addional addr esses or streets that require searching please contact us at 866-517-5204.

Subject: **PHASE II ENVIRONMENTAL SITE ASSESSMENT**
OPUD Yuba County Sewer and Water Infrastructure Project
Olivehurst, California

Mr. DeCou,

Blackburn Consulting (Blackburn) prepared this Phase II Environmental Site Assessment (Phase II) for the OPUD Sewer and Water Infrastructure Project located in Yuba County, California. The purpose of this Phase II is to address potential hazardous materials soil issues that may significantly impact the Project. Blackburn prepared this Phase II in accordance with our December 3, 2020 proposal.

As always, Blackburn appreciates the opportunity to be part of your team. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

Nicole Hart
Project Manager

Luke Morrell
Project Engineer

1 INTRODUCTION

Blackburn Consulting (Blackburn) prepared this Phase II Environmental Site Assessment (Phase II) for Jacobs Engineering Group (Jacobs) for the Olivehurst Public Utilities District (OPUD) Yuba County Sewer and Water Infrastructure Project (Project) in Olivehurst and unincorporated areas of Yuba County, California. Figure 1 presents the Vicinity Map. Jacobs, in cooperation with OPUD and Yuba County, proposes to construct new water and sewer utility infrastructure. The Project alignment is planned within existing right-of-way. The pump and lift station final locations have not been determined and will be constructed on private parcels.

Blackburn prepared the October 2020 Draft Phase I Initial Site Assessment (ISA) report for the Project and identified the following Recognized Environmental Conditions[1] (RECs) located at adjacent sites that warrant further assessment:

- A release of petroleum to soil and groundwater occurred at Tower Mart #60 located at 1976 McGowan Parkway. Potential contaminants of concern (COCs) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gasoline (TPH-g), and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX).
- A release of diesel to soil occurred at the PG&E North Valley Materials facility located at 3736 Rancho Road. Possible COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX.

Blackburn also identified the following general contamination issues within the Project limits:

- Yellow Traffic Striping. Yellow traffic stripes are known to contain heavy metals, such as lead and chromium, at concentrations exceeding the hazardous waste thresholds established by the *California Code of Regulations* and may produce toxic fumes when heated.
- Aerially Deposited Lead (ADL). ADL has been found to occur in soils adjacent to highways and high-use roadways. The lead is presumably from the historical use of leaded gasoline engines and subsequent exhaust emissions. There is the potential for encountering ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and therefore, have the potential to be impacted with ADL.
- Southern Pacific Railroad. The railroad is adjacent to the east shoulder of Rancho Road. Soils located adjacent to railroads may be impacted by on-going railroad operations. Potential COCs include TPHs, semi-volatile organic compounds (SVOCs), heavy metals, polycyclic aromatic hydrocarbons (PAHs), and organochlorine pesticides (OCPs).

[1] Blackburn uses the term Recognized Environmental Condition (REC) in general compliance with ASTM E1527-13, which defines the meaning as *"The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment, (2) under conditions indicative of a release to the environment or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimus conditions that generally do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies. Conditions determined to be de minimus are not recognized environmental conditions*."

DRAFT

- Historical Orchard. Topographic maps from 1947 and 1949 depict an orchard in the southeastern 1/2 -mile alignment of Rancho Road and the eastern 1/3 -mile alignment of Morrison Road. Soils in areas developed as orchards before the mid-1970s may be impacted by OCPs.

Blackburn no longer recommends a Phase II assessment of the Marysville Forest Products/Erickson Group Limited located at 4083 Rancho Road. The updated Project alignment locates the water line immediately adjacent to the northeast side of Rancho Road. It is unlikely that COCs from the Marysville Forest Product site would impact the Project due to the buffer the railroad provides and the distance from the Project.

In addition, Blackburn did not receive Right-of-Entry along Morrison Road and therefore did not perform a Phase II assessment along Morrison Road.

This Phase II scope is designed to evaluate whether impacts due to potential COCs require mitigation recommendations for construction and/or soil management. We prepared this Phase II in general conformance with the American Society of Testing and Materials (ASTM) Standard E1903-19, "Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process".

To conduct this Phase II, Blackburn:

- Reviewed the findings, conclusions and recommendations presented in the Blackburn ISA for the Project.
- Reviewed the project plans dated March 15, 2021, and provided by Jacobs, to identify sample locations.
- Confirmed Right-of-Entry restrictions with Jacobs.
- Prepared a limited Health and Safety Plan for our subsurface exploration.
- Confirmed receipt of an Encroachment Permit prior to drilling.
- Hand-augered 4 test holes to depths of 2.5-feet and collected soil samples on June 17, 2021.
- Drilled 44 test holes by Direct Push to depths ranging from 3.5- to 15-feet and collected soil samples on June 15-17, 2021.
- Submitted soil samples via chain-of-custody to Sunstar Laboratories (Sunstar) for environmental analyses.
- Summarized the soil sample test results.
- Performed statistical analysis for ADL.
- Provided conclusions and recommendations based on the soil sample test results.

Blackburn prepared this report for Jacobs Engineering Group (Jacobs) and the project design team to use during design and construction. This report shall not be used or relied upon by others, or for different locations or improvements without the written consent of Blackburn.

DRAFT

2 PROJECT LOCATION AND DESCRIPTION

2.1 Location and Description

The Project spans approximately 12.2 miles within the town of Olivehurst and surrounding areas. The Project alignment includes the OPUD Wastewater Treatment Plant located on Mary Avenue, and portions of the following alignments:

- Olivehurst Avenue from 7th Avenue to approximately 170 feet south of 11th Avenue;
- Mary Avenue from the OPUD wastewater treatment plant to McGowan Parkway;
- McGowan Parkway from Mary Avenue to Rancho Road;
- Olive Avenue from McGowan Parkway to approximately 100 feet to the north, then east crossing under Highway 65 to the northern terminus of Rancho Road;
- Rancho Road from its northern end to Morrison Road;
- Morrison Road from Highway 65 to Forty Mile Road (Blackburn understands access to this section is currently restricted);
- Forty Mile Road from the Toyota Amphitheater to Rancho Road;
- Slaughterhouse Road from Forty Mile Road to northwest for approximately 0.4 miles, crossing Highway 65 to the southern terminus of Shimer Road;
- Shimer Road from its southernmost extent to Rancho Road.

Pump and lift station locations will be installed on privately owned parcels; however, these locations have not been finalized.

The Project location with Project limits is shown on Figure 1, Vicinity Map. Site-specific features are shown on Figures 3a-3aa.

2.2 Geology and Physical Setting

The site lies within the Great Valley Geomorphic Province of California, which is a large, elongated, northwest-trending structural trough. The Province is subdivided into two major divisions designated as the Sacramento and San Joaquin Valleys. These valleys have been filled to their present elevation with thick sequences of sediment, ranging in age from Jurassic to present-day, creating a nearly flat-lying alluvial plain that extends from the Tehachapi Mountains in the south to the Klamath Mountains in the north. The western and eastern boundaries of this province are formed by the California Coast Ranges and the Sierra Nevada, respectively.

The study area is located on an alluvial plain in the Sacramento Valley located approximately 2.2 miles east of the Feather River at its closest point. The underlying deposits are mapped by Saucedo, G.J. and Wagner D.L. (1981) as alluvium, natural levee and channel deposits, basin deposits, Modesto Formation, and the Riverbank Formation. This formation is composed of fine-grained soils such as clay, silts, sand, and gravel.

DRAFT

The site topography is generally flat, except near Highway 65 and Highway 70, where the topography slopes toward the highways. The site elevations, excluding areas near the Highways, range between about 55 feet above mean sea level (msl) in the western portion of the Project and about 75 feet above msl in the easternmost portion of the Project.

2.3 Surface Water, Groundwater, Wells

The Site lies within the South Yuba Subbasin where groundwater flow direction is generally to the southwest toward the Feather River, though flow directions vary both locally and seasonally. The study area is east of the Feather River, south of the Yuba River, and north of the Bear River. Blackburn reviewed groundwater level data made available at California Department of Water Resources (DWR) website www.water.ca.gov/waterdatalibrary. Based on our review of the recent data, the groundwater beneath the site is generally between elevation 25- to 50- feet. Surface/storm water is directed by sidewalk curb, gutter and drains. The general flow direction is to the south and west towards the Feather River, except in area in proximity to Hutchison Creek and Reed Creek, which transect the Project in multiple areas flowing southwest toward the Feather River.

2.4 Current Land Use

Most of the Project area consists of roadways which traverse rural areas of Yuba County, with a portion of the project limits transecting the town of Olivehurst. Land adjacent to the Project along Rancho Road is zoned as agricultural industrial and light industrial. Land along Morrison Road is designated as sports entertainment district and employment center district. Land adjacent to Forty Mile Road is designated for agricultural use and sports entertainment. Land near the OPUD Wastewater treatment Facility on Mary Road is designated for use as public utilities land as well as single-family residential.

3 PHASE II ESA FIELD ACTIVITIES

3.1 Pre-Field Activities

Blackburn marked each boring location and contacted Underground Service Alert (USA North 811) to identify and mark underground utilities within the investigation area before subsurface exploration began. Jacobs obtained the Encroachment Permit with input from Blackburn. Blackburn prepared a limited health and safety plan (HASP) for the subsurface exploration to inform on-site personnel about potential chemical and physical hazards and outline specific emergency procedures to be employed in the event of an accident or changes in field conditions. On-site personnel acknowledged the HASP following daily tailgate meetings. The field work was completed without incident. Figure 2 presents an overview of the boring locations as the Overall Project Map obtained from the ESA. Figures 3a through 3aa presents specific sample locations.

3.2 Aerially Deposited Lead Assessment

The ISA identified the potential for ADL during construction and grading activities within the proposed Project limits along its entirety. Some of these roadways have been present in various alignments since at or before 1910 and, therefore, have the potential to be impacted with ADL. Blackburn located and drilled a total of 46 sample locations along the alignment including Rancho Road, Mary Avenue, Olivehurst Avenue, McGowan Parkway, Olive Avenue, Forty Mile Road, Slaughterhouse Road and Shimer Road.

DRAFT

Blackburn obtained the following ADL samples based on our review of the project plans:

- 19 sample locations along Rancho Road from its northern end to Morrison Road;
- 2 sample locations along Shimer Road;
- 1 sample location along Olive Avenue approximately 200 feet to the north of McGowan Parkway;
- 2 sample locations along Olivehurst Avenue from 13th Avenue to approximately 100 feet south of 11th Avenue;
- 4 sample locations along Mary Avenue from OPUD wastewater treatment plant to McGowan Parkway;
- 6 sample locations along McGowan Parkway from Mary Avenue to Rancho Road;
- 10 sample locations along Forty Mile Road from Plumas Arboga Road to Rancho Road;
- 2 sample locations along Slaughterhouse Road from Forty Mile Road to northwest for approximately 0.25 miles.

Blackburn generally collected the soil samples away from the roadway about 5- to 10-feet into the unpaved shoulders at three (3) depth intervals: Interval A from 0- to 0.5- feet; Interval B from 2- to 2.5- feet; and Interval C from 3- to 3.5- feet. Blackburn used a hand trowel to collect the shallow Interval A soil samples, and retained Environmental Control Associates, Inc. (ECA), our drilling subcontractor, to obtain Intervals B and C using a Geoprobe (Direct Push sampling).

Due to utility concerns at proposed sampling locations, Blackburn obtained Interval A and B samples on the eastern side of Forty Mile Road (FM1, FM7, FM9) and on the western side of Slaughterhouse Road (SH2) with a hand auger. Blackburn did not obtain Interval C samples for these sample locations.
For Interval A samples and hand auger samples, Blackburn transferred the samples into glass jars, labeled the jars with the sample time, date, location, depth and the sampler's initials. Blackburn cleaned the sampling equipment with an Alconox wash solution and a distilled water rinse before and after advancing each boring.

For Intervals B and C samples, ECA obtained the samples by pushing the Geoprobe to the desired sampling depth. The Geoprobe utilizes dual tube sampling which uses two sets of probe rods to retrieve continuous soil core samples. One set is driven into the subsurface and used as an outer casing. A second, smaller rod is placed inside the outer casing with a sample liner attached, which is then extracted to retrieve the full liner. ECA placed the tube on a table and Blackburn identified sample depths for ECA to cut. The sample tubes were capped under Teflon paper, labeled with sample time, date, location, depth, and the sampler's initials.

Blackburn packed the collected samples in a cooled ice chest and delivered the samples to SunStar Laboratories, a certified California Environmental Laboratory Accreditation Program (ELAP) analytical laboratory, under continuous chain-of-custody documentation.

Blackburn and ECA backfilled each boring with excess cuttings and discharged wash and rinse water to the ground surface at the project site.

DRAFT

3.3 Tower Mart #60, 1976 McGowan Parkway Assessment

The ISA identified that a release of petroleum to soil and groundwater occurred at Tower Mart #60 located at 1976 McGowan Parkway. Potential contaminants of concern (COCs) include total petroleum hydrocarbons (TPH) as diesel (TPH-d), gasoline (TPH-g), and motor oil (TPH-mo), metals, and benzene/toluene/ethylbenzene/xylene (BTEX). Blackburn therefore advanced two borings along the shoulder adjacent to the Tower Mart #60 site.

Blackburn advanced two borings and collected soil samples at 5 intervals: Interval A (0-0.5'); Interval B (1.5'-2'); Interval C (7'-7.5'); Interval D (11.5'-12'); and Interval E (14.5'-15').

Blackburn monitored volatile chemicals present in the samples, borehole, and worker breathing zones using a photoionization device (PID). The boring logs in Appendix A include the PID readings. PID readings did not reach action levels.

ECA obtained the samples by pushing the Geoprobe to the desired sampling depth and extruding the tube. ECA placed the tube on a table and split the entire tube open lengthwise for Blackburn to log and transfer the samples into glass jars. Blackburn labeled the glass jars with sample time, date, location, depth, and the sampler's initials.

Blackburn packed the collected samples in a cooled ice chest and delivered the samples to SunStar Laboratories, a certified California Environmental Laboratory Accreditation Program (ELAP) analytical laboratory, under continuous chain-of-custody documentation.

Blackburn and ECA backfilled each boring with excess cuttings and discharged wash and rinse water to the ground surface at the project site. For these borings drilled in asphalt, ECA patched the pavement with cold-mix asphalt, in accordance with the encroachment permit.

3.4 PG&E North Valley Materials Facility Assessment

The ISA identified that a release of diesel to soil occurred at the PG&E North Valley Materials Facility at 3736 Rancho Road. Potential COCs include TPH-d, TPH-g, TPH-mo, metals, and BTEX. Blackburn therefore advanced two borings along the shoulder of Rancho Road, adjacent to the PG&E facility.

Blackburn advanced two borings and collected soil samples at 4 intervals: Interval A (0-0.5'); Interval B (2.5'-3'); Interval C (6.5'-7'); and Interval D (9.5'-10').

Blackburn monitored volatile chemicals present in the samples, borehole, and worker breathing zones using a photoionization device (PID). PID readings did not reach action levels.

ECA obtained the samples by pushing the Geoprobe to the desired sampling depth and extruding the tube. ECA placed the tube on a table and split the entire tube open lengthwise for Blackburn to log and transfer the samples into glass jars. Blackburn labeled the glass jars with sample time, date, location, depth, and the sampler's initials.

DRAFT

Blackburn packed the collected samples in a cooled ice chest and delivered the samples to SunStar Laboratories, a certified California Environmental Laboratory Accreditation Program (ELAP) analytical laboratory, under continuous chain-of-custody documentation.

Blackburn and ECA backfilled each boring with excess cuttings and discharged wash and rinse water to the ground surface at the project site. For these borings drilled in asphalt, ECA patched the pavement with cold-mix asphalt, in accordance with the encroachment permit.

3.5 Historical Orchard Assessment

The ISA identified a historical orchard in the southeastern 1/2 -mile alignment of Rancho Road and the eastern 1/3 -mile alignment of Morrison Road. Soils in areas developed as orchards before the mid-1970s have the potential to be impacted by OCPs. Blackburn selected the two southernmost Rancho Road ADL borings for OCPs analysis. The borings are located near the historical orchards identified by historical topographic maps. Blackburn analyzed soil samples from 2 intervals: Interval A (0-0.5'); and Interval B (2'-2.5'). As discussed above, this Phase II ESA did not include Morrison Road due to access restrictions.

3.6 Southern Pacific Railroad Assessment

The Southern Pacific Railroad runs parallel to the east shoulder of Rancho Road. Potential COCs include TPHs, semi-volatile organic compounds (SVOCs), heavy metals, polycyclic aromatic hydrocarbons (PAHs) and OCPs. Blackburn selected five Rancho Road ADL borings to be additionally analyzed for railroad COCs. Blackburn analyzed soil samples at 2 intervals: Interval A (0-0.5'); and Interval B (2'-2.5') for analysis of TPHs, SVOCs including PAHs, heavy metals, and OCPs.

3.7 Traffic Control Striping Assessment

Blackburn retained Entek Consulting Group, Inc. (Entek) to assess the presence of lead and chromium in the yellow traffic striping on McGowan Parkway between Mary Avenue and Powerline Road, north of 1976 McGowan Parkway. Appendix B presents the July 2, 2021 Hazardous Materials Survey Final Report, which includes the field activities. On June 16, 2021, Entek collected one bulk sample of yellow traffic striping from the roadway surface for lead and chromium analyses.

4 PHASE II ESA LABORATORY ANALYSES

4.1 Aerially Deposited Lead Assessment

For the ADL Assessment, Blackburn initially submitted 92 samples (Intervals A and B at each location) to SunStar Laboratories for analysis of Total Lead by EPA Test Method 6010B and requested SunStar Laboratories to hold all Interval C. Nineteen samples exhibited Total Lead concentrations exceeding 50 milligrams per kilogram (mg/kg) along Rancho Road and McGowan Parkway. Blackburn therefore requested SunStar analyze all Rancho Road and McGowan Parkway Interval C samples and most McGowan Parkway Interval C samples for Total Lead. for Total Lead.

Blackburn selected all samples with Total Lead concentrations exceeding 50 mg/kg to be analyzed for Soluble Lead using the Waste Extraction Test method with Citric Acid buffer (CA-WET). The 50 mg/kg threshold is considered the minimum total lead concentration that can potentially result in a Soluble

DRAFT

Threshold Limit Concentration (STLC)[2] of 5 milligrams per liter (mg/l) due to a 10-fold dilution of the sample for the STLC test. Blackburn then selected all five samples with Soluble Lead concentrations reported above 5 mg/l to further analyze for Soluble Lead using the Waste Extraction Test method with Deionized Water buffer (DI-WET).

Blackburn randomly selected 4 samples for pH testing.

4.2 Tower Mart #60, 1976 McGowan Parkway Assessment

For the Tower Mart #60 assessment, Blackburn submitted 10 samples (Intervals A through E at two locations) to SunStar for analysis of total lead, TPH-d, TPH-g, TPH-mo, and BTEX.

4.3 PG&E North Valley Materials Facility Assessment

For the PG&E Assessment, Blackburn submitted 8 samples (Intervals A through D at two locations) to SunStar for analysis of total lead, TPH-d, PH-g, TPH-mo, and BTEX.

4.4 Historical Orchard Assessment

For the Historical Orchard Assessment, Blackburn submitted 4 samples (Intervals A and B at two locations) to SunStar for analysis of OCPs. Morrison Road was not included in this assessment.

4.5 Southern Pacific Railroad Assessment

For the Southern Pacific Railroad Assessment, Blackburn submitted 10 samples (Intervals A and B at five locations) to SunStar for analysis of TPHs, SVOCs including PAHs, heavy metals, and OCPs.

4.6 Traffic Control Striping Assessment

Appendix B contains Entek's report which describes the laboratory analysis. Entek transferred the bulk sample to ALS Environmental, an American Industrial Hygiene Association (AIHA) accredited lab in Salt Lake City, Utah, for lead and chromium analysis by a modified NIOSH 7300 method for bulk sampling.

5 PHASE II ESA LABORATORY ANALYTICAL RESULTS

5.1 Aerially Deposited Lead Assessment

Blackburn summarized the analytical results in Table 2. The ADL assessment test results indicate the following along each roadway.

Rancho Road (Rancho): Total lead concentrations within the 57 soil samples range from non-detect to 310 mg/kg. Sixteen (16) samples, all from sample Interval A, exhibited Total Lead concentrations exceeding 50 mg/kg. Blackburn therefore selected the sixteen (16) samples for testing by CA-WET. The results ranged from 1.7 milligram per liter (mg/l) to 7.6 mg/l. Five samples exceeded 5 mg/l and therefore, Blackburn selected these five samples for DI-WET testing. Only one sample, "Rancho 19A/Orchard 2A" was reported

[2] STLC and TTLC are regulatory limits defining hazardous waste in California.

DRAFT

for DI-WET with a concentration of 1.0 mg/l. All other results indicated non-detect above the laboratory reporting limits.

Shimer Road (Shimer): Total lead concentrations within the four soil samples range from non-detect to 44.9 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

Olive Avenue (Olive): Total lead concentrations within the two soil samples range from 4.4 to 14 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

Olivehurst Avenue (Olivehurst): Total lead concentrations within the four soil samples range from 4.1 to 18 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

Mary Avenue (Mary): Total lead concentrations within the eight soil samples range from non-detect to 25 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

McGowan Parkway (MP): Total lead concentrations within the 17 soil samples range from non-detect to 110 mg/kg. Three samples exhibited concentrations exceeding 50 mg/kg. Blackburn therefore selected the three exceedance samples for testing by CA-WET. The results ranged from 1.1 milligram per liter (mg/l) to 3.3 mg/l. No samples exceeded 5 mg/l.

Forty Mile Road (FM): Total lead concentrations within the 20 soil samples range from non-detect to 29 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

Slaughterhouse Road (SH): Total lead concentrations within the four soil samples range from 3.7 to 20 mg/kg. No samples exhibited concentrations exceeding 50 mg/kg.

5.2 ADL Statistical Analysis

Blackburn performed a statistical analysis of the ADL sample data using EPA ProUCL 5.1 software to calculate the sample mean (average) as well as the 95% Upper Confidence Limit (UCL) of the sample mean. ProUCL 5.1 software determines data calculation techniques based on data size, distribution, and skewness. Appendix C presents statistical analysis calculations performed using ProUCL 5.1.

5.2.1 Total Lead

Based on laboratory analytical results, Blackburn analyzed ADL data within the project limits in groups based on sample depth. Blackburn identified Rancho Road and McGowan Parkway as potentially containing lead impacts. Blackburn conducted additional statistical analyses for these sample groups analyzed separately and together.

The following table presents the ranges of lead concentrations, mean lead concentrations, and 95% UCL for each depth interval as well as the combined interval. The combined interval (0 – 2.5 feet or 0 – 3.5 feet) provides information on the sample population as a whole, whereas the soil depth Intervals A, B and C provide information on individual sample depths.

DRAFT

Total Lead ProUCL Statistical Summary by Depth Interval				
Sample Location	**Soil Depth Interval (feet bgs)**	**Total Lead - Sample Range (mg/kg)**	**Total Lead Mean (mg/kg)**	**Total Lead 95% UCL (mg/kg)**
Project Limits (Excluding Rancho Road and McGowan Parkway)[1]	A (0 – 0.5 feet)	3 to 44.9	13.35	19.1
	B (2 – 2.5 feet)	3 to 6.1	3.67	4.0
	Combined (0 – 2.5 feet)	3 to 44.9	8.73	15.2
Rancho Road[2]	A (0 – 0.5 feet)	3.16 to 310*	117.3*	176.2*
	B (2 – 2.5 feet)	3 to 27.3	5.98	13.0
	C (3 – 3.5 feet)	3 to 3.9	3.12	3.22
	Combined (0 – 3.5 feet)	3 to 310*	44.8	88.3*
McGowan Parkway[3]	A (0 – 0.5 feet)	11 to 110*	58.6	93.0*
	B (2 – 2.5 feet)	3 to 9.3	5.2	7.48
	C (3 – 3.5 feet)	3 to 4.8	3.78	4.47
	Combined (0 – 3.5 feet)	3 to 110*	22.5	59.4
(Combined) Rancho Road and McGowan Parkway	A (0 – 0.5 feet)	3.16 to 310*	105.6*	149.6*
	B (2 – 2.5 feet)	3 to 27.3	5.81	11.3
	C (3 – 3.5 feet)	3 to 4.8	3.26	3.43
	Combined (0 – 3.5 feet)	3 to 310*	40.12	75.5

*value exceeds DTSC Residential Soil Screening Level for Total Lead (80 mg/kg).

[1] "Project Limits" includes samples from Shimer Road, Olive Avenue, Olivehurst Avenue, Mary Avenue, Forty Mile Road, Slaughterhouse Road, and Interval A from Tower Mart sample locations on McGowan Parkway.

[2] Rancho Road does not include PGE samples below Interval A (potential to bias skew UCL downward).

[3] McGowan Parkway does not include Tower Mart samples (potential to bias skew UCL downward).

5.2.2 CA-WET Soluble Lead

Lead solubility (CA-WET) testing was conducted on the nineteen samples that reported total lead concentrations that exceed 50 mg/kg. Based on the reported results, Blackburn performed a linear regression analysis to predict the 95% UCL for CA-WET solubility in the Project area. For the regression analysis, we considered the nineteen data points (from Interval A samples collected on Rancho Road and McGowan Parkway) and defined the intercept to occur at the origin. The calculated r-squared correlation coefficient is 0.9485 which indicates an acceptable correlation between the total and soluble lead data sets.

The CA-WET data regression equation is calculated to be y = 0.0259(x)

Where: y = Soluble Lead concentrations in mg/l

x = Total Lead concentrations in mg/kg

We used the 95% UCL values for Total Lead in the regression formula to calculate the predicted CA-WET solubility for the soil depth intervals shown in the following table.

DRAFT

Predicted Lead Solubility by Depth Interval					
Sample Location	**Soil Depth Interval (feet bgs)**	**CA-WET Soluble Lead Sample Range (mg/l)**	**CA WET-Soluble Lead Mean (mg/l)**	**95% UCL Total Lead (mg/kg)**	**Predicted 95% UCL CA-WET-Soluble Lead (mg/l)**
Project Limits (Excluding Rancho Road and McGowan Parkway)[1]	A (0 – 0.5 feet)	NA	NA	13.35	0.35
	B (2 – 2.5 feet)	NA	NA	3.67	0.10
	Combined (0 – 2.5 feet)	NA	NA	8.73	0.23
Rancho Road[2]	A (0 – 0.5 feet)	1.7 – 7.6	3.84	176.2*	4.56
	B (2 – 2.5 feet)	NA	NA	13.0	0.34
	C (3 – 3.5 feet)	NA	NA	3.22	0.08
	Combined (0 – 3.5 feet)	NA	NA	88.3*	2.29
McGowan Parkway[3]	A (0 – 0.5 feet)	1.1 – 3.3	1.97	93.0*	2.41
	B (2 – 2.5 feet)	NA	NA	7.48	0.19
	C (3 – 3.5 feet)	NA	NA	4.47	0.12
	Combined (0 – 3.5 feet)	NA	NA	59.4	1.54
(Combined) Rancho Road and McGowan Parkway	A (0 – 0.5 feet)	1.1 – 7.6	3.54	149.6*	3.87
	B (2 – 2.5 feet)	NA	NA	11.3	0.29
	C (3 – 3.5 feet)	NA	NA	3.43	0.09
	Combined (0 – 3.5 feet)	NA	NA	75.5	1.96

*value exceeds DTSC Residential Soil Screening Level for Total Lead (80mg/kg).

[1] "Project Limits" includes samples from Shimer Road, Olive Avenue, Olivehurst Avenue, Mary Avenue, Forty Mile Road, Slaughterhouse Road, and Interval A from Tower Mart sample locations on McGowan Parkway.

[2] Rancho Road does not include PGE samples below Interval A (potential to bias skew UCL downward).

[3] McGowan Parkway does not include Tower Mart samples (potential to bias skew UCL downward).

5.2.3 DI-WET Soluble Lead

Blackburn selected all 5 samples (taken along Rancho Road) that exceeded 5 mg/l for CA-WET testing to be analyzed for DI-WET Soluble Lead. Four samples were reported as non-detect and one sample was reported to have a DI-WET Soluble Lead concentration of 1.0 mg/kg. Due to limited data, Blackburn was unable to statistically analyze DI-WET results.

5.3 Tower Mart #60, 1976 McGowan Parkway Assessment

Blackburn summarized the analytical results in Tables 1, 2, and 5. The Tower Mart #60 analytical test results indicate the following:

DRAFT

- 9 of the 10 samples tested for hydrocarbons exhibited non-detect concentrations for TPH-g, -d and -mo. Only one sample from Interval A, TM 2A, exhibited a concentration of 91 mg/kg for TPH-mo.
- 7 of the 10 samples tested for total lead were reported with concentrations ranging from 3.1 to 6.2 mg/kg, and 3 of the samples were non-detect for total lead.
- BTEX was not detected above laboratory reporting limits for all 10 samples tested.

5.4 PG&E North Valley Materials Facility Assessment

Blackburn summarized the analytical results in Tables 1, 2, and 5. The PG&E Facility analytical test results indicate the following:

- TPH-g, -d and -mo were not detected above laboratory reporting limits in 6 of the 8 samples.
- Samples "PGE 1A/Rancho 9A" and "PGE 2A" exhibited concentrations of 21 and 74 mg/kg, respectively, for TPH-mo.
- "PGE 2A" exhibited a concentration of 11 mg/kg for TPH-d.
- 3 of the 8 samples tested for total lead were reported non-detect. Sample concentrations in the other 5 samples ranged from 3.16 to 100 mg/kg in "PGE 2A".
- All 8 samples reported non-detect for BTEX.

5.5 Historical Orchard Assessment

Blackburn summarized the analytical results in Table 3. The Historical Orchard analytical test results indicate the following:

- "Rancho 18A/Orchard 1A" exhibited a concentration of 0.089 mg/k 4,4'-DDE and 0.110 mg/kg 4,4'-DDT.
- "Rancho 19A/Orchard 2A" exhibited a concentration of 0.092 mg/k 4,4'-DDE, 0.140 mg/kg 4,4'-DDT, and 0.008 mg/kg 4,4'-DDD.
- "Rancho 18B/Orchard 1B" and "Rancho 19B/Orchard 2B" reported non-detect concentrations of OCPs.

5.6 Southern Pacific Railroad Assessment

Blackburn summarized the analytical results in Tables 1, 2, 3, and 4A-C. The Southern Pacific Railroad analytical test results indicate the following:

- All samples tested for hydrocarbons exhibited non-detect concentrations for TPH-g; 6 of the 10 samples exhibited non-detect for TPH-d, and 2 of the 10 samples exhibited non-detect for TPH-mo.
- Sample concentrations of TPH-mo ranged from 14 mg/kg (Rancho 16B/RR5B) to 1300 mg/kg (Rancho 6A/RR1A).
- Sample concentrations of TPH-d ranged from 14 mg/kg (Rancho 16B/RR5B) to 360 mg/kg (Rancho 6A/RR1A).

DRAFT

- All 10 samples exhibited concentrations of Barium, Chromium, Cobalt, Copper, Nickel, Vanadium, and Zinc. Rancho 6A/RR 1A also exhibited Mercury at a concentration of 0.11 mg/kg.
- None of the samples reported concentrations above laboratory detection limits for OCPs or SVOCs.

5.7 Traffic Control Striping Assessment

Appendix B contains Entek's report which describes the laboratory analytical results. Based on information contained in this report, neither lead nor chromium were detected above the laboratory detection limit.

6 PHASE II ESA CONCLUSIONS AND SOIL MANAGEMENT RECOMMENDATIONS

6.1 Screening Levels

Blackburn prepared this Phase II ESA to evaluate and screen the potential presence of contaminants of concern using data collected during our field activities. Blackburn considered the following published screening levels as site action levels for the Project to assist in providing recommendations during construction:

- United States Environmental Protection Agency Regional Screening Levels May 2020, EPA Screening Level.
- Department of Toxic Substances Control HHRA Note 2, June 2020, DTSC-recommended screening level.
- San Francisco Bay Regional Water Quality Control Board Screening Levels (RWQCB ESLs) for TPH only.
- Department of Toxic Substances, Caltrans Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils (*Agreement*), June 30, 2016

Tables 1 through 6 include the available screening levels for each constituent.

6.2 Constituents of Concern

ADL

To evaluate appropriate soil management for the lead impacted soil, Blackburn considered the recommendations contained in the *Agreement* as a general guideline. Clean soil is defined in the *Agreement* as soil not containing total lead over 80 mg/kg based on a 95% UCL or soluble lead over 5 mg/l based on a 95% UCL as determined by the CA-WET and not containing other constituents at levels that would pose an unacceptable risk to human health or the environment or be unacceptable to the RWQCB with jurisdiction.

Tested total lead concentrations determined by EPA Method 6010 and based on a 95% UCL for soil depth interval A at Rancho Road (176.2 mg/kg) and McGowan Parkway (93.0 mg/kg), at the Combined Interval A-C at Rancho Road (88.3 mg/kg), and the combined Interval A for Rancho Road and McGowan Parkway (149.6 mg/kg) are above the 80 mg/kg threshold for ADL Contaminated Soil. One discrete sample along

DRAFT

McGowan Parkway and 13 discrete samples along Rancho Road exceed the DTSC Residential Soil Screening Level of 80 mg/kg.

Tested soluble lead concentrations determined by the CA-WET method and based on statistical modeling for all soil depth intervals are below the 5 mg/l threshold for ADL Contaminated Soil. Five discrete samples taken along Rancho Road exceeded 5 mg/l tested by the CA-WET method and only one of these samples further tested by DI WET extraction had a reported concentration of 1.0 mg/l, the other samples were not detected above laboratory reporting limits.

Based on the conclusions above, the contractor shall conduct all grading operations in accordance with the *Agreement* and with the awareness that lead impacted soils are present on McGowan Parkway and Rancho Road. Construction Project documents should include a site-specific Health and Safety Plan and special Soil Management Plan (SMP) to address elevated levels of lead along McGowan Parkway and Rancho Road. The SMP shall be in accordance with all applicable Cal/OSHA requirements and at a minimum, the SMP should include measures to control worker exposure to soil, airborne dust, and control runoff along both McGowan Parkway and Rancho Road.

Metals (Other than Total Lead)

None of the detected metals, which include Barium, Beryllium, Chromium, Cobalt, Copper, Nickel, Vanadium, Zinc and Mercury, exceeded screening levels. Special construction considerations are not required for these metals.

Total Petroleum Hydrocarbons

Neither EPA nor DTSC provide screening levels for TPH-g, -d, or -mo. However, these constituents were detected from the ground surface to 2.5 feet bgs. Blackburn therefore considered the RWQCB ESLs. Only one sample, Rancho 6A/RR 1A, exhibited a TPH-Diesel concentration of 360 mg/kg which exceeds the RWQCB ESL for Residential: Shallow Soil Exposure, Non-cancer Hazard of 260 mg/kg. The detected concentration, however, is well below the Commercial/Industrial RWQCB ESL screening level of 1,200 mg/kg and the Construction Worker Exposure RWQCB ESL screening level of 1,100 mg/kg, therefore, special construction considerations are not required for these COCs.

Organochlorine Pesticides

OCPs including 4,4'-DDE, 4,4'-DDT and 4,4'-DDD, were detected at two sample locations in the former Orchard area. The tested concentrations were below their respective screening levels. If future construction is anticipated along Morrison Road, Blackburn recommends additional Phase II sampling and analysis of OCPs near the former orchard areas at the eastern 1/3 -mile of Morrison Road.

Semi-Volatile Organic Compounds

SVOCs were not detected above laboratory reporting limits; therefore, special construction considerations are not required for these COCs.

Volatile Organic Compounds

VOCs were not detected above laboratory reporting limits; therefore, special construction considerations are not required for these COCs.

DRAFT

pH
pH values ranged from 6.2 to 7.3 which is close to neutral. Special construction considerations are not required.

Traffic Striping Lead and Chromium
Lead and Chromium were not detected above their respective laboratory reporting limits. Entek recommends that construction operations utilize general dust controls during paint striping removal on McGowan Parkway Road. In addition, Entek recommends consideration of dust or debris leading to or near storm drains, waterways, and other sources of water during future construction activities removal of pain striping.

7 LIMITATIONS

Blackburn prepared this Phase II for the specific use of Jacobs Engineering and applies only to the Project area described herein. We are not responsible for interpretations by others of data presented in this Phase II. This Phase II does not represent a legal opinion. No warranty is expressed or implied. We base our conclusions in this Phase II on judgement and experience. We performed this work in accordance with generally accepted standards of practice existing in Northern California at the time of the assessment.

Entek's report is presented in Appendix B, the report must be read in its entirety, and the reader must review all the detailed information provided in the body of the report prior to making any interpretations, or conclusions pertaining to the information.

The accompanying Phase II summarizes the laboratory analyses and findings and opinions of Blackburn, with regard to the potential for hazardous materials to be present on the properties at concentrations likely to warrant mitigation under current statutes and guidelines.

Blackburn based the findings presented in this report on limited soil samples obtained and laboratory analyses from within the Project area. Testing of groundwater was not within the scope of this investigation. We assume the soil conditions encountered in our explorations are representative of the subsurface conditions throughout the site. Conditions at locations other than our explorations could be different. We cannot warrant or guarantee that hazardous materials do not exist at the described site. To further reduce your risk, an extensive and invasive exploration may be necessary. Contact Blackburn for further evaluation if conditions encountered during Project construction are inconsistent with our Report.

Appendix A presents our boring logs. The lines designating the interface between soil types are approximate and are based on manual/visual classification. The transition between material types may be abrupt or gradual.
Due to site access restrictions, Morrison Road and the surrounding orchard was not included in this evaluation and must be evaluated by Blackburn if chosen as part of the Project's alignment.

Conditions at the site can and will change over time. Please contact Blackburn to revise this Phase II to reflect new information or if site conditions change.

DRAFT

PHASE II ENVIRONMENTAL SITE ASSESSMENT

OPUD Yuba County Sewer and Water Infrastructure Project

Olivehurst, CA

B. Backup Documents

Executive Summary

The purpose of the inspection was to determine the lead and chromium content associated with the yellow traffic striping on a small stretch of McGowan Parkway Road located at 1976 McGowan Parkway, Olivehurst, California for an upcoming construction project that involves the removal of the yellow paint striping.

This is a summary of the report. The report must be read in its entirety, and the reader must review all the detailed information provided in the body of the report prior to making any interpretations, or conclusions pertaining to the information. Any conclusions made by the reader about the information provided in the body of this report which are contradictory or not included in this report are the responsibility of the reader.

Introduction

This report presents results of a limited lead and chromium survey performed by Entek Consulting Group (Entek) which included the yellow paint striping located north of 1976 McGowan Parkway Road in Olivehurst, California. Entek understands that removal of the yellow paint striping on McGowan Parkway is anticipated to occur as part of future construction plans for the upcoming alignment project.

The survey was conducted by Mr. Karl Suarez on June 16, 2021. Mr. Suarez is a State of California Department of Public Health (CDPH) Certified Lead Sampling Technician under the direct supervision of Mr. Andy Roed who is a CDPH Lead Inspector/Assessor.

This report was prepared for Ms. Nicole Hart, Senior Project Manager with Blackburn Consulting.

Lead & Chromium

On June 16, 2021, Entek investigated the existing paint on McGowan Parkway Road in an effort to determine if lead and chromium were present in these materials.

The yellow paint striping on McGowan Parkway Road was sent to ALS Environmental an AIHA accredited lab for analysis. Based on the laboratory analysis, both chromium and lead were determined not to be present above the laboratory's detectable limits of <9.9 ppm for lead and <4.0 ppm for chromium.

Based on these results, any work impacting the yellow striping paint will not require any special training or work practices related to lead and chromium as both concentrations were below their respective laboratory limits.

Survey Area Description

One bulk sample of the road striping paint was collected directly from the paint on an asphaltic substrate in the middle of the road within the left-turn only lane located north of 1976 McGowan Parkway Road. McGowan Parkway Road is a medium traffic road with three lanes. One lane running eastbound, one lane running westbound, and one middle left-turn only lane in the middle of the two with businesses on both sides.

Lead Sampling Results

One (1) bulk sample of the paint on the asphaltic road from McGowan Parkway Road was collected from the middle of the road and submitted to ALS Laboratory in Salt Lake City Utah, which is an accredited laboratory governed by the American Industrial Hygiene Association (AIHA) to perform this analysis. This sample was analyzed by a modified NIOSH 7300 method for bulk sampling. Results of the analysis are listed in the following table:

Paints/Coatings/ Materials Determined NOT TO Contain Lead		
Paint/Coating Color	**Lead Content (ppm)**	**Component/Location**
Yellow Paint	<4.0	Yellow Striping Paint on Asphalt Collected from McGowan Parkway Road

Paints determined “NOT TO” contain lead for the purposes of this report are those samples which when analyzed did not indicate lead to be present at or above the limit of detection for the analysis method used. This limit of detection was 50 parts per million (ppm). As a result, any paints shown “NOT TO” contain lead will not require any special training or work practices related to lead when impacted and Cal/OSHA’s CCR, Title 8 Section 1532.1 (§1532.1) Lead in Construction Safety Orders will not apply.

Chromium Sampling Results

One (1) bulk sample of the paint on the asphaltic road from McGowan Parkway Road was collected from the middle of the road and submitted to ALS Laboratory in Salt Lake City Utah, which is an accredited laboratory governed by the American Industrial Hygiene Association (AIHA) to perform this analysis. This sample was analyzed by a modified NIOSH 7300 method for bulk sampling. Results of the analysis are listed in the following tables:

Paints/Coatings/ Materials Determined NOT TO Contain Chromium		
Paint/Coating Color	**Chromium Content (ppm)**	**Component/Location**
Yellow Paint	<9.9	Yellow Striping Paint on Asphalt Collected from McGowan Parkway Road

The analysis of the paint determined that chromium within the paint was below the laboratory’s detection limit of 9.9 ppm. Cal/OSHA has not established a concentration of chromium in a product where their regulations apply, therefore since chromium was analyzed below the laboratory’s detection limit, CCR, Title 8 Section 1532.2 (§1532.2) Chromium does not apply.

Although the Cal/OSHA’s Construction Safety Orders for both Lead and Chromium does not apply to the upcoming project, Entek recommends, that general dust controls be utilized during the removal of the paint striping on McGowan Parkway Road.

Additionally, construction dust or debris leading to or near storm drains, waterways, and other sources of water during removal of the yellow paint striping should be considered during future construction activities.

Limitations

Entek surveyed only the yellow striping paint expected to be impacted by the future construction work on McGowan Parkway Road. As a result, the information provided in this inspection report may not be used to extend the inspection results to areas not included in this report without additional review and sampling as necessary.

Entek's policy is to retain a full copy of these written documents for three (3) years once the file is closed. At the end of the 3-year period the written files will be destroyed without further notice. It is suggested copies of the file(s) are maintained as per Blackburn Consulting's policy.

Entek will be providing only this electronic copy of the report and its attachments for your use. However, if you would like a hard copy of this report please do not hesitate to ask. Entek will be happy to mail the report upon receipt of your request.

Thank you for choosing Entek for your environmental needs. Please call me at (916) 632-6800 if you have any questions regarding this report.

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
The following was provided by the client: Sample ID, Collection Date, Sampling Location, Media Type, Sampling Parameter.
Collection Date, Media Type, and Sampling Parameter can potentially affect the validity of the results.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Testing Sector	Accreditation Body (Standard)	Certificate Number	Website
Environmental	PJLA (DoD ELAP)	L20-57	http://www.pjlabs.com

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
O-04	This sample was received and analyzed outside the EPA recommended holding time.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Subject: RE: Mix up on COC

Hi Mike,

The samples listed at 11:15 are (Olivehurst) 2A, 2B, 2C and the samples listed at 11:30 are (Olivehurst) 1A, 1B, and 1C. The jars should be correct, I believe this was just an error on the COC.

Thanks for catching this.

Luke Morrell
Project Engineer

Subject: Mix up on COC

HI Luke,

Left you a VM just now, we have sample ID names on COC listed as (Olivehurst) 1A, 1B,1C and Jars that are marked as (Olivehurst) 2A, 2B,2C, the time listed on COC and Jars do match (11:15). Thanks

Mike Jaroudi

Notes and Definitions

S-GC	Surrogate recovery outside of established control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
S-13	Surrogate recovery outside of established control limits. The data was accepted based on valid recovery of surrogates in client samples and remaining QC including CCV.
R-07	Reporting limit for this compound(s) has been raised to account for dilution necessary due to high levels of interfering compound(s) and/or matrix affect.
QM-07	The spike recovery and or RPD was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
O-04	This sample was received and analyzed outside the EPA recommended holding time.
D-02	Hydrocarbon pattern present in the requested fuel quantitation range, but does not resemble the pattern of the requested fuel.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

SAMPLE RECEIVING REVIEW SHEET

Batch/Work Order #: T211964

Client Name: Blackburn Consulting (BCI) Project: ORud Phase 2

Delivered by: ☐ Client ☐ SunStar Courier ☒ GLS ☐ FedEx ☐ UPS

If Courier, Received by: _____ Date/Time Courier Received: _____

Lab Received by: Jennifer Date/Time Lab Received: 6/17/21 9.27

Total number of coolers received: 1 Thermometer ID: SC-GUN_____ Calibration due :8/17/21

Temperature: Cooler #1	4.9 °C +/- the CF (°C) =	4.7 °C corrected temperature		
Temperature: Cooler #2	°C +/- the CF (°C) =	°C corrected temperature		
Temperature: Cooler #3	°C +/- the CF (°C) =	°C corrected temperature		
Temperature criteria = ≤ 6°C (no frozen containers)	Within criteria?	☒ **Yes**	☐ **No**	☐ **N/A**
If NO: Samples received on ice?	☐ Yes	☐ **No → Complete Non-Conformance Sheet**		
If on ice, samples received same day collected?	☐ Yes → Acceptable	☐ **No → Complete Non-Conformance Sheet**		
Custody seals intact on cooler/sample		☒ Yes	☐ No*	☐ N/A
Sample containers intact		☒ Yes	☐ No*	
Sample labels match Chain of Custody IDs		☒ Yes	☐ No*	
Total number of containers received match COC		☒ Yes	☐ No*	
Proper containers received for analyses requested on COC		☒ Yes	☐ No*	
Proper preservative indicated on COC/containers for analyses requested		☒ Yes	☐ No*	☐ N/A
Complete shipment received in good condition with correct temperatures, containers, labels, volumes preservatives and within method specified holding times		☒ **Yes**	☐ **No***	

* Complete Non-Conformance Receiving Sheet if checked

West Sacramento CA, 95691	Project Manager: Luke Morrell	06/25/21 08:40

Notes and Definitions

S-GC	Surrogate recovery outside of established control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
QM-07	The spike recovery and or RPD was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
D-02	Hydrocarbon pattern present in the requested fuel quantitation range, but does not resemble the pattern of the requested fuel.
B-03	Analyte present in blank due to being a common laboratory contaminant.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Blackburn Consulting-West Sac.	Project: Opud Phase 2	
2491 Boatman Ave.	Project Number: 3842.x	**Reported:**
West Sacramento CA, 95691	Project Manager: Luke Morrell	07/06/21 16:06

Notes and Definitions

R-07	Reporting limit for this compound(s) has been raised to account for dilution necessary due to high levels of interfering compound(s) and/or matrix affect.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Subject: RE: Mix up on COC

Hi Mike,

The samples listed at 11:15 are (Olivehurst) 2A, 2B, 2C and the samples listed at 11:30 are (Olivehurst) 1A, 1B, and 1C. The jars should be correct, I believe this was just an error on the COC.

Thanks for catching this.

Luke Morrell
Project Engineer

Subject: Mix up on COC

HI Luke,

Left you a VM just now, we have sample ID names on COC listed as (Olivehurst) 1A, 1B,1C and Jars that are marked as (Olivehurst) 2A, 2B,2C, the time listed on COC and Jars do match (11:15). Thanks

Mike Jaroudi

1 INTRODUCTION

1.1 PURPOSE OF THE MITIGATION MONITORING PROGRAM

Section 21081.6 of the California Public Resources Code requires that:

> A public agency shall adopt a reporting or monitoring program for the changes to the project which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment. This mitigation monitoring program applies to mitigation measures adopted as part of EIRs or negative declarations.

The purpose of the Mitigation Monitoring and Reporting Program (MMRP) is to ensure that the mitigation measures included in the Initial Study/Mitigated Negative Declaration (IS/MND) for the South Yuba County Water and Wastewater Infrastructure Improvement project (State Clearinghouse # 2021020149) are implemented.

1.2 DESCRIPTION OF PROJECT

The Olivehurst Public Utility District (OPUD) is proposing to expand its wastewater collection system to provide capacity for wastewater from the City of Wheatland that will be received and treated at OPUD's Wastewater Treatment Plant (WWTP) to take advantage of unused treatment capacity at the WWTP consistent with State and local regionalization goals. Wheatland wastewater pipelines within the recently annexed South Yuba County Service Area would be oversized to accommodate planned urban development in this area. Separately, OPUD additionally proposes to extend the District's water service to the South County Service Area. The South Yuba County Water and Wastewater Infrastructure Improvement Project (South County Infrastructure Project) is intended to provide the water and sewer conveyance system improvements to meet these needs.

The proposed project would include improvements that will assist in the mitigation of sanitary sewer overflows (SSO) during significant rain events in its existing service area of historic (Old) Olivehurst. One of the new sewer pipelines for the project will be routed near areas that are subject to SSOs. Incrementally oversizing the new sewer pipelines to accommodate flow from the existing Old Olivehurst collection system was determined to be a cost-effective solution for SSO mitigation.

OPUD has identified this five-component project to meet these purposes. The five components would consist of:

- **Component 1.** Completion of SSO reduction measures to the existing wastewater collection system serving the existing community of Olivehurst;
- **Component 2.** Modification of the existing OPUD WWTP to accommodate increased wet weather flows and replace equipment within the WWTP that has reached the end of its operational life;
- **Component 3.** Expansion of OPUD's wastewater collection system to provide service to the recently annexed South County Service Area between Forty Mile Road and Rancho Road;
- **Component 4.** Construction and operation of a Water Plant and backbone treated water distribution pipelines within the General Plan growth area along Forty Mile Road and Rancho Road; and,
- **Component 5.** Construction and operation of a wastewater collection system to accept and treat City of Wheatland untreated wastewater at the existing OPUD WWTP.

In aggregate, these improvements are identified as the South County Infrastructure Project.

1.3 ORGANIZATION AND FORMAT

This program describes the requirements and procedures to be followed to ensure that all mitigation measures adopted as part of this project will be implemented as described in the IS/MND, and adopted by OPUD. This Mitigation Monitoring and Reporting Program contains the following chapters:

- **Chapter 2 - Inventory of Mitigation Measures.** This section contains a list of all mitigation measures included in the IS/MND as adopted by OPUD in numerical order.
- **Chapter 3 - Implementation Schedule and Monitoring Checklist.** This section contains a summary description of the required mitigation measures in checklist format. The timing of implementation of mitigation measures is indicated, in addition to implementation and monitoring responsibility.

1.4 IMPLEMENTATION OF THE MITIGATION MONITORING AND REPORTING PROGRAM

The OPUD General Manager shall assign staff or consultants to manage the South County Infrastructure Project MMRP under the District's responsibility.

Responsible staff shall have overall responsibility for ensuring implementation of measures under their jurisdiction and verification of such measures. Responsible staff may delegate duties to state or federal regulatory agencies, consultants, or other authorities as necessary and appropriate.

1.5 DOCUMENTATION

All mitigation measures will be included on the project construction plans as prepared by a qualified engineer and submitted to OPUD for review.

1.5.1 IMPLEMENTATION SCHEDULE AND MONITORING CHECKLIST

Chapter 3 contains a mitigation measure implementation schedule and monitoring checklist. Responsible OPUD staff may use the checklist as a summary of measures to be implemented and the entities responsible for mitigation implementation and monitoring, and check off mitigation implementation as it is completed.

1.5.2 MONITORING REPORTS

Responsible staff should prepare annual environmental monitoring reports summarizing the results of the program. The report may be based on the verification record sheets and information received from any person or agency regarding compliance. The monitoring report should include at least the following items:

1. Summary of implementation monitoring;
2. Analysis of deficiencies and actions taken to correct them, and;
3. Recommendations for future mitigation measures and other corrective actions needed.

2 INVENTORY OF MITIGATION MEASURES

This section contains all of the required mitigation measures identified in the IS/MND for the South County Infrastructure Project. The mitigation measures are listed in numerical order. The corresponding section in the IS/MND is indicated in parentheses following the issue area.

2.1 AIR QUALITY AND ODORS (IS/MND SECTION III)

Mitigation Measure AQ-1

A. Prior to construction, OPUD or its contractor shall obtain and implement a FRAQMD Dust Control Plan or Construction Notification form in compliance with Rule 3.16 Fugitive Dust.
B. OPUD or its contractor shall obtain and implement an Authority to Construct (ATC) and Permit to Operate (PTO) for the proposed emergency generators above 50 horsepower in accordance with Regulation IV: Stationary Emission Sources Permit System and Registration.
C. OPUD or its contractor additionally shall implement all applicable measures and requirements of FRAQMD Rules and Regulations as determined by the FRAQMD. Additional applicable FRAQMD Rules and Regulations may include: Rule 3.0: Visible Emissions, Rule 3:15: Architectural Coatings, and Rule 7:10: Indirect Source Fee.

Mitigation Measure AQ-2

OPUD will implement, or its construction contractors will implement, the following measures as established by the Standard Construction Mitigation Measures provided in the FRAQMD's Indirect Source Review Guidelines (2010) and FRAQMD Construction Phase Mitigation Measures (FRAQMD 2016) in order to reduce emissions during construction.

A. Develop and submit a fugitive dust control plan to minimize fugitive dust emissions during project construction to FRAQMD for approval.
B. Construction equipment exhaust emissions shall not exceed FRAQMD Regulation Ill, Rule 3.0, Visible Emissions limitations (40 percent opacity or Ringelmann 2.0).
C. The contractor shall be responsible to ensure that all construction equipment is properly tuned and maintained prior to and for the duration of on-site operation.
D. Limit idling time to five minutes
E. Utilize existing power sources (e.g., line power) or clean fuel generators rather than temporary power generators.
F. Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites.
G. Portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, may require California Air Resources Board (CARB) Portable Equipment Registration with the State or a local district permit. The owner/operator shall be responsible for arranging appropriate consultations with the CARB or FRAQMD to determine registration and permitting requirements prior to equipment operation at the site.

H. All grading operations on a project should be suspended when winds exceed 20 miles per hour or when winds carry dust beyond the property line despite implementation of all feasible dust control measures.
I. Work areas shall be watered or treated with Dust Suppressants as necessary to prevent fugitive dust violations.
J. An operational water truck should be available at all times. Apply water to control dust as needed to prevent visible emissions violations and off-site dust impacts. Travel time to water sources should be considered and additional trucks used if needed.
K. On-site dirt piles or other stockpiled material should be covered, wind breaks installed, and water and/or soil stabilizers employed to reduce wind-blown dust emissions. Incorporate the use of approved non-toxic soil stabilizers according to manufacturer's specifications to all inactive construction areas.
L. All transfer processes involving a free fall of soil or other particulate matter shall be operated in such a manner as to minimize the free fall distance and fugitive dust emissions.
M. Apply approved chemical soil stabilizers according to the manufacturers' specifications, to all- inactive construction areas (previously graded areas that remain inactive for 96 hours) including unpaved roads and employee/equipment parking areas.
N. To prevent track-out, wheel washers should be installed where project vehicles and/or equipment exit onto paved streets from unpaved roads. Vehicles and/or equipment shall be washed prior to each trip. Alternatively, a gravel bed may be installed as appropriate at vehicle/equipment site exit points to effectively remove soil buildup on tires and tracks to prevent/diminish track-out.
O. Paved streets shall be swept frequently (water sweeper with reclaimed water recommended; wet broom) if soil material has been carried onto adjacent paved, public thoroughfares from the project site.
P. Provide temporary traffic control as needed during all phases of construction to improve traffic flow, as deemed appropriate by the Department of Public Works and/or Caltrans and to reduce vehicle dust emissions.
Q. Reduce traffic speeds on all unpaved surfaces to 15 miles per hour or less and reduce unnecessary vehicle traffic by restricting access. Provide appropriate training, on-site enforcement, and signage.
R. Reestablish ground cover on the construction site as soon as possible and prior to final occupancy, through seeding and watering.

Mitigation Measure AQ-3

OPUD and its construction contractors shall implement the following measures to reduce, track, and offset construction-related project emissions, consistent with established FRAQMD Construction Phase Mitigation Measures (FRAQMD 2016).

A. Prior to beginning construction activities, OPUD shall assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that will be used an aggregate of 40 or more hours for the construction project.
B. OPUD and its construction contractors shall provide a plan for approval by FRAQMD demonstrating that the heavy-duty (equal to or greater than 50 horsepower) off-road equipment to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average 5 percent ROG reduction, 20 percent NOx reduction and 45 percent particulate reduction compared to the most recent CARB fleet average at time of construction. A Construction Mitigation Calculator (MS Excel) may be

downloaded from the SMAQMD website to perform the fleet average evaluation http://www.airquality.org/ceqa/index.shtml. Acceptable options for reducing emissions may include use of late model engines (Tier 4), CARB Approved low-emission diesel products, alternative fuels, engine retrofit technology (Carl Moyer Guidelines), after-treatment products, voluntary off-site mitigation projects, provide funds for air district off-site mitigation projects, and/or other options as they become available. The FRAQMD should be contacted to discuss alternative measures.

The results of the Construction Mitigation Calculator shall be submitted and approved by the FRAQMD prior to beginning work. OPUD and its construction contractors shall provide a monthly summary of heavy-duty off-road equipment usage to the FRAQMD throughout the construction of the project.

C. OPUD may also contribute to the FRAQMD's Off-Site Mitigation Program to reduce project emissions to less than significant. OPUD shall compile a list of all construction emission sources and consult with the FRAQMD staff to implement this mitigation measure. The project contractors shall track emissions generated from equipment and vehicles throughout construction of the project. If determined necessary by the FRAQMD and before construction activities begin, OPUD shall pay a deposit to FRAQMD for contribution to the FRAQMD Off-site Mitigation Fund. This deposit will be held by FRAQMD and applied toward the final off-site mitigation amount to be paid after project construction is complete. Total construction emissions shall be calculated at the end of construction activities. Using these calculations, OPUD shall make a final payment to the FRAQMD Off-Site Mitigation Fund, if necessary, to further offset construction pollutant emissions that exceeded FRAQMD thresholds. (*Personal communications* with Sondra Spaethe, FRAQMD 2023)

2.2 BIOLOGICAL RESOURCES (IS/MND SECTION IV)

Mitigation Measure BIO-1

Pre-construction special-status species plant surveys shall be conducted by OPUD or its contractor in all impact areas that provide potentially suitable habitat for special-status plants prior to initiating project construction activities. All surveys shall be conducted in accordance with agency-approved survey protocols during the appropriate blooming period. If no special-status species are identified in protocol surveys, no additional mitigation is required. If surveys determine that special-status species occur within impact areas, Mitigation Measure BIO-2 shall apply.

Mitigation Measure BIO-2

If special-status plants are identified within project impact areas, one of the following measures shall apply:

A. If feasible, the project shall be adjusted to avoid impacts to special-status plants. If modifications can be made to avoid special-status species, the installation of protective fencing may be necessary to prevent accidental encroachment. If adjustment of construction areas or methods is not feasible, Mitigation Measure BIO-2B shall apply.

B. If there is no feasible alternative to avoid special-status plant species impacts, OPUD shall mitigate for impacts to special-status plants. A Mitigation Plan shall be prepared and implemented that provides for plant salvage, transplantation, seed collection and replanting,

and/or topsoil collection and replacement as appropriate for the species identified within the project impact area. Transplantation or seed placement shall be within suitable or restored habitat after completion of construction for temporary impacts, or within off-site habitat at a mitigation site for permanent impacts. The Mitigation Plan shall include monitoring requirements to ensure successful establishment of special-status plants, that established performance criteria are achieved, and that no net loss of special-status plants has occurred after the prescribed monitoring period.

Mitigation Measure BIO-3 (Both direct and indirect impacts)

Section 7 Consultation with USFWS shall be conducted to analyze the direct and indirect effects on listed wildlife species and to obtain regulatory permits and authorizations for impacts to listed species and loss of habitat. Measures and requirements outlined in agency authorizations may supersede the following measures.

Mitigation Measure BIO-4 (Indirect impacts)

Trench excavation and stockpiling for pipeline installation shall be entirely located within the paved roadway or disturbed shoulder on Rancho Road in areas where seasonally wet ditches and depressions were mapped adjacent to the roadway. Equipment staging and trench excavation in these areas will be limited to designated workspace areas in the paved roadway and shoulder. To reduce the potential for indirect impacts to seasonally inundated ditches and depressions in close proximity to construction activities, but where no direct impacts will occur, the following measures shall apply:

A. Prior to the initiation of construction, crews shall attend an environmental Awareness Training Program that will include information regarding the potential presence of listed branchiopod species and the importance of avoiding impacts to these species and their habitat.
B. All work shall be conducted during the dry season when potential habitat features on or near the proposed pipeline installation areas are dry.
C. Fencing shall be placed and maintained to delineate the approved work areas and prevent encroachment on seasonally inundated ditch and depression features. A qualified biologist shall oversee the installation of fencing. Once fencing is installed, a biologist will inspect fencing weekly to ensure its integrity and effectiveness.
D. All excavation, construction staging, and stockpiles shall be limited to paved roadways, disturbed shoulder, and approved work areas.
E. Storm water BMPs (silt fencing and straw waddles) shall be placed around construction disturbance and dirt stockpiles to reduce potential for erosion and sedimentation into potential branchiopod habitat features.
F. No application of water (e.g., dust suppression) shall occur in seasonally inundated ditch or depression features without additional measures (such as barriers and/or use of low flow water truck nozzles) in place to keep water out of potential or known VPB habitat features during the dry season.
G. Any groundwater encountered within the trench excavation shall not be discharged to areas where seasonally inundated ditch or depression features are located.

Mitigation Measure BIO-5 (Direct impacts)

If avoidance of habitat features as described in BIO-4 is not feasible and direct impacts (temporary or permanent) will occur to seasonally inundated ditch and depression features, compliance with one of the following mitigation measures (5A or 5B) shall be required:

A. Prior to the initiation of construction, surveys conducted in accordance with USFWS protocols shall be conducted in all potentially suitable habitat to be impacted. If protocol surveys determine that the seasonally inundated ditch and depression features are not occupied by federally listed vernal pool branchiopod species, no further mitigation is required for impact to species habitat (mitigation for jurisdictional aquatic features consistent with Mitigation Measures BIO-1 and BIO-2 may still apply). If protocol surveys detect the presence of federally listed species, then the following measures shall be implemented:

    1. Prior to the initiation of construction, construction crews shall attend an Environmental Awareness Training Program that will include information regarding the potential presence of listed vernal pool branchiopod species and the importance of avoiding impacts to these species and their habitat.
    2. All work shall be conducted during the dry season when potential habitat features on or near the proposed pipeline installation areas are dry.
    3. Fencing shall be placed and maintained around any avoided (preserved) seasonally inundated ditch and depression features to prevent encroachment. A qualified biologist shall oversee the installation of fencing. Once fencing is installed, a biologist will inspect fencing weekly to ensure its integrity and effectiveness.
    4. A USFWS approved biologist shall monitor construction activities in known or potential vernal pool branchiopod habitat that results in temporary or permanent impacts.
    5. For temporary impacts that will be restored after construction, a Site Restoration Plan outlining requirements for topsoil collection, preservation, and restoration will be prepared and approved by the USFWS. Implementation of the approved Plan shall include the following requirements at minimum. Prior to excavation in locations with potential or known vernal pool branchiopod habitat, the uppermost soil layer that may contain branchiopods eggs (cysts) shall be collected, labelled, and stored under appropriate climatic conditions until construction in temporary impact areas is complete. Once construction is complete, topsoil shall be placed back in the feature from which it was collected.
    6. For permanent impacts, loss of vernal pool branchiopod habitat shall be mitigated through the use of USFWS approved mitigation credits in accordance with mitigation ratios approved by the USFWS.

B. If OPUD or its contractor chooses not to conduct protocol-level surveys, they may assume presence of listed vernal pool branchiopod species within seasonally inundated ditch and depression features that provide potentially suitable habitat. If presence of listed species is assumed, then measures BIO-5A (1) through (6) as set forth above shall apply to mitigate impacts to a less-than-significant level.

Mitigation Measure BIO-6

A. Prior to the initiation of construction, implement Mitigation Measure BIO-3. Measures and requirements outlined in agency authorizations may supersede the following measures.

B. A 20-foot exclusion zone extending from the dripline of the shrub shall be maintained during construction in all directions away from the pavement. The exclusion zone will be reduced on the pavement side of the shrub to the edge of gravel roadway shoulder so that the fencing will not interfere with the roadway. Consistent with measures outlined by the USFWS to mitigate potential impacts to VELB, the following measures shall be implemented:

   1. Fence and flag the elderberry shrub to be avoided and provide a minimum setback of at least 20 feet from the dripline of the elderberry plant for ground disturbance activities (e.g., trenching) to ensure that activities will not damage or kill the elderberry shrub. Due to its location at the edge of pavement on Forty Mile Road, the 20-foot setback will be adjusted (reduced) consistent with the edge of the gravel road shoulder so that fencing does not interfere with the paved roadway.
   2. Prior to the initiation of any construction, environmental training shall brief the contractors and key employees of the need to avoid any impacts to elderberry plants, and to advise them of penalties associated with damage or destruction of the plants. The work crew shall be instructed regarding the status of the VELB and the need to protect its elderberry host plant, and possible penalties for non-compliance with avoidance and minimization measures.
   3. A qualified biologist shall monitor the work area at project-appropriate intervals to assure that all avoidance and minimization measures are implemented. The amount and duration of monitoring will depend on the timing of project activities, and shall be determined in coordination with the USFWS biologist.
   4. As much as feasible, all activities within 165 feet of the elderberry shrub will be conducted outside the flight season of the VELB (March-July).
   5. No insecticides, herbicides, fertilizers, or other chemicals that might harm the VELB or its host plant shall be used within 100 feet of the elderberry plant with a stem measuring 1.0 inch or greater in diameter at ground level.
   6. Mechanical vegetation removal within the dripline of the elderberry shrub shall be limited to the season when adult VELB are not active (August-February) and shall avoid damaging the elderberry.
   7. Erosion control will be implemented, and the affected construction area shall be revegetated with appropriate native plants.

Mitigation Measure BIO-7

Implement the following measures:

A. Prior to the initiation of construction, construction staff shall attend an Environmental Awareness Training Program that will include information regarding identification of giant gartersnake and its habitat, protection measures for the species, and procedures to follow if a giant gartersnake or unknown snake is observed.
B. Construction of Lift Station 23 will occur when the rice field is inactive and has been dry for a minimum of 15 days.
C. Construction of Lift Station 22, Lift Station 23, and the HDD installation of pipelines under Kimball Creek, including all activities within 200 feet of Kimball Creek and the rice field at Lift Station 23, shall be restricted to the period between May 1 and October 1. This is the active period for GGS when the potential for direct mortality is reduced because GGS can actively avoid disturbance.

D. Prior to the start of the Kimball Creek HDD, construction of Lift Station 22, or the construction of Lift Station 23, a qualified biologist shall conduct a preconstruction survey for GGS at these locations prior to the initiation of disturbance. Exclusion fencing shall be installed, as directed by the qualified biologist, to isolate the workspace within 200 feet of suitable aquatic habitat and exclude snakes from the work areas. Exclusion fencing will be buried at the base to prevent snakes from moving under the fence into the construction area. Exclusion fencing shall be maintained for the duration of work in these areas and shall be routinely inspected by the qualified biologist to ensure the fencing is intact and effective. The workspace shall be inspected prior to the start of work each day to ensure that no snakes have entered the work area.
E. If a GGS is observed, the USFWS and CDFW shall be notified immediately. Construction will be suspended in the area until the snake leaves the site of its own volition.
F. All excavations within 200 feet of suitable GGS habitat shall be covered or have escape ramps installed to prevent entrapment prior to the end of work each day. These excavations shall be inspected by the qualified biologist prior to the start of work the following day.
G. Erosion control materials shall consist of tightly woven fibers and netting to prevent entanglement of reptiles and amphibians. No monofilament materials will be allowed.
H. For permanent impacts associated with construction of Lift Station 22 and Lift Station 23, loss of suitable GGS habitat shall be mitigated through the use of USFWS and CDFW approved mitigation credits or fee title acquisition with a conservation easement to protect managed marsh habitat in accordance with mitigation ratios approved by the USFWS and CDFW.

Mitigation Measure BIO-8

Implement the following measures:

A. A preconstruction survey for western pond turtle shall be conducted no more than 48 hours prior to the start of construction within 150 feet of the drainages or other suitable wetland habitat. If no western pond turtles are observed, no further mitigation would be necessary.
B. If a western pond turtle is observed within the project area, a qualified biologist shall relocate the individual to a suitable habitat location outside of the construction area.
C. If a pond turtle nest is identified, exclusion fencing shall be placed a minimum of 25 feet around the nest and disturbance to the area will be avoided until the hatchlings have emerged. The nest will be monitored daily by the qualified biologist to ensure nestlings emerge to a suitable habitat area safely outside the construction zone.

Mitigation Measure BIO-9 (Nest disturbance)

A. If construction or vegetation removal work occurs outside of Swainson's hawk nesting season (August 31 to Feb 1), impacts to the Swainson's hawk would be avoided. Surveys would not be required for work conducted during that part of the year, and no further mitigation for nest disturbance would be required.
B. If project activities occur between February 1 to August 31, surveys shall be conducted by a qualified biologist for active Swainson's hawk nests. OPUD or its contractor shall conduct a protocol-level survey in conformance with the "Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley," Swainson's Hawk Technical Advisory Committee (https://www.wildlife.ca.gov/conservation/survey-protocols#377281284-birds) (May 31, 2000) hereby incorporated by reference. This protocol prescribes minimum standards for survey equipment, mode of survey, angle and distance to

tree, speed, visual and audible clues, distractions, notes and observations, and timing of surveys. If the surveys show that there are no active Swainson's hawk nests within 0.25-mile of construction activities, no further mitigation for nest disturbance will be required. If active Swainson's hawk nests are identified near the project area, a 0.25-mile nest protection buffer shall be identified, and the following measures shall be required:

1. Apply a nest protection buffer with a minimum distance of 0.25-mile from an active nest. Postpone project activities within the nest protection buffer until after the young have fledged and are no longer dependent on the nest tree. The minimum nest protection buffer may be reduced in coordination with CDFW if existing site conditions, habituation to disturbance, proposed disturbance levels, and nest concealment or barriers between the nest and activities indicate a reduced buffer would be effective.
2. If it is not possible to postpone project activities within the minimum nest protection buffer, construction activities may proceed with CDFW approval and monitoring of the nest by a qualified raptor biologist. If the monitoring biologist observes signs of distress, they shall have the authority to stop construction work and coordinate with CDFW to establish additional protection measures to ensure avoidance of nest abandonment prior to the re-start of project activities.

C. A written report summarizing the pre-construction survey results shall be provided to CDFW within 30 days of survey completion.

Mitigation Measure BIO-10 (Foraging habitat)

If nesting occurrences of Swainson's hawks occur within 10 miles of the permanent impact areas (e.g., pump station, lift station, and WP sites) mitigation for loss of foraging habitat shall be required. Generally, CDFW requires mitigation for loss of Swainson's hawk foraging habitat based on the presence of active nests within 10 miles of the project. If an active nest site occurs within ten miles of the project, OPUD or its contractor will be required by CDFW to provide off-site foraging habitat management lands at a specified Mitigation Ratio that is based on nest proximity to the project site, as follows:

Distance from Project Boundary	Mitigation Acreage Ratio*
Within 1 mile	1.00:1**
Between 1 and 5 miles	0.75:1
Between 5 and 10 miles	0.50:1
*Ratio means [acres of mitigation land] to [acres of foraging habitat impacted]. **This ratio shall be 0.5:1 if the acquired lands can be actively managed for prey production.	

CDFW provides options for off-site habitat management by fee title acquisition or conservation easement acquisition with a CDFW-approved management plan, and by the acquisition of comparable habitat. Mitigation credits may be obtained through a CDFW-approved mitigation bank for Swainson's hawk with a service area that covers the project site.

Mitigation Measure BIO-11

A. A pre-construction survey of areas providing suitable burrowing owl habitat within 1,640 feet (500 meters) of construction at the WWTP shall be conducted by a qualified raptor biologist within 14 days prior to ground disturbance. Surveys shall follow guidelines outlined by CDFW in the Staff Report on Burrowing Owl Mitigation (CDFW 2012). If the required

pre-construction surveys show there are no active burrowing owl nests within the 1,640 feet (500 meters) of construction activities, no further mitigation for burrowing owl nest disturbance will be required.

B. If an occupied burrow is discovered during pre-construction surveys, a protective buffer consistent with CDFW guidelines shall be established. Appropriate protective buffers depend on the type of burrowing owl occurrence (nesting or overwinter), level of project disturbance, and time of year that the disturbance occurs. Nest protective buffers consistent with CDFW guidelines are outlined below.

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting Site	April 1 – Aug 15	200 m	500 m	500 m
Nesting Site	Aug 16 – Oct 15	200 m	200 m	500 m
Nesting Site	Oct 16 – March 31	50 m	100 m	500 m

A reduced buffer may be implemented upon CDFW approval and based upon site specific conditions, nesting phenology, and the recommendation of the qualified biologist.

C. A written report summarizing the pre-construction survey results shall be provided to OPUD and CDFW within 30 days of survey completion.

D. If occupied burrows cannot be avoided, OPUD or its contractor shall conduct a survey during the non-nesting season (September 30 through January 31) to identify occupied burrows within the disturbance footprint, exclude burrowing owls from burrows within the disturbance footprint, and then collapse the burrows in accordance with methodology outlined by the CDFW. Burrowing owl exclusion and burrow collapse must be conducted in coordination with CDFW and with the approval of CDFW.

Mitigation Measure BIO-12

A. If construction or vegetation removal work occurs outside of nesting season (August 31 to Feb 1), impacts would be avoided. Surveys would not be required for work conducted during this part of the year, and no further mitigation for nest disturbance would be required.

B. If vegetation removal or construction activities occur between February 1 to August 31, pre-construction surveys shall be conducted by a qualified biologist of suitable habitat within 500 feet of worksites and disturbance areas for passerines, and within 0.25-mile of worksites and disturbance areas for raptors. Pre-construction surveys shall be conducted within 14 days prior to the start of construction of vegetation removal. If nests are identified, a suitable nest protection buffer shall be recommended by the qualified biologist based on the species, nest phenology, and site-specific conditions. Construction activities shall be prohibited within the established buffer zones until the young have fledged. If a lapse in project-related activities occurs for 14 days or longer during the nesting season, another focused survey shall be conducted before construction activities can be reinitiated.

C. A written report summarizing the pre-construction survey results shall be provided to OPUD and CDFW within 30 days of survey completion.

Mitigation Measure BIO-13

A. Prior to the initiation of construction, OPUD or its contractor shall conduct a preliminary aquatic resource delineation of the project site to define the limits of jurisdictional areas and

determine the extent of project impacts. The delineation will be verified by the Corps. The verified delineation will provide OPUD with the impact acreage necessary for preparing a Waters of the US/Wetland Mitigation Plan and/or permit application if impacts to jurisdictional areas cannot be avoided. If the project can fully avoid delineated aquatic resources, no further mitigation would be required. If the project cannot fully avoid delineated aquatic resources, Mitigation Measure BIO-13 B will apply.

B. If project impacts to federal and State jurisdictional areas are identified, OPUD shall obtain all necessary permits for impacts to Waters of the US and wetlands from the Corps and RWQCB and/or for potential impacts to stream features from CDFW prior to project implementation. Implementation of the project shall comply with all permit conditions. Compensatory mitigation must be consistent with the Corps' standards pertaining to mitigation type, location, and ratios, but will be accomplished with a minimum of 1:1 replacement ratio.

   If compensatory mitigation is needed, OPUD may satisfy all or a portion of Waters of the US and wetlands mitigation through the purchase of "credits" at a mitigation bank approved by the Corps, RWQCB, and/or CDFW for compensatory mitigation of impacts to hydrologically similar Waters of the US, or through other means, such as on- or off-site wetland creation, conservation easement, contribution to approved in-lieu habitat fund, etc. The Mitigation Plan must be approved by the permitting agencies, and shall be implemented by OPUD subsequent to plan approval.

Mitigation Measure BIO-14

The proposed HDD installations under regulated drainages have a small potential to "frac out" or inadvertently release drilling muds to the surface during drilling operations. Because of the potential for a frac-out to impact waters and wetlands at the drainage crossings, OPUD or its contractor shall prepare and implement an Inadvertent Returns Contingency Plan that outlines the measures that will be taken to prevent inadvertent returns, and outlines the response measures to be employed and response equipment to be maintained on site for use in the unlikely event of an inadvertent return during drilling operations.

2.3 CULTURAL RESOURCES (IS/MND SECTION V)

Mitigation Measure CUL-1

A. If buried cultural resources such as chipped or ground stone, midden deposits, historic debris, building foundations, human bone, or paleontological resources are inadvertently discovered during ground-disturbing activities, work shall stop in that area and within 100 feet of the find until a qualified archaeologist or paleontologist can assess the significance of the find and, if necessary, develop responsible treatment measures in consultation with Yuba County and other appropriate agencies.

B. If remains of Native American origin are discovered during proposed project construction, it shall be necessary to comply with state laws concerning the disposition of Native American burials, which fall within the jurisdiction of the Native American Heritage Commission (NAHC). If any human remains are discovered or recognized in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

   - The County coroner has been informed and has determined that no investigation of the cause of death is required; and

- If the remains are of Native American origin:
  - √ The most likely descendants of the deceased Native Americans have made a recommendation to the landowner or person responsible for the excavation work for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in PRC 5097.98; or
  - √ The NAHC has been unable to identify a descendant, or the descendant failed to make a recommendation within 24 hours after being notified.

C. According to the California Health and Safety Code, six or more human burials at one location constitute a cemetery (Section 8100), and disturbance of Native American cemeteries is a felony (Section 7052). Section 7050.5 requires that construction or excavation be stopped in the vicinity of discovered human remains until the coroner can determine whether the remains are those of a Native American. If the remains are determined to be Native American, the coroner must contact the NAHC.

2.4 ENERGY (IS/MND SECTION VI)

Mitigation Measure EN-1

Implement Mitigation Measures AQ2 (b-f, and p) and AQ-3 (b and c).

2.5 GEOLOGY AND SOILS (IS/MND SECTION VII)

Mitigation Measure GEO-1

Implement Mitigation Measures HYD-1, HYD-2, and HYD-3.

Mitigation Measure GEO-2

A. In additional to civil drawing for the project, a final geotechnical engineering report for the proposed project shall be produced by a California Registered Civil Engineer or Geotechnical Engineer and submitted to Yuba County for review. The geotechnical engineering report measures shall address construction conditions, including but not limited to: excavation conditions, site clearing specifications, ground and subgrade preparation, general fill placement and compaction, dewatering, and foundations. Following approval in the geotechnical report by Yuba County, construction shall be completed in accordance with the geotechnical recommendations in the report, Yuba County Standard Specifications, and Cal OSHA requirements. Proof shall be provided for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the report. (Preliminary geotechnical recommendations are included in Appendix E of this Initial Study).

B. The Contractor shall retain an engineer to evaluate the impact of construction traffic vibrations, actual soil conditions exposed in the open excavations, seepage and/or groundwater conditions, surcharges adjacent to excavations, proximity of excavations to existing structures, and other factors that may promote excavation wall instability or cause excavation related damage to existing facilities and improvements and adjust excavation sloping/shoring methods accordingly.

Mitigation Measure GEO-3

Consistent with Yuba County 2030 General Plan policies, if potential paleontological resources are found during construction, work shall stop and consultation is required to avoid further

impacts. If potential paleontological resources are detected during construction, work shall stop and consultation shall be required to avoid further impacts. Actions after work stoppage will be designed to avoid significant impacts to the greatest extent feasible. These measures should include construction worker education, consultation with a qualified paleontologist, coordination with experts on resource recovery and curation of specimens, and/or other measures, as appropriate.

2.6 GREENHOUSE GAS EMISSIONS (IS/MND SECTION VIII)

Mitigation Measure GHG-1

Implement Mitigation Measures AQ-1, AQ-2, and AQ-3.

2.7 HAZARDS AND HAZARDOUS MATERIALS (IS/MND SECTION IX)

Mitigation Measure HAZ-1

A. Prohibit or restrict equipment refueling, fluid leakage, equipment maintenance, and road surfacing activities near wetlands and other sensitive areas. Require placement of fuel storage and refueling sites in safe areas well away from wetlands and other sensitive habitats. Safe areas include paved or cleared roadbeds, within contained areas such as lined truck beds, or other appropriate fuel containment sites. Inspect equipment and vehicles for hydraulic and oil leaks regularly. Require the use of drip pans below equipment stored onsite. Require that vehicles and construction equipment are in good working condition, and that all necessary onsite servicing of equipment be conducted away from wetlands or other sensitive areas.

B. Require all contractors to possess, and all vehicles to carry, emergency spill containment materials. Absorbent materials should be on hand at all times to absorb any minor leaks and spills.

Mitigation Measure HAZ-2

The contractor shall conduct all grading operations in accordance with the Department of Toxic Substances, Caltrans Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils (Agreement), June 30, 2016, and with the awareness that lead impacted soils are present on McGowan Parkway and Rancho Road. Construction project documents shall include a site-specific Health and Safety Plan and special Soil Management Plan (SMP) to address elevated levels of lead along McGowan Parkway and Rancho Road. The SMP shall be in accordance with all applicable Cal/OSHA requirements and, at a minimum, the SMP shall include measures to control worker exposure to soil, airborne dust, and control runoff along both McGowan Parkway and Rancho Road.

Mitigation Measure HAZ-3

The contractor shall use general dust controls during paint striping removal on McGowan Parkway Road. In addition, the contractor shall include measures to minimize dust or debris leading to or near storm drains, waterways, and other sources of water during construction activities that include removal of paint striping.

Mitigation Measure HAZ-4

Implement Mitigation Measure TRA-1.

2.8 HYDROLOGY, WATER QUALITY, AND SOIL EROSION (IS/MND SECTION X)

Mitigation Measure HYD-1

A. OPUD or its contractor shall submit Permit Registration Documents (PRD) for the Construction General Permit Order 2009-0009-DWQ to the State Water Resources Control Board, and comply with, and implement, all requirements of the permit. A Legally Responsible Person (LRP) shall electronically submit PRDs prior to commencement of construction activities in the Storm Water Multi-Application Report Tracking System. PRDs consist of the Notice of Intent, Risk Assessment, Post-Construction Calculations, a Site Map, the Storm Water Pollution Prevention Plan (SWPPP), a signed certification statement by the LRP, and the first annual fee. Following submittal of a Notice of Intent package and development of a SWPPP in accordance with the Construction General Permit, OPUD or its contractor will receive a Waste Discharge Identification Number from the SWRCB. All requirements of the site-specific SWPPP, including any revisions, shall be included in construction documents for the project. Prior to the initiation of any construction, proof of registration shall be submitted to the Yuba County Director of Public Works for review and approval and shall remain on the project site during all phases of construction.

B. For those project components within the Olivehurst urban area, OPUD or its contractor will apply for and obtain an Erosion and Sediment Control Plan in accordance with Yuba County Department of Public Works Improvement Standards and Specifications, and implement all identified erosion control measures set forth in the Plan.

Mitigation Measure HYD-2

Groundwater elevations were taken during the geotechnical exploration phase of the project design, and noted in the Geotechnical Data Report. However, groundwater elevations in the project areas will vary by season, and it is known that overall groundwater elevations in the South Yuba Basin are trending to rising slightly since surface water has been substituted for groundwater for agricultural use in the project area. OPUD or its contractor shall monitor groundwater and conduct construction operations in a manner intended to avoid pumping for groundwater control, using one or more of the following sub-measures:

A. Monitor groundwater elevations on a seasonal basis, and construct improvements (for all project components, but specifically auger bores, pump and lift station wet wells, and pipelines) during those time periods when pumping for groundwater control can be avoided.
B. If possible, given the depth of encountered groundwater, tremie concrete could be used in the bottom of pump and lift station wet wells, or
C. In the event that groundwater pumping is to be pursued by OPUD or its contractor, OPUD or the contractor shall apply for and obtain a Low Threat Discharge Permit and any other permits necessary for such pumping. Permits that may be required include NPDES permit requirements and CVRWQCB requirements, which may include the approval of a Dewatering Permit. Appropriate groundwater handling and disposal would be ensured as part of the SWPPP for the project and would include collection and treatment measures prior to discharge.

Mitigation Measure HYD-3

A. Implement Mitigation Measure HYD-1 and include the proposed water well and its settling basin within the NPDES permit.

B. In coordination with Yuba County, all construction activities shall implement stormwater pollution prevention Best Management Practices (BMP) designed to reduce potential impacts to water quality during construction of the water well, including, but not limited to:
   1. Protecting adjacent properties and waterways from the discharge of sediment or other contaminants from the well construction site,
   2. Scheduling as much project work as possible during the dry season,
   3. Using other BMPs as necessary, including applying rainy season erosion controls, managing stockpiles, disposing of well development water properly, and correctly managing and disposing of construction wastes,
   4. Maintaining all Best Management Practices, and
   5. Stabilizing the site after construction is complete, including removing sediment from the settling basin.

2.9 NOISE (IS/MND SECTION XIII)

Mitigation Measure NSE-1

To reduce the effects of construction noise on affected residents, the project contractor shall implement the following measures for all project components:

A. All work necessary to implement the project components will be performed between the hours of 7:00 a.m. and 7:00 p.m. Monday through Sunday.
B. All equipment will be equipped with appropriate muffler devices to reduce the noise impacts of the construction operations.
C. Prior to the initiation of construction, OPUD or its contractor shall consult with the Yuba County Community Development and Services Agency (CDSA) to determine whether proposed construction activities would require an exemption permit pursuant to Chapter 8.20.710 of the Yuba County Code. If it is determined that such a permit would be necessary or beneficial, OPUD or its contractor will submit a permit application to the CDSA and abide by the terms of the permit.

2.10 TRANSPORTATION (IS/MND SECTION XVII)

Mitigation Measure TR-1

Prior to the initiation of construction, OPUD or its contractor will obtain encroachment permits from Yuba County and Caltrans for work within the County and State rights of way. OPUD or its contractor will prepare a Traffic Control Plan/Plans that meets the requirements of Yuba County and Caltrans. For Yuba County, the TCP shall meet the current TCP Checklist and TCP Conditions of Acceptance requirements of Yuba County. The TCP shall include all required topics, including: traffic handling during each stage of construction, maintaining emergency service provider access by, if necessary, providing alternate routes, repositioning emergency equipment, or coordinating with nearby service providers for coverage during construction closures, and covering trenches during the evenings and weekends. A component of the TCP will involve public dissemination of construction-related information through notices to the nearby residences, press releases, and/or the use of changeable message signs. The project contractor will be required to notify all affected residents, post the construction impact schedule, and place articles and/or advertisements in appropriate local newspapers regarding construction impacts and schedules.

3 IMPLEMENTATION SCHEDULE AND CHECKLIST

This section contains an abbreviated description of each mitigation measure presented in tabular, checklist format. A complete description of each measure is contained in the preceding Chapter 2, *Inventory of Mitigation Measures*, contained within this document.

The mitigation measures to be implemented by the project applicant(s) and successors in interest are separated into the following phases:

- Prior to Construction
- During Construction
- Post Construction
- Prior to Operations
- Ongoing Operations

A summary of the checklist is presented below. Some measures have components that are to be implemented during several project phases. These measures are noted in each category. For mitigation measures that require implementation of a different mitigation measure required for the project, only the measure monitored is listed below.

Timing of Implementation of Measure	Mitigation Measure Number
Prior to Construction	AQ-1a, AQ-1b, AQ-1c, AQ-2, AQ-3, BIO-1, BIO-2, BIO-3, BIO-4, BIO5A, BIO-5B, BIO-6, BIO-7, BIO-8A, BIO-8B, BIO-8C, BIO-9B, BIO-9C, BIO-10, BIO-11A, BIO-11B, BIO-11C, BIO-11D, BIO-12A, BIO-12B, BIO-12C, BIO-12D, BIO-13A, BIO-13B, BIO-14, ENR-1, GEO-1, GEO-2, GHG-1, HAZ-2, HAZ-4, HYD-1, HYD-2, HYD-3, NSE-1, TR-1
During Construction	AQ-1a, AQ-1b, AQ-1c, AQ-2, AQ-3, BIO-2, BIO-3, BIO-4, BIO 5, BIO-6, BIO-7, BIO-8, BIO-9A, BIO-9B, BIO-9C, BIO-10, BIO-11B, BIO-11C, BIO-12A, BIO-12B, BIO-12C, BIO-12D, BIO-13B, BIO-14, CUL-1A, CUL-1B, CUL-1C, ENR-1, GEO-1, GEO-2, GEO-3, GHG-1, HAZ-1, HAZ-2, HAZ-3, HAZ-4, HYD-1, HYD-2, HYD-3, NSE-1, TR-1
Post Construction	AQ-3, BIO-2, BIO-3, BIO-5A, BIO-5B, BIO-6, BIO-10, BIO-13B, GEO-1, GEO-2, HYD-1, HYD-3,
Prior to Operations	AQ-1b, GHG-1
Ongoing Operations	AQ-1b, AQ-1c, GHG-1

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project
Mitigation Measure Implementation Schedule and Monitoring Checklist

Timing of Verification (To occur prior to or during the following actions)	Measure Complete? (check)	Mitigation Measures	Responsibility - Implementation	Responsibility - Monitoring
Prior to Construction, During Construction		Mitigation Measure AQ-1a (Construction dust): Obtain and implement a FRAQMD approved Dust Control Plan or Construction Notification in compliance with Rule 3.16, Fugitive Dust.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction, During Construction, Prior to Operations, Ongoing Operations		Mitigation Measure AQ-1b (Emergency generators): Obtain an Authority to Construct (ATC) and Permit to Operate (PTO) for the proposed emergency generators above 50 horsepower.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction, During Construction, Ongoing Operations		Mitigation Measure AQ-1c (Compliance with FRAQMD rules): Coordinate with FRAQMD to confirm applicable FRAQMD rules. Implement all applicable rules.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction, During Construction		Mitigation Measure AQ-2 (Compliance with FRAQMD construction rules): Coordinate with FRAQMD to confirm applicable construction-phase rules. Implement all applicable rules during construction.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction, During Construction, Post Construction		Mitigation Measure AQ-3 (Compliance with FRAQMD construction phase mitigation measures): Compile construction fleet information; Achieve emissions reduction targets; Complete the Construction Emissions Calculator and provide results to FRAQMD; Provide FRAQMD with a monthly summary of fleet usage; Participate in FRAQMD's Off-site Mitigation Fund.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction		Mitigation Measure BIO-1 (Special status plants): Complete pre-construction special status plant species surveys; If surveys identify the presence of plants, implement mitigation measure BIO-2.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-2 (Special status plants): Modify project elements to avoid special status plant species. If this is not possible, prepare and implement a Mitigation Plan.	Construction Manager, Construction Contractor	OPUD, CDFW

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project
Mitigation Measure Implementation Schedule and Monitoring Checklist

Timing of Verification (To occur prior to or during the following actions)	Measure Complete? (check)	Mitigation Measures	Responsibility - Implementation	Responsibility - Monitoring
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-3 (Vernal pool invertebrates): Complete Section 7 Consultation. Implement all needed regulatory permits and authorizations.	Construction Manager, Construction Contractor	OPUD, USFWS, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-4 (Vernal pool invertebrates): Limit pipeline installation and equipment staging to paved roadways or disturbed shoulders.	Construction Manager, Construction Contractor	OPUD, USFWS,, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-4A – G (Vernal pool invertebrates): Implement worker training and measures to reduce adverse effects, including dry season construction, oversight by a biologist, fencing, stormwater BMPs, water application limitations, and the discharge of groundwater	Construction Manager, Construction Contractor	OPUD USFWS
Prior to Construction, During Construction		Mitigation Measure BIO-5A (Vernal pool invertebrates): Conduct protocol surveys to determine whether ditch and depression features are inhabited by special status vernal pool species. If no brachiopods are present, no further mitigation is required.	Construction Manager, Construction Contractor	OPUD, USFWS
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-5A 1-6 (Vernal pool invertebrates): If surveys determine the presences of federally listed species, implement worker training and measures to reduce adverse effects, including dry season construction, oversight by a USFWS approved biologist, and fencing. Prepare and implement a Site Restoration Plan including collection of top soils. If impacts are permanent, obtain mitigation credits.	Construction Manager, Construction Contractor	OPUD, USFWS
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-5B (Vernal pool invertebrates): Alternatively, OPUD or its contractor can assume presence of vernal pool invertebrates and implement measure BIO-5A 1-6.	Construction Manager, Construction Contractor	OPUD, USFWS
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-6 (VELB): Implement Mitigation Measure BIO-3. Provide a 20-foot exclusion zone around the elderberry shrub. Implement working training and avoidance measures including fencing and flagging, monitoring by a biologist; limiting activities, minimizing the use of insecticides, herbicides, etc., limiting the use of removal equipment, and erosion control.	Construction Manager, Construction Contractor	OPUD, USFWS

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project
Mitigation Measure Implementation Schedule and Monitoring Checklist

Timing of Verification (To occur prior to or during the following actions)	Measure Complete? (check)	Mitigation Measures	Responsibility - Implementation	Responsibility - Monitoring
Prior to Construction, During Construction		Mitigation Measure BIO-7 (Giant gartersnake): Implement worker training and the following measures - limitations on the timing of construction for LS-22, LS-23, adjacent rice fields and HDD activities near Kimball Creek, completion of preconstruction and during-construction surveys, notification of USFWS and CDFW of the presence of giant gartersnake, installation of escape ramps, and use of proper erosion control materials.	Construction Manager, Construction Contractor	OPUD, USFWS, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-8A (Western pond turtle): complete time-limited preconstruction surveys if construction will occur near wetland habitat. If no turtles are identified, no further mitigation is necessary.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction		Mitigation Measures BIO-8B & C (Western pond turtle): If a pond turtle is revealed by surveys, relocate the turtle prior to the initiation of construction. If a pond turtle nest is identified, place exclusion fencing around the nest. A biologist shall monitor the nest on a daily basis until the young have safely relocated to an area outside of the construction zone.	Construction Manager, Construction Contractor	OPUD, CDFW
During Construction		Mitigation Measure BIO-9A (Swainson's hawk nest disturbance): For construction or removal of vegetation between August 31 and Feb. 1, no further mitigation would be required.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction		Mitigation Measure BIO-9B & C (Swainson's hawk nest disturbance): Outside of the August/February period, conduct nesting surveys. If no hawks are nesting within 0.25 miles of construction activities, no additional mitigation would be necessary. Submit survey results to CDFW.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-9B & C (Swainson's hawk nest disturbance): If hawks are nesting within 0.25 miles of construction activities, identify and implement a nest protection buffer or consult with CDFW to implement other protective measures. Submit survey results to CDFW.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-10 (Swainson's hawk foraging habitat): Complete a preconstruction survey to determine if hawk nests are located within 10 miles of construction activities. If so, provide off-site foraging habitat management lands.	Construction Manager, Construction Contractor	OPUD, CDFW

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project
Mitigation Measure Implementation Schedule and Monitoring Checklist

Timing of Verification (To occur prior to or during the following actions)	Measure Complete? (check)	Mitigation Measures	Responsibility - Implementation	Responsibility - Monitoring
Prior to Construction		Mitigation Measure BIO-11A & C (Burrowing Owl Habitat): Prior to construction at the WWTP, complete preconstruction surveys. Submit survey results to CDFW. If surveys indicate that no active burrowing owl nests within 1,640 feet of construction activities, no additional mitigation is required.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-11B & C (Burrowing Owl Habitat): If the survey identifies an occupied burrow, establish and maintain a protective buffer within which no construction will occur pursuant to CDFW guidelines.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction		Mitigation Measure BIO-11D (Burrowing Owl Habitat): If occupied burrows cannot be avoided, consult with CDFW to permit an exclusion and burrow collapse program.	Construction Manager, Construction Contractor	OPUD, CDFW
Prior to Construction, During Construction		Mitigation Measure BIO-12A & C (Nesting birds): For construction or removal of vegetation between August 31 and Feb. 1, no further mitigation would be required	Construction Manager, Construction Contractor	OPUD, CDFW, USFWS
Prior to Construction, During Construction		Mitigation Measure BIO-12B & C (Nesting birds): Outside of this period, conduct nesting surveys. If passerines are nesting within 500 feet or nesting raptors are nesting within 0.25 miles of construction activities, establish protection barriers within which no construction will occur prior to fledging. Submit survey results to CDFW.	Construction Manager, Construction Contractor	OPUD, CDFW, USFWS
Prior to Construction		Mitigation Measure BIO-13A (Aquatic resources): Conduct a preliminary aquatic resources delineation for verification by ACOE. Prepare and implement a Waters of the US/Wetland Mitigation Plan and/or permit application. If construction can fully avoid delineated aquatic resources, no further mitigation would be required.	Construction Manager, Construction Contractor	OPUD, ACOE, CVRWQCB, CDFW, USFWS
Prior to Construction, During Construction, Post Construction		Mitigation Measure BIO-13B (Aquatic resources): Conduct a preliminary aquatic resources delineation for verification by ACOE. If project impacts cannot be avoided, obtain all necessary federal and State permits, and implement all permit conditions, including compensatory mitigation.	Construction Manager, Construction Contractor	OPUD, ACOE, CVRWQCB, CDFW, USFWS

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project
Mitigation Measure Implementation Schedule and Monitoring Checklist

Timing of Verification (To occur prior to or during the following actions)	Measure Complete? (check)	Mitigation Measures	Responsibility - Implementation	Responsibility - Monitoring
Prior to Construction, During Construction		Mitigation Measure BIO-14 (Frac out): Prepare and implement an Inadvertent Returns Contingency Plan for all locations where trenchless construction methods are being used.	Construction Manager, Construction Contractor	OPUD, ACOE, CVRWQCB, CDFW
During Construction		Mitigation Measure CUL-1A (Inadvertent discovery of cultural or historic resources): In the event of the discovery of buried cultural resources, stop work, and obtain a professional archaeologist or historian to evaluate the discovery and identify any needed treatment measures.	Construction Manager, Construction Contractor	OPUD
During Construction		Mitigation Measure CUL-1B & C (Inadvertent discovery of human remains): In the event of the discovery of human remains, stop work, and contact the County Coroner and the NAHC; comply with State laws for the treatment of Native American origin.	Construction Manager, Construction Contractor	OPUD, Yuba County Coroner, NAHC
Prior to Construction, During Construction		Mitigation Measure ENR-1: Implement Mitigation Measures AQ-2 (b-f, and p) and AQ-3 (b and c). See above.	Construction Manager, Construction Contractor	OPUD, FRAQMD
Prior to Construction, During Construction, Post Construction		Mitigation Measure GEO-1: Implement Mitigation Measures HYD-1, HYD-2, and HYD-3. See below.	Construction Manager, Construction Contractor	OPUD, CVRWQCB, Yuba County DPW
Prior to Construction, During Construction, Post Construction		Mitigation Measure GEO-2: Prepare a final geotechnical engineering report for all project elements. Ensure that all earthwork has been performed in conformity with recommendations contained in the report.	Construction Manager, Construction Contractor	OPUD
During Construction		Mitigation Measure GEO-3: , If potential paleontological resources are found during construction, stop work and consult with a paleontologist to avoid further impacts.	Construction Manager, Construction Contractor	OPUD

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project Mitigation Measure Implementation Schedule and Monitoring Checklist				
Timing of Verification (To occur prior to or during the following actions)	**Measure Complete? (check)**	**Mitigation Measures**	**Responsibility - Implementation**	**Responsibility - Monitoring**
Prior to Construction, During Construction, Prior to Operations, Ongoing Operations		Mitigation Measure GHG-1: Implement Mitigation Measures AQ-1, AQ-2, and AQ-3. See above	Construction Manager, Construction Contractor	OPUD, FRAQMD
During Construction		Mitigation Measure HAZ-1 (Construction fuels, fluids): Conduct equipment refueling, maintenance and similar activities in safe areas away from wetlands and other sensitive areas. Equip vehicles with emergency spill containment materials`	Construction Manager, Construction Contractor	OPUD
Prior to Construction, During Construction		Mitigation Measure HAZ-2 (Aerially deposited lead): Conduct all grading operations in accordance with Caltrans Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils. Prepare and implement a Health and Safety Plan and special Soil Management Plan.	Construction Manager, Construction Contractor	OPUD, DTSC
During Construction		Mitigation Measure HAZ-3 (Paint striping removal): Implement dust controls, including measures that minimize paint striping dust from entering waterways and drainage infrastructure.	Construction Manager, Construction Contractor	OPUD, FRAQMD, DTSC
Prior to Construction, During Construction		Mitigation Measure HAZ-4 (Emergency Access): Implement Mitigation Measure TRA-1. See below.	Construction Manager, Construction Contractor	OPUD, Caltrans,, Yuba County DPW
Prior to Construction, During Construction, Post Construction		Mitigation Measure HYD-1 (Construction water runoff and quality): Obtain and implement the provisions of a General Construction Activity Storm Water Permit and/or NPDES Permit from the SWRCB. Apply for and implement the requirements of a Yuba County Erosion and Sediment Control Plan.	Construction Manager, Construction Contractor	OPUD SWRCB, Yuba County DPW
Prior to Construction, During Construction		Mitigation Measure HYD-2 (Groundwater management): Construct improvements when groundwater levels are below the work area; use tremie concrete at the bottom of wet wells; or obtain a Low Threat Discharge Permit or other necessary permits to allow the discharge of groundwater.	Construction Manager, Construction Contractor	OPUD, SWRCB, CVRWQCB, Yuba County DPW

OPUD South Yuba County Water and Wastewater Infrastructure Improvement Project Mitigation Measure Implementation Schedule and Monitoring Checklist				
Timing of Verification (To occur prior to or during the following actions)	**Measure Complete? (check)**	**Mitigation Measures**	**Responsibility - Implementation**	**Responsibility - Monitoring**
Prior to Construction, During Construction, Post Construction		Mitigation Measure HYD-3 (Well development): Implement Mitigation Measure HYD-1, and include the well in the NPDES Permit. Coordinate with Yuba County. Implement stormwater pollution prevention BMPs, including stabilizing the site and removing sediment from the settling basin.	Construction Manager, Construction Contractor	OPUD, CVRWQCB, Yuba County DPW
Prior to Construction, During Construction		Mitigation Measure NSE-1 (Construction noise): Obtain an Exemption Permit if necessary from Yuba County. Implement County construction noise requirements, including construction time limitations and equipment mufflers.	Construction Manager, Construction Contractor	OPUD, Yuba County CDSA
Prior to Construction, During Construction		Mitigation Measure TR-1 (Traffic Management during construction): Obtain encroachment permits for all activities within the public right of way. Obtain and implement a Traffic Control Plan or Plans that meet Yuba County and Caltrans standards.	Construction Manager, Construction Contractor	OPUD, Caltrans Yuba County DPW
